ABOUT THE AUTHORS

John C. Norcross received his baccalaureate *summa cum laude* from Rutgers University. He earned his master's and doctorate in clinical psychology from the University of Rhode Island and completed his internship at the Brown University School of Medicine. He is Professor of Psychology and Distinguished University Fellow at the University of Scranton, a clinical psychologist in independent practice, and editor of the *Journal of Clinical Psychology: In Session*. He is president-elect of the American Psychological Association's Society of Clinical Psychology and past-president of the APA Division of Psychotherapy. Dr. Norcross has published more than 250 articles and has authored or edited 16 books, the most recent being *Leaving It at the Office: A Guide to Psychotherapist Self-Care*, *Clinician's Guide to Evidence-Based Practice in Mental Health*, *Authoritative Guide to Self-Help Resources in Mental Health*, and *Psychotherapy Relationships That Work*. Among his awards are the Pennsylvania Professor of the Year from the Carnegie Foundation, Distinguished Practitioner from the National Academies of Practice, and the Distinguished Career Contribution to Education and Training Award from the American Psychological Association. Dr. Norcross has conducted workshops and research on graduate study in psychology for many years.

Michael A. Sayette received his baccalaureate *cum laude* from Dartmouth College. He earned his master's and doctorate in clinical psychology from Rutgers University and completed his internship at the Brown University School of Medicine. He is Professor of Psychology at the University of Pittsburgh, with a secondary appointment as Professor of Psychiatry at the Western Psychiatric Institute and Clinic, University of Pittsburgh School of Medicine. Dr. Sayette has published primarily in the area of substance abuse. His research, supported by the National Institute on Alcohol Abuse and Alcoholism and by the National Institute on Drug Abuse, concerns the development of psychological theories of alcohol and tobacco use. He has served on National Institutes of Health grant review study sections and is on the editorial boards of several journals. He also is an associate editor of *Journal of Abnormal Psychology* and a former associate editor of *Psychology of Addictive Behaviors*. Dr. Sayette has directed graduate admissions for the clinical psychology program at the University of Pittsburgh, and has presented seminars on applying to graduate school at several universities in North America and Europe.

Tracy J. Mayne received his baccalaureate from the State University of New York at Buffalo, where he graduated *magna cum laude* and *Phi Beta Kappa*. He received his Ph.D. as an Honors Fellow from Rutgers University and completed his internship and postdoctoral

ABOUT THE AUTHORS

fellowship at the University of California at San Francisco Medical School and the Center for AIDS Prevention Studies. He spent 2 years as an international scholar at the Institut Nationale de la Santé et de la Recherche Médicale in France and 3 years as the Director of HIV Epidemiology and Surveillance at the New York City Department of Health, where he received the Commissioner's Award for Outstanding Community Research. Dr. Mayne spent 5 years conducting research in cardiovascular medicine at Pfizer Pharmaceuticals and currently works in Global Health Economics at Amgen Inc., conducting research in cancer-supportive therapies. Dr. Mayne has published numerous articles and chapters in the area of health psychology, health economics, and emotion, and is the coeditor of *Emotions: Current Issues and Future Directions*, published by The Guilford Press.

ACKNOWLEDGMENTS

To paraphrase John Donne, no book is an island, entire of itself. This sentiment is particularly true of a collaborative venture such as ours: a coauthored volume in its tenth edition comprising the contributions of hundreds of psychologists and of reports on doctoral programs provided by training directors throughout North America. We are grateful to them all.

We are also indebted to the many friends, colleagues, and workshop participants for their assistance in improving this book over the years. Special thanks to Jeannette Ellis, who collected and organized data on individual program reports, as well as Krystle Evans for conducting data analysis for this edition. William Burke, Director of Financial Aid at the University of Scranton, updates our sections on financial aid and loan options every two years. Seymour Weingarten and his associates at The Guilford Press have continued to provide interpersonal support and technical assistance on all aspects of the project. Special thanks to our families for their unflagging support and patience with late night work!

Finally, our efforts have been aided immeasurably by our students, graduate and undergraduate alike, who courageously shared their experiences with us about the application and admission process.

PREFACE

One of the benefits of applying to clinical and counseling psychology programs is that you earn the right to commiserate about it afterwards. It was a night of anecdotes and complaints (while doing laundry) that led us to review our travails and compare notes on the difficulties we each experienced during the admission process. We emerged from three diverse backgrounds: one of us (T.J.M.) graduated from a large state university, took time off, and then entered a doctoral program; one of us (M.A.S.) graduated from a private liberal arts college and immediately pursued a doctorate; and another one of us (J.C.N.) graduated from a liberal arts college within a major state university after 5 years and then pursued doctoral studies.

Although we approached graduate school in different ways, the process was much the same. We each attempted to locate specific information on clinical and counseling psychology admissions, looked to people around us for advice, took that which seemed to be sound, and worked with it. Not all the advice was good (one professor went so far as to suggest a career in the theater instead!), and it was difficult to decide what was best when advice conflicted.

All in all, there was too little factual information available and too much unnecessary anxiety involved. No clearly defined or organized system was available to guide us through this process. So we decided to write an *Insider's Guide to Graduate Programs in Clinical and Counseling Psychology*. That was 10 editions, 20 years, and 100,000 copies ago.

The last dozen years have seen the entire process of choosing schools and applying become progressively more difficult. Approximately 76,000 bachelor's degrees are awarded every year in psychology, and about 20% of the recipients go on to earn a master's or doctoral degree in psychology. Clinical and counseling psychology programs continue to grow in number and to diversify in mission: 232 APA-accredited doctoral programs in clinical psychology, 67 APA-accredited doctoral programs in counseling psychology, 10 APA-accredited programs in combined psychology, dozens of non-APA-accredited doctoral programs, and hundreds of master's programs.

How should you prepare for admission into these graduate programs? Which should you apply to? And which type of program is best for you—counseling or clinical, practice-oriented Psy.D. or research-oriented Ph.D.? We shall take you step by step through this confusing morass and help you make informed decisions suited to your needs and interests.

In clear and concise language, we assist *you* through this process, from the initial decision to apply through your final acceptance. In Chapter 1, we describe the predominant training models in clinical and counseling psychology and alternatives to these disciplines. In the

next chapter, we discuss the essential preparation for graduate school—the course work, faculty mentoring, clinical experiences, research skills, entrance examinations, and extracurricular activities. From there, in Chapter 3, we get you started on the application process and assist you in understanding admission requirements. In Chapter 4, we show you how to systematically select schools on the basis of multiple considerations, especially research interests, clinical opportunities, theoretical orientations, financial assistance, and quality of life. Then in Chapter 5, we take you through the application procedure itself—forms, curricula vitae, personal statements, letters of recommendation, academic transcripts, and the like. In Chapter 6, we review the perils and promises of the interview, required by three-quarters of clinical and counseling psychology programs. Last, in Chapter 7, we walk you through the complexities of the final decisions. With multiple worksheets and concrete examples, we will help you feel less overwhelmed, better informed, and, in the end, more aware that *you* are the consumer of a program that best suits *your* needs.

In this new edition, we provide:

- listings of each program's concentrations and speciality tracks (Appendix G)
- updates on financial assistance and government-sponsored loans
- discussion of APA's decision to discontinue its accreditation of Canadian programs
- enhanced coverage of acceptance rates
- data on each program's attrition (dropout) rate
- a section for applicants with disabilities

In addition, we describe how you can capitalize on the Internet revolution to ease the graduate school admissions process—locating compatible programs, communicating with potential faculty mentors, submitting application forms, and helping faculty send letters of recommendation electronically. We also provide specific advice for racial/ethnic minority and lesbian, gay, bisexual, and transgendered (LGBT) applicants. Throughout the book, we provide Web sites to access for additional information and direction.

We have conducted original studies on graduate psychology programs for this book in an effort to inform your decision making. These results provide information on the differences between clinical and counseling psychology (Chapter 1), the distinctions between Ph.D. and Psy.D. programs (Chapter 1), the importance of various graduate school selection criteria (Chapter 2), acceptance rates (Chapter 3), the probability of financial assistance (Chapter 4), interview policies (Chapter 6), research areas (Appendix E), clinical and practica sites (Appendix F), and more. Indeed, we have extensively surveyed all APA-accredited programs in clinical, counseling, and combined psychology for 20 years now and present detailed information on each in the Reports on Individual Programs. A detailed Time Line (Appendix A) and multiple worksheets (Appendices B, C, and D) also provide assistance on the heretofore treacherous journey of applying to graduate programs in clinical and counseling psychology.

This volume will assist anyone seeking admission to graduate school in clinical and counseling psychology, both master's and doctoral degrees. However, the primary focus is on Ph.D. and Psy.D. applicants, as the doctorate is the entry-level qualification for professional psychology. Just as a master's degree in biology does not make one a physician, a master's in psychology does not, by state licensure and APA regulation, typically qualify one as a psychologist. Forty-eight states require the doctorate for licensure or certification as a psychologist; almost half the states grant legal recognition of psychological associates, assistants, or examiners with a master's degree (APA Practice Directorate, 1999). But the material presented here is relevant for master's (M.A. or M.S.) applicants as well.

With this practical manual, we wish you an application process less hectic and confusing than ours, but equally rewarding in the end result. Good luck!

CHAPTER 1

INTRODUCING CLINICAL AND COUNSELING PSYCHOLOGY

If you are reading this book for the first time, we assume you are either considering applying to graduate programs in clinical and counseling psychology or are in the process of doing so. For even the best-prepared applicant, this can precipitate a great deal of stress and confusion. The mythology surrounding this process is foreboding, and you may have heard some “horror” stories similar to these: “It’s the hardest graduate program to get into in the country”; “You need a 3.7 grade point average and 650s on your GREs or they won’t even look at you”; “If you haven’t taken time off after your bachelor’s degree and worked in a clinic, you don’t have enough experience to apply.”

Having endured the application process ourselves, we know how overwhelming the task appears at first glance. However, we have found that much of the anxiety is unwarranted. It does not take astronomical test scores or years of practical experience to get into clinical and counseling psychology programs. Although these qualifications certainly help, they are not sufficient. Equally important are a knowledge of how the system works and a willingness to put in extra effort during the application process. In other words, in this book, we will help you to work smarter and work harder in getting into graduate school.

Clinical and Counseling Psychology

Before dealing with the question of “how to apply,” we would like to address “why” to apply and what clinical and counseling psychology entail. Reading through the next section may be useful by making you aware of other programs of study that may better suit your needs.

Let us begin with clinical psychology, the largest specialty and the fastest growing sector in psychology. Two-thirds of the doctoral-level health service providers in the American Psychological Association (APA) identify with the specialty area of clinical psychology (VandenBos, Stapp, & Kilburg, 1981). A census of all psychological personnel residing in the United States likewise revealed that the majority reported clinical psychology as their major field (Stapp, Tucker, & VandenBos, 1985).

A definition of clinical psychology was adopted jointly by the APA Division of Clinical Psychology and the Council of University Directors of Clinical Psychology (Resnick, 1991). That definition states that the field of clinical psychology involves research, teaching, and services relevant to understanding, predicting, and alleviating intellectual, emotional, biological, psychological, social, and behavioral maladjustment, applied to a wide range of client populations. The major skill areas essential to clinical psychology are assessment, intervention, consultation, program development and evaluation, supervision, administration, conduct of research, and application of ethical standards. Perhaps the safest observation about clinical psychology is that both the field and its practitioners continue to outgrow the classic definitions.

Indeed, the discipline has experienced a veritable explosion since World War II in numbers, activities, and knowledge. Since 1949, the year of the Boulder Conference (see below), there has been a large and significant increase in psychology doctoral graduates. Approximately 2,400 doctoral degrees are now awarded annually in clinical psychology—1,400 Ph.D. degrees and 1,000 Psy.D. degrees. All told, doctoral

TABLE 1-1. Popularity and Doctorate Production of Psychology Subfields

Other or general	12%	387	560	438
Total	100%	2,883	3,287	3,199^a

Note. Data from Stapp, Tucker, & VandenBos (1985) and National Research Council, (selected years).

^aPlus 1,000 Psy.D. degrees awarded annually.

degrees in clinical psychology account for about 48% of all psychology doctorates (Norcross et al., 2005). Table 1-1 demonstrates the continuing popularity of clinical psychology and the growing number of clinical doctorates awarded annually.

These trends should continue well into the future. After a drop in the early 1980s, the percentage of psychology majors among college freshmen has continued to increase nationally to over 3%. In fact, the proportion of college freshmen who explicitly express an intention of becoming clinical psychologists has risen to 1.3% (Astin, Green, & Korn, 1987). A nationwide survey of almost 2 million high school juniors, reported in the *Occupational Outlook Quarterly*, found that psychology was the sixth most frequent career choice. Indeed, according to data from the U.S. Department of Education, interest in psychology as a major has never been higher (Murray, 1996). So, if you are seriously considering clinical or counseling psychology for a career, you belong to a large, vibrant, and growing population.

Counseling psychology is the second largest specialty in psychology and another rapidly growing sector. As also shown in Table 1-1, counseling psychology has experienced sustained growth over the past three decades. We are referring here to counseling *psychology*, the doctoral-level specialization in psychology, not to the master's-level profession of counseling. This is a critical distinction: our book and research studies

pertain specifically and solely to counseling psychology programs, not counseling programs.

The distinctions between clinical psychology and counseling psychology have steadily faded. Graduates of counseling psychology programs are eligible for the same professional benefits as clinical psychology graduates, such as psychology licensure, independent practice, and insurance reimbursement. The APA ceased distinguishing many years ago between clinical and counseling psychology internships: there is one list of accredited internships for both clinical and counseling psychology students. Both types of programs prepare doctoral-level psychologists who provide health care services.

At the same time, five robust differences between clinical psychology and counseling psychology are still visible (Morgan & Cohen, 2003; Norcross et al., 1998). First, clinical psychology is larger than counseling psychology: in 2007, there were 232 active APA-accredited doctoral programs in clinical psychology and 67 active APA-accredited doctoral programs in counseling psychology (APA, 2006) currently accepting students. Table 1-1 reveals that these counseling psychology programs—in addition to some unaccredited programs—produce about 500 doctoral degrees per year. By contrast, clinical psychology programs produce approximately 2,400 doctoral degrees (1,400 Ph.D. and 1,000 Psy.D.) per year. Second, clinical psychology graduate programs are almost exclusively housed in de-

partments or schools of psychology, whereas counseling psychology graduate programs are located in a variety of departments and divisions. Our research (Turkson & Norcross, 1996) shows that, in rough figures, one-quarter of doctoral programs in counseling psychology are located in psychology departments, one-quarter in departments of counseling psychology, one-quarter in departments or colleges of education, and one-quarter in assorted other departments. The historical placement of counseling psychology programs in education departments explains the occasional awarding of the Ed.D. (doctor of education) by counseling psychology programs.

A third difference is that clinical psychology graduates tend to work with more seriously disturbed patients and are more likely trained in projective assessment, whereas counseling graduates work with healthier, less pathological patients and conduct more career and vocational assessment. Fourth, counseling psychologists more frequently endorse a client-centered/Rogerian approach to psychotherapy, whereas clinical psychologists are more likely to embrace behavioral or psychodynamic orientations. And fifth, both APA figures (APA Research Office, 1997) and our research (Bechtoldt, Norcross, Wyckoff, Pokrywa, & Campbell, 2001) consistently reveal that 15% more clinical psychologists are employed in full-time private practice than are counseling psychologists, whereas 10% more counseling psychologists are employed in college counseling centers than are clinical psychologists. Studies on the roles and functions of clinical and counseling psychologists substantiate these differences, but the similarities are far more numerous (Brems & Johnson, 1997; Fitzgerald & Osipow, 1986; Watkins, Lopez, Campbell, & Himmel, 1986a, 1986b).

In order to extend this previous research, we conducted a study of APA-accredited doctoral programs in counseling psychology (95% response rate) and clinical psychology (99% response rate) regarding their number of applications, characteristics of incoming students, and research areas of the faculty (Norcross, Sayette, Mayne, Karg, & Turkson, 1998). We found:

- The average acceptance rates of Ph.D. clinical (6%) and Ph.D. counseling (8%) psychology programs were quite similar despite the higher number of applications to clinical programs (270 vs. 130).
- The average grade point averages (GPAs) and GRE scores for incoming doctoral students were nearly identical in Ph.D. clinical and Ph.D. counseling psychology programs (3.5 for both).
- The counseling psychology programs accepted more ethnic minority students (25% vs. 18%) and

master's students (67% vs. 21%) than the clinical psychology programs.

- The counseling psychology faculty were far more interested than clinical psychology faculty in research pertaining to minority/cross-cultural issues (69% vs. 32% of programs) and vocational/career testing (62% vs. 1% of programs).
- The clinical psychology faculty, in turn, were far more interested than the counseling psychology faculty in research pertaining to psychopathological populations (e.g., attention deficit disorders, depression, personality disorders) and activities traditionally associated with medical settings (e.g., neuropsychology, pain management, pediatric psychology).

Please bear in mind that these systematic comparisons reflect broad differences in the APA-accredited Ph.D. programs; they say nothing about Psy.D. programs (which we discuss later in this chapter) or nonaccredited programs. Also bear in mind that these data can be used as a rough guide in matching your interests to clinical or counseling psychology programs. The notion of discovering the best match between you and a graduate program is a recurrent theme of this *Insider's Guide*.

As shown in Table 1-2, clinical and counseling psychologists devote similar percentages of their day to the same professional activities. About one-half of their time is dedicated to psychotherapy and assessment and a quarter of their time to research and administration. A stunning finding was that over half of clinical and counseling psychologists were routinely involved in all seven activities—psychotherapy, assessment, teaching, research, supervision, consultation, and administration. Flexible career indeed!

The scope of clinical and counseling psychology is continually widening, as are the employment settings. Many people mistakenly view psychologists solely as practitioners who spend most of their time seeing patients. But in truth, clinical and counseling psychology are wonderfully diverse and pluralistic professions. Consider the employment settings of American clinical psychologists: 40% in private practices, 19% in universities or colleges, 5% in psychiatric hospitals, 9% in medical schools, 4% in general hospitals, another 5% in community mental health centers, 4% in outpatient clinics, and 11% in “other” placements (Norcross, Karg, & Prochaska, 1997a, 1997b). This last category included, just to name a few, child and family services, correctional facilities, rehabilitation centers, school systems, health maintenance organizations, psychoanalytic institutes, and the federal government.

TABLE 1-2. Professional Activities of Clinical and Counseling Psychologists

Activity	Clinical psychologists		Counseling psychologists	
	% involved in	Average % of time	% involved in	Average % of time
Psychotherapy	80	34	74	28
Diagnosis/assessment	64	15	62	12
Teaching	50	10	60	18
Clinical supervision	50	6	54	6
Research/writing	51	14	50	8
Consultation	47	7	61	7
Administration	53	13	56	15

Note. Data from Norcross, Karpiak, & Santoro (2005) and Watkins, Campbell, & Himmell (1986a).

Although many psychologists choose careers as clinicians in private practice, hospitals, and clinics, a large number also pursue careers in research. For some, this translates into an academic position. Uncertainties in the health care system increase the allure of academic positions, where salaries are less tied to client fees. Academics teach courses and conduct research, usually with a clinical population. They hope to find a “tenure-track” position, which means they start out as an assistant professor. After a certain amount of time (typically 5 or 6 years), a university committee reviews their research, teaching, and service, and decides whether they will be hired as a permanent faculty member and promoted to associate professor. Even though the tenure process can be pressured, the atmosphere surrounding assistant professors is very conducive to research activity. They are often given “seed” money to set up facilities and attract graduate students eager to share in the publication process. (For additional information on the career paths of psychology faculty, consult *The Psychologist’s Guide to an Academic Career*; Rheingold, 1994, or *Career Paths in Psychology*, Sternberg, 2006.)

In addition, research-focused industries (like pharmaceutical and biomedical), as well as community-based organizations, are increasingly employing psychologists to design and conduct outcomes research. The field of outcomes research combines the use of assessment, testing, program design, and cost-effectiveness analyses within contexts as varied as clinical trials and community interventions. Although lacking the job security of tenure, industry can offer greater monetary compensation and is a viable option for research-oriented PhDs.

But even this range of primary employment settings does not accurately capture the opportunities in

the field. About half of all clinical and counseling psychologists hold more than one professional position (Norcross et al., 1997a; Watkins et al., 1986a). By and large, psychologists incorporate several pursuits into their work, often simultaneously. They combine activities in ways that can change over time to accommodate their evolving interests. Of those psychologists not in full-time private practice, over half engage in some part-time independent work (Norcross et al., 1997b). Without question, this flexibility is an asset.

As a university professor, for example, you might run a research group studying aspects of alcoholism, treat alcoholics and their families in private practice, and teach a course on alcohol abuse. Or, you could work for a company supervising marketing research, do private testing for a school system, and provide monthly seminars on relaxation. The possibilities are almost limitless.

This flexibility is also evident in clinical and counseling psychologists’ “self-views.” About 60% respond that they are primarily clinical practitioners, 20% are academicians, 7% administrators, 5% researchers, 5% consultants, and 2% supervisors (Norcross et al., 1997b; Watkins et al., 1986a).

Also comforting is the consistent finding of relatively high and stable satisfaction with graduate training and career choice. Over two-thirds of graduate students in clinical and counseling psychology express satisfaction with their post-baccalaureate preparation. Moreover, 87 to 91% are satisfied with their career choice (Norcross et al., 2005; Tibbits-Kleber & Howell, 1987). The conclusion we draw is that clinical and counseling psychologists appreciate the diverse pursuits and revel in their professional flexibility, which figure prominently in their high level of career satisfaction.

According to *Money* magazine and Salary.com, psychologist is one of the 10 best jobs in America. And so, too, is college professor.

Combined Programs

APA accredits doctoral programs in four areas: clinical psychology, counseling psychology, school psychology, and combined psychology. The last category is for those programs that afford doctoral training in two or more of the specialties of clinical, counseling, and school psychology.

The “combined” doctoral programs represent a relatively new development in graduate psychology training, and thus are relatively small in number, about 3% of APA-accredited programs. In emphasizing the core research and practice competencies among the specialties, combined programs try to enlist their respective strengths and to capitalize on their overarching competencies. In doing so, the hope is that a combined program will be “greater than the sum of its parts” (Salzinger, 1998). For students undecided about a particular specialty in professional psychology and seeking broad clinical training, these accredited combined programs warrant a close look.

The chief reasons that students select combined doctoral programs are for greater breadth and flexibility of training and for more opportunity of integrative training across specializations. The emphasis on breadth of psychological knowledge ensures that combined training will address the multiplicity of interests that many students have and that many psychologists will need in practice (Beutler & Fisher, 1994). The chief disadvantages of combined programs are, first, their lack of depth and specialization and, second, the fact that other mental health professionals may not understand the combined degree. Our research on combined training programs (Castle & Norcross, 2002; Cobb, Reeve, Shealy, Norcross, et al., 2004) does, in fact, substantiate the broader training and more varied employment of their graduates. Consult the Reports of Combined Programs at the end of this book for details on these innovative programs. Also consult two special issues of the *Journal of Clinical Psychology* (Shealy, 2004) on the combined-integrative model of doctoral training in professional psychology.

The Boulder Model (Ph.D.)

The diversity in professional activities has produced a diversity of training models in professional psychology. Without a firm understanding of the differences in these

training models, many applicants will waste valuable time and needlessly experience disappointment. Let us now distinguish between the two prevalent training models in clinical psychology—the Boulder model and the Vail model. Combined programs and counseling psychology have parallel differences in training emphases; however, they do not typically employ the same terms as clinical psychology and offer only a handful of Psy.D. degrees.

The first national training conference on clinical psychology was held during 1949 in Boulder, Colorado (hence, the “Boulder model”). At this conference, equal weight was accorded to the development of research competencies and clinical skills. This dual emphasis resulted in the notion of the clinical psychologist as a *scientist-practitioner*. Clinical psychologists were considered first and foremost as psychologists and were to have a rigorous, broad-based education in psychology. Their training would encompass statistics, history and systems, and research, with core courses in development, biopsychology, learning, and the like. The emphasis was on psychology; clinical was the adjective.

The Boulder conference was a milestone for several reasons. First, it established the Ph.D. as the required degree, as in other academic research fields. To this day, all Boulder model, scientist-practitioner programs in clinical psychology award the Ph.D. degree. Second, the conference reinforced the idea that the appropriate location for training was within university departments, not separate schools or institutes as in medicine and law. And third, clinical psychologists were trained for simultaneous existence in two worlds: academic/scientific and clinical/professional.

The important implication for you, as an applicant, is to know that Boulder-model programs provide rigorous education as a researcher along with training as a clinician. Consider this dual thrust carefully before applying to Boulder-model programs. Some first-year graduate students undergo undue misery because they dislike research-oriented courses and the research projects that are part of the degree requirements. These, in turn, lead to the formal dissertation required by Boulder-model programs. Many applicants are specifically seeking this sort of training.

A recent movement toward a “bolder” Boulder model was crystallized by the 1995 creation of the Academy of Psychological Clinical Science (APCS). According to its Web site, APCS is “an alliance of leading, scientifically oriented, doctoral training programs in clinical and health psychology, committed to empirical approaches to advancing knowledge.” “The Academy seeks as members those programs that are strongly

committed to research training and to the integration of such training with clinical training.” APCS includes 43 clinical psychology Ph.D. programs. These programs are listed in Table 1-3. More information on APCS can be found on their Web site: w3.arizona.edu/~psych/apcs/apcs.html.

Based on the data from our previous editions of the *Insider’s Guide* we found that, compared to non-member programs, APCS programs admit a slightly lower percentage of applicants (who had higher GRE scores) and were more likely to provide full financial support. APCS programs also subscribe more frequently to a cognitive-behavioral orientation, report a stronger research emphasis, and engage more frequently in research supported by funding agencies than non-APCS programs (Sayette, Mayne, Norcross, & Giuffre, 1999). Students interested in a Boulder-model clinical Ph.D program may find these programs to be especially attractive in that they represent empirically based, research-focused training.

Other applicants are seeking training focused on clinical practice. For these applicants, there is an alter-

native to the Boulder model: the Vail model of training psychologists.

The Vail Model (Psy.D.)

Some dissension with the recommendations of the Boulder conference emerged at later meetings; however, there was a strong consensus that the scientist-practitioner model, Ph.D. degree, and university training should be retained. But in the late 1960s and early 1970s, change was in the wind. Training alternatives were entertained, and diversification was encouraged. This sentiment culminated in a 1973 national training conference held in Vail, Colorado (hence, the “Vail model”).

The Vail conferees endorsed different principles than the Boulder model, leading to a diversity of training programs (Peterson, 1976, 1982). Psychological knowledge, it was argued, had matured enough to warrant creation of explicitly professional programs along the lines of professional programs in medicine, dentistry, and law. These “professional programs”

were to be added to, not replace, Boulder-model programs. Further, it was proposed that different degrees should be used to designate the scientist role (Ph.D.—Doctor of Philosophy) from the practitioner role (Psy.D.—Doctor of Psychology). Graduates of Vail-model professional programs would be *scholar-professionals*: the focus would be primarily on practice and less on research.

This revolutionary conference led to the emergence of two distinct training models typically housed in different settings. Boulder-model, Ph.D. programs are almost universally located in graduate departments of large universities. However, Vail-model programs can be housed in three organizational settings: within a psychology department; within a university-affiliated psychology school (for instance, Rutgers and Adelphi universities); and within an independent, “freestanding” university (e.g., Alliant University, Argosy University). These latter programs are part of independent institutions, some of which are run as for-profit companies. Although they are titled “universities,” they are frequently not comprehensive universities offering degrees in dozens of subjects. Rather, they only offer degrees in a handful of subjects and thus not “universities” in the traditional sense of comprehensive universities.

Table 1-4 lists APA-accredited clinical Psy.D. programs. (For a listing of non-accredited Psy.D. programs, see www.apadiv2.org/otrp/resources/brynolf07psyd.pdf)

Clinical psychology now has two established and complementary training models. All the Ph.D. programs together produce approximately 1.2 times as many doctoral-level psychologists per year as Psy.D. programs collectively. Although Boulder-model programs still outnumber Vail-model programs, Vail-model programs enroll, as a rule, three to four times the number of incoming doctoral candidates. This creates almost a numerical parity in terms of psychologists produced.

Several studies have demonstrated that initial worries about stigmatization, employment difficulties, licensure uncertainty, and second-class citizenship for Psy.D.s have *not* materialized (see Hershey, Kopplin, & Cornell, 1991; Peterson, Eaton, Levine, & Snapp, 1982). There do not appear to be strong disparities in the pre-internship clinical skills of Ph.D. and Psy.D. students as evaluated by internship supervisors (Snapp & Peterson, 1988). Nor are there discernible differences in employment except, of course, that the more research-oriented, Boulder-model graduates are far more likely to be employed in academic positions and medical schools (Gaddy, et al., 1995). While Vail-

model graduates may be seen as second-class citizens by some Boulder-model traditionalists, this is not the case among health care organizations or individual patients.

Which training model do clinical psychologists themselves prefer? In one of our studies (Norcross, Gallagher, & Prochaska, 1989), we found that 50% favored the Boulder model, 14% the Vail model, and the remaining 36% both models equally. However, preferences varied as a function of the psychologist’s own doctoral program: 93% of the psychologists trained in a strong Boulder tradition preferred the Boulder model or both equally. Likewise, 90% of the psychologists trained in a strong Vail tradition preferred the Vail model or both equally. In short, psychologists preferred the training model to which they applied and in which they completed their training.

Differences between Boulder and Vail Programs

The differences between Boulder-model and Vail-model programs are quantitative, not qualitative. The primary disparity lies in the relative emphasis on research: Boulder programs aspire to train producers of research; Vail programs train consumers of research. Even Vail programs require research and statistics courses; you simply cannot avoid research sophistication in any accredited psychology program. The practice opportunities are very similar for students in both types of programs.

At the same time, as we discuss in subsequent chapters, there are important trade-offs between Vail-model and Boulder-model programs. Here are 7 differences to bear in mind as you read through our book and as you become an informed consumer.

1. *Research skills.* Vail-model, Psy.D. programs provide slightly more clinical experience and courses but less research experience and courses than do Boulder-model programs (Tibbits-Kleber & Howell, 1987).

Psy.D. programs typically require a clinical dissertation, substantially less than an original research dissertation required by Ph.D. programs. An important caveat: if you desire to teach full time at a 4-year college or university, we strongly advise you *not* to seek the Psy.D. degree. The Psy.D. is an explicitly professional or practitioner degree; your training and expertise will be as a practitioner, not as a professor, researcher, or academician.

2. *Length of training.* The additional research training and the large dissertation required in Boulder-

model Ph.D. programs translate into an additional year of training, on average. Students in Ph.D. programs take significantly longer, 1 to 1.5 years longer, to complete their degrees than do Psy.D. students (Gaddy et al., 1995; Norcross, Castle, Sayette, & Mayne, 2004). Various interpretations are given to this robust difference, from “Psy.D. training is more focused and efficient” on one pole, to “Ph.D. training is more comprehensive and rigorous” on the other.

3. *Acceptance rates.* Both Vail and Boulder programs have similar admission criteria, which favor grade point average, entrance examination scores, letters of recommendation, and so on. (All these topics are covered in detail in later chapters.) But Vail-model programs afford easier admission than Boulder-model programs. On average, clinical Ph.D. programs accept 6 to 10% of applicants, whereas clinical Psy.D. programs accept 41 to 50% of applicants (see Table 3-1 for details).

4. *Financial assistance.* Admission rates are higher in Psy.D. programs, but financial assistance is lower.

These numbers are plainly visible in the Reports on Individual Programs. As a rule, only 3 to 10% of Psy.D. students will receive full financial assistance (tuition waiver plus a paid assistantship), whereas 61 to 81% of clinical Ph.D. students will. (See Table 4-3 for details.).

5. *Loan debt.* The paucity of financial assistance to Psy.D. students translates into increased personal debt. If the program does not provide funding, then students are forced to rely on personal funds or loans. The median debt for Psy.D. recipients is now \$90,000 (Wicherski & Kohout, 2005). The median debt for clinical Ph.D. recipients is \$50,000, lower but still substantial. (For comparison, the median debt for psychology Ph.D.s in non-clinical fields is \$21,500; Wicherski & Kohout, 2005).

6. *Accredited internships.* All doctoral students in clinical and counseling psychology will complete the equivalent of a year-long, full-time internship before receiving their degrees. Students desire an internship accredited by APA or APPIC (Association of Psychology Postdoctoral and Internship Centers). The competition for an APA or APPIC-accredited internship can be keen, and in recent years, only 75% of intern applicants matched with an accredited internship. The research consistently demonstrates that students enrolled in large, freestanding Psy.D. programs match at a lower rate than students enrolled in smaller, Ph.D. programs (APPIC, 2006).

7. *Licensure exam scores.* One disconcerting trend is that Vail-model, Psy.D. graduates do not perform as well as Ph.D. graduates on the national licensing examination for psychologists (Kupfersmid & Fiola, 1991; Maher, 1999). That is, doctoral students who graduate with a professional degree (the Psy.D.) score lower, on average, than doctoral students who graduate from a traditional clinical psychology Ph.D. program on the Examination for Professional Practice in Psychology (EPPP), the national licensing test. Higher EPPP scores have been reliably associated with smaller-sized clinical programs and larger faculty-to-student ratios, in addition to traditional Ph.D. curricula.

These 7 differences between Boulder-model, Ph.D. programs and Vail-model, Psy.D. programs do not reliably favor one training model over the other. As a potential applicant, you will probably prefer the shorter training

and higher admission rates among Psy.D. programs, on the one hand. You will prefer the greater probability of financial assistance, accredited internships, and higher licensure scores among Ph.D. programs, on the other hand. These truly represent choice points for an informed student.

Moreover, these broad differences must be interpreted carefully. Psy.D. programs, in particular, constitute a heterogeneous bunch—some are small, university-based programs accepting 10 students a year and others are huge, for-profit campuses accepting hundreds per year.

In order to become an informed applicant, know these broad differences. But more importantly, know the specific data on programs to which you will apply. The Reports on Individual Programs later in this book present these data—length of training, acceptance rates, financial assistance, students securing accredited internships, and more—for each APA-accredited program.

The key task for you as a potential applicant is to recognize the diversity in training emphases. We describe this as the practice–research continuum. On one end of the continuum are the practice-oriented Psy.D. programs. These account for roughly one-third of APA-accredited doctoral programs. In the middle of the continuum are the equal-emphasis Ph.D. programs that, as the name implies, emphasize both research and practice. These programs account for another one-third of APA-accredited clinical, counseling, and combined programs. On the other end of the continuum are the research-oriented Ph.D. programs that account for the final one-third of the accredited programs.

The bottom line for applicants to psychology doctoral programs is one of choice, matching, and parity. You have the choice of two training models (and all the programs in between the two extremes). The choice should be matched to your strengths and interests. Parity has been achieved in that almost half of all doctorates in clinical psychology are awarded by Vail-model programs. The choices are yours, but make informed decisions.

A Word on Accreditation

Accreditation comes in many guises, but the two primary types are institutional accreditation and program accreditation. Institutional applies to an entire institution. Seven regional accreditation bodies, such as the Commission on Higher Education of the Middle States Association of Colleges and Schools, oversee accreditation for the university or college itself. A school receives accreditation when it has been judged to have

met minimum standards of quality for postsecondary education.

Beware of any institution that is not accredited by its regional accreditation body. A degree from this institution will probably not be recognized by licensing boards, certifying organizations, or insurance companies (Dattilio, 1992). It is necessary to be particularly careful about nontraditional or external degree programs that offer the option of obtaining a degree based on independent study, typically away from the institution itself. Some of these are reputable programs, but many are “diploma mills” (Stewart & Spille, 1988). Many diploma mills have names similar to legitimate universities, so you must be vigilant. Here are several diploma mills with potentially misleading titles: Columbia State University (Louisiana), La Salle University (Louisiana), Chadwick University (Alabama), American State University (Hawaii), American International University (Alabama). (For additional information about diploma mills, consult the fact sheets at the Council for Higher Education Accreditation at www.CHEA.org, www.degreefinders.com/distance_learning/diploma.php and www.web-miner.com/deun accredited.htm).

If you have any doubt, inquire thoroughly into whether the institution as a whole is recognized by professional associations. This can be accomplished by referring to the document, *Doctoral Psychology Programs Meeting Designation Criteria*, jointly published by the Association of State and Provincial Psychology Boards (ASPPB) and the National Register of Health Service Providers in Psychology (2005). You can access an updated list at www.nationalregister.org/designate.htm.

The second type of accreditation pertains to the clinical or counseling psychology program itself. Specialized accreditation of the discipline is performed by the American Psychological Association (APA). This accreditation is a voluntary procedure for the doctoral program itself, not the entire institution. Most programs capable of meeting the requirements of APA accreditation will choose to apply for accreditation. Accreditation of a clinical or counseling psychology program by the APA presumes regional accreditation of the entire institution.

As of 2007, APA had accredited 232 active clinical psychology programs (60 of these awarding the Psy.D. degree), 67 active counseling psychology programs (3 of these awarding the Psy.D. degree), and 10 active combined professional–scientific psychology programs (Accredited, 2006). The Reports on Individual Programs in this book provide detailed descriptions of these 300 clinical psychology, counseling psychology, and combined programs, respectively.

Take note that APA does *not* accredit master’s programs. Accordingly, references to “accredited” master’s psychology programs are to regional or state, not APA, accreditation.

The program accreditation criteria can be obtained from the APA Office of Accreditation (www.apa.org/ed/accreditation/). The general areas assessed include institutional support, sensitivity to cultural and individual differences, training models and curricula, faculty, students, facilities, and practicum and internship training. These criteria are designed to insure at least a minimal level of quality assurance.

The APA (Accredited, 2005) recognizes three categories of accreditation. Accreditation is granted to programs that meet the criteria in a satisfactory manner. “Accredited, inactive” is the designation for programs that have not accepted students for 2 years. This indicates that the program is taking a hiatus as part of a restructuring process, or is phasing out the program (for example, New York University’s Clinical Psychology program). “Accredited, probation” is the designation for programs that were previously accredited but are not currently in satisfactory compliance with the criteria.

For more than 30 years, doctoral psychology programs in Canada have enjoyed the option of simultaneous accreditation by the Canadian Psychological Association (CPA) and the American Psychological Association (APA). This dual accreditation enabled United States citizens to travel north to attend APA-accredited Canadian programs and facilitated internship placement and licensure in the United States for both American and Canadian students. Graduates of APA-accredited programs, whether located in Canada or the United States, were eligible for same privileges.

In 2007, the American Psychological Association decided to phase out accrediting Canadian psychology programs. The phase out will occur gradually over a 7-year period. Mutual recognition agreements will continue, but formal APA accreditation of Canadian programs will not. Most jurisdictions in the United States recognize CPA-accredited or National Register-designated programs for the purposes of licensure. But a few do not. Thus, be aware of this transition and the potential consequences on internship and licensure in selected USA states. We do *not* want to discourage anyone from attending excellent Canadian doctoral programs in psychology; we *do* want you to be informed consumers.

Our Reports on Individual Programs provide crucial descriptive and application information on each APA-accredited doctoral program in clinical, counseling, and combined psychology. The APA Education Directorate updates the listing of accredited programs

annually in the December issue of the *American Psychologist* and bimonthly on their Web site, www.apa.org/ed.

How important is it to attend an APA-accredited program? The consensus ranges from slightly important to absolutely essential. APA accreditation ensures a modicum of program stability, quality assurance, and professional accountability. Graduates of APA-accredited programs are practically guaranteed to meet the educational requirements for state licensure. Students are in a more advantageous and competitive position coming from an APA-approved program in terms of their internship choices (Drummond, Rodolfa, & Smith, 1981) and their eventual employment prospects (Walfish & Sumprer, 1984). The federal government, the Veterans Administration, and most universities now insist on a doctorate and internship from APA-accredited programs. Graduates of APA programs also score significantly higher, on average, than do students of non-APA-accredited programs on the licensure exam (Kupfersmid & Fiola, 1991). Licensure and employment as a psychologist are not precluded by attending a non-APA-accredited program, but the situation is tightening. Five states now license only graduates from APA-accredited programs. All other things being equal, an accredited clinical or counseling psychology program gives you a definite advantage over a non-accredited program.

Online Graduate Programs

Practically every institution of higher education now offers some online courses and distance education. Some institutions have gone further to create graduate programs that are almost entirely online, with all discussions being conducted electronically on bulletin boards and all assignments being submitted by computer. The only on-campus contact might be a couple of weeks or several weekends per year.

Several of these online or distance learning institutions offer doctoral programs in clinical and counseling psychology, including Walden, Capella, and Fielding. Fielding Graduate University requires several weeks of in-person residency per year, making it the only distance program that is APA accredited. Capella and Walden are both regionally accredited.

We are frequently approached by students intrigued with these and other distance learning doctoral programs and asked whether we think they are credible programs. Our answer is that they are credible but definitely not preferred for several reasons. First, we recommend that students favor APA-accredited programs, and only one of these programs has met the

minimum educational criteria set forth by APA. Second, many psychology licensing boards will not issue licenses to graduates of distance learning programs (Hall, Wexelbaum, & Boucher, 2007). Third, online programs lack quality control over their clinical supervisors, who are scattered around the country. Fourth, much of the learning in doctoral programs occurs in close, interpersonal relationships with faculty on a daily basis. Frequent computer contact is useful, but in our opinion, not equivalent. And fifth, without sounding too stodgy, we believe online programs are still too new and alternative to have developed a track record of producing quality psychologists. Most internship directors and potential employers feel likewise; graduates of non-APA-accredited distance programs have experienced difficulty in securing employment as psychologists.

Of course, each online program needs to be evaluated on its own merits, and each graduate student must be considered for his or her individual abilities. In the end, graduate students will get out of a program what they put in—whether through a traditional, bricks-and-mortar institution or an innovative, online program. The early research on distance and online education indicates that it produces comparable outcomes to traditional education, at least in acquiring knowledge and academic skills. Unfortunately, there is insufficient research on the online preparation of professional psychologists to render any conclusions.

Should you decide to apply to online doctoral programs in psychology, we would advise you to:

- complete your master's degree in a conventional program to secure one in-person degree and to meet the admission prerequisites of most online doctoral programs.
- obtain information on the program's track record of producing graduates who secure APA-accredited internships and eventually licensure as psychologists.
- determine the residency requirement (how much time per year is expected on campus).
- expect no financial assistance from the online institution itself (but loans are available).
- become very comfortable and savvy with computers, as most of your contact and assignments will be conducted online.
- be an organized, self-motivated individual who can meet deadlines without supervision.
- realize that the vast majority of interaction with fellow students and professors will occur online, not in a conventional classroom.
- be prepared for intensive research and writing on your own.

Practice Alternatives

In addition to doctoral programs in clinical and counseling psychology, we would like to describe several alternative programs of study that should be considered. We have classified these programs along the practice–research continuum. The practice-oriented programs are outlined first. Portions are abstracted from APA’s (1986) *Careers in Psychology*, which can be found online at www.apa.org/students/brochure/index.html. Additional details on helping professions can also be accessed online at www.teachpsych.org/otrp/resources/resources.php. *A Student Guide to Careers in the Helping Professions* by Melissa Himelein provides information on typical job duties, potential earnings, required degrees, and the like.

You are restricted neither to clinical/counseling psychology nor even to psychology in selecting a career in mental health. School psychology, as discussed below, is a viable alternative. Also note that psychology is only one of five nationally recognized mental health disciplines, the others being psychiatry (medicine), clinical social work, psychiatric nursing, and counseling.

We do not wish to dissuade you from considering clinical or counseling psychology, but a mature career choice should be predicated on sound information and contemplation of the alternatives. A primary consideration is what you want to do—your desired activities. Conducting psychotherapy is possible in any of the following fields. Prescribing medication is currently restricted to physicians and some nurses, although psychologists are steadily securing prescription privileges around the country. Psychological testing and empirical research are conducted by psychologists. As discussed previously, psychologists also enjoy a wide range and pleasurable integration of professional activities. Following is a sampling of alternatives to a doctorate in clinical and counseling psychology.

1. School Psychology. Some undergraduates have a particular interest in working with children, adolescents, and their families. Admission into the Boulder-model programs with a child clinical specialty is particularly competitive. A doctorate in school psychology is much more accessible, with two or three times the acceptance rate of clinical psychology programs. The APA (Accredited, 2006) has accredited 56 of these programs, which provide doctoral-level training in clinical work with children in school settings.

One disadvantage of pursuing a career as a master’s-level school psychologist lies in the fact that, unlike the other alternatives, one’s professional work

may be limited to the school. If this limitation is not a concern, then training as a school psychologist can be an excellent option for those interested in working with children and families (Halgin, 1986).

At the doctoral level, school psychologists are credentialed to function in both school and nonschool settings. Research finds substantial overlap in the coursework of child clinical programs and school psychology programs (Minke & Brown, 1996). Some differences remain, of course—such as more courses in consultation and education in school programs and more courses in psychopathology in child clinical programs—but the core curricula are quite similar. School psychology training at the doctoral level is broadening to include experience outside of the school setting and with adolescents and families as well (Tryon, 2000).

