31:0	00000000h RO	**RxTCP Good Octets (RXTCPGDOCT):** This field indicates the number of bytes received in a good TCP segment. This counter does not count IP header bytes.

10.2.275 RXTCP_ERROR_OCTETS — Offset 87Ch

This register provides the number of bytes received by GbE Controller in a TCP segment that had checksum errors. This counter does not count IP header bytes.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 87Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxTCP Error Octets (RXTCPERROCT):** This field indicates the number of bytes received in a TCP segment that had checksum errors. This counter does not count IP header bytes.

10.2.276 RXICMP_GOOD_OCTETS — Offset 880h

This register provides the number of bytes received by GbE Controller in a good ICMP segment. This counter does not count IP header bytes.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 880h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxICMP Good Octets (RXICMPGDOCT):** This field indicates the number of bytes received in a good ICMP segment. This counter does not count IP header bytes.

10.2.277 RXICMP_ERROR_OCTETS — Offset 884h

This register provides the number of bytes received by GbE Controller in a ICMP segment that had checksum errors. This counter does not count IP header bytes.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 884h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxICMP Error Octets (RXICMPERROCT):** This field indicates the number of bytes received in a ICMP segment that had checksum errors. This counter does not count IP header bytes.

10.2.278 MMC_FPE_TX_INTERRUPT — Offset 8A0h

This register maintains the interrupts generated from all FPE related Transmit statistics counters. The MMC FPE Transmit Interrupt register maintains the interrupts generated when transmit statistic counters reach half their maximum values (0x8000_0000 for 32 bit counter and 0x8000 for 16 bit counter), and when they cross their maximum values (0xFFFF_FFFF for 32-bit counter and 0xFFFF for 16-bit counter). When Counter Stop Rollover is set, the interrupts are set but the counter remains at all-ones. The MMC FPE Transmit Interrupt register is a 32 bit register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read. The least significant byte lane (Bits[7:0]) of the respective counter must be read to clear the interrupt bit.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8A0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1	0h RO	**MMC Tx Hold Request Counter Interrupt Status (HRCIS):** This bit is set when the Tx_Hold_Req_Cntr counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. Exists when any one of the RX/TX MMC counters are enabled during FPE with AV_EST Enabled configuration. 0x0 (INACTIVE): MMC Tx Hold Request Counter Interrupt Status not detected. 0x1 (ACTIVE): MMC Tx Hold Request Counter Interrupt Status detected.
0	0h RO	**MMC Tx FPE Fragment Counter Interrupt status (FCIS):** This bit is set when the Tx_FPE_Fragment_Cntr counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. 10.2.295 MAC_LAYER4_ADDRESS1 — Offset 934h

The MAC_Layer4_Address(#i), MAC_L3_L4_Control(#i), MAC_Layer3_Addr0_Reg(#i), MAC_Layer3_Addr1_Reg(#i), MAC_Layer3_Addr2_Reg(#i) and MAC_Layer3_Addr3_Reg(#i) registers are reserved (RO with default value) if Enable Layer 3 and Layer 4 Packet Filter option is not selected while configuring the core.

You can configure the Layer 3 and Layer 4 Address Registers to be double-synchronized by selecting the Synchronize Layer 3 and Layer 4 Address Registers to Rx Clock Domain option while configuring the core. When you select this option, the synchronization is triggered only when Bits[31:24] of the Layer 3 and Layer 4 Address Registers are written. For proper synchronization updates, you should perform consecutive writes to same Layer 3 and Layer 4 Address Registers after at least four clock cycles delay of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 934h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**Layer 4 Destination Port Number Field (L4DP1):** When the L4PEN0 bit is reset and the L4DPM0 bit is set in the MAC_L3_L4_Control0 register, this field contains the value to be matched with the TCP Destination Port Number field in the IPv4 or IPv6 packets. When the L4PEN0 and L4DPM0 bits are set in MAC_L3_L4_Control0 register, this field contains the value to be matched with the UDP Destination Port Number field in the IPv4 or IPv6 packets.
15:0	0000h RW	**Layer 4 Source Port Number Field (L4SP1):** When the L4PEN0 bit is reset and the L4SPM0 bit is set in the MAC_L3_L4_Control0 register, this field contains the value to be matched with the TCP Source Port Number field in the IPv4 or IPv6 packets. When the L4PEN0 and L4SPM0 bits are set in MAC_L3_L4_Control0 register, this field contains the value to be matched with the UDP Source Port Number field in the IPv4 or IPv6 packets.

10.2.296 MAC_LAYER3_ADDR0_REG1 — Offset 940h

For IPv4 packets, the Layer 3 Address 0 Register 0 register contains the 32-bit IP Source Address field. For IPv6 packets, it contains Bits[31:0] of the 128-bit IP Source Address or Destination Address field.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 940h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Layer 3 Address 0 Field (L3A01):** When the L3PEN0 and L3SAM0 bits are set in the MAC_L3_L4_Control0 register, this field contains the value to be matched with Bits[31:0] of the IP Source Address field in the IPv6 packets. When the L3PEN0 and L3DAM0 bits are set in the MAC_L3_L4_Control0 register, this field contains the value to be matched with Bits[31:0] of the IP Destination Address field in the IPv6 packets. When the L3PEN0 bit is reset and the L3SAM0 bit is set in the MAC_L3_L4_Control0 register, this field contains the value to be matched with the IP Source Address field in the IPv4 packets.

10.2.297 MAC_LAYER3_ADDR1_REG1 — Offset 944h

For IPv4 packets, the Layer 3 Address 1 Register 0 register contains the 32-bit IP Destination Address field. For IPv6 packets, it contains Bits[63:32] of the 128-bit IP Source Address or Destination Address field.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 944h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Layer 3 Address 1 Field (L3A11):** When the L3PEN0 and L3SAM0 bits are set in the MAC_L3_L4_Control0 register, this field contains the value to be matched with Bits[63:32] of the IP Source Address field in the IPv6 packets. When the L3PEN0 and L3DAM0 bits are set in the MAC_L3_L4_Control0 register, this field contains the value to be matched with Bits[63:32] of the IP Destination Address field in the IPv6 packets. When the L3PEN0 bit is reset and the L3SAM0 bit is set in the MAC_L3_L4_Control0 register, this field contains the value to be matched with the IP Destination Address field in the IPv4 packets.

10.2.298 MAC_LAYER3_ADDR2_REG1 — Offset 948h

The Layer 3 Address 2 Register 0 register is reserved for IPv4 packets. For IPv6 packets, it contains Bits[95:64] of 128-bit IP Source Address or Destination Address field.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 948h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Layer 3 Address 2 Field (L3A21):** When the L3PEN0 and L3SAM0 bits are set in the MAC_L3_L4_Control0 register, this field contains the value to be matched with Bits[95:64] of the IP Source Address field in the IPv6 packets. When the L3PEN0 and L3DAM0 bits are set in the MAC_L3_L4_Control0 register, this field contains the value to be matched with Bits[95:64] of the IP Destination Address field in the IPv6 packets. When the L3PEN0 bit is reset in the MAC_L3_L4_Control0 register, this field is not used.

10.2.299 MAC_LAYER3_ADDR3_REG1 — Offset 94Ch

The Layer 3 Address 3 Register 0 register is reserved for IPv4 packets. For IPv6 packets, it contains Bits[127:96] of 128-bit IP Source Address or Destination Address field.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 94Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Layer 3 Address 3 Field (L3A31):** When the L3PEN0 and L3SAM0 bits are set in the MAC_L3_L4_Control0 register, this field contains the value to be matched with Bits[127:96] of the IP Source Address field in the IPv6 packets. When the L3PEN0 and L3DAM0 bits are set in the MAC_L3_L4_Control0 register, this field contains the value to be matched with Bits[127:96] of the IP Destination Address field in the IPv6 packets. When the L3PEN0 bit is reset in the MAC_L3_L4_Control0 register, this field is not used.

10.2.300 MAC_TIMESTAMP_CONTROL — Offset B00h

This register controls the operation of the System Time generator and processing of PTP packets for timestamping in the Receiver.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B00h	00002000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**AV 802.1AS Mode Enable (AV8021ASMEN):** When this bit is set, the MAC processes only untagged PTP over Ethernet packets for providing PTP status and capturing timestamp snapshots, that is, IEEE 802.1AS mode of operation. When PTP offload feature is enabled, for the purpose of PTP offload, the transport specific field in the PTP header is generated and checked based on the value of this bit. 0x0 (DISABLE): AV 802.1AS Mode is disabled. 0x1 (ENABLE): AV 802.1AS Mode is enabled.
27:25	0h RO	**Reserved**
24	0h RW	**Transmit Timestamp Status Mode (TXTSSTSM):** When this bit is set, the MAC overwrites the earlier transmit timestamp status even if it is not read by the software. The MAC indicates this by setting the TXTSSMIS bit of the MAC_Tx_Timestamp_Status_Nanoseconds register. When this bit is reset, the MAC ignores the timestamp status of current packet if the timestamp status of previous packet is not read by the software. The MAC indicates this by setting the TXTSSMIS bit of the MAC_Tx_Timestamp_Status_Nanoseconds register. 0x0 (DISABLE): Transmit Timestamp Status Mode is disabled. 0x1 (ENABLE): Transmit Timestamp Status Mode is enabled.
23:21	0h RO	**Reserved**
20	0h RW	**External System Time Input (ESTI):** When this bit is set, the MAC uses the external 64-bit reference System Time input for the following: - To take the timestamp provided as status - To insert the timestamp in transmit PTP packets when One-step Timestamp or Timestamp Offload feature is enabled. When this bit is reset, the MAC uses the internal reference System Time. 0x0 (DISABLE): External System Time Input is disabled. 0x1 (ENABLE): External System Time Input is enabled.
19	0h RW	**Enable checksum correction during OST for PTP over UDP/IPv4 packets (CSC):** When this bit is set, the last two bytes of PTP message sent over UDP/IPv4 is updated to keep the UDP checksum correct, for changes made to origin timestamp and/or correction field as part of one step timestamp operation. The application shall form the packet with these two dummy bytes. When reset, no updates are done to keep the UDP checksum correct. The application shall form the packet with UDP checksum set to 0. 0x0 (DISABLE): checksum correction during OST for PTP over UDP/IPv4 packets is disabled. 0x1 (ENABLE): checksum correction during OST for PTP over UDP/IPv4 packets is enabled.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RW	**Enable MAC Address for PTP Packet Filtering (TSENMACADDR):** When this bit is set, the DA MAC address (that matches any MAC Address register) is used to filter the PTP packets when PTP is directly sent over Ethernet. When this bit is set, received PTP packets with DA containing a special multicast or unicast address that matches the one programmed in MAC address registers are considered for processing as indicated below, when PTP is directly sent over Ethernet. For normal time stamping operation, MAC address registers 0 to 31 is considered for unicast destination address matching. For PTP offload, only MAC address register 0 is considered for unicast destination address matching. 0x0 (DISABLE): MAC Address for PTP Packet Filtering is disabled. 0x1 (ENABLE): MAC Address for PTP Packet Filtering is enabled.
17:16	0h RW	**Select PTP packets for Taking Snapshots (SNAPTYPSEL):** These bits, along with Bits 15 and 14, decide the set of PTP packet types for which snapshot needs to be taken. The encoding is given in Timestamp Snapshot Dependency on Register Bits Table.
15	0h RW	**Enable Snapshot for Messages Relevant to Master (TSMSTRENA):** When this bit is set, the snapshot is taken only for the messages that are relevant to the master node. Otherwise, the snapshot is taken for the messages relevant to the slave node. 0x0 (DISABLE): Snapshot for Messages Relevant to Master is disabled. 0x1 (ENABLE): Snapshot for Messages Relevant to Master is enabled.
14	0h RW	**Enable Timestamp Snapshot for Event Messages (TSEVNTENA):** When this bit is set, the timestamp snapshot is taken only for event messages (SYNC, Delay_Req, Pdelay_Req, or Pdelay_Resp). When this bit is reset, the snapshot is taken for all messages except Announce, Management, and Signaling. For more information about the timestamp snapshots, see Timestamp Snapshot Dependency on Register Bits Table. 0x0 (DISABLE): Timestamp Snapshot for Event Messages is disabled. 0x1 (ENABLE): Timestamp Snapshot for Event Messages is enabled.
13	1h RW	**Enable Processing of PTP Packets Sent over IPv4-UDP (TSIPV4ENA):** When this bit is set, the MAC receiver processes the PTP packets encapsulated in IPv4-UDP packets. When this bit is reset, the MAC ignores the PTP transported over IPv4-UDP packets. This bit is set by default. 0x0 (DISABLE): Processing of PTP Packets Sent over IPv4-UDP is disabled. 0x1 (ENABLE): Processing of PTP Packets Sent over IPv4-UDP is enabled.
12	0h RW	**Enable Processing of PTP Packets Sent over IPv6-UDP (TSIPV6ENA):** When this bit is set, the MAC receiver processes the PTP packets encapsulated in IPv6-UDP packets. When this bit is clear, the MAC ignores the PTP transported over IPv6-UDP packets. 0x0 (DISABLE): Processing of PTP Packets Sent over IPv6-UDP is disabled. 0x1 (ENABLE): Processing of PTP Packets Sent over IPv6-UDP is enabled.
11	0h RW	**Enable Processing of PTP over Ethernet Packets (TSIPENA):** When this bit is set, the MAC receiver processes the PTP packets encapsulated directly in the Ethernet packets. When this bit is reset, the MAC ignores the PTP over Ethernet packets. 0x0 (DISABLE): Processing of PTP over Ethernet Packets is disabled. 0x1 (ENABLE): Processing of PTP over Ethernet Packets is enabled.
10	0h RW	**Enable PTP Packet Processing for Version 2 Format (TSVER2ENA):** When this bit is set, the IEEE 1588 version 2 format is used to process the PTP packets. When this bit is reset, the IEEE 1588 version 1 format is used to process the PTP packets. The IEEE 1588 formats are described in 'PTP Processing and Control'. 0x0 (DISABLE): PTP Packet Processing for Version 2 Format is disabled. 0x1 (ENABLE): PTP Packet Processing for Version 2 Format is enabled.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**Timestamp Digital or Binary Rollover Control (TSCTRLSSR):** When this bit is set, the Timestamp Low register rolls over after 0x3B9A_C9FF value (that is, 1 nanosecond accuracy) and increments the timestamp (High) seconds. When this bit is reset, the rollover value of sub-second register is 0x7FFF_FFFF. The sub-second increment must be programmed correctly depending on the PTP reference clock frequency and the value of this bit. 0x0 (DISABLE): Timestamp Digital or Binary Rollover Control is disabled. 0x1 (ENABLE): Timestamp Digital or Binary Rollover Control is enabled.
8	0h RW	**Enable Timestamp for All Packets (TSENALL):** When this bit is set, the timestamp snapshot is enabled for all packets received by the MAC. 0x0 (DISABLE): Timestamp for All Packets disabled. 0x1 (ENABLE): Timestamp for All Packets enabled.
7	0h RO	**Reserved**
6	0h RW	**Presentation Time Generation Enable (PTGE):** When this bit is set the Presentation Time generation is enabled. 0x0 (DISABLE): Presentation Time Generation is disabled. 0x1 (ENABLE): Presentation Time Generation is enabled.
5	0h RW	**Update Addend Register (TSADDREG):** When this bit is set, the content of the Timestamp Addend register is updated in the PTP block for fine correction. This bit is cleared when the update is complete. This bit should be zero before it is set. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Addend Register is not updated. 0x1 (ENABLE): Addend Register is updated.
4	0h RO	**Reserved**
3	0h RW	**Update Timestamp (TSUPDT):** When this bit is set, the system time is updated (added or subtracted) with the value specified in MAC_System_Time_Seconds_Update and MAC_System_Time_Nanoseconds_Update registers. This bit should be zero before updating it. This bit is reset when the update is complete in hardware. The Timestamp Higher Word register (if enabled during core configuration) is not updated. When Media Clock Generation and Recovery is DWC_EQOS_FLEXI_PPS_OUT_EN=1 enabled MAC_Presn_Time_Updt should also be updated before setting this field. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Timestamp is not updated. 0x1 (ENABLE): Timestamp is updated.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Initialize Timestamp (TSINIT):** When this bit is set, the system time is initialized (overwritten) with the value specified in the MAC_System_Time_Seconds_Update and MAC_System_Time_Nanoseconds_Update registers. This bit should be zero before it is updated. This bit is reset when the initialization is complete. The Timestamp Higher Word register (if enabled during core configuration) can only be initialized. When Media Clock Generation and Recovery is DWC_EQOS_FLEXI_PPS_OUT_EN=1 enabled MAC_Presn_Time_Updt should also be updated before setting this field. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Timestamp is not initialized. 0x1 (ENABLE): Timestamp is initialized.
1	0h RW	**Fine or Coarse Timestamp Update (TSCFUPDT):** When this bit is set, the Fine method is used to update system timestamp. When this bit is reset, Coarse method is used to update the system timestamp. 0x0 (COARSE): Coarse method is used to update system timestamp. 0x1 (FINE): Fine method is used to update system timestamp.
0	0h RW	**Enable Timestamp (TSENA):** When this bit is set, the timestamp is added for Transmit and Receive packets. When disabled, timestamp is not added for transmit and receive packets and the Timestamp Generator is also suspended. You need to initialize the Timestamp (system time) after enabling this mode. On the Receive side, the MAC processes the 1588 packets only if this bit is set. 0x0 (DISABLE): Timestamp is disabled. 0x1 (ENABLE): Timestamp is enabled.

10.2.301 MAC_SUB_SECOND_INCREMENT — Offset B04h

This register specifies the value to be added to the internal system time register every cycle of clk_ptp_ref_i clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B04h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:16	00h RW	**Sub-second Increment Value (SSINC):** The value programmed in this field is accumulated every clock cycle (of clk_ptp_i) with the contents of the sub-second register. For example, when the PTP clock is 50 MHz (period is 20 ns), you should program 20 (0x14) when the System Time Nanoseconds register has an accuracy of 1 ns [Bit 9 (TSCTRLSSR) is set in MAC_Timestamp_Control]. When TSCTRLSSR is clear, the Nanoseconds register has a resolution of ~0.465 ns. In this case, you should program a value of 43 (0x2B) which is derived by 20 ns/0.465.
15:8	00h RW	**Sub-nanosecond Increment Value (SNSINC):** This field contains the sub-nanosecond increment value, represented in nanoseconds multiplied by 2^8. This value is accumulated with the sub-nanoseconds field of the subsecond register. For example, when TSCTRLSSR field in the MAC_Timestamp_Control register is set. and if the required increment is 5.3ns, then SSINC should be 0x05 and SNSINC should be 0x4C.
7:0	0h RO	**Reserved**

10.2.302 MAC_SYSTEM_TIME_SECONDS — Offset B08h

The System Time Seconds register, along with System Time Nanoseconds register, indicates the current value of the system time maintained by the MAC. Though it is updated on a continuous basis, there is some delay from the actual time because of clock domain transfer latencies (from clk_ptp_ref_i to CSR clock).

Type	Size	Offset	Default
MMIO	32 bit	BAR + B08h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Timestamp Second (TSS):** The value in this field indicates the current value in seconds of the System Time maintained by the MAC.

10.2.303 MAC_SYSTEM_TIME_NANOSECONDS — Offset B0Ch

The System Time Nanoseconds register, along with System Time Seconds register, indicates the current value of the system time maintained by the MAC.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B0Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:0	00000000h RO	**Timestamp Sub Seconds (TSSS):** The value in this field has the sub-second representation of time, with an accuracy of 0.46 ns. When Bit 9 is set in MAC_Timestamp_Control, each bit represents 1 ns. The maximum value is 0x3B9A_C9FF after which it rolls-over to zero.

