## TEST REPORT

Test report no.: 1-0037/20-01-02-A

### Testing laboratory

#### CTC advanced GmbH

Untertuerkheimer Strasse 6 – 10

66117 Saarbruecken / Germany

Phone: + 49 681 5 98 - 0

Fax: + 49 681 5 98 - 9075

Internet: <http://www.ctcadvanced.com>

e-mail: [mail@ctcadvanced.com](mailto:mail@ctcadvanced.com)

#### Accredited Testing Laboratory:

The testing laboratory (area of testing) is accredited according to DIN EN ISO/IEC 17025 (2005) by the Deutsche Akkreditierungsstelle GmbH (DAkkS)

The accreditation is valid for the scope of testing procedures as stated in the accreditation certificate with the registration number: D-PL-12076-01-03

### Applicant

#### hiSky SCS Ltd

24 Amal St. Park Afek, Rosh Hay'ayin

P.O.B 11363 / Israel 4809268

Phone: +972-3-6588000

Contact: Yori Adi

e-mail: [yoria@hiskysat.com](mailto:yoria@hiskysat.com)

Phone: +972-3-9646144

Fax: +972-3-6587999

### Manufacturer

#### Jabil Circuits Italy

Via per Casapuzzano, 1

81025 Marcianise CE, Italy

### Test standard/s

47 CFR Part 25

Title 47 of the Code of Federal Regulations; Chapter I; Part 25 - Satellite Communications

SRSP-101

Technical Requirements for Fixed Earth Stations Operating above 1 GHz in Space Radiocommunication Services and Earth Stations On Board Vessels (ESVs) Operating in the Fixed-Satellite Service

For further applied test standards please refer to section 3 of this test report.

### Test Item

**Kind of test item:** Fixed Smartellite Terminal Ka 8X8 V1

**Model name:** Fixed Terminal Ka 8X8 V1

**FCC ID:** 2A4L8-FKA8X8V1

**Frequency:** TX: 28.35 – 28.6, 29.25 – 30.0 GHz, RX: 18.3 – 18.8, 19.7 – 20.2 GHz

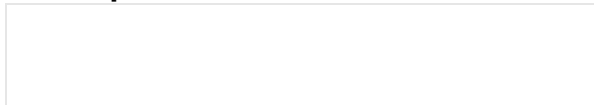

**Characteristics:** Tx/Rx, BPSK

**Power supply:** 100 – 240 V AC, 50/60 Hz, 56 V DC via PoE Injector

**Temperature range:** -20 °C to +60 °C

This test report is electronically signed and valid without handwriting signature. For verification of the electronic signatures, the public keys can be requested at the testing laboratory.

### Test report authorized:

Meheza Walla  
Lab Manager  
Radio Communications & EMC

### Test performed:

Thomas Vogler  
Lab Manager  
Radio Communications & EMC

## 2 General information

### 2.1 Notes and disclaimer

The test results of this test report relate exclusively to the test item specified in this test report. CTC advanced GmbH does not assume responsibility for any conclusions and generalizations drawn from the test results with regard to other specimens or samples of the type of the equipment represented by the test item.

The test report may only be reproduced or published in full. Reproduction or publication of extracts from the report requires the prior written approval of CTC advanced GmbH.

The testing service provided by CTC advanced GmbH has been rendered under the current "General Terms and Conditions for CTC advanced GmbH".

CTC advanced GmbH will not be liable for any loss or damage resulting from false, inaccurate, inappropriate or incomplete product information provided by the customer.

Under no circumstances does the CTC advanced GmbH test report include any endorsement or warranty regarding the functionality, quality or performance of any other product or service provided.

Under no circumstances does the CTC advanced GmbH test report include or imply any product or service warranties from CTC advanced GmbH, including, without limitation, any implied warranties of merchantability, fitness for purpose, or non-infringement, all of which are expressly disclaimed by CTC advanced GmbH.

All rights and remedies regarding vendor's products and services for which CTC advanced GmbH has prepared this test report shall be provided by the party offering such products or services and not by CTC advanced GmbH. In no case this test report can be considered as a Letter of Approval.

This test report is electronically signed and valid without handwritten signature. For verification of the electronic signatures, the public keys can be requested at the testing laboratory.

### 2.2 Application details

Date of receipt of order:	2020-04-27
Date of receipt of test item:	2023-02-13
Start of test:	2023-02-13
End of test:	2023-02-17
Person(s) present during the test:	Mr. Assaf Goldstein

### 3 Test standards and references

#### 3.1 Test standards

Test standard	Date	Test standard description
47 CFR Part 25	2021-03	Title 47 of the Code of Federal Regulations; Chapter I; Part 25 - Satellite Communications
SRSP-101	2019-08	Technical Requirements for Fixed Earth Stations Operating above 1 GHz in Space Radiocommunication Services and Earth Stations On Board Vessels (ESVs) Operating in the Fixed-Satellite Service