(APA’s Division of School Psychology)
- www.naspweb.org
(National Association of School Psychologists)
- www.ispaweb.org/
(International School Psychology Association)
- www.schoolpsychology.net
(comprehensive links to the field and graduate schools)

2. Community Psychology. This field shares with clinical and counseling psychology a concern with individual well-being and healthy psychological development. However, community psychology places considerable emphasis on preventing behavioral problems (as opposed to only treating existing problems), adopting a broader ecological or community perspective, and changing social policies.

Graduate training in community psychology occurs within clinical-community psychology programs or within explicitly community psychology programs. The former are clinical psychology programs with an emphasis on or a specialization in community; these doctoral programs are listed in Appendix E (Research Areas) under “community psychology.” Ten universities in the United States offer a doctorate in community psychology, and an additional 12 offer a doctorate in community-clinical psychology. If your interests lean toward prevention and community-based interventions, then by all means check out a specialization or a program in community psychology. The Web sites at www.scra27.org and www.communitypsychology.net provide further information about the field and training programs.

3. Clinical Social Work. A master's degree in social work (M.S.W.) is a popular practice alternative these days. One big advantage of this option is a much higher rate of admission to M.S.W. programs, with about 65% of applicants being accepted to any given program, on average (O'Neill, 2001). Other advantages are GREs less often required for admission, fewer research requirements, an emphasis on professional training, and completion of the M.S.W. in less than half the time necessary to obtain a psychology Ph.D. With legal regulation in all 50 states and third-party vendor status (insurance reimbursement) in 49 states, social workers are increasingly achieving autonomy and respect, including more opportunities for independent practice.

The major disadvantages lie in the less comprehensive nature of the training, which is reflected in a lower pay scale as compared to psychologists. Not becoming a "doctor" and not being able to conduct psychological testing also prove troublesome for some.

Students interested in clinical social work as a career should peruse an introductory text on the profession, consult career publications (for example, Wittenberg, 2003), and contact the National Association of Social Workers (NASW). This organization provides detailed information on the emerging field, student membership, and accredited programs in clinical social work. NASW resources can be accessed via the Web (www.naswdc.org) or the telephone (1-800-742-4089). Three other Web sites on social work programs also prove handy: www.petersons.com/graduate_home.asp?path=gr.home; www.socialworksearch.com; and www.gradschools.com.

4. Psychiatry (Medicine). Students often dismiss the possibility of applying to medical schools, believing that medical school admission is so difficult that it is out of the question (Halgin, 1986). However, the student interested in neuroscience and the more severe forms of psychopathology may find this an attractive choice. Although the application process necessitates more rigorous training in the "hard" sciences than most psychology programs, the admission rate may also be higher than the most competitive doctoral programs in clinical and counseling psychology. Of the 40,000 people applying to medical school annually, about 45% are admitted, and half of them are women. The average GPA of applicants accepted to medical school is between 3.5 and 3.6 (see aamc.org for details).

Medical school thus remains an attractive option for many students headed toward a career in mental health. For further information and demystification of

this subject, refer to the data-driven *Medical School Admission Requirements 2008-2009: The Most Authoritative Guide to U.S. and Canadian Medical Schools* (Chanatry, 2007) and *Medical School Admissions: The Insider's Guide* (Zebala, Jones, & Jones, 1999). Prime Web sites include www.premedonline.com and www.aamc.org, the official Web site of the Association of American Medical Colleges.

The advantages of a medical degree should be recognized. First, an M.D. (allopath) or D.O. (osteopath) allows one to prescribe medication. Second, the average income for psychiatrists is higher than for psychologists. Third, a medical degree permits more work in inpatient (hospital) facilities. Applicants should not dismiss this possibility out of hand, and should explore medicine as a career, especially if their interests lie on a more physiological level.

5. Psychiatric Nursing. Although sometimes regarded as the handmaiden of psychiatry, master's-level psychiatric nursing is an autonomous profession. The employment opportunities for nursing are excellent at this time, especially for psychiatric nurses who have the flexibility of working in hospitals, clinics, health centers, or private practice. Of course, psychiatric nurses are nurses first and are required to obtain a bachelor's degree (B.S.N.) and to become registered (R.N.) prior to obtaining their Master of Science in Nursing (M.S.N.). They do not conduct psychological testing and rarely perform research, but psychiatric nurses practice psychotherapy in both inpatient and outpatient settings. Further, certified nurse practitioners now have the authority to write medication prescriptions in 47 states. Consult a textbook on mental health nursing and visit the Web site of the American Psychiatric Nurses Association at www.apna.org/ to learn more about psychiatric/mental health nursing and its graduate programs.

6. Counseling. A master's degree in counseling, as distinct from a doctorate in counseling psychology, prepares one for state licensure as a professional counselor. The high acceptance rates of counseling programs, their two years of practical training, and eligibility for state licensure in 49 states represent definite assets. Master's-level clinicians, such as social workers and counselors, have become the front-line providers of most mental health services in community clinics and public agencies. For those students committed to practice and untroubled by the lack of training in conducting research and psychological testing, the profession of counseling deserves consideration. Visit the webpage of the American Counseling Association

(www.counseling.org/) for more information on careers and the webpage of accredited counseling programs (www.cacrep.org/directory.html) to locate counseling programs of interest to you.

7. Psychology and the Law. There is a great deal of interest in the burgeoning amalgam of psychology and law, as evidenced by an APA division, two energetic professional societies, and many scholarly journals (Bersoff et al., 1997; Otto & Heilbrun, 2002). Doctoral students must be trained in both fields, of course, increasing the length of graduate training. At least five programs now award law degrees and psychology doctorates together—joint J.D. and Ph.D./Psy.D. programs (Arizona, Drexel, Nebraska, Pacific, and Widener Universities). Graduates pursue both practice and research careers—practicing law in mental health arenas, specializing in forensic psychology, working in public policy, and pursuing scholarship on the interface of law and psychology, for example. This is an exciting career, albeit one requiring extra commitment in terms of effort and knowledge during doctoral studies.

Another two dozen clinical programs offer Ph.D.s or Psy.D.s with specializations in forensic psychology or clinical forensic psychology. (Consult Appendix G and the following Web sites for a list of the programs.) These clinical psychologists specialize in the practice of forensic psychology. It's a growing and exciting specialization in psychology, but one that rarely involves the criminal profiling featured in television shows and *Silence of the Lambs!* Instead, forensic psychologists are far more likely to conduct child custody evaluations, assess a patient's psychological damage, evaluate a person's competence to stand trial, consult with lawyers on jury selection, and conduct disability evaluations. For tips on undergraduate preparation and graduate training in forensic psychology, consult these Web links:

- www.teachpsych.org/otr/resources/resources.php?category=Advising
(Undergraduate Preparation for Graduate Training in Forensic Psychology)
- www.ap-ls.org/ (APA's American Law–Psychology Society)
- www.abfp.com/ (American Board of Forensic Psychology)

8. Other. Marital and family therapy, student guidance, art therapy, occupational therapy, and a plethora of other human service programs present attractive alternatives to clinical and counseling psychology. They are typically less competitive master's-level programs

in which admission rates are quite high and in which the training is quite practical. Relative disadvantages of these programs, in addition to lack of a doctorate, include less prestige, lower salaries, diminished probability of an independent practice, and variable licensure status across the United States.

If one or more of these options seem suited to your needs, discuss it with a psychology advisor, interview a professional in that field, peruse the Web sites, or write to the respective organizations for additional information.

Research Alternatives

Some graduate students enter clinical or counseling psychology to become researchers. They are less interested in working with patients than researching clinical phenomena. If you are most interested in research, here are some nonpractice alternatives that might appeal to you.

1. Social Psychology. Social psychology is concerned with the influence of social and environmental factors on behavior. Personality, attitude change, group processes, interpersonal attraction, and self-constructs are some of the research interests. Social psychologists are found in a wide variety of academic settings and, increasingly, in many nonacademic settings. These include positions in advertising agencies, personnel offices, corporations, and other business settings. Check out the official Web sites of the Society for Personality and Social Psychology (www.spsp.org) and the Social Psychology Network (www.socialpsychology.org) for additional resources.

2. Industrial/Organizational Psychology. This branch of psychology focuses on the individual in the workplace. Industrial/organizational psychologists frequently select and place employees, design jobs, train people, and help groups of workers to function more effectively. Master's programs generally prepare students for jobs in human resources and personnel departments, whereas doctoral programs are geared to preparing students for academic positions and for management and consulting work on larger-scale projects. Industrial/organizational psychologists earn among the highest median salaries compared to other areas of psychology (Kohout & Wicherski, 1992). Academics find positions in both psychology departments and business schools.

The Society for Industrial and Organizational Psychology (2006) produces a useful list of *Graduate Training Programs in Industrial/Organizational Psy-*

chology and Related Fields, which describes 200 plus graduate programs in “I/O” psychology and how to contact each. It is available free from the society’s Web site (www.siop.org). Students interested in pursuing a career in I/O psychology should obtain, beyond psychology classes, courses in management, marketing, and organizational behavior as well as research experience.

3. Behavioral Neuroscience. For the student interested in biological research, the workings of the brain, and the influence of the brain on behavior, programs in neuroscience may be a better match. By employing animal subjects, researchers can control the conditions of their studies to a rigor often elusive when using human participants. Research areas include learning, psychopharmacology, memory, and motivation. For example, recent investigations on memory have provided valuable insight into the etiology and course of Alzheimer’s disease. Go to www.andp.org/programs/gradgeo.htm for a splendid list of graduate programs in neuroscience.

Research demonstrates that neuroscience graduate programs expect entering students to possess course work and lab work beyond the standard psychology curriculum (Boitano, 1999). Essential courses would include biology, chemistry, calculus, and introduction to neuroscience. Desirable courses would sample from cell biology, biochemistry, and anatomy and physiology. These are all possible, with adequate planning, to incorporate into the psychology major, should you decide on this path relatively early in your undergraduate career. The Web site (www.undergraduateneuroscience.org/) of Faculty for Undergraduate Neuroscience (FUN) provides a bounty of useful information on preparing for a career in neuroscience.

4. Developmental Psychology. The developmental psychologist studies behavior change beginning at the prenatal stages and extending through the lifespan. Areas such as aging, identity, and development of problem-solving abilities are popular areas within developmental psychology. The characteristics of individuals at different age ranges, such as the work of Piaget on child cognition, are of particular interest to developmental psychologists.

Geropsychology, or the psychology of aging, has become a popular specialty as the elderly population in this country presents special needs that are insufficiently addressed. Employment opportunities in geropsychology are sure to grow over the next several decades. Visit the Web sites of APA’s Division of Adult Development and Aging (apadiv20.php.ufl.edu/) and

the friendly Geropsychology Central (www.premier.net/~gero/geropsyc.html) for more.

5. Cognitive Psychology. Cognitive psychology presents an attractive option for students whose interests lie in the exploration of human thought processes. Major areas include language structure, memory, perception, attention, and problem solving. Research in cognitive psychology has gained insight into what in the past was considered inexplicable behavior. For example, research into how moods affect the interpretation of ambiguous events has implications for the study of depression. Much research on the accuracy of eyewitness testimony has been conducted by cognitive psychologists. Cognitive programs emphasize artificial intelligence, cognitive neuroscience, and affective neuroscience. Indeed, interest in cognitive neuroscience and affective neuroscience has increased of late.

6. Experimental Psychology. Often a student is interested in research but has not yet defined an area of interest. Or a student is fascinated with a certain psychopathology but does not desire to practice. In both cases, a graduate program in experimental psychology might be the ticket. These programs allow a student to explore several research areas, such as learning, measurement, and memory. Other programs focus on experimental psychopathology, which is geared more specifically for the researcher interested in clinical populations.

Experimental programs offer excellent training in research methods, statistical analysis, and a great deal of hands-on research experience. In fact, some experimental programs now classify themselves as quantitative or measurement programs. If interested in these programs, consult www.apa.org/divisions/div5/programs.html for a list of graduate psychology programs with a measurement and quantitative focus.

7. Sport Psychology. This emerging specialization typically entails both research and applied activities. Research focuses on all aspects of sports, whereas application involves psychological assessment, individual skills training, and group consultation. Research and training encompass stress management, self-confidence, mental rehearsal, competitive strategies, and sensory-kinetic awareness. Consult the *Directory of Graduate Programs in Applied Sport Psychology* (Sachs, Burke, & Loughren, 2006) for information on specific psychology programs. Consult, too, the Web site of APA’s Division of Exercise and Sport Psychology at www.apa.org/about/division/div47.html for information on career possibilities in this area.

8. Medicine. A medical degree (M.D., D.O.) earned concurrently or sequentially with a psychology doctorate (Ph.D.) may allow the greatest flexibility of all the aforementioned programs of study. This option allows one to practice medicine and psychology while also affording a basic education in research and statistics. For an extremely bright and motivated student, this can be a real possibility, but it is certainly the most challenging of all the alternatives. Earning two doctoral degrees will take longer than earning either alone. This choice is for someone interested in the biological aspects of behavior in addition to gaining a rigorous education in the scientific study of human behavior.

Once again, if your interest lies in research, there are many options available besides clinical and counseling psychology. Talking to a professional in the relevant discipline and consulting textbooks about the discipline will help you to explore that option more fully. An increasing number of Web sites also offer valuable career advice. Five of our favorites are:

- www.psychwww.com/careers/index.htm
- www.lemoyne.edu/career_services/resources/index.htm
- www.apa.org/students/
- www.socialpsychology.org/career.htm
- www.gradschools.com

On “Backdoor” Clinicians

The APA ethical guidelines outline two pathways to becoming a clinical or counseling psychologist. The first is to complete a doctoral program and formal internship in clinical or counseling psychology. The second is to obtain a nonclinical psychology doctorate and then to complete a formal respecialization program in clinical or counseling psychology, which includes the internship. Formal training and supervised experience, not simply the desire to become a clinical or counseling psychologist, are required according to the APA ethical code.

In the past, some psychologists obtained doctorates in developmental, experimental, social, or educational psychology or in a psychology-related discipline and managed to practice as “clinical psychologists” or “counseling psychologists.” This was possible because of the paucity of clinical and counseling psychology doctoral programs and because of generic state licensure laws, which recognize only one broad (generic) type of psychologist. However, this educational and licensure process circumvents the established pathway, increases the prospects of inadequate training, and in some cases results in unethical representation. Hence

the term “backdoor”—unable to enter through the front door, they sneak in through the back entrance. Major universities, the federal government, the Veterans Administration, and practically all universities now insist on the doctorate (or respecialization) in clinical or counseling psychology for employment as a clinical or counseling psychologist. Although individuals with nonclinical psychology doctorates may be eligible for state licensure, they will be increasingly unable to identify themselves as clinical or counseling psychologists.

Circuitous routes to becoming a clinical or counseling psychologist may still exist, but they have become far less common and ethical. We emphatically recommend against these “backdoor” practices on both clinical and ethical grounds.

To Reiterate Our Purpose

The purpose of this book is to help you navigate the heretofore unknown and frightening process of applying to clinical and counseling psychology graduate programs. But nothing can eradicate the fact that gaining admission to such competitive programs requires a good deal of time and energy. There are the matters of taking the appropriate undergraduate courses, gaining clinical experience, acquiring research competencies, requesting letters of recommendation, locating the appropriate schools to which to apply, succeeding on entrance examinations, completing the application, creating personal statements, traveling to interviews, and deciding which program actually to attend. We have known people who have quit jobs or taken months off just to invest all their time to the application process. However, with this book and a fair degree of organization, you can make such extremes unnecessary.

Emotional strain is an inherent part of the application process. This is unlike many job interviews, where you are marketing yourself merely as a provider of services. Here you are marketing yourself as a human being. This is a personal process. The application forms and interviews require self-exploration and even a certain amount of justification. Why do you like clinical work? What do you enjoy about spending time with people who are disturbed? Do you really like research? You may end up questioning your answers and may feel compelled to examine the beliefs that have led you to this point in your life.

With the help of this book, you ultimately become the consumer for a program best fitted to you. And 86% of students say that their sense of fit with a program is the single most important factor in choosing a graduate program (Kyle, 2000). By negotiating this

process in a systematic manner, you can become an informed consumer of psychology graduate programs. Many interviewers recommend that the final interview should be approached by the applicant in this way. With this approach to the admission process, much of the stress can be allayed.

Although the application process itself can appear intimidating, or the prospect of being rejected upsetting, we urge you *not* to allow fear to cause you to abandon the process altogether or to dismiss the option prematurely. Do not allow yourself to be one of the students who gets rejected unnecessarily. If you apply to the appropriate programs and present yourself with a certain savvy, your chances of getting in are vastly improved.

Our Approach

Having now counseled thousands of clinical and counseling psychology aspirants and conducted scores of workshops on applying to graduate school, the three of us have gravitated toward a particular approach to the topic. It might be called *realistically encouraging*.

It is realistic in that we present the hard facts about the competition for entrance into doctoral psychology programs. We will not resort to the disservice of feeding you illusions (“Anyone can become a psychologist!”), even though the reality may leave you feeling discouraged at times.

Still, our approach is unabashedly encouraging in that we support people seeking their goals. With knowledge and perseverance, most of our students have made it. Consider the real-life story of Justin, a success story in the quest for a doctorate in clinical psychology.

Justin almost flunked out of college during his first 2 years, before discovering his abiding interest in psychology. He took his GREs late in his senior year

without adequate preparation but obtained combined verbal and quantitative scores of 1100. His applications to doctoral programs that year were hastily and poorly prepared. Justin was, to complicate matters, grossly unaware of typical admission requirements, acceptance rates, and application guidelines. He had no clinical experience whatsoever and had never engaged in research beyond course requirements. Not surprisingly, letters of recommendation about him were mildly positive but without detail or conviction (the deadly, two-paragraph “He/she’s nice, but we haven’t had much contact” letters). He received dismal rejections, not even a hint of a possible interview or finalist pool.

Well, as people are apt to do, Justin was about to give up and throw in the towel. But he then attended one of our workshops and began to understand that he had neglected virtually every guideline for sophisticated application to graduate school. The next year was devoted to preparing himself for the hunt: he took extra courses after receiving his degree in order to increase his GPA and to improve his GRE psychology score; he volunteered 10 hours a week at two supervised placements; he worked 20 hours a week for a small stipend as a research assistant; and he copublished three articles. Not surprisingly, his letters of recommendation were now enthusiastic and detailed. That year, Justin obtained six acceptances into clinical doctoral programs with full financial support at three of them.

There *are* concrete steps you can take to improve your application. It is as much knowing how to apply as it is your actual credentials. And if you do get rejected once, many steps can enhance the probability of acceptance the next time around, as in Justin’s case. Knowledge of the process can make a tremendous difference. The following chapters provide suggestions and strategies that will increase your attractiveness as an applicant.

CHAPTER 2

PREPARING FOR GRADUATE SCHOOL

People begin the graduate school application process at different stages in their lives. You may be a junior or a senior in college. Maybe you have a bachelor's degree in psychology and have worked for a year or two. Perhaps you are a master's-level counselor or social worker who has decided to return for a doctorate. Or maybe you were not a psychology major but have decided you want to make a career change. Depending on your situation, your needs will be somewhat different. Therefore, each situation is addressed separately throughout this chapter.

But whatever your current status, recognize this about becoming a clinical or counseling psychologist: *Do not wait until the year of your application to begin the preparation.* Securing admission into competitive doctoral programs necessitates preparation throughout your undergraduate career and any intervening years. Good grades, adequate test scores, clinical work, and research experience cannot be instantaneously acquired simply because you have made a decision to pursue psychology as your career.

Plan ahead of time using the knowledge and strategies presented in this chapter. Preparing for graduate study is *not* for seniors only (Fretz & Stang, 1980). Timeliness is everything, or, in the vernacular, “you snooze you lose” (Mitchell, 1996).

Much of the “advice” bandied about by fellow students and even some faculty is hopelessly general. Their well-intentioned comments are meant to be universal—one size fits all. However, this advice is akin to the bed of the legendary Greek innkeeper, Procrustes, who insisted on one size bed and who stretched or shortened his unfortunate guests to fit that bed! Do not fall prey to these Procrustean maneuvers; different appli-

cants have different needs. Understanding your particular circumstances and needs will produce an individualized plan for applying to graduate school.

Different Situations, Different Needs

Underclassmen

Some of you will be undergraduates, not yet in your senior year. By getting a head start, you can take the appropriate courses and attain the optimal clinical and research training possible at your institution. The more time invested in preparation, the better able you will be to meet the requirements of the application process with confidence, which puts you in a very desirable position. This book will provide you with information that can help guide your undergraduate experiences, academic as well as practical. The “Time Line” presented in Appendix A outlines important steps to be taken during your freshman, sophomore, and junior years.

Seniors

Some of you are seniors, deciding whether to go directly on to graduate school. This is a difficult time, and you are likely to be given advice ranging from “everyone *must* take time off” to “if you take a year, you'll lose the momentum and study skills and never go back.” Obviously, this decision is based on the needs and experiences of each individual. There are two guidelines, however, that can help you muddle through these decisions.

1. Are you primarily interested in becoming a practitioner and wish to have only a minimal amount of

research training? If so, a practice-oriented psychology program will probably best suit your needs. These programs tend to put the emphasis on clinical experience (Piotrowski & Keller, 1996). They favor applicants who have a master's degree or have been involved in a clinical setting and who will come into a program with some practice skills already in their repertoire. The average age of students admitted into these programs is slightly older than that in research-oriented programs, reflecting time spent out of school in a work environment. Consequently, if you are interested in a practice-oriented program, you could take time off to gain relevant experience in clinical work and research.

2. Are you interested in a program that is primarily research oriented? If you have a solid grounding in research as an undergraduate, such a program is less likely to emphasize the need for postgraduation clinical experience. The necessary and sufficient research experience can certainly be attained during an undergraduate education without taking time off. Adding work experiences and clinical skills to an application, however, can only improve your chances of acceptance into a research-oriented program.

The decision to postpone graduate school for a year or more can be influenced by the time constraints of the application process. Applications for doctoral programs in clinical and counseling psychology are typically due between mid-December and mid-February of the year before you plan to attend school. First-semester seniors just beginning an honors or research project may not be in a position to showcase their talents by application time. The additional preparation for the Graduate Record Examination (GRE) (see Entrance Examinations) may lead a potential applicant to wait a year before applying.

For all these reasons, first-semester seniors may not easily meet the requirements of the recommended Time Line presented in Appendix A. This is a frequent predicament, the solution to which is to wait another year to apply or to do what you can in the remaining time available. In either case, do not give up! Rather, review the Time Line carefully and check off what you have and have not accomplished before making the momentous decision to go for it this year, or to wait until next year. Some shortcuts may well be necessary to apply this year; the ideal time line will need to be modified to fit your reality (Keith-Spiegel, 1991). Some of the items will have to be sacrificed, some accomplished later or more hastily, and others with great energy.

Should you elect to wait a year after receiving your baccalaureate degree, you will begin the application

process almost immediately after graduation. In addition to gaining research and clinical experience, the year away from school is spent applying to graduate school. This is not a year to relax or “goof off”; rather, it should be an intense year of preparation for graduate admission.

Our research on the admission statistics of APA-accredited clinical psychology programs demonstrates that, on average, approximately three-quarters of incoming doctoral students held bachelor's degrees only and one-quarter possessed a master's degree (Norcross et al., 2004; Oliver et al., 2005). However, this generalization is limited by significant differences among the types of programs: research-oriented Ph.D. programs enrolled a significantly higher percentage of baccalaureate-level students (85% on average; 15% master's), while Psy.D. programs enrolled more master's-level students (35% on average).

In summary, the advantages of taking time off depend on the type of psychology program you desire and the strength of your current credentials. If you desire to focus exclusively on clinical practice and a Psy.D. degree, it may be advisable to take time off to gain some practical experience and to save some money. If you are more research oriented and already possess skills in this area, you may be in a position to apply at present. If your current credentials—grades, GRE scores, research—are marginal, then another year may also be required.

In using this book, you will be introduced to the admission criteria for graduate school. And by using the worksheets, you can determine how well prepared you are to apply to schools at this point. Following the steps in this book will help you assess how prepared you are to apply to graduate school successfully and whether some time out in the “real world” would be advised.

Previous College Graduates

Some of you are college graduates and have already taken time off, or you are a member of the working world contemplating a career change. A solid work record and a mature perspective on psychology are certainly advantageous.

Those of you who have been out of school and in the real world for several years may feel at a disadvantage in terms of taking the GREs, finding academic letters of recommendation, and locating research opportunities. But by faithfully following the strategies in this book, you can master these steps—as have thousands of returning students before you. And by reviewing the admissions criteria for graduate programs and using the worksheets provided, you will be able to

evaluate the degree of your preparation in order to decide whether it is prudent to begin the application process immediately or to bolster your credentials before beginning. Pay particular attention to the steps listed under “application year” in the Time Line (Appendix A).

Returning Master’s-Level Clinicians

Some of you will be master’s-level clinicians interested in obtaining the doctorate in clinical or counseling psychology. Although your wealth of clinical experience gives you an immediate edge over undergraduates in the admissions race to Psy.D. programs, you cannot ignore the importance assigned to entrance examinations and research experience.

Psy.D. programs and practice-oriented Ph.D. programs tend to accept proportionally more incoming students with master’s degrees than with baccalaureate degrees only. Interestingly, counseling psychology programs also seem to prefer master’s-level students: Two-thirds of incoming students in APA-accredited counseling psychology programs already held their master’s. Of course, these are merely averages that mask the huge differences between, for example, the one-third of counseling psychology programs which *only* accept master’s recipients and the one-tenth of programs which primarily accept baccalaureate recipients (Turkson & Norcross, 1996).

Hines (1985) conducted a survey of clinical psychology doctoral programs regarding their policies and experiences in accepting students with master’s degrees in psychology. Following are several of the salient findings.

The first question was “What effect (if any) will having a master’s degree have on an applicant’s chances for admission to your program?” Most responses indicated that having a master’s per se made little or no difference, with some respondents suggesting that it was the student’s performance in the master’s program that was more important. However, 10% answered that having a master’s degree had a definite positive effect. Only 3% indicated that having a master’s would have a definite negative bias.

The second question requested that respondents rate the importance of seven criteria for admission to their programs. Each criterion was rated on a 5-point, Likert-type scale ranging from least important to most important. The three highest ratings were for GRE scores, letters of recommendation, and research experience. The rest, in descending order of importance, were undergraduate grades, graduate grades, quality of the master’s program, and practicum experience.

As you can see, GRE scores and research experience definitely count in admissions decisions for master’s-level applicants. The lower ratings given to graduate grades and to undergraduate grades reflect a difference among schools in whether graduate or undergraduate grades are considered more important. The standard deviation for graduate grades was particularly high, indicating wide variability in the importance placed on graduate grades among different programs. Comments suggested that some schools tended to downplay graduate grades “because they are universally high”; another suggested that “high grades don’t help, but poor grades hurt.”

Having a master’s degree in and of itself, then, neither helps nor hinders your chances in most doctoral admission decisions. It is not possessing the master’s degree itself that matters, but the quality of performance in academic courses, clinical practice, and research experiences during master’s training and thereafter that give a definite edge in the admission process.

Master’s degree recipients with combined Verbal and Quantitative GRE scores below 1,000 can take hope from a study of similar students admitted to Ph.D. programs (Holmes & Beishline, 1996). Ten such applicants were admitted by virtue of “compensatory virtues,” such as presentations or publications that helped mitigate the effect of low GRE scores. If you find yourself in this position, emphasize the other, positive elements of your application and, again, seriously consider Psy.D. clinical and Ph.D. counseling psychology programs that enroll a higher percentage of master’s-level students (Norcross et al., 1998). Assuming other parts of your credentials are acceptable, master’s recipients should not be discouraged from applying to doctoral programs on the basis of GRE scores alone.

While clinical experience is valued, for most doctoral programs this factor is a secondary consideration to research. The vast majority of clinical and counseling doctoral programs prefer a thesis or a journal article over a graduate internship or post-master’s clinical experience (Keller, Beam, Maier, & Pietrowski, 1995). All programs expect evidence of conducting empirical research: Ph.D. programs favor it over clinical experience and Psy.D. programs weigh it equally with clinical experience.

A Master’s Degree First?

A common question during our graduate school workshops is whether students should secure a master’s degree before seeking the doctorate. Fortunately, our

workshop participants and you realize that no simple answer is possible to such a complex question. Nonetheless, the following are some broad reasons for seeking a master's degree first.

- *Low grade-point average.* The vast majority of doctoral programs will not consider applicants with a GPA below 3.0.
- *Weak GRE scores.* Similarly, doctoral programs rarely accept bachelor's-level applicants whose combined Verbal and Quantitative scores fall below 1,000.
- *Scarce research or clinical experiences.* Doctoral admission committees understandably desire that you have had some direct experience with those activities you intend to pursue for a lifetime.
- *Uncertain career goal.* Indecision about your subfield in psychology, or outside of psychology, is a strong indicator for a master's program initially.
- *Late application.* Doctoral programs hold to earlier deadlines than do master's programs, so those students waiting too late to apply will be redirected to master's programs.
- *Terse letters of recommendation.* By virtue of late transfer into a university or into psychology, some students lack sufficient contact with faculty for them to write positive and detailed letters of recommendation expected by doctoral programs.
- *Inadequate coursework in psychology.* Doctoral programs require a minimum level of education in the discipline prior to acceptance, typically at least 15 to 18 credits of psychology course work.

Completing a rigorous master's program in psychology can correct many of the foregoing impediments to acceptance into a doctoral program. As we describe in Chapter 7, students typically strengthen their grade point average, acquire clinical and research experience, sharpen their career goals, and establish close relationships with faculty during the 2 years of a master's program. For these and other reasons, many students opt for a master's degree at one institution before seeking the doctorate at another.

Doctoral psychology faculty were surveyed in detail regarding the value of a clinical master's degree for gaining admission to their programs (Bonifzi, Crespy, & Rieker, 1997). Assuming a *good* undergraduate GPA and *good* GREs, the effect of having a master's degree on the applicant's chances for admission was negative for 7% of the programs, neutral for 48% of the programs, and positive for 45% of programs. However, assuming *mediocre* GPA and *mediocre* GREs, the effect

of having a master's was more neutral than positive overall. Put another way, it is clearly the applicant's overall credentials—rather than possession of a master's degree—that carries the day.

This same study (Bonifzi et al., 1997) and our own research (Mayne et al., 1994; Norcross et al., 2004) consistently demonstrate that Ph.D. clinical programs hold a positive bias toward baccalaureate-level applicants. By contrast, Psy.D. clinical, Ph.D. counseling, and Ph.D. school psychology programs view master's degree recipients more favorably and accept higher proportions of master's-level applicants. Keep these biases in mind as you consider the selection criteria of graduate schools.

Graduate School Selection Criteria

As an applicant, your perceptions of graduate admissions criteria probably differ from those of the admissions committee. Some of the things you may think are important are actually not so important (Collins, 2001). For two examples, your GRE Psychology Subject score is less important than your GRE Verbal and Quantitative scores, and your extracurricular accomplishments do not count as much as you might like (Cashin & Landrum, 1991). On the other hand, you probably underestimate the importance of other admissions criteria; two examples are letters of recommendation and research experience, which students routinely underestimate compared to admissions committees (Nauta, 2000).

In this section we acquaint you with the evidence-based practices of graduate admissions committees. Learn what they value in graduate applicants and then tailor your application to those criteria in order to maximize your success.

A number of studies have been conducted to determine the relative importance of selection criteria in psychology graduate programs. The findings of our most recent and largest study (Norcross, Kohout, & Wicherski, 2005) are summarized in Table 2-1. This table presents the average ratings of various criteria for admission into 410 doctoral programs and 179 master's programs in psychology. A rating of 3 denotes high importance; 2, medium importance; and 1, low importance.

The top-rated variables for doctoral programs were letters of recommendation, personal statements, GPA, interview, research experience, and GRE scores. All received ratings of 2.50 and higher on the 3-point scale, indicative of high importance. Extracurricular activity and work experience were valued significantly lower.

TABLE 2-1. Importance of Various Criteria in Psychology Admissions Decisions

Criteria	Master's programs		Doctoral programs	
	Mean ^a	SD	Mean ^a	SD
Letters of recommendation	2.74	.49	2.82	.42
Personal statement/goals	2.63	.55	2.81	.41
GPA	2.75	.43	2.74	.45
Interview	2.30	.76	2.62	.60
Research experience	2.04	.74	2.54	.65
GRE scores	2.36	.66	2.50	.55
Clinically related public service	1.94	.70	1.91	.69
Work experience	1.91	.65	1.87	.68
Extracurricular activity	1.46	.54	1.41	.55

Note. Data from Norcross, Kohout, & Wicherski (2005).

^aMeans are calculated on ratings where 1 = low importance, 2 = medium importance, 3 = high importance.

The implications for enhancing your application are thus clear and embedded throughout this *Insider's Guide*: secure positive letters of recommendation, write compelling personal statements, maintain your GPA, ace the preadmission interview, secure research experience, and prepare thoroughly for the GREs. At the same time, being heavily involved in student organizations and campus activities does not carry nearly as much weight as these other criteria.

Another study (Eddy, Lloyd, & Lubin, 1987) investigated the selection criteria of only APA-accredited doctoral programs in clinical psychology. Program directors rated the importance of each type of undergraduate preparation on a scale ranging from very low importance, 1, to very high importance, 5. Table 2-2

presents the mean ratings and standard deviations for clinical psychology programs.

Research experience emerged as the top-rated variable. The authors of the study concluded that there is simply no better way to increase one's chances for graduate school acceptance than research. A personal visit to a department on an invited interview, computer proficiency, and paid clinical experience were also highly valued. However, as in the previous study, extracurricular activities, such as Psi Chi membership, were rated relatively unimportant.

Not all research experiences count equally in graduate admissions. The most important are published articles in referred journals and paper/poster presentations at national conferences. Of course, serving as

TABLE 2-2. Importance Assigned by Clinical Psychology Doctoral Programs to Various Types of Undergraduate Preparation

Preparation	Mean	SD
Research methods	4.28	0.91
Personal visit to department	3.14	1.41
Computer knowledge and skills	3.00	0.85
Paid human service experience	2.90	1.07
Volunteer human service	2.85	1.13
Double major with basic science	2.78	1.10
Master's degree	2.16	0.99
Double major with social science	2.08	0.84
Psi Chi membership	2.00	0.94

Note. From Eddy, Lloyd, & Lubin (1987). © 1987 Lawrence Erlbaum Associates. Reprinted by permission.

first author counts more than second or third author. Paper/poster presentations at regional conferences follow in importance, then state conferences. Publishing in nonrefereed or undergraduate journals bring less credit in graduate admissions decisions, but still credit (Kaiser et al., 2007; Keith-Spiegel et al., 1994).

To sum up, the results of these and other studies (e.g., Briihl & Wasielski, 2004; Mayne et al., 1994; Munoz-Dunbar & Stanton, 1999; Purdy, Reinehr, & Swartz, 1989) consistently indicate that the ideal applicant has high GRE scores, strong letters of recommendation, research experience, clinical experience, and high GPA. The results also consistently demonstrate that the admission requirements for doctoral programs are more stringent than for master’s programs.

The remainder of this chapter highlights these pivotal criteria used by graduate admissions committees in selecting their students. We consider, in order, course work, faculty mentoring, clinical experience, research skills, entrance examinations, and extracurricular activities.

Course Work

Although graduate programs differ in the courses they prefer you to have taken prior to admission, there are

some “core” courses that nearly all require (Smith, 1985). These include Introduction to Psychology, Statistics, Research Methods, Abnormal Psychology, Physiological Psychology/Biopsychology, and Learning/Cognition.

Our research on clinical doctoral programs in the United States and Canada reveals that both Vail- and Boulder-model programs hold similar expectations on desirable undergraduate courses (Mayne et al., 1994; Oliver et al., 2005). Approximately 60% of the programs require or recommend specific undergraduate courses, 15% require an undergraduate psychology major, 10% specify a minimum number of psychology credits (but not specific courses), and the remainder have no set policy on the matter.

Table 2-3 presents the percentage of psychology courses required (first column), recommended (second column), and either required or recommended (third column) for entry into APA-accredited clinical programs. Bear in mind that these figures systematically *underestimate* the actual percentage of programs requiring these courses as they do not include those graduate programs requiring a psychology major as a prerequisite and thus probably requiring most of the courses listed in Table 2-3. Introduction to Psychology was presumed to be a prerequisite for these advanced

TABLE 2-3. Undergraduate Courses Required or Recommended by APA-Accredited Clinical Psychology Programs

Psychology course	Percentage of programs		
	Required	Recommended	Either
Statistics	65	29	94
Research methods	48	19	68
Abnormal/psychopathology	29	22	51
Physiological/biopsychology	10	23	33
Learning/cognition	10	19	30
Personality	15	13	28
Child/developmental	11	13	24
Social psychology	7	16	23
History and systems	6	9	16
Psych testing/assessment	6	8	15
Laboratory course	6	5	11
Sensation and perception	3	2	5
Clinical/psychotherapy	1	1	2
Comparative psychology	1	1	2
Motivation and emotion	1	1	2
Neuropsychology	1	0	1

Note. Adapted from Mayne, Norcross, & Sayette (1994).

psychology courses and was therefore omitted from the table. Courses you should complete, according to these results, are Statistics, Research Methods, Abnormal Psychology, Physiological Psychology, Learning/Cognition, Personality, and Developmental Psychology.

Doctoral programs require more courses on average than do master's programs (Smith, 1985). Accordingly, both to meet admissions criteria and to improve your GRE Psychology Subject score, we heartily recommend that you complete Social Psychology, History and Systems, Psychological Testing, and at least one laboratory course. The safest plan, of course, is to complete a rigorous undergraduate major in psychology to satisfy all these courses, but a well-planned minor in psychology may suffice. The rule of thumb: the more competitive the graduate program, the more stringent the required undergraduate course work.

If you were not a psychology major, it is still important that you take the minimum of six core courses mentioned. In addition, you may have to invest additional time studying for the Psychology Subject test of the Graduate Record Examination (more about this later).

If you have been out of college for several years and feel deficient in this course work, you might consider taking a course or two as a part-time student at a local university. This will shore up your record and prepare you more fully for admission and the GRE. Those of you who are not psychology majors but have studied extensively for this test and have done well will often be considered favorably by admissions committees.

Beyond these classes, we recommend an introductory computer science course, particularly if you are interested in research-oriented programs. Not only will it accustom you to the workings of computers, which are standard research tools, but it will also serve as a springboard for learning the statistical software used for data analysis. Recall that computer proficiency is rated a moderately important admission variable by doctoral programs.

Graduate selection committees prefer a broad undergraduate background in a variety of arts and sciences (Fretz & Stang, 1980). Exposure to biological sciences, math competency, and verbal skills are generally valued. If you are anxious or phobic regarding oral presentations, then by all means complete a public speaking course. Composition and writing courses are also vital; you may well face three or four major papers each semester in graduate school.

At this point, you may want to glance at the Reports on Individual Programs following Chapter 7 to get a better idea of which courses particular doctoral

programs recommend or require of applicants. You will find the specific courses that each accredited clinical, counseling, and combined psychology program recommends or requires applicants to have taken.

For students who have gotten an early start or who are seniors, we would like to suggest considering advanced course work. To allay any anxieties, we would emphasize that the vast majority of applicants do *not* take these courses as undergraduates. Your application can be very strong without taking the courses we are about to mention. However, those fortunate enough to be in a position to add these to their academic transcripts should seriously consider taking advantage of the opportunity.

Consider an advanced or graduate statistics course. Statistical acumen is highly regarded, especially in research-oriented programs, and advanced knowledge may pave the way for funding as a graduate assistant or research assistant. Another suggestion would be to take a course specifically focused on one of the data analysis programs. Learning one of the major statistical packages—Statistical Analysis System (SAS) or Statistical Package for the Social Sciences (SPSS)—is a definite advantage. Such knowledge increases your employability and may catch the eye of a professor in need of a data analyst. Lastly, we suggest an advanced course in physiological psychology, biopsychology, or neuroscience. This is certainly helpful in increasing your understanding of the biological aspects of behavior, an increasingly important focus in psychology today. If you have the time and abilities, these courses can help distinguish a very good application from an outstanding one.

As mentioned earlier, your GPA is a very important criterion for admission. Three types of GPA may be considered by graduate programs: overall GPA, psychology GPA, and GPA during your junior and senior years. Most programs focus only on your overall or cumulative GPA. Determine which GPAs programs evaluate and also how much importance they place on them. For example, if you have an overall GPA of 3.2 (on a 4-point scale where $A = 4$, $B = 3$, $C = 2$, and $D = 1$), a psychology GPA of 3.6, and a junior/senior GPA of 3.5, you might concentrate on schools that emphasize the latter two averages.

Our research has shed light on the average GPAs among incoming doctoral and master's students in psychology (Norcross et al., 2005). For doctoral programs, the mean GPA is 3.54 for all undergraduate courses, 3.66 for psychology courses, and 3.67 for the last 2 years of course work. For master's programs, the mean GPA is 3.37 for all undergraduate courses, 3.48 for psychology courses, and 3.44 for the last 2 years of

course work. Please employ your statistical sagacity in interpreting these figures: half of the incoming students will possess GPAs above these scores, and half of the students will possess GPAs below them.

Although we do not want to discourage anyone, a GPA below 3.0 is considered unsatisfactory by most APA-accredited programs. Regardless of the prestige of the institution, admissions committees view a GPA under 3.0 as below the acceptable limits of course performance. If your GPA is below 3.0, then consider the following steps:

- Take additional courses to bolster your GPA.
- Retake courses to improve it.
- Wait another year to apply in order for all of your senior-year grades to be factored into your GPA.
- Complete a master's program first to show doctoral admissions committees you can perform academically at a higher level.

Try to speak with an academic advisor about how best to improve your standing within the workings of your own institution. Academic performance in your junior and senior psychology courses is particularly vital. Your grades in these courses affect your overall, final 2 years, and psychology GPAs.

Your “academic” performance is not limited to exam grades in the classroom. Faculty members—several of whom may submit a letter of recommendation on your behalf—also assess your interpersonal skills, verbal ability, and professional commitment in the classroom, outside formal course work, and in everyday interactions. The direct implication is to avoid undesirable interpersonal behaviors—for instance, silliness, arrogance, and hostility—in any interactions with your professors (Keith-Spiegel, 1991). Although the wisdom of avoiding such undesirable behaviors may be obvious, students are frequently unaware of the importance faculty attach to good questions, genuine attentiveness, respectful disagreements, office visits, mature disposition, interpersonal responsibility, and so forth. These are the characteristics a student heading for graduate studies should manifest in and outside of the classroom.

Finally, there is a corpus of general knowledge regarding clinical and counseling psychology that may not have been covered in your courses. This body of information includes at least a cursory understanding of diagnosis, for example, the *Diagnostic and Statistical Manual*, 4th ed. (DSM-IV); various assessment devices, such as the Minnesota Multiphasic Personality Inventory-2 (MMPI-2) and the Wechsler Intelligence Scales (WAIS-IV, WISC-IV); and ordinary therapy prac-

tices, such as individual, group, and family therapy. You must have a passing familiarity with theoretical orientations, for example, cognitive-behavioral, psychodynamic, family systems, and integrative/eclectic, in order to understand program materials. If you are not already familiar with these concepts, it would be wise to review an introductory textbook in clinical psychology.

You should also be gaining knowledge specifically about psychology as a field and about the current issues within this field. Toward this end, we suggest you begin reading the *Monitor on Psychology*, a publication sent to all APA members and student affiliates, or the *APS Observer*, the newsletter distributed to all members of the American Psychological Society (APS). Both publications feature articles dealing with psychology in general and clinical/counseling psychology in particular. You can become an APA or APS affiliate and receive a subscription, peruse your library's copy, or ask to borrow a professor's old issues.

Faculty Mentoring

Learning about psychology and achieving good grades are important components of academic work. But classes are also important in that they provide you with the opportunity to become acquainted and form relationships with faculty. It is natural to feel shy around faculty, especially if you are part of a 300-person lecture class. Substantial courage is required to muster the nerve to ask a question or to stay after class and introduce yourself. Equally anxiety provoking is a visit alone to a professor's office during office hours. In the one case, you expose yourself in front of your peers; in the other, you are individually vulnerable and do not have a crowd of faces to blend into. *But find a way to become comfortable in approaching faculty members.*

The irony of student reticence to approach faculty is that professors generally would like more students to approach them. Many faculty sit alone during office hours wondering why students never come to see them. They love to have students come after class or during office hours with questions. Ideas for questions can include something mentioned in the lecture or something you encountered in the readings. You do not have to be a star pupil or ask brilliant questions to begin a conversation with a professor. If you want to develop a relationship, ask professors about their research or other courses they are teaching.

What is the importance of meeting faculty? Three compelling reasons spring to mind. First, having a mentor to advise you in your growth as a future psychologist is invaluable. There is no better way to learn

about psychology than in a one-on-one, mentoring relationship. When you apply to graduate school, having a professor to guide you through the process is a huge advantage. Second, eventually you will need faculty to write letters of recommendation on your behalf. Whether you are applying to graduate school or for employment, everyone wants a few references regarding your performance and responsibility. Occasionally faculty members are asked to write a letter for a pupil who has taken a lecture course with 100 or more students—the professor may not even know the student until he or she requests a letter! It makes a huge difference if you have spent some office hours or time after class with a faculty member, and he or she knows you more personally.

