Summary

Standard Listed part of	Compliant
FCC CFR 47 part 24/ RSS 133, RSS-Gen	
2.1046/ 6.4 RF power output, conducted	Yes
2.1049/ 6.6 Occupied bandwidth	Yes
2.1051/ 6.5 Band edge	Yes
2.1051/ 6.5 Spurious emission at antenna terminals	Yes
2.1053/ 6.5 Field strength of spurious radiation	Yes
2.1055/ 6.3 Frequency stability	-, Note

Note: The test was not performed due to no changes regarding frequency determining circuitry.

Description of the test object

Equipment:	Radio equipment Radio 4415 B2 B25 Product number KRC 161 636/1 and KRC 161 636/3 FCC ID: TA8AKRC161636 IC: 287AB-AS161636
HVIN:	AS161636
FVIN:	CXP 901 7316/7, rev. R68LB
Hardware revision state:	KRC 161 636/1: R2B KRC 161 636/3: R1C
Tested configuration:	Single RAT NB IoT stand-alone operation and Multi RAT with LTE
Frequency range:	TX: 1930 – 1995 MHz (for GSM 1930 – 1990 MHz) RX: 1850 – 1915 MHz (for GSM 1850 –1910 MHz)
IBW:	NB-IoT SA and NB IoT SA + GSM: 20 MHz NB IoT SA + WCDMA and NB IoT SA + LTE: 40 MHz (Max 20 MHz carrier separation for carriers BW ≤ 3 MHz)
Output power:	Max 40 W/ antenna port
Antenna ports:	4 TX / 4 RX ports
Antenna:	No dedicated antenna, handled during licensing
RF configurations:	NB-IoT SA: max 2 carriers/ port Contiguous Spectrum (CS), Non-Contiguous Spectrum (NCS), NB-IoT SA: TX Diversity one carrier NB-IoT SA + GSM: max 6 carriers/ port for NB-IoT SA max 2 carriers/ port and for GSM max 4 carriers/ port NB-IoT SA +WCDMA max 6 carriers/ port for IoT max 2 carriers/ port and for WCDMA max 5 carriers/ port NB-IoT SA +LTE max 6 carriers/ port for NB-IoT SA max 2 carriers/ port and for LTE max 5 carriers/ port

Channel bandwidths:	200 kHz
Modulations:	QPSK
RF power Tolerance:	+0.6/ -2.5 dB
CPRI Speed	Up to 10.1 Gbit/s
Nominal supply voltage:	-48VDC

The information above is supplied by the manufacturer.

Note: KRC 161 636/1 and KRC 161 636/3 are electrically identical according to the manufacturer.

Purpose of test

The purpose of this test is to justify a Permissive Change to include Single RAT NB IoT stand-alone operation, and Multi RAT NB IoT stand-alone + LTE, NB IoT stand-alone + WCDMA and NB IoT stand alone + GSM.

Operation modes during measurements

Measurements with multi RAT configuration was limited to NB IoT stand-alone + LTE representing worst case but includes configurations stated in section *Purpose of test.*
Measurements with NB IoT stand-alone carriers were performed with the test object transmitting test model N-TM representing QPSK as defined in 3GPP TS 36.141.
Measurements with LTE carriers measurements were performed with the test object transmitting test model E-TM1.1 representing QPSK as defined in 3GPP TS 36.141.

All measurements were performed with the test object configured for maximum transmit power. The measured configurations covers worst case settings.

The duty cycle was determined using the method described in ANSI 63.26 section 5.2.4.4.2. Then $10\log(\frac{1}{duty\ cycle})$ was added to the measured power level to compute the average power during constant transmission.
A 86 % duty cycle of the IoT carrier resulted in a 0.65 dBm adjustment added to the measured value.

In multi RAT mode, when added a LTE carrier the total combined duty cycle was 90.7 % calculated $10\log(\frac{1}{((1+0.86+0.86)/3)})$ resulting in a total power adjustment of 0.42 dBm.

Conducted measurements

The test object was supplied with -48 VDC by an external power supply. Additional connections are documented in the set-up drawings for conducted measurements.

Radiated measurements

The test object was powered with -48 VDC by an external power supply. Additional connections are documented in the set-up drawings for radiated measurements.

Uncertainties

Measurement and test instrument uncertainties are described in the quality assurance documentation ”SP-QD 10885”. The uncertainties are calculated with a coverage factor k=2 (95% level of confidence).
Compliance evaluation is based on a shared risk principle with respect to the measurement uncertainty.

Reservation

The test results in this report apply only to the particular test object as declared in the report.

Delivery of test object

The test object was delivered: 2018-01-26.

Manufacturer’s representative

Mikael Jansson, Ericsson AB.

Test engineers

Tomas Isbring for radiated tests, RISE
Andreas Johnson for conducted tests, RISE.

Test participant(-s)

None.

IoTM	42.97	43.12	43.28	43.02	49.28

[2)]: Measure and add 10 log(N_{ant}) according to ANSI C63.26 section 6.4.3.2.4

Remark

ERP/EIRP compliance is addressed at the time of licensing. as required by the responsible FCC/IC Bureau(s). Licensee's are required to take into account maximum antenna gain used in combination with above power settings to prevent the radiated output power to exceed the limits.