10.2.304 MAC_SYSTEM_TIME_SECONDS_UPDATE — Offset B10h

The System Time Seconds Update register, along with the System Time Nanoseconds Update register, initializes or updates the system time maintained by the MAC. You must write both registers before setting the TSINIT or TSUPDT bits in MAC_Timestamp_Control register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Timestamp Seconds (TSS):** The value in this field is the seconds part of the update. When ADDSUB is reset, this field must be programmed with the seconds part of the update value. When ADDSUB is set, this field must be programmed with the complement of the seconds part of the update value. For example, if 2.000000001 seconds need to be subtracted from the system time, the TSS field in the MAC_Timestamp_Seconds_Update register must be 0xFFFF_FFFE (that is, 2^32 - 2).

10.2.305 MAC_SYSTEM_TIME_NANOSECONDS_UPDATE — Offset B14h

MAC System Time Nanoseconds Update register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Add or Subtract Time (ADDSUB):** When this bit is set, the time value is subtracted with the contents of the update register. When this bit is reset, the time value is added with the contents of the update register. 0x0 (ADD): Add time. 0x1 (SUB): Subtract time.
30:0	00000000h RW	**Timestamp Sub Seconds (TSSS):** The value in this field is the sub-seconds part of the update. When ADDSUB is reset, this field must be programmed with the sub-seconds part of the update value, with an accuracy based on the TSCTRLSSR bit of the MAC_Timestamp_Control register. When ADDSUB is set, this field must be programmed with the complement of the sub-seconds part of the update value as described below. When TSCTRLSSR bit in MAC_Timestamp_Control is set, the programmed value must be 10^9 - <sub-second value>. When TSCTRLSSR bit in MAC_Timestamp_Control is reset, the programmed value must be 2^31 - <sub-second_value>. When the TSCTRLSSR bit is reset in the MAC_Timestamp_Control register, each bit represents an accuracy of 0.46 ns. When the TSCTRLSSR bit is set in the MAC_Timestamp_Control register, each bit represents 1 ns and the programmed value should not exceed 0x3B9A_C9FF. For example, if 2.000000001 seconds need to be subtracted from the system time, then the TSSS field in the MAC_Timestamp_Nanoseconds_Update register must be 0x7FFF_FFFF (that is, 2^31 - 1), when TSCTRLSSR bit in MAC_Timestamp_Control is reset and 0x3B9A_C9FF (that is, 10^9 - 1), when TSCTRLSSR bit in MAC_Timestamp_Control is set.

10.2.306 MAC_TIMESTAMP_ADDEND — Offset B18h

Timestamp Addend register. This register value is used only when the system time is configured for Fine Update mode (TSCFUPDT bit in the MAC_Timestamp_Control register). The content of this register is added to a 32-bit accumulator in every clock cycle (of clk_ptp_ref_i) and the system time is updated whenever the accumulator overflows.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Timestamp Addend Register (TSAR):** This field indicates the 32-bit time value to be added to the Accumulator register to achieve time synchronization.

10.2.307 MAC_SYSTEM_TIME_HIGHER_WORD_SECONDS — Offset B1Ch

System Time - Higher Word Seconds register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0000h RW	**Timestamp Higher Word Register (TSHWR):** This field contains the most-significant 16-bits of timestamp seconds value. This register is optional. You can add this register by selecting the Add IEEE 1588 Higher Word Register option. This register is directly written to initialize the value and it is incremented when there is an overflow from 32-bits of the System Time Seconds register. Access restriction applies. Updated based on the event. Setting 1 sets. Setting 0 clears.

10.2.308 MAC_TIMESTAMP_STATUS — Offset B20h

Timestamp Status register. All bits except Bits[27:25] gets cleared when the application reads this register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B20h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:25	00h RO	**Number of Auxiliary Timestamp Snapshots (ATSNS):** This field indicates the number of Snapshots available in the FIFO. A value equal to the selected depth of FIFO (4, 8, or 16) indicates that the Auxiliary Snapshot FIFO is full. These bits are cleared (to 00000) when the Auxiliary snapshot FIFO clear bit is set. This bit is valid only if the Add IEEE 1588 Auxiliary Snapshot option is selected.
24	0h RO	**Auxiliary Timestamp Snapshot Trigger Missed (ATSSTM):** This bit is set when the Auxiliary timestamp snapshot FIFO is full and external trigger was set. This indicates that the latest snapshot is not stored in the FIFO. This bit is valid only if the Add IEEE 1588 Auxiliary Snapshot option is selected. 0x0 (INACTIVE): Auxiliary Timestamp Snapshot Trigger Missed status not detected. 0x1 (ACTIVE): Auxiliary Timestamp Snapshot Trigger Missed status detected.
23:20	0h RO	**Reserved**
19:16	0h RO	**Auxiliary Timestamp Snapshot Trigger Identifier (ATSSTN):** These bits identify the Auxiliary trigger inputs for which the timestamp available in the Auxiliary Snapshot Register is applicable. When more than one bit is set at the same time, it means that corresponding auxiliary triggers were sampled at the same clock. These bits are applicable only if the number of Auxiliary snapshots is more than one. One bit is assigned for each trigger as shown in the following list: - Bit 16: Auxiliary trigger 0 - Bit 17: Auxiliary trigger 1 - Bit 18: Auxiliary trigger 2 - Bit 19: Auxiliary trigger 3 The software can read this register to find the triggers that are set when the timestamp is taken. Access restriction applies. Clears on read. Self-set to 1 on internal event.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Tx Timestamp Status Interrupt Status (TXTSSIS):** In non-EQOS_CORE configurations when drop transmit status is enabled in MTL, this bit is set when the captured transmit timestamp is updated in the MAC_Tx_Timestamp_Status_Nanoseconds and MAC_Tx_Timestamp_Status_Seconds registers. When PTP offload feature is enabled, this bit is set when the captured transmit timestamp is updated in the MAC_Tx_Timestamp_Status_Nanoseconds and MAC_Tx_Timestamp_Status_Seconds registers, for PTO generated Delay Request and Pdelay request packets. This bit is cleared when the MAC_Tx_Timestamp_Status_Seconds register is read (or write to MAC_Tx_Timestamp_Status_Seconds register when RCWE bit of MAC_CSR_SW_Ctrl register is set). 0x0 (INACTIVE): Tx Timestamp Status Interrupt status not detected. 0x1 (ACTIVE): Tx Timestamp Status Interrupt status detected.
14:6	0h RO	**Reserved**
5	0h RO	**Timestamp Target Time Error (TSTRGTERR1):** This bit is set when the latest target time programmed in the MAC_PPS1_Target_Time_Seconds and MAC_PPS1_Target_Time_Nanoseconds registers elapses. This bit is cleared when the application reads this bit. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): Timestamp Target Time Error status not detected. 0x1 (ACTIVE): Timestamp Target Time Error status detected.
4	0h RO	**Timestamp Target Time Reached for Target Time PPS1 (TSTARGT1):** When this bit is set and MCGREN1 of MAC_PPS_Control register is reset, it indicates that the value of system time is greater than or equal to the value specified in the MAC_PPS1_Target_Time_Seconds and MAC_PPS1_Target_Time_Nanoseconds registers. Access restriction applies. When this bit is set and MCGREN1 of MAC_PPS_Control register is set, it indicates that mcgr_dma_req_o[1] is asserted. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event.
3	0h RO	**Timestamp Target Time Error (TSTRGTERR0):** This bit is set when the latest target time programmed in the MAC_PPS0_Target_Time_Seconds and MAC_PPS0_Target_Time_Nanoseconds registers elapses. This bit is cleared when the application reads this bit. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): Timestamp Target Time Error status not detected. 0x1 (ACTIVE): Timestamp Target Time Error status detected.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RO	**Auxiliary Timestamp Trigger Snapshot (AUXTSTRIG):** This bit is set high when the auxiliary snapshot is written to the FIFO. This bit is valid only if the Add IEEE 1588 Auxiliary Snapshot option is selected. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): Auxiliary Timestamp Trigger Snapshot status not detected. 0x1 (ACTIVE): Auxiliary Timestamp Trigger Snapshot status detected.
1	0h RO	**Timestamp Target Time Reached (TSTARGT0):** When this bit is set and MCGREN0 of MAC_PPS_Control register is reset, it indicates that the value of system time is greater than or equal to the value specified in the MAC_PPS0_Target_Time_Seconds and MAC_PPS0_Target_Time_Nanoseconds registers. Access restriction applies. When this bit is set and MCGREN0 of MAC_PPS_Control register is set, it indicates that mcgr_dma_req_o[0] is asserted. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event.
0	0h RO	**Timestamp Seconds Overflow (TSSOVF):** When this bit is set, it indicates that the seconds value of the timestamp (when supporting version 2 format) has overflowed beyond 32'hFFFF_FFFF. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): Timestamp Seconds Overflow status not detected. 0x1 (ACTIVE): Timestamp Seconds Overflow status detected.

10.2.309 MAC_TX_TIMESTAMP_STATUS_NANOSECONDS — Offset B30h

This register contains the nanosecond part of timestamp captured for Transmit packets when Tx status is disabled.

The MAC_Tx_Timestamp_Status_Nanoseconds register, along with MAC_Tx_Timestamp_Status_Seconds, gives the 64-bit timestamp captured for the PTP packet successfully transmitted by the MAC. This value is considered to be read by the application when the last byte (bits [31:24]) of MAC_Tx_Timestamp_Status_Nanoseconds is read.

If the application does not read these registers and timestamp of another packet is captured, then either the current timestamp is lost (overwritten) or the new timestamp is lost (dropped), depending on the setting of the TXTSSTSM bit of the MAC_Timestamp_Control register. The status bit TXTSC bit [15] in MAC_Timestamp_Status register is set whenever the MAC transmitter captures the timestamp.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Transmit Timestamp Status Missed (TXTSSMIS):** When this bit is set, it indicates one of the following: - The timestamp of the current packet is ignored if TXTSSTSM bit of the MAC_Timestamp_Control register is reset - The timestamp of the previous packet is overwritten with timestamp of the current packet if TXTSSTSM bit of the MAC_Timestamp_Control register is set. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Transmit Timestamp Status Missed status not detected. 0x1 (ACTIVE): Transmit Timestamp Status Missed status detected.
30:0	00000000h RO	**Transmit Timestamp Status Low (TXTSSLO):** This field contains the 31 bits of the Nanoseconds field of the Transmit packet's captured timestamp.

10.2.310 MAC_TX_TIMESTAMP_STATUS_SECONDS — Offset B34h

The register contains the higher 32 bits of the timestamp (in seconds) captured when a PTP packet is transmitted.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B34h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Transmit Timestamp Status High (TXTSSHI):** This field contains the lower 32 bits of the Seconds field of Transmit packet's captured timestamp.

10.2.311 MAC_AUXILIARY_CONTROL — Offset B40h

The Auxiliary Timestamp Control register controls the Auxiliary Timestamp snapshot.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B40h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5	0h RW	**Auxiliary Snapshot 1 Enable (ATSEN1):** This bit controls the capturing of Auxiliary Snapshot Trigger 1. When this bit is set, the auxiliary snapshot of the event on ptp_aux_trig_i[1] input is enabled. When this bit is reset, the events on this input are ignored. 0x0 (DISABLE): Auxiliary Snapshot $i is disabled. 0x1 (ENABLE): Auxiliary Snapshot $i is enabled.
4	0h RW	**Auxiliary Snapshot 0 Enable (ATSEN0):** This bit controls the capturing of Auxiliary Snapshot Trigger 0. When this bit is set, the auxiliary snapshot of the event on ptp_aux_trig_i[0] input is enabled. When this bit is reset, the events on this input are ignored. 0x0 (DISABLE): Auxiliary Snapshot $i is disabled. 0x1 (ENABLE): Auxiliary Snapshot $i is enabled.
3:1	0h RO	**Reserved**
0	0h RW	**Auxiliary Snapshot FIFO Clear (ATSFC):** When set, this bit resets the pointers of the Auxiliary Snapshot FIFO. This bit is cleared when the pointers are reset and the FIFO is empty. When this bit is high, the auxiliary snapshots are stored in the FIFO. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Auxiliary Snapshot FIFO Clear is disabled. 0x1 (ENABLE): Auxiliary Snapshot FIFO Clear is enabled.

10.2.312 MAC_AUXILIARY_TIMESTAMP_NANOSECONDS — Offset B48h

The Auxiliary Timestamp Nanoseconds register, along with MAC_Auxiliary_Timestamp_Seconds, gives the 64-bit timestamp stored as auxiliary snapshot. These two registers form the read port of a 64-bit wide FIFO with a depth of 4, 8, or 16 as selected while configuring the core.

You can store multiple snapshots in this FIFO. Bits[29:25] in MAC_Timestamp_Status indicate the fill-level of the FIFO. The top of the FIFO is removed only when the last byte (bits [31:24]) of MAC_Auxiliary_Timestamp_Seconds register is read.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B48h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:0	00000000h RO	**Auxiliary Timestamp (AUXTSLO):** Contains the lower 31 bits (nanoseconds field) of the auxiliary timestamp.

10.2.313 MAC_AUXILIARY_TIMESTAMP_SECONDS — Offset B4Ch

The Auxiliary Timestamp - Seconds register contains the lower 32 bits of the Seconds field of the auxiliary timestamp register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B4Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Auxiliary Timestamp (AUXTSHI):** Contains the lower 32 bits of the Seconds field of the auxiliary timestamp.

10.2.314 MAC_TIMESTAMP_INGRESS_ASYM_CORR — Offset B50h

The MAC Timestamp Ingress Asymmetry Correction register contains the Ingress Asymmetry Correction value to be used while updating correction field in PDelay_Resp PTP messages.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B50h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**One-Step Timestamp Ingress Asymmetry Correction (OSTIAC):** This field contains the ingress path asymmetry value to be added to correctionField of Pdelay_Resp PTP packet. The programmed value should be in units of nanoseconds and multiplied by 2^16. For example, 2.5 ns is represented as 0x00028000. The value can also be negative, which is represented in 2's complement form with bit 31 representing the sign bit.

10.2.315 MAC_TIMESTAMP_EGRESS_ASYM_CORR — Offset B54h

The MAC Timestamp Egress Asymmetry Correction register contains the Egress Asymmetry Correction value to be used while updating the correction field in PDelay_Req PTP messages.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B54h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**One-Step Timestamp Egress Asymmetry Correction (OSTEAC):** This field contains the egress path asymmetry value to be subtracted from correctionField of Pdelay_Resp PTP packet. The programmed value must be the negated value in units of nanoseconds multiplied by 2^16. For example, if the required correction is +2.5 ns, the programmed value must be 0xFFFD_8000, which is the 2's complement of 0x0002_8000(2.5 * 216). Similarly, if the required correction is -3.3 ns, the programmed value is 0x0003_4CCC (3.3 * 216).

10.2.316 MAC_TIMESTAMP_INGRESS_CORR_NANOSECOND — Offset B58h

This register contains the correction value in nanoseconds to be used with the captured timestamp value in the ingress path.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B58h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Timestamp Ingress Correction (TSIC):** This field contains the ingress path correction value as defined by the Ingress Correction expression.

10.2.317 MAC_TIMESTAMP_EGRESS_CORR_NANOSECOND — Offset B5Ch

This register contains the correction value in nanoseconds to be used with the captured timestamp value in the egress path.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B5Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Timestamp Egress Correction (TSEC):** This field contains the nanoseconds part of the egress path correction value as defined by the Egress Correction expression.

10.2.318 MAC_TIMESTAMP_INGRESS_CORR_SUBNANOSEC — Offset B60h

This register contains the sub-nanosecond part of the correction value to be used with the captured timestamp value, for ingress direction.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B60h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:8	00h RW	**Timestamp Ingress Correction, sub-nanoseconds (TSICSNS):** This field contains the sub-nanoseconds part of the ingress path correction value as defined by the "Ingress Correction" expression.
7:0	0h RO	**Reserved**

10.2.319 MAC_TIMESTAMP_EGRESS_CORR_SUBNANOSEC — Offset B64h

This register contains the sub-nanosecond part of the correction value to be used with the captured timestamp value, for egress direction.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B64h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:8	00h RW	**Timestamp Egress Correction, sub-nanoseconds (TSECSNS):** This field contains the sub-nanoseconds part of the egress path correction value as defined by the "Egress Correction" expression.
7:0	0h RO	**Reserved**

10.2.320 MAC_TIMESTAMP_INGRESS_LATENCY — Offset B68h

This register holds the Ingress MAC latency.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B68h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27:16	000h RO	**Ingress Timestamp Latency, in sub-nanoseconds (ITLNS):** This register holds the average latency in sub-nanoseconds between the input ports (phy_rxd_i) of MAC and the actual point (GMII/MII) where the ingress timestamp is taken.
15:8	00h RO	**Ingress Timestamp Latency, in nanoseconds (ITLSNS):** This register holds the average latency in nanoseconds between the input ports (phy_rxd_i) of MAC and the actual point (GMII/MII) where the ingress timestamp is taken.
7:0	0h RO	**Reserved**

10.2.321 MAC_TIMESTAMP_EGRESS_LATENCY — Offset B6Ch

This register holds the Egress MAC latency.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B6Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27:16	000h RO	**Egress Timestamp Latency, in nanoseconds (ETLNS):** This register holds the average latency in nanoseconds between the actual point (GMII/MII) where the egress timestamp is taken and the output ports (phy_txd_o) of the MAC.
15:8	00h RO	**Egress Timestamp Latency, in sub-nanoseconds (ETLSNS):** This register holds the average latency in sub-nanoseconds between the actual point (GMII/MII) where the egress timestamp is taken and the output ports (phy_txd_o) of the MAC.
7:0	0h RO	**Reserved**

10.2.322 MAC_PPS_CONTROL — Offset B70h

PPS Control register.

Bits[30:24] of this register are valid only when four Flexible PPS outputs are selected.
Bits[22:16] are valid only when three or more Flexible PPS outputs are selected.
Bits[14:8] are valid only when two or more Flexible PPS outputs are selected.
Bits[6:4] are valid only when Flexible PPS feature is selected.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B70h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**Time Select (TRGTMODSEL1):** When set, 64-bit PTP time is used to capture time at MCGR trigger[0] input. When reset, presentation time is used to capture time at trigger input, maintaining backward compatibility.
27:16	0h RO	**Reserved**
15	0h RW	**MCGR Mode Enable for PPS1 Output (MCGREN1):** This field enables the 1st PPS instance to operate in PPS or MCGR mode. When set it operates in MCGR mode and on reset it operates in PPS mode. 0x0 (DISABLE): 1st PPS instance is disabled to operate in PPS or MCGR mode. 0x1 (ENABLE): 1st PPS instance is enabled to operate in PPS or MCGR mode.
14:13	0h RW	**Target Time Register Mode for PPS1 Output (TIMESEL):** This field indicates the Target Time registers (MAC_PPS1_Target_Time_Seconds and MAC_PPS1_Target_Time_Nanoseconds) mode for PPS1 output signal. 0x0 (ONLY_INT): Target Time registers are programmed only for generating the interrupt event. The Flexible PPS function must not be enabled in this mode, otherwise spurious transitions may be observed on the corresponding Pulse Per Second (PPS) output signal. 0x1 (MCGR): Enables MCGR Interrupt whose status bit is indicated by TSTARGT1 (MAC_Timestamp_Status[4]). 0x2 (INT_ST): Target Time registers are programmed for generating the interrupt event and starting or stopping the PPS0 output signal generation. 0x3 (ONLY_ST): Target Time registers are programmed only for starting or stopping the PPS0 output signal generation. No interrupt is asserted.
12	0h RO	**Reserved**
11:8	0h RW	**Flexible PPS1 Output Control (PPSCMD1):** This field controls the flexible PPS1 output signal. This field is similar to the PPSCMD0 field. If MCGREN1 is set, then PPSCMD1 indicated by these 4 bits [11:8] are taken as Presentation Time Control bits for media clock generation and recovery for comparator instance 1. This field is similar to the PPSCMD0 Presentation Time Control bits. If MCGREN1 is not set then only 3 bits from [10:8] is used as PPSCMD1 and the 4th bit is to be set as 0. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.
7	0h RW	**MCGR Mode Enable for PPS0 Output (MCGREN0):** This field enables the 0th PPS instance to operate in PPS or MCGR mode. When set it operates in MCGR mode and on reset it operates in PPS mode. 0x0 (PPS): 0th PPS instance is enabled to operate in PPS mode. 0x1 (MCGR): 0th PPS instance is enabled to operate in MCGR mode.