And third, once you get to know professors, you may have the opportunity to work with them on a research project or as part of their clinical activities. You will be working closely with your major professor in graduate school, and you might as well begin as soon as possible as a colleague-in-training. Though more will be said about this later, we cannot overemphasize the need to cultivate such a relationship and obtain the rewards that can ensue.

To put it bluntly, the single largest contributor to preparedness for graduate school is students' interaction with faculty members at their undergraduate institution. That's what the research concludes and what graduate students report (Huss et al., 2002). Psychology students who had a mentor and who had high-quality interactions with faculty felt more prepared for graduate school. And the second largest contributor to graduate school preparedness is research activity—a point to which we shall return in a few pages.

Beyond meeting professors, read your textbooks with an eye toward graduate school. If you come across an interesting study, note the author and check in the back of the text for the reference. When you have time, go to the library or online and read the original article. If it is recent, note the author's university. You will be surprised at how much you can learn about the field just by doing your typical class work.

Clinical Experience

What is clinical experience? In its loosest sense, it involves spending time working in human service or mental health agencies. Graduate programs in clinical and counseling psychology expect that you will have some experience working with emotionally, intellectually, or behaviorally disadvantaged people. Many students volunteer or intern during their undergraduate years, whereas other people get paid as part of a sum-

mer job or during their time off. In research-oriented Ph.D. programs, you will be expected to have some clinical experience as a prelude to your clinical training and as an aid to researching clinically relevant problems. Experience of this nature will be considered essential.

What kinds of clinical experience count? Largely two types—paid and volunteer—under individual supervision. Paid part-time work in a clinical setting may be available in your community (but your involvement should not be at the expense of your academic performance). Returning master's-level clinicians will obviously have a multitude of employment possibilities, whereas undergraduates will have to search vigilantly for part-time employment.

For college students, a prime opportunity is to complete an undergraduate internship (or field experience) for academic credit. This is a great way to “kill two birds with one stone.” One study (VandeCreek & Fleisher, 1984) found that over two-thirds of colleges and universities provided undergraduate internships in psychology. Further, students consistently rate fieldwork as one of the most rewarding experiences and relevant courses in their college career. Internships “pay” in multiple ways: clinical experience, academic credit, familiarity with human service agencies, professional supervision, potential sources for letters of recommendation, and a shot at a full-time job.

Check with your undergraduate advisor and the college catalogue to determine whether such an opportunity exists for you. To learn more about the specific placements, you should consult the Psychology Department or the faculty member responsible for internship placements.

In selecting a place to work or volunteer, please consider several factors. Although it may be difficult to accomplish, it is ideal to gain clinical experience in a setting that complements a research interest. For example, if your research is in the area of alcohol abuse, you might seek experience in a college counseling center or a substance abuse prevention program. Find out exactly what your responsibilities will entail.

The optimal program is one that will train you in clinical skills (such as crisis counseling on a hot line), will allow you to deal directly with clients, and will provide regular supervision by an experienced clinician.

Supervision is probably the most important consideration in choosing a clinical setting. It is important that you be supervised by a professional, one with at least a master's degree. Determine the qualifications of the person who will be supervising your work. Aside from the valuable insight supervisors can offer, they may also be familiar with faculty at different graduate

programs and assist you in selecting schools. In addition, you may eventually decide to request letters of recommendation from them. Letters from a clinical supervisor are particularly important for practice-oriented graduate programs. In a later section we offer suggestions regarding approaching professors for letters of recommendation. The same strategies apply here.

If you are volunteering, you should insist on receiving supervision. Learn not only who will supervise you, but also how often and for what length of time. You will need to be assertive when searching out and interviewing possible agencies. If this seems difficult for you, try to remember that you are a volunteer—giving your time and energy, without financial compensation, to an agency that is in need of people like yourself. You seek only experience and supervision. You are a valuable commodity, so do not sell yourself short!

Numerous settings are available to people seeking clinical experience. Here are several excellent sources of hands-on experience that can be found in most communities:

- *Crisis hot lines.* These typically provide training in counseling skills, suicide prevention, and outreach services. The clientele range from sexual assault victims to suicidal teens to lonely elderly who need to talk with someone. Volunteers usually provide telephone counseling, although opportunities to work with an emergency outreach team may also be available. This can be a great way to gain exposure to a multitude of psychopathologies and to acquire fundamental helping skills. One word of caution: new members of most crisis hot lines are expected to take a large share of the midnight to 8 A.M. shifts. Be prepared to pay your dues.
- *Centers for homeless or runaway adolescents.* Much of what is done in these settings is similar to case management, in that these teenagers need to be put in contact with social service agencies. However, in-house counseling may also be provided to these youths, who frequently come from disadvantaged families. Be particularly careful about specifying the supervision arrangement before starting. The facilities are often understaffed and financially strapped, meaning you may have to be assertive to get the training you desire.
- *Schools for emotionally disturbed children and adolescents.* These placements offer exposure to both educational and clinical services. Educational activities might include tutoring, classroom management, and one-on-one homework supervision. Clinical activities typically involve recreational supervision, art therapy, and perhaps individual, group, and family therapy.
- *Supervised homes for the developmentally disabled or chronically mentally ill.* These are unlocked transitional facilities where clients live and work in a therapeutic milieu (an environment consisting of peers). Depending on your prior experience, you might be expected to conduct skills training, recreational counseling, and work/school supervision. The programs are often behavioral, affording you experience with reinforcement schedules, shaping techniques, and token economies. Often the goal is to graduate clients to the outside world.
- *Summer camps for the physically challenged, developmentally disabled, or emotionally disturbed.* These can be either day or overnight camps, where counselors are expected to supervise recreation and train campers in skills and vocational activities. The positions are usually paid, ideal for college students who want to gain field experience while working for the summer. They also tend to be full-time positions, while they last. They offer short-term but intensive training.
- *Community mental health centers.* These provide experience with patients suffering from serious mental disorders, such as schizophrenia, bipolar disorders, substance abuse, and anxiety disorders. The programs vary but are likely to include an outpatient department, partial (day) hospitalization, and an education/outreach wing. Duties may include helping out during recreational activities or assisting with individual and group therapy. Though supervising recreational activities allows contact with patients, you might not be observing any clinical methods. Do not be shy about asking for greater responsibilities!
- *College peer programs.* These provide students with peer education and assistance on specific disorders, such as bulimia or substance abuse. Less common but still available is peer counseling on more general concerns, for example, “Need to Talk? Call Us.” Both peer education and peer counseling programs are typically flexible in the number of hours you must work and usually provide training in listening and counseling skills. They may also provide an opportunity to begin learning about a specific clinical problem.
- *Women’s resource centers.* These are multiservice centers that offer or coordinate a plethora of human services for women—rape crisis counseling, domestic violence education, “safe homes” for victims of abuse, and so on. Possible activities likewise vary, but the training and *esprit de corps*

are highly regarded. Students with abiding interest in women's issues and feminist therapy will find these placements particularly satisfying.

- *Drug and alcohol treatment facilities.* These offer a variety of detoxification and rehabilitation interventions designed to help patients cope with the physical and psychological components of addiction. Although not all "D & A" programs will afford undergraduate placements, substance abuse is one of the most popular research areas in clinical and counseling psychology (see Appendix E). Students can gain exposure to several models of addiction, interact with a multidisciplinary treatment team, and observe clinical services with substance abusers across gender, racial, and socioeconomic lines.
- *Psychiatric hospitals.* These offer comprehensive behavioral care in an inpatient setting and typically feature individual psychotherapy, group counseling, psychoactive medication, psychological assessment, occupational therapy, and recreational therapy. Students are likely to observe patients with severe disorders receiving many treatments provided by multidisciplinary staff. In addition, large state hospitals depend upon the kindness of volunteers to staff social events, community outings, and recreational opportunities for patients.
- *Legal and probation offices.* These offer ideal experiences for students interested in forensic applications. Students frequently volunteer or intern with District Attorney's offices, probation officers, criminal lawyers, state police, and other criminal justice professionals. In these settings, ask to be exposed to the psychological or psychiatric side of criminal justice.

A word of caution about initial clinical encounters. Be careful not to generalize from one experience. One of the authors worked with runaways at a crisis center for adolescents in the Times Square area of New York City. The rate of employee turnover at this facility was exceptionally high. The "success" rate for clients was low, and the population was difficult indeed. Although it was a rich experience, some of the volunteers became disillusioned with psychology as a result of working there. Settings vary considerably, depending on the populations they serve and the resources available. An unpleasant experience may only mean that the specific population you were working with was not ideally suited to you. Try something else, and you may feel quite differently.

Though clinical work is important (and often rewarding), remember it is only one of several experi-

ences you must acquire for admission to graduate school. Some Ph.D. applicants make the mistake of accumulating a wealth of clinical experiences at the expense of gaining research training. By doing so, you may be inadvertently presenting yourself as being uninterested in research or perhaps better suited to a Psy.D. than a Ph.D. program. Clinical experience must be balanced with research competencies. This balance will be weighted toward clinical work or research depending on your desire to gain either a Psy.D. or Ph.D. or whether the Ph.D. program is practice or research oriented.

Research Skills

Research experience, as discussed earlier in this chapter, consistently emerges as a top admission criteria to nearly all Ph.D. programs in clinical and counseling psychology. To a lesser but still significant degree, Psy.D. programs also value your research experience for what it communicates about your intellectual ability and professional commitment. Recall the conclusion of one study on graduate school admission: there is simply no single better way to enhance an application than by obtaining research experience (Eddy et al., 1987). The desired skills—to critique the literature, to apply methodological reasoning, to write in scientific language, among others—are essential. Even though all psychologists need not produce original research, all must intelligently consume and apply research.

The benefits of student research, according to recent research (Landrum & Nelsen, 2002), boil down to two dimensions. The first might be labeled specific skills and abilities. These skills include developing clear research ideas, conducting literature searches, choosing appropriate measures, analyzing data, using statistical procedures, preparing conference presentations, and improving writing ability. The second dimension might be called interpersonal goals. These tend to be overshadowed by the specific technical skills listed above, but they are critical benefits in preparing and mentoring psychologists-in-training. These entail influencing decisions about graduate school, meeting other students involved in research, getting to know faculty members better, improving teamwork, forming relationships for the basis of letters of recommendation, developing leadership, and improving interpersonal communication. You seek *both* types of benefits in securing a research experience or assistantship.

Gaining research experience is largely dependent on your own initiative. It can be an intimidating process, and a knowledge of the potential opportunities

can help you to maximize your gains during the course of your research.

Common Paths

Let us begin by outlining six common avenues for students engaging in scholarly research. The first is probably the most frequent—volunteering to work with a faculty member on one of his or her research projects. A second avenue is to complete a student research program for a notation on your transcript but not academic credit. Students identify potential professors to work with from a faculty directory of research interests, jointly complete a learning contract, and then devote a minimum number of hours (say, 75) throughout a semester working directly with the faculty sponsor. A third option is to enroll in independent psychology research for academic credit. This entails individual study and research under the supervision of a faculty member and is ordinarily limited to junior and senior psychology majors.

A fourth and increasingly common approach is to work or volunteer for a researcher outside of your university—in a hospital, medical center, research institute, industry, or community-based organization, for example. Especially in large cities, researchers with major grants depend upon individuals (both pre- and post-baccalaureate) for many elements of study management, data collection, and statistical analyses. Many industries, especially biomedical and pharmaceutical research, offer summer research internships. These positions can provide valuable experience, in randomized controlled trial research. Conversely, community-based organizations commonly conduct outcomes research around clinical or community interventions and accept interns throughout the year. If you have taken a statistics or research methods course that included SPSS or SAS, you may have sufficient skills for an entry-level position on an active research team outside of a university.

A fifth alternative, restricted to matriculated undergraduates, is to complete an honors thesis in either a departmental or a university-wide honors program. As with additional courses and post college work, an honors thesis is a “feather in your cap.” For students desiring to move straight into a Ph.D. program, it is one means of presenting evidence to graduate admissions committees that you are capable of performing graduate-level work. Many schools allow motivated students to complete an honors thesis, an original study that the student conceptualizes, conducts, analyzes, and has some hope of presenting at a regional conference or even publishing. An honors thesis shows a genuine

commitment to psychology and is a palpable sign of ability in the applicant.

A sixth and final avenue toward acquiring research competencies is restricted to master’s students. A comprehensive paper or a formal master’s thesis, requiring original research, practically guarantees additional experience with research. For this reason, undergraduates denied admission directly into doctoral programs frequently enter master’s programs to gain valuable research (and clinical) competencies. And remember: the majority of clinical psychology doctoral programs prefer master’s-level applicants to have completed a thesis (Piotrowski & Keller, 1996).

Whatever avenue you eventually pursue, the procedures are quite similar. Following is a step-by-step guide to help you make the most of your research experience.

Determining Your Interests

The first step is finding a research area that interests you. If you are not interested in the work, it will diminish your energy and enthusiasm and probably your decision to apply to graduate school. A good place to begin is to read through your department brochure or Web site describing faculty interests and current research. If you are out of school, check with a local university. Look for professors who have a proven track record of scholarly publications. If the program has a graduate psychology faculty, so much the better—look to those professors first.

Once you have a list of faculty interests, you may find someone interesting but not be sure exactly what the research is all about (“I’ve heard about autism and think I’d like to study it, but I don’t really know much about it. . .”). If specific publications are not provided in the Web site or brochure, or if reprints are not posted in the department, then you can go to *PsycLIT* or *PsycINFO* (found in most university libraries; ask at the reference desk) and read what that professor has published in the area over the last 5 to 7 years. This should make it easier to decide which professor you would like to approach to volunteer to do research with. *Do not narrow your choices too quickly!* Find at least two or three professors whose work initially interests you.

Selecting Professors

Next, find out more about that professor as a person. Do you know people who have taken a class with him or her? What did they think? Are there other undergraduate or graduate students working with this professor now? What do they do, and what is it like working

under this person? Is the professor easy to get along with? Is the professor helpful to students? Do not be afraid to approach people and ask questions.

Having narrowed the choice to two or three professors whose work interests you and with whom you think you might get along, consider the rank of the professor. There are tenured faculty (a *full* or *associate* professor) and untenured (an *assistant* professor), both with respective advantages and disadvantages.

Full or associate professors have been in the field longer and will probably have colleagues at other universities. If the professor is well known, it gives your letter of recommendation that much more weight. If your professor's reputation in the field is strong, with a long list of publications, you are also likely to learn more and increase your own attractiveness as a candidate. However, once a faculty member becomes tenured, he or she is no longer under the same pressure to produce research as when he or she was pursuing tenure. Certainly if these faculty members are still conducting grant-funded research, they are likely to be committed to maintaining their productivity. Regardless, you should establish that tenured faculty are actively engaged in research and are currently publishing their work.

Assistant professors are newer to the field, probably 1 to 6 years post doctorate. They are often in more need of undergraduate help and will likely involve you to your full potential. The possibility of being included on a presentation or publication as a coauthor may also be increased. What they lack in terms of a reputation built on years of publications may be balanced by their energy and their motivation to produce.

One word of caution: some professors maintain large research facilities and employ vast numbers of undergraduates to help them with their data management. If there are 10 or 15 undergraduates working in a lab, the attention given to each individual tends to decrease, as well as the value of the research experience. On the other hand, some large laboratories provide unique research opportunities unavailable elsewhere. The key is to talk to students who have worked there to learn about their experiences and to determine if former students have had success applying to graduate school.

An optimal research context, then, is one in which there is a faculty member or research mentor who has an established reputation in his or her field of inquiry, a record of producing publishable research, similar interests to your own, a history of working successfully with students, a propensity to share authorship credit with students, and the ability to construct discrete research projects. Be guided by these general principles

in selecting professors to approach, but do not expect all these qualities to be available to you.

Making Initial Contact

Having chosen a professor you would like to work with, it is now time to make yourself known to him or her. You need to schedule an appointment or approach the professor during posted office hours. It is natural for you to be nervous! However, the more familiar with his or her work you are, the more secure you are likely to feel. Once again, read what the professor has written. Additionally, it helps to remember that you are coming to the professor to offer your services.

A good opening line might be, "Hello, Dr. Jones, my name is Chris Smith. I've been doing some reading on autism and came across several articles you've written. I'm pretty interested and was wondering if I could help with your research project." As the conversation progresses, let the professor know your long-term goals as well as your immediate desire both to contribute as a member of the research team and to acquire research skills. Let him or her know you are seriously considering graduate study in clinical or counseling psychology—it will increase your appeal.

Negotiating Research Responsibilities

"Well Mr./Ms. Smith, I'd be very interested in speaking with you about helping out with my research. . . ." You have made the contact. If the professor does not need help, you have lost nothing and gained the experience. Ask if he or she knows of someone with similar interests who is looking for help, or simply approach the next person on your list.

After the initial contact, your next move is dictated by your professor's needs and your abilities. Regardless of all your wonderful qualities, be prepared to run some of the grunt work! Photocopying needs to be done, literature searches need to be conducted, and at times you might well be expected to do some lab cleanup. You are "low person on the totem pole," so approach this with humility. But if you have experience with test administration or statistical analysis, let the professor know, being aware that ultimately your activities will be dictated first by his or her needs. However, if grunt work is the full extent of your duties, your needs are not being addressed properly. Spending a year doing nothing but photocopying would be a waste of time.

Research experience is, above all, an opportunity to learn. Volunteer to be trained to be of more use. For example, learn the computer skills to input data and conduct statistical analyses. Learn to score and, more importantly, to *understand* a Minnesota Multiphasic

Personality Inventory-2 (MMPI-2) or a Beck Depression Inventory (BDI-II). Learn how to calibrate and run psychophysiological equipment. Whatever equipment or tests, find out about them and their use. And always ask questions about what you do not understand. When it comes time to put your research on your curriculum vitae, these are the responsibilities you will want to list.

Some researchers have a weekly lab group or research meeting with graduate students, undergraduates, or both. These might entail a discussion of the project at hand, or a presentation on another area within the field, or a training session for new people. In any of these cases, it is an opportunity to learn more about your area of interest. If you have not been invited to these meetings, go ahead and ask about them. Optimize your contact with your professor! Convey your willingness and enthusiasm. Give your professor reason to write an outstanding letter of recommendation.

Finally, there are some instances where undergraduates are solely supervised by graduate students and have little contact with the professor in charge of the project. This can happen if faculty members have a large number of students working with them or if they are well known and are continually approached by masses of students. Being supervised exclusively by a graduate student is an undesirable situation for a potential applicant. Although there is much to be learned from graduate students—and they are fresh from the application process themselves—a letter of recommendation from a graduate student does not carry the same weight as one from a professor. Moreover, a lack of interaction with the professor means that he or she must depend solely on graduate students for feedback on your work, thus detracting from the value of his or her assessment.

This is *not* to say that you must avoid research opportunities that are primarily supervised by graduate students. Personal access to the faculty member is, however, one of several important factors to be considered in your decision on where to volunteer for research experience.

Arranging Credit and Semesters

Most colleges allow students to complete a certain amount of research experience for academic credit. If the opportunity is available, take advantage of it. Some professors may even demand that you sign up for credit, because it institutes a contract between them and you as to the number of hours per week required and how long they can count on you to work with them. Generally speaking, multiply the number of course credits by 3, and this will give you

the number of weekly hours that you should spend doing research.

Expect to spend two semesters on a project. This demonstrates your commitment and allows ample contact between you and your professor. Thus, it is a good idea to work with someone at least 1 year before you plan to apply to graduate school. For instance, begin research in fall 2007 if you are applying in fall 2008 for a fall 2009 entrance to graduate school.

In consultation with your faculty advisor, consider applying for a university or national grant to fund your research project. These grant monies may be used to purchase equipment, pay postage for surveys, reimburse research participants for their time, and send you to a convention to present your findings. In most colleges and universities, these small grants are called undergraduate research grants, summer research fellowships, or something similar. At the University of Scranton, for example, the summer grants allow students to live on campus free for the summer, provide a tidy stipend, contribute up to \$500 for research supplies, and fund travel to a conference in order to present the research. At the national level, Psi Chi and several publishers provide small awards and grants for research. Go to www.psichi.org/awards to access the list.

In terms of research, there is no such thing as too much for a Ph.D. applicant. The longer you have worked on a project and the greater your responsibilities, the more attractive you are as an applicant. Ideally, you would work with two professors over the course of your undergraduate education. This is not necessary, but when schools expect three letters of recommendation, having two letters summarizing two different research experiences is particularly strong. Although they will allocate less attention to research than Ph.D. applicants, Psy.D. applicants are reminded that research is still an important admission criterion.

One word of caution: do not overextend yourself. Be realistic about the amount of time you can commit. Some students juggle two or three research projects at once and end up performing poorly on them all. It is far more important to concentrate your energies and perform solidly on one project than it is to spread yourself too thin. Do as much research as your academic studies and other commitments allow.

An ideal time to begin research is during the summer, when you can balance it with a part- or full-time job. Since most undergraduates and some graduate students leave during the summer, professors may be short-staffed during this period. It is a prime opportunity to optimize your usefulness at the outset and increase your chances of picking up desirable skills.

The net result of your research experiences will be skill enhancement and professional identification. Depending on the nature of your project, you will probably have engaged in a literature search, hypothesis generation, experimental design, data collection, statistical analyses, and the write-up.

Presenting and Publishing Research

Presenting or publishing your research is a definite asset. Opportunities for presentation are numerous: a department or university colloquium, a local or regional undergraduate psychology conference, a state or national psychology convention. Participation in research conferences is viewed favorably as an index of your professional identification and commitment. Check with your advisor about these opportunities and other possibilities for your work to be seen by colleagues.

Publication of your research in a scholarly journal is held in very high regard by graduate admissions committees. As we discuss in Chapter 6, research experience leading to a coauthored publication is the most highly rated final selection criterion for Ph.D. (though not necessarily Psy.D.) admission decisions following the interview. The peer-review process by which journals accept papers for publication gives a seal of collegial affirmation that the research contributes to the scientific understanding of behavior. Although not common, undergraduate publication is slowly becoming more frequent.

If your research project is not quite up to the standards of a competitive, peer-reviewed journal, then consider sending the paper to a journal publishing student research in psychology. One such publication is the *Psi Chi Journal of Undergraduate Research*, which has the twofold purpose of fostering the scholarly efforts of undergraduate psychology students and of providing them with a valuable learning experience. Other publications for student research in psychology are *Modern Psychological Studies*, *Journal of Psychology and Behavioral Sciences*, and *Journal of Psychological Inquiry*. All these journals publish research in psychology conducted and written by students. Look for their instructions to authors on the Web (puffin.creighton.edu/psy/journal/studentjournals.asp), on departmental bulletin boards, or in *Eye on Psi Chi* (the national newsletter of Psi Chi).

Of course, though submission to these journals can be instructive, publishing in them does not carry as much weight as publication in established peer-reviewed journals. In fact, recent research suggests that a student publication in an undergraduate journal may be judged neutral or even unfavorably by research-

oriented professors in a doctoral programs (Ferrari & Hemovich, 2004). So, always aim to publish your research in peer-reviewed, scholarly journals.

Still impressive is a paper/poster presentation at a state, regional, or national meeting. Only between 10% and 20% of undergraduate psychology majors present their research at some type of research conference, whether local, regional, or national (Terry, 1996; Titus & Buxman, 1999).

Most regional and national meetings are listed in each issue of the *American Psychologist*, *APS Observer*, and *Eye on Psi Chi*. These meetings are also listed on the Psi Chi Web site. Psi Chi members who present papers can receive a certificate recognizing their excellence in research. This award should be duly noted on your curriculum vitae and application. Refer to *Eye on Psi Chi*, ask your local Psi Chi moderator or consult their Web site at www.psichi.org/pdf/postcert.pdf to receive the form entitled "Certificate Recognition Program for Paper Presentations by Psi Chi Members."

Different graduate programs will assess your research experience in different ways, of course. Nonetheless, as an aid to applicants, we reproduce below (with permission) two rating scales employed at different times by one clinical program (University of Rhode Island) over the past 10 years. The first rating scale emphasizes research activity. Examples of relevant activities might include producing honors theses, serving as a research assistant, conducting independent research, coauthoring scientific publications, and developing research skills, such as data analysis and interviewing.

Rating	Criteria
5	Senior author of one or more articles in significant journals in addition to experience that provided a basis for extensive mastery of one or more directly related research skills.
4	Coauthor of one or more articles in significant journals in addition to experiences providing considerable familiarity with one or more directly relevant research skills.
3	Project leadership or significant participation in research activity (beyond activities connected with course work) serving to provide for considerable development of mastery of one or more relevant research skills.
2	Experience that provides a basis for some familiarity with relevant research skills.
1	Little if any experience according to these criteria.

The second rating scale, now in use at the University of Rhode Island, favors four criteria in evaluating research experience.

1. *Demonstrated research productivity*: sole or co-authorship of research publications, presentation of papers at scientific meetings, other tangible indications of research achievement.
2. *Breadth and quality of experience*: development of one or more research skills, data collection with different populations, work on more than one project.
3. *Research interest*: the strength of interest in research can be inferred from research activity over a sustained period of time and recommendations from research supervisors documenting skills, motivation, participation, and accomplishments.
4. *Individual autonomy*: responsibility for planning, implementing and carrying out research tasks as a member of a research team or evidence of independent work.

Rankings are based on the aforementioned criteria and assigned as follows:

Rating	Criteria
5	Satisfies all four criteria
4	Satisfies three criteria
3	Satisfies two criteria
2	Satisfies one criterion
1	Evidence of some prior research involvement or interest

Balance is the key. On the one hand, an absence of research experience is usually seen as a serious drawback to an application. On the other hand, over committing yourself to multiple projects at one time can lead to poor performance and a neglect of clinical experience and GRE preparation. And do not forget, research also provides you with the opportunity to make professional contacts. The professors or graduate students with whom you collaborate are excellent sources of information about the field and about applying to graduate schools.

Entrance Examinations

About 90% of doctoral clinical psychology programs (Mayne et al., 1994; Steinpreis, Queen, & Tennen, 1992) and 80% of doctoral counseling psychology programs (Turkson & Norcross, 1996) require you to complete two exams: the Graduate Record Examination (GRE) General Test and the GRE Psychology Subject Test.

The two GRE tests are often used to complement each other in admission decisions because the General Test is a measure of broad abilities and the Subject Test is an index of achievement in a specific field of study. The Miller Analogies Test (MAT) is required by fewer programs, about 3% of doctoral programs and 9% of master's programs in psychology (Murray & Williams, 1999; Norcross et al., 2005).

Blanket statements about entrance exams are difficult because not all schools require all tests, and some schools require additional testing (e.g., in the past the University of Minnesota required clinical psychology applicants to take the MMPI—a personality inventory!). Moreover, not all schools weight these tests equally among the application criteria. Some schools clearly state a minimum score that all applicants must obtain, whereas others state that they have no such criteria. Interestingly, a study at Boston University (Rem, Oren, & Childrey, 1987) showed that even without an imposed cutoff, applicants admitted into its program had GRE scores of 600 or better. This suggests that even if a program does not emphasize entrance exams, (1) scores can still play a major role in the selection of candidates, or (2) applicants with high exam scores are also the applicants considered most desirable on the other admissions criteria.

Consequently, the best assistance that can be offered is a brief description of each test, an overview of minimum and actual GRE scores of incoming graduate students, guidelines for deciding how much preparation will be needed, and some suggestions as to the available study aids for each test.

GRE General Test

Use of GRE scores for admission to clinical and counseling psychology programs continues to be the norm and continues to be controversial (Dollinger, 1989; Ingram, 1983; Sternberg, 1997). The traditional rationale—buttressed by some evidence—is that the GRE is ordinarily more valid than undergraduate GPA in predicting graduate school success (Boudreau et al., 1983; Goldberg & Alliger, 1992). Another rationale is that GRE performance is an “equalizer” among the diverse curriculum requirements and grading practices in thousands of undergraduate institutions. The entrance exam is probably the only standardized measure of all applicants that an admissions committee has. Does a 3.7 GPA and stellar letters of recommendation from Backwater College reflect more, the same, or less knowledge than a 3.3 GPA and strong letters of recommendation from Ivy League University? Since all students take the identical GRE test, the playing field is leveled.

The empirical research indicates that the GRE General Test has modest predictive validity for graduate school performance. A meta-analysis of studies conducted in psychology and counseling departments found that GRE scores predicted about 8% of the variance in graduate school GPA (Goldberg & Alliger, 1992). A later meta-analysis of two dozen studies encompassing more than 5,000 test takers similarly reported that 6% of the variance in graduate-level academic achievement was accounted for by GRE scores (Morrison & Morrison, 1995). These and other studies (e.g., Chernyshenko & Ones, 1999; Kuncel, Hezlett, & Ones, 2001) indicate that GRE General Test scores are generalizably valid in a modest way for all sorts of measures of graduate performance, especially when selection/admission ratios are taken into account. At the same time, Subject Test scores tend to be better predictors than the General Test scores (Kuncel et al., 2001).

The Educational Testing Service (ETS), located in Princeton, New Jersey, provides a free, online booklet entitled *GRE Information and Registration Bulletin* (www.ets.org/media/tests/gre/pdf/0708_gre_bulletin.pdf; Graduate Record Examinations, 2007), which describes the test and offers examples of the types of questions you can expect to encounter on each section. You can obtain the same information and register for the test by visiting GRE online at www.gre.org. In addition, at this Web site you can order (with a credit card) ETS test preparation books and download preparation software directly onto your home computer.

The test is similar in format to the Scholastic Aptitude Test (SAT) that most of you took prior to college. The three GRE scales are Verbal Reasoning (V), Quantitative Reasoning (Q), and Analytical Writing (AW). The Verbal and Quantitative scales are multiple-choice in format, and scores on the test are based on the number of correct answers selected. Most graduate schools rely on the Verbal and Quantitative scores in evaluating candidates.

The Analytical Writing section, in which you write two essays, is delivered on the computer, and you word-process your responses. For the “Present Your Perspective on an Issue” task, you will choose one of two essay topics selected by the computer from a larger pool of topics. For the “Analyze an Argument” task, you do not have a choice of topics; the computer will present you with a single topic. Your essays are read and scored by two trained raters using a holistic 6-point scale (scoring guidelines can be found at www.gre.org/pracmats.html). Your Analytical Writing (AW) score is reported on the 0–6 scale in half-point increments. Since the AW test is relatively recent, many grad-

uate schools are not yet placing as much emphasis on it as the Verbal and Quantitative scores in admission decisions. But this will surely change in the near future, as graduate admissions committees seek an independent measure of your writing ability.

The GRE General Test is now available only on computer; the traditional paper-and-pencil version was phased out in 1999. This computer-based test always begins with the 75-minute Analytical Writing section: 45 minutes for the Issue essay and 30 minutes for Argument essay. Then follows the 30-minute Verbal section and the 45-minute Quantitative section.

In addition, a pretest section or research section may be included, but answers to these sections do not count toward your score. All told, you will probably spend about 4 hours at the testing center.

When you complete all sections of the GRE at the testing center, you will be asked two questions: Do you want to cancel your scores? To which four graduate schools would you like your test scores sent? If you do *not* cancel your scores, then your Verbal and Quantitative scores are immediately presented on the computer screen. Your Analytical Writing score will arrive by mail in another 4 weeks or so. If you cancel your scores, then you are not provided with those scores.

The testing center consists of multiple cubicles, each containing a computer station. The center may be noisy, so many of our students recommend wearing ear plugs or accepting the offered headphones to minimize the extraneous noise and to enhance your concentration. Some test-takers are unnerved by the presence of cameras in the center (or above the cubicle); these exist only for test security purposes. But knowing in advance will probably decrease your anxiety.

The GRE registration booklet and the free tutorial software (POWER PREP, available at www.ets.org/powerprep) will familiarize you with the computer-based adaptive format of the Verbal and Quantitative sections. Briefly put, adaptive testing means that your responses to the early items determine the difficulty level of subsequent items and your range of possible scores. As you answer each question, the computer immediately scores that question and your preceding answers to determine which question is presented next. Correct answers lead to increasingly difficult items (and eventually higher test scores); incorrect answers lead to less difficult items (and lower test scores). As a consequence, you may not skip any questions and you may not go back and change a previous answer. An equally important consequence is that you should be very familiar with the test format and computer functions before test day!

TABLE 2-4. Minimum GRE Scores Preferred by APA-Accredited Clinical Psychology Programs

Preferred minimum score	Psy.D. programs		Practice- oriented Ph.D.		Equal- emphasis Ph.D.		Research- oriented Ph.D.		All programs	
	<i>M</i>	<i>SD</i>	<i>M</i>	<i>SD</i>	<i>M</i>	<i>SD</i>	<i>M</i>	<i>SD</i>	<i>M</i>	<i>SD</i>
Quantitative scale	544	46	566	58	580	44	598	36	581	46
Verbal scale	533	50	566	58	583	46	598	36	580	48
Psychology subject test	542	49	601	17	581	48	605	43	587	47

Note. Adapted from Mayne, Norcross, & Sayette (1994) and Turkson & Norcross (1996).

In deciding how much and what type of preparation you will need for this test, ask yourself several questions:

1. What were my SAT scores? These two tests are highly correlated in a positive direction, so this may be your first clue as to how much preparation is ahead of you.
2. How well have I done on multiple-choice tests in college? There is a certain savvy to taking standardized tests, and this is one way to assess yours.
3. How anxious do I become in a testing situation? A moderate amount of test anxiety is optimal: too little anxiety can breed indifference, but too much begets interference. If you tend to approach tests with more than moderate discomfort, you might benefit from additional preparation aimed at relaxing yourself and building your confidence.
4. Can I discipline myself to do the necessary studying? If you are in need of additional preparation, this question is important in deciding what the most appropriate form of preparation will be for you. Be honest with yourself. If you cannot imagine sitting down regularly and studying independently for the GREs, you might be better off taking a preparatory course offered privately in most cities.

Students typically spend an inordinate amount of time worrying about the GREs. The myth exists that clinical applicants need a score of 650 on each of their subscales to be considered seriously. This is simply not the case. Some Psy.D. programs do not even require the GREs. On the other hand, many APA-approved Ph.D. programs prefer GREs of 600 or above. The average GRE score (combined Verbal and Quantitative) of first-year graduate students in psychology master's programs is 1053; in doctoral psychology programs, 1183 (Norcross et al., 2005).

However, even these averages mask considerable variation in preferred minimum GRE scores. In our study of the admission statistics of APA-accredited clinical doctoral programs (Mayne et al., 1994), we found that the preferred minimum scores differed consistently according to the type of program. As shown in Table 2-4, research-oriented clinical Ph.D. programs preferred the highest GRE minimum scores—about 600 each for the Quantitative and Verbal scales. Psy.D. programs were willing to accept lower (but still not low) minimum GRE scores—about 520 to 540 each on the two scales. In between these two poles is the remainder of clinical and counseling psychology doctoral programs, which expect a minimum score of 550 to 560 on each of the scales, on average (Turkson & Norcross, 1996).

Even if your scores are lower than 550, you can bolster other areas of your application to overcome low scores. But if your GRE scores are below 500, then most Ph.D. programs in clinical and counseling psychology will not seriously consider your application. In this case, it will probably be necessary to take them again after completing a preparatory course or after spending time with a study guide. Or you may decide to apply to Psy.D. and master's programs as well.

Overconfidence can be disastrous here. Even if you obtained 700 SATs, aced every multiple-choice exam in college, and are cool-headed in testing situations, you should still familiarize yourself with the test format and complete the practice test offered in the application booklet. It certainly would not hurt to prepare more, but this should be considered the bare minimum.

Many self-study manuals and software packages are sufficient for a disciplined applicant to ready him or herself for the GRE. The books provide helpful test-taking hints, vocabulary and math reviews, and sample tests that the student can self-administer. Many include actual questions given on past GREs that can provide a

real flavor for the material likely to be seen on testing day. The software packages administer sample tests and give helpful hints. Sample questions, practice manuals, and downloadable practice software packages can also be found and ordered on the official GRE Web site at www.gre.org. In addition to the official ETS site, several comprehensive and commercial Internet sites provide valuable tips and full-length practice tests. Some of the material is offered for free; some offered for a price. Visit:

- www.princetonreview.com/gre
- www.kaptest.com/Kaplan/3/Psychology/GRE
- www.mygretutor.com/
- 800score.com/gre-index.html
- www.greguide.com/

We heartily recommend taking an online GRE practice test. A practice GRE test serves as a diagnostic tool to assess your abilities, gauges your competitiveness for admission to graduate programs, and identifies areas that need further improvement (Walfish, 2004). Our favorites are the practice GRE tests at www.kaplan.com and www.princetonreview.com. These are free and confidential; use the practice test as a starting point.

Lastly, give yourself *at least* 6 weeks of study time if you decide to use a manual or 8 weeks if you do not have a lot of time to devote solely to studying.

Students feeling less confident, more anxious, or “out of the exam business” should contemplate private courses designed to help you prepare for the GRE. They offer a number of benefits beyond those of study guides:

- A structured time one or more times a week when the material is taught by an impartial instructor who can assess your strengths and weaknesses
- An abundance of study materials and the possibility of individual tutoring
- The chance to take tests under actual test-taking conditions (especially helpful for those with test anxiety)
- Specific work on test-taking skills and the shortcuts that can make problems easier
- Brief introduction to relaxation exercises that can counter test anxiety

The imposed structure on studying and the conscious use of test-taking skills can be very useful. Although these classes cannot guarantee that they will improve your scores, they are undoubtedly the best course of action for some students. Having worked for

one of these agencies, we have seen the benefits of this system for many students.

Many students attempt to strengthen their vocabulary for the GRE Verbal section by preparing flashcards or memorizing a vocabulary word each day. The early research on the word-a-day method suggests it can slightly enrich your vocabulary (Prevoznak & Bubka, 1999), but more importantly, it gets you into the swing of GRE preparation and the admissions process. If you are inclined to try this method, consider receiving a word a day from the Web site, www.wordsmith.org, which presents a word with its pronunciation and examples. Or try the vocabulary builders at www.supervoca.com/gre.htm and www.number2.com. They require only a couple of minutes per day.

Scheduling *when* to take your general GRE should be carefully considered. If you do poorly on the test, you can retake it. Consequently, it is prudent to take it at least 6 months before the application deadline, which gives you time to study and prepare for a second administration. For undergraduates planning to apply to graduate school during their senior year, this means taking it during the summer following your junior year or early fall of the senior year. For graduates, this means taking it the spring before you plan to apply. Even if you improve your scores, the current ETS policy is to send to each institution scores from *all* your tests taken during the last 5 years.

We are frequently asked by students in our graduate school workshops if they should retake the GRE General Test if they are dissatisfied with their original scores. Our immediate answer is: it depends. If you studied diligently for the test and if you performed similar to the practice tests, then no—do not retake the test. But if any of the following five factors apply to you, then retaking the test once seems like a good idea (Keith-Spiegel & Wiederman, 2000): (1) You were ill the day you took the GRE; (2) you were immobilized by test anxiety; (3) you did not prepare for the test content; (4) you were unfamiliar with the computer-based format and the adaptive design; (5) your SAT scores were much higher than your GRE scores.

Should you decide to retake the GRE General Test, please be aware of the probable effects of repeating it. The average score gain for repeaters is about 27 points on the Verbal scale and 30 points on the Quantitative scale. Increases of more than 100 points rarely occur, in only 1 or 2% of repeaters (ETS, 1984).

Your GRE score can partially determine where to apply. Low scores suggest applying only to institutions whose minimum scores you surpass. In this way, your GREs can help you make realistic decisions as to your

chances of being accepted at a given school and ultimately whether to apply there.

GRE Psychology Subject Test

The General Test measures knowledge acquired over a long period of time and not indigenous to any specific field of study. By contrast, the Subject Tests—such as the Psychology Subject Test—assume an undergraduate major or extensive background in the specific subject. Consequently, the test may be relatively difficult if you were not an undergraduate psychology major.

Another difference between the General Test and the Subject Test lies in the mode of administration. The General Test is a computer-based test available year-round at over 600 test centers. The Subject Test, by contrast, continues to be a paper-based test offered three times during the academic year.

Table 2-5 summarizes the differences between the GRE General Test and the GRE Subject Test. These profound test differences will lead to different preparation and test-taking strategies on your part.

The GRE Psychology Test consists of about 215 multiple-choice questions. Each item has five options, from which you select the correct or best response.

The total time allotted for the test is 2 hours and 50 minutes.

The GRE Psychology Test yields a total score and two subscores. Virtually all graduate programs, however, concentrate on the total score, not on the subscores. The preferred minimum score is 587 for clinical psychology doctoral programs and 541 for counseling psychology doctoral programs (Mayne et al., 1994; Turkson & Norcross, 1996). That is, most programs will be expecting you to secure a score at or above this number. But here again, as shown in Table 2-4, the preferred minimum ranges from a low of 542 in Psy.D. programs to a high of 605 in research-oriented Ph.D. programs.

The two subscales are an Experimental or natural science orientation and a Social or social science orientation. The Experimental subscore covers questions in learning, cognition, perception, comparative psychology, sensation, and physiological psychology. The Social subscore includes an equal number of questions in personality, clinical, abnormal, developmental, and social psychology.

Percentages of questions devoted to a subject area will vary somewhat from one test administration to

TABLE 2-5. Comparison of the GRE General Test and the GRE Psychology Subject Test

	General Test	Psychology Subject Test
Content assessed	Broad knowledge	Specific knowledge in psychology
Test format	Computer	Paper-and-pencil
Administration Schedule	Throughout the year	Three times per year (Oct., Nov., & Apr.)
Recommended test date	Summer of junior year Early Fall of senior year	October for Ph.D./Psy.D. applicants November for master's applicants
Administration Format	Individual	Group
Test cost (2007–2008)	\$140	\$130
Repeat policy	May repeat test once per calendar month up to 5 times per year	May repeat test as often as it is offered
Testing time	2 hours, 45 minutes	2 hours, 50 minutes
Scoring procedure	Adaptive: your early responses determine difficulty level of subsequent questions	Total items answered correctly minus one-fourth the number answered incorrectly
Skipping questions	Not permitted; computer administers one question at a time	Permitted
Scores provided	3 scores (Verbal Reasoning, Quantitative Reasoning, & Analytical Writing)	1 total score, 2 subscores
Scores range	200–800 for Verbal and Quantitative; 0–6 for Analytical Writing	200–990
Scores mean (SD)	500 (100)	540 (100)
Recommended preparation	Intense	Moderate

another. Nonetheless, one set of investigators (Waters, Drew, & Ayers, 1988) found these approximate percentages on past tests:

Physiological/comparative psychology	14%
Developmental psychology	12%
Learning and motivation	12%
Sensation and perception	12%
Clinical/abnormal psychology	11%
Personality and social psychology	11%
Cognition and complex human learning	10%
Applied psychology	9%
Research methodology	9%

Scores on the GRE Psychology Test are best predicted by your GRE General Test scores and the number of basic psychology courses completed. The irony is that students can obtain excellent grades in all their psychology courses but still not perform adequately on the Psychology Test if they have not taken the critical courses. A narrow focus on—and many courses in—clinical psychology will probably detract from your score since this one area only accounts for 10 to 12% of the test items. The questions are drawn from courses most commonly offered at the undergraduate level within psychology (ETS, 1995).

A maximum number of “traditional” courses in psychology, as represented in the foregoing list, and a minimum of special topics and “pop” psychology will prepare you best for the GRE Psychology Subject Test. Choose your elective courses for breadth and rigor, not merely your specialized interest.

The GRE Psychology Subject Test is designed to be challenging. Students accustomed to getting 90% correct on in-class exams often worry about the large number of items they miss. The average student answers about half the items correctly, misses about 30%, and omits 20% (Kalat & Matlin, 2000). Because your score is based on the number of questions answered correctly minus one-fourth of the questions answered incorrectly, guessing does *not* lower your score. You are not penalized for guessing; but you are rewarded for eliminating one or two possible answers.

Adequate preparation is essential for this test. We—and others—suggest four steps: (1) obtain the free ETS booklet *A Description of the Advanced Psychology Test*; (2) review a good introductory psychology textbook; (3) volunteer to be a TA (teaching assistant) for the Introduction to Psychology course; and (4) purchase one of the study guides with practice tests. Our favorite study guides are *Practicing to Take the GRE Psychology Test* (2004, published by the GRE board and which can be ordered at the ETS Web site), *Graduate*

Record Examination—Psychology (Raphael & Halpert, 1999; published by Prentice Hall), *GRE Psychology with CD-ROM—The Best Test Prep for the GRE* (Kellogg, 2003; published by Research & Education Association), and *Cracking the GRE Psychology* (2005 by Princeton Review). If these four steps do not suffice, then private courses in preparing for the psychology test are available.

The standard error of measurement for the GRE is quite small, and retaking the General Test in the absence of any *intense* remediation is unlikely to result in a significant change in your score. Your Psychology Test scores, however, may be significantly different if intervening study or additional courses occur between the test sessions.

A graduate school may adopt one or more policies in handling cases in which a candidate reports two sets of GRE scores: consider only the most recent one; consider the higher of the two scores; or average the scores. The latter is probably the best alternative, since it creates the least bias and is the most reliable.

Miller Analogies Test

A few clinical and counseling psychology doctoral programs request the MAT, a 50-minute test consisting of 100 word analogies. Your score is the total number correct; the mean for students intending to study psychology in graduate school is 50 to 51 (The Psychological Corporation, 1994). As with the GREs, booklets are available to help improve your scores on the test, and it is useful to take practice tests to familiarize and prepare yourself for the actual event. There are states in which the MAT cannot be administered (e.g., New York) because of test disclosure laws enacted in those states, so be sure to locate the testing center nearest you.