Limits

§24.232 The maximum output power may not exceed 3280 W/MHz (EIRP).
The Peak to Average Ratio (PAR) may not exceed 13 dB.

RSS-133 The maximum equivalent isotopically radiated power (EIRP) limits in SRSP-510 apply, resulting in a maximum EIRP of 3280 W/MHz.
The Peak to Average Ratio (PAR) may not exceed 13 dB.

Complies?	Yes

Occupied bandwidth measurements according to CFR47 2.1049 / RSS-Gen 6.6

Date	Temperature	Humidity
2018-02-27	25 °C ± 3 °C	12 % ± 5 %

Test set-up and procedure

The measurements were made per definition in ANSI C63.26, 5.4.4. The output was connected to a signal analyzer with the Peak detector activated in max hold.

Measurement equipment	RISE number
R&S FSW 43	902 073

Band edge measurements according to CFR 47 §2.1049

Date	Temperature	Humidity
2018-02-27	25 °C ± 3 °C	12 % ± 5 %
2018-02-28	25 °C ± 3 °C	12 % ± 5 %
2018-04-06	22 °C ± 3 °C	9 % ± 5 %

Test set-up and procedure

The measurements were made per definition in ANSI C63.26, 5.7.3. The test object was connected to a spectrum analyzer with the RMS detector activated.

A RBW 1% of EBW was used up to 1 MHz away from the band edges. A smaller resolution bandwidth is permitted provided that the measured power is integrated over the full required measurement bandwidth. Where a smaller RBW was used the limit in the plot is adjusted by 10 log ($RBW_{used}/RBW_{specified}$) [dB] according to the following table:

Carrier BW	RBW_{used}	$RBW_{specified}$ (1% of EBW)	Limit correction	Adjusted limit
200 kHz	2 kHz	2.88kHz	-1.6 dBm	-14.6 dBm

From 1 MHz to 30 MHz away from the band edges a RBW of 100 kHz was used. To compensate for the reduced RBW the limit was adjusted by 10 dB to -23 dBm in this frequency range.

Diagram	Symbolic name	Tested Port
9 a-c	1L2IoTb	RF C
10 a-c	I1L2IoTt	RF C

Note: Measurements were mainly limited to port RF C due to the measurement result in single carrier mode that shows that the ports are electrical identical as declared by the client.

Remark

The emission at 9 kHz on the plots was not generated by the test object. A complementary measurement with a smaller RBW showed that it was related to the LO feed-through.

The highest fundamental frequency is 1995 MHz. The measurements were made up to 20 GHz (10x1995 MHz = 19950 MHz).

Limits

CFR 47 §24.238 and RSS-133 6.5

Outside a licensee's frequency band(s) of operation the power of any emission shall be attenuated below the transmitter power (P) by at least 43 + 10 log (P) dB. resulting in a limit of -13 dBm per 1 MHz RBW.

Complies?	Yes

Field strength of spurious radiation measurements according to CFR 47 §2.1053 / IC RSS-133 6.5

Date	Temperature	Humidity
2018-02-06	21 °C ± 3 °C	20 % ± 5 %
2018-02-08	21 °C ± 3 °C	29 % ± 5 %
2018-02-09	21 °C ± 3 °C	23 % ± 5 %

The test site conform to the site validation criterion specified in ANSI C63.4 2014. The test site complies with RSS-Gen. Industry Canada file no. 3482A-1.

The measurements were performed with both horizontal and vertical polarization of the antenna. The antenna distance was 3 m in the frequency range 30 MHz – 18 GHz and 1 m in the frequency range 18 GHz – 20 GHz.

RF absorbers were covering a floor area in the frequency range 1 GHz – 18 GHz to comply with site validation requirements according to ANSI C63.4-2014.

The EUT was placed 0.8 m above reference ground plane in frequency range 30 MHz – 1 GHz and 1.5 m above reference ground plane in frequency range 1 GHz – 20 GHz.

The measurement was performed with a RBW of 1 MHz.

A propagation loss in free space was calculated. The used formula was $\gamma = 20\log\left(\frac{4\pi D}{\lambda}\right)$. γ is the propagation loss and D is the antenna distance.

The measurement procedure was as the following:

1. A pre-measurement is performed with peak detector. For measurement < 1 GHz the test object was measured in eight directions with the antenna at three heights. 1.0 m. 1.5 m and 2.0 m. For measurements > 1 GHz the test object was measured in seventeen directions with the antenna height 1.0 m. 1.5 m and 2m.
2. Spurious radiation on frequencies closer than 20 dB to the limit in the pre-measurement is scanned 0-360 degrees and the antenna is scanned 1- 4 m for maximum response. The emission is then measured with the RMS detector and the RMS value is reported. Frequencies closer than 10 dB to the limit when measured with the RMS detector were measured with the substitution method according to ANSI 63.26.

The test set-up during the spurious radiation measurements is shown in the picture below:
30-1000 MHz