Bit Range	Default & Access	Field Name (ID): Description
6:5	0h RW	**Target Time Register Mode for PPS0 Output (TRGTMODSEL0):** Target Time Register Mode for PPS0 Output This field indicates the Target Time registers (MAC_PPS0_Target_Time_Seconds and MAC_PPS0_Target_Time_Nanoseconds) mode for PPS0 output signal. 0x0 (ONLY_INT): Target Time registers are programmed only for generating the interrupt event. The Flexible PPS function must not be enabled in this mode, otherwise spurious transitions may be observed on the corresponding Pulse Per Second (PPS) output signal. 0x1 (MCGR): Enables MCGR Interrupt whose status bit is indicated by TSTARGT0 (MAC_Timestamp_Status[1]) 0x2 (INT_ST): Target Time registers are programmed for generating the interrupt event and starting or stopping the PPS0 output signal generation 0x3 (ONLY_ST): Target Time registers are programmed only for starting or stopping the PPS0 output signal generation. No interrupt is asserted.
4	0h RW	**Flexible PPS Output Mode Enable (PPSEN0):** When this bit is set, Bits[3:0] function as PPSCMD. When this bit is reset, Bits[3:0] function as PPSCTRL (Fixed PPS mode). 0x0 (DISABLE): Flexible PPS Output Mode is disabled. 0x1 (ENABLE): Flexible PPS Output Mode is enabled.

Bit Range	Default & Access	Field Name (ID): Description
3:0	0h RW	**PPS Output Frequency Control (PPSCTRL_PPSCMD):** This field controls the frequency of the PPS0 output signal. The default value of PPSCTRL is 0000, and the PPS output is 1 pulse (of width clk_ptp_i) every second. For other values of PPSCTRL, the PPS output becomes a generated clock of following frequencies: - 0001: The binary rollover is 2 Hz, and the digital rollover is 1 Hz. - 0010: The binary rollover is 4 Hz, and the digital rollover is 2 Hz. - 0011: The binary rollover is 8 Hz, and the digital rollover is 4 Hz. - 0100: The binary rollover is 16 Hz, and the digital rollover is 8 Hz. - .. - 1111: The binary rollover is 32.768 KHz and the digital rollover is 16.384 KHz. Note: In the binary rollover mode, the PPS output signal has a duty cycle of 50 percent with these frequencies. In the digital rollover mode, the PPS output frequency is an average number. The actual clock is of different frequency that gets synchronized every second. For example: - When PPSCTRL = 0001, the PPS (1 Hz) has a low period of 537 ms and a high period of 463 ms - When PPSCTRL = 0010, the PPS (2 Hz) is a sequence of One clock of 50 percent duty cycle and 537 ms period Second clock of 463 ms period (268 ms low and 195 ms high) - When PPSCTRL = 0011, the PPS (4 Hz) is a sequence of Three clocks of 50 percent duty cycle and 268 ms period Fourth clock of 195 ms period (134 ms low and 61 ms high) This behavior is because of the non-linear toggling of bits in the digital rollover mode in the MAC_System_Time_Nanoseconds register. or Flexible PPS Output Control Programming these bits with a non-zero value instructs the MAC to initiate an event. When the command is transferred or synchronized to the PTP clock domain, these bits get cleared automatically. The software should ensure that these bits are programmed only when they are 'all-zero'. The following list describes the values of PPSCMD0: - 0000: No Command - 0001: START Single Pulse This command generates single pulse rising at the start point defined in MAC_PPS0_Target_Time_Seconds and MAC_PPS0_Target_Time_Nanoseconds register and of a duration defined in the PPS0 Width Register. - 0010: START Pulse Train This command generates the train of pulses rising at the start point defined in the Target Time Registers and of a duration defined in the PPS0 Width Register and repeated at interval defined in the PPS Interval Register. By default, the PPS pulse train is free-running unless stopped by the 'Stop Pulse train at time' or 'Stop Pulse Train immediately' commands. - 0011: Cancel START This command cancels the START Single Pulse and START Pulse Train commands if the system time has not crossed the programmed start time. - 0100: STOP Pulse train at time This command stops the train of pulses initiated by the START Pulse Train command (PPSCMD = 0010) after the time programmed in the Target Time registers elapses. - 0101: STOP Pulse Train immediately This command immediately stops the train of pulses initiated by the START Pulse Train command (PPSCMD = 0010). - 110: Cancel STOP Pulse train This command cancels the STOP pulse train at time command if the programmed stop time has not elapsed. The PPS pulse train becomes free-running on the successful execution of this command. - 0111-1111: Reserved or Presentation Time Control If MCGREN0 is set then these bits are treated as Presentation time control bits. The following list describes the values of PPSCMD0: - 0000: MCGR operation is not carried out. If set to this value in the mid of clock recovery or generation, all the processing inputs are flushed - 0001: Capture the Presentation time at the rising edge of mcg_pst_trig_i[0] into the MAC_PPS0_Target_Time_Seconds register - 0010: Capture the Presentation time at the falling edge of mcg_pst_trig_i[0] into the MAC_PPS0_Target_Time_Seconds register - 0011: Capture the Presentation time at both edges of mcg_pst_trig_i[0] into the MAC_PPS0_Target_Time_Seconds register - 0100-1000: Reserved - 1001: Toggle output on compare - 1010: Pulse output low on compare for one PTP-clock cycle - 1011: Pulse output high on compare for one PTP-clock cycle - 1100-1111: Reserved

10.2.323 MAC_PPS0_TARGET_TIME_SECONDS — Offset B80h

The PPS Target Time Seconds register, along with PPS Target Time Nanoseconds register, is used to schedule an interrupt event [Bit 1 of MAC_Timestamp_Status] when the system time exceeds the value programmed in these registers.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B80h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**PPS Target Time Seconds Register (TSTRH0):** This field stores the time in seconds. When the timestamp value matches or exceeds both Target Timestamp registers, the MAC starts or stops the PPS signal output and generates an interrupt (if enabled) based on Target Time mode selected for the corresponding PPS output in the MAC_PPS_Control register. If DWC_EQOS_FLEXI_PPS_OUT_EN is enabled in the configuration and PTGE field of MAC_Timestamp_Control Register is set with Presentation time control set in recovery mode, then these bits indicate the TPT being programmed by the application and in generation mode it indicates the CPT generated at the sampled trigger.

10.2.324 MAC_PPS0_TARGET_TIME_NANOSECONDS — Offset B84h

PPS0 Target Time Nanoseconds register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B84h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**PPS Target Time Register Busy (TRGTBUSY0):** The MAC sets this bit when the PPSCMD0 field in the MAC_PPS_Control register is programmed to 010 or 011. Programming the PPSCMD0 field to 010 or 011 instructs the MAC to synchronize the Target Time Registers to the PTP clock domain. The MAC clears this bit after synchronizing the Target Time Registers to the PTP clock domain The application must not update the Target Time Registers when this bit is read as 1. Otherwise, the synchronization of the previous programmed time gets corrupted. 0x0 (INACTIVE): PPS Target Time Register Busy status is not detected. 0x1 (ACTIVE): PPS Target Time Register Busy is detected.
30:0	00000000h RW	**Target Time Low for PPS Register (TTSL0):** This register stores the time in (signed) nanoseconds. When the value of the timestamp matches the value in both Target Timestamp registers, the MAC starts or stops the PPS signal output and generates an interrupt (if enabled) based on the TRGTMODSEL0 field (Bits [6:5]) in MAC_PPS_Control. When the TSCTRLSSR bit is reset in the MAC_Timestamp_Control register, this value should be (time in ns / 0.465). The actual start or stop time of the PPS signal output might have an error margin up to one unit of sub-second increment value. When the TSCTRLSSR bit is set in the MAC_Timestamp_Control register, this value should not exceed 0x3B9A_C9FF. The actual start or stop time of the PPS signal output might have an error margin up to one unit of sub-second increment value. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.

10.2.325 MAC_PPS0_INTERVAL — Offset B88h

The PPS0 Interval register contains the number of units of sub-second increment value between the rising edges of PPS0 signal output.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B88h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**PPS Output Signal Interval (PPSINT0):** These bits store the interval between the rising edges of PPS0 signal output. The interval is stored in terms of number of units of sub-second increment value. You need to program one value less than the required interval. For example, if the PTP reference clock is 50 MHz (period of 20 ns), and desired interval between the rising edges of PPS0 signal output is 100 ns (that is, 5 units of sub-second increment value), you should program value 4 (5-1) in this register.

10.2.326 MAC_PPS0_WIDTH — Offset B8Ch

The PPS0 Width register contains the number of units of sub-second increment value between the rising and corresponding falling edges of PPS0 signal output.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B8Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**PPS Output Signal Width (PPSWIDTH0):** These bits store the width between the rising edge and corresponding falling edge of PPS0 signal output. The width is stored in terms of number of units of sub-second increment value. You need to program one value less than the required interval. For example, if PTP reference clock is 50 MHz (period of 20 ns), and width between the rising and corresponding falling edges of PPS0 signal output is 80 ns (that is, four units of sub-second increment value), you should program value 3 (4-1) in this register. Note: The value programmed in this register must be lesser than the value programmed in MAC_PPS0_Interval.

10.2.327 MAC_PPS1_TARGET_TIME_SECONDS — Offset B90h

The PPS Target Time Seconds register, along with PPS Target Time Nanoseconds register, is used to schedule an interrupt event [Bit 1 of MAC_Timestamp_Status] when the system time exceeds the value programmed in these registers.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B90h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**PPS Target Time Seconds Register (TSTRH1):** This field stores the time in seconds. When the timestamp value matches or exceeds both Target Timestamp registers, the MAC starts or stops the PPS signal output and generates an interrupt (if enabled) based on Target Time mode selected for the corresponding PPS output in the MAC_PPS_Control register. If DWC_EQOS_FLEXI_PPS_OUT_EN is enabled in the configuration and PTGE field of MAC_Timestamp_Control Register is set with Presentation time control set in recovery mode, then these bits indicate the TPT being programmed by the application and in generation mode it indicates the CPT generated at the sampled trigger.

10.2.328 MAC_PPS1_TARGET_TIME_NANOSECONDS — Offset B94h

PPS0 Target Time Nanoseconds register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B94h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**PPS Target Time Register Busy (TRGTBUSY1):** The MAC sets this bit when the PPSCMD0 field in the MAC_PPS_Control register is programmed to 010 or 011. Programming the PPSCMD0 field to 010 or 011 instructs the MAC to synchronize the Target Time Registers to the PTP clock domain. The MAC clears this bit after synchronizing the Target Time Registers to the PTP clock domain The application must not update the Target Time Registers when this bit is read as 1. Otherwise, the synchronization of the previous programmed time gets corrupted. 0x0 (INACTIVE): PPS Target Time Register Busy status is not detected. 0x1 (ACTIVE): PPS Target Time Register Busy is detected.
30:0	00000000h RW	**Target Time Low for PPS Register (TTSL1):** This register stores the time in (signed) nanoseconds. When the value of the timestamp matches the value in both Target Timestamp registers, the MAC starts or stops the PPS signal output and generates an interrupt (if enabled) based on the TRGTMODSEL0 field (Bits [6:5]) in MAC_PPS_Control. When the TSCTRLSSR bit is reset in the MAC_Timestamp_Control register, this value should be (time in ns / 0.465). The actual start or stop time of the PPS signal output might have an error margin up to one unit of sub-second increment value. When the TSCTRLSSR bit is set in the MAC_Timestamp_Control register, this value should not exceed 0x3B9A_C9FF. The actual start or stop time of the PPS signal output might have an error margin up to one unit of sub-second increment value. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.

10.2.329 MAC_PPS1_INTERVAL — Offset B98h

The PPS0 Interval register contains the number of units of sub-second increment value between the rising edges of PPS0 signal output.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**PPS Output Signal Interval (PPSINT1):** These bits store the interval between the rising edges of PPS0 signal output. The interval is stored in terms of number of units of sub-second increment value. You need to program one value less than the required interval. For example, if the PTP reference clock is 50 MHz (period of 20 ns), and desired interval between the rising edges of PPS0 signal output is 100 ns (that is, 5 units of sub-second increment value), you should program value 4 (5-1) in this register.

10.2.330 MAC_PPS1_WIDTH — Offset B9Ch

The PPS0 Width register contains the number of units of sub-second increment value between the rising and corresponding falling edges of PPS0 signal output.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**PPS Output Signal Width (PPSWIDTH1):** These bits store the width between the rising edge and corresponding falling edge of PPS0 signal output. The width is stored in terms of number of units of sub-second increment value. You need to program one value less than the required interval. For example, if PTP reference clock is 50 MHz (period of 20 ns), and width between the rising and corresponding falling edges of PPS0 signal output is 80 ns (that is, four units of sub-second increment value), you should program value 3 (4-1) in this register. Note: The value programmed in this register must be lesser than the value programmed in MAC_PPS0_Interval.

10.2.331 MAC_PTO_CONTROL — Offset BC0h

This register controls the PTP Offload Engine operation. This register is available only when the Enable PTP Timestamp Offload feature is selected.

Type	Size	Offset	Default
MMIO	32 bit	BAR + BC0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:8	00h RW	**Domain Number (DN):** This field indicates the domain Number in which the PTP node is operating.
7	0h RW	**Disable Peer Delay Response response generation (PDRDIS):** When this bit is set, the Peer Delay Response (Pdelay_Resp) response is not be generated for received Peer Delay Request (Pdelay_Req) request packet, as required by the programmed mode. Note: Setting this bit to 1 affects the normal PTP Offload operation and the time synchronization. So, this bit must be set only if there is problem with Pdelay_Resp generation in Hardware and/or Pdelay_Resp generation is handled by Software. 0x0 (ENABLE): Peer Delay Response response generation is enabled. 0x1 (DISABLE): Peer Delay Response response generation is disabled.
6	0h RW	**Disable PTO Delay Request/Response response generation (DRRDIS):** When this bit is set, the Delay Request and Delay response is not generated for received SYNC and Delay request packet respectively, as required by the programmed mode. 0x0 (ENABLE): PTO Delay Request/Response response generation is enabled. 0x1 (DISABLE): PTO Delay Request/Response response generation is disabled.
5	0h RW	**Automatic PTP Pdelay_Req message Trigger (APDREQTRIG):** When this bit is set, one PTP Pdelay_Req message is transmitted. This bit is automatically cleared after the PTP Pdelay_Req message is transmitted. The application should set the APDREQEN bit for this operation. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Automatic PTP Pdelay_Req message Trigger is disabled. 0x1 (ENABLE): Automatic PTP Pdelay_Req message Trigger is enabled.
4	0h RW	**Automatic PTP SYNC message Trigger (ASYNCTRIG):** When this bit is set, one PTP SYNC message is transmitted. This bit is automatically cleared after the PTP SYNC message is transmitted. The application should set the ASYNCEN bit for this operation. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Automatic PTP SYNC message Trigger is disabled. 0x1 (ENABLE): Automatic PTP SYNC message Trigger is enabled.
3	0h RO	**Reserved**
2	0h RW	**Automatic PTP Pdelay_Req message Enable (APDREQEN):** When this bit is set, PTP Pdelay_Req message is generated periodically based on interval programmed or trigger from application, when the MAC is programmed to be in Peer-to-Peer Transparent mode. 0x0 (DISABLE): Automatic PTP Pdelay_Req message is disabled. 0x1 (ENABLE): Automatic PTP Pdelay_Req message is enabled.
1	0h RW	**Automatic PTP SYNC message Enable (ASYNCEN):** When this bit is set, PTP SYNC message is generated periodically based on interval programmed or trigger from application, when the MAC is programmed to be in Clock Master mode. 0x0 (DISABLE): Automatic PTP SYNC message is disabled. 0x1 (ENABLE): Automatic PTP SYNC message is enabled.
0	0h RW	**PTP Offload Enable (PTOEN):** When this bit is set, the PTP Offload feature is enabled. 0x0 (DISABLE): PTP Offload feature is disabled. 0x1 (ENABLE): PTP Offload feature is enabled.

10.2.332 MAC_SOURCE_PORT_IDENTITY0 — Offset BC4h

This register contains Bits[31:0] of the 80-bit Source Port Identity of the PTP node. This register is available only when the Enable PTP Timestamp Offload feature is selected.

Type	Size	Offset	Default
MMIO	32 bit	BAR + BC4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Source Port Identity 0 (SPI0):** This field indicates bits [31:0] of sourcePortIdentity of PTP node.

10.2.333 MAC_SOURCE_PORT_IDENTITY1 — Offset BC8h

This register contains Bits[63:32] of the 80-bit Source Port Identity of the PTP node. This register is available only when the Enable PTP Timestamp Offload feature is selected.

Type	Size	Offset	Default
MMIO	32 bit	BAR + BC8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Source Port Identity 1 (SPI1):** This field indicates bits [63:32] of sourcePortIdentity of PTP node.

10.2.334 MAC_SOURCE_PORT_IDENTITY2 — Offset BCCh

This register contains Bits[79:64] of the 80-bit Source Port Identity of the PTP node. This register is available only when the Enable PTP Timestamp Offload feature is selected.

Type	Size	Offset	Default
MMIO	32 bit	BAR + BCCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0000h RW	**Source Port Identity 2 (SPI2):** This field indicates bits [79:64] of sourcePortIdentity of PTP node.

10.2.335 MAC_LOG_MESSAGE_INTERVAL — Offset BD0h

This register contains the periodic intervals for automatic PTP packet generation. This register is available only when the Enable PTP Timestamp Offload feature is selected.

Type	Size	Offset	Default
MMIO	32 bit	BAR + BD0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RW	**Log Min Pdelay_Req Interval (LMPDRI):** This field indicates logMinPdelayReqInterval of PTP node. This is used to schedule the periodic Pdelay request packet transmission. Allowed values are -15 to 15.Negative value must be represented in 2's-complement form. For example, if the required value is -1, the value programmed must be 0xFF.
23:11	0h RO	**Reserved**
10:8	0h RW	**DRSYNCR:** Delay_Req to SYNC Ratio In Slave mode, it is used for controlling frequency of Delay_Req messages transmitted. - 0: DelayReq generated for every received SYNC - 1: DelayReq generated every alternate reception of SYNC - 2: for every 4 SYNC messages - 3: for every 8 SYNC messages - 4: for every 16 SYNC messages - 5: for every 32 SYNC messages - 6-7: Reserved The master sends this information (logMinDelayReqInterval) in the DelayResp PTP messages to the slave. The GbE Controller Receiver processes this value from the received DelayResp messages and updates this field accordingly. In the Slave mode, the host must not write/update this register unless it has to override the received value. In Master mode, the sum of this field and logSyncInterval (LSI) field is provided in the logMinDelayReqInterval field of the generated multicast Delay_Resp PTP message. Access restriction applies. Updated based on the event. Setting 1 sets. Setting 0 clears. 0x0 (SYNC1): DelayReq generated for every received SYNC. 0x1 (SYNC2): DelayReq generated every alternate reception of SYNC. 0x2 (SYNC4): for every 4 SYNC messages. 0x3 (SYNC8): for every 8 SYNC messages. 0x4 (SYNC16): for every 16 SYNC messages. 0x5 (SYNC32): for every 32 SYNC messages. 0x6 (RSVD): Reserved.
7:0	00h RW	**LSI:** Log Sync Interval This field indicates the periodicity of the automatically generated SYNC message when the PTP node is Master. Allowed values are -15 to 15. Negative value must be represented in 2's-complement form. For example, if the required value is -1, the value programmed must be 0xFF.