The MATs are rarely required by graduate schools. Because the test can be scheduled at any time, through a network of over 600 testing centers nationwide, consider taking this test after you have received your GRE scores and after you have selected the schools you would like to apply to. You will save time and money if none of the schools that interest you require the test.

Part of the expense of applying to graduate school is the cost of sending test scores. One possible way to reduce costs is to make copies of the test results sent to you and mail them with your application. Any school that is interested in you will request that you have the scores “officially” sent to them. Any school not interested will not need your official scores, and you will have saved the expense of having them forwarded.

Two words of caution must accompany this possibility. First, only do this if you send in your application

early. Unless you check with a graduate program before the application deadline to make sure that this procedure will not exclude you as an applicant, you should not send copies. Second, some students send copies of test scores after altering the original document, for example, whiting out poor scores or past scores, putting scores in different columns, and even falsifying scores. *You must never resort to these practices!* These should immediately invalidate your application, and any school that accepts you will need official copies sent anyway.

Finally, low scores on entrance exams do not automatically preclude you from applying to clinical or counseling psychology graduate programs. Rather, low scores mean you will apply to programs that do not emphasize test scores or that accept scores in your range. You can partially compensate in other areas to help offset weak GRE scores. As with each admission criterion, entrance examinations are only one part of the overall picture of a candidate. The best anyone can do is to make his or her application as attractive as possible.

Extracurricular Activities

An applicant's extracurricular pursuits are accorded less weight than GPAs, GRE scores, research competency, and clinical experience. The research reviewed earlier in this chapter clearly bears this point out. However, extracurricular activities, such as Psi Chi membership and campus involvement, are still considered in evaluating the "total person" of the applicant.

The admission implications are thus proscriptive and prescriptive. Strictly in terms of enhancing your candidacy (not in terms of other goals, such as life satisfaction), you should favor good grades and research experience over extracurricular activities. Involvement in a dozen student organizations will not compensate for meager grades and research; doctoral programs will not accept you because you coached youth soccer. When confronted with time conflicts, recall that admissions committees place a premium on variables other than intense campus commitments.

Having stated the obvious but unpleasant facts, we would also urge you to routinely engage in *some* campus and community pursuits. The reasoning here is that clinical and counseling psychology programs seek well-rounded individuals with diverse interests. The "egghead" or "Mr. Peabody" image is to be avoided in the practice of psychology, where your interpersonal skills are as critical as your scientific preparation. Moderate involvement can also better acquaint you with faculty members, who may serve as sources of recom-

mendations, and with the discipline of psychology itself. You can create professional opportunities by simply being involved in departmental activities. "Familiar faces" are frequently given first shots at clinical or research opportunities.

Applicants frequently learn too late that active involvement outside of the classroom is an indispensable education in and of itself. Consider the following student qualities contained in many letter of recommendation forms:

- Academic performance
- Organizational skills
- Interest/enthusiasm
- Interpersonal skills
- Emotional stability
- Communication skills
- Originality/resourcefulness
- Social judgment
- Responsibility/dependability
- Stress tolerance

Most of these dimensions refer to faculty–student interactions *outside* of the classroom, not to your course grades. Many a bright student has sabotaged his or her educational experience, recommendation letters, and career goal by not becoming involved outside of the classroom.

In your extracurricular activities, try to exhibit the chief personality trait which, interacting with intelligence, relates most to vocational success—namely, conscientiousness (Jensen, 1998). Be responsible, dependable, organized, and persistent. This trait applies to every kind of educational and job success. What's more, you want colleagues and friends to document in their letters of recommendation that you are extraordinarily conscientious.

Four specific suggestions come to mind regarding the type of extracurricular activities to pursue. First, join departmental student organizations, such as the Psychology Club, Psi Chi, and the American Psychological Society's Student Caucus. Second, we heartily recommend that you join the American Psychological Association (APA) and/or the American Psychological Society (APS) as a student affiliate. Your APA affiliation brings with it monthly issues of the *American Psychologist*, the flagship journal, and the *APA Monitor*, the association's newspaper. Similarly, APS membership includes subscriptions to the monthly journal *Psychological Science* and the *APS Observer*. Student membership in professional associations reflects favorably on your commitment to the discipline, and this affiliation should be recorded on your curriculum vitae. Your psychology

advisor might have applications for student affiliation in his or her office; if not, go online to www.apa.org/membership/forstudents.html and www.psychologicalscience.org/join/.

Third, additional campus and community commitments should be guided by your interests. But those associated with human services, social causes, and artistic endeavors seem to be differentially rewarded. These will obviously vary with the locale; examples include Hand-in-Hand, campus ministries, course tutoring, peer advising, homeless shelters, women's centers, BACHUSS, SADD, theater productions, creative writing, Amnesty International, and the like.

A fourth and invaluable extracurricular experience is to attend a regional or national psychology convention. The benefits are many: socializing you into the profession; learning about current research; discovering how students and professors present research; meeting and hearing nationally known psychologists; adding to your growing professional network; attending and perhaps participating in sessions designed for prospective graduate students (e.g., the Psi Chi sessions and workshops); experiencing the intellectual stimulation; and enjoying the interpersonal camaraderie of fellow students and psychologists (Lubin, 1993; Tryon, 1985). For all these reasons, we have never—and we mean *never*—heard a single graduate school applicant express disappointment about attending his or her first psychology convention.

The challenge for most prospective psychologists is to locate and afford travel to one of the regional or national psychology conferences. To locate upcoming conferences in your area, ask your psychology professors, consult the lists regularly published in *Eye on Psi Chi* and *American Psychologist*, and keep an eye open for announcements and posters on departmental bulletin boards. “Convention season” in psychology is from March to May, when the regional psychological associations hold their annual conventions. These include the Eastern Psychological Association, Midwestern Psychological Association, Rocky Mountain Psychological Association, Western Psychological Association, and

Southeastern Psychological Association. The national conventions of APA and APS are annually held in the late spring and summer months. To afford the travel and lodging, consider organizing a convention trip with your fellow students, requesting information on special hotel and registration rates for students, volunteering as a convention assistant, and holding fund-raisers with psychology student organizations to offset your expenses. By hook or crook, definitely plan on expanding your extracurricular horizons by attending a psychology convention.

Extracurricular activities should reflect your active and passionate pursuit of excellence. This is, after all, your chosen profession, your career, your future. Join honor societies, compete for awards, pursue honors, and consider applications for Truman, Rhodes, and Fulbright scholarships. You should be actively investigating undergraduate grants for your research, such as those administered nationally by Psi Chi or those awarded locally in your university. Passivity doesn't cut it in graduate school (or life).

Finally, as part of your preparation, discuss your graduate plans with those people who will be affected by those plans, such as partner, spouse, parents, children, and close friends. The sooner you start discussing your plans, the better. You may move hundreds of miles away and will probably be working 60 hours a week as a graduate student. Your absence—psychological and physical—will likely impact other people close to you. Begin the discussions now, not after you apply (Megargee, 2001).

In this chapter, we reviewed six admission criteria—course work, faculty mentoring, clinical experience, research skills, entrance examinations, and extracurricular activities—and suggested ways to improve in these areas. The material covered in this chapter is concerned with how you as the applicant can improve your credentials or marketability. But the application process goes both ways. In addition to selling yourself, you are also a consumer, evaluating the programs and deciding which ones are for you. The next two chapters help you evaluate characteristics of graduate programs.

CHAPTER 3

GETTING STARTED

Up to this point, we have focused on what you can do to enhance your credentials before beginning the application process. At some point, you must take realistic stock and evaluate where you stand as an applicant. Maybe you have taken your GREs. Perhaps you have signed up for some advanced psychology courses and have a satisfactory GPA. You have been supervised in a clinical setting and have begun research. You have reviewed your credentials and found that you have many strengths but also some weaknesses. You either shore up the deficient areas or make a decision to go ahead with what you have and hope to sell it well. In other words, you are ready to get started with the application process.

Process is an appropriate word to describe the endeavor that you are about to begin. The way you approach this task will greatly influence your chances of gaining admission. Sure, you can simply complete an application and passively wait for an interview. And this may work if your credentials are extremely strong. But for most individuals, an informed approach to the process can make all the difference!

Prospective graduate students frequently become nervous about the application process for several reasons. Perhaps the following remarks sound familiar: “Well, I have good recommendations and a 3.3 GPA, but my GREs are low”; “I have good GREs and spent a year working on a suicide hot line, but I don’t have a lot of research experience”; “Although my credentials are excellent, all the schools that I applied to only accept 10 out of 300 applicants.” Whichever of these situations applies, simply submitting an application minimizes your chances of acceptance. You can do a great deal to increase your admission probabilities and

to decrease your anxiety as you compare yourself to exaggerated standards.

Common Misconceptions

We would like to begin by dispelling three common misconceptions about clinical and counseling psychology programs. The first misconception: there is a direct correlation between a university’s undergraduate reputation and the status of its psychology graduate programs. In fact, there is no such correlation. Many of the best undergraduate institutions—Brown, Princeton, and the elite liberal arts colleges, for example—do not even offer graduate studies in clinical or counseling psychology.

A second misconception is that you should apply to a graduate psychology program on the basis of that institution’s sports performance. We have met a number of students who have used this selection criterion with unfortunate consequences. Please do not allow your application decisions to rest on whether a university has an excellent football team or whether their basketball team made it to the Final Four of the NCAA tournament! Do not scoff at the reality of this practice; careful research has demonstrated that winning a national championship in a visible college sport consistently translates into increased applications to the winning institution (Toma & Cross, 1998).

A third common misconception is that there is an authoritative list of the finest graduate programs in clinical psychology. In reality, unlike business or law schools, there is no definitive ranking of the “best” psychology graduate programs. The quality of a program depends on what *you* are looking to get out of it.

The best school for someone seeking to become a psychologist conducting psychoanalytic psychotherapy in private practice is probably not going to be the program of choice for someone who has set his or her heart on becoming a psychophysiological researcher at a medical school. Each person could attend the “best” school for psychology in his or her area.

What we want to do is to shift the burden from you trying to meet a school’s admissions demands to you finding a school that meets *your* needs. Graduate schools are looking for students with direction and passion. This does not mean you have made an irrevocable commitment to an area of research or type of clinical work. It means that you have an idea of the professional work you would like to do and toward which theoretical orientation(s) you lean.

You are selecting an institution based on your belief that it will mold you in the direction *you* have chosen. Graduate programs will look for this attitude in your statement of purpose. During your interviews, you will be asked about which professors you want to work with and what thoughts you have about their research projects. Even more likely, you will be directly asked, “Why are you applying here instead of someplace else?” By identifying your graduate training goals, you will impress interviewers at your selected programs with your direction and passion.

Acceptance Rates

The most pervasive myth about doctoral psychology programs is that “hardly anyone gets in—only 10%.” Like most myths, this one does have a grain of truth. The average acceptance rate for *all* APA-accredited doctoral programs in clinical and counseling psychology is, in fact, 10% (Norcross et al., 2004; Turkson & Norcross, 1996). But in a very real way, the 10% figure is misleading and inaccurate on many counts.

Let’s begin our foray into acceptance rates by defining the term. “Acceptance rate” refers to the percentage of applicants accepted for admission into a single

graduate program, *not* the percentage of the entire applicant pool to all programs accepted for admission in a given year. The clinical doctoral program at University X may accept only 15 of 150 applicants (10%), but many of the applicants to University X not accepted there will be admitted elsewhere. Although only 10% of the applicants to a single doctoral program might be accepted into that *particular* program, about half of the entire applicant pool will be accepted into *some* clinical or counseling doctoral program. And half a chance isn’t that bad.

Note, too, that the 10% figure refers only to acceptance rates of APA-accredited doctoral programs in clinical or counseling psychology. The acceptance rates at *non*-APA-accredited doctoral programs are double that for APA-accredited programs: 20% for nonaccredited Ph.D. programs and 60% for nonaccredited Psy.D. programs (Norcross et al., 2005). The acceptance rates for master’s programs are also much higher than those for doctoral programs. The median acceptance rates for master’s programs are 49% in clinical psychology and 67% in counseling psychology (Norcross et al., 2005).

Most importantly, the acceptance rates vary tremendously from doctoral program to doctoral program as a function of the research–practice continuum. As shown in the Reports on Individual programs following Chapter 7, acceptance rates at research-oriented clinical Ph.D. programs, such as Yale and Duke, are as low as 3%. The acceptance rates at freestanding Psy.D. programs are often over 50%.

Table 3-1 summarizes the findings of several of our studies on acceptance rates to APA-accredited clinical psychology programs as a function of the type of program. All types of program average between 150 and 200 applications per year. Research-oriented Ph.D. programs accept only 6% of their applicants, on average, whereas the corresponding figures are 10% for equal-emphasis Ph.D. and 12% for practice-oriented Ph.D. programs. University-based Psy.D. programs accept 41% of their applicants on average, and freestanding Psy.D. programs accept 50%. That’s quite a

TABLE 3-1. Average Acceptance Rates for APA-Accredited Clinical Psychology Programs

	Freestanding Psy.D.	University- based Psy.D.	Practice- oriented Ph.D.	Equal- emphasis Ph.D.	Research- oriented Ph.D.
Number of applications	186	164	154	170	189
Number of acceptances	93	53	18	21	13
Acceptance rate	50%	41%	10%	10%	6%

Note. Data from Norcross, Castle, Sayette, & Mayne (2004); Norcross & Oliver (2005); and Norcross, Sayette, Mayne, Karg, & Turkson (1998).

range of acceptance rates—6% to 50%—all in APA-accredited doctoral programs in clinical psychology. And that's why we urge caution in tossing around the 10% acceptance rate.

Costs of Applying

Applying to graduate school is an expensive proposition—not only in terms of your valuable time but also in terms of hard money. Application fees average \$50 per doctoral program and \$35 per master's program (Norcross et al., 2004). Only 7% of graduate schools let you apply for free (Norcross et al., 1996). The fee (in 2008) for the GRE General Test is \$140, with a \$50 rescheduling fee, and the Psychology Subject Test costs another \$130. ETS will electronically transmit your GRE scores free of charge to four graduate schools that you designate in advance; however, each additional score report costs \$15 per recipient. Throw in the costs of transcripts, photocopying, postage, and the innumerable telephone calls, and the investment can become quite costly. All told, we estimate that applying to 12 schools will run about \$1,000 (and that number can increase depending on the cost of traveling to multiple interviews).

Several students challenged our estimate that the graduate application process would cost them \$1,000. They protested that our figure was way too high. So, we encouraged them, like good psychologists, to collect data as they proceeded through the process. Here is the breakdown of costs from one typical applicant (Dennis Reidy) who applied to 13 doctoral programs in 2003:

Taking the GRE tests	\$235
Sending GRE scores	\$180
Requesting transcripts	\$106
Application fees	\$455
Mailing applications	\$78

That's a total of \$1,054 in 2003 dollars, before he traveled to three programs for personal interviews. He now believes the \$1,000 estimate is on target.

The good news is that graduate schools are sensitive to financial hardship and that, for many students, the burdensome short-term cost is an excellent long-term investment. Schools build into the application process allowances for students who cannot afford the expense. Even the GRE has a fee waiver for students in dire financial circumstances. One of us was supporting himself on a meager social service salary and was able to keep the cost down to a few hundred dollars.

Moreover, think of the application cost as an investment in yourself and in your career. If you gain

acceptance into a doctoral program with tuition remission and a stipend for 4 years, your \$1,000 can be converted into a \$60,000 to \$100,000 payback over the course of your graduate school career.

The bottom line in getting started is this: anticipate the costs of applying to graduate school and plan to have the funds (or waivers) available before you begin completing applications.

Starting Early

Let's discuss timing up front. Applications are typically due from the middle week of December to the second week in February. The sooner you begin preparing, the more advantage you can take of an aggressive, early start to the admission process. As mentioned in earlier chapters and in the Time Line (Appendix A), for undergraduates, ideally this would take place the summer of your junior year. For others, this would best occur the summer of the year before you actually plan to attend graduate school. If it is past that point, you are not too late. You can follow the steps we will describe as late as October of your application year.

Applying to graduate school is like planning a political campaign or a military operation. It is impossible to begin too soon or to be too thorough (Megargee, 1990). Recognize this about the application process and *start almost a year before you expect to begin graduate school*. Completing the application materials in the fall semester alone will consume as much time as a 3-credit course!

Virtually all APA-accredited clinical and counseling psychology programs only accept matriculating students for their fall semesters. As mentioned earlier, in order to be accepted for the fall of 2008, most doctoral programs have application deadlines anywhere from mid-December 2007 to February 2008. The typical deadline for doctoral programs in clinical and counseling psychology is January 15 (Norcross et al., 1996). Accordingly, you will need college transcripts, test scores, and letters of recommendation, not to mention time to prepare yourself before the application deadline. You should expect to begin no later than the fall of the year before you intend to attend graduate school. If you are willing to put in the maximum effort to get into a program, expect to begin the spring before that.

The APA has accredited 232 active doctoral programs in clinical psychology, 67 active doctoral programs in counseling psychology, and 10 active doctoral programs in combined psychology throughout the United States and Canada. Toss in nonaccredited doctoral programs and the mass of master's programs in

clinical and counseling psychology and you wind up with roughly 600 graduate programs. How does one proceed in whittling this list to a manageable number?

To begin the selection process, ask yourself, “What kind of research or clinical work do I like? Is there some article I’ve read or presentation I’ve heard that really interests me?” There is a certain advantage if you have already conducted research or completed clinical experience as an undergraduate and know something about the field. And if you have completed an honors project or thesis, you may even have a certain amount of expertise. Or you may decide you would like to try something different now.

For example, suppose you have an interest in suicidology, but you are not sure that you want to do research in that area or exactly what that research would entail. Or you think you’d like to specialize in suicide prevention, but you’re not sure how psychologists deal with the issue clinically. There are several approaches you can take to familiarize yourself with this area. Ask one of your professors for some readings. Check out a current textbook in the area. Go to a suicide prevention or crisis center and read through their literature. Surf the web. Then decide whether you like the questions being asked and the methods used to answer them.

In summary, have an idea of the field(s) in which you would like to work, either the ones with which you are already familiar or those you are willing to research. Familiarize yourself with the questions being asked and the techniques being used to answer them. Use as many sources as possible to gain information to help you narrow down your interests and educate yourself about them.

In addition to the resources in this book, a number of Internet sites will help you at this stage of the process. You can familiarize yourself with psychology graduate programs in the United States and Canada by accessing a large number of Web sites. Our favorites are:

- www.apa.org/students/
(APA’s site for students includes a list of accredited programs, relevant articles, and other useful materials)
- www.socialpsychology.org/clinical.htm
(useful page features hyperlinks to 185 departments in the United States offering a Ph.D. in psychology)
- www.clas.ufl.edu/CLAS/american-universities.html#A
(links for a plethora of American universities)
- www.psychwww.com/resource/deptlist.htm
(an impressive listing of over 1,000 psychology department Web sites)

- www.petersons.com/gradchannel/
(brief descriptions of programs offering graduate training in clinical and counseling psychology)
- www.gradschools.com/listings/menus/psych_clinic_menu.html and
- www.gradschools.com/listings/menus/psych_cmt_menu.html
(for searching clinical and counseling psychology programs, respectively, with the added ability to search by geographic region)
- www.jobweb.org/catapult/gguides.htm
(links to sites about applying to and financing graduate school, and about making the transition to graduate school)

All these—and other—sites enable you to take a virtual tour of graduate programs in professional psychology. Develop an early feel for various departments and begin to sharpen your interests.

Next is the task of putting this knowledge to use. You have interests, and you now need to learn which graduate programs can provide these research or clinical opportunities. Though knowing how much you enjoy research or clinical work may not take a lot of reflection, deciding whether to select a research-oriented, a practice-oriented, or an equal-emphasis program is a question with far-reaching ramifications. This question tends to divide people into three groups: the research oriented (scientists); the practice oriented (practitioners); and the dually committed (scientist–practitioners). The following sections are designed to lead each group in its appropriate direction. These groups tend to follow three rather distinctive career paths in the profession of clinical and counseling psychology (Bernstein & Kerr, 1993; Conway, 1988).

We have repeatedly surveyed the APA-accredited clinical and counseling psychology programs over the past 20 years. Their responses to our questionnaires (e.g., Farry et al., 1995; Mayne et al., 1994; Norcross et al., 1998; Norcross et al., 2004; Norcross, 2005; Oliver et al., 2005; Sayette & Mayne, 1990; Sayette et al., 1999; Turkson & Norcross, 1996) can serve as the basis for your initial selection of graduate programs. By using their responses, we will lead you through an exercise that will provide you with a list that ranks schools by how closely they meet your expectations and interests.

As you review the Reports on Individual Programs, bear in mind that the listings are alphabetical, not geographical. We list the programs alphabetically as they are on the APA (2007; www.apa.org/ed/accreditation/doctoral.html) materials, but sometimes the order is counterintuitive. For example, the University of Arkansas is not listed under “U,” but between Arizona State

University and Auburn University. Thus, you might need to look under two letters to identify specific programs of interest.

For the Research Oriented and Dually Committed

This section gives guidance to those applicants who are centrally focused on research and those with equal practice and research interest. We group these two sorts of applicants together because their initial selection of schools will place more emphasis on the research available at each program and secondarily on the clinical work available. This will allow people with an equal emphasis to cast their nets as widely and as efficiently as possible.

One question we asked of each program in our studies was “In which areas of research are your faculty presently working? Do they presently have a grant in that area?” Appendix E lists all the research areas provided by the graduate programs along with the number of faculty interested in these areas and an indication of whether they have a grant. This information provides you with an index of how intensively each program is pursuing this area of research. Thus, a program with three faculty members researching autism that has a grant supporting their work indicates serious involvement on the part of that faculty.

Find your areas of interest in the appendix; underneath them you will see a list of programs doing that type of research. In addition, you will know the number of professors with whom you could potentially work and whether there is grant money supporting this research.

A few words of caution in interpreting this appendix: not all programs were equally comprehensive in completing the survey. Some schools only included core faculty, whereas others included adjunct faculty. This accounts for what seems to be an overrepresentation of some institutions on the list. Also, some schools had research interests combining two different areas and listed a single grant under both.

Appendix B, entitled “Worksheet for Choosing Programs,” is used to select programs to which you will eventually apply. Begin by writing your research interest in the far left-hand column. In the next column, marked “Schools,” write the list of schools under that heading in Appendix B. In columns 3 and 4, write down the number of faculty in that area at each school and whether they are grant funded. In addition, some schools merely indicated the presence of grant funding and not the total number of grants. Thus, a “1” in the “Grants” column indicated *at least* one grant. A “0”

indicates no grants, and numbers greater than 1 indicate multiple grants.

There are two worksheets provided in Appendix B, allowing you to explore different areas of interest. If you have more than two main areas of interest, unless they are closely related, you may find the list becoming exceptionally long. In that case, you may wish either to narrow your areas of interest or to complete this worksheet with the aid of a trusted professor who can help you pare down the list of schools to a manageable number. If you have more than one area of interest, put stars next to the programs that have faculty doing research in both of them.

If your interests lean toward research, then you want to pick a program highly regarded in the area of research you would like to pursue. How do you evaluate the clinical and counseling psychology programs on your list in terms of research? Refer to Table 3-2, which is adapted from the results of the *Social Sciences Citation Index* (SSCI) and *Science Citation Index* (SCI) databases. More than 225 psychology journals from 1998 to 2002 were analyzed to determine the institutions with the most citations. The goal was to identify the institutions employing faculty members who authored the most frequently referenced articles in psychology journals. The table lists, in rank order, the frequency with which articles written by members of a particular institution are cited. Only those institutions with an APA-accredited clinical or counseling program are included on this list. It should also be noted that the list only includes those institutions that produced at least 100 papers over the 5-year span; as a result, several smaller institutions with clinical or counseling psychology programs did not make the list.

Using Table 3-2, write the citation ranking for each school in column 5, labeled “Citation Rank.” Be advised that this ranking reflects the psychology department in general, not just the clinical or counseling program. In fact, about 20% of the institutions on the original list of 75 were deleted because they do not have clinical or counseling psychology programs. Inclusion of these nonclinical influences will affect the ranking of the schools you have selected. Still, this will provide you with a rough idea of where each school stands in terms of its research. Our position is that a school that makes it onto this list is probably a strong research-oriented institution. If the school fails to appear on the table, then it may or may not emphasize psychological research. Recognize that only about 20% of APA-accredited programs appear on this list.

Table 3-2 also contains a column headed “Faculty Production Rank.” This number represents the rank ordering of APA-accredited clinical psychology programs

TABLE 3-2. Institutions with Most Citations, Most Papers, and Strongest Clinical Faculty Production in Psychology

Citation rank	Institution ^a	Citations	Papers	Faculty production rank
2	University of Michigan	3,999	816	3
4	University of Minnesota	3,231	741	4
5	University of California–Los Angeles	3,211	867	9
6	University of Wisconsin–Madison	2,901	652	5.5
7	University of Illinois at Urbana–Champaign	2,856	690	1
8	Yale University	2,816	585	18.5
9	University of Pittsburgh	2,555	542	10
10	University of Pennsylvania	2,514	582	29
11	Indiana University	2,387	667	7.5
12	University of Washington	2,362	619	13.5
13	Duke University	2,344	453	18.5
14	Pennsylvania State University	2,302	766	11.5

continued

on the basis of the total number of clinical faculty members trained by that program (Ilardi, Rodriguez-Hanley, Roberts, & Seigel, 2000). Any program that received a ranking in the top 60 has an established track record of producing clinical psychologists who, themselves, later assumed clinical psychology faculty positions. Remember that these lists heavily favor older programs and that no single measure can ever capture the excellence of graduate education. And, again, only

about 20% of APA-accredited clinical programs appear on the list. Still, the list does direct students interested in academic careers to programs that have historically excelled in this domain.

As mentioned, any APA-accredited program must provide both clinical and research training. Thus, it is important also to evaluate the clinical opportunities available. As already mentioned, Psy.D. programs by definition emphasize practice and train students to be

^aInstitutions without APA-accredited programs in clinical or counseling psychology have been omitted from this table.

practitioners. Although it is possible to obtain research training at a Psy.D. program, this is not the primary emphasis of such programs. Consequently, a student with a clear research orientation should probably choose a Ph.D. program. For the research oriented, this column will be used to cross schools off their application list. Look up each school on your list in the reports on individual programs. If any of these schools offer only Psy.D. programs (see Table 1-4), you can delete that program.

The first column under the “Clinical” section of Appendix B is marked “Orientation.” Under each program listed in our reports on individual programs, you will see a list of five theoretical orientations:

- Psychodynamic/psychoanalytic
- Radical behavioral/applied behavioral analysis
- Systems/family systems
- Humanistic/existential
- Cognitive/cognitive-behavioral

If you are clearly committed to (or strongly leaning toward) one of these orientations, then it is important that some faculty share that orientation with you. Check each program on your list and see if a suitable percentage of the faculty shares your orientation. If so, mark the "Orientation" column with a "+" sign. If not, mark it with a "-" sign.

If you are unsure of an orientation, or see yourself as integrative or eclectic, then be sure there is a wide variety of faculty orientations. If there is representation among the faculty in four or more of these orientations, that's a good sign. If the total you get when adding up all the percentages in the different orientations is greater than 100%, this is also a plus. It means some (or most) of the faculty bridge orientations and are integrative themselves. In other words, professors are listed under more than one category. In either case, mark the "Orientation" column with a "+" sign. If the faculty are of one or two orientations and without overlap, then mark this column with a "-" sign.

The second column under "Clinical" is "Res/Clin." Turn to Appendix F, "Specialty Clinics and Practica Sites." This is a list of specialty clinics and practica available at different programs. Specialty clinics focus on a specific clientele, such as depressed or eating-disordered clients. Practica are placements where students will conduct clinical work in their second, third, and/or fourth years of study. Some practica also specialize in a certain clientele. If you have a research interest in a particular population, it is important that the population be available for you to study and that you have the chance to work with that population clinically. For this reason, it is a great help for a researcher to have a specialty clinic or practicum in his or her area.

Look up your research area in Appendix F. If any of the programs on your list in Appendix B has a clinic or practicum in that area, mark the "Res/Clin" column with a plus. You can do likewise using Appendix G Concentrations and Specialty Tracks. Programs offering a formal track or concentration in your area of interest deserve a plus as well.

Again, this is just one indicator and must be kept in perspective. Most programs will have their own psychological training clinic, where a wide range of clinical populations may be seen or made available for research. Additionally, a faculty member may have a research population readily available in the community. And last, a few programs did not include practica placements off campus in the community, thus underrepresenting their practica opportunities. Still, being informed about a clinic or practicum specializing in your population of interest is certainly an advantage in selecting potential graduate programs.

The third column under the "Clinical" section is marked "Rank." Here, we refer to a program's production of students who go on to distinguished careers as clinicians, as measured by becoming ABPP Diplomates and by election as Fellows in APA's Division of Clinical Psychology or Division of Counseling Psychology. The "ABPP" refers to diplomate status awarded by the American Board of Professional Psychology (www.abpp.org), which certifies excellence in 13 fields of psychology, including clinical psychology and counseling psychology. Applicants for ABPP must have at least 5 years of postdoctoral experience, submit examples of their clinical work, and pass an oral examination. The entrance requirements and performance standards are more rigorous than those involved in licensure and represent excellence in applied psychology. Fellowship in APA is based on evidence of unusual and outstanding performance in psychology.

One study (Robyak & Goodyear, 1984) investigated the graduate school origins of ABPP Diplomates and APA Fellows in clinical and counseling psychology. Although older and larger doctoral programs are obviously favored in such a historical study, the results nonetheless give some indication of institutional reputation and their graduates' accomplishments. Table 3-3 presents the top 25 institutional origins of clinical psychology diplomates and fellows as well as the top 12 institutional origins of counseling psychology diplomates and fellows. Clinical psychology diplomates graduated from 153 different universities; fellows from 92. Counseling psychology diplomates graduated from 55 universities; fellows from 46.

If a school is listed in Table 3-3, place a "+" in the "Rank" column in the "Clinical" section. Though many schools not listed on this table provide fine clinical training, this listing indicates that the program is outstanding in terms of its track record for producing excellent professional psychologists.

Finally, there is a column in Appendix B marked "Self-Rating." The first question we asked each program to answer was, "On a 7-point scale, how research or practice oriented would you rate your program?" (1 = practice emphasis; 4 = equal emphasis; and 7 = research emphasis). You will find the school's rating of itself under each individual listing in the reports on individual programs sections. Mark this number under the "Self-Rating" column.

What you now have before you is a list of programs that offer research in your area of interest. You also have the number of faculty in the area that you might work with and whether they presently have grant funding. Finally, you have an approximate rank of that school's research standing.

Note. From Robyak & Goodyear (1984). © 1984 American Psychological Association. Reprinted by permission.

In clinical terms, you have some sense of whether that school will conform to your theoretical orientation, whether it has clinical training or a formal track in your area of interest, how it ranks in terms of producing outstanding clinicians, and whether it rates itself as emphasizing practice or research.

Given the information before you, you may already want to begin crossing programs off your list. If you're research oriented, and the program is a Psy.D. program or rates itself a 1, 2, or 3 (meaning it is practice oriented), you may choose to delete that school. Alternatively, if your interests reflect equal research and clinical emphasis and you lean toward a psychodynamic orientation, you may want to cross off a school that rates itself as a 7 (very research oriented) or whose faculty is 100% behavioral.

Your revised list of schools can probably satisfy your research and clinical interests. In addition, you have the start of a ranking system, which at this point gives you a rough idea of how well each school conforms to your interests and needs. Unfortunately, this provides you with only half of the information you need to begin writing to schools. The second part of this process asks, "How close do you come to the standards they specify?" This is covered in a later section entitled "Assessing Program Criteria."

For the Practice Oriented

This section gives guidance to those applicants who are centrally focused on psychological practice. These applicants will want to begin to choose their programs based on their theoretical orientation and the availability of clinical opportunities.

Begin by turning to Table 1-4, which lists all the APA-accredited Psy.D. programs. With this list, turn to Appendix B, "Worksheet for Choosing Programs." Under the column marked "School," write the names of the programs found in Table 1-4.

In addition to these programs, you may have a specific population in mind that you are especially eager to work with. Perhaps you already have a sense that you want to work specifically with patients suffering from, say, anxiety disorders. In this case, turn to Appendix F. This appendix, "Specialty Clinics and Practica Sites," lists specialty clinics or practica areas available at different programs. Specialty clinics focus on specific clientele, such as depressed or eating-disordered clients. As mentioned in the previous section, practica are placements where a student will conduct clinical work in his or her second, third, and/or fourth year of study, and some practica also specialize in treating a certain clientele. For a practice-

oriented student, it would be especially desirable to be in a program with a specialty clinic in his or her particular area of treatment interest. Therefore, write down the names of programs with specialty clinics or practica in your area of interest on your list in Appendix B.

Do likewise for programs that offer a formal track or concentration in your area of interest. This information can be found in Appendix G, Concentrations and Specialty Tracks.

A word of caution is in order. Most programs will have their own psychology training clinic where a wide range of clinical populations may be seen or made available for research. Practica may also be available in a wide range of settings in the community, providing fertile ground for a rich clinical experience. Still, a clinic or practicum specializing in a population that is of special interest to you is a definite plus and an additional piece of information on which to base your decision. If a program both offers a Psy.D. and has a specialty clinic in your area, put a star next to it.

The next important column for the practice oriented applicant is marked "Orientation." In the Reports on Individual Programs, you will find each school listed, along with information pertaining to its program. Among that information, you will see a list of five theoretical orientations, followed by the percentage of the faculty that subscribes to that orientation:

- Psychodynamic/psychoanalytic
- Radical behavioral/applied behavioral analysis
- Systems/family systems
- Humanistic/existential
- Cognitive/cognitive-behavioral

If you are clearly committed to (or strongly leaning toward) one of these orientations, then it is important that some portion of the faculty share that orientation with you. Check each program on your list and determine if a suitable percentage of the faculty shares your orientation. If so, mark the "Orientation" column with a "+" sign; if not, mark it with a "-" sign.

If you are unsure of your orientation or see yourself as integrative or eclectic, then be sure there is a wide variety of faculty orientations. If there is representation among the faculty in four of these orientations, that's a good sign. If the total you obtain after adding up all the percentages in the different areas is greater than 100%, this is also advantageous. It means some (or most) of the faculty bridge orientations and are integrative themselves. In either case, mark the "Orientation" column with a "+" sign. If you're integrative and the faculty are of one or two orientations and do not overlap, then mark this column with a "-" sign.

The next column is marked “Res/Clin.” As we mentioned previously, even if you are looking for a practice oriented program, you still will have to do research: a lengthy professional paper or a clinical dissertation at the very least! Consequently, it is important that someone in your program is conducting research in an area that interests you. With this in mind, look through Appendix E and locate area(s) of research that you find interesting. Under each area, you will find a list of schools that have researchers in that field. If any of the schools on your list in Appendix B is listed here, place a “+” in the column marked “Res/Clin.”

The third column under “Clinical” is marked “Rank.” Here, we refer to a program’s production of students who go on to distinguished careers as clinicians, as imperfectly measured by their becoming ABPP Diplomates and by their election as Fellows in APA’s Division of Clinical Psychology and Division of Counseling Psychology. The “ABPP” refers to diplomate status awarded by the American Board of Professional Psychology (www.abpp.org), which certifies excellence in 13 fields of psychology, including clinical psychology and counseling psychology. Applicants for ABPP must have at least 5 years of postdoctoral experience, submit examples of their clinical work, and pass an oral examination. The entrance requirements and performance standards are more rigorous than those involved in licensing and represent excellence in applied psychology. The APA Fellowship is based on evidence of unusual and outstanding performance.

One study (Robyak & Goodyear, 1984) investigated the graduate school origins of ABPP Diplomates and APA Fellows in clinical and counseling psychology. Although older and larger doctoral programs are obviously favored in such a historical study, the results nonetheless give some indication of institutional reputation and their graduates’ accomplishments. Table 3-3 presents the top 25 institutional origins of these diplomates and fellows as well as the top 12 institutional origins of counseling psychology diplomates and fellows. Because this list indicates programs that have historically produced outstanding clinicians, place a “+” in this column for any program included in Table 3-3. Though many schools not listed in this table offer fine clinical training, the list provides an indication of the Ph.D. programs (Psy.D. programs are too new to be listed) that are likely to offer the sort of clinical training you seek.

Finally, there is a column in Appendix B marked “Self-Rating.” In the reports on individual programs you will find each school’s rating of itself (1 = practice emphasis; 4 = equal emphasis; and 7 = research emphasis). Mark this number under the “Self-Rating” col-

umn. Though Psy.D. programs are practice oriented by definition, they vary on how much research they expect their students to conduct. Thus, their ratings will allow you to guide your expectations of what each program will expect of you. This self-rating will also help you avoid a Ph.D. program with a specialty clinic in your area that is clearly research oriented.

What you now have before you is a list of programs that are practice oriented and/or that offer a specialty clinic or formal track in your area of interest. You have some sense of whether these schools will conform to your theoretical orientation and whether they have ongoing research in your area of clinical interest. You also have their self-rating of the program’s emphasis on practice or research.

Given the information on your worksheet, you may already want to begin crossing programs off your list. If you’re practice oriented and a Ph.D. program offers a specialty clinic in your area but rates itself with a 6 or 7 (very research oriented), you may choose to delete that school. Alternatively, if you’re very behaviorally oriented, you may want to cross off a school where 100% of the faculty is psychodynamic/psychoanalytic.

Your revised list of schools can provide you with practice oriented training and possibly special clinical training in your population of choice. In addition, you have the start of a ranking system that at this point gives you a rough idea of how well each school conforms to your interests and needs. Unfortunately, this only provides you with half the information you need to begin writing to schools. The second half of this process is related to how closely you come to the specified standards of these programs. This is covered in the “Assessing Program Criteria” section.

For the Racial/Ethnic Minority Applicant

Before continuing to the assessment of program criteria, it is important to discuss the special case of minority applications. “Minority” in this context refers to racial or ethnic background, although with women comprising 70% of all doctoral students in psychology (Pate, 2001), a few graduate student programs are starting to treat men as minority applicants. Ethnic minority students now account for 21% of master’s students in psychology and 27% of doctoral students in psychology (Norcross, Kohout, & Wicherski, 2005).

Nearly every APA-accredited program makes special efforts to recruit minority applicants (Munoz-Dunbar & Stanton, 1999; Rogers & Molina, 2006), recognizing the need in our society for well-trained minority professionals. Typical methods for recruiting underrepresented groups to clinical and counseling

psychology programs are offers of financial aid, the use of personal contacts, visits to other schools, use of APA's Minority Undergraduate Students of Excellence (MUSE) program, diversity courses, special events, reimbursements of application fees, and preferential screening (Rogers & Molina, 2006; Steinpreis et al., 1992). Programs often make an extra effort to review minority applications to ensure that qualified candidates are given appropriate consideration.

In fact, a study of Psy.D. programs revealed that 82% of them implemented formal minority admissions policies designed to improve racial representation (Young & VandeCreek, 1996). The study found that:

- 94% of the programs gave extra points on ratings of application materials to minority applicants;
- 69% of the programs waived or lowered GRE scores for minority applicants;
- 41% of the programs waived or lowered GPA cut-offs for minority applicants; and
- 21% of the programs interviewed all minority applicants, regardless of the quality of their application materials.

As a consequence, ethnic minorities in the applicant pool are significantly more likely than whites to receive offers of admission (Munoz-Dunbar & Stanton, 1999). Our guidance and the following worksheets in this *Insider's Guide* may thus not accurately reflect a minority applicant's enhanced chances of acceptance. We recommend that you carefully read program descriptions regarding their minority selection procedures and encourage you to apply to programs that are within reach of your credentials.

Several ethnic/racial minority students have written to us over the years and complained that they were neither actively recruited nor accepted for admission into the doctoral psychology programs to which they had applied. So let us be perfectly clear and honest: Most, but not all, doctoral programs have implemented policies (as reviewed above) to recruit and admit underrepresented racial/ethnic minority students. However, that does not mean that all programs will be knocking down your door to interview you. Nor does that mean that most programs will finance your interview. Nor does that mean acceptance is a certainty. Doctoral programs will evaluate all candidates on their GPAs, GREs, letters of recommendation, research experiences, and so on. A modest advantage is just that—an advantage, never a guarantee.

The APA is committed to ensuring that the practice of psychology—and the production of psychologists—is in the vanguard of addressing the needs of culturally

diverse populations. The APA's Commission on Ethnic Minority Recruitment, Retention, and Training in Psychology produces several valuable publications in this regard. Go to www.apa.org/pi/oema/careers/book3/page1.html to read APA's guidebook, *For College Students of Color Applying to Graduate & Professional Programs*. Also consult the Web site of *Project 1000*, a national program created to assist students of color applying to graduate school (mati.eas.asu.edu:8421/p1000).

Although the special consideration given minority applicants is advantageous, it also represents a special challenge. One well-qualified minority student we knew was advised by a university career counselor that he would have no problem getting into the school of his choice. He applied to several very competitive programs, and received acceptances and offers of financial aid across the board. Unfortunately, he skipped the process of matching his interests with the strengths of the program. After 1 year, he was looking to transfer to another program that had more faculty conducting research and psychotherapy in his areas of interest.

The moral of the story is: Don't let the potential advantage of being a minority candidate become a disadvantage. Just because you can get into a program doesn't mean that it is the best program for you. A rigorous approach to the application process is the best approach for everyone.

For the LGBT Applicant

Lesbian, gay, bisexual, and transgendered (LGBT) applicants to doctoral programs can face the same social and interpersonal hurdles as ethnic/racial minority applicants. There is, however, a key difference: There are limited federal protections for members of the LGBT community. This fact may lead lesbian, gay, bisexual, and transgendered students to question whether to disclose their sexual orientation ("come out") in the application process, or even to inquire about the atmosphere of inclusivity toward sexual minorities within a particular program. In this section, we review some research and advice on LGBT applicants' selection of graduate programs and present potential strategies for those who elect to come out during the application process.

Before turning to the specifics, let us emphasize this general point: The burden should not be placed on the potentially stigmatized applicant to disclose sexual orientation. Such a burden promotes silence and fear. Rather, each applicant should choose his/her own path, and program faculty should create an inclusive, welcoming atmosphere for all students. The APA accredi-

tation guidelines require doctoral programs to embrace diversity in their students.

Qualitative research (e.g., APA, 2006; Lark & Croteau, 1998; Rader, 2000) indicates that LGBT psychology students screen prospective graduate schools for their gay affirming (or at least, nonhomophobic) position. The typical criteria used for screening prospective programs are (Biaggio et al., 2003):

- Reports of other LGBT students
- Presence of faculty who are openly lesbian/gay or heterosexual allies
- Availability of specific training on LGBT issues and opportunity to work with LGBT clients
- Sensitivity to diversity issues on campus (including the presence of LGBT support and advocacy groups)
- Geographic location of the program (frequently avoiding programs in conservative rural areas)
- Size of the educational institution (larger public institutions being relatively more liberal)

In addition, we recommend that LGBT students look for climate indicators favorable to sexual diversity. Screen prospective programs by

- searching departmental and university homepages for the presence of an LGBT student union and faculty teaching and researching on sexuality
- looking for specific housing policies for LGBT couples (remember, though legally married in one state, another state may not recognize your gay marriage or civil union, and the university may not be legally bound to provide equal access to “married” housing).
- avoiding institutions that require a religious or doctrinal oath and that prohibit LGBT organizations on campus.
- seeking programs with curricula that explicitly integrate LGBT and other diversity issues.
- reviewing APA’s list of graduate faculty in psychology interested in lesbian and gay issues (available at www.apa.org/pi/lgbc/publications/lgburvey/grad_home.html).
- evaluating the university’s mission statement for a formal commitment to diversity of sexual orientation.
- determining if the institution has a coordinator (or office) for lesbian, gay, and bisexual concerns
- considering the state laws concerning equitable treatment of LGBT, such as civil unions, domestic partnership, adoption, health insurance for partners, and the like.

Homophobia and heterosexism continue to exist in the United States and, unfortunately, also in institutions of higher education. Although the situation has improved considerably in recent decades, some institutions remain “tolerant” as opposed to “affirming” of sexual diversity, whereas other institutions may favor an LGBT student to maintain or expand program diversity.

The question, then, is whether to come out during the application process. On one side, there is the risk of being rejected from a program where some discrimination persists. On the other side, there is the potential advantage of being a member of a minority group in a program that actively pursues diversity. In either case, the alternative to not coming out during the application process is to come out later, or to try to hide your sexual orientation for 4 to 6 years.

If and when to disclose sexual orientation in the admissions process is ultimately a personal decision, and it can occur at different stages in the process: in the application itself, during the interview, upon acceptance to the program, or upon the decision to attend the program. As part of your application, you can indicate your sexual orientation in your research interests (e.g., lesbian health), clinical experiences (e.g., working with gay youth), and/or extracurricular activities (e.g., member of the LGBT alliance on campus). More directly, you can incorporate your sexual identity into your personal statement, especially if it has bearing on your choice of clinical or research work, or your decision to pursue psychology as a career. If you do come out in your personal statement, be sure that this fact is integrated into the overall statement and not simply a dangling fact unconnected to the rest of what you’ve written.