#### 3.2 Measurement guidance

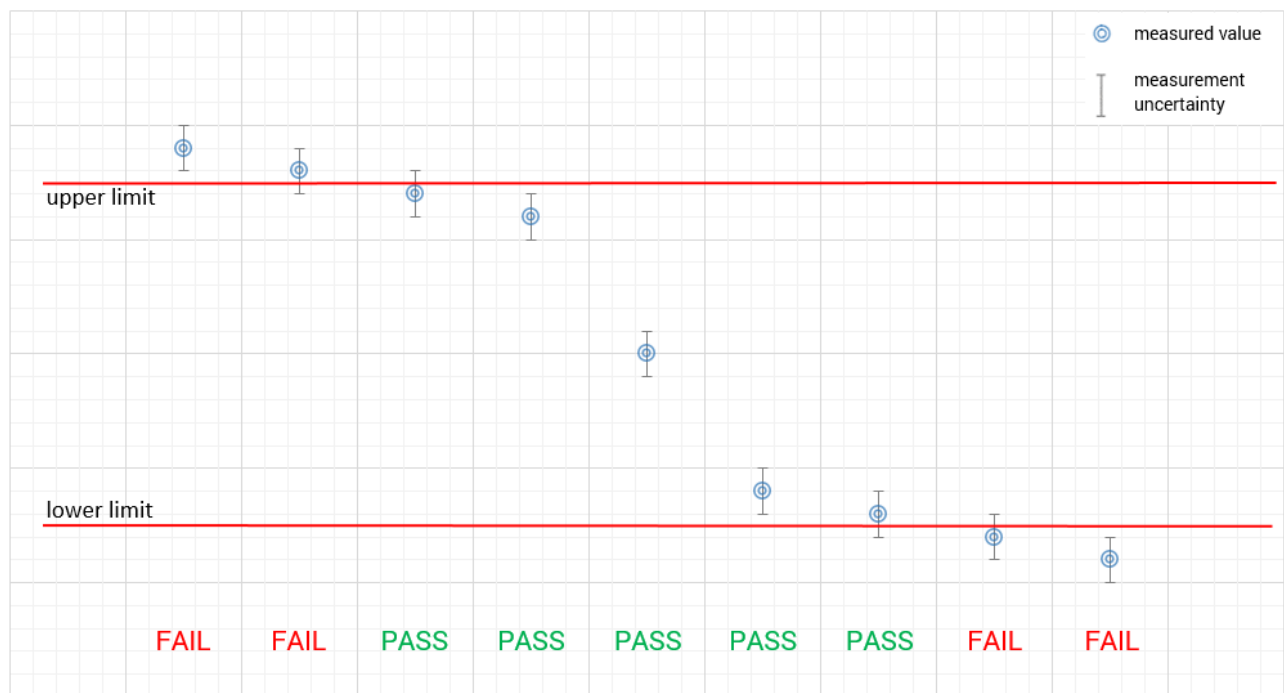

Guidance	Version	Description
ANSI C63.4-2014	-/-	American national standard for methods of measurement of radio-noise emissions from low-voltage electrical and electronic equipment in the range of 9 kHz to 40 GHz
ANSI C63.10-2013	-/-	American national standard of procedures for compliance testing of unlicensed wireless devices
ANSI C63.26-2015	-/-	American National Standard for Compliance Testing of Transmitters Used in Licensed Radio Services

### 3.3 Reporting statements of conformity – decision rule

Only the measured values related to their corresponding limits will be used to decide whether the equipment under test meets the requirements of the test standards listed in chapter 3.

The measurement uncertainty is mentioned in this test report, but is not taken into account - neither to the limits nor to the measurement results. Measurement results with a smaller margin to the corresponding limits than the measurement uncertainty have a potential risk of more than 5% that the decision might be wrong."

measured value, measurement uncertainty, verdict

## 4 Test environment

Temperature:	T <sub>nom</sub> T <sub>max</sub> T <sub>min</sub>	+22 °C during room temperature tests +50 °C during high temperature tests -20 °C during low temperature tests
Relative humidity content:		50 %
Barometric pressure:		not relevant for this kind of testing
Power supply:	V <sub>nom</sub> V <sub>max</sub> V <sub>min</sub>	120 V AC by external USB-C power supply 138 V AC by external USB-C power supply 102 V AC by external USB-C power supply

## 5 Test laboratories sub-contracted

None

## 6 Test item

### 6.1 General Description

Kind of test item	:	Fixed Smartellite Terminal Ka 8X8 V1
Type identification	:	Fixed Terminal Ka 8X8 V1
hardware version	:	V1
software version	:	1.0
firmware version	:	1.0
Frequency band	:	TX: 28.35 – 28.6, 29.25 – 30.0 GHz, RX: 18.3 – 18.8, 19.7 – 20.2 GHz
TX output power cond	:	1 W
TX output power rad.	:	21 dBW nominal
Att. betw. HPA/Antenna	:	0 dB
Type of radio transmission : Use of frequency spectrum :		MF-TDMA / TDMA / SCPC
Type of modulation	:	BPSK 2.24 MSym/s
Data rate	:	13 kbit/s
Channel spacing	:	depends on modem
Power supply	:	100 – 240 V AC, 50/60 Hz with power supply 56 V DC via PoE Injector
Temperature range	:	-20 °C to +60 °C

## 6.2 List of components

No.	Equipment	Manufacturer Type name	(version, model/part number)	Serial number	Note no.	tested (Y/N)
1	Fixed Terminal Ka 8X8 V4	hiSky SCS Ltd	P/N: HSK_FXD_RL_XXV4	29200100000171		Y
2	PoE Injector	Tycon	P/N: TP-POE-HP-48G	19B007784DRC12		Y

### Note:

- 1) The item can optionally be equipped with this additional component.
- 2) The item can optionally be equipped with this component instead of no. xxx.
- 3) Because of conceptional and electrical equality no. xxx was/were representatively tested as worst case.
- 4) This component corresponds with the no. xxx but it's not fully provided.
- 5) The item can be combined with this component. The test of this component is documented in test report no. xxxxx/xxxxx/xx.
- 6) This component was sufficiently taken into account, see test report no. xxxxx/xxxxx/xx.
- 7) This component is not part of the test item - it was representatively used to establish the operation and test modes.
- 8) This component is integrated repeatedly in the item because of redundancy - the redundant components were not tested because of equality to the primary parts.
- 9) This component is not relevant relating to the requirements of the test specification as well as baseband equipment - the EMC conformity and eventually the approval for connection to public telecommunication networks are only expected.