10.2.336 MTL_OPERATION_MODE — Offset C00h

The Operation Mode register establishes the Transmit and Receive operating modes and commands.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C00h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW	**Flexible Rx parser Enable (FRPE):** When this bit is set to 1, the Programmable Rx Parser functionality is enabled. When the Rx parser is disabled and if the Rx parser is in the middle of the parsing then it gets disabled only after completing the current packet parsing. When the Rx parser is enabled from disabled state then the Rx parser gets activated for the next immediate packet. 0x0 (DISABLE): Flexible Rx parser is disabled. 0x1 (ENABLE): Flexible Rx parser is enabled.
14	0h RW	**RxParser Software Error/Incomplete Parsing Packet Drop Enable (RXPED):** When set to 0, packets encountering software programming errors (NPE/NVE/frame offset overflow errors) or incomplete parsing are forwarded to application with the corresponding RxParser status. When set to 1, backward compatibility is maintained where all above mentioned packets are dropped (when RA is not set). 0x0 (DISABLE): Flexible Rx parser, packet drop in case software error is disabled. 0x1 (ENABLE): Flexible Rx parser, packet drop in case software error is enabled.
13:10	0h RO	**Reserved**
9	0h RW	**Counters Reset (CNTCLR):** When this bit is set, all counters are reset. This bit is cleared automatically after 1 clock cycle. If this bit is set along with CNT_PRESET bit, CNT_PRESET has precedence. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Counters are not reset. 0x1 (ENABLE): All counters are reset.
8	0h RW	**Counters Preset (CNTPRST):** When this bit is set, - MTL_TxQ[0-7]_Underflow register is initialized/preset to 12'h7F0. - Missed Packet and Overflow Packet counters in MTL_RxQ[0-7]_Missed_Packet_Overflow_Cnt register is initialized/preset to 12'h7F0. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Counters Preset is disabled. 0x1 (ENABLE): Counters Preset is enabled.
7	0h RO	**Reserved**
6:5	0h RW	**Tx Scheduling Algorithm (SCHALG):** This field indicates the algorithm for Tx scheduling: 0x0 (WRR): WRR algorithm. 0x1 (WFQ): WFQ algorithm when DCB feature is selected.Otherwise, Reserved. 0x2 (DWRR): DWRR algorithm when DCB feature is selected.Otherwise, Reserved. 0x3 (SP): Strict priority algorithm.
4:3	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Receive Arbitration Algorithm (RAA):** This field is used to select the arbitration algorithm for the Rx side. - 0: Strict priority (SP) Queue 0 has the lowest priority and the last queue has the highest priority. - 1: Weighted Strict Priority (WSP) 0x0 (SP): Strict priority (SP). 0x1 (WSP): Weighted Strict Priority (WSP).
1	0h RW	**Drop Transmit Status (DTXSTS):** When this bit is set, the Tx packet status received from the MAC is dropped in the MTL. When this bit is reset, the Tx packet status received from the MAC is forwarded to the application. 0x0 (DISABLE): Drop Transmit Status is disabled. 0x1 (ENABLE): Drop Transmit Status is enabled.
0	0h RO	**Reserved**

10.2.337 MTL_DBG_CTL — Offset C08h

The FIFO Debug Access Control and Status register controls the operation mode of FIFO debug access.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C08h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	**Reserved**
18:17	0h RW	**ECC Inject Error Control for Tx, Rx and TSO memories (EIEC):** When EIEE bit of this register is set, following are the errors inserted based on the value encoded in this field. 0x0 (M_1BIT): Insert 1 bit error. 0x1 (M_2BIT): Insert 2 bit errors. 0x2 (M_3BIT): Insert 3 bit errors. 0x3 (M_1BIT_ADDR): Insert 1 bit error in address field.
16	0h RW	**ECC Inject Error Enable for Tx, Rx and TSO memories (EIEE):** When set, enables the ECC error injection feature. When reset, disables the ECC error injection feature. 0x0 (DISABLE): ECC Inject Error for Tx, Rx and TSO memories is disabled. 0x1 (ENABLE): ECC Inject Error for Tx, Rx and TSO memories is enabled.
15	0h RW	**Transmit Status Available Interrupt Status Enable (STSIE):** When this bit is set, an interrupt is generated when Transmit status is available in slave mode. 0x0 (DISABLE): Transmit Packet Available Interrupt Status is disabled. 0x1 (ENABLE): Transmit Packet Available Interrupt Status is enabled.
14	0h RW	**Receive Packet Available Interrupt Status Enable (PKTIE):** When this bit is set, an interrupt is generated when EOP of received packet is written to the Rx FIFO. 0x0 (DISABLE): Receive Packet Available Interrupt Status is disabled. 0x1 (ENABLE): Receive Packet Available Interrupt Status is enabled.

Bit Range	Default & Access	Field Name (ID): Description
13:12	0h RW	**FIFO Selected for Access (FIFOSEL):** This field indicates the FIFO selected for debug access: 0x0 (TXFIFO): Tx FIFO. 0x1 (TXSTSFIFO): Tx Status FIFO (only read access when SLVMOD is set). 0x2 (TSOFIFO): TSO FIFO (cannot be accessed when SLVMOD is set). 0x3 (RXFIFO): Rx FIFO.
11	0h RW	**FIFO Write Enable (FIFOWREN):** When this bit is set, it enables the Write operation on selected FIFO when FIFO Debug Access is enabled. This bit must not be written to 1 when FIFO Debug Access is not enabled, that is FDBGEN bit is 0. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets. 0x0 (DISABLE): FIFO Write is disabled. 0x1 (ENABLE): FIFO Write is enabled.
10	0h RW	**FIFO Read Enable (FIFORDEN):** When this bit is set, it enables the Read operation on selected FIFO when FIFO Debug Access is enabled. This bit must not be written to 1 when FIFO Debug Access is not enabled, that is FDBGEN bit is 0. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets. 0x0 (DISABLE): FIFO Read is disabled. 0x1 (ENABLE): FIFO Read is enabled.
9	0h RW	**Reset Pointers of Selected FIFO (RSTSEL):** When this bit is set, the pointers of the currently-selected FIFO are reset when FIFO Debug Access is enabled. This bit must not be written to 1 when FIFO Debug Access is not enabled, that is FDBGEN bit is 0. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets. 0x0 (DISABLE): Reset Pointers of Selected FIFO is disabled. 0x1 (ENABLE): Reset Pointers of Selected FIFO is enabled.
8	0h RW	**Reset All Pointers (RSTALL):** When this bit is set, the pointers of all FIFOs are reset when FIFO Debug Access is enabled. This bit must not be written to 1 when FIFO Debug Access is not enabled, that is FDBGEN bit is 0. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets. 0x0 (DISABLE): Reset All Pointers is disabled. 0x1 (ENABLE): Reset All Pointers is enabled.
7	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
6:5	0h RW	**Encoded Packet State (PKTSTATE):** This field is used to write the control information to the Tx FIFO or Rx FIFO. Tx FIFO: - 00: Packet Data - 01: Control Word - 10: SOP Data - 11: EOP Data Rx FIFO: - 00: Packet Data - 01: Normal Status - 10: Last Status - 11: EOP 0x0 (PKT_DATA): Packet Data. 0x1 (CW_NS): Control Word/Normal Status. 0x2 (SOP_LS): SOP Data/Last Status. 0x3 (EOP): EOP Data/EOP.
4	0h RO	**Reserved**
3:2	0h RW	**Byte Enables (BYTEEN):** This field indicates the number of data bytes valid in the data register during Write operation. This is valid only when PKTSTATE is 2'b10 (EOP) and Tx FIFO or Rx FIFO is selected. 0x0 (B0_VAL): Byte 0 valid. 0x1 (B01_VAL): Byte 0 and Byte 1 are valid. 0x2 (B012_VAL): Byte 0, Byte 1, and Byte 2 are valid. 0x3 (B0123_VAL): All four bytes are valid.
1	0h RW	**Debug Mode Access to FIFO (DBGMOD):** When this bit is set, it indicates that the current access to the FIFO is read, write, and debug access. In this mode, the following access types are allowed: - Read and Write access to Tx FIFO, TSO FIFO, and Rx FIFO - Read access is allowed to Tx Status FIFO. When this bit is reset, it indicates that the current access to the FIFO is slave access bypassing the DMA. In this mode, the following access are allowed: - Write access to the Tx FIFO - Read access to the Rx FIFO and Tx Status FIFO 0x0 (DISABLE): Debug Mode Access to FIFO is disabled. 0x1 (ENABLE): Debug Mode Access to FIFO is enabled.
0	0h RW	**FIFO Debug Access Enable (FDBGEN):** When this bit is set, it indicates that the debug mode access to the FIFO is enabled. When this bit is reset, it indicates that the FIFO can be accessed only through a master interface. 0x0 (DISABLE): FIFO Debug Access is disabled. 0x1 (ENABLE): FIFO Debug Access is enabled.

10.2.338 MTL_DBG_STS — Offset C0Ch

The FIFO Debug Status register contains the status of FIFO debug access.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C0Ch	00000018h

Bit Range	Default & Access	Field Name (ID): Description
31:15	00000h RO	**Remaining Locations in the FIFO (LOCR):** Slave Access Mode: This field indicates the space available in selected FIFO. Debug Access Mode: This field contains the Write or Read pointer value of the selected FIFO during Write or Read operation, respectively.
14:10	0h RO	**Reserved**
9	0h RW	**Transmit Status Available Interrupt Status (STSI):** When set, this bit indicates that the Slave mode Tx packet is transmitted, and the status is available in Tx Status FIFO. This bit is reset when 1 is written to this bit. 0x0 (INACTIVE): Transmit Status Available Interrupt Status not detected. 0x1 (ACTIVE): Transmit Status Available Interrupt Status detected.
8	0h RW	**Receive Packet Available Interrupt Status (PKTI):** When set, this bit indicates that MAC layer has written the EOP of received packet to the Rx FIFO. This bit is reset when 1 is written to this bit. 0x0 (INACTIVE): Receive Packet Available Interrupt Status not detected. 0x1 (ACTIVE): Receive Packet Available Interrupt Status detected.
7:5	0h RO	**Reserved**
4:3	3h RO	**Byte Enables (BYTEEN):** This field indicates the number of data bytes valid in the data register during Read operation. This is valid only when PKTSTATE is 2'b10 (EOP) and Tx FIFO or Rx FIFO is selected. 0x0 (B0_VAL): Byte 0 valid. 0x1 (B01_VAL): Byte 0 and Byte 1 are valid. 0x2 (B012_VAL): Byte 0, Byte 1, and Byte 2 are valid. 0x3 (B0123_VAL): All four bytes are valid.
2:1	0h RO	**Encoded Packet State (PKTSTATE):** This field is used to get the control or status information of the selected FIFO. Tx FIFO: - 00: Packet Data - 01: Control Word - 10: SOP Data - 11: EOP Data Rx FIFO: - 00: Packet Data - 01: Normal Status - 10: Last Status - 11: EOP This field is applicable only for Tx FIFO and Rx FIFO during Read operation. 0x0 (PKT_DATA): Packet Data. 0x1 (CW_NS): Control Word/Normal Status. 0x2 (SOP_LS): SOP Data/Last Status. 0x3 (EOP): EOP Data/EOP.
0	0h RO	**FIFO Busy (FIFOBUSY):** When set, this bit indicates that a FIFO operation is in progress in the MAC and content of the following fields is not valid: - All other fields of this register - All fields of the MTL_FIFO_Debug_Data register 0x0 (INACTIVE): FIFO Busy not detected. 0x1 (ACTIVE): FIFO Busy detected.

10.2.339 MTL_FIFO_DEBUG_DATA — Offset C10h

The FIFO Debug Data register contains the data to be written to or read from the FIFOs.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**FIFO Debug Data (FDBGDATA):** During debug or slave access write operation, this field contains the data to be written to the Tx FIFO, Rx FIFO, or TSO FIFO. During debug or slave access read operation, this field contains the data read from the Tx FIFO, Rx FIFO, TSO FIFO, or Tx Status FIFO.

10.2.340 MTL_INTERRUPT_STATUS — Offset C20h

The software driver (application) reads this register during interrupt service routine or polling to determine the interrupt status of MTL queues and the MAC.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C20h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	0h RO	**MTL Rx Parser Interrupt Status (MTLPIS):** This bit indicates that there is an interrupt from Rx Parser Block. To reset this bit, the application must read the MTL_ Rxp_Interrupt_Status register to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): MTL Rx Parser Interrupt status not detected. 0x1 (ACTIVE): MTL Rx Parser Interrupt status detected.
22:19	0h RO	**Reserved**
18	0h RO	**EST (TAS- 802.1Qbv) Interrupt Status (ESTIS):** This bit indicates an interrupt event during the operation of 802.1Qbv. To reset this bit, the application must clear the error/event that has caused the Interrupt. 0x0 (INACTIVE): EST (TAS- 802.1Qbv) Interrupt status not detected. 0x1 (ACTIVE): EST (TAS- 802.1Qbv) Interrupt status detected.
17	0h RO	**Debug Interrupt status (DBGIS):** This bit indicates an interrupt event during the slave access. To reset this bit, the application must read the FIFO Debug Access Status register to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): Debug Interrupt status not detected. 0x1 (ACTIVE): Debug Interrupt status detected.
16:8	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Queue 7 Interrupt status (Q7IS):** This bit indicates that there is an interrupt from Queue 7. To reset this bit, the application must read the MTL_Q7_Interrupt_Control_Status Status register to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): Queue 7 Interrupt status not detected. 0x1 (ACTIVE): Queue 7 Interrupt status detected.
6	0h RO	**Queue 6 Interrupt status (Q6IS):** This bit indicates that there is an interrupt from Queue 6. To reset this bit, the application must read the MTL_Q6_Interrupt_Control_Status register to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): Queue 6 Interrupt status not detected. 0x1 (ACTIVE): Queue 6 Interrupt status detected.
5	0h RO	**Queue 5 Interrupt status (Q5IS):** This bit indicates that there is an interrupt from Queue 5. To reset this bit, the application must read the MTL_Q5_Interrupt_Control_Status register to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): Queue 5 Interrupt status not detected. 0x1 (ACTIVE): Queue 5 Interrupt status detected.
4	0h RO	**Queue 4 Interrupt status (Q4IS):** This bit indicates that there is an interrupt from Queue 4. To reset this bit, the application must read the MTL_Q4_Interrupt_Control_Status register to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): Queue 4 Interrupt status not detected. 0x1 (ACTIVE): Queue 4 Interrupt status detected.
3	0h RO	**Queue 3 Interrupt status (Q3IS):** This bit indicates that there is an interrupt from Queue 3. To reset this bit, the application must read the MTL_Q3_Interrupt_Control_Status register to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): Queue 3 Interrupt status not detected. 0x1 (ACTIVE): Queue 3 Interrupt status detected.
2	0h RO	**Queue 2 Interrupt status (Q2IS):** This bit indicates that there is an interrupt from Queue 2. To reset this bit, the application must read the MTL_Q2_Interrupt_Control_Status register to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): Queue 2 Interrupt status not detected. 0x1 (ACTIVE): Queue 2 Interrupt status detected.
1	0h RO	**Queue 1 Interrupt status (Q1IS):** This bit indicates that there is an interrupt from Queue 1. To reset this bit, the application must read the MTL_Q1_Interrupt_Control_Status register to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): Queue 1 Interrupt status not detected. 0x1 (ACTIVE): Queue 1 Interrupt status detected.
0	0h RO	**Queue 0 Interrupt status (Q0IS):** This bit indicates that there is an interrupt from Queue 0. To reset this bit, the application must read Queue 0 Interrupt Control and Status register to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): Queue 0 Interrupt status not detected. 0x1 (ACTIVE): Queue 0 Interrupt status detected.

10.2.341 MTL_RXQ_DMA_MAP0 — Offset C30h

The Receive Queue and DMA Channel Mapping 0 register is reserved in EQOS-CORE and EQOS-MTL configurations.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**Queue 3 Enabled for Dynamic (per packet) DMA Channel Selection (Q3DDMACH):** When set, this bit indicates that the packets received in Queue 3 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 3 are routed to the DMA Channel programmed in the Q3MDMACH field (Bits[26:24]). 0x0 (DISABLE): Queue 3 disabled for DA-based DMA Channel Selection. 0x1 (ENABLE): Queue 3 enabled for DA-based DMA Channel Selection.
27	0h RO	**Reserved**
26:24	0h RW	**Queue 3 Mapped to DMA Channel (Q3MDMACH):** This field controls the routing of the received packet in Queue 3 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: DMA Channel 5 - 110: DMA Channel 6 - 111: DMA Channel 7 This field is valid when the Q3DDMACH field is reset. Note: The width of this field depends on the number of RX DMA channels and not all the values might be valid in some configurations. For example, if the number of RX DMA channels selected is 2, only 000 and 001 are valid, the others are reserved
23:21	0h RO	**Reserved**
20	0h RW	**Queue 2 Enabled for DA-based DMA Channel Selection (Q2DDMACH):** When set, this bit indicates that the packets received in Queue 2 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 2 are routed to the DMA Channel programmed in the Q2MDMACH field (Bits[18:16]). 0x0 (DISABLE): Queue 2 disabled for DA-based DMA Channel Selection. 0x1 (ENABLE): Queue 2 enabled for DA-based DMA Channel Selection.
19	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
18:16	0h RW	**Queue 2 Mapped to DMA Channel (Q2MDMACH):** This field controls the routing of the received packet in Queue 2 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: DMA Channel 5 - 110: DMA Channel 6 - 111: DMA Channel 7 This field is valid when the Q2DDMACH field is reset.
15:13	0h RO	**Reserved**
12	0h RW	**Queue 1 Enabled for DA-based DMA Channel Selection (Q1DDMACH):** When set, this bit indicates that the packets received in Queue 1 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 1 are routed to the DMA Channel programmed in the Q1MDMACH field (Bits[10:8]). 0x0 (DISABLE): Queue 1 disabled for DA-based DMA Channel Selection. 0x1 (ENABLE): Queue 1 enabled for DA-based DMA Channel Selection.
11	0h RO	**Reserved**
10:8	0h RW	**Queue 1 Mapped to DMA Channel (Q1MDMACH):** This field controls the routing of the received packet in Queue 1 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: DMA Channel 5 - 110: DMA Channel 6 - 111: DMA Channel 7 This field is valid when the Q1DDMACH field is reset. The width of this field depends on the number of RX DMA channels and not all the values might be valid in some configurations. For example, if the number of RX DMA channels selected is 2, only 000 and 001 are valid, the other bits are reserved.
7:5	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	**Queue 0 Enabled for DA-based DMA Channel Selection (Q0DDMACH):** When set, this bit indicates that the packets received in Queue 0 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 0 are routed to the DMA Channel programmed in the Q0MDMACH field. 0x0 (DISABLE): Queue 0 disabled for DA-based DMA Channel Selection. 0x1 (ENABLE): Queue 0 enabled for DA-based DMA Channel Selection.
3	0h RO	**Reserved**
2:0	0h RW	**Queue 0 Mapped to DMA Channel (Q0MDMACH):** This field controls the routing of the packet received in Queue 0 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: DMA Channel 5 - 110: DMA Channel 6 - 111: DMA Channel 7 This field is valid when the Q0DDMACH field is reset. The width of this field depends on the number of RX DMA channels and not all the values might be valid in some configurations. For example, if the number of RX DMA channels selected is 2, only 000 and 001 are valid, the other bits are reserved.