Some applicants choose to come out during the interview process with a simple but straightforward statement: “As a gay man (or lesbian), it’s important to me to be in a gay-friendly environment. Would being gay be a concern in this program?” Though it would be a mistake to over-generalize, such questions are typically met with positive responses about program diversity and discussions of resources for LGBT students. If such questions are met otherwise, it serves as a key piece of information in your decision process.

Another strategy is to raise sexual orientation at the point at which an offer of admission is tendered. As discussed in subsequent chapters, once an offer is made, an applicant has some latitude in negotiating issues around admission, tuition remission, funding, and so on. This can be the time to indicate that having a gay-affirmative environment is one of the factors in your decision of which program to accept and to inquire about the atmosphere in that program. Still other

LGBT students elect not to disclose until they are actually matriculated in the program and have begun coursework.

Whatever path you decide to take, your sexual orientation should not be the defining issue of your application; your composite strengths as a potential doctoral student remain the center of your application. [For additional information, consult the *APAGS Resource Guide for LGBT Students in Psychology* (APA, 2006) and *Graduate Faculty in Psychology Interested in Lesbian, Gay, and Bisexual Issues* (at www.apa.org/pi/lgbc/publications/lgbsurvey/grad_home.html)].

For the Disabled Applicant

Organized psychology is increasingly aware that diversity extends beyond gender, ethnicity, and sexual orientation to all individual differences, including disability status. Applicants with disabilities confront many of the same prejudices as other minority populations, including obstacles to graduate applications and interviews. APA's *Resource Guide for Psychology Graduate Students with Disabilities* (www.apa.org/pi/cdip/resources/home.html) presents tips on applying to graduate school, requesting fair accommodations, and preparing for a successful experience. The guide also lists national resources on disability issues; our favorite is Ken Pope's website on accessibility in psychology graduate education and practice (at kpope.com).

When and how to disclose a disability is a complex and personal decision, a decision that you must make after sorting through the choices and perhaps discussing them with a knowledgeable mentor. There are eight different occasions during the admissions process when you might choose to disclose (Khubchandani, 2002):

- In your CV or application form
- When a prospective graduate school contacts you for an interview
- During the interview
- After the interview but before an offer
- After the offer but before an acceptance
- After you start the graduate program
- After a problem on the job
- Never (disclose)

There are pros and cons for each timing of disclosure, but ultimately your decision will be based on what you know about your own needs and what you have learned about the specific graduate program (Khubchandani, 2002). If and when you do disclose a disability, be straightforward and factual about it only

as it affects your specific job functions, as defined by the Americans with Disabilities Act. Specify the type of accommodation that you will require or the work restrictions that are involved. Don't dwell on your disability; rather, be enthusiastic about your skills and resources. Stress that your disability did not interfere with previous performance or attendance.

Your multiple abilities, not select disabilities, are what count in graduate school. As with ethnicity and sexual orientation, your disability status should not occupy center stage in your application. Assertively request fair accommodation and accessibility as provided by law, to be sure. But help the admissions committee avoid the stereotype of equating you with your disability. Your application should focus squarely on your credentials and accomplishments.

Assessing Program Criteria

Assessing the criteria clinical and counseling psychology programs use to evaluate applicants is an important step in the process of applying to graduate school. To illuminate this point, we will relate the story of one applicant we knew several years ago. She was an Ivy League graduate, a 3.8 psychology major, who had conducted research with a prominent psychologist. She had fine letters of recommendation and clinical experience with developmentally disabled children, but her GREs were in the low 500s. Thinking that her credentials were excellent, she applied to the most competitive research programs and one practice-oriented program. She was rejected across the board at these top research schools and just barely made it into what she had mistakenly considered her practice-oriented "safety school." Her mistake was to ignore the fact that all the research-oriented schools to which she applied specified minimum GRE scores of 600 or more. Her application was unsuccessful because she ignored one piece of information each school had indicated to be essential. She was nearly rejected in the more practice-oriented program she had felt was a "sure thing" because she did not possess the clinical experience they were looking for. And she was lucky that that particular doctoral program did not have GRE requirements beyond her range!

The moral of the story is twofold: (1) Attend closely to the admission standards of each program. If a school sets standards you cannot realistically meet, you need to work very, very hard to get them to make an exception. In other words, think twice about applying there. (2) Apply to programs with a range of admission criteria, and consider a safety school as one that announces admission requirements that you exceed by

a wide margin. This does not guarantee acceptance, but does dramatically increase the probability of making it into their finalist pool.

Now, turn your attention to Appendix C, “Worksheet for Assessing Program Criteria.” In Appendix C, you will rate yourself on how well you conform to each school’s admission requirements. The aim is that you not waste time and money applying to programs that indicate in no uncertain terms that you do not meet their criteria. There is no reason to feel inadequate because you fall short of these specifications. There may be programs on your list with requirements you do meet or exceed. If you are unable to meet the minimum requirements of any programs on your list, you should seriously consider taking time off to better prepare yourself or applying to less competitive master’s programs.

Begin by transferring the name of each school from Appendix B to the “School” column of Appendix C. Simply copy the list from one table to the other. Also copy the number in the “Self-Rating” column from one worksheet to the other. Next, look up the first program on your list in the Reports on Individual Programs. Read through all the information provided just to start familiarizing yourself with that program.

As you begin filling out Appendix C and listing each school’s admission criteria, remember that these are simply indications of your strength as an applicant to each school. These scales are not set in stone and do not guarantee that you will be accepted. You may not readily fall into any of the categories listed and will have to make some rough approximations for yourself. Or you may find that you fall between categories and have to add 0.5 point here or subtract 0.5 point there. If you think it is appropriate to modify the categories or scoring systems, by all means do so. *The most important result is not an absolute number but a relative sense of how well you meet each program’s admission criteria.*

You may also find that a graduate program does not require certain test scores, or gives no mean GRE scores, or doesn’t list preferred or mandatory courses. In this case, simply score a “0” in the appropriate column. When it comes time to total each school’s score, this will neither detract from nor add to your ability to meet their requirements.

Now, go to the respective Reports on Individual Programs and look at the prerequisite courses. You will see two questions pertaining to course preparation prior to applying: “What courses are required for incoming students to have completed prior to enrolling?” and “Are there courses you recommend that are not mandatory?” Underneath each question you will find a

list of courses that the particular school assigned to each category. On your list in Appendix C, under the column marked “Courses,” score yourself as follows (in this table, “M” indicates “mandatory” and “R” indicates “recommended”):

- +2** You have taken all the M and R courses and earned B+ or better in them all.
- +1** You have taken all the M courses and/or several of the R courses and earned B+ or better.
- 0** You have taken all the M courses, but none of the Rs, or earned B– or lower in some M courses.
- 1** You have not taken one or two of the M courses, or have earned B– or lower in several of them.
- 2** You have not taken several or any of the M courses or have received C or lower in some of the M or R courses.

The next section on each “Program” page is marked GREs and GPA. This section gives mean scores for the GREs and GPAs for each program listed.

On your list, under the columns marked “GRE-V” (verbal), “GRE-Q” (quantitative), and “GRE-S” (psychology subject test), score yourself as follows:

- +2** You exceed the school’s M score by at least 100 points.
- +1** You exceed the school’s M score by more than 50 but less than 100 points.
- 0** You meet the school’s M minimum or exceed it by less than 50 points.
- 1** You do not meet the school’s M score, but are less than 100 points below it.
- 2** You are below the M score by 100 points or more.

For GPA, we asked programs for the mean score of their incoming class and asked if that applied to more than one type of GPA. It is not uncommon for programs to look at cumulative or overall GPA (all undergraduate courses taken), psychology GPA (only psychology courses), and junior/senior GPA (all courses taken in the last 2 years of college). Again, it is wise to review the average GPA of incoming students. Under the column marked “GPA,” score yourself as follows:

- +2** You exceed the school’s M GPA by 0.5 points or more.
- +1** You exceed the school’s M GPA by less than 0.5 points.

- 0 You meet the school's M GPA.
- 1 You do not meet the school's M GPA, but are less than 0.2 below it.
- 2 You are below the school's M by more than 0.5 points.

Next, look back to the second column of Appendix C, "Self-Rating." This is how the program rates itself on the practice–research continuum. If a program emphasizes one more than the other, this gives some indication of what it would consider important in an applicant. A school that stresses research will probably desire an applicant to have some amount of research experience. Under the "Research" column in Appendix C, rate yourself as follows:

- +2 The school rates itself as a 6 or a 7 and you will have completed an honors thesis or will have at least 2 years of experience in psychology research.
- +1 The school rates itself as a 4, 5, 6, or 7 and you will have at least 1 year of experience in psychology research.
- 0 The school rates itself as a 1, 2, or 3.
- 1 The school rates itself as a 4 or 5, and you have no research experience.
- 2 The school rates itself as a 6 or 7, and you have no research experience.

Similarly, a program emphasizing clinical work will prefer that an applicant enter with some practical experience in human services or health care. Under the "Clinical" column, rate yourself as follows:

- +2 The school rates itself as a 1 or a 2, and you will have worked in a full-time (35+ hr./week) clinical position for at least 1 year.
- +1 The school rates itself as a 1, 2, 3, or 4 and you will have volunteered part-time (8+ hr./week) at a clinical facility for at least 1 year.
- 0 The school rates itself as a 5, 6, or 7.
- 1 The school rates itself as a 3 or 4, and you have no clinical experience.
- 2 The school rates itself as a 1 or 2, and you have no clinical experience.

At this point, you should have completed the first nine columns of Appendix C from "School" to "Clinical."

Additional information provided for each program in the Reports on Individual Programs are "How many applications were received in 2007?," "How many applicants were given an admission offer in 2007?,"

and "How many admitted students are incoming?" These give a rough estimate of the competitiveness of a program.

You may be amazed at how high this ratio can become. The average acceptance rates at freestanding Psy.D. programs is now 50% (Norcross et al., 2005). In applying to programs, be realistic and reasonable. You may have a sterling application, but when Yale accepts roughly 1 in 50 applicants, you had best be applying to other places as well.

Bear in mind: Programs accept more applicants than actually end up attending. This makes programs appear more restrictive than they actually are. This is why we added the third item regarding the number of students who will enter the program—a number invariably smaller than the number of accepted students. For example, an applicant gaining acceptance to five programs will ultimately reject four of them. A program planning on an incoming class of six students will accept more than six before gaining their new class. Nonetheless, apply to several schools with a range of competitiveness as a precautionary measure.

In the column marked "Compete" in Appendix C, record the ratio of applications to acceptances. It should be noted that competitiveness is difficult to quantify. Although we have selected the ratio of applicants to acceptances as our measure, other relevant criteria include GRE scores and GPA. Since we have already discussed these criteria, we are using this opportunity to highlight yet another area related to competitiveness.

The last column is marked "Total." Add the numbers under the "Courses," "GRE-V," "GRE-Q," "GRE-S," "GPA," "Research," and "Clinical" columns. This will provide you with a total somewhere between -14 and +14, which is a rough indication of how well you meet each school's admission requirements and expectations.

Now you have a grand list of programs that are performing research or clinical work in the areas you have specified. In addition, you have several indications of how well each school will address your needs and expectations as a graduate student. Finally, you have a rating of yourself as an applicant to each program.

The best way to begin your decision-making process is to select the programs that have admission requirements within your reach. As you look through the "school requirements" part of your list, note any -2s. Unless you can reasonably expect to change these to zeros or better before you complete your applications, you are better off dropping these programs from your list. After that, you will then have to decide for yourself what are reasonable places to apply.

Below is a rating system based on your “Total” column for each school. Although this system may help you decide where to apply, it is by no means definitive. *These are rough approximations*, and ultimately you will have to decide where to apply based on this and any other information to which you are privy. From the “Total” column of Appendix C, evaluate each program as follows:

- 10 to 14** Your chances are very good. Apply to many of these schools, since your application may be especially strong here.
- 6 to 9** Your chances are good. These schools are within your reach, as you exceed several of the credentials they value.
- 4 to 5** Your chances are moderately good here, but be sure to apply to some schools where you rank more highly.
- 0 to 3** These schools are within your range of abilities. Your application may not be outstanding, but it is somewhere between “adequate” and “more than adequate.” Be sure also to apply to several schools in a higher range.
- 1 to -4** These schools are a stretch for you. Go ahead and apply to a few, but the bulk of your applications should go to schools on which you achieved a higher score.
- <-4** These schools are looking for something different from your experience or performance at this time. If you wish to attend a program in this range, take time off or attend a master’s program to bolster your research, clinical, and academic performance.

Although this worksheet embodies many of the relevant criteria used by admissions committees, it of course cannot integrate all possible criteria. If a professor has expressed interest in working with you, for example, the worksheet total may underestimate your chances for acceptance. Other useful resources when selecting your list of schools include specific professors, undergraduate psychology advisors, and bulletin boards in the psychology building that display postgraduate brochures. Graduate students at your local university can also be helpful, and a few large universities have even created notebooks on clinical and counseling psychology graduate programs (Todd & Farinato, 1992). Take advantage of all the available information to augment the data provided in the Reports on Individual Programs.

Using the system in Appendix C, delete some of the schools that have admission criteria outside of your

present range. This will enable you to begin the next phase: selecting programs that match your expectations in terms of the training you desire.

For the research-oriented applicant, these decisions may be easiest. Look at the schools remaining on your worksheet. Note the number of faculty interested in your research area(s) and whether any of them are funded. Grant funding is a rough indicator of the intensity of the program’s commitment to a particular research area. The premise is that a grant-funded area may offer more opportunities to study the issue and may be more likely to generate research. In addition, grant funding has the potential of making assistantship money available. This by no means suggests that a program that does not have a grant in your area is not conducting current research or will not have money available to you. Additionally, a program with several faculty in an area may simply be “between” grants. Thus, the number of faculty alone also can indicate a school’s commitment to this area of research.

Next, check the program’s productivity ranking and their self-rating as being more practice or research oriented. Again, if you are more research oriented, you may well find yourself crossing those schools off your list that are low on productivity and that are clearly practice oriented. You are going to find that this shortens your list but that you still have a number of schools that cover a wide range of desirability. This is exactly where you want to be at this point! What you desire is a list of 15 to 30 programs for which you will secure additional information. Then, you can begin fine-tuning and selecting the 10 to 20 programs to which you will actually apply.

If you are more strongly inclined toward practice, you will find yourself crossing schools off your list that are research oriented, favor theoretical orientations different from your own, or are too restricted for your needs. The programs highlighting clinical work, and especially those sharing your orientation or providing a specialty clinic in your area, will be the most desirable.

The applicant who equally emphasizes practice and research training is the most challenged. You want a program that is research oriented, but not at the cost of clinical work. But you also want a program that will offer high-quality clinical training without sacrificing high standards in research. Using your list, find the programs that are moderate or high in productivity and that have a number of people interested in your area. Check to see that they rate themselves as a 4 or 5, indicating that they emphasize practice and research nearly equally. Then, check to see if their theoretical orientation conforms to your own and whether they

Director of Admissions
Department of Psychology
Bogus University
1234 Monument Square
Upstate, NY 14000

Dear Sir or Madam:

I am interested in applying to your Ph.D. (Psy.D.) program in clinical (counseling) psychology for the fall of 2009. Please send me an application and any information you have available concerning your program. Kindly include financial aid information as well.

Thank you for your time and consideration.

Sincerely yours,

Chris Smith

FIGURE 3-1. Sample E-mail requesting application and information.

have a specialty clinic or formal tracks in your area. Again, you are going to find a range of programs, some conforming to your needs better than others. This is exactly what you want at this point in the process.

You are now ready to gather the detailed information necessary to choose among the 15 to 30 programs you will use for your selection pool. If your number of schools does not fall within these parameters, you should consider modifying your list. The Web site, mailing address, and e-mail address of each program are listed with each entry in the Reports on Individual Programs. At this point, all you need is to spend a few

hours on the Web. Research demonstrates that Web sites provide more information about graduate programs than direct mailings, especially in areas not directly related to graduate applications (Bartsch, Warren, Sharp, & Green, 2003), so feel comfortable in securing the requisite information online.

Instead, you could send a brief letter requesting information and an application. When requesting information, your e-mail or letter should be neat, typed, and focused. Figure 3-1 shows a sample letter or e-mail.

Congratulations! You have taken the first steps in your application process.

CHAPTER 4

SELECTING SCHOOLS

Between late summer and late fall you will spend time on the World Wide Web, or e-mail or “snail mail” a letter similar to the one displayed in Figure 3-1 to a number of graduate programs for information. You will scan Web sites and download files describing each program. You are ahead of the game if you begin during late summer, because most applicants will not be starting this process for another 2 to 3 months. This is an opportunity for you to take advantage of an early start to set yourself apart as an organized and optimal candidate.

When applying for undergraduate study, you probably visited a few colleges to help you decide where to apply. When applying for graduate study, by contrast, visits are rare—at least until you are invited. The exception may be when you live close to a graduate school of special interest. But otherwise, you will only visit doctoral programs “virtually” through online descriptions until invited for a pre-admission interview.

In order to select programs that best suit your needs and interests, we again return to the questions: What is it I want for myself? What is it I’m interested in doing? And where do I want to do it? A firm commitment to a single clinical interest, research area, geographic location, or theoretical orientation is not required at this time; however, the more specific your interests, the more intelligent a choice you are going to make.

In the previous chapter we helped you to get started in narrowing your choices of potential graduate programs. We did so by identifying your interests, comparing your credentials to those required by graduate programs of interest, and by searching for potential matches with the offerings of graduate programs.

In this chapter we will help you by reviewing five critical variables to take into account in narrowing your choices: research interests, clinical opportunities, theoretical orientations, financial aid, and quality of life.

A Multitude of Considerations

Each graduate school applicant is undeniably unique in his or her reasons for applying to particular programs in clinical or counseling psychology. As we advise students and conduct workshops on graduate school admission, we hear a litany of specific restrictions: “I have to stay close to my spouse in Los Angeles,” “It must be a Catholic school,” “I can only attend if I receive full financial aid,” “The program needs to be gay friendly, or have gay faculty mentors,” “I am interested solely in cognitive-behavioral programs,” “I would really like to be near the mountains,” “The program must have lots of women faculty,” and so on. There is obviously no single, definitive list of factors to consider in selecting potential schools. Although we will examine in some detail the five most common considerations, we will be unable to canvass the almost infinite range of reasons for selecting programs to which to apply.

In an ideal world, graduate student aspirants would have sufficient funds and freedom to consider any clinical or counseling psychology program in the country. In the real world, however, you may be limited in your choice by financial, family, and geographic considerations. Although we appreciate these very real constraints, we encourage you not to be prematurely limited by your own vision. Try to think broadly and boldly. It is, quite simply, your career at stake.

Geographic location will be a determining factor for some applicants. By this we mean both the area of the country and proximity to significant others in your life, such as parents, spouses/partners, siblings, or lovers. If you do not possess the mobility to relocate to another area of the country, then you might delay applying until your situation changes or apply only to regional schools, even if they are less desirable. Don't spend time, money, and energy on futile missions, in this case applying to programs you will be unable to attend.

At the same time, we heartily encourage you to "get out of town." Far too often students restrict themselves unnecessarily to schools close to their homes or to their undergraduate institution. Yet, graduate programs that better match their needs may be located across the country or four states south. Your future demands that you "look around" the entire country and Canada.

The gender, ethnicity, or sexual orientation composition makeup of programs may be an influential factor for other applicants. If this is the case for you, obtain updated resource directories from the American Psychological Association and apply accordingly. Three examples are APA's *Graduate Faculty Interested in the Psychology of Women* (www.apa.org/pi/wpo/gradfaculty2005.html), *The Directory of Ethnic Minority Professionals in Psychology*, and *Graduate Faculty Interested in Gay and Lesbian Issues in Psychology* (www.apa.org/pi/lgbc/publications/lgbsurvey/grad_home.html). The Reports on Individual Programs also present the percentage of ethnic minority, international, and women students in each clinical, counseling, and combined psychology program. These can be a useful source of direction in your choice.

Our general point is this: think through your personal criteria for applying to certain programs and then be proactive in securing information about those criteria. Even if your choice of programs is limited, make it an informed choice. Accept as you must the restrictions in the range of potential graduate schools, but do not leave your future to chance!

Research Interests

The Web site for most programs will include a list of psychology faculty members in that department and their current research. You are looking to learn something from the faculty, so our advice is to find the professors who are experts in your areas of interest. If you are interested in family therapy, locate those psychologists active in training and research in that field. If you are interested in alcohol studies, find the alcohol

researchers or clinicians. Download the faculty member's Web page, or the description provided by the department. Read their descriptions carefully with a highlighter. What kind of questions are they asking? Have you asked yourself those same questions? Is this the sort of thing you can envision yourself exploring? Have you read a sample of what they have written?

In selecting professors whose interests parallel your own, you are searching for a good *match*. You are looking for mentors—psychologists who will take you on as an apprentice and teach you about your chosen profession. The more similar your views are, the better the match. For example, if you are practice oriented, psychodynamically disposed, and interested in private practice, you might choose to cross off your list a program with professors who operate exclusively from behavioral orientations and research perspectives. This does not mean your interest has to be pinpoint focused. Knowing you would rather investigate or treat psychodynamically may be enough to narrow your list of schools down to a sufficient range. But it is our experience that the more focused you are, the better fit you can find.

As you review the faculty list and other materials, you should begin to get a sense of whom you would like to work with, who is going to have the facilities to allow you to research or treat the population in which you are interested. You should eventually have a list of 10 to 20 programs that have faculty with whom you would like to work and a general idea of what each of them does.

Having created such a list of programs, we suggest that you review some of the articles or books that these professors have written. Most Web sites include a list of each faculty member's recent publications. So examine their bibliographies on the Web, inspect the program brochure, or search the *Psychological Abstracts* on *PsycLIT* for the last 5 to 7 years to locate some recent publications. Then go online and look them up. What methods do they use? What are the specifics of their psychotherapy or research that really hold your attention? If you find yourself quickly getting bored or saying, "So what? OK, so alcoholics tend to smoke more? Who cares?," then you have a valuable piece of information. If you are finding these articles interesting, you are on the right track. This is a time to get excited about your field and where you want to attend graduate school!

Here are some additional bits of information you can gather to whittle down your number of applications in terms of research interests. Consult (1) the data in the Reports on Individual Programs in this book, (2) the program's Web page, (3) correspondence with faculty,

(4) interviews with professors and/or graduate students at your own school about the programs in question, and (5) the CUR Registry of Undergraduate Researchers and Graduate Schools (at www.cur.org/UGRegistryselect.html). The latter links undergraduate students who have research experience with graduate programs interested in recruiting such students. Get the necessary information and corroborate it, if possible.

When it comes to your research interests, discover if there is a medical school library or science facilities at your disposal. Library facilities should be a prime consideration, but we have found that medical libraries in particular contain journals and books not usually available elsewhere. Access to journals online through university computer facilities is also essential. An associated medical school or hospital may also offer facilities and populations available for your research. Determine if they are present, and then investigate their relationship to the Psychology Department. In addition, learn more about the research space specific to your area. For example, does someone have the equipment you need, lab or research space, funding? If you desire to conduct research in cardiovascular psychophysiology and you have found a professor who has published several articles, determine if he or she has equipment to monitor cardiac responses. If not, there should be equipment available somewhere in the department.

We realize that this process requires a great deal of time and energy. It may also provoke anxiety in an already nerve-wracking application process. This is one reason why we advocate an early start. Again, we would emphasize that you can get into a program without doing this extra work. This preparation, however, will give you the edge to get into the program of your choice or to overcome any weaknesses in your application.

Clinical Opportunities

Having read articles by the professors with whom you would like to work, you know better which ones you find interesting. However, if your career interest is primarily practice, it is possible you might find that the person you're most interested in working with does not have recent publications in your area(s) of interest. Or you know a program has an alcohol abuse clinic, but you can't figure out which professors treat clients there. Your first recourse should be to search the university's Web site to try to locate this information. If it is not on the psychology program's Web page, it may exist somewhere else within the university's Web site. If all else fails, call the department and ask to speak

with the director of training. Simply ask this person for materials specific to the clinic you would like to work in, or ask to speak with the director of that clinic to determine which faculty are practicing there.

Now, we are going to suggest something that we have found to be a powerful way of making final decisions about where to apply and of increasing your chances of being accepted there. During early fall of the year you apply, contact a *few* of the professors you have been investigating. E-mail the ones whose interests seem most closely aligned to your own. Most program Web sites include faculty e-mail addresses.

There are many reasons to directly contact a faculty member. First, it gives you an opportunity to gain information you probably could not gather in any other way—information about the program, its facilities, and its faculty. Second, these e-mails give you a chance to get to know someone you are genuinely interested in working with. It gives you an opportunity to evaluate how happy you would be in a mentorship with this faculty member. Of course, there must be aspects of this person's research or clinical work that attract you. If you do not know his or her interests or the literature well enough to demonstrate a working knowledge of the individual's contributions, do *not* write to him or her. Professors routinely receive letters from people looking to make contact, and unless you can pique their interest and demonstrate familiarity with their work, you are unlikely to receive a response.

Whether your interests are oriented toward research, practice, or both, you are not looking to take this person or his or her field by storm. You seek to make a contribution in this particular area, a contribution made *after* you have taken the time to learn and gain experience in the field under their mentorship. Or, you are looking to gain experience and clinical training with an experienced practitioner.

Take a moment to look at this relationship from the professor's perspective. If she is a researcher, then she is looking for students to help with that research, for students with the knowledge and drive to run studies. If she is a clinician, then she is looking for individuals eager for supervision who will be able to carry a client load. And that is what you have to offer. You are looking for the best fit of a program and faculty to your interests.

Contacting a professor is not a necessity. Many students are admitted to excellent programs and then take 1 or 2 years to explore, to figure out what they want and where they fit in. In fact, some programs require students to work with several professors during their initial year before selecting an adviser. Nonetheless, it is to your advantage to spend sufficient time deciding

Pat Morris, Ph.D.
Department of Psychology
University of Southern States
13 Peachtree Drive
Wilkesville, VA 15000

Dear Dr. Morris:

I am a psychology senior at Babylon University, where I have been working with Dr. Frances Murrow, studying the effects of self-esteem on math performance anxiety. As I was searching the literature, I read several of your articles concerning the use of relaxation techniques to improve self-esteem and test anxiety.

After reading your paper "The Uses of Relaxation in Schools" (December issue of *School Psychology*), I had some questions I hoped you could answer. We used several of the questionnaires that you used in that study. In looking at our data, we have found that participants responded quite differently to the Test Anxiety Questionnaire at various times in the semester. We found that the further into the semester students progressed, the more their anxiety affected their scores. Have you also found this to be true in your research? Secondly, I have begun to wonder if self-efficacy might not be a factor affecting both test anxiety and self-esteem. I noticed that you had done some early work involving self-efficacy and was wondering what ideas you might have on this subject.

On a related matter, I will soon be applying to clinical psychology doctoral programs that offer research training in performance anxiety. I would be very interested in learning whether you routinely supervise the research of doctoral students at the University of Southern States on this topic and, if so, whether you will be taking any new students in the next academic year.

Thank you for your time and consideration. I look forward to hearing from you.

Sincerely yours,

Chris Smith

FIGURE 4-1. Sample e-mail of introduction—research oriented.

which professors would be best suited for you. Locate programs and professors who seem appropriate; then go ahead and contact a few of them to test the waters.

Figures 4-1 and 4-2 show sample e-mails of introduction, the former for research-oriented applicants and the latter for practice oriented. *These are not forms to copy in which you simply insert your own words!* You may want to show a draft of your letter to a professor to preview how well it is likely to be received.

Some students have asked whether it is acceptable to send letters to more than one faculty member at the

same program. Despite the fact that applicants may have multiple research and clinical interests, most faculty (ourselves included) have a negative reaction to learning that the same person has written to more than one faculty member. Remember, there is a certain amount of self-interest involved: We're looking for bright, motivated students to collaborate on research and clinical work. It can be awkward when an admissions committee is discussing an applicant, and two faculty express a desire to work with him/her, only to find that the applicant has been actively expressing in-

University of Southern States
13 Peachtree Drive
Wilkesville, VA 15000

Dear Dr. Morris:

I am a psychology senior at Babylon University, where I recently completed an upper-level course in clinical/counseling psychology. My professor, Dr. Frances Ellis, discussed your social problem-solving program targeted to elementary school children. Dr. Ellis spoke highly about the manner in which you use your clinical findings to derive theoretical models of problem solving and use these models to guide your interventions.

I am interested in learning more about school-based social problem-solving programs. I have been involved in such a project with Dr. Ellis and wish to continue my education in this area. I am preparing applications for Psy.D. programs and would like to learn more about your particular program. Specifically, what opportunities exist for clinical Psy.D. students to work on your social problem-solving program? My interests lie primarily in the clinical aspects of your school-based program. I would like to help train teachers in imparting social problem-solving skills to students.

I would appreciate any materials that you could send me describing your problem-solving program in greater detail. I am especially interested in the role for Psy.D. students. Thank you for your time and consideration.

Sincerely yours,

Chris Smith

FIGURE 4-2. Sample e-mail of introduction—practice oriented.

terest in *both* of them. Our advice: Don't write to more than one faculty member in any one graduate program.

What if the professor does not respond within a month? Absence of a response does not mean that you will not be able to work with that individual if you are accepted. Most likely the professor received too many queries to respond. Indeed, at some schools, professors are receiving dozens of e-mails during the months leading up to the application deadline. Later, when your application is reviewed, your e-mail may be read.

If the selected professor does write back, then it may be the beginning of a working relationship. Even if you are not accepted to his or her program or ultimately decide not to attend, you are making professional contacts in your field. There is no guideline as

to exactly how to behave from here, since each professor is different. But you should begin getting a sense of whether this is the right person (and program) for you.

If the task of introducing yourself to a professor "cold" seems overly daunting, consider alternatives. Local and regional conferences present prime opportunities for meeting potential mentors and gathering information about graduate programs. Numerous societies hold yearly conferences in which research is presented in specialty areas of psychology. For example, if one of your interests lies in health psychology or behavioral medicine, there is the Society for Behavioral Medicine, the American Psychosomatic Society, and the Society for Psychophysiological Research. If, for another example, your interests lie in psychotherapy,

there are the annual conferences of the Society for Psychotherapy Research, the APA Division of Psychotherapy, and the Society for the Exploration of Psychotherapy Integration. Your psychology advisor can probably suggest several societies in each area of psychology.

Student membership in a scientific society brings a number of benefits. For beginners, it will probably provide you with a directory of members (including contact information), which is an easy way of quickly ascertaining who is doing research in your area. Most scientific organizations will invite you to join their electronic listserve. With membership also typically comes a newsletter or a journal, which can give you a sense of the leaders in the field.

Attending a conference can provide a great deal more information, as we have already emphasized in Chapter 2. If you are interested in particular professors, you may have a chance to see them “in action” if they are presenting a poster or a paper. In this way, you can get acquainted with the person and the research without taking the risk of formally introducing yourself. Alternatively, you may approach the professor directly and express your interest in the research or ask your psychology advisor to make the introduction. Many graduate students first met their mentors in these ways.

After you have communicated with a professor, it may be appropriate to ask to tour this person’s research lab or clinical facilities. This is a wonderful opportunity, in that you will get a chance to gather all sorts of information if you visit a school ahead of time. Meeting this professor face to face, getting a sense of his or her personal, clinical, and research style, and seeing how you might fit into an ongoing team can be indispensable information. If you do find yourself in the position of visiting a professor before interviews, use the advice in Chapter 6 to help guide you in gathering information during this phase.

Try to determine if this department’s psychological clinic serves the surrounding community or only the college community. College students are fine clients with whom to begin, but you will probably desire a greater diversity of populations and disorders. Learn more about the school’s affiliated or specialized departmental clinics. Who can work there and when? Who does the supervision? Do you have to be affiliated with a specific professor, or is there a competitive process toward earning that placement? If you’re choosing a school in part based on the availability of this clinic, how available will this clinic really be to you?

Table 4-1, “Questions to Ask about Psy.D. Programs,” contains questions more specific to Psy.D. and practice oriented Ph.D. applicants. This list was com-

plied, in part, by surveying the clinical Psy.D. students at the Graduate School of Applied and Professional Psychology at Rutgers University and asking them what questions they had (or wish they had) asked when applying to Psy.D. programs.

Theoretical Orientations

A question related to clinical and research opportunities is whether the graduate program will provide you with training in the desired theoretical orientations. We are *not* recommending that you prematurely affiliate with any theoretical camp; rather, we suggest that you identify those orientations you are interested in learning more about and those you are not. Several programs in the Northeast are strongly committed to a psychoanalytic approach and offer few, if any, training opportunities beyond that. The obvious implication is to avoid applying to programs that will not offer supervised experience in your theoretical approach(es). By the same token, you may scratch programs from your preliminary list that rigidly adhere to, say, a behavioral persuasion if you are disinclined toward behaviorism.

The Reports on Individual Programs provide the approximate percentage of faculty in each program who subscribe to the five most popular theoretical orientations—psychodynamic/psychoanalytic, behavioral analysis/radical behavioral, family systems/systems, existential/phenomenological/humanistic, and cognitive/cognitive-behavioral. Let these figures guide you in ruling out a few programs that fail to address your theoretical predilections or, if you are uncommitted, that neglect exposure to multiple or integrative approaches.

Table 4-2 presents the average percentage of faculty endorsing these five theoretical orientations in APA-accredited clinical and counseling programs. In general, the cognitive/cognitive-behavioral tradition predominates, accounting for half of the faculty members. Radical behaviorism is relatively infrequent, with psychodynamic, systems, and humanistic theories falling in between these two extremes. These global figures do not specifically include the integrative/eclectic orientation, which is the most popular approach of mental health professionals (Norcross & Goldfried, 2005). The fact that the percentages add up to more than 100% indicates that faculty practice across orientations. Note too that the counseling psychology faculty endorse the humanistic/existential orientations much more frequently than do the clinical psychology faculty (28% versus 10%).

These average percentages mask significant differences among programs as a function of their placement along the practice–research continuum. Research-

TABLE 4-1. Questions to Ask about Psy.D. Programs

Is the Psy.D. program freestanding or part of a university?
 Is the program owned or operated by a for-profit company?
 If the program also has a clinical Ph.D. program, are the “best” practicum opportunities available to Psy.D. students or Ph.D. students? Is it possible to take the Ph.D. courses as well? What is the relationship between the Psy.D. and Ph.D. students?
 Will the internship occur in the third or fourth year? Do you complete an internship before or after your clinical dissertation?
 What percentage of Psy.D. students receive full financial support? What is the annual tuition?
 What is the typical debt level of graduating students?
 Does the university offer housing for Psy.D. students? If not, how much are the monthly rents locally?
 Are there opportunities for live supervision? Do the full-time faculty perform the clinical supervision?
 Does the school offer exposure to a variety of theoretical orientations, or is it dominated by one orientation?
 Is it possible to gain experience working with . . . ? With families? With groups?
 What types of clinical populations are available?
 What percentage of the faculty are full-time? What percent are tenured?
 Do the faculty have independent practices?
 What percentage of first-year students complete the program? How many years does it typically require to complete the program?
 What is the size of the incoming class? How many students are in a typical graduate course?
 What percentage of students obtain an APA or APPIC-accredited internship?

oriented programs, as a rule, have a higher percentage of cognitive-behavioral faculty, while practice-oriented programs have a higher percentage of psychodynamic faculty (Mayne et al., 1994). These differences are quite large: Fully 64% of faculty members in research-oriented Ph.D. programs are cognitive-behavioral versus 33% in practice-oriented Psy.D. programs. Only 12% of faculty in research-oriented Ph.D. programs are psychodynamic versus 29% in practice-oriented Psy.D. programs (Norcross et al., 2005).

The upshot is to investigate thoroughly the area of psychology (clinical, counseling) and the type of program (practice-oriented to research-oriented) that

regularly provide training in your preferred theoretical orientation(s).

In addition to reviewing the percentages of faculty theoretical orientations in the Reports on Individual Programs, those of you with an intense hankering for training in a particular theoretical orientation may want to peruse specialty directories. A number of professional societies maintain or publish lists of graduate programs that offer training in their theory of choice. The Association for Behavioral and Cognitive Therapies (ABCT), for example, publishes a directory of graduate programs in behavior therapy and experimental clinical psychology (www.aabt.org). The Society for the

TABLE 4-2. Theoretical Orientations of Faculty in APA-Accredited Clinical and Counseling Psychology Programs

Orientations	% of clinical faculty	% of counseling faculty
Psychodynamic/Psychoanalytic	24	18
Applied behavioral analysis/Radical behavioral	7	4
Family systems/Systems	19	24
Existential/Phenomenological/Humanistic	10	28
Cognitive/Cognitive-behavioral	51	43

Note. Data from Oliver, Norcross, Sayette, Griffin, & Mayne (2005).

Exploration of Psychotherapy Integration (SEPI), for another example, has pulled together a list of integrative and eclectic training programs throughout North America (visit www.cyberpsych.org/sepi/, Norcross & Kaplan, 1995). The APA Division of Humanistic Psychology, for a final example, cosponsors a directory of graduate programs in humanistic and transpersonal psychology (visit www.westga.edu/~psydept/humanistic directory). Consult your advisors regarding the existence of specialty directories in your field of interest.

The popularity of theories, as with other professional fads, undergoes transformation over time. Extrapolating from historical trends and expert predictions (Norcross, Hedges, & Prochaska, 2002), cognitive-behavioral, eclectic/integrative, family systems, and multicultural theories will be in the ascendancy in the future. By contrast, classical psychoanalysis, humanistic theories, and existentialism are expected to decline. In an era of managed care, theoretical orientations that emphasize brief problem-focused treatments and document their effectiveness will probably thrive.

Financial Aid

The next question, and it is by no means premature, is the availability of financial aid. Unless you can afford to pay for graduate school on your own or you are prepared to take out substantial loans, you require some idea of the probability of support from the graduate program. This is not a suggestion to avoid schools with scarce financial aid. It is a suggestion not to apply only to schools with scarce financial aid.

APA's (2002) *Ethical Principles of Psychologists and Code of Conduct* requires truth in advertising about graduate programs. Standard 7.02 (Description of Programs) stipulates that "Psychologists responsible for education and training programs take reasonable steps to ensure that there is a current and accurate description of program content . . . stipends and benefits, and requirements that must be met for satisfactory completion of the program. This information must be made readily available to all interested parties." Not only is it your perfect right to request such information, but it is also the ethical obligation of the graduate psychology program to provide it.

Yet, research indicates that only a minority of psychology doctoral programs are fully disclosing all of the information required by the APA Commission on Accreditation (Burgess, Keeley, & Blashfield, 2006). Graduate programs need to be more disclosing of these crucial data. A prime objective of this *Insider's Guide* is to present financial aid information in our Reports on Individual Programs.

Figuring the total cost of full-time graduate study must include both academic expenses and living expenses. The academic side includes tuition, fees, supplies, books, and journals. Full-time tuition ranges from a low of \$3,000 a year for some in-state Ph.D. students to \$25,000 for some private, Psy.D. programs (Pate, 2001). Multiplying the tuition by 4 years gives you some idea of the probable tuition burden. The living side includes rent, transportation, food, clothing, insurance, and entertainment. Health insurance has emerged as a large part of the cost of graduate studies. Some assistantships include health insurance, but others do not. Not surprisingly, most graduate students are relatively poor; at least you will have company in your financial misery (Fretz & Stang, 1980).

Determine the availability of teaching assistantships and research assistantships from the program's home page and the Reports on Individual Programs. In particular, find out the percentage of first-year students who receive assistantships. Is it 100%, 50%, or 0%? Do the assistantships include health insurance? If not, you will either go without insurance or purchase it on your own.

On average, 57% of full-time doctoral students in psychology receive some financial support from the program; the remaining 43% do not. The picture is less encouraging for full-time master's students in psychology: only 23% receive any support (Gehlman, Wicher-ski, & Kohout, 1995). As you can see, the probability of financial support from the program itself is a very salient consideration in narrowing your choices.

Be wary of online descriptions of doctoral programs that simply declare "all incoming students receive financial aid" unless that same description provides the sources of the aid and the typical monetary stipend. We are aware of several psychology programs that automatically award "fellowships" to every student in the amount of \$1,000 but then immediately charge over \$20,000 annual tuition! Hence, we have begun to use the phrase *full assistantship in our Reports on Individual Programs*.

These reports provide the percentages of incoming doctoral students who receive full tuition waiver only, full assistantship/fellowship only, and both tuition waiver *and* assistantship for each doctoral program. Table 4-3 summarizes these data across the practice-research continuum for APA-accredited clinical psychology programs. The continuum moves from the freestanding Psy.D. programs on one end, through the equal-emphasis Ph.D. programs in the middle, to the research-oriented Ph.D. programs on the other end. As seen there, the probability of receiving financial assistance in graduate school is a direct function of

TABLE 4-3. Percentage of Students Receiving Financial Aid in APA-Accredited Clinical Psychology Programs

	Free-standing Psy.D.	University-based Psy.D.	Equal-emphasis Ph.D.	Research-oriented Ph.D.
Tuition waiver only	10%	13%	10%	1%
Assistantship only	13%	25%	10%	13%
Waiver and assistantship	3%	10%	63%	81%

Note. Data from Norcross, Castle, Sayette, & Mayne (2004) and Norcross & Oliver (2005).

the type of program (Norcross et al., 2004). Only 3 to 10% of Psy.D. students, on average, will receive both a tuition waiver and a full assistantship, compared to 81% of students in research-oriented Ph.D. programs in clinical psychology. You don't need to perform a *t* test; that is a large, significant difference. The equal-emphasis programs tend to fall in between; about 63% of their students receive both a tuition waiver and a full assistantship.

In other words, higher acceptance rates come at a (tuition and living) cost to the incoming student. More rigorous admission standards and acceptance odds translate into increased probability of substantial financial aid (Kohout, Wicherski, & Pion, 1991; Mayne et al., 1994). In the most extreme comparison (Psy.D. vs. research-oriented Ph.D. programs), students are 5 times more likely to gain acceptance but 10 times less likely to receive full funding (stipend plus tuition waiver). An awareness of these trade-offs among the different types of programs will enable you to make informed choices regarding your graduate applications and career trajectories.

There *is* financial aid available from graduate schools to students possessing sterling credentials, and we wish to reaffirm its existence. Nevertheless, the increasing number of acceptances into clinical and counseling psychology doctoral programs during a period of economic "downsizing" raises difficult questions about internal funding opportunities and federal financial assistance. Our findings (Norcross et al., 2004) on financial aid portend a "pay as you go" expectation for half of all doctoral candidates in clinical and counseling psychology. This is particularly true, as we have seen, in Psy.D. programs. The explicit expectation, as is true in such other practice disciplines as medicine and law, is that graduates will be able to repay their debt after they are engaged in full-time practice. We should note, however, that uncertainties regarding health care—specifically changes in insurance coverage for mental health—in the United States make this expectation difficult to evaluate at the present time.

The debt may be substantial. Research demonstrates that 77% of recent graduates in clinical and counseling psychology have debt related to graduate studies (over and above any debt associated with their undergraduate education; APA, 2003). Graduates of Psy.D. programs report a median debt of \$90,000 (Wicherski & Kohout, 2005). The median debt for clinical Ph.D. graduates is \$50,000, lower but still substantial. As noted earlier, there is considerable variation here, as some clinical Ph.D. programs—such as those in the APCS—offer full tuition and stipend to nearly all their students, while clinical Ph.D. programs housed in professional schools rarely offer this degree of assistance.

With a median starting salary of approximately \$50,000 for new psychology doctorates (Wicherski & Kohout, 2005), graduate school debt represents a heavy financial burden for many years. (Go to the Loan Repayment Calculator at www.finaid.org/calculators/ for a sobering look at repayment schedules.)

In large part, the difference in debt between Psy.D.s and Ph.D.s is attributable to the huge differences in financial aid between Vail-model and Boulder-model programs as pictured in Table 4-3. The APA researchers who compiled the debt figures conclude, "It is important to disseminate this information to students who may be considering a career in psychology—so that their decisions can be fully informed" (Kohout & Wicherski, 1999, p. 10). We wholeheartedly agree.

In fact, we recently completed a study that looked specifically at the financial assistance offered by various types of Psy.D. programs (Norcross et al., 2004). You may recall from Chapter 1 that Psy.D. programs can be housed in three different settings: (1) in a university's Psychology Department; (2) as a separate school or institute in a university; (3) as a private, free-standing institution without affiliation to a comprehensive university. As you have already learned, Psy.D. programs give proportionally less financial assistance to students than Ph.D. programs. But it gets a bit more complicated because not all Psy.D. programs are

SELECTING SCHOOLS

created equally with regard to financial assistance. An average of 26% of incoming Psy.D. students to a freestanding program will receive *any* financial support from the program and only 3% of incoming students will receive a full boat (tuition remission plus assistantship). By contrast, an average of 48% of incoming Psy.D. students to a Psychology Department program will receive some financial support and 10% of incoming students a full boat (see Table 4-3). That's a whopping difference. If you desire considerable financial assistance directly from the graduate program, then do not apply to freestanding Psy.D. programs. Your best bet, financially speaking, will be the university-affiliated Psy.D. programs and, of course, the research-oriented Ph.D. programs.