## 6.3 Antenna system(s)

The EUT contains an integrated phased array antenna for left hand and right hand circular polarization, which has a gain of 21 dBi and a half power beam width of 13° at 0° direction.  
See technical documentation of manufacturer for details.

Note: Above mentioned antenna test reports / antenna pattern must be in compliance with test standard(s) listed under section 3! Refer to customer documentation for more details.

## 6.4 Operating conditions

- Operating condition 1: 29.255 GHz (=fm, 28.355 GHz = fl, 29.995 GHz = fh)  
BPSK
- Operating condition 2: Emissions disabled  
TX off

Note: Middle frequency (=fm) was set to closest band edge allowed by regulations.

## 6.5 Additional information

The content of the following annexes is defined in the QA. It may be that not all of the listed annexes are necessary for this report, thus some values in between may be missing.

Test setup- and EUT-photos are included in test report: 1-0037/20-01-01\_AnnexA  
1-0037/20-01-01\_AnnexB  
1-0037/20-01-01\_AnnexD

Test plots are included in test report: 1-0037/20-01-01\_AnnexG

## 7 Description of the test setup

Typically, the calibrations of the test apparatus are commissioned to and performed by an accredited calibration laboratory. The calibration intervals are determined in accordance with the DIN EN ISO/IEC 17025. In addition to the external calibrations, the laboratory executes comparison measurements with other calibrated test systems or effective verifications. Weekly chamber inspections and range calibrations are performed. Where possible, RF generating and signaling equipment as well as measuring receivers and analyzers are connected to an external high-precision 10 MHz reference (GPS-based or rubidium frequency standard).

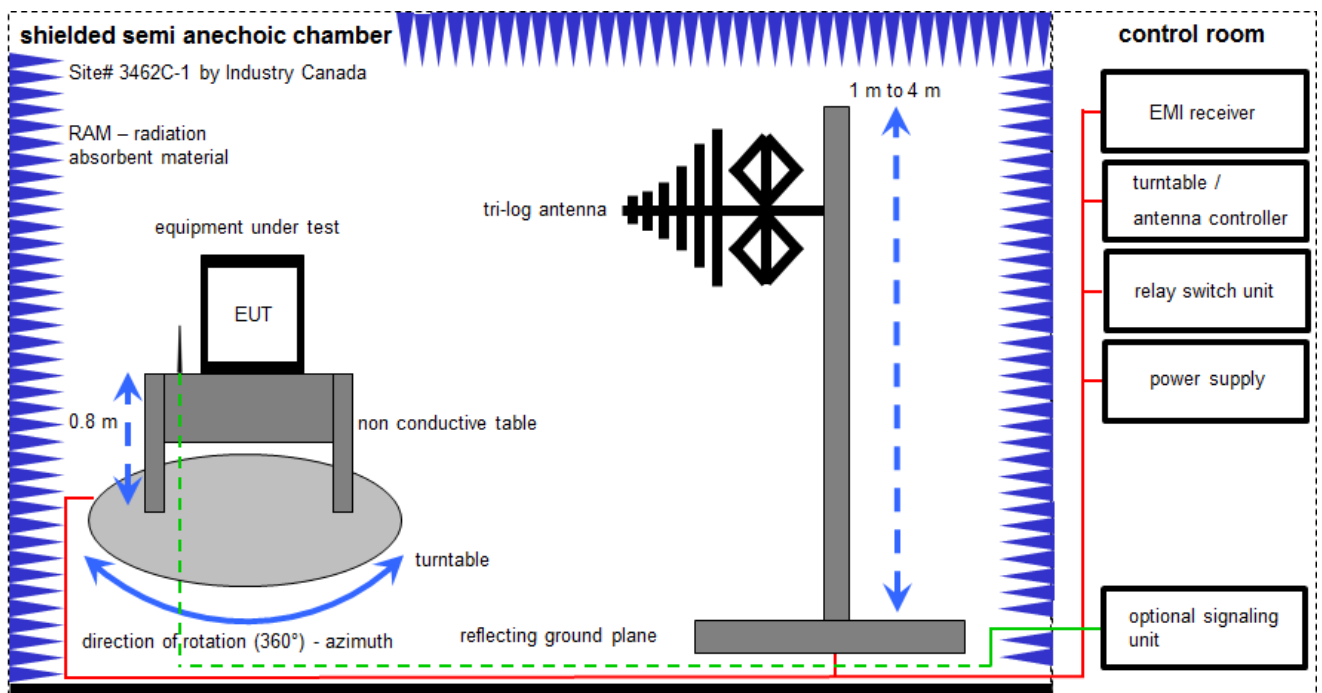

In order to simplify the identification of the equipment used at some special tests, some items of test equipment and ancillaries can be provided with an identifier or number in the equipment list below (Lab/Item).