10.2.342 MTL_RXQ_DMA_MAP1 — Offset C34h

The Receive Queue and DMA Channel Mapping 1 register is reserved in EQOS-CORE and EQOS-MTL configurations.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C34h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**Queue 7 Enabled for DA-based DMA Channel Selection (Q7DDMACH):** When set, this bit indicates that the packets received in Queue 7 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 7 are routed to the DMA Channel programmed in the Q7MDMACH field. 0x0 (DISABLE): Queue 5 disabled for DA-based DMA Channel Selection. 0x1 (ENABLE): Queue 5 enabled for DA-based DMA Channel Selection.
27	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
26:24	0h RW	**Queue 7 Mapped to DMA Channel (Q7MDMACH):** This field controls the routing of the packet received in Queue 7 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: DMA Channel 5 - 110: DMA Channel 6 - 111: DMA Channel 7 This field is valid when the Q7DDMACH field is reset. The width of this field depends on the number of RX DMA channels and not all the values might be valid in some configurations. For example, if the number of RX DMA channels selected is 2, only 000 and 001 are valid, the other bits are reserved.
23:21	0h RO	**Reserved**
20	0h RW	**Queue 6 Enabled for DA-based DMA Channel Selection (Q6DDMACH):** When set, this bit indicates that the packets received in Queue 6 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 6 are routed to the DMA Channel programmed in the Q6MDMACH field. 0x0 (DISABLE): Queue 6 disabled for DA-based DMA Channel Selection. 0x1 (ENABLE): Queue 6 enabled for DA-based DMA Channel Selection.
19	0h RO	**Reserved**
18:16	0h RW	**Queue 6 Mapped to DMA Channel (Q6MDMACH):** This field controls the routing of the packet received in Queue 6 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: DMA Channel 5 - 110: DMA Channel 6 - 111: DMA Channel 7 This field is valid when the Q6DDMACH field is reset. The width of this field depends on the number of RX DMA channels and not all the values might be valid in some configurations. For example, if the number of RX DMA channels selected is 2, only 000 and 001 are valid, the other bits are reserved.
15:13	0h RO	**Reserved**
12	0h RW	**Queue 5 Enabled for DA-based DMA Channel Selection (Q5DDMACH):** When set, this bit indicates that the packets received in Queue 5 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 5 are routed to the DMA Channel programmed in the Q5MDMACH field. 0x0 (DISABLE): Queue 5 disabled for DA-based DMA Channel Selection. 0x1 (ENABLE): Queue 5 enabled for DA-based DMA Channel Selection.
11	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
10:8	0h RW	**Queue 5 Mapped to DMA Channel (Q5MDMACH):** This field controls the routing of the packets received in Queue 5 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: DMA Channel 5 - 110: DMA Channel 6 - 111: DMA Channel 7 This field is valid when the Q5DDMACH field is reset. The width of this field depends on the number of RX DMA channels and not all the values might be valid in some configurations. For example, if the number of RX DMA channels selected is 2, only 000 and 001 are valid, the other bits are reserved.
7:5	0h RO	**Reserved**
4	0h RW	**Queue 4 Enabled for DA-based DMA Channel Selection (Q4DDMACH):** When set, this bit indicates that the packets received in Queue 4 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 4 are routed to the DMA Channel programmed in the Q4MDMACH field. 0x0 (DISABLE): Queue 4 disabled for DA-based DMA Channel Selection. 0x1 (ENABLE): Queue 4 enabled for DA-based DMA Channel Selection.
3	0h RO	**Reserved**
2:0	0h RW	**Queue 4 Mapped to DMA Channel (Q4MDMACH):** This field controls the routing of the packet received in Queue 4 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: DMA Channel 5 - 110: DMA Channel 6 - 111: DMA Channel 7 This field is valid when the Q4DDMACH field is reset. The width of this field depends on the number of RX DMA channels and not all the values might be valid in some configurations. For example, if the number of RX DMA channels selected is 2, only 000 and 001 are valid, the other bits are reserved.

10.2.343 MTL_TBS_CTRL — Offset C40h

This register controls the operation of Time Based Scheduling.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C40h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RW	**Launch Expiry Offset (LEOS):** The value in units of 256 nanoseconds that has to be added to the Launch time to compute the Launch Expiry time. Value valid only when LEOV is set. Max value: 999,999,999 ns, additionally should be smaller than CTR-1 value when ESTM mode is set since this value is a modulo CTR value.
7	0h RO	**Reserved**
6:4	0h RW	**Launch Expiry GSN Offset (LEGOS):** The number GSN slots that has to be added to the Launch GSN to compute the Launch Expiry time. Value valid only when LEOV is set.
3:2	0h RO	**Reserved**
1	0h RW	**Launch Expiry Offset Valid (LEOV):** When set indicates the LEOS field is valid. When not set, indicates the Launch Expiry Offset is not valid and the MTL must not check for Launch expiry time. 0x0 (INVALID): LEOS field is invalid. 0x1 (VALID): LEOS field is valid.
0	0h RW	**EST offset Mode (ESTM):** When this bit is set, the Launch Time value used in Time Based Scheduling is interpreted as an EST offset value and is added to the Base Time Register (BTR) of the current list. When reset, the Launch Time value is used as an absolute value that should be compared with the System time [39:8]. 0x0 (DISABLE): EST offset Mode is disabled. 0x1 (ENABLE): EST offset Mode is enabled.

10.2.344 MTL_EST_CONTROL — Offset C50h

This register controls the operation of Enhancements to Scheduled Transmission (IEEE802.1Qbv).

Type	Size	Offset	Default
MMIO	32 bit	BAR + C50h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RW	**PTP Time Offset Value (PTOV):** The value of PTP Clock period multiplied by 6 in nanoseconds. This value is needed to avoid transmission overruns at the beginning of the installation of a new GCL.
23:12	000h RW	**Current Time Offset Value (CTOV):** Provides a 12 bit time offset value in nano second that is added to the current time to compensate for all the implementation pipeline delays such as the CDC sync delay, buffering delays, data path delays etc. This offset helps to ensure that the impact of gate controls is visible on the line exactly at the pre-determined schedule (or as close to the schedule as possible).
11	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
10:8	0h RW	**Time Interval Left Shift Amount (TILS):** This field provides the left shift amount for the programmed Time Interval values used in the Gate Control Lists. - 000: No left shift needed (equal to x1ns) - 001: Left shift TI by 1 bit (equal to x2ns) - 010: Left shift TI by 2 bits (equal to x4ns) - . - . - 100: Left shift TI by 7 bits (equal to x128ns) Based on the configuration one or more bits of this field should be treated as Reserved/Read-Only.
7:6	0h RW	**Loop Count to report Scheduling Error (LCSE):** Programmable number of GCL list iterations before reporting an HLBS error defined in EST_Status register. 0x0 (M_4_ITERNS): 4 iterations. 0x1 (M_8_ITERNS): 8 iterations. 0x2 (M_16_ITERNS): 16 iterations. 0x3 (M_32_ITERNS): 32 iterations.
5	0h RW	**Drop Frames causing Scheduling Error (DFBS):** When set frames reported to cause HOL Blocking due to not getting scheduled (HLBS field of EST_Status register) after 4,8,16,32 (based on LCSE field of this register) GCL iterations are dropped. 0x0 (DONT_DROP): Do not Drop Frames causing Scheduling Error. 0x1 (DROP): Drop Frames causing Scheduling Error.
4	0h RW	**Do not Drop frames during Frame Size Error (DDBF):** When set, frames are not be dropped during Head-of-Line blocking due to Frame Size Error (HLBF field of EST_Status register). 0x0 (DROP): Drop frames during Frame Size Error. 0x1 (DONT_DROP): Do not Drop frames during Frame Size Error.
3:2	0h RO	**Reserved**
1	0h RW	**Switch to S/W owned list (SSWL):** When set indicates that the software has programmed that list that it currently owns (SWOL) and the hardware should switch to the new list based on the new BTR. Hardware clears this bit when the switch to the SWOL happens to indicate the completion of the switch or when an BTR error (BTRE in Status register) is set. When BTRE is set this bit is cleared but SWOL is not updated as the switch was not successful. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Switch to S/W owned list is disabled. 0x1 (ENABLE): Switch to S/W owned list is enabled.
0	0h RW	**Enable EST (EEST):** When reset, the gate control list processing is halted and all gates are assumed to be in Open state. Should be set for the hardware to start processing the gate control lists. During the toggle from 0 to 1, the gate control list processing starts only after the SSWL bit it set. If any uncorrectable error is detected in the EST memory the hardware resets this bit and disables the EST function. 0x0 (DISABLE): EST is disabled. 0x1 (ENABLE): EST is enabled.

10.2.345 MTL_EST_STATUS — Offset C58h

This register provides Status related to Enhancements to Scheduled Transmission (IEEE802.1Qbv).

Type	Size	Offset	Default
MMIO	32 bit	BAR + C58h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19:16	0h RO	**Current GCL Slot Number (CGSN):** Indicates the slot number of the GCL list. Slot number is a modulo 16 count of the GCL List loops executed so far. Even if a new GCL list is installed, the count is incremental.
15:8	00h RO	**BTR Error Loop Count (BTRL):** Provides the minimum count (N) for which the equation Current Time =< New BTR + (N * New Cycle Time) becomes true. N = "11111111" indicates the iterations exceeded the value of 128 and the hardware was not able to update New BTR to be equal to or greater than Current Time. Software intervention is needed to update the New BTR. Value cleared when BTRE field of this register is cleared.
7	0h RO	**S/W owned list (SWOL):** When '0' indicates Gate control list number "0" is owned by software and when "1" indicates the Gate Control list "1" is owned by the software. Any reads/writes by the software (using indirect access via GCL_Control) is directed to the list indicated by this value by default. The inverse of this value is treated as HWOL. R/W operations performed by hardware are directed to the list pointed by HWOL by default. 0x0 (INACTIVE): Gate control list number "0" is owned by software. 0x1 (ACTIVE): Gate control list number "1" is owned by software.
6:5	0h RO	**Reserved**
4	0h RW	**Constant Gate Control Error (CGCE):** This error occurs when the list length (LLR) is 1 and the Cycle Time (CTR) is less than or equal to the programmed Time Interval (TI) value after the optional Left Shifting. The above programming implies Gates are either always Closed or always Open based on the Gate Control values; the same effect can be achieved by other simpler (non TSN) programming mechanisms. Since the implementation does not support such a programming an error is reported. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Constant Gate Control Error not detected. 0x1 (ACTIVE): Constant Gate Control Error detected.
3	0h RO	**Head-Of-Line Blocking due to Scheduling (HLBS):** Set when the frame is not able to win arbitration and get scheduled even after 4 iterations of the GCL. Indicates to software a potential programming error. The one hot encoded values of the Queue Numbers that are not able to make progress are indicated in the MTL_EST_Sch_Error register. Bit cleared when MTL_EST_Sch_Error register is all zeros. 0x0 (INACTIVE): Head-Of-Line Blocking due to Scheduling not detected. 0x1 (ACTIVE): Head-Of-Line Blocking due to Scheduling detected.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RO	**Head-Of-Line Blocking due to Frame Size (HLBF):** Set when HOL Blocking is noticed on one or more Queues as a result of none of the Time Intervals of gate open in the GCL being greater than or equal to the duration needed for frame size (or frame fragment size when preemption is enabled) transmission. The one hot encoded Queue numbers that are experiencing HLBF are indicated in the MTL_EST_Frm_Size_Error register. Additionally, the first Queue number that experienced HLBF along with the frame size is captured in MTL_EST_Frm_Size_Capture register. Bit cleared when MTL_EST_Frame_Size_ Error register is all zeros. 0x0 (INACTIVE): Head-Of-Line Blocking due to Frame Size not detected. 0x1 (ACTIVE): Head-Of-Line Blocking due to Frame Size detected.
1	0h RW	**BTR Error (BTRE):** When "1" indicates a programming error in the BTR of SWOL where the programmed value is less than current time. If the BTRL = "11111111", SWOL is not updated and Software should reprogram the BTR to a value greater than current time and then set SSWL to reinitiate the switch to SWOL. Else if the value of BTRL < "11111111", SWOL is updated and this field indicates the number of iterations (of + CycleTime) taken by hardware to update the BTR to a value greater than Current Time. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): BTR Error not detected. 0x1 (ACTIVE): BTR Error detected.
0	0h RW	**Switch to S/W owned list Complete (SWLC):** When "1" indicates the hardware has successfully switched to the SWOL, and the SWOL bit has been updated to that effect. Cleared when the SSWL of EST_Control register transitions from 0 to 1, or on a software write. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Switch to S/W owned list Complete not detected. 0x1 (ACTIVE): Switch to S/W owned list Complete detected.

10.2.346 MTL_EST_SCH_ERROR — Offset C60h

This register provides the One Hot encoded Queue Numbers that are having the Scheduling related error (timeout).

Type	Size	Offset	Default
MMIO	32 bit	BAR + C60h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Schedule Error Queue Number (SEQN):** The One Hot Encoded Queue Numbers that have experienced error/timeout described in HLBS field of status register. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect.

10.2.347 MTL_EST_FRM_SIZE_ERROR — Offset C64h

This register provides the One Hot encoded Queue Numbers that are having the Frame Size related error.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C64h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Frame Size Error Queue Number (FEQN):** The One Hot Encoded Queue Numbers that have experienced error described in HLBF field of status register. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect.

10.2.348 MTL_EST_FRM_SIZE_CAPTURE — Offset C68h

This register captures the Frame Size and Queue Number of the first occurrence of the Frame Size related error. Up on clearing it captures the data of immediate next occurrence of a similar error.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C68h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	**Reserved**
18:16	0h RO	**Queue Number of HLBF (HBFQ):** Captures the binary value of the of the first Queue (number) experiencing HLBF error (see HLBF field of status register). Value once written is not altered by any subsequent queue errors of similar nature. Once cleared the queue number of the next occurring HLBF error is captured. Width is based on the number of Tx Queues configured; remaining bits are Read-Only. Cleared when MTL_EST_Frm_Size_Error register is all zeros.
15	0h RO	**Reserved**
14:0	0000h RO	**Frame Size of HLBF (HBFS):** Captures the Frame Size of the dropped frame related to queue number indicated in HBFQ field of this register. Contents of this register should be considered invalid, if this field is zero. Cleared when MTL_EST_Frm_Size_Error register is all zeros.

10.2.349 MTL_EST_INTR_ENABLE — Offset C70h

This register implements the Interrupt Enable bits for the various events that generate an interrupt. Bit positions have a 1 to 1 correlation with the status bit positions in MTL_ETS_Status register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C70h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4	0h RW	**Interrupt Enable for CGCE (CGCE):** When set, generates interrupt when the Constant Gate Control Error occurs and is indicated in the status. When reset this event does not generate an interrupt 0x0 (DISABLE): Interrupt for CGCE is disabled. 0x1 (ENABLE): Interrupt for CGCE is enabled.
3	0h RW	**Interrupt Enable for HLBS (IEHS):** When set, generates interrupt when the Head-of-Line Blocking due to Scheduling issue and is indicated in the status. When reset this event does not generate an interrupt. 0x0 (DISABLE): Interrupt for HLBS is disabled. 0x1 (ENABLE): Interrupt for HLBS is enabled.
2	0h RW	**Interrupt Enable for HLBF (IEHF):** When set, generates interrupt when the Head-of-Line Blocking due to Frame Size error occurs and is indicated in the status. When reset this event does not generate an interrupt. 0x0 (DISABLE): Interrupt for HLBF is disabled. 0x1 (ENABLE): Interrupt for HLBF is enabled.
1	0h RW	**Interrupt Enable for BTR Error (IEBE):** When set, generates interrupt when the BTR Error occurs and is indicated in the status. When reset this event does not generate an interrupt. 0x0 (DISABLE): Interrupt for BTR Error is disabled. 0x1 (ENABLE): Interrupt for BTR Error is enabled.
0	0h RW	**Interrupt Enable for Switch List (IECC):** When set, generates interrupt when the configuration change is successful and the hardware has switched to the new list. When reset this event does not generate an interrupt. 0x0 (DISABLE): Interrupt for Switch List is disabled. 0x1 (ENABLE): Interrupt for Switch List is enabled.

10.2.350 MTL_EST_GCL_CONTROL — Offset C80h

This register provides the control information for reading/writing to the Gate Control lists.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C80h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:22	0h RW	**ECC Inject Error Control for EST Memory (ESTEIEC):** When EIEE bit of this register is set, following are the errors inserted based on the value encoded in this field. 0x0 (M_1BIT): Insert 1 bit error. 0x1 (M_2BIT): Insert 2 bit errors. 0x2 (M_3BIT): Insert 3 bit errors. 0x3 (M_1BIT_ADDR): Insert 1 bit error in address field.
21	0h RW	**EST ECC Inject Error Enable (ESTEIEE):** When set along with EEST bit of MTL_EST_Control register, enables the ECC error injection feature. When reset, disables the ECC error injection feature. 0x0 (DISABLE): EST ECC Inject Error is disabled. 0x1 (ENABLE): EST ECC Inject Error is enabled.
20:17	0h RO	**Reserved**
16:8	000h RW	**Gate Control List Address: (GCLA when GCRR is "0"). (ADDR):** Provides the address (row number) of the Gate Control List at which the R/W operation has to be performed. By default the Gate Control List pointed by SWOL of MTL_EST_Status is selected for R/W, however if the DBGM bit of this register is set, a debug mode access is given to R/W from DBGB. Gate Control list Related Registers Address: (GCRA when GCRR is "1"). By default the GCL related register set pointed by SWOL of MTL_EST_Status is selected for R/W, however if the DBGM bit of this register is set, a debug mode access is given to R/W from DBGB. Lower 3 bits are only used in this mode, higher order bits are treated as dont cares. - 000: BTR Low (31:0) - 001: BTR High (63:31) - 010: CTR Low (31:0) - 011: CTR High (39:32) - 100: TER (31:0) - 101: LLR (n:0) (where n is (log{512} / log2)) - Others: Reserved
7:6	0h RO	**Reserved**
5	0h RW	**Debug Mode Bank Select (DBGB):** When set to "0" indicates R/W in debug mode should be directed to Bank 0 (GCL0 and corresponding Time related registers). When set to "1" indicates R/W in debug mode should be directed to Bank 1 (GCL1 and corresponding Time related registers). This value is used when DBGM is set and overrides by value of SWOL which is normally used. 0x0 (BANK0): R/W in debug mode should be directed to Bank 0. 0x1 (BANK1): R/W in debug mode should be directed to Bank 1.
4	0h RW	**Debug Mode (DBGM):** When set to "1" indicates R/W in debug mode where the memory bank (for GCL and Time related registers) is explicitly provided by DBGB value, when set to "0" SWOL bit is used to determine which bank to use. 0x0 (DISABLE): Debug Mode is disabled. 0x1 (ENABLE): Debug Mode is enabled.
3	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Gate Control Related Registers (GCRR):** When set to "1" indicates the R/W access is for the GCL related registers (BTR, CTR, TER, LLR) whose address is provided by GCRA. When "0" indicates R/W should be directed to GCL from the address provided by GCLA. 0x0 (DISABLE): Gate Control Related Registers are disabled. 0x1 (ENABLE): Gate Control Related Registers are enabled.
1	0h RW	**Read '1', Write '0': (R1W0):** When set to '1': Read Operation When set to '0': Write Operation. 0x0 (WRITE): Write Operation. 0x1 (READ): Read Operation.
0	0h RW	**Start Read/Write Op (SRWO):** When set indicates a Read/Write Op has started and is in progress. When reset by hardware indicates the R/W Op has completed or an error has occurred (when bit 20 is set) Reads: Data can be read from MTL_EST_GCL_Data register after this bit is reset Writes: MTL_EST_GCL_Data should be programmed with write data before setting SRWO. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Start Read/Write Op disabled. 0x1 (ENABLE): Start Read/Write Op enabled.