How do students cobble together the necessary funds to pay for doctoral study in psychology? By a mixture of means:

- university-provided financial assistance
- personal savings
- family support
- graduate school loans
- earnings during graduate school
- federal fellowships or traineeships

Many universities provide specific Web pages on these sources of funding graduate school. In addition to general information, they often list school- or program-specific scholarships and fellowships available to incoming students. It is worth the added effort to examine the financial aid pages at each school to search for scholarship programs for which you may be eligible.

In addition to aid provided by the school itself, financial assistance is available from external private and public organizations. This funding comes under various names—self-sought, external, independent—to distinguish it from financial aid provided internally by the university. A variety of scholarships and fellowships is offered annually, but you will need to research those that pertain to your circumstances.

Your local Office of Career Services and Office of Financial Assistance should be able to direct you to potential sources of external support for graduate studies.

We recommend Princeton Review's (2005) *Paying for Graduate School Without going Broke*. Another very useful resource is *Financing Graduate School*, a compact paperback authored by Patricia McWade (1996). The subtitle captures the centrality of the topic—*How to Get the Money for Your Master's or Ph.D.* These two books transverse the entire geography of financial aid—grant applications, loan possibilities, federal and state support, and other sources of money for graduate study.

Peterson also offers a free online cram course in financial aid at www.petersons.com/gradchannel/file.asp?id=1080&path=gr.pfs.overview. Be sure to check out the loads of advice and searchable databases online at www.finaid.com and at www.studentaid.ed.gov/PORTALSWebApp/students/english/gradstudent.jsp.

Federal funding is also available for psychology graduate students, either in the form of training and research grants to institutions, which then fund graduate assistantships, or in the form of fellowships and dissertation grants awarded directly to students (Bullock, 1997). The National Science Foundation (NSF) funds separate competitions for Graduate Fellowships and for Minority Graduate Fellowships. NSF does not support clinical or counseling research per se, only research directed at elucidating basic functioning, not focused on disease-related processes. The National Institutes of Health (NIH) also fund psychology student awards through the National Institute of Mental Health, the National Institute on Drug Abuse, the National Institute on Alcohol Abuse and Alcoholism, and the Office of AIDS Research. Check out these programs through their Web pages: www.nsf.gov and www.nih.gov.

Several funding directories are also available free of charge from philanthropic and professional organizations. Among the more prestigious (and therefore, more competitive) are the predoctoral fellowships sponsored by the Danforth Foundation, Ford Foundation, and Armed Forces Health Professions Scholarship. The American Psychological Association publishes an online *Directory of Selected Scholarship, Fellowship, and Other Financial Aid Opportunities for Women and Ethnic Minorities in Psychology*, which we highly recommend (forms.apa.org/pi/financialaid/). The APA Minority Fellowship Program is now online at www.apa.org/mfp. APA also offers an online list of resources for financial assistance at www.apa.org/ppo/funding/.

As you can anticipate, the Web has literally exploded with interactive sites devoted to securing financial assistance for graduate school. Many of these are useful and recommended, but be wary of and avoid those that charge you for their services. In addition to the APA sites listed above, we would suggest you visit:

- www.gradview.com/financialaid/
- www.scholarships.com
- www.petersons.com/finaid/
- www.finaid.org/otheraid
- collegeapps.about.com/

Explore all these possibilities early and actively.

Student loans are also available for graduate students, but these are monies that must be repaid. The Federal Family Education Loan (FFEL) Program and

the William D. Ford Federal Direct Loan (Direct Loan) Program, generally known as Stafford Loans, are available to assist graduate and professional students. Students may borrow up to \$8,500 per academic year through the subsidized Stafford Loan. The interest on these loans is subsidized by the federal government and repayment at reasonable interest rates does not begin until 6 months after graduation, or following withdrawal from the program. In addition to this \$8,500, up to an additional \$12,500 per academic year can be borrowed through the unsubsidized Stafford Loans. The total amount that can be borrowed, including both subsidized and unsubsidized portions, is currently \$138,500. The in-school interest on the unsubsidized Stafford Loans may be paid quarterly or deferred and repaid when principal repayments begin.

Starting in 2006, the government began offering Graduate PLUS Loans, federally sponsored loans for students attending graduate school at least half time. With a Grad PLUS loan, you may borrow up to the full cost of your education, less other financial aid received including Federal Stafford loans. Graduate students should exhaust their federal Stafford loan eligibility before applying for a Graduate PLUS loan because the Staffords charge lower interest.

Some institutions also award Federal Perkins Loans, a long-term loan program with a 5% interest rate available to graduate students demonstrating financial need. Other state loan programs exist; check these out as well. The bottom line is that every full-time graduate student is eligible for loans to finance his or her education, if necessary.

Speaking of loans reminds us to mention loan repayment options and loan forgiveness programs. We recommend that you visit the U.S. Department of Education Web site, www.ed.gov, which describes student loan types and loan repayment options. Three options that can trim loan payments for graduate students are the graduated repayment plans, income-sensitive repayment plans, and the loan consolidation plans. See the Web site for details, but remember that most student loans only permit a single refinancing or consolidation. Clinical and counseling psychologists working in designated underserved areas as part of the National Health Services Corps (NHSC) are also eligible for loan forgiveness (up to \$25,000 or \$35,000 per year) while receiving a competitive salary. Go to nhsc.bhpr.hrsa.gov for details of the program.

Quality of Life

A fifth and final consideration in selecting graduate schools is the quality of student life. It may be difficult

to imagine, but occasionally you will want a break from graduate studies, to relax or engage in some non-psychological pursuit!

You should have a handle on the specifics of your own needs. Can they be met by the university and surrounding community? Do you want museums, fine dining, and professional theater? Then you probably want to live in or near a large city. If not, do you have a car capable of regularly getting you to one? Or do you get away to the mountains, enjoy rock climbing and camping, or find the city distracting? Or do you prefer to work late at night and need a campus that's safe after dark? Then be sure to apply to some rural campuses. Also, consider whether you have friends or family nearby. Having a place to escape to can be important, especially if you do not have the funds to *really* escape. You are not going to base your decisions exclusively on any of these factors. But you can increase the probability of having everything you want by applying to schools you know can provide it all.

The Web is an excellent resource for investigating locations, towns, and cities that are far away and that you may not have the time or finances to visit. Most cities have their own Web pages, which include pictures, maps, lists of attractions, and so on, for potential visitors and residents. Take the time to "virtually" explore the towns and cities of programs on your list. You may find that it is far more (or less) desirable than you had imagined.

The weight accorded to the quality of life in application decisions varies considerably among people. At one extreme are those applicants who give little thought to program location and heavily value the research and clinical opportunities. In the words of one colleague, "I'd live in hell for 4 or 5 years [the time it ordinarily takes to complete a doctorate] to be trained by the best people in my field." At the other extreme are those who will only apply to programs situated near family, friends, or an attractive community. "Five years," they say, "is too long to be away from what I need as a person." We will not be so presumptuous as to advise which position you should adopt for yourself, except to remark that you should carefully weigh personal (location, fit) and professional (reputation, opportunities) considerations.

Putting It All Together

Having seriously reflected on your own interests and having carefully examined the clinical opportunities, research training, theoretical orientations, financial aid, and quality of life of various programs, you are very close to completing applications.

SELECTING SCHOOLS

Now is the time to put together all the information you have obtained about yourself and graduate programs in the form of a final list of schools—anywhere from 10 to 20, depending on the specificity of your interests and the strength of your credentials. As you make a final list of the applications you are about to complete, make one last check to insure that you are applying to the programs that best fit your needs. You may do this informally by mentally reviewing the program information you have obtained or you may do this systematically by completing Appendix D.

To complete Appendix D, write the name of each graduate program in the first column. In column 2, “School Criteria,” write the total you computed for each school in Appendix C. This is an index of your strength as an applicant and should range from about 5 to 15. For each of the next five columns, you can rate your impressions about each program on a 5-point scale. Create these scales yourself in ways that are personally relevant to you. The important thing is to know where each school rates in these areas in terms of your needs and desires. Below are some examples of rating systems you might model your own after.

In the column marked “Research,” rate how strongly you feel toward the professors you have singled out as wanting to work with:

- 1 I do not know enough about them, but their research is in my area.
- 3 I like the specifics of their research but do not know enough about their lab or their personalities.
- 5 I have been in contact with these professors and am impressed by their facilities and by them personally. I would like to work with them.

In the column marked “Clinical,” rate each school according to how its opportunities suit your needs.

- 1 The school has only a psychological training clinic that treats students, and I want more experience.
- 3 The school has a good psychological training clinic, but it has no practica in the community, and getting various populations may be difficult.
- 5 The school has many excellent clinical opportunities, including a specialty (e.g., eating disorders) clinic or track in my area of interest.

Or, possibly:

- 1 The school requires students to find their own clinical placements in the community, and I don’t like that system.
- 3 The school has a college counseling center, but I’m not interested in working only with college students.
- 5 The school has a good psychological services clinic, and that’s all I need.

“Theoretical Orientation” is the following column:

- 1 The program avers strict adherence to, and training in, a theoretical orientation that is in contrast to mine.
- 3 The program offers some courses and supervision in my preferred theoretical orientation.
- 5 The program provides considerable training in my preferred theoretical orientation plus other opportunities.

Next, consider “Financial Aid”:

- 1 There is no funding for first-year students and no mention of outside means of support, and I need it.
- 3 I am likely to get at least tuition remission and have the possibility of working part-time for the university. It is likely that I could be a resident advisor and get free housing.
- 5 For the last 5 years, all first-year students have gotten full stipends and full tuition remission.

Or, possibly:

- 1 There is no funding for first-year students and no mention of outside means of support.
- 3 I am likely to get at least tuition remission, though only for the first 2 years.
- 5 The school guarantees tuition remission for 4 years, and that’s all I need.

And last, rate the “Quality of Life”:

- 1 This program is located in an unattractive area and seems bereft of culture.
- 3 I am indifferent to the location, and there is culture within the college community.

-
- 5 The area is ideal for me, and there are museums, concert halls, and theaters nearby.

Or, possibly:

- 1 This university is located in an unsafe section of a large city where I don't know anyone.
- 3 This university is located in a small city, and a friend of mine also attends.
- 5 This university is located in a small college town, and I have several close relatives and friends there.

Look at your list. Are you applying to programs within a realistic range of admission criteria? Are you applying to at least some programs where you like the faculty, where the clinical facilities are suitable, where

the theoretical orientation is compatible, where financial aid is available, and where you will feel comfortable living? If the answer to all of these is "No," then go back a step. Find at least a few graduate programs where these qualities are present, possibly in abundance, and add them to your list of applications.

Before moving on to the next chapter of this *Insider's Guide* and the next step in the application process, take one final moment to celebrate. You deserve it! You have learned much about graduate training in clinical and counseling psychology, investigated potential graduate programs, assessed your match with those programs, and whittled down your final list. You have already mastered challenges more intense than those associated with many college courses. So, after weeks of arduous and sometimes anxious work, you deserve affirmation and reward. Give them to yourself or, at least, allow us to affirm and reward you from afar.

CHAPTER 5

APPLYING TO PROGRAMS

You are ready to start completing the applications. You have assessed your interests and have located programs that provide the training and mentorship you desire. You have evaluated your own credentials and have chosen programs that will consider you seriously. You have received applications from these programs either by mail or by downloading materials from the 90% of clinical programs with Web pages (Corcoran, Michels, & Ahina, 1999). You have carefully looked at their research offerings, clinical opportunities, theoretical orientations, financial aid, quality of life, and other variables of importance to you. Your task now is to actually apply to these graduate programs.

You should attack this application process with all the drive and commitment you can muster. The rewards of applying are typically in direct proportion to your exertion. Try to emulate the manic zeal of successful medical school applicants. As they will readily inform you, the application itself reflects directly on your potential as a graduate student. In a real sense, your professional future is at stake.

The “application year,” as it is known, will probably be intense. We suggest that you take a lighter course load or work schedule during the fall of your application year. Completing applications, securing letters of recommendation, and writing personal statements constitute more work than a typical college course. We also suggest that you inform friends and family members that you will be more preoccupied and distracted than usual. Position yourself for a busy fall.

A completed application will typically consist of the following elements: application form, curriculum vitae, personal statement, letters of recommendation, tran-

scripts, entrance examination scores, and an application fee. This chapter traces the requisite steps of compiling, completing, and transmitting these materials in a coordinated fashion. But before we address the nuts and bolts of doing so, let us touch upon the crucial question of how many programs to apply to.

How Many?

The average number of applications made by students to clinical and counseling psychology programs is about 13. The precise number to which you should apply depends on the strength of your credentials and the competitiveness of the prospective programs; more applications are indicated for weaker credentials and more competitive programs.

Our rule of thumb is to apply to *at least* 10 to 12 programs: five “safe” (you clearly meet or exceed their standards); five “target” or “ambitious” programs (your credentials just make or miss their requirements); and perhaps one or two “reach” or “stretch” programs (where you do not approximate their standards but you have a particular hunch, research compatibility, or personal relationship that has a chance of sweeping you into the finalist pool). We have met industrious students who have applied to over 40 programs and confident students who have applied to just four or five.

But “don’t pull a Missar,” as we say at the University of Scranton. David Missar was an exceptional undergraduate and good-humored fellow (who gave us permission to use his story as a lesson for others to learn). He had a sky-high GPA, impressive GREs, a practicum to his credit, and even a coauthored publication. He was feeling a bit too confident in applying

to only four doctoral programs, all located around his home town of Washington, D.C., which happens to have some of the most competitive programs in the country. Despite his stellar academic credentials, Dave did not receive any acceptances his first year simply because his research interests and strengths did not “match” those of the clinical faculty and institutions to which he applied. Had he applied to a greater number or larger variety of programs, he surely would have been accepted somewhere, as he was easily the next year when he corrected his miscalculations.

Application Form

You have a list of 10 to 20 programs in front of you. The deadlines range from mid-December to mid-February. You have used the late summer and fall months to investigate potential programs—the professors, the orientations, the locations, and the costs. It is now time to start writing.

One of the easiest parts is filling out the application itself. When you download an application from the Web, be sure it is on clean, white, high-quality paper. Some students have found it useful to make a copy of the application and complete a first draft on the photocopy. The completed application reflects on you; keep it as professional and neat as possible.

Slightly more than half of all graduate programs allow you to submit an application through e-mail or the World Wide Web (Norcross et al., 2005). If you have the choice, we advise against doing this. Taking the time to carefully consider (and often change) portions of your application is an important part of the process. Your personal statement requires a great deal of thought and will go through many revisions. By completing the application and reading it over several times before mailing it, you are likely to catch and correct errors or poor choices. This is one of the places where we recommend against taking full advantage of technological advances!

Online applications can be an Internet nightmare. You don’t know what your completed application will look like. You don’t know where it goes—or where it does not go. You can easily fail to indicate essential information, such as faculty members with whom you desire to work. On the other hand, online applications are quick, potentially less expensive, and the software improving rapidly. So, if you elect to submit an application online, please be careful. Proofread the document several times and try to cut and paste a fully formed personal statement from a word processing file.

Begin the applications at least 1 month before the earliest deadline. Some applicants, particularly under-

graduates in their senior year, wait until the end of the fall semester on the holiday break. *This is too late*—do not wait, lest you be rushed, unprepared, and working on a tight deadline.

Unlike the medical school process, which uses an identical application form for every school, each graduate program in psychology has its own, unique application. Providing the same information over and over again in slightly different formats can become frustrating and time consuming. Several years ago a committee recommended a standardized graduate application form to reduce the paperwork, but comparatively few programs have instituted it. Nonetheless, it provides a good idea of the information that will be requested of you:

- Full name
- Previous and maiden names
- Citizenship status
- Semester of entrance
- Current mailing address
- Permanent home address
- Educational history
- Degree sought
- Field of study
- Relevant courses taken
- Grade point averages
- Academic honors
- Clinical experience
- Special qualifications
- Employment history
- Teaching/research experience
- Career objectives
- References

Submitting applications is worse than filling out income tax returns (Fretz & Stang, 1980). Allow yourself enough uninterrupted time to do it carefully and completely. Illegible handwriting, incorrect spelling, and poor grammar will hurt your chances.

Some additional tips:

- Keep the application forms for each school separated. Individual file folders might help. Since the forms are often poorly marked, you may not otherwise know which forms belong to what school.
- Create a spreadsheet to keep track of your multiple applications—the application deadlines, number of recommendations required, what was sent, what was received, and so on. This method helps to organize the blizzard of paperwork, especially if you are applying to more than a few graduate programs.
- Enclose with each application a self-addressed, stamped postcard that the school can return to

verify receipt of your application. On the back of the card simply type: "Please send to verify receipt of application to _____ University."

- Print a copy or photocopy each application before mailing it. Graduate schools and the postal service have been known to lose—or misplace—entire forms. A hard copy will enable you to quickly re-submit if necessary.

On a side note, completing application forms for graduate school marks a good time to critically examine the impression that your voice- and e-mail are communicating to others. A Dave Matthews tune on your voice mail may entertain fellow students, but probably not the director of clinical training. Cute e-mail addresses, such as bongmeister@gmail.com or hotchick@aol.com, may delight romantic partners, but certainly not the dean of the graduate school. So now may be the time to alter those messages and convey a more professional demeanor.

By the same token, take a few moments to clean up your homepage, blog, and MySpace account. You may believe that your biographical entries and provocative photos are entertaining, but academics may question your judgment. More than one-quarter of employers state that they have researched potential job candidates on the Web (National Association of Colleges and Employers, 2007). We have every reason to believe that members of graduate admission committees do likewise.

Curriculum Vitae

Curriculum vitae means, literally, "the course of your life." The vitae or CV summarizes your academic and employment history in a structured form.

Both resumes and CVs summarize your credentials, but they differ in several ways. A resume is typically for employment, whereas a CV is for graduate school and academic positions. Resumes are brief, typically on a single page, whereas CVs go on for several pages. Resumes always list objectives, such as "To obtain an entry-level position in . . .", but CVs do not. Resumes frequently present personal interests and hobbies; CVs rarely do.

Figures 5-1 and 5-2 present two possible formats for a CV; you will need to adapt these samples to your individual needs. Although the samples are single-spaced and occupy only one page, CVs are *double-spaced* between entries and occupy several pages.

As a general comment, keep the CV honest and positive. Never fabricate, but perhaps "embellish" ap-

propriately. The line to be drawn here is demarcated by whether you can look an interviewer directly in the eye and factually defend an entry that could subsequently be corroborated by a supervisor, professor, or another person. Structured brevity is the key; lengthy expositions of experiences are best left to personal statements or job descriptions.

And this "academic resume" should be positive, upbeat in tone. Avoid any negative features that might red-flag your application. Save confessions and excruciating honesty for the clergy and psychotherapist. Omit sections that do not apply to you, such as "Presentations" or "Publications" if you have had none at this point in your career.

Let's proceed through the different sections of a CV and offer some additional hints. List your legal name, including any suffixes such as "Jr." Distinguish between a current address and a permanent home address, if this applies to your living circumstances. Note any anticipated changes in your address. Include telephone numbers and e-mail addresses at which program directors or professors can easily reach you. If you share voice mail or an answering machine with other people, insure that they will graciously take a message for you and reliably transmit that message to you.

Information on your marital status and dependents is definitely optional. Opinions differ widely on whether you should include this material on your CV: the probable positives are that you are being honest and sharing information about yourself; the likely downsides are that the information may be used against you or lead to illegal considerations in admission decisions. The marital status question is now almost moot since approximately half of all graduate students in psychology are married (Pate, 2001).

Regarding education, list degrees as "anticipated" if they have not yet been awarded. Impressive grade point averages may also be listed here. Honors are listed in chronological order, usually excluding those obtained in high school. If you received an honor specific to a university (e.g., the Lawrence Lennon Memorial Award), then record what it is for. Similarly, specify the disciplines of honor societies. Clinical experiences and research experiences can be listed together or separately, depending on what will strengthen your CV, but in either case indicate position title, relevant dates, number of hours, duties performed, and the supervisor. Include any presentations or publications in APA style, thereby demonstrating your familiarity with the psychologist's publication manual. The names of references should be listed only after you have obtained their permission to do so. *Never list a reference*

November 2008

CURRICULUM VITAE

Name: Chris Smith
Address: 15 Easy Street
 Babylon, NY 12345
Telephone: (516) 555-1212
E-mail: bear@babu.edu
Place of Birth: Scranton, Pennsylvania
Citizenship: United States of America

Education:

H.S. Diploma Cherry Hill High School, City, State, June 2005
 B.S. (anticipated) Psychology, Babylon University, May 2009

Honors and Awards:

New York State Regents Scholarship, 2005–2009
 Dean's List, Babylon University, 2008–2009
 Psi Chi, 2008
 Babylon University Honors Program, 2007–2008
 Who's Who Among Students in American Colleges & Universities, 2008

Clinical Experience:

Mental Health Technician, Friendship House, Jackson, Wyoming, June 2007–August 2008. Duties: recreational counseling and supervision of 20 behaviorally and emotionally disturbed children. Supervisor: Doris Day, M.S. 40 hours weekly.

Telephone Counselor, Mesopotamia County Community Crisis Center, Babylon, New York, 2006–2007. Duties: used a crisis intervention model to counsel a wide range of callers. Supervisor: Randal Kaplan, M.A. 4 hours weekly.

Research Experience:

Research Assistant, Babylon University, Department of Psychology, September 2007–June 2008. Duties: word processing, manuscript preparation, and data analyses for Chris Demanding, Ph.D. 15 hours weekly.

Honors Research, Babylon University with Rita Murrow, Ph.D., 2006–2008. Duties: proposed and conducted an original project; data input and analysis using SPSSx; write-up and oral defense.

Professional and Honor Societies:

Psi Chi, National Honor Society in Psychology
 American Psychological Association (student affiliate)
 Alpha Gamma Epsilon Omega (National Honor Society in Ergonomics)

Presentations and Publications:

Smith, C., & Murrow, F. A. (2007, April). *Self-esteem and math performance: Another look*. Paper presented at the meeting of the Babylon Psychological Association, New York.

Murrow, F. A., & Smith, C. (2008). The effects of self-esteem on math test performance. *Journal of Psychology*, 46, 113–117.

Campus Activities and Leadership:

Psychology Club, member (2007–2008) and president (2007–2008)
 University Singers, Babylon University, 2005–2007
 Hand-in-Hand, participant (2005–2008) and campus coordinator (2008)

References:

Frances Murrow, Ph.D., Associate Professor, Department of Psychology, Babylon University, Babylon, NY 12345.
 Voice: 516-555-1212; e-mail: murrow@babu.edu

 Voice: 516-555-1212; e-mail: les@babu.edu

Doris Day, M.S., Senior Therapist, Children's House, 78 Oak Street, Jackson, WY 12345. Voice: 307-555-1212

FIGURE 5-1. One format for curriculum vitae.

Personal History:

Business Address: Department of Psychology
 Babylon University
 Babylon, New York 12345
 Phone: (516) 555-1212
 Home Address: 1017 Jefferson Avenue
 Cherry Hill, NJ 08002
 Phone: (609) 555-1212
 E-mail: bear@babu.edu
 Birthdate: March 15, 1987
 Citizenship: United States of America

Educational History:

Babylon University, Babylon, New York
 Major: Psychology
 Degree: B.S. (anticipated), May 2009
 Dean's List, 2006–2008
 Who's Who Among Students in American Colleges & Universities, 2008
 Honors Thesis: Investigation of the relationship between self-esteem and math performance (Chairperson: Rita Murrow, Ph.D.)

Professional Positions:

1. Telephone Counselor, Mesopotamia County Community Crisis Center, Babylon, New York. Part-time position, 2006–2008. Duties: used a crisis intervention model to counsel a wide range of callers. Supervisor: Randal Kaplan, M.A.
2. Mental Health Technician, Friendship House, Jackson, Wyoming. Full-time summer, 2007. Duties: recreational counseling and supervision of 20 behaviorally and emotionally disturbed children. Supervisor: Doris Day, M.S.
3. Research Assistant, Babylon University. Half-time position, 2007–2008. Duties: word processing, manuscript preparation, and data analysis. Supervisor: Chris Demanding, Ph.D.

Membership in Professional Associations:

Psi Chi (National Honor Society in Psychology)
 American Psychological Association (student affiliate)
 Alpha Gamma Epsilon Omega (National Honor Society in Ergonomics)

Professional Activities:

President, Babylon University Chapter of Psi Chi, 2007–2008
 Member of Program Committee, Babylon University Psychology Conference, 2007
 Papers Presented:
 Smith, C. E., & Murrow, F. A. (2007, April). *Self-esteem and math performance: Another look*. Paper presented at the meeting of the Babylon Psychological Association, New York.

Publication:

Murrow, F. A., & Smith, C. (2007). The effects of self-esteem on math test performance. *Journal of Psychology*, 46, 113–117.

Campus Activities:

Psychology Club, member (2006–2008) and president (2007–2008)
 University Singers, Babylon University, 2006–2008
 Hand-in-Hand, participant (2005–2008) and campus coordinator (2008)

FIGURE 5-2. Another format for curriculum vitae.

on a CV or application form unless you have secured that person's agreement to write a letter in support of your application.

Place the date (month and year) on the upper right-hand corner of the CV. In this way, you can submit an addendum if your credentials significantly improve by, say, having a paper accepted for publication or receiving your department's "student of the year" award. Lay out the information in an attractive and organized manner. Use a consistent format both within each section and between sections. For example, if you opt to list your clinical experiences from the most recent to the past, then maintain this format in all the other sections.

Here is an idea to enhance the CV for students who have developed specific research or computer competencies. List them on your vitae as a separate section. Computer skills might include proficiency with SPSS, SAS, Pascal, Harvard Graphics, Chartmaster, SigmaScan, SigmaPlot, CricketGraph, and Aldus Pagemaker. Research skills might include performing computerized library searching on *PsycLIT* or *Medline*, administering the Wisconsin Card Sorting Test (or another psychological test), or operating an electroencephalograph (EEG). Also include here any special skills, such as fluency in foreign languages or proficiency in American Sign Language. A faculty member screening applications may realize that these competencies are exactly what he or she is looking for in a new graduate assistant or research assistant. So use your CV to highlight your abilities! Omit this optional section if you have none or only one specific competency; in the latter case, describe the special qualification in your personal statement.

What should *not* be put on the CV? Eliminate listings of religion, hobbies, pets, favorite books, and items of that kind (Hayes & Hayes, 1989). They are unnecessary; save them for a resume. Nor is a photograph customary.

Padding of all varieties must be avoided. Padding occurs when a reader reacts to the CV as more form than substance ("Who are they trying to fool?!"). Potentially risky is listing professional projects under way—one or two legitimate research projects may pass but any more will probably be considered suspect. Other signs of padding, and therefore sections to exclude, are conventions attended, journals read, and projects you worked on in a nonprofessional capacity.

Pumping up your past on CVs and application forms is common but inadvisable. A recent survey of 2.6 million job applications discovered that 44% of them contained lies (Kluger, 2002); do not be among the 44%. Once you are caught fibbing on a graduate school

application, it is practically impossible to restore your integrity and character at that program. While some of your friends may exhort you to exaggerate your previous positions and to inflate your GPA, we strongly advise honesty.

Proofread the document carefully; review it with an advisor before you print it. It ideally would be produced on a laser printer with a few fonts, but any letter-quality printer will suffice. Staple the pages together when finished (Hayes & Hayes, 1989).

The CV, like personal statements (below), should be printed on standard-sized white or cream stock. Purchase good quality bond paper for these documents. Avoid onionskin paper, goldenrod color, odd-sized papers, memo pads, green or red ink, and other unconventional or "cheap" materials.

Although much of the information contained in the CV is requested on the application form itself, we believe the inclusion of a CV enhances your application—providing it is properly prepared. A CV denotes a scholarly demeanor, highlights your accomplishments, and communicates familiarity with the workings of academia.

Personal Statements

Another bridge you must cross is writing the statement of purpose. Every program will want to know why you chose clinical or counseling psychology and the area within it that you plan to study. Admissions committees will also want to know how you came to this decision and what sorts of goals you have in mind. Each application will ask this question in a slightly different way because each program has different expectations and approaches to training. *Read the instructions carefully.* Do not just word process one statement and submit it to everyone.

Do not misinterpret the meaning of personal in *personal statement*. This essay is not the place to espouse your philosophy of life, to describe your first romance, or to tell the story about your being bitten by the neighbor's dog and subsequently developing an anxiety disorder. Instead, think of the essay as a *professional statement*. Write about your activities and experiences as an aspiring psychologist (Bottoms & Nysse, 1999).

An analysis of 360 essays required as part of the graduate application process demonstrated wide variability in the content requested (Keith-Spiegel, 1991). The most frequent requests were to articulate:

- Career plans
- Clinical experiences

- Interest areas
- Specific faculty of interest
- Research experiences
- Autobiographical statement
- Academic objectives
- Reasons for applying to that particular program
- Educational background

To reiterate: carefully read the question, individualize your response to each program, and respond to all parts of the question posed to you.

Be attentive to what the program requests. If they stress research, highlight your research interests and experience. If they stress clinical work, highlight the development of these interests and your training experiences to date. Show how you started with a question or a clinical observation, how you pursued that question, and how it developed into a greater understanding of the issues at hand and a need to know more. Demonstrate how this program meets your needs and is the ideal place to continue to pursue knowledge. State the goals you wish to attain with this knowledge, the career path you hope to work toward. If you are committed to the Boulder model, indicate how research is useful and how it is clinically applicable.

If you can make this connection in your personal statement, you will impress on the admission committee the integration APA sets forth as its ideal for Boulder-model, Ph.D. programs.

Graduate selection committees value clarity, focus, and “passion” in personal statements (Keith-Spiegel, 1991). Clarity and focus are typically construed as indicators of lucid thought, realistic planning, and self-direction, all valuable assets in a graduate student. At the same time, try to communicate a heartfelt commitment to your chosen career. “Passion” is not too strong a term—even relentless, obsessed, committed, fascinated; in short, what we call “catching the fever!” Your statement might well include such assertions as “I love college and the academic environment,” “I am fascinated by counseling psychology and its potential to empower people and change communities,” or “Research is a passion, not only a course requirement.” Graduate faculty seek students who find it difficult to distinguish between work and pleasure when it comes to academic tasks (Kieth-Spiegel & Wiederman, 2000).

The personal statement is a prime opportunity to induce a match with the research and clinical interests of a faculty member. Many programs, as we have said, attempt to match faculty with incoming graduate students on the basis of mutual interest, for example, family therapy, women’s issues, or neuropsychological assessment. This matching strategy is more often em-

ployed by research-oriented than practice-oriented programs, but attempt it in all of your personal statements.

To illustrate, consider the clinical admissions process of the University of Ottawa, a program with an equal emphasis on research and practice. Like many programs, they create a finalist pool by eliminating applications with inadequate GPAs and GRE scores. Then each of the clinical faculty members reviews all the finalist applications in order to locate several possible matches. These applicants then receive interviews. As you can see, and as we have repeated throughout this book, gaining admission into competitive doctoral programs is not limited simply to one’s credentials but also includes a match in research and clinical interests.

Here, then, are a few general guidelines for writing personal statements that increase the probability of a match:

- Mention at least two and perhaps up to four of your interests. This obviously covers a wider range than a single interest.
- Cast your interests in fairly broad terms—not administering the Wisconsin Card Sorting Test, but neuropsychological assessment; not a mail survey of counseling psychologists, but the characteristics and practices of psychotherapists.
- Nominate at least two professors with whom you would like to work at that particular graduate program. This, too, enhances the chance of a successful match.
- Integrate the program’s training philosophy into your personal statement. For example, “I resonate with Babylon University’s goal of producing multi-culturally competent psychologists to work directly in the community.”

A commonly asked question is, “How personal should I get in my personal statement?” Although there is no universally correct answer, some suggestions can be offered. A personal detail, such as describing how growing up with a handicapped or disturbed sibling has affected your life and decision to enter psychology, is appropriate. However, depicting the situation in intimate detail without relating it to its contribution to your own growth may lead an admissions committee to question your judgment. A rule of thumb is to be introspective and self-revealing without sounding exhibitionistic. For example, it is appropriate for an applicant to state how personal life experiences have contributed to better self-understanding, but it sounds peculiar when the applicant goes into great detail about particular relationships or early life events (Halgin, 1986). Although allusions to your personal psycho-

therapy in personal statements does not appear to overly stigmatize candidates or lead disproportionately to their rejections (Schaefer, 1995), we recommend against including your personal therapy in written materials. Better to save such intimate disclosures for the personal interview, if appropriate.

Many personal statements are ineffective because, first, the student fails to spend time preparing them and, second, the student fails to be “personal” (Osborne, 1996). Therefore, as an applicant you should devote a substantial amount of time thinking, writing, rethinking, and rewriting the personal statement. Your statement should include personal details that relate to your ability to be a successful graduate student and that demonstrate maturity, adaptation, and motivation—the very characteristics sought by admissions committees.

Another question we are frequently asked is, “How distinctive or unique should my personal statement be?” Our answer is “as distinctive or unique as you are.” Some applicants labor under the delusion that personal statements should resemble creative writing samples that magnify their singular accomplishments or that set the world on fire. Set the bar more realistically and aim for a personal statement that tells your own story clearly and convincingly.

A good idea is to show humility. Even if you have golden research and clinical experiences and 1400 GRE scores, you are still entering as a student. You are coming to learn. Mention the areas you hope to develop during your graduate school experience.

Be prepared to back up the claims you make in your personal statements. If you profess a working knowledge of, say, experiential psychotherapy, then be prepared for questions on the work of Carl Whitaker, Leslie Greenberg, and Alvin Mahrer. Similarly, if you claim fluency in Spanish, then expect one of the interviews to be conducted entirely in Spanish (Megargee, 1990).

The “to do’s” of personal statements are process suggestions and thus difficult to pinpoint, but the “not to do’s” are content oriented and easier to delineate (Whitbourne, 1999). We characterize three such “nots” as the three H’s: Humor, Hyperbole, and Hard luck stories. Humor rarely works in a formal written statement; so unless you are an unusually gifted satirist, we recommend you avoid jokes and funny stories about your life. Similarly, hyperbole rarely impresses the admissions committee. References to your “overwhelming childhood trauma” and “triumph over undiagnosed learning disabilities” in personal statements cast doubt on the veracity and accuracy of your judgment. And hard luck stories typically come off feebly. Many students financed their undergraduate educations, many

survived disastrous relationship choices, and many muddled through three academic majors before finding their niche in psychology. Avoid making adversity the theme of your statement.

Our advice is supported by a recent study on the “kisses of death” in the graduate school application process (Appleby & Appleby, 2004). Eighty-eight chairs of graduate admissions committees provided examples of application materials that caused the admissions committee to draw negative conclusions about the applicant. A prevalent theme among these kisses of death was damaging personal statements that were (a) overly altruistic, (b) excessively disclosing, or (c) professionally inappropriate. Examples of the overly altruistic statements were “I want to help all people live happy lives” and “I want to help people because of how very much I have been helped.” Examples of excessive self-disclosure were “being a recovering drug addict daughter of a sexually deviant and alcoholic mother” and excruciating details of an applicant’s year-long struggle with painful hemorrhoids! Our favorite example of professional inappropriateness was the applicant who submitted a statement of purpose titled “Statement of Porpoise” that contained drawings of the sea mammal and a description of the applicant frolicking in the ocean with a porpoise on a visit to Florida. As we said, avoid humor, hyperbole, and hard luck in your personal statement.

One way to make your personal statement sparkle is to describe any teaching assistantships or experiences. Talk about how you learned leadership skills and teamwork in this role. Specific examples of how you responsibly handled challenging courses or teaching activities will lead the reader to infer you possess the “right stuff.”

Your personal statement should tell a compelling, integrative story of a reflective individual who explicates accomplishments without joking or bragging or sobbing. As our colleague Sue Krauss Whitbourne (1999) puts it: Don’t say it softly or loudly, just say it clearly!

You will be asked in practically every personal statement and personal interview why you chose to apply to *this* particular graduate program in clinical or counseling psychology. Figure 5-3 presents a *portion* of a sample statement, addressing this ubiquitous question, written by one of our undergraduate students in his successful bid for entry into a clinical psychology doctoral program committed to the scientist–practitioner model. His reasons for applying to “Bogus University” are presented only as a single example; your statements will need to be tailored to your interests and credentials as well as the application instructions. Remember

It is my strong desire to attend a doctoral program in clinical psychology. I am seeking a program committed to the Boulder model, training scientist-practioners able to serve society in a variety of capacities. The program I attend should stress the importance of understanding and integrating the broad field of psychology, as well as providing the knowledge and training specific to clinical psychology.

After a thorough review of more than 50 programs in clinical psychology, I have chosen to apply to Bogus university for a number of reasons. First, your program is known for producing stellar graduates, and has been repeatedly recommended to me by several psychology faculty. Second, Bogus university allows students to immerse themselves in research early in their graduate careers. Third, I am drawn toward several of your faculty members, including Dr. Babe Ruth for her work in substance abuse and cognitive therapy, and Dr. Ty Cobb for his work in sexual health, stress, and coping. I would be pleased to have either of these faculty members as my mentor. Fourth, the available clinical experiences would allow me to work with a population I find of particular interest, such as adults and families at the Psychological Services Center. And fifth, I am looking to attend school in a scenic area of the country where both my fiancé and I think we would be happy.

FIGURE 5-3. Portion of a sample autobiographical statement.

that this is just one part of an entire autobiographical statement.

Nonetheless, his why-I-applied-to-your-program statement illustrates several important points. First, he advances multiple reasons for applying to that particular program. Five reasons sound much more convincing than one or two. Second, his reasons for applying to Bogus U. primarily address his professional match with the program (their reputation, faculty members, clinical opportunities) but nicely concludes with a personal touch (geographic location). Third, he mentions two specific faculty and several potential research interests in an attempt to maximize the chances of a match. Fourth, the statement reflects his careful reading and incorporation of the program's self-description; for example, he cites the opportunity to immerse himself early into research and names the Psychological Services Center. Fifth, the statement is systematically organized and clearly written—indicators of an organized and clear-thinking graduate student!

Compose your personal statement as carefully as you would an important term paper. Write several rough drafts and then set it aside for a few days. Avoid slang words on the one hand, and overly technical or elaborate words on the other. Stick to the information requested; avoid too many “ruffles” and lengthy expositions of your own philosophy (Fretz & Stang, 1980). Write as many drafts as necessary until the statement sounds right to you.

Before you finish your personal statement, have friends read it for grammar, spelling, and typos. Regardless of the content, technical accuracy really makes a difference. Once it is error free, have one or more fac-

ulty members read it and make suggestions. Let them know where the statement is going, and they should be able to guide you on form and appropriateness.

For further tips on writing your personal statement, skim Donald Asher's (2000) *Graduate Admissions Essays: How to Write Your Way into the Graduate Program of Your Choice* and visit the following Web sites:

We hope that our suggestions in this section guide you in writing your personal statement. It is also our hope that they are not too constraining. This is the part of the application where an admissions committee gets to see you in a more personal, three-dimensional light, an area where “you can be you.”

Letters of Recommendation

What do admission committees gain from letters of recommendation? The answer is a personal but objective evaluation of your work from a professional experienced in the field. Admission committees desire a more objective sense of your abilities and experience than what you provide about yourself. Consequently, it is best to have at least two of the people writing your let-

ters be at the doctoral level in psychology or psychology-related disciplines. One fine letter from a master's-level clinician is usually acceptable, but he or she will not be in a position to attest to your ability to complete doctoral studies. By the same token, bachelor's degree recipients, friends, and relatives should never write letters of recommendation to doctoral programs—they simply do not have the experience or knowledge of what it takes to earn a doctorate. Letters from politicians and your psychotherapists typically are inappropriate as well—they tend to write personal and psychological testimonies instead of academic letters of reference.

Choose people with whom you have worked for a long enough period, preferably for a year or more. That typically excludes professor you have taken a single class with, even if you did get an A. If you wrote a particularly strong paper in the class and the professor knows you a bit better, then he or she could serve as a reference, but this reference is still not the most desirable. At best this person can say, "This student was

always on time, participated in discussions, attended office hours, and tested very well. On this basis I consider him/her an intelligent student and a good candidate for graduate school."

By contrast, admissions committees want to hear something more detailed, like: "This student has worked with me for 1 year. During that time she scored MMPIs, tested participants using a Grass Model 7 polygraph, analyzed data, and conducted her own honors thesis. She was dependable and worked beyond what was required by the department. Given this student's intelligence, motivation, and responsibility, I think she would make an outstanding doctoral student." Though the above is a strong example, the point is that you want someone to attest to your ability and responsibility.

Table 5-1 lists some of the self-sabotaging things students do to receive neutral letters of recommendation. Although presented for its humor, it also provides sage warnings about interpersonal behaviors that annoy professors.

TABLE 5-1. Professors' Pet Peeves: Avoiding Neutral Letters of Recommendation

Students sometimes are unaware of how the seemingly innocuous things they do and say can annoy their professors. In turn, the professors provide students with less than enthusiastic letters of recommendation. Here are some examples suggested by William W. Nish of Georgia College, reprinted with his kind permission.

Be quick to apply such concise labels as "busy work," "irrelevant," and "boring" to anything you do not like or understand. Not only is this a convenient way of putting the professor down, but also you will not be bothered with the inconvenience of understanding something before you judge it.

Always be ready with reasons why you are an exception to the rules established for the class, such as the dates for submitting written assignments.

Avoid taking examinations at the same time as the rest of the class. Be certain to take it for granted that the professor will give you a make-up exam at your convenience, regardless of your reason for missing the exam.

Be very casual about class attendance. When you see your professor be sure to ask, "Did I miss anything important in class today?" This will do wonders for his or her ego. By all means expect the professor to give a recital of all of the things you missed instead of taking the responsibility for getting the information from another member of the class.

Be consistently late to class and other appointments. This shows other people how much busier you are than they are.

Do not read your assignments in advance of class lecture and discussion. This actually allows you to study more efficiently, for you can take up class time asking about things that are explained in the reading.

Avoid using the professor's office hours or making an appointment. Instead, show up when he or she is frantically trying to finish a lecture before the next class hour and explain that you must see him or her right that minute.

Do not participate in such mundane activities as departmental advising appointments. Instead, wait until the last minute for approval of your schedule, and then expect the professor to be available at your convenience.

Other students receive neutral letters of recommendation through no fault of their own. They experience difficulty in securing detailed letters of recommendation because they:

- Transferred from one college to another college before graduating (which occurs, according to the U.S. Department of Education, to almost one-third of all students);
- Attended a mammoth state university where they only took huge lecture classes and never had the same psychology professor twice; or
- Switched majors relatively late in their college career and did not get to know their psychology professors well.

We are sympathetic to these plights. If you fall into one of these categories, then you need to double your efforts to get involved in clinical experiences, research activities, and departmental matters—and do so quickly.

Most graduate programs request three or four letters of recommendation. Try to secure letters that will give the admissions committee the information it desires. At a practice-oriented program, two letters from clinical supervisors and one from a research advisor might be prudent. At a research-oriented school, two letters from research advisors and one from a clinical supervisor would probably be better. All things being equal, it is preferable to have your “research” letters come from faculty. However, if you believe that a letter from an employer would be significantly more helpful than that of a professor with whom you are not well acquainted, then it is probably a good idea to use the employer.

Our general advice was confirmed by an interesting study (Keith-Spiegel & Wiederman, 2000) that asked members of admissions committees to rank sources of recommendation letters. Raters were asked to assume that the letters from these different sources were equally positive so that rating variations were due solely to the referee’s characteristics. The most valuable sources of letters of recommendation were (in descending order): (1) A mentor with whom the applicant has done considerable work; (2) the applicant’s professor, who is also a well-known and highly respected psychologist; (3) an employer in a job related to the applicant’s professional goals; (4) the chair of the academic department in which the applicant is majoring; (5) a professor from another department from whom the applicant has taken a relevant upper-division course. By contrast, a letter from a graduate teaching assistant was rated, essentially, as no help.

And a letter from one’s personal therapist was rated negatively!

Very important: First ask the person writing the letters whether he or she can write you a good one. Ask this direct and specific question: “Can you write a good letter of recommendation for me?” If the person is hesitant or gives any indication of having reservations, *ask someone else!* A bad letter of recommendation is deadly. Better to have one brief letter from a professor who gave you an “A” than from someone who might express reservations about your abilities. “I don’t know” is better than “I know, but I have reservations.”

The way you approach professors for a recommendation is an underappreciated topic. You will ask specifically, “Can you write a good recommendation for me?” If the person responds in the affirmative, we strongly recommend that you provide that person with a letter similar to that shown in Figure 5-4. The person writing a letter of recommendation needs adequate information in order to produce a credible and informative letter. You can be powerful in shaping a professor’s letter of recommendation!

This letter—and the attendant course listing and CV—will promote accuracy and detail. These are essential characteristics of strong letters of recommendation in that the admissions committee looks for positive tone *and* detail. A two-paragraph laudatory letter on the order of “Great student, fine person” simply doesn’t make the detailed case for your admission into competitive doctoral programs.

What admissions committees also find useless in letters are duplicate and irrelevant information. One set of researchers (Elam et al., 1998) queried members of admissions committees and discovered the five *least* helpful aspects of letters of recommendation:

- Repetition of information from the application (e.g., repeating grades, honors, and scores available elsewhere on the application)
- Unsubstantiated superlatives or vague generalities
- Detailed descriptions of grades in one particular course
- Lack of strong relationship between applicant and letter writer
- Inclusion of irrelevant information, such as religious beliefs or hearsay

Put another way, give your referees sufficient data to render informed and positive letters about your personal characteristics, academic strengths, and interpersonal skills so that they do not resort to filling your recommendations with irrelevant content.