**Agenda:** Kind of Calibration

k	calibration / calibrated		EK	limited calibration
ne	not required (k, ev, izw, zw not required)		zw	cyclical maintenance (external cyclical maintenance)
ev	periodic self verification		izw	internal cyclical maintenance
Ve	long-term stability recognized		g	blocked for accredited testing
vkl!	Attention: extended calibration interval			
NK!	Attention: not calibrated		*)	next calibration ordered / currently in progress

## 7.1 Shielded semi anechoic chamber

The radiated measurements are performed in vertical and horizontal plane in the frequency range from 30 MHz to 1 GHz in semi-anechoic chambers. The EUT is positioned on a non-conductive support with a height of 0.80 m above a conductive ground plane that covers the whole chamber. The receiving antennas are conform to specifications ANSI C63. These antennas can be moved over the height range between 1.0 m and 4.0 m in order to search for maximum field strength emitted from EUT. The measurement distances between EUT and receiving antennas are indicated in the test setups for the various frequency ranges. For each measurement, the EUT is rotated in all three axes until the maximum field strength is received. The wanted and unwanted emissions are received by spectrum analyzers where the detector modes and resolution bandwidths over various frequency ranges are set according to requirement ANSI C63.

Measurement distance: tri-log antenna 10 meter

$$FS = UR + CL + AF$$

(FS-field strength; UR-voltage at the receiver; CL-loss of the cable; AF-antenna factor)

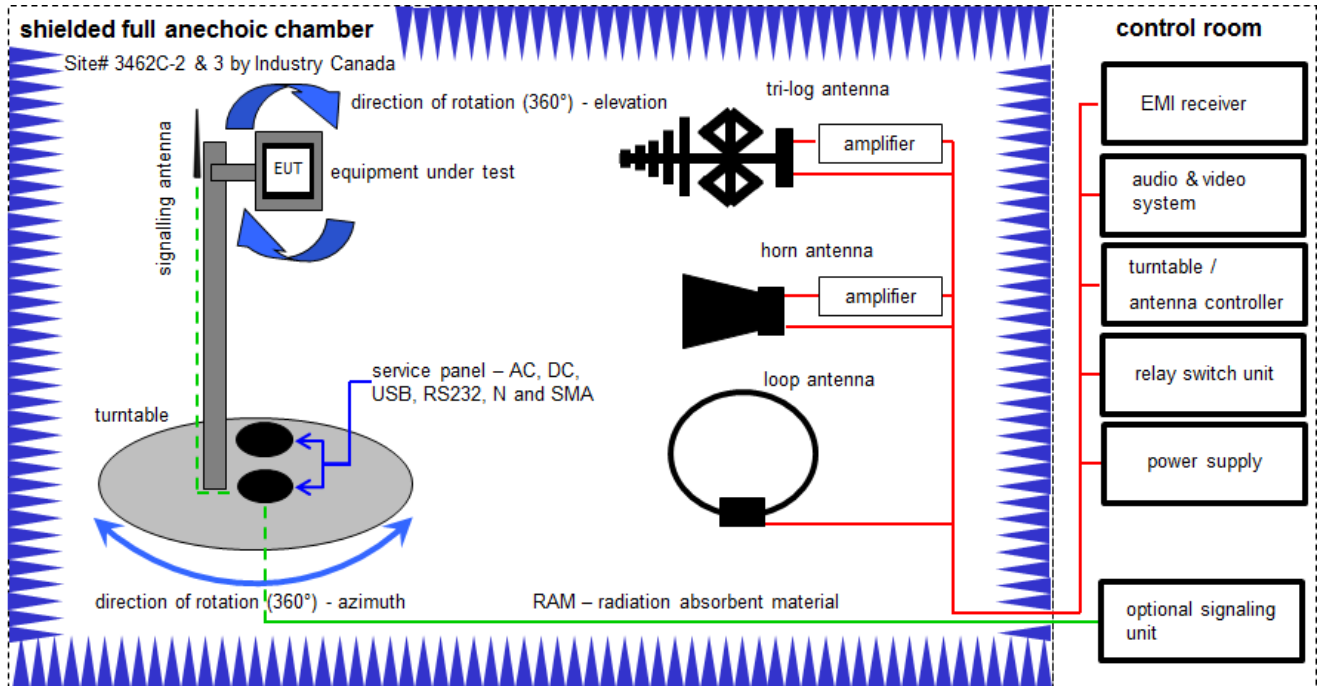

Example calculation:

$$FS \text{ [dB}\mu\text{V/m]} = 12.35 \text{ [dB}\mu\text{V/m]} + 1.90 \text{ [dB]} + 16.80 \text{ [dB/m]} = 31.05 \text{ [dB}\mu\text{V/m]} \text{ (35.69 } \mu\text{V/m)}$$

## 7.2 Shielded fully anechoic chamber

Measurement distance: tri-log antenna and horn antenna 3 meter; loop antenna 3 meter  
BAT-EMC software version: 3.16.0.49

$$OP = AV + D - G + CA$$

(OP-radiated output power; AV-analyzer value; D-free field attenuation of measurement distance;  
G-antenna gain+amplifier gain; CA-loss signal path)

Example calculation:

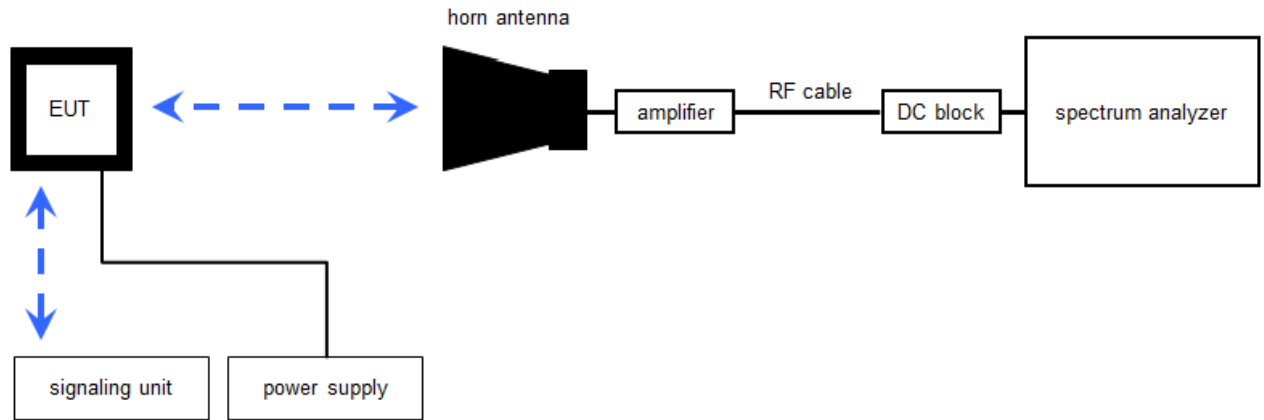

$$OP [dBm] = -65.0 [dBm] + 50 [dB] - 20 [dBi] + 5 [dB] = -30 [dBm] (1 \mu W)$$

**Equipment table:**

### 7.3 Radiated measurements < 50 GHz

#### Radiated measurements > 18 GHz

$$OP = AV + D - G$$

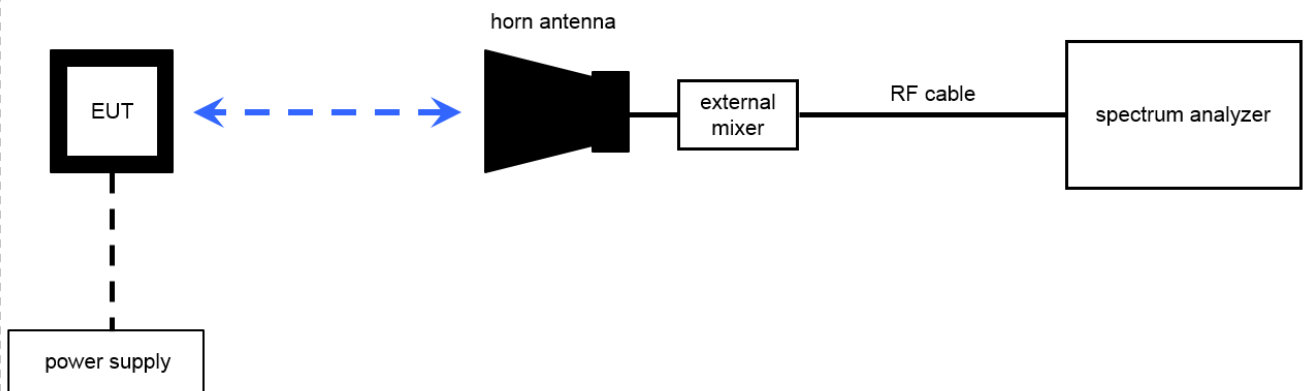

(OP-rad. output power; AV-analyzer value; D-free field attenuation of measurement distance; G-antenna gain)

#### Example calculation:

$$OP [dBm] = -54.0 [dBm] + 64.0 [dB] - 20.0 [dBi] = -10 [dBm] \text{ (100 } \mu\text{W)}$$

### 7.4 Radiated measurements > 50 GHz

#### Radiated measurements RF laboratory

$$OP = AV + D - G$$

(OP-rad. output power; AV-analyzer value; D-free field attenuation of measurement distance; G-antenna gain)

#### Example calculation:

$$OP [dBm] = -54.0 [dBm] + 64.0 [dB] - 20.0 [dBi] = -10 [dBm] \text{ (100 } \mu\text{W)}$$

Note: conversion loss of mixer is already included in analyzer value.

## 8 Sequence of testing

### 8.1 Sequence of testing radiated spurious 9 kHz to 30 MHz

#### Setup

- The equipment is set up to simulate normal operation mode as described in the user manual or defined by the manufacturer.
- If the EUT is a tabletop system, it is placed on a table with 0.8 m height.
- If the EUT is a floor standing device, it is placed directly on the turn table.
- Auxiliary equipment and cables are positioned to simulate normal operation conditions as described in ANSI C 63.4.
- The AC power port of the EUT (if available) is connected to a power outlet below the turntable.
- Measurement distance is 3 m (see ANSI C 63.4) – see test details.
- EUT is set into operation.

#### Premeasurement\*

- The turntable rotates from 0° to 315° using 45° steps.
- The antenna height is 1 m.
- At each turntable position the analyzer sweeps with positive-peak detector to find the maximum of all emissions.

#### Final measurement

- Identified emissions during the pre-measurement are maximized by the software by rotating the turntable from 0° to 360°.
- Loop antenna is rotated about its vertical axis for maximum response at each azimuth about the EUT. (For certain applications, the loop antenna plane may also need to be positioned horizontally at the specified distance from the EUT)
- The final measurement is done in the position (turntable and elevation) causing the highest emissions with quasi-peak (as described in ANSI C 63.4).
- Final levels, frequency, measuring time, bandwidth, turntable position, correction factor, margin to the limit and limit will be recorded. A plot with the graph of the premeasurement and the limit is stored.

\*)Note: The sequence will be repeated three times with different EUT orientations.

