

Configuring SIP Trunking on Unified SRST

This chapter describes how to configure SIP trunking on Cisco Unified Survivable Remote Site Telephony (Unified SRST).

This chapter describes the configuration recommendations and details on the various line side and SIP trunking features on Unified SRST. Also, details are provided on the co-location of Unified Border Element and Unified SRST.

- [Unified SRST and Unified Border Element Co-location, on page 1](#)
- [Feature Information for Configuring SIP Trunking on Cisco Unified SRST, on page 16](#)

Unified SRST and Unified Border Element Co-location

For Unified SRST Release 12.1 and later releases, you can deploy product instances of Cisco Unified Border Element and Unified SRST (only for SIP) on the same Cisco 4000 Series Integrated Services Router.

Co-location of Unified SRST and Unified Border element is supported from the release Cisco IOS XE Fuji 16.7.1. All the Cisco SIP IP Phones are supported for this deployment. The phone support includes, but is not limited to:

- Cisco IP Phone 7800 Series
- Cisco IP Phone 8800 Series
- Cisco Unified IP Phone 9900 Series

When the Wide Area Network (WAN) is available, the router acts as a pure Cisco Unified Border Element, and not as a Unified SRST.

During a WAN outage, the phones registered to the Unified Communications Manager fall back on the Unified SRST. However, phones registered to Unified SRST can place or receive PSTN calls through SIP trunk.

The Unified SRST and the Unified Border Element feature set is limited to the features mentioned. The following features are supported on the phone when registered to Unified SRST:

- Incoming or Outgoing Basic Call
- Hold/Resume
- Call Forward
- Call Transfer

Unified SRST and Unified Border Element Co-location

- Conference (Built-in Bridge)
- Hunt Groups
- MOH (for SIP lines in SRST mode)

The list of SIP trunk features supported for Unified SRST and Unified Border Element co-location are:

- SIP-UA Registration/Authentication, Registrar, Register/Register Refresh
- SIP-Server, Outbound Proxy
- DNS Service Record
- Bind Global / Dial-peer
- SRTP / TLS, SRTP – RTP Interworking
- Connection Reuse
- IP Trust List
- Voice class tenant
- RTP-NTE DTMF
- P-Called-Party ID, Privacy Header (PAI)
- SIP Normalization

For more information on configuring tenants on SIP trunks, see [Cisco Unified Border Element Configuration Guide](#). For more information on the recommended configurations for the Unified Border Element co-location, see [Configuration Recommendations for Unified SRST and Unified Border Element Co-location, on page 3.](#)

The Figure shows a co-located deployment of Unified SRST with Cisco Unified Border Element.

Figure 1: Co-located Deployment of Unified SRST and Cisco Unified Border Element

393597

Configuration Recommendations for Unified SRST and Unified Border Element Co-location

Note The recommended configurations have considered single SIP trunk dial-peer, acting as both inbound and outbound dial-peer to handle calls to and from the Service Provider. Similarly, a single dial-peer, acting as both inbound and outbound dial-peer to handle calls to and from the Communication Manager.

The dial-peers created after the phones (registered to Unified Communications Manager) fall back on Unified SRST are dynamic dial-peers. Hence, the configurations under **voice service voip** and **sip-ua** are inherited by these dynamic dial-peers. Move **voice service voip** and **sip-ua** configurations under **voice class tenant** configuration mode to avoid configuration conflict. The **voice class tenant** is included in the SIP trunk dial-peer configuration.

Similarly, the relevant global configurations are grouped under a **voice class tenant** and can be applied on the dial-peer toward Unified Communications Manager as well. These configurations grouped under the **voice class tenant** are used whenever the Unified Communications Manager is available (WAN is available). For sample configurations of the co-located deployment of Unified SRST and Unified Border Element, see [Examples, on page 6](#).