246 Wood Street
 Babylon, NY 14000

November 2008

Leslie Jones, Ph.D.
 Department of Psychology
 East Coast University
 1200 Faculty Building
 Hausman, MD 43707

Dear Dr. Jones:

Thank you for agreeing to write a letter of recommendation on my behalf. I hereby waive (or do not waive) my right to inspect the letter of recommendation written for me and sent to the designated schools of my choice. I am applying to (master's, doctoral) programs in clinical (counseling) psychology. My earliest deadline is _____.

Here are the courses I have taken from you.

Fall 2006	Abnormal Psychology	A-
Spring 2007	Clinical Psychology	B+
Fall 2008	Undergraduate Research	

Here are other activities in which I have participated.

2007–2008	Research Assistant
2006–2007	Vice President of Psi Chi

My latest GRE scores were 580 Verbal, 590 Quantitative, and 5.0 Analytical Writing. My Psychology Subject Test score was 610.

Finally, I attach a copy of my current vitae and a list of psychology courses for any additional information that might prove useful. Please feel free to call me at 555-1212 or to e-mail me at Chris_smith@phonyemail.com. Thanks again.

Sincerely yours,

Chris Smith

Encls.

FIGURE 5-4. Sample letter to request a letter of recommendation.

Here's how one doctoral program (University of Rhode Island) attempts to translate the content of recommendation letters into numerical categories.

1 Summary recommendations in all three letters are neutral or negative. Positive and

negative assessments are listed. Overall evaluation in all three is neutral.

2 Letters meet criteria between anchor points 1 and 3.

3 Summary recommendations in all three letters are positive and general. Positive

statements from all three letters. Statements are general in nature.

- 4 Letters meet criteria between anchor points 3 and 5.
- 5 Summary recommendations in all three letters are excellent and detailed. Positive statements from all three letters are very favorable and very detailed in their support.

Note, again, that the emphasis is on positive tone *and* supportive detail. This is the desired result of your extra work in providing references with factual information and assertive requests for letters of recommendation. A “liability letter” is one that communicates limited knowledge of the applicant, leading an admissions committee to conclude that the person was only minimally connected to professors in his or her undergraduate or master’s department (Halgin, 1986).

Many universities provide their own form for recommendations as part of the application package. Your institution will probably have one of two ways of handling these forms. One way is to provide your professor with these forms and stamped envelopes addressed to the schools to which the forms are to be sent. This is a small but crucial precaution—do not take the chance that postage will delay return of the letter. It is also courteous: Your professor is doing you a favor taking considerable time and contemplation to write a good letter. Another way is to provide your professor with these forms; he or she will then complete them and return them to the Office of Career Services/Planning for processing and mailing. Ask your reference which method he or she prefers.

A growing proportion of graduate schools are requesting that letters of recommendation be submitted electronically through their homepages or admission portals. In this case, you list the names, positions, and e-mail addresses of people writing you letters of recommendation on your application. The graduate schools then directly contact your referees via e-mail and provide them with the URL and a password to electronically submit their letters of recommendation to your application file. Online submission of recommendations will streamline the entire process and will become the rule in the near future.

The recommendation forms from graduate schools may appear to be quite different at first glance; however, closer inspection will reveal that they request essentially the same information. The forms typically ask the people writing the letters to note the length of time they have known you and in what capacities. Then the referees are asked to rate your research ability, originality, writing skills, organizational ability, maturity,

interpersonal skills, persistence, and similar qualities on a structured grid. Typical forms request an appraisal of the applicant in terms of 10 qualities in comparison with others applying for graduate study whom the referees have known in the applicant’s proposed field of study. The rating grid offers responses of top 3%, next 10%, next 20%, middle third, lowest third, and unable to judge. On most forms, an open space is then presented for a narrative description of your strengths and weaknesses. The forms usually conclude with a request for a summary rating: a check mark on a continuum from “not recommended” to “highly recommended” or a numerical value representing an overall ranking of this student to others taught in the past or some similar estimate.

Researchers have identified the most frequent applicant characteristics that recommenders were requested to rate on the forms (Appleby, Keenan, & Mauer, 1999). The resulting list—based on the analysis of 143 recommendation forms—describes the characteristics that psychology graduate programs value in their applicants. In descending order of frequency, the top dozen are as follows:

- Motivated and hardworking
- High intellectual/scholarly ability
- Research skills
- Emotionally stable and mature
- Writing skills
- Speaking skills
- Teaching skills/potential
- Works well with others
- Creative and original
- Strong knowledge of area of study
- Character or integrity
- Special skills, such as computer or lab

One important lesson to be learned is that graduate school aspirants should make a concerted effort to behave in ways that allow them to acquire relevant skills (research, writing, speaking, computer) and to be perceived by at least three of their professors as motivated, bright, emotionally stable, capable of working well with others, and possessing integrity (Appleby et al., 1999).

These forms, by law, will contain a waiver statement asking whether you do or do not waive your right to inspect the completed letter of reference. The Family Education Rights and Privacy Act of 1974 (the so-called Buckley Amendment) mandated that students over age 18 be given access to school records unless they waive this right. This is a complicated topic, but we advise applicants to waive their right of access *pro-*

viding, as previously discussed, the person writing the letter knows the student well and has unhesitatingly agreed to serve as a reference. Do not waive access—or better yet, do not request letters—from persons you do not trust or do not know.

A confidential letter carries more weight. By waiving your right to access, you communicate a confidence that the letters will be supportive, and you express trust in your reference. In fact, over 90% of health profession schools prefer letters of recommendation that are waived by the student (Chapman & Lane, 1997). Our experiences and naturalistic studies (e.g., Ceci & Peters, 1984; Shaffer & Tomarelli, 1981) suggest that professors' honest evaluations will be compromised when you have access to what they have written. By waiving the right, you are communicating an intent to have the "truth" told. Otherwise, admissions committees may lump the letter with all the other polite and positive testimonials (Halgin, 1986).

In making your choice of whether to waive or not to waive, be clear about the law. Most students correctly know that if they waive their rights they may never see the letter. However, many students erroneously think that choosing not to waive their rights means that they can see their letter if they do not get accepted or that they have a right to preview the letter before it is sent (Ault, 1993). These are common fallacies, but fallacies nonetheless.

The relevant laws do not dictate that professors must show students the completed letter. One study (Keith-Spiegel, 1991) of college faculty found that 17% never show students their letters of recommendation, 46% usually do not, 8% only to students they know well, 15% only if students ask, and 14% routinely show students their letters. Nor does the law guarantee a student access to letters if the student is rejected from a graduate program; in fact, students may inspect their files at a graduate school only after they have been accepted at and enrolled in that graduate school (Ault, 1993).

Going one step further, contrary to some students' beliefs, faculty do *not* have to write letters of recommendation for students. Letters are a common and voluntary courtesy, not a job requirement.

Why might faculty members decline to write a letter for a student? The single most common reason is that they don't know the student well enough (Keith-Spiegel, 1991). Other frequent reasons given by faculty are that they question the student's motivation level, emotional stability, academic credentials, or professional standards. If faculty defer on your request for a letter, politely inquire about their reasoning and graciously thank them for their candor.

One creative study asked psychologists how they would handle requests for a letter of recommendation from a student exhibiting specific problems (Grote, Robiner, & Haut, 2001). The majority indicated that they would *not* write a letter for a student who was abusing substances or who had shown unethical behavior. For most of the other student problems—interpersonal problems, lack of motivation, paucity of responsibility, marginal clinical skills—psychologists routinely would tell the student about their reservations, then write the letter including the negative information. If faculty members tell you that they have reservations about your behavior, then they will probably include the negative evaluation in their letter of recommendation. Politely inquire if their reservation will in fact appear in the letter. If so, thank them for their candor and withdraw your request for a letter.

Play it safe and provide the reference form at least 6 weeks before the deadline. Completing your recommendation may not be the top priority of the person you have asked to write it, or he or she may be out of town prior to the deadline. Do not take any chances that a letter will be late. Allow 2 weeks and ask if the letter has been sent. Be politic: do not pester, but do follow up.

If you seek additional information on requesting letters of recommendation, then we suggest the pointers offered by the following Web sites:

(click on All About Recommendation Letters)
- www.uwm.edu/People/ccp2/work/recletter.html
- www.psychwww.com/careers/lettrec.htm

Transcripts and GRE Scores

An application file will not be complete—and probably not even considered by the admissions committee—unless the required academic transcripts and entrance examination scores have been received. Your task here consists of requesting the appropriate organizations to transmit official copies of these materials to the graduate schools of your choice and then ensuring that the schools have received them.

With respect to transcripts, you must request that the Registrar's Office of all attended colleges and universities mail an *official* copy of your transcript directly to the graduate school. An official copy will contain the seal, stamp, and authorized signature of the institution. The cost of transcripts varies from place to place, but it averages \$3 to \$5 per copy. Submit transcript requests at least 1 month before the application deadline. Many universities take 2 weeks during the

semester to process these requests. The college form requesting a transcript will most likely accompany the transcript itself and thereby enter your graduate application file. Accordingly, this request form or mailing address should be typed or printed neatly.

Virtually all graduate programs continue to require hard copies of transcripts mailed from academic institutions. Online transcript exchange has been difficult to establish and is still uncommon. However, online transcripts will become more common with the advent of companies such as the recently formed National Transcript Center to provide secure electronic transmissions among institutions (Faubert, 2006).

A reminder: request an unofficial copy of your own transcript in September or October prior to applying. Inspect it closely for errors and omissions. Horror stories abound regarding erroneous transcript entries misleading admissions committees—an initial grade of I (incomplete) becoming an F (failure), honors credits not registered, unpaid term bills delaying transcripts, and so on. Don't leave it to chance; check it out yourself.

One creative researcher (Landrum, 2003) surveyed graduate admissions directors about the impact of transcripts and withdrawals in the admissions process. Results show that your transcript will get a careful review in practically all programs and will be reviewed by more than one member of the admissions committee in about 87% of the programs. With respect to the effects of course withdrawals (dropping a course after mid-semester) on transcripts, less than 4% of programs indicated that a withdrawal from a single course would hurt an applicant's chance of admission into the graduate program. But more than 20% of the programs indicated that two or more withdrawals hurt a student's entry into their graduate program. Thus, our advice to students contemplating a course withdrawal is that one is probably not hurtful, but that two or more withdrawals, especially from required courses such as statistics and research methods, may well have a negative impact.

With respect to GREs, score reports will automatically be mailed to you and electronically submitted to the four graduate schools you listed when you completed the GRE testing. The mailing date for the score reports is approximately 6 weeks after the test date for paper-based testing (Psychology Subject Test) and 2 weeks for computer-based testing (General Test). Your copy of the score report is intended only for your information; official reports are sent directly by ETS to the score recipients you designate. This procedure—as with the registrar transmitting an official transcript—is

intended to ensure that no questions are raised about the authenticity of a score report" (GRE, 2001, p. 16).

You will probably be applying to more than the four schools you designated for score reports. Toward this end, you can use the "Phone Service for Additional Score Reports" by dialing 1-888-GRE-SCORE. The charge is \$10.00 per call plus \$15.00 for each report requested, charged to your credit card. Your scores will be mailed within 5 working days. Or, you can submit an "Additional Score Report Request Form," published by ETS and obtainable at your Career Services Office, and remit your payment of \$15.00 for *each* score recipient listed. ETS pledges in writing to "make every effort to send your score reports within 10 working days after receipt of your request" (GRE, 2001), but you should allow for at least 1 month. You may have your GRE scores transmitted at any time during the 5-year period after they are initially reported.

Remember: only send unofficial copies of your GRE scores if you are applying well before the deadline, and telephone to be sure that this will not impede your application.

Unsolicited Documents

A frequently asked question is, "What if a program doesn't ask for something that I'd like to send?" Some examples are the curriculum vitae, a research paper, and job descriptions. If a program does not want additional documents, it will state so clearly on the application. In that case, do as the program requests. But even then, you may be able to make additional documents a part of your application if you have come to know a professor at the school and have shared any of these documents with him or her. In general, it is a good idea to send a curriculum vitae, research paper, and/or job descriptions if they are applicable.

If you have relevant work and clinical experiences but can only use one for a letter of reference, then include a curriculum vitae or job description. One benefit is that these allow you to spend less time focusing on the details of these work experiences in your personal statement. You can relate how the experiences influenced you without wasting space explaining exactly what you did.

As a professional, you will need a CV eventually, and we recommend you begin one even if you do not use it in every application. Start a vitae file and toss notes and memos into it regarding assistantship duties, noteworthy activities, committee assignments, professional associations—in short, everything you need to update your vitae (Hayes & Hayes, 1989).

A job description details your duties and responsibilities. When asking a supervisor to write a job description, ask him or her to focus on your specific tasks and how well you performed them rather than asserting how well suited you are to graduate school. This allows you to spend less time describing what you did and how well you did it when writing your personal statement. For example, prior to graduate school, one of us worked with a psychotherapist conducting a social skills group for preadolescents. In his personal statement he was simply able to speak about how that experience had affected him. By referring to the “enclosed job description,” the personal statement did not get bogged down in the details of this experience. Further, if you performed well at this job, having a supervisor’s positive assessment allows you to be more modest in your personal statement.

If you have a large number of work experiences, be careful not to overwhelm admissions committees with paperwork. Choose two experiences that showcase your diversity and that highlight characteristics not likely tapped by those writing your letters of recommendation. If you send more job descriptions than this, you may weaken their impact and increase the chances that the most laudatory ones will not be read (or at least not carefully).

If you have written a thesis or a research paper and have received feedback that it is well written, then include it. If there is someone whose research corresponds with your own, this may open a door for you. However, if there is a question as to your paper’s quality, then do not to send it. A questionable paper may do more harm than good.

Application Fees

Last but unfortunately not least, most schools require application fees. These fees range from \$0 to \$100 per school, and average \$50 for doctoral programs and \$35 for master’s programs (Norcross et al., 2005). Send a personal check or a cashier’s check (never cash). Attach the check securely and prominently on the front of the application with a paper clip.

If you are in financial need or are experiencing trouble meeting application expenses, read the application instructions carefully. There is usually a statement allowing fees to be waived because of financial hardship. Go to the school’s application Web site, or call and ask how to have the application fee waived. That some students cannot afford the fees is the reason schools make the allowance in the first place. Graduate schools are sensitive to the impoverished status of

many applicants, so please feel no compunction about requesting a fee waiver if it applies to you.

Check and Recheck

At this point, you have completed the application forms, requested letters of recommendation (and seen to it they were sent), written your personal statement, asked to have transcripts and GREs transmitted, and copied the unsolicited documents you plan to include in your applications. Once again, before you actually submit the material, have one of your professors check that it is accurate and well written. Have friends review it for typos and spelling. All material should be typed or word processed: it should look neat, error-free, and professional. It represents you in a very real way. Anything handwritten or tattered can convey the message that you are careless and unprofessional. Submission of materials should reflect a meticulous attention to detail. Finally, make sure your personal statement is not among those we see each year that carelessly includes the name of a different university when explaining why it is a perfect match!

After all this effort, make certain your application is sent on time. We suggest (if you can afford the extra expense) that you send your application via FedEx, UPS, Express, or certified mail. Each of these systems will allow you to track your materials to ensure they have arrived and to have the name of the person to whom they were delivered. However, our suggestion does not imply that you should wait until the last minute to express mail your application, implying procrastination (not a positive quality in a graduate student). Do express mail, but do it well ahead of the deadline.

One of the most frustrating experiences in the graduate application process is ascertaining that the respective programs have in fact, received all of your materials. Your application, transcripts, GREs, letters of recommendation—all need to be received, processed, and filed correctly by the graduate admissions office. Horror stories abound about application materials being lost or misfiled or sent to the wrong department. It happened to one of us!

Recently, one of our students shared a similar story. The ETS claimed that her GRE scores were electronically transmitted to and downloaded at a major Midwest university. The university, which required two official sets of GRE scores, claimed that they never received either set. The student was caught in the middle between two opposing claims. She telephoned ETS again and the university’s graduate admissions

APPLYING TO PROGRAMS

office repeatedly. The GREs had to be resent, at the student's expense.

We estimate that 50% of graduate programs will send a letter or e-mail apprising you of the application materials they have received on your behalf. Another 20% to 25% of graduate programs will post an application status page on their Web site where you can check yourself. That leaves 25% of the graduate programs that you can either blindly trust (which we *do not* recommend) or that you can contact (which we *do* recommend).

Call or e-mail the admissions office and verify that the material has been received. Some students prefer to include a self-addressed postcard to verify receipt, as discussed earlier, whereas others prefer the telephone. In either case, you have invested too much sweat, time, and money to leave the application to chance. Do not rely on graduate schools to keep you apprised; take personal responsibility.

CHAPTER 6

MASTERING THE INTERVIEW

The applications have been electronically submitted or mailed and are now out of your hands. Following the short-lived relief of finishing the applications, this period can be a nerve-wracking time. You have sold yourself on paper, and now it is up to the programs to decide which applicants to contact for further consideration and probable interviews.

The doctoral admissions process has been characterized as “multiple hurdles,” with some of the hurdles applied sequentially (King, Beehr, & King, 1986). The initial hurdle in most programs is the GRE and GPA score minimums. The second hurdle is rating of applications on such criteria as clinical experience, research skills, letters of recommendation, and the like. Being invited for an interview means you have successfully leaped these early hurdles, and this is a great compliment in and of itself. The final and determining hurdle for most programs is the personal interview.

Not all programs require personal interviews, and they will most likely state in the application if they do not. Make a note of this so that you do not become distressed when you are not invited. We wonder which is worse: the disappointment of not being asked to interview or the stress of being asked!

Our research on APA-accredited clinical, counseling, and combined psychology programs found that 93% of them required some type of preadmission interview (Oliver et al., 2005). As shown in Figure 6-1, 62% of APA-accredited programs strongly preferred an interview in person but were willing to accept a telephone interview. Another 27% of the programs absolutely required a face-to-face interview. Four percent required only a telephone interview. All told, only 7%

of programs did not require an interview before admission into the program.

Nearly all clinical and counseling psychology programs, then, require some type of personal interview, be it by phone or in person, prior to acceptance. Since some programs absolutely insist on interviews in person, do *not* apply to distant programs requiring an in-person interview unless you can afford it. Only in very rare instances will programs reimburse the applicant for all interview costs, and only 10% of the programs reimburse for some of the costs (Kohout et al., 1991). In other words, 90% of the programs expect you to absorb all the interview expenses personally.

Expect to hear from interested doctoral programs that require interviews from mid-January through early

FIGURE 6-1. Preadmission interview policies of APA-accredited programs. Data from Oliver, Norcross, Sayette, Griffin, & Mayne (2005).

March. Programs rarely contact students in the finalist pool after March 30 because the first round of offers usually goes out on April 1. It is still possible to be contacted, however, if you are on the alternate or waiting list.

Interview Strategically

The simple situation occurs when you are invited on a couple of interviews, the dates of the interviews do not conflict, and you have set aside enough money to travel to all the interviews. If only life were so simple! Instead, some applicants will not receive any interview offers, some will be invited to interview on a day they are already scheduled elsewhere for an interview, and still others will have depleted their funds and cannot afford interview travel.

How to handle these complex situations? In a word, strategically. Think through your options, discuss them with your mentor, and consider the following strategies.

If you have not received an interview request or a rejection letter by the middle of March, then calmly e-mail or telephone the doctoral program and inquire about the status of your application. If you have been rejected, politely thank the person. You never know, you may apply there again or have professional contact with the people in that program in the future. If your application is still being considered, it is permissible to ask when you might expect a decision. Just be careful not to be rigid or demanding.

If you are offered a personal interview at two doctoral programs on the very same day, not to worry. Should you be so blessed, we recommend that you (1) inquire if the programs have alternative interview days (and schedule one program on the alternative day). If not, then (2) ask if you can complete a video-conference interview or telephone interview at the less-preferred program. Remember that approximately two-thirds of programs will accept a telephone interview. If you value both programs equally, then (3) accept the interview at the least expensive program or the program with the highest likelihood of acceptance.

If you have depleted your funds for interview travel, then honestly inform the program and respectfully request a phone interview. Your email might read: "I am very interested in your program and initially planned to attend your interview day on February 15th. Unfortunately, my personal finances do not allow me to travel to Bogus University on that day. I am hopeful that you will permit me to conduct a phone interview on a day that is convenient for you. Thanks very much for understanding; I do wish that I could visit in person."

Many applicants obtain strategic information on interview invitations and admission offers from online message boards. The last few years have witnessed an increase in the number and popularity of these message boards devoted to doctoral programs in psychology (Fauber, 2006). Three examples spring to mind: Psych Grad.org, the Student Doctor Network (psychology), and Yahoo Message Board. These and other online boards are particularly valuable for notifying everyone the moment interview invitations are extended and admission offers are delivered. They also provide peer support through the taxing application process. However, we have read much online advice that is questionable, even downright wrong. Thus, use the free online boards to secure strategic information and timely support from peers but be wary of the proffered advice.

The Dual Purpose

The interview provides a critical opportunity for information gathering, not only for the program but also for you. That is, the dual purpose of an interview is for the program to check you out and for you to check the program out. Perhaps right now it seems outrageous to contemplate evaluating a doctoral program—you're probably delighted just to be asked! But a few interviews and an acceptance or two will reorient your perspective.

If you go on more than one interview, these interactions will give you the decisive information in choosing which program to attend. You will find out about clinical training, faculty members, student life, program fit, research facilities, and the like. Interviewers will be looking at your social skills, your emotional stability, your professional maturity, your focus, and your goals. The interviewers may want to see the development of your pursuits, the connection between your research and clinical work, or perhaps your adherence to the Boulder or Vail model. You may be asked pointed questions and will be expected to ask probing questions about the program.

Although the interview often generates anxiety for an applicant, it need not. As with anything else in the application process, the more you prepare, the more confident and less nervous you will feel.

A few basic observations about the interview process will contribute to your preparation. The interview is highly charged for the applicants and programs alike. *Both* wish to be evaluated positively and to achieve the best match. You are not alone in trying to put your best foot forward! Interview styles, moreover, vary tremendously—from a conversational tone to grueling questions, from casual to formal, from mundane con-

tent to intrusively personal content. Be prepared for all styles, and remember that all count equally in the final analysis.

That final analysis is the program's unenviable task of deciding which of the interviewees they will eventually select for admission. Programs ordinarily interview two to three times as many students as they can admit. The pool must be whittled down from, say, 200 applicants, from which 25 are selected for interviews, and from which 10 to 15 will be tendered an offer to obtain 7 confirmed acceptances.

Rehearsal and Mock Interviews

Rehearse the interview beforehand with a professor, a career counselor, or a knowledgeable friend. Although the research-oriented schools are usually less personal and invasive in their interviews, it may behoove you to get accustomed to being asked personal questions without being thrown. Such practice is invaluable, especially for preparing you to think on your feet. Rehearsing also will desensitize you to some degree, take the edge off of your anxiety, and add to your comfort with the process. During the interview you are on stage, selling yourself, and knowing what the interview is all about can only help you.

In keeping with the dual purpose of the interview, rehearsing will also afford you practice in the interview style you seek to convey. A respectful and curi-

ous tone—"I am wondering about the chances of receiving an assistantship if I am fortunate enough to be accepted?"—is preferable to a blunt and forceful disposition—"How much will you pay me if I come?" How you phrase a question is important. The interviewer will be more impressed with your eagerness to learn if you ask how many courses in an area are *offered* as opposed to how many are *required* (Megargee, 1990).

Rehearsing should also entail preparation for frequently asked questions of applicants. Table 6-1 presents common interview questions to anticipate and prepare for. *We strongly recommend that you have a concise and thoughtful response ready for each of these.* An "I haven't really given that question much thought" answer hurts. Role-play these questions with a professor or, better yet, undergo a "mock interview" at your career services center. During this pretend experience, request that the interviewer ask several of the questions in Table 6-1 and videotape the encounter.

Beneath the dozens and dozens of possible questions that an interviewer could ask you, career experts say they all boil down to only a few basic questions. The people making the final decisions really want to know (Bolles, 2006):

- Why are you *here*? (As opposed to another graduate program; in other words, how well do you fit with us?)

TABLE 6-1. Common Interview Questions to Anticipate

1. Why do you want to be a psychologist?
2. What qualifications do you have that will make you a successful psychologist?
3. What attracts you to <i>our</i> program?
4. Will you tell me a little about yourself as a person?
5. Do you think your undergraduate grades (or GRE scores) are valid indicators of your academic abilities?
6. What do you see as your strengths and weaknesses?
7. What do you bring into the program? What are your special attributes?
8. Have you ever had personal therapy? If yes, what sort of issues did you work on? If no, why not?
9. What are your research interests? Tell me about your research project/honors thesis.
10. What is your theoretical orientation?
11. Which of our faculty members do you think you would work with?
12. Where else have you applied or interviewed?
13. Can you tell me about a recent clinical encounter? How did you conceptualize or treat your last client?
14. What are your hobbies, avocations, favorite books, and interests outside of psychology?
15. What are your future plans and goals as a psychologist?
16. What questions do you have for me?

- What can you do for us? (How can your skills, knowledge, and experience enhance our program?)
- What kind of person are you? (Are you reliable and personable? Can we trust you with our research projects and/or our clinic patients?)
- What distinguishes you from 20 other people who can do the same tasks? (What makes you different from the other qualified applicants we are interviewing? Do you work better, harder, longer, more thoroughly?)
- Can we get you here? (If we accept you into our program, what is the probability that you will attend? How much will it cost us—in tuition remission or an assistantship, for example?)

Of course, you cannot anticipate all possible questions. Some interviewers pride themselves on avoiding stock questions and instead asking novel questions, thus precluding rehearsed and polished replies. The rationale behind these queries, such as “Who are your heroes?” and “What was the best day in your life?” is that they give a glimpse into your natural response style and tap into spontaneous information processing. One method to handle novel queries is to delay thoughtfully, remark that it is one you have not been asked before, request a moment of contemplation, and then respond forthrightly.

Similar to novel questions are behavior-based interview questions. These are increasingly being asked to assess an applicant’s behavioral repertoire and actual experiences. The behavioral questions rely on the familiar psychological dictum, “Past behavior is the best predictor of future behavior,” to glean something about your future behavior in their doctoral program. Four examples are:

- Tell me about an instance when someone asked you to do something that you considered ethically or morally wrong. How did you respond?
- Describe the biggest challenges you faced in the past year and how you handled it.
- Tell me about a work or school situation where you had to do creative problem solving.
- Relate a recent situation in which you had to persuade someone to accept your idea or proposal.

Your answers will enable you to concretely demonstrate integrity, resilience, creativity, and persuasion as opposed to simply saying you possess the traits. In sure that your responses communicate a successful ending, both for you and the other party involved in the situation.

Interview Attire

Your interview rehearsal should direct attention to your physical attire, which will be an influential factor in attributions made about you. For men, we recommend a conservative two-piece suit or a jacket and slacks, white or light shirt, and contrasting tie. Three-piece suits and “funeral outfits” are out. Wear shined brown or black shoes that are well maintained; as your parents have probably told you, the way you take care of your shoes communicates a lot about you. Dark socks only; save your white socks for work-outs. Hair should be trimmed and neatly groomed. For women, we recommend a pant suit or a suit with a skirt, dark in color or muted plaid, polished pumps or medium heels in matching color. Wear a simple style blouse, white or soft color. Interview professionals suggest a “no distraction” hairstyle, tasteful makeup, and clear or light nail polish. One pair of small earrings should suffice. For both men and women, plan your interview clothes, try them on, and lay them out well before the interview to assure that they fit, are clean, and are in good repair.

Attire should err on the side of conservative and formal; better to be overdressed and loosen a tie or remove a scarf than to be underdressed for the occasion. Avoid flashy colors and loud fashions. Jewelry should be conservative and understated; go light on the perfume and cologne. Leave the piercings at home.

Some applicants complain to us that many faculty interviewers are wearing business casual, and thus ask why they (the applicants) can’t wear business casual as well. Our answer is clear: You are an applicant trying to make a stellar impression as a serious, motivated candidate for a competitive graduate program. You are trying to distinguish yourself as one of the premier students, not one of the underdressed herd. We urge you to “dress for success” in interviews, not in business casual. You can wear casual clothes after you are admitted to the program for most of your graduate life. But during the interview, you never have a second chance to make a first impression.

Questions about the program and other written material should be held in a professional attaché or briefcase. The location and weather will influence your choice of clothing. Reliable answers about expected attire can be provided by graduate students with whom you are staying prior to the interview itself.

Travel Arrangements

While preparing and rehearsing for the interviews, you will simultaneously be making arrangements to travel

to the interviews. The costs of travel vary wildly—from a few bucks for parking at a local university on interview day to more than \$1,000 for a 3-day jaunt across the nation involving air travel, rental car, and hotel. Our intent in the following paragraphs is to save you hassle and money in getting to the interviews.

As a general rule, you can save a great deal of money by booking early and paying promptly for air travel, but you must pay a stiff penalty if you make any changes in your reservation. So begin early to find those bargains. Start by calling the airlines on their toll-free numbers to ask for their best rates. Then use your computer and go online to seek the best fares through that airline's Web site. Airlines typically post special discounted fares on their Web sites. Before booking, take a quick look at expedia.com, travelocity.com, and other commercial sites that promise the lowest possible fares. Compare the schedules and fares from all three sources—the airline agents, the airlines' Web site, and commercial Web sites—and then make a decision.

Being flexible in your travel schedule will probably save you money. It may save you money to leave from a different city than the one closest to you. We have saved hundreds of dollars on airfare by simply driving an extra hour to another airport. Or it may save you money to fly to a different city and then drive an hour or two to the interview. Try inserting nearby alternative cities in your computer search and see what fare comes up. One applicant flew out of Washington, D.C. instead of his home airport of Norfolk, Virginia, and reduced his ticket price from over \$1,000 to \$278 (Megargee, 2001).

Another way of being flexible is changing when you fly. As most business travelers return home on the weekend, airlines typically offer deep discounts on trips that extend over a Saturday night. The cost of another night at the hotel might save you hundreds in airfare. And consider flying on the "red eye" or "night owl" flights that criss-cross the country overnight. In order to fill otherwise empty seats, airlines frequently offer reduced fares at unpopular (and ungodly) hours (Megargee, 2001).

Booking an airline ticket with multiple destinations (circle trips) can also ease the toll on your credit card. You can fly from Chicago to an interview in Denver and then onto an interview in Dallas before returning to Chicago. This circle ticket often costs less than a separate round trip to each destination.

Some doctoral programs coordinate rides from the airport to the university for applicants, but most do not. You are on your own. In advance of your arrival, check out bus and train routes. The university's home-

page will typically have public transportation routes and driving directions from the local airport to the campus. If public transportation is unavailable, you will need to rent a car at the airport. You will find, again, that the rental costs vary widely. And you will, again, investigate the costs early and aggressively to locate the best fare. Rely on the three traditional sources—the rental company's toll free number, its Web site, and the commercial travel Web sites—for two or three rental companies.

Renting a car on your own will require at least three things: a valid driver's license; a major credit card in your name; and a chronological age over the minimum, typically 25 years of age. The latter can be a huge hassle if you are still an undergraduate; be aware of the company's age policy in advance. Most companies will charge an extra daily fee for renters age 21 to 24—typically about \$25 per day.

Most doctoral programs will extend you an invitation to room with a graduate student in the program the night before the interview. If possible, take advantage of this opportunity. It will allow you to save money, acquire masses of information, and gain a sense of student life and the campus community from people in a position to know. If you reside with a graduate student, ask for a tour the day or night before the interview. Ask to see the psychology building, the training clinic, the library, and some of the labs. If possible, get comfortable with the rooms where the interviews will be held.

Unfortunately, not all programs offer or provide a free place to sleep. In these cases, unless you have a large extended family, you will spend an evening or two in a hotel. Your task here is to secure a safe, convenient location at a reasonable rate. Use the AAA tour book and the Web for preliminary reconnaissance. If you have wheels, you can often save money by staying at one of the less expensive places on the edge of town or near an Interstate exit. In particular, if you are on a tight budget, be sure to check out places with the code word "Inn" in their names, as in Comfort Inn, Days Inn, Fairfield Inn, Hampton Inn, Hobo Inn, and Red Roof Inn (Megargee, 2001).

Even these inns may have negotiated rates. Ask the person scheduling your interview if the university has negotiated special rates with any local hotels. When booking your room, ask what discounts are available—for students, AAA members, government employees, and so on.

Whether you spend the night in a hotel or with a graduate student, you may well be invited to dinner. Be sociable and friendly, but do not drink heavily or

party hearty the night before (even though you may be invited!). Get a solid night's sleep, arise on time, and eat a sensible breakfast.

Although we discussed attire and appearance in the previous section, it is worth a few more sentences as applied to travel. You may well experience some delays in your flight itinerary or in your driving time to the interview. As a consequence, you may not have that expected hour or two to clean up and change clothes before the interview. Or you may well meet other applicants en route and faculty members at the airport. The moral: do not travel in cutoffs, warm-up suits, or t-shirts unless you are prepared to interview in that outfit. Dress and travel like a professional.

Interview Style

The objective of your interview style is to present yourself as a confident, knowledgeable, and genuine person—an imperfect human, to be sure, but one without major interpersonal deficits or gross psychopathology. Even if you are anxious, try to appear relaxed, calm, confident. Any anxiety you may be experiencing is understandable and should be dealt with maturely. Strive to be as mature and natural as possible.

The interview is designed for the interviewer to get to know you as a person—your interpersonal skills, career goals, and clinical acumen. One of the few empirical studies on the role of the personal interview in the psychology admission process found that the rating of an applicant's clinical potential was the most highly weighted measure among all the interview data. Ratings of verbal skills and research skills also contributed to the prediction equation, but ratings of clinical potential contributed most to discriminating among groups of accepted applicants, alternates, and rejected applicants (Nevid & Gildea, 1984). In one way or another, you must impress the interviewers as someone they would be comfortable sending a member of their own family to for professional treatment.

The following factors have been found to lead to rejection of an applicant during interviews (Fretz, 1976):

- Poor personal appearance
- Overbearing, overaggressive, know-it-all style
- Inability to express yourself clearly—poor voice, diction, grammar
- Inadequate interest and enthusiasm—passive, indifferent
- Lack of confidence and poise—nervousness, appearing ill at ease

- Making excuses, evasiveness, hedging on unfavorable factors in record
- Lack of tact and maturity
- Condemnation of past professors
- Little sense of humor
- Emphasis on whom you know
- Inability to take criticism
- Failure to ask questions about the program

The last point is worth emphasizing. Each interviewer will want to get to know you as a person and will expect you to ask questions. Nothing is tougher on an interviewer than the person who does not ask questions or simply responds “Yes” or “No.”

So even if it has been a long day, when the fifth interviewer asks you if you have any questions, don't reply, “No, all my questions have already been answered.” And respond to the questions of the fifth interviewer with the same enthusiasm as you showed to the first interviewer (Megargee, 1990).

At the same time that you are conveying clinical potential and a mature interpersonal presence, you want to acquire the factual program information necessary to make informed decisions. Table 6-2 presents questions you can ask when you interview. You should ask some of these questions during the interview, others before, and others after. Some should be asked of professors, because they are best suited to answer them and asking can make you look prepared and informed. Some questions should be asked of first-year students because they have recently been through the process and are closest to your situation. Some questions are better asked of fourth-year students because they are about to leave and may have less investment in hiding the program's shortcomings.

The best questions to ask are those that indicate initiative, curiosity, and responsibility (Hersh & Poey, 1984). Try to communicate motivation to learn and eagerness to participate in many activities; avoid questions that promote a speculation that you are demanding, complaining, or single-minded.

A caveat: never ask for information that is available in the program description or the graduate catalog. These questions make you appear unprepared for the interview and uninterested in the program.

Alternatively, link your specific question to general information sent to you. Examples might include: “I read that all of your first-year students receive an assistantship and tuition remission. Is this also true of second-year students?” “Your graduate catalogue lists a Couples Therapy course, a special interest of mine, but it does not indicate if clinical supervision in that area is

TABLE 6-2. Interview Questions an Applicant Might Ask

Clinical

Is training available in different theoretical orientations?
 Is the supervision individual or group? Is it live supervision?
 Do the full-time faculty conduct the clinical supervision?
 What type of supervision will I receive?
 When do I actually begin clinical work?
 How many practica are offered?
 What are your off-campus clinical practica like? Where are they located?
 What types of patient populations are available?
 Are specialty clinics available?
 Do the faculty have active private practices?
 Do faculty serve as clinicians or consultants at local mental health facilities?

Research

What is the student–faculty ratio?
 About how many dissertations and master’s theses are chaired by each faculty member?
 When and how am I assigned an advisor?
 Does this person have weekly research meetings?
 Could I sit in on a lab meeting?
 How many of the core faculty are actively involved in research projects (e.g., regularly publishing)?
 How many research grants finance graduate students?
 If I wanted to change my mentor or advisor, is that allowed?
 How many lab computers are available to graduate students?
 Are computers readily available? Is photocopying free?
 Is SAS or SPSS available?
 What is the relationship with the medical or law school?

Finances

What percentage of students receive full financial support (assistantship plus tuition waiver)?
 What types of fellowships are available?
 What types of research and teaching assistantships are available?
 What is the average amount of a 9-month assistantship?
 Who gets tuition remission? What are my chances?
 Do the stipends cover the costs of living in this area? How are the rents?
 What percentage of students receive funding during the summer?
 Do any of the assistantships include health insurance?
 What percentage of students have taken out student loans?

Quality of Life

What is it like to live around campus? Is it safe? Expensive?
 What is the surrounding city/town like?
 Is graduate housing available? Do most students live on campus?

What is the off-campus housing situation like? The neighborhoods?
 Where can I go to get a housing application today?
 Are there theaters, movies, decent restaurants nearby?
 Is there public transportation, or do I need a car?
 What are some of the campus events and clubs?
 Is the Graduate Student Association active?
 Do the students socialize frequently?
 How is the student cohesion?
 Do students and faculty attend the colloquia?

Department and Politics

Do students and faculty have good relationships with each other?
 Do graduate students have a role in departmental policy and admission decisions?
 In your experience, what are the best and worst features of this program? (ask of graduate students)
 What are one or two things you wished you knew before attending this program? (ask of graduate students)
 What is the standing of the psychology department within the university?
 How do the different branches of psychology interact?
 What are the professional goals of the current students?
 How many fifth-, sixth-, seventh- . . . year students are there?
 Is there a sense of competition or cooperation among the students?
 How much emphasis is put on course work and grades?
 How common are grades of C?
 Do professors tend to collaborate on projects?
 Do I get a master’s degree along the way? When is this usually done?
 Can the program be undertaken on a part-time basis? What percentage of the student body is part-time?
 When do I take the qualifying exams? What are they like? How many people fail? Can they be retaken?
 Could I see a course schedule for next (or last) year?
 Are teaching opportunities available for graduate students?
 For applicants who already have a master’s: Once accepted, how are transcripts evaluated regarding credits?

Outcomes

Where do your students complete their internships?
 What percentage of your students obtains an APPIC or APA-accredited internship?
 What is the average length of the program (including internship)?
 What percentage of your incoming students eventually earn their doctorates here?
 Do dissertations usually get published?
 In what type of settings do most of your graduates eventually find employment—academic, private practice, clinics?

available.” “While reading about your impressive Psychological Services Clinic, I wondered how many of the full-time clinical faculty provide supervision there.” And so on.

The intent is to get beyond the gloss and formality of the published program descriptions to the lived and personal experiences of the program participants. Virtually all descriptions of clinical and counseling psychology programs, for example, will allude to ample opportunities for practical experience in off-campus placements. But when you directly ask students, “What is your clinical placement like?” their answers may diverge substantially from the published information. Their responses may indeed be positive, but it is not uncommon to learn that some of the placements are 50 miles away, do not offer any stipend, and are very competitive. To be sure, be tactful in your questioning, but also be assertive in securing crucial data.

Program directors (e.g., Hersh & Poey, 1984) have nominated certain questions to *avoid* asking. These unwittingly annoy interviewers or communicate an undesirable impression: questions regarding the typical length of a graduate-student week, which may indicate fear of hard work or a long week; persistent inquiries regarding an area of interest that the graduate program only minimally provides; questions reflecting resistance to learning the major theoretical orientation offered by that program; and antagonistic questions concentrating on the perceived limitations of the program, be they financial, faculty, or geographical.

Bring your list of questions with you to the interview, but do not constantly have it in plain sight to check off. Your task is to ask the questions of the most appropriate individuals in a respectful manner. On a similar note, many people have “palm pilots” to help organize personal information. Though you might use one to make an important note at the *end* of an interview, keep them away during the interview itself. And on that note, cell phones and beepers should be turned off during the interview. Having one beep or buzz will be disruptive, and checking a pager or taking a call would be seen as *extremely* unprofessional and rude.

Extreme ideologies—religious, sociopolitical, or clinical—do not bode well in interviews. One interesting study (Gartner, 1986) mailed mock graduate school applications to professors of clinical psychology. The results showed that professors were more likely to admit an applicant who made no mention of religion than they were to admit an otherwise identical applicant who was identified as a fundamentalist Christian. Do not deny your beliefs, of course, but try to avoid expressions of rigid extremes. Academics favor informed pluralism and critical open-mindedness.

Bernard Lubin (1993), a former national president of Psi Chi and a veteran of conducting admission interviews, enjoins applicants to present themselves as *knowledgeable* and *collaborative* during the interview. Being familiar with the research interests and productivity of the program faculty can go a long way. Carefully reading the program’s guide and identifying faculty publications through *PsycLIT* are direct evidence of a mature and scholarly attitude. This leads to presenting yourself as a potential collaborator: welcoming opportunities to work with faculty members and fellow students, displaying an affirming and positive attitude toward interdependent activities.

A final piece of advice on interview style concerns your nonverbal behavior. Some applicants are so preoccupied with asking questions and trying to impress the interviewer that they neglect the way they present themselves nonverbally. But interviewer impressions of candidate personality depend heavily on nonverbal behaviors (Anderson & Shackleton, 1990). Maintaining eye contact, making changes in posture, and varying facial expressions strongly contribute to an image as a mature and enthusiastic person. The research consistently advises interviewees to keep high levels of eye contact with the interviewer and to display frequent positive facial expressions to maximize their chances of success. Your mock and actual interviews should strive for an interpersonally engaging style that creates personal liking and that cultivates an impression of interpersonal and intellectual skill.

Literally hundreds of Web sites offer advice on interviewing skills. Although they are no substitute for live rehearsals and mock interviews, they are a source of considerable information and examples. Some even offer virtual interviews. Our favorite sites are:

- www.quintcareers.com
- www.quintcareers.com/behavioral_interviewing.html
(specifically on behavioral interviewing)
- www.content.monster.com/interview/home.aspx
- www.glencoe.com/sec/careers/career_city/index.html
- www.nextstep.org

Stressful Questions

This brings us to consider a prominent fear, namely, being placed on the spot with intensely personal questions. You may have heard stories about applicants being asked intimate questions about their families of origin, romantic relationships, and personal history they would prefer not to share. You should be prepared to

answer personal questions about such relationships and self-perceptions. Answering these questions in a straightforward manner contributes to the interviewer's positive evaluation of an applicant.

The nature of these questions varies with the interviewer's style as well as the program's theoretical orientation. Applying to a research-oriented behavioral program, however, is no guarantee that you will not be interviewed by a psychodynamic member of their faculty. Questions pertaining to family conflict or to your personal therapy could arise. Anticipating such questions can help you to determine how to handle them most comfortably and to decide how much information you are willing to disclose. Knowing where to set your boundaries will lead to a smoother interview.

Speaking of boundaries, the APA Ethics Code (APA, 2002, p. 1068) does not require students to disclose sensitive information regarding their "sexual history, history of abuse and neglect, psychological treatment, and relationships with parents, peers, and spouses or significant others" unless the training program has clearly identified this requirement ahead of time. Thus, unless the program sent you a specific notice of such a requirement for the interview, you are not ethically obliged to reveal such personal information. Our advice is to balance your need for privacy with the program's need for information about your personal history and psychological dynamics.

One stressful but popular question concerns your personal weaknesses. Applicants naturally wonder how honest to be about their deficits and try to balance the need for honesty with the need to leave a favorable impression. We have found three strategies useful in approaching this question. One is to minimize an existing limitation: showing your awareness of it but not articulating the full severity or manifestation. If being taken advantage of frequently is your perceived weakness, for example, you might reply on the order of "Occasionally I find myself being taken advantage of by others in small but consistent ways." A second strategy is to turn the weakness into a possible strength. Following the same example, you might remark that "I give to a fault on occasion and find some people will take advantage of my tendency to look for the best in people." A third possible strategy is to express your awareness of the weakness and your efforts to remediate it; this reply demonstrates both introspective and corrective attitudes. "I've been working to become more conscious of how people, especially personality-disordered clients, can take advantage of me. My over-trusting nature is slowly giving way as I attend more closely to this relationship pattern." Whatever strategy—or combination of strategies—you elect, the response

must be consistent with who you are. A phony or inauthentic response can immediately strike an applicant from further consideration.