## 8.2 Sequence of testing radiated spurious 30 MHz to 1 GHz

### Setup

- The equipment is set up to simulate normal operation mode as described in the user manual or defined by the manufacturer.
- If the EUT is a tabletop system, a table with 0.8 m height is used, which is placed on the ground plane.
- If the EUT is a floor standing device, it is placed on the ground plane with insulation between both.
- Auxiliary equipment and cables are positioned to simulate normal operation conditions as described in ANSI C 63.4.
- The AC power port of the EUT (if available) is connected to a power outlet below the turntable.
- Measurement distance is 10 m or 3 m (see ANSI C 63.4) – see test details.
- EUT is set into operation.

### Premeasurement

- The turntable rotates from 0° to 315° using 45° steps.
- The antenna is polarized vertical and horizontal.
- The antenna height changes from 1 m to 3 m.
- At each turntable position, antenna polarization and height the analyzer sweeps three times in peak to find the maximum of all emissions.

### Final measurement

- The final measurement is performed for at least six highest peaks according to the requirements of the ANSI C63.4.
- Based on antenna and turntable positions at which the peak values are measured the software maximize the peaks by changing turntable position  $\pm 45^\circ$  and antenna height between 1 and 4 m.
- The final measurement is done with quasi-peak detector (as described in ANSI C 63.4).
- Final levels, frequency, measuring time, bandwidth, antenna height, antenna polarization, turntable angle, correction factor, margin to the limit and limit are recorded. A plot with the graph of the premeasurement with marked maximum final results and the limit is stored.

### 8.3 Sequence of testing radiated spurious 1 GHz to 18 GHz

#### Setup

- The equipment is set up to simulate normal operation mode as described in the user manual or defined by the manufacturer.
- If the EUT is a tabletop system, a 2-axis positioner with 1.5 m height is used.
- If the EUT is a floor standing device, it is placed directly on the turn table.
- Auxiliary equipment and cables are positioned to simulate normal operation conditions as described in ANSI C 63.4.
- The AC power port of the EUT (if available) is connected to a power outlet below the turntable.
- Measurement distance is 3 m (see ANSI C 63.4) – see test details.
- EUT is set into operation.

#### Premeasurement

- The turntable rotates from 0° to 315° using 45° steps.
- The antenna is polarized vertical and horizontal.
- The antenna height is 1.5 m.
- At each turntable position and antenna polarization the analyzer sweeps with positive peak detector to find the maximum of all emissions.

#### Final measurement

- The final measurement is performed for at least six highest peaks according to the requirements of the ANSI C63.4.
- Based on antenna and turntable positions at which the peak values are measured the software maximizes the peaks by rotating the turntable from 0° to 360°. This measurement is repeated for different EUT-table positions (0° to 150° in 30°-steps) and for both antenna polarizations.
- The final measurement is done in the position (turntable, EUT-table and antenna polarization) causing the highest emissions with Peak and RMS detector (as described in ANSI C 63.4).
- Final levels, frequency, measuring time, bandwidth, turntable position, EUT-table position, antenna polarization, correction factor, margin to the limit and limit are recorded. A plot with the graph of the premeasurement with marked maximum final results and the limit is stored.

## 8.4 Sequence of testing radiated spurious above 18 GHz

### Setup

- The equipment is set up to simulate normal operation mode as described in the user manual or defined by the manufacturer.
- Auxiliary equipment and cables are positioned to simulate normal operation conditions as described in ANSI C 63.4.
- The AC power port of the EUT (if available) is connected to a power outlet.
- The measurement distance is as appropriate (e.g. 0.5 m).
- The EUT is set into operation.

### Premeasurement

- The test antenna is handheld and moved carefully over the EUT to cover the EUT's whole sphere and different polarizations of the antenna.

### Final measurement

- The final measurement is performed at the position and antenna orientation causing the highest emissions with Peak and RMS detector (as described in ANSI C 63.4).
- Final levels, frequency, measuring time, bandwidth, correction factor, margin to the limit and limit are recorded. A plot with the graph of the premeasurement and the limit is stored.

## 8.5 Sequence of testing radiated spurious above 50 GHz with external mixers

### Setup

- The equipment is set up to simulate normal operation mode as described in the user manual or defined by the manufacturer.
- Auxiliary equipment and cables are positioned to simulate normal operation conditions as described in ANSI C 63.4.
- The AC power port of the EUT (if available) is connected to a power outlet.
- The measurement distance is as appropriate for far field (e.g. 0.25 m).
- The EUT is set into operation.

### Premeasurement

- The test antenna with external mixer is handheld and moved carefully over the EUT to cover the EUT's whole sphere and different polarizations of the antenna.
- Caution is taken to reduce the possible overloading of the external mixer.

### Final measurement

- The final measurement is performed at the position and antenna orientation causing the highest emissions with Peak and RMS detector (as described in ANSI C 63.4).
- As external mixers may generate false images care is taken to ensure that any emission measured by the spectrum analyzer does indeed originate in the EUT. Signal identification feature of spectrum analyzer is used to eliminate false mixer images (i.e., it is not the fundamental emission or a harmonic falling precisely at the measured frequency).
- Final levels, frequency, measuring time, bandwidth, correction factor, margin to the limit and limit are recorded. A plot with the graph of the premeasurement and the limit is stored.

## 9 Measurement results

### 9.1 Summary

The present test report:

<input checked="" type="checkbox"/>	<b>No deviations from the technical specifications were ascertained</b>
<input type="checkbox"/>	There were deviations from the technical specifications ascertained
<input type="checkbox"/>	This test report is only a partial test report. The content and verdict of the performed test cases are listed below.

