Cisco Nexus 9000 Series NX-OS Verified Scalability Guide, Release 10.2(1)F

Introduction

This document describes the Cisco NX-OS configuration limits for Cisco Nexus 9000 Series switches.

The values provided in this guide should not be interpreted as theoretical system limits for Cisco Nexus 9000 Series hardware or Cisco NX-OS software. These limits refer to values that have been validated by Cisco. They can increase over time as more testing and validation is done.

Verified Scalability Limits - Unidimensional

The tables in this section list the verified scalability limits for the Cisco Nexus 9000 Series switches for Cisco NX-OS Release 10.2(1).

These limits are validated with a unidimensional configuration. The values are provided in these tables focus on the scalability of one particular feature at a time.

Each number is the absolute maximum that is currently supported by this Cisco NX-OS release for the corresponding feature. If the hardware is capable of a higher scale, future software releases could increase this verified maximum limit. Results might differ from the values that are listed in this guide when you try to achieve maximum scalability with multiple features enabled.

> **Note**
> 1. If only one number is provided, the verified limit applies to all supported platforms and line cards.
> 2. Verified limits are provided only for supported platforms.
> 3. If a feature is not supported for a particular platform, the verified limit is not provided.

Table 1: Cisco Nexus 2000 Series Fabric Extenders (FEX) Straight Through Mode Verified Scalability Limits (Unidimensional)

Feature	Supported Platforms	Verified Limits
Fabric Extenders[1] and Fabric Extender server interfaces	Nexus 9300-EX/FX/FX2/FX3 switches	16 and 768
VLANs across all Fabric Extenders	Nexus 9300-EX/FX/FX2/FX3 switches	562
VLANs per Fabric Extender server interface[2]	Nexus 9300-EX/FX/FX2/FX3 switches	75
Port channels	Nexus 9300-EX/FX/FX2/FX3 switches + FEX	511

[1] When FEX configured using "AA" mode, then the maximum number of 6 FEX on the NFE base ToR and 16 FEX for the LSE base ToR are supported.

[2] For FEX HIF port channels, Cisco recommends that you enable STP port type edge using the **spanning tree port type edge [trunk]** command.

Table 2: ePBR Verified Scalability Limits (Unidimensional)

Feature	Supported Platforms	Verified Limits
Maximum services per switch	Nexus 9300 and 9500 switches	150[3]
Endpoints per service	Nexus 9300 and 9500 switches	32
ePBR policies per switch	Nexus 9300 and 9500 switches	150
Policies per VRF	Nexus 9300 and 9500 switches	16

Match per policy.	Nexus 9300 and 9500 switches	16
Aces per match	Nexus 9300 and 9500 switches	256

[3] Only 62 unique ACLs can be configured per slice of ASIC. Each ACL takes one label. If the same ACL is configured on multiple interfaces, the same label is shared. If each ACL has unique entries, the ACL labels are not shared, and the label limit is 62. In order to achieve 150 services per switch with the limitation of 62 ACLs per slice, the ingress interfaces should be spread across multiple slices of ASIC.

Note

1. For a list of platforms on which ePBR is supported, see the Cisco Nexus 9000 Series NX-OS ePBR Configuration Guide.

2. For the ACL limitations, see the Cisco Nexus 9000 Series NX-OS Security Configuration Guide.

		In Cisco Nexus Release 9.3(3), the **hardware qos** command is not supported.

[18] A single forwarding engine instance supports four SPAN or ERSPAN sessions. For Cisco Nexus 9300 Series switches, if the first three sessions have bidirectional sources, the fourth session has hardware resources only for Rx sources. This limitation might also apply to Cisco Nexus 9500 Series switches, depending on the SPAN or ERSPAN source's forwarding engine instance mappings.

[19] If the source interface configured for a monitor session is on the same line card, the maximum supported active SPAN sessions are 4. Based on the number of line cards in the EoR, the total number of active SPAN sessions are 4 x n, where n is the number of line cards on EoR, provided the source and destination interface are on the same line module.