One stressful situation necessitates your careful preparation. A few programs and faculty use what is called a "stress interview." In this interview, the faculty member intentionally acts inappropriately and tries to intimidate applicants, simply to see how they handle the stress of the situation. This can come in many forms: long silences after you answer questions; asking overly intimate questions; disagreeing violently with your position or answer; feigning disinterest in you as an applicant; or even giving you coffee in one hand, a powdered donut without a napkin in the other, and then handing you an article to browse! Knowing ahead of time that this can happen is crucial, because you can remind yourself that it is not personal but simply part of the process. In a few programs, the professors place all the applicants in an empty room and suggest they speak with each other while the professors observe the interpersonal process: no other directions, no other structure. This all serves to compound the students' anxiety.

Stress interviews are designed to assess how comfortably you behave under such interpersonally challenging conditions. The interviewers deliberately arrange situations or ask questions that you cannot predict, for examples, "How would you redesign a giraffe?" or "Where is Oregon?" The particular answer you give is not as important as the manner in which you answer. Here your interpersonal savvy and presence can triumph. The interviewer is testing your reaction to stress: do you react to stress with humor, anxiety, self-denigration, anger? The stress interview is an ambiguous, semi-projective device.

Our advice is to remain calm and polite, yet assertive. Generally, it is not wise to become entangled in a verbal battle or retreat into an apologetic or defensive stance. In the face of an inappropriately personal question, a "I wonder how that question relates to my admission here?" will demonstrate both your personal boundaries and your willingness to broach a difficult topic. In the face of continuing conflict, a polite "we respectfully disagree" can suffice, and leave it at that (Heppner & Downing, 1982).

Practicing stress interviews with professors or peers may sufficiently desensitize you to keep your head and field the situation without too much ego bruising. Another way to prepare yourself is to stay overnight before the interview and take the opportunity to ask graduate students which professors might conduct such an interview, allowing you to know ahead of time that this person is likely to intentionally try to

stress you. Foreknowledge and preparation are the best defenses.

Group Interviews

Admission interviews in clinical and counseling psychology differ markedly from one program to another. At one extreme, a few programs invite you for a single, 2-hour interview with a senior faculty member. That's it—no tour, no group interview, no program orientation, and no interaction with current graduate students.

At the other extreme, a number of programs invite selected applicants for an entire admissions weekend. At the University of Pittsburgh, for example, invitees to the clinical psychology program's weekend spend a full day (about 7 hours) interviewing with faculty and graduate students. In addition, there are clinical and research information sessions, laboratory tours, evening parties, and a poster session featuring research projects. Many of the applicants arrive on Friday and leave Sunday morning.

In between these two approaches are intensive 1-day sessions. For instance, at Fordham University's counseling psychology program (Kopala et al., 1995), the interview process entails a brief orientation to the program, individual interviews with a faculty member and a graduate student, a videotaped group experience, a 30-minute writing sample, an open session with graduate students, and then a closing session with the director of training.

Virtually all programs will arrange for at least one individual interview with a faculty member and for some interactions with current doctoral students. A healthy proportion of programs will also include admission interviews featuring multiple candidates in the same room at the same time. This group interview may be conducted in the interest of sheer efficiency, of observing your interpersonal style, or both.

Our advice on your interview style and objectives in these group interviews remains essentially the same as for the individual interviews, but there are a couple of twists. First of all, strive to be pleasant and honest with the other interviewees. Share your experiences, never denigrate their credentials, and treat them like future colleagues (which they may very well be). A negativistic or superior attitude is likely to be held against you in the final deliberations of the admission committee.

Second of all, since it is a group situation, try to present yourself as an admirable facilitator. Don't be a group psychotherapist or a control maniac, but a respectful cofacilitator of the interview process. If you have already asked a few questions about the pro-

gram, for instance, you might say that you have additional questions but would first like other people to have an opportunity to have their questions answered. As they say in the social psychology literature, try to manifest both a high task orientation and a high social orientation.

Additional Tips

Whether it is an individual interview or a group interview, here are additional tips regarding the interview.

- Arrive at least 15 minutes early on interview day. Find the offices, acclimate to the building, and get settled.
- Be compulsive and double-check your interview schedule. Being late or missing an interview (even when it is not your fault) can reflect poorly on you.
- Greet each interviewer in a friendly, open manner. Your handshake should be firm and your eye contact frequent.
- Demonstrate your active listening skills: wait to answer until the interviewer has completed asking the question and give complete answers to the question posed to you.
- Keep your answers to 1.5 to 2 minutes long. Use good grammar and diction. Say "No," not "nah."
- Avoid all irritating hiccups in your answers. On the short list are the irritating "you know," "like," and "okay."
- Always bring extra copies of your CV. Every interviewer may have not received a copy or may have not yet reviewed it, so bring along copies to present and leave with people (Megargee, 1990).
- Take cash along in case you are invited to lunch or dinner with graduate students.
- Conclude each interview by thanking the interviewer for her time and information. Wrap it up with a cordial and pleasant tone.

Our collective experience in conducting interviews also generates a list of *don'ts*:

- Don't call faculty members by their first names until (or if) they offer. The default option is to call them "Dr." or "Professor."
- Don't whine or complain about the interview arrangements. Accept the free housing with gratitude; be agreeable about the food; act flexibly about interview dates. Nobody, including admissions committees, likes a fussbudget.
- Don't accept offers of coffee or other beverages during the interview itself. It tends to be messy,

distracting, and awkward for you as the interviewee. Wait until after the interviews are complete and then graciously accept the offer.

- Don't ask about or negotiate financial assistance before receiving an offer of admission. The nitty-gritty of finances can wait until later.
- And don't ask questions during the interview that are answered in the materials sent to you or posted on the program Web site. We have already made this point earlier in the chapter, but it is important enough to reiterate it here.

If you follow these steps, you will find it easier to relax during the interview. The more prepared you are, the more confident and at ease you will feel.

Telephone Interviews

Two situations may dictate a telephone interview. In the first, you are asked to visit the school for an interview, but you cannot afford to do so. This is no reason to be embarrassed, and the more straightforward you are about it the better. You can request a phone interview in advance if you do not have the resources for an actual visit. In the second situation, you receive the

dreaded, unannounced phone interview. At least one of your prospective programs will probably call without prior notice and ask to speak with you on the spot.

Luckily, if you anticipate telephone interviews, you have nothing to worry about. One strategy is to rarely or never take a phone interview "cold." Consider telling the caller, "I'm sorry, but I was just leaving for an appointment. Could you leave a number and arrange for me to call you back?" This buys you time to review your information on that program and to prepare for the interview. However, you do not want to communicate disinterest in the program.

Another strategy is to prepare phone cards, palm pilot notes, or computer files. You make index cards or short files for each program to which you applied. On it, record a few reasons for your interest in that graduate program and the name(s) of the professor(s) you are interested in working with, a little about their research areas, and questions you may have about clinical training or facilities (many of the questions in Table 6-2). Figure 6-2 is an example of such a card. Keep a stack of these by the phone, or on a computer by the phone and in moments you will find the card for a particular school and not be caught unaware! This little extra effort can prevent a serious detraction

University of Alexandria

Reasons for my interest: Great reputation in child psychopathology and psychotherapy; specific professors (Smith, Adams); geographic location; has specialty clinic in behavioral medicine.

Key professors:

Dr. Smith: child psychopathology; substance abuse

I read your May [2007] article in *Journal of Bogus Psychology*, in which you found offspring of alcoholics to be more receptive to the anxiety-reducing effects of alcohol than control subjects. Do you expect to continue this line of research next year? Is an assistantship available?

Dr. Adams: behavioral medicine; psychotherapy

I was impressed that you have a separate clinic in behavioral medicine. What type of clients do you most often treat? What opportunities are there for clinical experience?

Other professors with potential interest:

Dr. Jones: prevention

Dr. Watson: forensic psychology

Program questions: [Refer to Table 6-2 for representative listing]

When do I begin seeing clients in the training clinic?

What percentage of incoming students are financially supported?

What are the research opportunities in child psychopathology?

FIGURE 6-2. Sample telephone card.

246 Wood Street
Babylon, NY 14000

March 16, 2008

Patricia Smith, Ph.D.
Director of Clinical Training
Department of Psychology
University of Western States
13 Orangegrove Drive
Wilksville, CA 98765

Dear Dr. Smith:

I want to thank you for interviewing me for a position in your clinical psychology doctoral program. I enjoyed meeting with your faculty and staff and learning more about the program. My enthusiasm for the program was particularly strengthened as a result of my interactions with Drs. Timothy Hogan, Elizabeth Cannon, and Carole Buchanan.

I want to reiterate my strong interest in attending your program; the University of Western States offers a great deal that appeals to me. Please feel free to call me at (123) 456-7890 or e-mail me at csmith@uofs.edu if I can provide you with any additional information.

Again, thank you for the interview and your consideration.

Sincerely yours,

Chris Smith

FIGURE 6-3. Sample letter of appreciation to an interviewer.

from your application. If you receive one of these telephone calls and cannot remember which professors are at that school, their areas of research, or their facilities, it tells the interviewer that you are not serious about his or her program. This could place you lower than someone who has this information off the top of his or her head.

A Note of Thanks

Once you have completed an interview, whether by telephone or in person, a brief note of thanks to the interviewer is in order. This gesture serves multiple purposes: it demonstrates your social skills, communicates your gratitude to the faculty and students involved, reaffirms your interest in the program, and keeps your name alive in the admission process. Seldom will such a brief note do so much for you.

The “who” and “what” of these thank-you letters are almost entirely dependent on your interview experiences. The “who” should certainly include anyone who has shown you special attention, such as a graduate student you roomed with the night before or after the interview, a professor who personally escorted you around a lab or clinic, or a faculty member who offered an unscheduled interview. Letters to several people are often called for. If the interview was less personal, then at a minimum send the Director of Training a letter of appreciation. A sample letter is displayed in Figure 6-3. An e-mail note of appreciation may suffice, but we definitely prefer an ordinary letter by mail, because it will probably be placed in your application file for all to see and appreciate.

The “what” of the letter must be individualized to your particular experiences, but will probably contain at least three components: an expression of gratitude

for the interview, an enumeration of your favorable impressions of the program, and a reiteration of your interest in attending that program. Try to personalize each letter by referring to specific topics or experiences; for instance, recall your discussion of potential research studies or mention the friendliness of the graduate students. There is no definitive list of do's and don't's, but don't send a generic, impersonal letter and don't promote your candidacy. Do sound appreciative and personal. As with all written materials, insure that your letter communicates an image of sincerity and professionalism. Most of the letters should probably be word-processed, but a neat, handwritten note is appropriate if an interview was relatively informal and personal.

The Wait

Once you have finished the interviews and mailed the thank-you letters, it is a waiting game. But not for the programs, which still have a finalist pool of students much larger than they are able to accept! The interview process has probably weeded out a few, but the faculty are left with too many finalists, all of whom have acceptable GPAs, GREs, and letters of recommendation.

What, then, are the *final* selection criteria? This pivotal question was addressed in a study by Keith-Spiegel, Tabachnick, and Spiegel (1994), who had 113 faculty members actively involved in selecting psychology Ph.D. students rate criteria used in making the last cuts in admission decisions. (Results of this study should *not* be generalized to Psy.D. programs.) The faculty members were asked to imagine that they were left with a pool of finalists, three times the size of the number they can accept, all of whom had strong undergraduate GPAs, GRE scores, and letters of recommendation. They then rated 31 final variables in terms of importance.

Congruent with this book's advice and earlier studies, the top-rated criteria in clinical programs pertained to student match with the program and its fac-

ulty, research experience resulting in a journal article or a paper presentation, and the clarity and focus of the applicant's statement of purpose. Considered to be somewhat to very important in assisting selection committees with their final admission decisions were research assistant experience; reputation of the student's referees; relevant clinical experience; membership in an underrepresented ethnic minority group; knowledge and interest in the program; number of statistics, methodology, and hard science courses completed; prestige of the psychology faculty in the student's undergraduate department; reputation of the undergraduate institution itself; and honors bestowed on the student by that undergraduate institution. Rated as not important or minimally important were such variables as the student's geographic residence, Psi Chi membership, and a close relationship between the student and former graduates of that program.

Demand always exceeds supply in competitive clinical and counseling psychology programs. The three primary criteria used to evaluate applicants by doctoral selection committees—grade point averages, GREs, and letters of recommendation—typically fail to narrow the applicant pool to the small number of slots available. At that point, research skills, clinical experiences, “good match” factors, and writing skills come to the fore (Keith-Spiegel et al., 1994). Bear these considerations in mind as you approach your interview—just as we have in preparing this book.

And now you wait until contacted with the final decision of the admissions committee. Until the week before April 1, it is probably not a good idea to contact a program and ask where you stand. Applicants who make repeated calls or e-mails may appear overly anxious and irritate the staff (Mitchell, 1996). The one exception is if you have received other offers, and the program you would most like to attend has not contacted you—a situation covered in Chapter 7.

This brings us to the last step in the application process and the final chapter of the *Insider's Guide*.

CHAPTER 7

MAKING FINAL DECISIONS

As with any realm of human affairs, good decisions regarding graduate school require time, preparation, and knowledge (Scott & Silka, 1974).

By April 1, all APA-accredited clinical, counseling, and combined psychology programs will make their first round of acceptance offers. At this point you will have 2 weeks to make your final decision as to where you want to go to school. By APA regulations, you have the right to consider offers until April 15, at which time an offer may be withdrawn. So you must be thoughtful but decisive in these 2 weeks.

To protect applicants from making hasty, premature decisions, all APA-accredited programs and most others have agreed to allow candidates until April 15 for a final decision (or the first Monday after April 15, if April 15 falls on a weekend). This is in accordance with a policy adopted by the Council of Graduate Schools in the United States in 1965 and renewed in 2004. It was endorsed by the Council of Graduate Departments of Psychology in 1981 and again in 2000. The Resolution Regarding Graduate Scholars, Fellows, Trainees and Assistants (www.cgsnet.org/portals/0/pdf/cgsresolutionjune2005.pdf) reads as follows:

Acceptance of an offer of financial aid (such as graduate scholarship, fellowship, traineeship, or assistantship) for the next academic year by a prospective or enrolled graduate student completes an agreement that both student and graduate school expect to honor. In that context, the conditions affecting such offers and their acceptance must be defined carefully and understood by all parties.

Students are under no obligation to respond to offers of financial support prior to April 15; earlier dead-

lines for the acceptance of such offers violate the intent of this Resolution. In those instances in which the student accepts the offer before April 15 and subsequently desires to withdraw that acceptance, the student may submit in writing a resignation of the appointment at any time through April 15. However, an acceptance given or left in force after April 15 commits the student not to accept another offer without first obtaining a written release from the institution to which the commitment has been made. Similarly, an offer by an institution after April 15 is conditional on presentation by the student of the written release from any previously accepted offer. It is further agreed by the institutions and organizations subscribing to the above Resolution that a copy of this Resolution should accompany every scholarship, fellowship, traineeship, and assistantship offer.

Acceptances and Rejections

What do you do when one program makes you an offer and you are still waiting to hear from another program you would prefer to accept? To begin with, *don't say yes to any graduate program until you are certain that this is where you want to go!* Once you say "yes," that is it. You are committed. Saying yes to another program can endanger your acceptance at both places. If you have any reservations, do not feel pressured to say yes. Thank the person and say that you have been made other offers and you need a few days to consider this crucial decision.

If you have received offers but have not heard from the programs that most interest you, telephone or e-mail them. Explain that you are considering offers

TABLE 7-1. Student Reasons for Choosing a Clinical Psychology Doctoral Program

Reason	Mean rating	Rank
Reputation of the program	4.29	1
Amount of clinical supervision	4.27	2
Training facilities available	4.21	3
Appropriate mentors available	4.19	4.5
Emotional atmosphere of the program	4.19	4.5
Tuition waiver available	4.10	6
Amount of stipend offered	4.07	7
Theoretical orientation	4.04	8
Diversity of program	4.00	9
Specific specialty training available	3.89	10
Research experience available	3.85	11
Expected length of program	3.82	12
Amount of research supervision	3.80	13
Success of previous graduates	3.79	14
Specificity of the training program	3.66	15
Geographic location	3.60	16
Specific professor to work with	3.57	17
Family/significant others in area	3.00	18
Recreational activities available	2.69	19
Number of minority members in program	2.48	20
Break required during program	2.30	21

but that you do not want to act on them until you know what your status is there. It's OK to say, "I've been accepted at University X and Y, but I am most interested in your program. Can you give me an indication where my application stands, or at least whether it is still being considered?"

The "Guidelines for Graduate School Offers and Acceptances," adopted by the Council of University Directors of Clinical Psychology (1993), specifically encourage directors of training (or admissions) to apprise students of their position on the alternate list. Typically this entails a placement of high, middle, or low on the alternate list. If such a designation is used, the operational definition of "high on the alternate list" is that, in a normal year, the student would receive an offer of admission (but not necessarily funding) prior to the April 15 decision date.

Earlier, we emphasized the point that you should not accept an offer until you are certain that is the program you want to attend. On the other hand, if you have been accepted at three programs, and one of them is obviously less suited to your needs, be considerate of other applicants and decline that offer. The program

can then make their offer to someone else who may very much want to attend that school. *Only keep two offers alive at any one time.* Otherwise, a huge "log-jam" or "bottleneck effect" will occur across the country, with each program waiting for a few students to decide.

As long as there is a possibility that you may attend a certain program, be careful not to decline prematurely. As other students decline at these schools, you may be offered a better financial package if you have not yet made a formal commitment.

When all is said and done, how will you decide on which offer to accept? This is a difficult question to answer because of the multiple factors involved and because the final determinant will be how you, as an individual, weigh those various factors.

One study (Walfish, Stenmark, Shealy, & Shealy, 1989) had 201 first-year graduate students rate the reasons for their final selection of a doctoral clinical program. Their average ratings are shown in Table 7-1, where a rating of 1 was "very unimportant" and 5 was "very important." As seen there, the most important factors were the reputation of the program, the amount

of clinical supervision, the training facilities, availability of mentors, and the emotional atmosphere of the program. We have emphasized throughout the preceding chapters the importance of the first four factors, but not the last.

The emotional and interpersonal ambience of a program should not be underestimated. Seriously consider interactions with faculty and graduate students in your decision. The faculty–student relationship may be the single most important factor in your intellectual and professional development, and this relationship may be formal or informal, distant or close. Concurrently, the vast majority of graduate student time is spent with other students rather than with faculty members. You are likely to retain these personal contacts and professional relationships over the years. Moreover, fellow students are essential sources of encouragement, companionship, and inspiration. You want a good, lasting “fit” with the program (Scott & Silka, 1974).

In choosing a graduate program, all students place a premium on general factors such as program quality, training opportunities, emotional atmosphere, and financial aid. At the same time, ethnic minority applicants rate the relevance of multicultural factors higher than do white students (Bernal et al., 1999; Toia, Herron, Primavera, & Javier, 1997). These considerations include minority students in the program, presence of minority faculty, research on minority topics, and opportunity to work with multicultural clients. Be particularly attentive to the program’s diversity as it relates to your interests and goals.

The expected length of the doctoral program is a fairly important reason for choosing a particular program, as seen in the middle of Table 7-1. You may recall from Chapter 1 that clinical Ph.D. students take an average of 6.2 years to complete their doctorates, including the 1-year internship. Psy.D. students take an average of 5.1 years, a consistent difference of 1 to 1.5 years less. On the one hand, the shorter training period favors the Psy.D. programs. But, on the other hand, the financial aid favors the Ph.D. programs. As you have learned, far more Ph.D. students are receiving tuition waivers and assistantship stipends than Psy.D. students, most of whom are footing the entire bill for their doctoral education. Use the Reports on Individual programs to consider the expected length of the program in the context of probable financial aid from the program.

The reasons for choosing a clinical psychology program, as shown in Table 7-1, are largely self-evident, but two reasons *not* listed in that table deserve some consideration. *Attrition rates* refers to the percentage of students not completing the program. Attrition has

been characterized as a “hidden crisis in graduate education” (Lovitts & Nelson, 2000). Between 20 and 24% of full-time psychology students, on average, formally leave programs without completing their doctorates (Fennell & Kohout, 2002). Attrition in graduate programs is not solely related to academic ability; life problems, financial difficulties, interpersonal conflicts, and program dissatisfaction enter into the equation. Doctoral programs in which more than 25% of the students fail to graduate should be carefully screened when you make your final decision.

Our Reports on Individual Programs provide the attrition rates for each doctoral program, as reported by that program’s director of training. The attrition rate is calculated for the past 7 years as the number of matriculated students who have left the program for any reason divided by the total number of students matriculated in the program. Again, pay close attention to any program in which more than a quarter of students have left the program.

Preliminary or qualifying examinations, another consideration in the complexities of your choice, are a series of structured tests that some programs require at the end of their first or second year. These examinations assume many forms, but they all test a candidate’s knowledge of a wide range of areas in psychology—research methodology, learning, development, motivation, history, social, and personality. In some programs, only one attempt may be permitted to pass this examination (Scott & Silka, 1974). You should learn if the program requires “prelims” or “quals,” whether multiple attempts are provided, and what percentage of students pass, before you make your final decision.

You should now be well acquainted with the importance of the decision criteria presented in Table 7-1 in your own life and well informed about the program’s attractiveness on these criteria. If not, immediately request additional information on any of these for which you lack knowledge prior to making an informed choice of the program to attend.

The Financial Package

Note in Table 7-1 that the sixth and seventh most important selection factors are financial (tuition waiver and stipend amount). For many applicants, the financial aid offered by the school will probably assume an even higher priority in making final decisions. When an offer is made, establish if the program is offering financial assistance. If so, does it cover tuition remission? Is it guaranteed for 4 years? Is it considered taxable at that institution? Does it provide health insurance? If you have a teaching or research assistantship, how

TABLE 7-2. Median Tuition Costs in Psychology by Institution Type and Degree Level

	Institution type		Degree level	
	Public	Private	Doctoral	Master's
State residents	\$3,178	\$16,596	\$5,362	\$2,776
Nonstate residents	\$8,416	\$16,596	\$11,824	\$7,217

Note. Adapted from Pate (2001).

many hours per week will it entail? Are you allowed to earn additional outside income?

On average, private universities are more expensive than public or state universities. Typically, the “in-state” versus “out-of-state” cost difference that operates in undergraduate education is not as salient in graduate education. That is because (1) once you begin study, you can establish residency there and pay in-state tuition after the first year, and (2) many financial aid packages include a tuition remission.

But graduate training is expensive, and external sources of financial support are slowly drying up. Consider, for instance, the average stipends and accumulated loans for Ph.D. psychology students over the years (Golding, Lang, Eymard, & Shadish, 1988). Back in the 1960s and 1970s the average graduate stipend was higher, and the typical student’s accumulated loan lower, than in the 2000s, adjusted for inflation. In fact, the average stipend amount decreased 36% (controlled for inflation) over the past 30 years. About three-quarters of psychology doctoral candidates carry loans. Support is still available but not to the degree it once was—which accounts, in part, for your professors’ fond memories of their “good ol’ graduate days.”

Federal support for graduate training has been eroding in all fields, including psychology. In the 1970s, for instance, almost 30% of Ph.D. recipients in clinical psychology reported that federal grants and traineeships provided the major support for their graduate training (Coyle & Bae, 1987). Thirty years later, federal sources supported less than 4% of full-time graduate students in psychology (Wicherski & Kohout, 2005). Federal sources have slipped as a primary source of support for psychology graduate students and, to compensate for these shrinking resources, students have had to look elsewhere, to personal resources, student loans, and university financial assistance.

Research supports the conclusion that today’s graduate students are being asked to shoulder a larger share of their education costs. This is particularly true in Psy.D. programs, which fund proportionally fewer graduate students than Boulder-model Ph.D. programs.

Refer to the Reports on Individual Programs for the percentage of a program’s students who receive partial or full funding.

Table 7-2 shows the median tuition costs for psychology graduate students. The numbers demonstrate that tuition is largely a function of three variables: institution type, state residence, and degree level. Private universities uniformly charge higher graduate tuition than public institutions, just as is the case on the undergraduate level. Tuition at private institutions per academic year is four times higher than state tuition at public institutions. Psy.D. programs, routinely charge between \$15,000 and \$25,000 per year for tuition. Although your state residence does not influence tuition at private universities, it definitely reduces your tuition at public universities—from a median of \$8,416 for non-state residents to \$3,178 for state residents per year. Predictably, too, tuition is higher for doctoral programs than for master’s programs. So, your annual tuition can range from \$0 if you secure tuition remission, to \$3,000 if you are a resident attending your state university, to \$16,000 if you attend a Ph.D. program at a private university with no financial assistance, all the way up to \$25,000 if you attend a freestanding Psy.D. program.

Table 7-3 presents the assistantship stipends for psychology graduate students in 2004. As seen there, the median 9-month stipends for teaching and research assistantships averaged \$5,000 for master’s students and \$10,000 for doctoral students (Norcross et al., 2005). The typical hours worked per week for an assistantship are 15 to 16. Stipends for doctoral students are consistently higher than those for master’s students (Fennell & Kohout, 2002).

Financial considerations include the tuition cost, available stipend, and living costs. The latter cannot be ignored: although tuition costs may be equivalent in New York City and Kansas, the living costs are certainly not.

Once accepted into a doctoral program, you will naturally be eager to learn about the status of your financial assistance, but you will hear from institutions

TABLE 7-3. Median Assistantship Stipends in Psychology

	Doctoral students	Master's students
Teaching assistantship	\$10,617	\$5,000
Research assistantship	\$10,065	\$5,000
Fellowship/scholarship	\$11,500	\$2,000
Traineeship	\$13,658	\$6,000

Note. Data from Norcross, Kohout, & Wicherski (2005).

at different times depending on the form of the financial assistance. If it is department-controlled financial assistance, then you will ordinarily hear when you are accepted or shortly thereafter. If it is university financial assistance, not directly controlled by the psychology department or school, then it may well be weeks after you are accepted. Examples in this category are fellowships from the Graduate School, resident assistantships from Student Affairs, or a Graduate Assistantship in the Admission Office. If it is financial assistance from a government agency, such as the National Science Foundation (NSF) or National Institutes of Health (NIH), then you will hear on or before their published notification dates. Finally, if it is financial assistance in the form of loans, then you will hear from the bank, Sally Mae, or the lending institution on their (painfully slow) schedule.

The Alternate List

Your fervent hope is to receive an e-mail or telephone call early in April from the director of admissions offering you acceptance into your top-rated program with generous financial aid. But this glorious dream may not happen; instead, the sobering reality is that many applicants will be rejected from several programs, will secure offers from programs lower on their list, or will receive offers without financial assistance. Many will also receive calls informing them that they have been “wait listed”—that is, placed on the alternate list.

As mentioned previously, ask the director of admissions where you stand on the alternate list—high, middle, or low. For your planning purposes, be politely assertive in probing further: “In typical years, what percentage of students with this position on the alternate list receive an admission offer? What percentage of the students admitted from the alternate list receive funding?” Without answers to these questions, you cannot render an informed decision on your other offers.

The admissions directors will, in all likelihood, arrange for you to be kept abreast of your admissions

status until April 15th. They may email you or you may email them on occasion to determine the probability of admission.

When speaking with the program representative try to impress upon him or her three key ideas. First, you are keenly interested in attending that program. Second, express your availability by stating you have not accepted another offer of admission. And third, if you have received another offer, inform the program accordingly; most schools desire people who are attractive to others. Enthusiasm, availability, and attractiveness frequently move students up the alternate list.

The tricky part of this process is how frequently an alternate should contact (by telephone or e-mail) the program representative. Too much contact will appear aggressive or desperate; too little, passive or complacent. Strike a balance by asking the program representative how often you may contact him or her without being irritating.

Decision Making

The choice of which offer to accept and which program to attend is a momentous one indeed. You, like 86% of students enrolling in graduate programs, will quickly discover that the decision-making process boils down to your sense of fit with a program (Kyle, 2000). A few fortunate souls may receive an early offer with excellent financial aid from their number one program. But most graduate school applicants will ultimately select the program that makes the “best” offer—an offer that needs to be seriously weighed on a host of the aforementioned and often conflicting considerations.

The “April madness” abounds with such quandaries as: “Should I take Program X with the best training but with no financial aid or Program Y with solid training and half tuition remission for 4 years?”; “Two programs have offered the same money, but the one that I prefer is 600 miles from my partner. What should I do?”; “My top program guaranteed me a teaching as-

sistantship that requires 15 hours a week. My fourth choice is offering tuition remission and a fellowship. Any advice?”

Our advice centers on using systematic decision making. Begin by gathering all the salient data by interviewing program faculty and students, consulting published materials, and speaking with your mentors. Prioritize your primary reasons for selecting one program over another. Then develop a decision-making grid that will assist you in ranking your choices.

Two practical articles describe in detail how to apply decision-making techniques to choosing psychology programs and internships. Jacob's (1987) decision grid asks candidates to evaluate training programs along criteria that are important to them. You weigh those criteria that are more important to you correspondingly higher. You then tally the ratings for each training program to make the final decision. While it may sound a bit over-intellectual, in practice we have found that the decision grid forces students to identify the criteria that they value most highly.

Stewart and Stewart (1996) describe a paired-comparison ranking technique, a method originally traced back to psychophysiological methods developed by Gustav Fechner. The first step of this technique is to select the relevant personal, professional, and practical criteria that you will use in comparing programs to one another. Consult the preceding pages to identify these criteria; more importantly, conduct an honest self-evaluation to determine which of these lie in your heart. The second step involves prioritizing these selection criteria. Do this by writing the name of each criterion on a single index card or piece of paper, and then forcing yourself to rank them in order. The third step entails generating a list of programs that will be compared to one another. We suggest that you use those programs that have accepted you or which have placed you on their waiting list.

The fourth step of the technique involves the actual pairwise comparison of the programs. Write the names of the graduate programs along one side of a large piece of paper and the selection criteria on the other side. Which of the training programs most clearly satisfies your criteria? Make a choice and allow no ties. For each criterion, put a hash mark across from the program that wins. The hash marks will be counted to determine your choice.

Although the final result will generally agree with what you expected, the more productive outcome of these two decision-making techniques may be that they force you to view your selection decision from multiple perspectives and to prioritize numerous criteria. To be

sure, this is a complex method for a complex decision, but one that we and our students have repeatedly found surprisingly effective for making “impossible” choices more thoughtfully and systematically.

Finalizing Arrangements

An offer must eventually be formalized and specified in writing. Verbal offers and verbal acceptances are binding, but your acceptance of the offer should be in writing at the end of the process. Likewise, assistantships, tuition waivers, and stipends should be guaranteed in the written offer; respectfully insist that the financial arrangements be specified so that misunderstandings do not ensue. Should the offer be “contingent on expected funding,” determine the odds of the funding coming through. No position is absolutely certain in life, but some are more certain than others.

Weighing offers, negotiating financial aid, and dealing with rejections make this a heady period. Be careful not to get caught up in the experience and forget the most important point: accept one offer and confirm it in writing!

One of our students (the affable Jean Willi) was offered admission to a prestigious doctoral program, with financial assistance. He carefully considered alternative offers, negotiated with other programs, leading to predictable delays. He awoke one morning in a cold sweat, realizing that he had turned down all other offers but had not formally accepted the offer of admission and financial package from his school of choice. He was in graduate school purgatory! Although the school was understanding and everything eventually worked out for Jean, because he missed the deadline, the school had the option of changing the financial aid package, or even revoking the offer of admission. The moral of the story: don't pull a Willi! Be clear and decisive and put it in writing.

Figure 7-1 presents a representative letter of acceptance. Note that the letter should explicitly mention any conditions of your acceptance, including financial assistance.

Once you have formally accepted an offer of admission in writing, two small matters of etiquette remain: (1) informing other programs who have accepted you, and (2) expressing your appreciation to those mentors who wrote letters of recommendation on your behalf and on their own time. Figure 7-2 offers a sample letter declining an offer of admission. It should be succinct yet polite. Thereafter, send a brief e-mail or thank-you note to those who have assisted you through your graduate application journey. They will

Annika Jones, Ph.D.
Director, Admissions Committee
Department of Psychology
University of Western States
13 Orangegrove Drive
Wilksville, CA 98765

Dear Dr. Jones:

I am pleased to accept your offer of admission to the University of Western State's Ph.D. program in counseling psychology as a full-time matriculated student beginning in the Fall 2009 term. My acceptance is predicated on the conditions outlined in your letter of March 20th (attached), including full tuition remission for three years. I appreciate your confidence in me and very much look forward to joining the counseling psychology program.

Sincerely yours,

Chris Smith

FIGURE 7-1. Sample letter of acceptance.

be interested in the outcome of your application process and may well join the ensuing celebration!

If Not Accepted

What happens if you are not accepted anywhere? The grim truth is that about one-third of the entire applicant pool to APA-accredited clinical and counseling psychology programs will *not* make it in a given year. There are at least five alternatives:

1. *Contact the APA Education Directorate in early May and request a copy of the "Graduate School Openings List."* This document contains a list of graduate programs in psychology that still have openings for students in the fall. Although there are no APA-accredited clinical or counseling doctoral programs and only a few nonclinical doctoral programs on the list, you may find other programs of interest to you. To review the listings, go to the APA Web site in May at www.apa.org/ed/graduate/homepage.html.

2. *Apply to master's programs in clinical or counseling psychology.* Master's degrees are frequent stepping stones to the doctorate in psychology. Although taking your master's at one institution and transferring to another for the doctorate is not as efficient as being admitted directly into a doctoral program, there are advantages nonetheless. One is that the acceptance odds are more favorable—49% for master's programs in clinical psychology and 67% for master's in counseling psychology on average (Norcross, Kohout, & Wicherski, 2005). A second advantage is that a few years of graduate training in psychology can improve your grade point average, GRE Psychology Test score, clinical acumen, and research skills. A third plus is an opportunity to confirm that psychology is the career for you. A cruel irony of baccalaureate recipients admitted directly into doctoral programs is that they have little direct contact with the field they claim as their lifelong career! A fourth advantage is exposure to twice the number of faculty supervisors and theoretical orientations. A fifth and final advantage is the flexible

March 25, 2008

Annika Jones, Ph.D.
Director, Admissions Committee
Department of Psychology
University of Western States
13 Orangegrove Drive
Wilksville, CA 98765

Dear Dr. Jones:

I was pleased to receive your March 19th letter offering me admission to the Psy.D. program in clinical psychology at the University of Western States. I thoroughly enjoyed speaking with you and your colleagues and appreciated your generous offer of financial assistance. Unfortunately, I can only accept one admission offer, and I must regrettably decline your attractive offer. Please extend my genuine thanks and best wishes to the entire admissions committee.

Sincerely yours,

Chris Smith

FIGURE 7-2. Sample letter declining an admission offer.

course offerings—part-time study and, frequently, night courses are available in master's programs (Actkinson, 2000).

Selecting a *quality* master's program in psychology may be a key to eventual admission into a doctoral clinical program. By all means try to avoid master's programs that have come to be pejoratively called "money mills." These programs exhibit most or all of the following features: accepting a very high percentage (80% plus) of applicants; offering courses only in the evening or largely by part-time faculty; providing no funded graduate assistantships; being reluctant or unwilling to state what percentage of their graduates go on to doctoral programs; declaring openly their disinterest in research; requiring little undergraduate preparation in psychology; and communicating greater interest in filling classroom seats than in attracting qualified students.

By contrast, quality terminal master's programs in psychology can be roughly assessed by three criteria: exhibiting few of the aforementioned characteristics of "money mills"; holding a favorable reputation among the psychological community; and faculty producing

published research. Gordon (1990) lists 20 American master's programs ranked highest in productivity in 15 APA journals; interested students are directed to that article.

In addition to the foregoing research-based article, we heartily recommend that you consult an extensive compilation of master's programs in psychology. The classic is APA's (2007) *Graduate Study in Psychology*, which lists hundreds of master's (and doctoral) programs in psychology throughout the United States and Canada. To order, go to APA's Web site where you can purchase a hard copy or purchase a three-month electronic access. Another source, consisting of over 260 master's programs, is *Master's Programs in Psychology and Counseling Psychology* (Buskist & Mixon, 1998). To order, call 1-800-278-3525 or e-mail ablongwood@aol.com.

3. *Apply to doctoral programs that are not accredited by APA.* In general these programs fit into one of two categories. They may be credible institutions that simply have not been around long enough to gain APA approval. Programs cannot apply for accreditation

until they have graduated students, which takes several years. Usually these programs are planning on applying for accreditation as soon as they are eligible.

However, there is a second category of institution not accredited by APA. These programs usually do not conform to APA standards and often do not even attempt to gain accreditation. The quality of these programs is often considerably lower than those of the APA-accredited programs. Because of their status, non-APA-accredited programs typically provide greater probabilities for acceptance. If you do apply to such programs, by all means determine why they are not accredited, and whether their students are able to gain admission into credible internships and, later, to become licensed psychologists. You should refer to the most recent edition of APA's *Graduate Study in Psychology* to explore these and other programs.

4. *Decide against a doctorate in clinical or counseling psychology.* If your goal is to become a researcher or a practitioner, psychology is not your only option. Reexamine the other choices listed in Chapter 1 and consult your advisors to see if one of these options is suited to your needs.

5. *Apply again in a year or two to APA-accredited programs.* Knowing the criteria used by graduate schools, take a realistic look at what seem to be the limitations in your application. Many students continue to resubmit the same rejected application year after year to no avail; "doing more of the same" typically results in more of the same misery.

Another year can be an opportunity to remediate your weaknesses. Were your GREs low? Take a professional preparation course and retake the test. Was your GPA a bit low? Then take some additional courses or retake some old courses in which you did not perform your best to improve it. Take some graduate courses in psychology on a nonmatriculating basis to demonstrate your ability. Were you short on research skills? Then take 1 or 2 years and acquire a research position, paid or volunteer, in a psychology or psychiatry department. Did you lack significant clinical experience? Then spend a night or two a week working for a suicide hot line or find a job at a women's shelter. Were your letters of recommendation tepid or brief? Then acquaint yourself better with potential referees so they can write a positive and detailed letter.

Another year can also provide an opportunity to enhance your interview style or to acquire better

matches with graduate faculty members. Some applicants find themselves in the position of perennial "bridesmaids" or "best men," not because their credentials were inadequate, but because their interview style or matching potential was a tad weak. Spend the extra months improving your interpersonal presentation and investigating programs that promise to be better fits with your interests.

The so-called gap year is not intended as a vacation or a "year off." Instead, it is a year dedicated to improving your credentials and working hard at what interests you. When friends or parents ask what you are doing on your purported "year off," we believe the appropriate response is to proudly reply, "Preparing for my career in clinical/counseling psychology!"

In summary, reread this text and conduct a rigorous self-assessment of where you are and where you want to be. If you're still set on a career in clinical or counseling psychology, be prepared to take the time and energy to make yourself a better applicant. Especially if you are still in college and had planned to go straight on to graduate school, take time to gain some life experiences. Age and experience can work in your favor, and they will certainly help you better define your goals next time through the application process.

Two Final Words

Realism and persistence. Be realistic about your credentials, capacities, and acceptance odds. Some applicants refuse to accept the hard facts of the admission process and tragically resubmit the identically flawed application year after year to no avail. An honest evaluation of your credentials, perhaps with the assistance of an experienced professor, will enable you to strengthen your application, select more appropriate programs, or reevaluate your career decisions. This is not to dissuade or discourage you; it is realistic encouragement.

And be persistent! Many successful psychologists have required two or three tries to get into a doctoral program. Thousands of clinical and counseling psychologists have earned a master's degree at one institution before moving on to receive a doctorate at a different university. There is no shame in reaching for the stars; the real loss is not to reach at all.

We hope the information and suggestions contained in this *Insider's Guide* have been helpful to you. We wish you the best success in the application process and in graduate school.

REPORTS ON INDIVIDUAL CLINICAL PSYCHOLOGY PROGRAMS

Percentage of faculty subscribing to each of the following orientations:

Psychodynamic/Psychoanalytic	10%
Applied behavioral analysis/Radical behavioral	10%
Family systems/Systems	10%
Existential/Phenomenological/Humanistic	0%
Cognitive/Cognitive-behavioral	70%

Courses required for incoming students to have completed prior to enrolling:

While no specific courses are absolutely required, the most competitive students have solid, broad coursework in psychology, especially methodology and statistics, as well as undergraduate research experience (e.g., research assistantship or undergraduate independent thesis research; preferably, though not necessarily, in psychological sciences).

Recommended but not mandatory courses:

The most competitive students also show a strong record of coursework in mathematics (calculus preferable), natural sciences, other social sciences

GRE mean

Preference is given to students with a combined 1200 GRE Verbal and Quantitative.
Verbal: 593
Quantitative: 666

APPENDIX A

TIME LINE

Freshman and Sophomore Years

1. Take the core psychology courses—introduction, statistics, research methods, abnormal, physiological.
2. Find out about faculty interests and research.
3. Make preliminary contact with faculty members whose research interests you.
4. Explore volunteer opportunities in clinical settings.
5. Investigate various career choices.
6. Join psychology student organizations and become an active member.
7. Attend departmental colloquia and social gatherings.
8. Enroll in courses helpful for graduate school, including biological sciences, mathematics, writing, and public speaking.
9. Learn to use library and electronic resources, such as scholarly journals and PsycLit.
10. Consider participating in your university's honors program, if you qualify.
11. Begin a career folder and place activities, honors, and other valuable reminders in it.
12. Discuss your career interests with faculty members and other mentors.
3. Volunteer for research with faculty and begin researching a potential honors thesis/independent project.
4. Continue contact with faculty and upperclassmen.
5. Enroll in professional organizations, for example, student affiliate of American Psychological Association or American Psychological Society.
6. Apply for membership in your local Psi Chi chapter.
7. Visit your career services office on campus and determine how the staff can assist you in applying to graduate school.
8. Draft a curriculum vitae to determine your strengths and weaknesses.
9. Attend a state or regional psychology convention.
10. Peruse graduate school bulletins online to acquaint yourself with typical requirements, offerings, and policies.
11. Surf the Web. Become comfortable with leading Web sites on graduate school admissions.
12. Access the GRE bulletin and information online. Begin preparation for the GRE by purchasing a study guide, attending a preparation course, and taking practice tests.
13. Update your folder by putting your curriculum vita/resume and reminders of your activities and accomplishments in it.

Junior Year

1. Take more advanced psychology courses, for example, cognitive, developmental, psychological testing.
2. Begin clinical work, both volunteer and practicum.
14. Try to focus your interests in particular research areas, theoretical orientations, and clinical populations.
15. Consider serving as an officer in one of the student organizations on campus.
16. Meet with your advisor or mentor before summer to review your plan for graduate applications.

Application Year

June–August

1. Continue to acquire research competencies and clinical experiences.
2. Surf the Web and begin to gather information from program Web sites.
3. Begin to narrow down potential schools to 20–40.
4. Prepare intensively for the GREs.
5. Consider taking the GRE General Test if you are prepared; this will afford ample time to retake them in the fall if necessary.
6. Investigate financial aid opportunities for graduate students.
7. Set aside money for the cost of the GREs and applications.

August–September

1. Download program information and applications from program Web sites and/or write to schools for applications.
2. Receive information packets and read through them.
3. Consult with advisors regarding graduate programs, application procedures, faculty of interest, etc.
4. Continue to study diligently for the GREs.
5. Update your curriculum vitae.
6. Investigate possible financial aid opportunities.
7. Begin a file in your institution's Office of Career Services/Planning.
8. Gather applications for salient fellowships and scholarships.

September–October

1. Take the GRE General Test (for first or second time).
2. Register for the GRE Psychology Subject Test administered in November and December.
3. Create a short list of schools using the worksheets.
4. Record the deadlines for submitting each application.
5. Choose the faculty at each school that most interest you.
6. Research your area of interest, focusing on the work of faculty with whom you would like to work.
7. Write to graduate faculty expressing interest in their work (if appropriate).
8. Request a copy of your own transcript and inspect it for any errors or omissions.
9. Begin first drafts of your personal statement and get feedback on it.

10. Update your CV or resume.
11. Calculate costs of applications and admission interviews and acquire the money for them.
12. Finalize the decision on whom you will ask for letters of recommendation.

October–November

1. Take the GRE Psychology Subject Test.
2. Take the MAT (only if necessary).
3. Prepare packets to distribute to your recommenders, including a complete vitae or resume.
4. Request letters of recommendation.
5. Arrange for the registrar to send your transcripts to schools.
6. Gather information on financial aid and loans available to graduate students.
7. Finalize your personal statements.

November–December

1. Complete applications.
2. Maintain a photocopy of each application for your records.
3. If the opportunity arises, visit professors with whom you have been in contact.
4. Submit applications.
5. Verify that the applications and all necessary materials have been received.
6. Request ETS forward your GRE scores to the appropriate institutions.

January–March

1. Wait patiently.
2. Insure that all of your letters of recommendation have been sent.
3. Be prepared for surprise telephone interviews.
4. Practice and prepare for admission interviews.
5. Travel to interviews as invited.
6. Develop contingency plans if not accepted into any programs.

April–May

1. If other programs make early offers, contact your top choices to determine the current status of your application.
2. Accept an offer of admission and promptly turn down less-preferred offers.
3. Finalize financial aid arrangements for next year.
4. Send official transcripts with Spring term grades to the program you plan to attend.
5. If not accepted to any schools, refer to Chapter 7.
6. Celebrate (if accepted) or regroup (if not accepted).
7. Inform people who wrote you letters of recommendation of the outcome.