The following are the configuration recommendations for the Unified SRST and Unified Border Element co-location:

- Move SIP trunk specific **voice service voip** and **sip-ua** configurations under **voice class tenant**. This is to avoid configuration conflict between SIP trunk and line side dial-peer configurations. When tenant is configured under dial-peer, the configurations are applied in the following order of preference:

1. Dial-peer configuration

2. Tenant configuration
3. Global configuration

**Note**

Certain CLI commands which need to be moved under **tenant**, are moved under **dial-peer** configuration mode. This is because these CLIs are not available under **voice class tenant**. For example, the CLI command **srtp fallback** needs to be configured under **dial-peer**, not **voice class tenant** configuration mode.

- Use dial-peer groups feature to group multiple outbound dial-peers into a dial-peer group and configure this dial-peer group as the destination of an inbound dial-peer (Unified CM trunk). For more information on dial-peer groups, see [Dial Peer Configuration Guide](#).
- Configure SIP Options Request Keepalives to monitor reachability towards Unified Communications Manager. For example:

```
voice class sip-options-keepalive 101
  up-interval 30
  retry 3 transport tcp

Options keepalive under dialpeer

dial-peer voice 101 voip
  description **CUCM/PBX**
  voice-class sip options-keepalive profile 101
```

- The relevant CLI commands for configuring dial-peer groups are:
 - voice class dpgdial-peer-group-id** (Creates a dial-peer group).
 - destination dpgdial-peer-group-id**(Specifies the dial-peer group from which the outbound dial-peer(s) is chosen).
- Avoid configuring dial-peer groups on the Service Provider SIP trunk dial-peer.
- Configure the destination pattern (.T) on the Unified Communications Manager dial-peer.
- It is mandatory to configure**voice class tenant** on the Service Provider SIP trunk dial-peer router. A configuration with voice class tenant on the Unified Communications Manager dial-peer is also validated, though it is not mandatory.
- Configure the CLI command **destination dpgdial-peer-group-id** (destination dpg 101) on the Unified Communications Manager dial-peer. This dpg configuration has Service Provider SIP trunk dial-peer information. You can configure preferences for the dial-peers within the dial-peer group:

```
voice class dpg 1
dial-peer 2900 preference 2
dial-peer 3900 preference 1
```

- Do not configure **incoming called-number** (.T), on the Service Provider SIP trunk dial-peer. Match the incoming call from SIP trunk using the address information From URI.

```
voice class uri 201 sip
host dns:sip-trunk.sample
```

```
Under dial-peer:
incoming uri from 201
```

- Configure the CLI command **transport tcp tls v1.2 undersip-ua** configuration mode, not **voice class tenant**.
- Avoid modification of contact header in a Secure SIP to SIP (and vice versa) call flow, as it leads to call establishment issues. If sip-profiles are used to modify header information from sips: to sip: in SIP REQUESTS and RESPONSES, there must be rules to include ‘transport=tls’ in the contact header.
- If dial-peers are using **voice class codec**, configure the same **voice class codec** under **voice register pool** too.
- Ensure that an srtp voice-class is created using the **voice class srtp-cryptocrypto-tag** command. A sample configuration is as follows:

```
voice class srtp-crypto 1
crypto 1 AES_CM_128_HMAC_SHA1_32
crypto 2 AES_CM_128_HMAC_SHA1_80
```

- Configure the SIP Registrar under **voice service voip sip** configuration mode with maximum and minimum expiry time for an incoming registration using the CLI command **registrar server [expires [max sec] [minsec]]**.

registrar server expires max120min60

- Move all the CLI commands related to SIP Bind feature under **voice class tenant** configuration mode. For example, it is recommended to have the CLI commands **voice-class sip bind control**, and **voice-class sip bind media**, under **voice class tenant** configuration mode.
- Exclude SIP ports from NAT services, if NAT is configured on the router. The recommended CLIs for excluding SIP ports from NAT services are:

no ip nat service sip udp port 5060

no ip nat service sip tcp port 5060

- Configure the CLI commands **no supplementary-service sip refer**, **no supplementary-service sip moved-temporarily**, **supplementary-service media-renegotiate** under **voice service voip** configuration mode.
- For the co-located deployment of Unified SRST and Unified Border Element, do not configure the CLI command **no transport udp** under **sip-ua** configuration mode. This is because, phones register to the Unified SRST device using UDP for signaling transport with the non-secure SIP SRST configuration.
- Playback of MOH from the flash memory of the router is supported for SIP lines in SRST mode in a co-located deployment of Unified SRST and Cisco Unified Border Element. Cisco IOS XE Fuji 16.7.1 and later releases support this feature.
- Redundancy is not supported for the co-located deployment of Unified SRST and Unified Border Element.
- Virtual interfaces are not supported for the co-located deployment of Unified SRST and Unified Border Element.
- Configure Media Inactivity Timer to enable router to monitor and disconnect calls if no Real-Time Protocol (RTP) packets are received within a configurable time period. A sample configuration is as follows:

```
ip rtcp report interval 9000
gateway
media-inactivity-criteria all
```

Restrictions

```
timer receive-rtp 1200
timer receive-rtcp 5
```

Restrictions

The following restrictions are observed for a co-located deployment of Unified SRST and Unified Border Element:

- You need to disable the NAT firewall support for SIP trunk side, using the CLI commands **no ip nat service sip udp port 5060** and **no ip nat service sip tcp port 5060**.
- All the SIP trunk features are not supported in a Unified SRST and Unified Border Element co-location deployment. For the list of supported features, see [Unified SRST and Unified Border Element Co-location, on page 1](#).

Examples

The following is a sample configuration for a voice class tenant:

```
voice class tenant 1
registrar ipv4:10.64.86.64:5061:5061 scheme sips expires 240 tcp tls auth-realm
sip-trunk.sample
credentials number +492281844672 username xxxx password xxxx realm sip-trunk.sample
authentication username xxxx password xxxx realm sip-trunk.sample
no remote-party-id
timers expires 900000
timers register 100
sip-server dns:sip-trunk.sample:5061
connection-reuse
asserted-id pai
bind control source-interface GigabitEthernet0/0/1
bind media source-interface GigabitEthernet0/0/1
conn-reuse
sip-profiles 3000
outbound-proxy dns:reg.sip-trunk.sample
privacy-policy passthru
call-route p-called-party-id
midcall-signaling preserve-codec
```

In the following configuration, the voice class tenant configured in the previous example is part of the dial-peer on the SIP trunk.

```
dial-peer voice 201 voip
description **SIP-TRUNK.SAMPLE**
session protocol sipv2
session target sip-server
session transport tcp tls
destination e164-pattern-map 201
incoming uri from 201
voice-class codec 1
voice-class sip url sips
voice-class sip asserted-id pai
voice-class sip outbound-proxy dns:reg.sip-trunk.sample
voice-class sip tenant 1
voice-class sip srtp-crypto 1
voice-class sip bind control source-interface GigabitEthernet0/0/1
voice-class sip bind media source-interface GigabitEthernet0/0/1
dtmf-relay rtp-nte
srtp
fax-relay ecm disable
fax rate 14400
```

```
ip qos dscp cs6 signaling
clid strip name
no vad
```

The following example provides the show running-config command output for the co-located deployment of Unified SRST and Unified Border Element:

Feature Information for Configuring SIP Trunking on Cisco Unified SRST

Not all commands may be available in your Cisco IOS Software release. For release information about specific command, see the [command reference](#) documentation.

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Cisco Catalyst operating system software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. You do not need an account on Cisco.com.

Note The table lists only the Cisco IOS Software release that introduced support for a given feature in a given Cisco IOS Software release train. Unless noted otherwise, subsequent releases of that Cisco IOS Software release train also support that feature.

The following table lists the release history for this feature.

Feature Name	Releases	Feature Information
Cisco Unified SRST and Cisco Unified Border Element Co-location	Cisco IOS XE Fuji 16.7.1	Added Support for co-location of Cisco Unified SRST and Cisco Unified Border Element on Cisco 4000 Series Integrated Services Router.