10.2.351 MTL_EST_GCL_DATA — Offset C84h

This register holds the read data or write data in case of reads and writes respectively.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C84h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Gate Control Data (GCD):** The data corresponding to the address selected in the GCL_Control register. Used for both Read and Write operations.

10.2.352 MTL_FPE_CTRL_STS — Offset C90h

This register controls the operation of, and provides status for Frame Preemption (IEEE802.1Qbu/802.3br).

Type	Size	Offset	Default
MMIO	32 bit	BAR + C90h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RO	**HRS:** Hold/Release Status - 1: Indicates a Set-and-Hold-MAC operation was last executed and the pMAC is in Hold State. - 0: Indicates a Set-and-Release-MAC operation was last executed and the pMAC is in Release State. 0x0 (SET_REL): Indicates a Set-and-Release-MAC operation was last executed and the pMAC is in Release State. 0x1 (SET_HOLD): Indicates a Set-and-Hold-MAC operation was last executed and the pMAC is in Hold State.
27:16	0h RO	**Reserved**
15:8	00h RW	**Preemption Classification (PEC):** When set indicates the corresponding Queue must be classified as preemptable, when '0' Queue is classified as express. When both EST (Qbv) and Preemption are enabled, Queue-0 is always assumed to be preemptable. When EST (Qbv) is enabled Queues categorized as preemptable here are always assumed to be in "Open" state in the Gate Control List.
7:2	0h RO	**Reserved**
1:0	0h RW	**Additional Fragment Size (AFSZ):** used to indicate, in units of 64 bytes, the minimum number of bytes over 64 bytes required in non-final fragments of preempted frames. The minimum non-final fragment size is (AFSZ +1) * 64 bytes

10.2.353 MTL_FPE_ADVANCE — Offset C94h

This register holds the Hold and Release Advance time.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C94h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**Release Advance (RADV):** The maximum time in nanoseconds that can elapse between issuing a RELEASE to the MAC and the MAC being ready to resume transmission of preemptable frames, in the absence of there being any express frames available for transmission.
15:0	0000h RW	**Hold Advance (HADV):** The maximum time in nanoseconds that can elapse between issuing a HOLD to the MAC and the MAC ceasing to transmit any preemptable frame that is in the process of transmission or any preemptable frames that are queued for transmission.

10.2.354 MTL_RXP_CONTROL_STATUS — Offset CA0h

The MTL_RXP_Control_Status register establishes the operating mode of Rx Parser and provides some status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + CA0h	80FF00FFh

Bit Range	Default & Access	Field Name (ID): Description
31	1h RO	**RX Parser in Idle state (RXPI):** This status bit is set to 1 when the Rx parser is in Idle State and waiting for a new packet for processing. This bit is used as a handshake with software when parser gets disables. After disabling, when bit is set then software can update the Rx parser instruction table. 0x0 (INACTIVE): RX Parser not in Idle state. 0x1 (ACTIVE): RX Parser in Idle state.
30:24	0h RO	**Reserved**
23:16	FFh RW	**Number of parsable entries in the Instruction table (NPE):** This control indicates the number of parsable entries in the Instruction Memory. This is used in Rx parser logic to detect programming Error. In case number of parsed entries for a packet is more than this entry then NPEOVIS bit in the MTL_RXP_Interrupt_Control_Status register is set.
15:8	0h RO	**Reserved**
7:0	FFh RW	**Number of valid entry address/index in the Instruction table (NVE):** This control indicates the number of valid entries address/index in the Instruction Memory (i.e. when NVE field in register=31, the maximum valid entry address is NVE+1 i.e. addresses/indices=0 to 32, or 33 entries). This is used in Rx parser logic to detect any programming Error. In case while parsing Table address (memory address) found to be more than this maximum valid entry address then NVEOVIS bit in the MTL_RXP_Interrupt_Control_Status register is set. Note: The minimum value of this should be 2.

10.2.355 MTL_RXP_INTERRUPT_CONTROL_STATUS — Offset CA4h

The MTL_RXP_Interrupt_Control_Status registers provides enable control for the interrupts and provides interrupt status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + CA4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19	0h RW	**Packet Drop due to RF Interrupt Enable (PDRFIE):** When this bit is set, the PDRFIS interrupt is enabled. When this bit is reset, the PDRFIS interrupt is disabled. 0x0 (DISABLE): Packet Drop due to RF Interrupt is disabled. 0x1 (ENABLE): Packet Drop due to RF Interrupt is enabled.
18	0h RW	**Frame Offset Overflow Interrupt Enable (FOOVIE):** When this bit is set, the FOOVIS interrupt is enabled. When this bit is reset, the FOOVIS interrupt is disabled. 0x0 (DISABLE): Frame Offset Overflow Interrupt is disabled. 0x1 (ENABLE): Frame Offset Overflow Interrupt is enabled.
17	0h RW	**Number of Parsable Entries Overflow Interrupt Enable (NPEOVIE):** When this bit is set, the NPEOVIS interrupt is enabled. When this bit is reset, the NPEOVIS interrupt is disabled. 0x0 (DISABLE): Number of Parsable Entries Overflow Interrupt is disabled. 0x1 (ENABLE): Number of Parsable Entries Overflow Interrupt is enabled.
16	0h RW	**Number of Valid Entries Overflow Interrupt Enable (NVEOVIE):** When this bit is set, the NVEOVIS interrupt is enabled. When this bit is reset, the NVEOVIS interrupt is disabled. 0x0 (DISABLE): Number of Valid Entries Overflow Interrupt is disabled. 0x1 (ENABLE): Number of Valid Entries Overflow Interrupt is enabled.
15:4	0h RO	**Reserved**
3	0h RW	**Packet Dropped due to RF Interrupt Status (PDRFIS):** If the Rx Parser result says to drop the packet by setting RF=1 in the instruction memory, then this bit is set to 1. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Packet Dropped due to RF Interrupt Status not detected. 0x1 (ACTIVE): Packet Dropped due to RF Interrupt Status detected.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Frame Offset Overflow Interrupt Status (FOOVIS):** While parsing if the Instruction table entry's 'Frame Offset' found to be more than EOF offset, then then this bit is set. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Frame Offset Overflow Interrupt Status not detected. 0x1 (ACTIVE): Frame Offset Overflow Interrupt Status detected.
1	0h RW	**Number of Parsable Entries Overflow Interrupt Status (NPEOVIS):** While parsing a packet if the number of parsed entries found to be more than NPE[] (Number of Parseable Entries in MTL_RXP_Control register),then this bit is set to 1. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Number of Parsable Entries Overflow Interrupt Status not detected. 0x1 (ACTIVE): Number of Parsable Entries Overflow Interrupt Status detected.
0	0h RW	**Number of Valid Entry Address/Index Overflow Interrupt Status (NVEOVIS):** While parsing if the Instruction address found to be more than NVE (Number of Valid Entry Address/index in MTL_RXP_Control register), then this bit is set to 1. For example, when NVE field in register=31, the maximum valid entry address/index is NVE+1 i.e. 32 (addresses/indices=0 to 32, or 33 entries), so NVEOVIS is set when currently processed entry indicates next address is 33 or more i.e. 34th or later entries. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Number of Valid Entries Overflow Interrupt Status not detected. 0x1 (ACTIVE): Number of Valid Entries Overflow Interrupt Status detected.

10.2.356 MTL_RXP_DROP_CNT — Offset CA8h

The MTL_RXP_Drop_Cnt register provides the drop count of Rx Parser initiated drops.

Type	Size	Offset	Default
MMIO	32 bit	BAR + CA8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Rx Parser Drop Counter Overflow Bit (RXPDCOVF):** When set, this bit indicates that the MTL_RXP_Drop_cnt (RXPDC) Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Rx Parser Drop count overflow not occurred. 0x1 (ACTIVE): Rx Parser Drop count overflow occurred.
30:0	00000000h RO	**Rx Parser Drop count (RXPDC):** This 31-bit counter is implemented whenever a Rx Parser Drops a packet due to RF =1. The counter is cleared when the register is read.

10.2.357 MTL_RXP_ERROR_CNT — Offset CAChh

The MTL_RXP_Error_Cnt register provides the Rx Parser related error occurrence count.

Type	Size	Offset	Default
MMIO	32 bit	BAR + CACh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Rx Parser Error Counter Overflow Bit (RXPECOVF):** When set, this bit indicates that the MTL_RXP_Error_cnt (RXPEC) Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Rx Parser Error count overflow not occurred. 0x1 (ACTIVE): Rx Parser Error count overflow occurred.
30:0	00000000h RO	**Rx Parser Error count (RXPEC):** This 31-bit counter is implemented whenever a Rx Parser encounters following Error scenarios - Entry address >= NVE[] - Number Parsed Entries >= NPE[] - Entry address > EOF data entry address The counter is cleared when the register is read.

10.2.358 MTL_RXP_INDIRECT_ACC_CONTROL_STATUS — Offset CB0h

The MTL_RXP_Indirect_Acc_Control_Status register provides the Indirect Access control and status for Rx Parser memory.

Type	Size	Offset	Default
MMIO	32 bit	BAR + CB0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**FRP Instruction Table Access Busy (STARTBUSY):** When this bit is set to 1 by the software then it indicates to start the Read/Write operation from/to the Rx Parser Memory. Software should read this bit as 0 before issuing read or write request to access the Parser Memory Instructions. This bit when set to 1 indicates that hardware is busy until its gets cleared by hardware and software should not issue any read or write operation. 0x0 (INACTIVE): hardware not busy. 0x1 (ACTIVE): hardware is busy (Read/Write operation from/to the Rx Parser Memory).
30:23	0h RO	**Reserved**
22:21	0h RW	**ECC Inject Error Control for Rx Parser Memory (RXPEIEC):** When EIEE bit of this register is set, following are the errors inserted based on the value encoded in this field. 0x0 (M_1BIT): Insert 1 bit error. 0x1 (M_2BIT): Insert 2 bit errors. 0x2 (M_3BIT): Insert 3 bit errors. 0x3 (M_1BIT_ADDR): Insert 1 bit error in address field.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**ECC Inject Error Enable for Rx Parser Memory (RXPEIEE):** When set, enables the ECC error injection feature. When reset, disables the ECC error injection feature. 0x0 (DISABLE): ECC Inject Error for Rx Parser Memory is disabled. 0x1 (ENABLE): ECC Inject Error for Rx Parser Memory is enabled.
19:17	0h RO	**Reserved**
16	0h RW	**Read Write Control (WRRDN):** When this bit is set to 1 indicates the write operation to the Rx Parser Memory. When this bit is set to 0 indicates the read operation to the Rx Parser Memory. 0x0 (READ): Read operation to the Rx Parser Memory. 0x1 (WRITE): Write operation to the Rx Parser Memory.
15:10	0h RO	**Reserved**
9:0	000h RW	**FRP Instruction Table Offset Address (ADDR):** This field indicates the ADDR of the 32-bit entry in Rx parser instruction table. Each entry has 128-bit (4x32-bit words). There are 256 FRP entries. This must be written by the software before issuing any Read/Write command. The hardware does not support auto-increment of ADDR.

10.2.359 MTL_RXP_INDIRECT_ACC_DATA — Offset CB4h

The MTL_RXP_Indirect_Acc_Data registers holds the data associated to Indirect Access to Rx Parser memory.

Type	Size	Offset	Default
MMIO	32 bit	BAR + CB4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**FRP Instruction Table Write/Read Data (DATA):** Software should write this register before issuing any write command. The hardware provides the read data from the Rx Parser Memory for read operation when STARTBUSY =0 after read command.

10.2.360 MTL_ECC_CONTROL — Offset CC0h

The MTL_ECC_Control register establishes the operating mode of ECC related to MTL memories.

Type	Size	Offset	Default
MMIO	32 bit	BAR + CC0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved**
8	0h RW	**MTL ECC Error Address Status Over-ride (MEEAO):** When set, the following error address fields hold the last valid address where the error is detected. When reset, the following error address fields hold the first address where the error is detected. EUEAS/ECEAS of MTL_ECC_Err_Addr_Status register. 0x0 (DISABLE): MTL ECC Error Address Status Over-ride is disabled. 0x1 (ENABLE): MTL ECC Error Address Status Over-ride is enabled.
7:5	0h RO	**Reserved**
4	0h RW	**TSO memory ECC Enable (TSOEE):** When set to 1, enables the ECC feature for TSO memory in DMA. When set to zero, disables the ECC feature for TSO memory in DMA. 0x0 (DISABLE): TSO memory ECC is disabled. 0x1 (ENABLE): TSO memory ECC is enabled.
3	0h RW	**MTL Rx Parser ECC Enable (MRXPEE):** When set to 1, enables the ECC feature for Rx Parser memory. When set to zero, disables the ECC feature for Rx Parser memory. 0x0 (DISABLE): MTL Rx Parser ECC is disabled. 0x1 (ENABLE): MTL Rx Parser ECC is enabled.
2	0h RW	**MTL EST ECC Enable (MESTEE):** When set to 1, enables the ECC feature for EST memory. When set to zero, disables the ECC feature for EST memory. 0x0 (DISABLE): MTL EST ECC is disabled. 0x1 (ENABLE): MTL EST ECC is enabled.
1	0h RW	**MTL Rx FIFO ECC Enable (MRXEE):** When set to 1, enables the ECC feature for MTL Rx FIFO memory. When set to zero, disables the ECC feature for MTL Rx FIFO memory. 0x0 (DISABLE): MTL Rx FIFO ECC is disabled. 0x1 (ENABLE): MTL Rx FIFO ECC is enabled.
0	0h RW	**MTL Tx FIFO ECC Enable (MTXEE):** When set to 1, enables the ECC feature for MTL Tx FIFO memory. When set to zero, disables the ECC feature for MTL Tx FIFO memory. 0x0 (DISABLE): MTL Tx FIFO ECC is disabled. 0x1 (ENABLE): MTL Tx FIFO ECC is enabled.

10.2.361 MTL_SAFETY_INTERRUPT_STATUS — Offset CC4h

The MTL_Safety_Interrupt_Status registers provides Safety interrupt status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + CC4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1	0h RO	**MTL ECC Uncorrectable error Interrupt Status (MEUIS):** This bit indicates that an uncorrectable error interrupt event in the MTL ECC safety feature. To get the exact cause of the interrupt the application should read the MTL_ECC_Interrupt_Status register. 0x0 (INACTIVE): MTL ECC Uncorrectable error Interrupt Status not detected. 0x1 (ACTIVE): MTL ECC Uncorrectable error Interrupt Status detected.
0	0h RO	**MTL ECC Correctable error Interrupt Status (MECIS):** This bit indicates that a correctable error interrupt event in the MTL ECC safety feature. To get the exact cause of the interrupt the application should read the MTL_ECC_Interrupt_Status register. 0x0 (INACTIVE): MTL ECC Correctable error Interrupt Status not detected. 0x1 (ACTIVE): MTL ECC Correctable error Interrupt Status detected.

10.2.362 MTL_ECC_INTERRUPT_ENABLE — Offset CC8h

The MTL_ECC_Interrupt_Enable register provides enable bits for the ECC interrupts.

Type	Size	Offset	Default
MMIO	32 bit	BAR + CC8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	**Reserved**
12	0h RW	**Rx Parser memory Correctable Error Interrupt Enable (RPCEIE):** When set, generates an interrupt when an uncorrectable error is detected at the Rx Parser memory interface. It is indicated in RPCES status bit of MTL_ECC_Interrupt_Status register. When reset this event does not generates an interrupt. 0x0 (DISABLE): Rx Parser memory Correctable Error Interrupt is disabled. 0x1 (ENABLE): Rx Parser memory Correctable Error Interrupt is enabled.
11:9	0h RO	**Reserved**
8	0h RW	**EST memory Correctable Error Interrupt Enable (ECEIE):** When set, generates an interrupt when a correctable error is detected at the MTL EST memory interface. It is indicated in the ECES bit of MTL_ECC_Interrupt_Status register. When reset this event does not generates an interrupt. 0x0 (DISABLE): EST memory Correctable Error Interrupt is disabled. 0x1 (ENABLE): EST memory Correctable Error Interrupt is enabled.
7:5	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	**Rx memory Correctable Error Interrupt Enable (RXCEIE):** When set, generates an interrupt when a correctable error is detected at the MTL Rx memory interface. It is indicated in the RXCES bit of MTL_ECC_Interrupt_Status register. When reset this event does not generates an interrupt. 0x0 (DISABLE): Rx memory Correctable Error Interrupt is disabled. 0x1 (ENABLE): Rx memory Correctable Error Interrupt is enabled.
3:1	0h RO	**Reserved**
0	0h RW	**Tx memory Correctable Error Interrupt Enable (TXCEIE):** When set, generates an interrupt when a correctable error is detected at the MTL Tx memory interface. It is indicated in the TXCES bit of MTL_ECC_Interrupt_Status register. When reset this event does not generates an interrupt. 0x0 (DISABLE): Tx memory Correctable Error Interrupt is disabled. 0x1 (ENABLE): Tx memory Correctable Error Interrupt is enabled.

10.2.363 MTL_ECC_INTERRUPT_STATUS — Offset CCCh

The MTL_ECC_Interrupt_Status register provides MTL ECC Interrupt Status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + CCCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	**Reserved**
14	0h RW	**Rx Parser memory Uncorrectable Error Status (RPUES):** When set, indicates that an uncorrectable error is detected at Rx Parser memory interface. 0x0 (INACTIVE): Rx Parser memory Uncorrectable Error Status not detected. 0x1 (ACTIVE): Rx Parser memory Uncorrectable Error Status detected.
13	0h RW	**MTL Rx Parser memory Address Mismatch Status (RPAMS):** This bit when set indicates that address mismatch is found for address bus of Rx Parser memory. 0x0 (INACTIVE): MTL Rx Parser memory Address Mismatch Status not detected. 0x1 (ACTIVE): MTL Rx Parser memory Address Mismatch Status detected.
12	0h RW	**MTL Rx Parser memory Correctable Error Status (RPCES):** This bit when set indicates that correctable error is detected at RX Parser memory interface. 0x0 (INACTIVE): MTL Rx Parser memory Correctable Error Status not detected. 0x1 (ACTIVE): MTL Rx Parser memory Correctable Error Status detected.
11	0h RO	**Reserved**
10	0h RW	**MTL EST memory Uncorrectable Error Status (EUES):** When set, indicates that an uncorrectable error is detected at MTL EST memory interface. 0x0 (INACTIVE): MTL EST memory Uncorrectable Error Status not detected. 0x1 (ACTIVE): MTL EST memory Uncorrectable Error Status detected.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**MTL EST memory Address Mismatch Status (EAMS):** This bit when set indicates that address mismatch is found for address bus of MTL EST memory. 0x0 (INACTIVE): MTL EST memory Address Mismatch Status not detected. 0x1 (ACTIVE): MTL EST memory Address Mismatch Status detected.
8	0h RW	**MTL EST memory Correctable Error Status (ECES):** This bit when set indicates that correctable error is detected at the MTL EST memory. 0x0 (INACTIVE): MTL EST memory Correctable Error Status not detected. 0x1 (ACTIVE): MTL EST memory Correctable Error Status detected.
7	0h RO	**Reserved**
6	0h RW	**MTL Rx memory Uncorrectable Error Status (RXUES):** When set, indicates that an uncorrectable error is detected at the MTL Rx memory interface. 0x0 (INACTIVE): MTL Rx memory Uncorrectable Error Status not detected. 0x1 (ACTIVE): MTL Rx memory Uncorrectable Error Status detected.
5	0h RW	**MTL Rx memory Address Mismatch Status (RXAMS):** This bit when set indicates that address mismatch is found for address bus of the MTL Rx memory. 0x0 (INACTIVE): MTL Rx memory Address Mismatch Status not detected. 0x1 (ACTIVE): MTL Rx memory Address Mismatch Status detected.
4	0h RW	**MTL Rx memory Correctable Error Status (RXCES):** This bit when set indicates that correctable error is detected at the MTL Rx memory. 0x0 (INACTIVE): MTL Rx memory correctable Error Status not detected. 0x1 (ACTIVE): MTL Rx memory correctable Error Status detected.
3	0h RO	**Reserved**
2	0h RW	**MTL Tx memory Uncorrectable Error Status (TXUES):** When set, indicates that an uncorrectable error is detected at the MTL TX memory interface. 0x0 (INACTIVE): MTL Tx memory Uncorrectable Error Status not detected. 0x1 (ACTIVE): MTL Tx memory Uncorrectable Error Status detected.
1	0h RW	**MTL Tx memory Address Mismatch Status (TXAMS):** This bit when set indicates that address mismatch is found for address bus of the MTL Tx memory. 0x0 (INACTIVE): MTL Tx memory Address Mismatch Status not detected. 0x1 (ACTIVE): MTL Tx memory Address Mismatch Status detected.
0	0h RW	**MTL Tx memory Correctable Error Status (TXCES):** This bit when set indicates that a correctable error is detected at the MTL Tx memory. 0x0 (INACTIVE): MTL Tx memory Correctable Error Status not detected. 0x1 (ACTIVE): MTL Tx memory Correctable Error Status detected.