[20] The number of SPAN or ERSPAN sessions per line card reduces to two if the same interface is configured as the bidirectional source in more than one session.

Note   PTP is supported for all Cisco Nexus 9000 Series switches hardware except for the 100G 9408PC line card and the 100G M4PC generic expansion module (GEM).

[25] Internet profile with additional IPv4 routes (total of 914K routes consisting of IPv4 and 62K of IPv6)

[26] Internet profile with additional IPv6 routes (total of 871K routes consisting of IPv6 and 696K of IPv4)

[27] If the user has Multi-protocol configuration, user should configure appropriate CoPP policies to avoid any control plane traffic drops.

For the Cisco Nexus 9200 Platform switches, the default value for LPM unicast routes is 6000 (IPv4) or 1900 (IPv6). You can use the **hardware profile multicast max-limit lpm-entries 0** command to increase the number of IPv4 LPM unicast routes to 8000. The **hardware profile ipv6 lpm-entries maximum 0** command reserves the entire LPM table for IPv4. With this configuration, the IPv4 LPM scale is 14,000 (with 2000 reserved for multicast by default). This value can be increased to 16,000 with the **hardware profile multicast max-limit lpm-entries 0** command. The **hardware profile ipv6 lpm-entries maximum 4096** command reserves the entire LPM table for IPv6. With this configuration, the IPv6 LPM scale is 3900. When you allocate the entire table for IPv4 or IPv6 LPM unicast routes, the other address family cannot be used.

The maximum number of PBR next-hops based on 4 FM-E supported is 192 per slice of the forwarding engine

Note

- The IPv4/IPv6 host routes and the IPv4 multicast routes share the same hardware table. Limits are provided for both the default line card mode and the max host line card mode.

- The IPv4 and IPv6 unicast routes share the same hardware table. Limits are provided for both the default line card mode and the max host line card mode.

- High availability (graceful restart and stateful switchover) is not supported when unicast or multicast aggressive timers are configured at any scale.

Guidelines and Limitations for OSPF Verified Scalability Limits

- To achieve the highest scale, we recommend that you use a single OSPF instance instead of multiple instances.

- Each OSPFv2 and OSPFv3 scale value might vary when combined with other parameters.

- The graceful restart timeout value might be increased in multidimensional scenarios.

[37] In case of IR, each VNI can have a maximum number of 64 peers; 512 peers supported on 100 VNIs only.

[38] This is the limit for the Cisco Nexus 93180YC-EX and other fiber based switches. All copper based 9300-EX switches are not applicable.

[39] Only one provider VLAN is supported.

[40] The maximum number of Layer-2 subinterfaces is based on the available entries allocated for ing-pacl-sb tcam region.

[41] Since Nexus 9300-EX and 9300-FX have only one slice, the maximum number of Layer-2 subinterfaces that can be created is lower than the limit for NExus 9300-FX2.

[42] Only 1,900 SVI are supported if dual stack is used/IPv6 is used.

[43] ECMP objects are not shared across multiple VRFs.

Verified Scalability Limits - Multidimensional

The tables in this section list the verified scalability limits for the Cisco Nexus 9508 switch with an X9636C-R, X9636C-RX, or X9636Q-R line card or a C9508-FM-R fabric module and Cisco Nexus 9504 with -R line cards for Cisco NX-OS Release 10.2(1). These limits are validated with a multidimensional configuration. The values provided in these tables focus on the scalability of all listed features at the same time.

Each number is the absolute maximum currently supported by this Cisco NX-OS release for the corresponding feature. If the hardware is capable of a higher scale, future software releases might increase this verified maximum limit. Results might differ from the values listed here when trying to achieve maximum scalability with multiple features enabled.

⚠️

Attention These numbers are not the maximum verified values if each feature is viewed in isolation. For these numbers, see the "Verified Scalability Limits" section.