TC identifier	Description	Verdict	Date	Remark
RF-Testing	CFR 47 Part 25 (Ka-Band) SRSP-101	see below	2023-06-12	-/-

Test Specification Clause	Test Case	C	NC	NA	NP	Remark

## 9.2 RF power output / Power limits

### Description / Limit:

#### §2.1046 Measurements required: RF power output.

#### §25.204 Power limits

(a) In bands shared coequally with terrestrial radio communication services, the equivalent isotropically radiated power transmitted in any direction towards the horizon by an earth station, other than an ESV, operating in frequency bands between 1 and 15 GHz, shall not exceed the following limits except as provided for in paragraph (c) of this section:

+ 40 dBW in any 4 kHz band for  $\theta \leq 0^\circ$

+ 40 + 3 $\theta$  dBW in any 4 kHz band for  $0^\circ < \theta \leq 5^\circ$

where  $\theta$  is the angle of elevation of the horizon viewed from the center of radiation of the antenna of the earth station and measured in degrees as positive above the horizontal plane and negative below it.

(b) In bands shared coequally with terrestrial radiocommunication services, the equivalent isotropically radiated power transmitted in any direction towards the horizon by an earth station operating in frequency bands above 15 GHz shall not exceed the following limits except as provided for in paragraph (c) of this section:

+ 64 dBW in any 1 MHz band for  $\theta \leq 0^\circ$

+ 64 + 3  $\theta$  dBW in any 1 MHz band for  $0^\circ < \theta \leq 5^\circ$

where  $\theta$  is as defined in paragraph (a) of this section.

(c) For angles of elevation of the horizon greater than  $5^\circ$  there shall be no restriction as to the equivalent isotropically radiated power transmitted by an earth station towards the horizon.

### Measurement results:

### 9.3 EIRP Spectral Density

#### Description / Limit:

**§2.1046 Measurements required: RF power output.**

**§25.218 Off-axis EIRP density envelopes for FSS earth stations transmitting in certain frequency bands.**

(a) This section applies to applications for fixed and temporary-fixed FSS earth stations transmitting to geostationary space stations in the conventional C-band, extended C-band, conventional Ku-band, extended Ku-band, conventional Ka-band, or 24.75-25.25 GHz and applications for ESIMs transmitting in the conventional C-band, conventional Ku-band, or conventional Ka-band, except for applications proposing transmission of analog command signals at a band edge with bandwidths greater than 1 MHz or transmission of any other type of analog signal with bandwidths greater than 200 kHz.

(i) Digital earth station operation in the conventional Ka-band. (1) For co-polarized transmissions in the plane tangent to the GSO arc:

$32.5-25\log(\theta)$	dBW/MHz	for $2.0^\circ \leq \theta \leq 7^\circ$ .
11.5	dBW/MHz	for $7^\circ \leq \theta \leq 9.2^\circ$
$35.5-25\log(\theta)$	dBW/MHz	for $9.2^\circ \leq \theta \leq 19.1^\circ$
3.5	dBW/MHz	for $19.1^\circ < \theta \leq 180^\circ$

Where:

$\theta$  is as defined in paragraph (c)(1) of this section.

(2) For co-polarized transmissions in the plane perpendicular to the GSO arc:

$35.5-25\log(\theta)$	dBW/MHz	for $3.5^\circ \leq \theta \leq 7^\circ$
14.4	dBW/MHz	for $7^\circ < \theta \leq 9.2^\circ$
$38.5-25\log(\theta)$	dBW/MHz	for $9.2^\circ < \theta \leq 19.1^\circ$
6.5	dBW/MHz	for $19.1^\circ < \theta \leq 180^\circ$

Where  $\theta$  is as defined in paragraph (c)(1) of this section.

(3) The EIRP density levels specified in paragraphs (i)(1) and (2) of this section may be exceeded by up to 3 dB, for values of  $\theta > 7^\circ$ , over 10% of the range of theta ( $\theta$ ) angles from 7-180° on each side of the line from the earth station to the target satellite.

(4) For cross-polarized transmissions in the plane tangent to the GSO arc and in the plane perpendicular to the GSO arc:

$22.5-25\log(\theta)$	dBW/MHz	for $2.0^\circ < \theta \leq 7.0^\circ$
-----------------------	---------	--

Where  $\theta$  is as defined in paragraph (c)(1) of this section.

(c) (1) Where  $\theta$  is the angle in degrees from a line from the earth station antenna to the assigned orbital location of the target satellite.

**§25.204 Power limits for earth stations.**

(e) To the extent specified in paragraphs (e)(1) through (e)(3) of this section, earth stations in the Fixed-Satellite Service may employ uplink adaptive power control or other methods of fade compensation to facilitate transmission of uplinks at power levels required for desired link performance while minimizing interference between networks.

**(3) For stations employing uplink power control, the values in paragraphs §25.218(i)(1), (2), and (4) may be exceeded by up to 20 dB under conditions of uplink fading due to precipitation.**

**Test setup:** 7.3

#### **Plots:**

see Annex G, chap. 2, plots 7 - 9

## 9.4 Occupied bandwidth

### Description / Limit:

#### §2.1049 Measurements required: Occupied bandwidth

The occupied bandwidth, that is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers radiated are each equal to 0.5 percent of the total mean power radiated by a given emission shall be measured under the following conditions as applicable:

(h) Transmitters employing digital modulation techniques—when modulated by an input signal such that its amplitude and symbol rate represent the maximum rated conditions under which the equipment will be operated. The signal shall be applied through any filter networks, pseudo-random generators or other devices required in normal service.