10.2.364 MTL_ECC_ERR_STS_RCTL — Offset CD0h

The MTL_ECC_Err_Sts_Rctl register establishes the control for ECC Error status capture.

Type	Size	Offset	Default
MMIO	32 bit	BAR + CD0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5	0h RW	**Clear Uncorrectable Error Status (CUES):** When this bit is set along with EESRE bit of this register, based on the EMS field of this register, the respective memory's uncorrectable error address and uncorrectable error count values are cleared upon reading. Hardware resets this bit when all the error status values are cleared. 0x0 (INACTIVE): Clear Uncorrectable Error Status not detected. 0x1 (ACTIVE): Clear Uncorrectable Error Status detected.
4	0h RW	**Clear Correctable Error Status (CCES):** When this bit is set along with EESRE bit of this register, based on the EMS field of this register, the respective memory's correctable error address and correctable error count values are cleared upon reading. Hardware resets this bit when all the error status values are cleared. 0x0 (INACTIVE): Clear Correctable Error Status not detected. 0x1 (ACTIVE): Clear Correctable Error Status detected.
3:1	0h RW	**MTL ECC Memory Selection (EMS):** When EESRE bit of this register is set, this field indicates which memory's error status value to be read. The memory selection encoding is as described below. 0x0 (TX_MEM): MTL Tx memory. 0x1 (RX_MEM): MTL Rx memory. 0x2 (EST_MEM): MTL EST memory. 0x3 (RXP_MEM): MTL Rx Parser memory. 0x4 (TSO_MEM): DMA TSO memory.
0	0h RW	**MTL ECC Error Status Read Enable (EESRE):** When this bit is set, based on the EMS field of this register, the respective memory's error status values are captured as described: - The correctable and uncorrectable error count values are captured into MTL_ECC_Err_Cnt_Status register - The address location's of correctable and uncorrectable errors are captured into MTL_ECC_Err_Addr_Status register. Hardware resets this bit when all the status values are captured into the MTL_ECC_Err_Cnt_Status and MTL_ECC_Err_Addr_Status registers. 0x0 (DISABLE): MTL ECC Error Status Read is disabled. 0x1 (ENABLE): MTL ECC Error Status Read is enabled.

10.2.365 MTL_ECC_ERR_ADDR_STATUS — Offset CD4h

The MTL_ECC_Err_Addr_Status register provides the memory addresses for the correctable and uncorrectable errors.

Type	Size	Offset	Default
MMIO	32 bit	BAR + CD4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	**MTL ECC Uncorrectable Error Address Status (EUEAS):** Based on the EMS field of MTL_ECC_Err_Sts_Rctl register, this field holds the respective memory's address locations for which an uncorrectable error or address mismatch is detected. When MEEAO bit of MTL_ECC_Control register is set, this field holds the last valid address of memory for which either an uncorrectable error or an address mismatch is detected. When MEEAO bit of MTL_ECC_Control register is reset, this field holds the first address of the memory for which either an uncorrectable error or address mismatch is detected.
15:0	0000h RO	**MTL ECC Correctable Error Address Status (ECEAS):** Based on the EMS field of MTL_ECC_Err_Sts_Rctl register, this field holds the respective memory's address locations for which a correctable error is detected. When MEEAO bit of MTL_ECC_Control register is set, this field holds the last valid address of memory for which correctable error or address mismatch is detected. When MEEAO bit of MTL_ECC_Control register is reset, this field holds the first address of the memory for which correctable error is detected.

10.2.366 MTL_ECC_ERR_CNTR_STATUS — Offset CD8h

The MTL_ECC_Err_Cntr_Status register provides ECC Error count for Correctable and uncorrectable errors.

Type	Size	Offset	Default
MMIO	32 bit	BAR + CD8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19:16	0h RO	**MTL ECC Uncorrectable Error Counter Status (EUECS):** Based on the EMS field of MTL_ECC_Err_Cntr_Rctl register, this field holds the respective memory's uncorrectable error count value.
15:8	0h RO	**Reserved**
7:0	00h RO	**MTL ECC Correctable Error Counter Status (ECECS):** Based on the EMS field of MTL_ECC_Err_Cntr_Rctl register, this field holds the respective memory's correctable error count value.

10.2.367 MTL_DPP_CONTROL — Offset CE0h

The MTL_DPP_Control establishes the operating mode of Data Parity protection and error injection.

Type	Size	Offset	Default
MMIO	32 bit	BAR + CE0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13	0h RW	**Insert Parity error in CSR Read data parity generator (IPECW):** When set to 1, parity bit of first valid data generated by the CSR parity generator (or at PG10 as shown in AXI slave Interface Data path parity protection diagram) is flipped. Hardware clears this bit once respective parity bit is flipped. 0x0 (DISABLE): Insert Parity error in CSR Read data parity generator is disabled. 0x1 (ENABLE): Insert Parity error in CSR Read data parity generator is enabled.
12	0h RW	**Insert Parity error in AXI Slave Write data parity generator (IPEASW):** When set to 1, parity bit of first valid data generated by the AXI parity generator is (or at PG9 as shown in AXI slave Interface Data path parity protection diagram) flipped. Hardware clears this bit once respective parity bit is flipped. 0x0 (DISABLE): Insert Parity error in AXI Slave Write data parity generator is disabled. 0x1 (ENABLE): Insert Parity error in AXI Slave Write data parity generator is enabled.
11	0h RW	**Insert Parity error in Rx write-back Descriptor parity generator (IPERD):** When set to 1, parity bit of first valid data generated by the DMA Rx write-back descriptor parity generator(or at PG8 as shown in Receive data path parity protection diagram) is flipped. 0x0 (DISABLE): Insert Parity error in Rx write-back Descriptor parity generator is disabled. 0x1 (ENABLE): Insert Parity error in Rx write-back Descriptor parity generator is enabled.
10	0h RW	**Insert Parity error in Tx write-back Descriptor parity generator (IPETD):** When set to 1, parity bit of first valid data generated by the DMA Tx write-back descriptor parity generator(or at PG4 as shown in Transmit data path parity protection diagram) is flipped. Hardware clears this bit once respective parity bit is flipped. 0x0 (DISABLE): Insert Parity error in Tx write-back Descriptor parity generator is disabled. 0x1 (ENABLE): Insert Parity error in Tx write-back Descriptor parity generator is enabled.
9	0h RW	**Insert Parity Error in DMA TSO parity generator (IPETSO):** When set to 1, parity bit of first valid data generated by the DMA TSO parity generator is (or at PG3 as shown in Transmit data path parity protection diagram) flipped. Hardware clears this bit once respective parity bit is flipped. 0x0 (DISABLE): Insert Parity Error in DMA TSO parity generator is disabled. 0x1 (ENABLE): Insert Parity Error in DMA TSO parity generator is enabled.
8	0h RW	**Insert Parity Error in DMA DTX Control word parity generator (IPEDDC):** When set to 1, parity bit of first valid data generated by the DMA DTX Control word parity generator (or at PG2 as shown in Transmit data path parity protection diagram) is flipped. Hardware clears this bit once respective parity bit is flipped. 0x0 (DISABLE): Insert Parity Error in DMA DTX Control word parity generator is disabled. 0x1 (ENABLE): Insert Parity Error in DMA DTX Control word parity generator is enabled.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Insert Parity Error in MTL Rx FIFO read control parity generator (IPEMRF):** When set to 1, parity bit of first valid data generated by the MTL Rx FIFO read control parity generator (or at PG7 as shown in Receive data path parity protection diagram) is flipped. Hardware clears this bit once respective parity bit is flipped. 0x0 (DISABLE): Insert Parity Error in MTL Rx FIFO read control parity generator is disabled. 0x1 (ENABLE): Insert Parity Error in MTL Rx FIFO read control parity generator is enabled.
6	0h RW	**Insert Parity Error in MTL Tx Status parity generator (IPEMTS):** When set to 1, parity bit of first valid data generated by the MTL Tx Status parity generator (or at PG6 as shown in Transmit data path parity protection diagram) is flipped. Hardware clears this bit once respective parity bit is flipped. 0x0 (DISABLE): Insert Parity Error in MTL Tx Status parity generator is disabled. 0x1 (ENABLE): Insert Parity Error in MTL Tx Status parity generator is enabled.
5	0h RW	**Insert Parity Error in MTL checksum parity generator (IPEMC):** When set to 1, parity bit of first valid data generated by the MTL checksum parity generator (or at PG5 as shown in Transmit data path parity protection diagram) is flipped. Hardware clears this bit once the respective parity bit is flipped. 0x0 (DISABLE): Insert Parity Error in MTL checksum parity generator is disabled. 0x1 (ENABLE): Insert Parity Error in MTL checksum parity generator is enabled.
4	0h RW	**Insert Parity Error in Interface Data parity generator (IPEID):** When set to 1, parity bit of first valid input data generated by the Interface data parity generator (or at PG1 as shown in Transmit data path parity protection diagram) is flipped. Following are the input data bus on which parity bits are generated based on configuration selected In AHB Config, hrdata_i In AXI config, rdata_m_i In DMA Config, mdc_rdata_i In MTL Config, ati_data_i Hardware clears this bit once the respective parity bit is flipped. 0x0 (DISABLE): Insert Parity Error in Interface Data parity generator is disabled. 0x1 (ENABLE): Insert Parity Error in Interface Data parity generator is enabled.
3:2	0h RO	**Reserved**
1	0h RW	**Odd Parity Enable (OPE):** When set to 1, enables odd parity protection on all the external interfaces and when set to 0, enables even parity protection on all the external interfaces. 0x0 (DISABLE): Odd Parity is disabled. 0x1 (ENABLE): Odd Parity is enabled.
0	0h RW	**Enable Data path Parity Protection (EDPP):** When set to 1, enables the parity protection for EQOS datapath by generating and checking the parity on EQOS datapath. When set to 0, disables the parity protection for EQOS datapath. 0x0 (DISABLE): Data path Parity Protection is disabled. 0x1 (ENABLE): Data path Parity Protection is enabled.

10.2.368 MTL_TXQ0_OPERATION_MODE — Offset D00h

The Queue 0 Transmit Operation Mode register establishes the Transmit queue operating modes and commands.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D00h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:16	00h RW	**Transmit Queue Size (TQS):** This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. The TQS field is read-write only if the number of Tx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on, so user should be programming TQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (TQS+1)*256 bytes. When the number of Tx Queues is one, the field is read-only and the configured TX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Tx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
15:7	0h RO	**Reserved**
6:4	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
3:2	0h RW	**Transmit Queue Enable (TXQEN):** This field is used to enable/disable the transmit queue 0. - 2'b00: Not enabled - 2'b01: Reserved - 2'b10: Enabled - 2'b11: Reserved This field is Read Only in Single Queue configurations and Read Write in Multiple Queue configurations. Note: In multiple Tx queues configuration, all the queues are disabled by default. Enable the Tx queue by programming this field. 0x0 (DISABLE): Not enabled. 0x1 (EN_IF_AV): Enable in AV mode (Reserved in non-AV). 0x2 (ENABLE): Enabled. 0x3 (RSVD2): Reserved.
1	0h RW	**Transmit Store and Forward (TSF):** When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped. 0x0 (DISABLE): Transmit Store and Forward is disabled. 0x1 (ENABLE): Transmit Store and Forward is enabled. Note: This bit should always be set as we do not support cut through mode.
0	0h RW	**Flush Transmit Queue (FTQ):** When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the MTL_TxQ1_Operation_Mode register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission. Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (clk_tx_i) should be active. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Flush Transmit Queue is disabled. 0x1 (ENABLE): Flush Transmit Queue is enabled.

10.2.369 MTL_TXQ0_UNDERFLOW — Offset D04h

The Queue 0 Underflow Counter register contains the counter for packets aborted because of Transmit queue underflow and packets missed because of Receive queue packet flush

Type	Size	Offset	Default
MMIO	32 bit	BAR + D04h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RO	**Overflow Bit for Underflow Packet Counter (UFCNTOVF):** This bit is set every time the Tx queue Underflow Packet Counter field overflows, that is, it has crossed the maximum count. In such a scenario, the overflow packet counter is reset to all-zeros and this bit indicates that the rollover happened. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Overflow not detected for Underflow Packet Counter. 0x1 (ACTIVE): Overflow detected for Underflow Packet Counter.
10:0	000h RO	**Underflow Packet Counter (UFFRMCNT):** This field indicates the number of packets aborted by the controller because of Tx Queue Underflow. This counter is incremented each time the MAC aborts outgoing packet because of underflow. The counter is cleared when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

10.2.370 MTL_TXQ0_DEBUG — Offset D08h

The Queue 0 Transmit Debug register gives the debug status of various blocks related to the Transmit queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D08h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:20	0h RO	**Number of Status Words in Tx Status FIFO of Queue (STXSTSF):** This field indicates the current number of status in the Tx Status FIFO of this queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of status words in Tx Status FIFO.
19	0h RO	**Reserved**
18:16	0h RO	**Number of Packets in the Transmit Queue (PTXQ):** This field indicates the current number of packets in the Tx Queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of packets in the Transmit queue.
15:6	0h RO	**Reserved**
5	0h RO	**MTL Tx Status FIFO Full Status (TXSTSFSTS):** When high, this bit indicates that the MTL Tx Status FIFO is full. Therefore, the MTL cannot accept any more packets for transmission. 0x0 (INACTIVE): MTL Tx Status FIFO Full status is not detected. 0x1 (ACTIVE): MTL Tx Status FIFO Full status is detected.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO	**MTL Tx Queue Not Empty Status (TXQSTS):** When this bit is high, it indicates that the MTL Tx Queue is not empty and some data is left for transmission. 0x0 (INACTIVE): MTL Tx Queue Not Empty status is not detected. 0x1 (ACTIVE): MTL Tx Queue Not Empty status is detected.
3	0h RO	**MTL Tx Queue Write Controller Status (TWCSTS):** When high, this bit indicates that the MTL Tx Queue Write Controller is active, and it is transferring the data to the Tx Queue. 0x0 (INACTIVE): MTL Tx Queue Write Controller status is not detected. 0x1 (ACTIVE): MTL Tx Queue Write Controller status is detected.
2:1	0h RO	**MTL Tx Queue Read Controller Status (TRCSTS):** This field indicates the state of the Tx Queue Read Controller: 0x0 (IDLE): Idle state. 0x1 (READ): Read state (transferring data to the MAC transmitter). 0x2 (WAIT): Waiting for pending Tx Status from the MAC transmitter. 0x3 (FLUSH): Flushing the Tx queue because of the Packet Abort request from the MAC.
0	0h RO	**Transmit Queue in Pause (TXQPAUSED):** When this bit is high and the Rx flow control is enabled, it indicates that the Tx Queue is in the Pause condition (in the full-duplex only mode) because of the following: - Reception of the PFC packet for the priorities assigned to the Tx Queue when PFC is enabled - Reception of 802.3x Pause packet when PFC is disabled 0x0 (INACTIVE): Transmit Queue in Pause status is not detected. 0x1 (ACTIVE): Transmit Queue in Pause status is detected.

10.2.371 MTL_TXQ0_ETS_STATUS — Offset D14h

The Queue 0 ETS Status register provides the average traffic transmitted in Queue 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RO	**Average Bits per Slot (ABS):** This field contains the average transmitted bits per slot. When the DCB operation is enabled for Queue 0, this field is computed over every 10 million bit times slot (4 ms in 2500 Mbps; 10 ms in 1000 Mbps; 100 ms in 100 Mbps). The maximum value is 0x989680.

10.2.372 MTL_TXQ0_QUANTUM_WEIGHT — Offset D18h

The Queue 0 Quantum or Weights register contains the quantum value for Deficit Weighted Round Robin (DWRR), weights for the Weighted Round Robin (WRR), and Weighted Fair Queuing (WFQ) for Queue 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved**
20:0	000000h RW	**Quantum or Weights (ISCQW):** When the DCB operation is enabled with DWRR algorithm for Queue 0 traffic, this field contains the quantum value in bytes to be added to credit during every queue scanning cycle. The maximum value is 0x1312D0 bytes. When DCB operation is enabled with WFQ algorithm for Queue 0 traffic, this field contains the weight for this queue. The maximum value is 0x3FFF where weight of 0 indicates 100% bandwidth. Bits[20:14] must be written to zero. The higher the programmed weights lesser the bandwidth allocated for the particular Transmit Queue. This is because the weights are used to compute the packet finish time (weights*packet_size). Lesser the finish time, higher the probability of the packet getting scheduled first and using more bandwidth. When DCB operation or generic queuing operation is enabled with WRR algorithm for Queue 0 traffic, this field contains the weight for this queue. The maximum value is 0x64. Bits [20:7] must be written to zero.

10.2.373 MTL_Q0_INTERRUPT_CONTROL_STATUS — Offset D2Ch

This register contains the interrupt enable and status bits for the queue 0 interrupts.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**Receive Queue Overflow Interrupt Enable (RXOIE):** When this bit is set, the Receive Queue Overflow interrupt is enabled. When this bit is reset, the Receive Queue Overflow interrupt is disabled. 0x0 (DISABLE): Receive Queue Overflow Interrupt is disabled. 0x1 (ENABLE): Receive Queue Overflow Interrupt is enabled.
23:17	0h RO	**Reserved**
16	0h RW	**Receive Queue Overflow Interrupt Status (RXOVFIS):** This bit indicates that the Receive Queue had an overflow while receiving the packet. If a partial packet is transferred to the application, the overflow status is set in RDES3[21]. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Queue Overflow Interrupt Status not detected. 0x1 (ACTIVE): Receive Queue Overflow Interrupt Status detected.
15:10	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**Average Bits Per Slot Interrupt Enable (ABPSIE):** When this bit is set, the MAC asserts the sbd_intr_o or mci_intr_o interrupt when the average bits per slot status is updated. When this bit is cleared, the interrupt is not asserted for such an event. 0x0 (DISABLE): Average Bits Per Slot Interrupt is disabled. 0x1 (ENABLE): Average Bits Per Slot Interrupt is enabled.
8	0h RW	**Transmit Queue Underflow Interrupt Enable (TXUIE):** When this bit is set, the Transmit Queue Underflow interrupt is enabled. When this bit is reset, the Transmit Queue Underflow interrupt is disabled. 0x0 (DISABLE): Transmit Queue Underflow Interrupt Status is disabled. 0x1 (ENABLE): Transmit Queue Underflow Interrupt Status is enabled.
7:2	0h RO	**Reserved**
1	0h RW	**Average Bits Per Slot Interrupt Status (ABPSIS):** When set, this bit indicates that the MAC has updated the ABS value. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Average Bits Per Slot Interrupt Status not detected. 0x1 (ACTIVE): Average Bits Per Slot Interrupt Status detected.
0	0h RW	**Transmit Queue Underflow Interrupt Status (TXUNFIS):** This bit indicates that the Transmit Queue had an underflow while transmitting the packet. Transmission is suspended and an Underflow Error TDES3[2] is set. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Queue Underflow Interrupt Status not detected. 0x1 (ACTIVE): Transmit Queue Underflow Interrupt Status detected.