Operating condition	Frequency	Modulation	Data rate / Symbol rate	Occupied bandwidth [MHz]	Annex G / Plot
1	fl, fm, fh	BPSK	2.24 MSym/s	1.26	chap. 2 – 2, 4, 6

### Test setup(s):

Test setup 7.3

### Plots:

see also Annex G, chap. 2, plots 2, 4, 6

## 9.5 Emissions limitations (conducted emissions)

### Description / Limit:

**§2.1051 Measurements required: Spurious emissions at antenna terminals.**

### **§25.202 Frequencies, frequency tolerance and emission limitations**

(f) *Emission limitations.* Except for SDARS terrestrial repeaters and as provided for in paragraph (i), the mean power of emissions shall be attenuated below the mean output power of the transmitter in accordance with the schedule set forth in paragraphs (f)(1) through (f)(4) of this section. The out-of-band emissions of SDARS terrestrial repeaters shall be attenuated in accordance with the schedule set forth in paragraph (h) of this section.

(1) In any 4 kHz band, the center frequency of which is removed from the assigned frequency by more than 50 percent up to and including 100 percent of the authorized bandwidth: 25 dB;

(2) In any 4 kHz band, the center frequency of which is removed from the assigned frequency by more than 100 percent up to and including 250 percent of the authorized bandwidth: 35 dB;

(3) In any 4 kHz band, the center frequency of which is removed from the assigned frequency by more than 250 percent of the authorized bandwidth: An amount equal to 43 dB plus 10 times the logarithm (to the base 10) of the transmitter power in watts;

(4) In any event, when an emission outside of the authorized bandwidth causes harmful interference, the Commission may, at its discretion, require greater attenuation than specified in paragraphs (f) (1), (2) and (3) of this section.

### Measurement results:

Conducted Spurious Emissions [ dBm ]								
fl			fm			fh		
F [ GHz ]	Detector	Level [ dBm ]	F [ GHz ]	Detector	Level [ dBm ]	F [ GHz ]	Detector	Level [ dBm ]
No peaks 20 dB below the limit detected.			No peaks 20 dB below the limit detected.			No peaks 20 dB below the limit detected.		
Measurement uncertainty			± 2 dB					

**Test setup:** 7.3, 7.4

### **Plots:**

see also Annex G, chap. 2, plots 15 - 35

### **Note:**

This measurement was performed with the radiated set-up because the antenna is fully integrated and can't be separated.

## 9.6 Emissions limits (radiated emissions)

### Description / Limit:

**§2.1053 Measurements required: Field strength of spurious radiation.**

**§25.202 Frequencies, frequency tolerance and emission limitations**

(f) *Emission limitations.* Except for SDARS terrestrial repeaters and as provided for in paragraph (i), the mean power of emissions shall be attenuated below the mean output power of the transmitter in accordance with the schedule set forth in paragraphs (f)(1) through (f)(4) of this section. The out-of-band emissions of SDARS terrestrial repeaters shall be attenuated in accordance with the schedule set forth in paragraph (h) of this section.

(1) In any 4 kHz band, the center frequency of which is removed from the assigned frequency by more than 50 percent up to and including 100 percent of the authorized bandwidth: 25 dB;

(2) In any 4 kHz band, the center frequency of which is removed from the assigned frequency by more than 100 percent up to and including 250 percent of the authorized bandwidth: 35 dB;

(3) In any 4 kHz band, the center frequency of which is removed from the assigned frequency by more than 250 percent of the authorized bandwidth: An amount equal to 43 dB plus 10 times the logarithm (to the base 10) of the transmitter power in watts;

(4) In any event, when an emission outside of the authorized bandwidth causes harmful interference, the Commission may, at its discretion, require greater attenuation than specified in paragraphs (f) (1), (2) and (3) of this section.

### Measurement results:

Radiated Spurious Emissions [ dBm ]

and Annex G, chap. 3, plots 1, 2, 3

## 9.7 Transmitter frequency tolerance

### Description / Limit:

§2.1055 Measurements required: Frequency stability.

### §25.202 Frequencies, frequency tolerance and emission limitations

(d) *Frequency tolerance, Earth stations.* The carrier frequency of each earth station transmitter authorized in these services shall be maintained within 0.001 percent of the reference frequency.

Temperature [ °C ]	Voltage [ V AC ]	Reference Frequency [ GHz ]	Measured Frequency [ GHz ]	Deviation [ kHz ]	Deviation [ ppm ]

**Test setup:** 7.3 + climatic chamber

**Note:**

For performing the frequency stability test the whole system was placed in the climatic chamber and forced to transmit an unmodulated carrier (CW).

## 9.8 Receiver Spurious Emission Limits (radiated emissions)

### Description / Limit:

#### **SRSP-101, 4.5 Receiver Spurious Emission Limits for Space Radiocommunication Services**

Receiving earth stations may not emit electromagnetic waves that have a field strength greater than that which would occur if the stations were replaced by an isotropic transmitter of five nanowatts (= -53 dBm).

### Measurement results:

Radiated Spurious Emissions [ dBm ]								
bottom			middle			top		
F [ GHz ]	Detector	Level [ dBm ]	F [ GHz ]	Detector	Level [ dBm ]	F [ GHz ]	Detector	Level [ dBm ]
			0.0408	RMS	-53.8			
Measurement uncertainty			± 2 dB					

### Note:

Emissions not related to satellite radio but mainly from PoE.

### Test setup:

Test setup 7.1

### Plots:

see Annex G, chap. 2, plots 36 – 39 and chap. 3, plot 4 and 5