10.2.374 MTL_RXQ0_OPERATION_MODE — Offset D30h

The Queue 0 Receive Operation Mode register establishes the Receive queue operating modes and command.

The RFA and RFD fields are not backward compatible with the RFA and RFD fields of 4.00a release

Type	Size	Offset	Default
MMIO	32 bit	BAR + D30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved**
26:20	00h RW	**Receive Queue Size (RQS):** This field indicates the size of the allocated Receive queues in blocks of 256 bytes. The RQS field is read-write only if the number of Rx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on, so user should be programming RQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (RQS+1)*256 bytes. When the number of Rx Queues is one, the field is read-only and the configured RX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Rx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
19:14	00h RW	**Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) (RFD):** These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1.5 KB, that is, FULL 1.5 KB - 2: Full minus 2 KB, that is, FULL 2 KB - 3: Full minus 2.5 KB, that is, FULL 2.5 KB - ... - 62: Full minus 32 KB, that is, FULL 32 KB - 63: Full minus 32.5 KB, that is, FULL 32.5 KB The de-assertion is effective only after flow control is asserted. Note: The value must be programmed in such a way to make sure that the threshold is a positive number. When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register. The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13:8	00h RW	**Threshold for Activating Flow Control (in half-duplex and full-duplex (RFA):** These bits control the threshold (fill-level of Rx queue) at which the flow control is activated: For more information on encoding for this field, see RFD.
7	0h RW	**Enable Hardware Flow Control (EHFC):** When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. 0x0 (DISABLE): Hardware Flow Control is disabled. 0x1 (ENABLE): Hardware Flow Control is enabled.
6	0h RW	**Disable Dropping of TCP/IP Checksum Error Packets (DIS_TCP_EF):** When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC. When this bit is reset, all error packets are dropped if the FEP bit is reset. 0x0 (ENABLE): Dropping of TCP/IP Checksum Error Packets is enabled. 0x1 (DISABLE): Dropping of TCP/IP Checksum Error Packets is disabled.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**Receive Queue Store and Forward (RSF):** When this bit is set, the GbE Controller reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register. 0x0 (DISABLE): Receive Queue Store and Forward is disabled. 0x1 (ENABLE): Receive Queue Store and Forward is enabled.
4	0h RW	**Forward Error Packets (FEP):** When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped. When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet might be forwarded to the application or DMA. 0x0 (DISABLE): Forward Error Packets is disabled. 0x1 (ENABLE): Forward Error Packets is enabled.
3	0h RW	**Forward Undersized Good Packets (FUP):** When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. 0x0 (DISABLE): Forward Undersized Good Packets is disabled. 0x1 (ENABLE): Forward Undersized Good Packets is enabled.
2	0h RO	**Reserved**
1:0	0h RW	**Receive Queue Threshold Control (RTC):** These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred. This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1. 0x0 (M_64BYTE): 64. 0x1 (M_32BYTE): 32. 0x2 (M_96BYTE): 96. 0x3 (M_128BYTE): 128.

10.2.375 MTL_RXQ0_MISSED_PACKET_OVERFLOW_CNT — Offset D34h

The Queue 0 Missed Packet and Overflow Counter register contains the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D34h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27	0h RO	**Missed Packet Counter Overflow Bit (MISCNTOVF):** When set, this bit indicates that the Rx Queue Missed Packet Counter crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Missed Packet Counter overflow not detected. 0x1 (ACTIVE): Missed Packet Counter overflow detected.
26:16	000h RO	**Missed Packet Counter (MISPKTCNT):** This field indicates the number of packets missed by the GbE Controller because the application asserted ari_pkt_flush_i[] for this queue. This counter is reset when this register is read with mci_be_i[0] at 1b1. This counter is incremented by 1 when the DMA discards the packet because of buffer unavailability. Access restriction applies. Clears on read. Self-set to 1 on internal event.
15:12	0h RO	**Reserved**
11	0h RO	**Overflow Counter Overflow Bit (OVFCNTOVF):** When set, this bit indicates that the Rx Queue Overflow Packet Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Overflow Counter overflow not detected. 0x1 (ACTIVE): Overflow Counter overflow detected.
10:0	000h RO	**Overflow Packet Counter (OVFPKTCNT):** This field indicates the number of packets discarded by the GbE Controller because of Receive queue overflow. This counter is incremented each time the GbE Controller discards an incoming packet because of overflow. This counter is reset when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

10.2.376 MTL_RXQ0_DEBUG — Offset D38h

The Queue 0 Receive Debug register gives the debug status of various blocks related to the Receive queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D38h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:16	0000h RO	**Number of Packets in Receive Queue (PRXQ):** This field indicates the current number of packets in the Rx Queue. The theoretical maximum value for this field is 256KB/16B = 16K Packets, that is, Max_Queue_Size/ Min_Packet_Size.
15:6	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
5:4	0h RO	**MTL Rx Queue Fill-Level Status (RXQSTS):** This field gives the status of the fill-level of the Rx Queue: 0x0 (EMPTY): Rx Queue empty. 0x1 (BLW_THR): Rx Queue fill-level below flow-control deactivate threshold. 0x2 (ABV_THR): Rx Queue fill-level above flow-control activate threshold. 0x3 (FULL): Rx Queue full.
3	0h RO	**Reserved**
2:1	0h RO	**MTL Rx Queue Read Controller State (RRCSTS):** This field gives the state of the Rx queue Read controller: 0x0 (IDLE): Idle state. 0x1 (READ_DATA): Reading packet data. 0x2 (READ_STS): Reading packet status (or timestamp). 0x3 (FLUSH): Flushing the packet data and status.
0	0h RO	**MTL Rx Queue Write Controller Active Status (RWCSTS):** When high, this bit indicates that the MTL Rx queue Write controller is active, and it is transferring a received packet to the Rx Queue. 0x0 (INACTIVE): MTL Rx Queue Write Controller Active Status not detected. 0x1 (ACTIVE): MTL Rx Queue Write Controller Active Status detected.

10.2.377 MTL_RXQ0_CONTROL — Offset D3Ch

The Queue Receive Control register controls the receive arbitration and passing of received packets to the application.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D3Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**Receive Queue Packet Arbitration (RXQ_FRM_ARBIT):** When this bit is set, the GbE Controller drives the packet data to the ARI interface such that the entire packet data of currently-selected queue is transmitted before switching to other queue. When this bit is reset, the GbE Controller drives the packet data to the ARI interface such that the following amount of data of currently-selected queue is transmitted before switching to other queue: - PBL amount of data (indicated by ari_qN_pbl_i[]) or - Complete data of a packet The status and the timestamp are not a part of the PBL data. Therefore, the GbE Controller drives the complete status (including timestamp status) during first PBL request for the packet (in store-and-forward mode) or the last PBL request for the packet (in Threshold mode). 0x0 (DISABLE): Receive Queue Packet Arbitration is disabled. 0x1 (ENABLE): Receive Queue Packet Arbitration is enabled.
2:0	0h RW	**Receive Queue Weight (RXQ_WEGT):** This field indicates the weight assigned to the Rx Queue 0. This field needs to be programmed with one value less than the required weight, i.e. reset value of 0 indicates weight of 1, value of 1 indicates weight of 2, and so on. The weight is used as the number of continuous PBL or packets requests (depending on the RXQ_FRM_ARBIT) allocated to the queue in one arbitration cycle. Note: The change in value of RXQ_WEGT takes effect only after the completion of current service round or when there is change from RAA=SP to RAA=WSP algorithm. This approach is taken so that there is smooth transition. For the RXQ_WEGT value to take effect at the start, the MTL_RxQ(#i)_Control registers must be programmed before the MTL_Operation_Mode register.

10.2.378 MTL_TXQ1_OPERATION_MODE — Offset D40h

The Queue 1 Transmit Operation Mode register establishes the Transmit queue operating modes and commands.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D40h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:16	00h RW	**Transmit Queue Size (TQS):** This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. The TQS field is read-write only if the number of Tx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on, so user should be programming TQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (TQS+1)*256 bytes. When the number of Tx Queues is one, the field is read-only and the configured TX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Tx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
15:7	0h RO	**Reserved**
6:4	0h RO	**Reserved**
3:2	0h RW	**Transmit Queue Enable (TXQEN):** This field is used to enable/disable the transmit queue 0. - 2'b00: Not enabled - 2'b01: Enable in AV mode - 2'b10: Enabled - 2'b11: Reserved Note: In multiple Tx queues configuration, all the queues are disabled by default. Enable the Tx queue by programming this field. 0x0 (DISABLE): Not enabled. 0x1 (EN_IF_AV): Enable in AV mode (Reserved in non-AV). 0x2 (ENABLE): Enabled. 0x3 (RSVD2): Reserved.
1	0h RW	**Transmit Store and Forward (TSF):** When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped. 0x0 (DISABLE): Transmit Store and Forward is disabled. 0x1 (ENABLE): Transmit Store and Forward is enabled. Note: This bit should always be set as we do not support cut through mode.
0	0h RW	**Flush Transmit Queue (FTQ):** When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the MTL_TxQ1_Operation_Mode register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission. Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (clk_tx_i) should be active. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Flush Transmit Queue is disabled. 0x1 (ENABLE): Flush Transmit Queue is enabled.

10.2.379 MTL_TXQ1_UNDERFLOW — Offset D44h

The Queue 1 Underflow Counter register contains the counter for packets aborted because of Transmit queue underflow and packets missed because of Receive queue packet flush

Type	Size	Offset	Default
MMIO	32 bit	BAR + D44h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RO	**Overflow Bit for Underflow Packet Counter (UFCNTOVF):** This bit is set every time the Tx queue Underflow Packet Counter field overflows, that is, it has crossed the maximum count. In such a scenario, the overflow packet counter is reset to all-zeros and this bit indicates that the rollover happened. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Overflow not detected for Underflow Packet Counter. 0x1 (ACTIVE): Overflow detected for Underflow Packet Counter.
10:0	000h RO	**Underflow Packet Counter (UFFRMCNT):** This field indicates the number of packets aborted by the controller because of Tx Queue Underflow. This counter is incremented each time the MAC aborts outgoing packet because of underflow. The counter is cleared when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

10.2.380 MTL_TXQ1_DEBUG — Offset D48h

The Queue 1 Transmit Debug register gives the debug status of various blocks related to the Transmit queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D48h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:20	0h RO	**Number of Status Words in Tx Status FIFO of Queue (STXSTSF):** This field indicates the current number of status in the Tx Status FIFO of this queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of status words in Tx Status FIFO.
19	0h RO	**Reserved**
18:16	0h RO	**Number of Packets in the Transmit Queue (PTXQ):** This field indicates the current number of packets in the Tx Queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of packets in the Transmit queue.

Bit Range	Default & Access	Field Name (ID): Description
15:6	0h RO	**Reserved**
5	0h RO	**MTL Tx Status FIFO Full Status (TXSTSFSTS):** When high, this bit indicates that the MTL Tx Status FIFO is full. Therefore, the MTL cannot accept any more packets for transmission. 0x0 (INACTIVE): MTL Tx Status FIFO Full status is not detected. 0x1 (ACTIVE): MTL Tx Status FIFO Full status is detected.
4	0h RO	**MTL Tx Queue Not Empty Status (TXQSTS):** When this bit is high, it indicates that the MTL Tx Queue is not empty and some data is left for transmission. 0x0 (INACTIVE): MTL Tx Queue Not Empty status is not detected. 0x1 (ACTIVE): MTL Tx Queue Not Empty status is detected.
3	0h RO	**MTL Tx Queue Write Controller Status (TWCSTS):** When high, this bit indicates that the MTL Tx Queue Write Controller is active, and it is transferring the data to the Tx Queue. 0x0 (INACTIVE): MTL Tx Queue Write Controller status is not detected. 0x1 (ACTIVE): MTL Tx Queue Write Controller status is detected.
2:1	0h RO	**MTL Tx Queue Read Controller Status (TRCSTS):** This field indicates the state of the Tx Queue Read Controller: 0x0 (IDLE): Idle state. 0x1 (READ): Read state (transferring data to the MAC transmitter). 0x2 (WAIT): Waiting for pending Tx Status from the MAC transmitter. 0x3 (FLUSH): Flushing the Tx queue because of the Packet Abort request from the MAC.
0	0h RO	**Transmit Queue in Pause (TXQPAUSED):** When this bit is high and the Rx flow control is enabled, it indicates that the Tx Queue is in the Pause condition (in the full-duplex only mode) because of the following: - Reception of the PFC packet for the priorities assigned to the Tx Queue when PFC is enabled - Reception of 802.3x Pause packet when PFC is disabled 0x0 (INACTIVE): Transmit Queue in Pause status is not detected. 0x1 (ACTIVE): Transmit Queue in Pause status is detected.

10.2.381 MTL_TXQ1_ETS_CONTROL — Offset D50h

The Queue ETS Control register controls the enhanced transmission selection operation.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D50h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:4	0h RW	**Slot Count (SLC):** If the credit-based shaper algorithm is enabled, the software can program the number of slots (of duration programmed in DMA_CH(#i)_Slot_Interval register) over which the average transmitted bits per slot, provided in the MTL_TxQ(#i)_ETS_Status register, need to be computed for Queue. The encoding is as follows: 0x0 (M_1_SLOT): 1 slot. 0x1 (M_2_SLOT): 2 slots. 0x2 (M_4_SLOT): 4 slots. 0x3 (M_8_SLOT): 8 slots. 0x4 (M_16_SLOT): 16 slots. 0x5 (RSVD): Reserved.
3	0h RW	**Credit Control (CC):** When this bit is set, the accumulated credit parameter in the credit-based shaper algorithm logic is not reset to zero when there is positive credit and no packet to transmit in Channel 1. The credit accumulates even when there is no packet waiting in Channel 1 and another channel is transmitting. When this bit is reset, the accumulated credit parameter in the credit-based shaper algorithm logic is set to zero when there is positive credit and no packet to transmit in Channel 1. When there is no packet waiting in Channel 1 and other channel is transmitting, no credit is accumulated. 0x0 (DISABLE): Credit Control is disabled. 0x1 (ENABLE): Credit Control is enabled.
2	0h RW	**AV Algorithm (AVALG):** When Queue 1 is programmed for AV, this field configures the scheduling algorithm for this queue: This bit when set, indicates credit based shaper algorithm (CBS) is selected for Queue 1 traffic. When reset, strict priority is selected. 0x0 (DISABLE): CBS Algorithm is disabled. 0x1 (ENABLE): CBS Algorithm is enabled.
1:0	0h RO	**Reserved**

10.2.382 MTL_TXQ1_ETS_STATUS — Offset D54h

The Queue 1 ETS Status register provides the average traffic transmitted in Queue 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D54h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RO	**Average Bits per Slot (ABS):** This field contains the average transmitted bits per slot. If AV operation is enabled, this field is computed over number of slots, programmed in the SLC field of MTL_TxQ(#i)_ETS_CONTROL register. The maximum value of this field is 0x6_4000 in 100 Mbps, 0x3E_8000 in 1000 Mbps and 9C_4000 in 2500 Mbps mode respectively. When the DCB operation is enabled for Queue, this field is computed over every 10 million bit times slot (4 ms in 2500 Mbps; 10 ms in 1000 Mbps; 100 ms in 100 Mbps). The maximum value is 0x989680.

10.2.383 MTL_TXQ1_QUANTUM_WEIGHT — Offset D58h

The Queue 1 idleSlopeCredit, Quantum or Weights register provides the average traffic transmitted in Queue 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D58h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved**
20:0	000000h RW	**ISCQW:** idleSlopeCredit, Quantum or Weights - idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns for 100 Mbps; 8 ns for 1000 Mbps; 3.2 ns for 2500 Mbps) when the credit is increasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. Bits[20:14] must be written to zero. - Quantum When the DCB operation is enabled with DWRR algorithm for Queue 1 traffic, this field contains the quantum value in bytes to be added to credit during every queue scanning cycle. The maximum value is 0x1312D0 bytes. - Weights When DCB operation is enabled with WFQ algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x3FFF where weight of 0 indicates 100% bandwidth. Bits[20:14] must be written to zero. When DCB operation or generic queuing operation is enabled with WRR algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x64. Bits [20:7] must be written to zero. - Note 1: In multiple Queue configuration this field in respective per queue register must be programmed to some non-zero value when multiple queues are enabled or single queue other than Q0 is enabled. This field need not be programmed when only Q0 is enabled. In general, when WRR algorithm is selected a non-zero value must be programmed on both Receive and Transmit. In Receive, the register is MTL_Operation_Mode register. - Note 2: For WFQ algorithm, higher the programmed weights lesser the bandwidth allocated for that Transmit Queue. The finish time is not a function of particular packet alone but it is as per the formula: (previous_finish_time of particular Transmit Queue + (weights*packet_size)) - Note 3: The weights programmed do not correspond to the number of packets but the fraction of bandwidth or time allocated for particular queue w.r.t. total BW or time.

10.2.384 MTL_TXQ1_SENDSLOPECREDIT — Offset D5Ch

The sendSlopeCredit register contains the sendSlope credit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D5Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13:0	0000h RW	**sendSlopeCredit Value (SSC):** When AV operation is enabled, this field contains the sendSlopeCredit value required for credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns, 8 ns and 3.2 ns for 100 Mbps, 1000 Mbps and 2500 Mbps respectively) when the credit is decreasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. This field should be programmed with absolute sendSlopeCredit value. The credit-based shaper logic subtracts it from the accumulated credit when Channel 1 is selected for transmission.

10.2.385 MTL_TXQ1_HICREDIT — Offset D60h

The hiCredit register contains the hiCredit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D60h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:0	00000000h RW	**hiCredit Value (HC):** When the AV feature is enabled, this field contains the hiCredit value required for the credit-based shaper algorithm. This is the maximum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1,024. The maximum value is maxInterferenceSize, that is, best-effort maximum packet size (16,384 bytes or 131,072 bits). The value to be specified is 131,072 * 1,024 = 134,217,728 or 0x0800_0000.

10.2.386 MTL_TXQ1_LOCREDIT — Offset D64h

The loCredit register contains the loCredit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D64h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:0	00000000h RW	**loCredit Value (LC):** When AV operation is enabled, this field contains the loCredit value required for the credit-based shaper algorithm. This is the minimum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1,024. The maximum value to be programmed is corresponds to twice the maxFrameSize transmitted from this queue. If the maxFrameSize is 8192 bytes, then (8192*2) * 8 * 1024 = 134,217,728 or 0x0800_0000. Because it is a negative value, the programmed value is 2's complement of the value, that is, 0x1800_0000.

10.2.387 MTL_Q1_INTERRUPT_CONTROL_STATUS — Offset D6Ch

This register contains the interrupt enable and status bits for the queue 1 interrupts.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D6Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**Receive Queue Overflow Interrupt Enable (RXOIE):** When this bit is set, the Receive Queue Overflow interrupt is enabled. When this bit is reset, the Receive Queue Overflow interrupt is disabled. 0x0 (DISABLE): Receive Queue Overflow Interrupt is disabled. 0x1 (ENABLE): Receive Queue Overflow Interrupt is enabled.
23:17	0h RO	**Reserved**
16	0h RW	**Receive Queue Overflow Interrupt Status (RXOVFIS):** This bit indicates that the Receive Queue had an overflow while receiving the packet. If a partial packet is transferred to the application, the overflow status is set in RDES3[21]. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Queue Overflow Interrupt Status not detected. 0x1 (ACTIVE): Receive Queue Overflow Interrupt Status detected.
15:10	0h RO	**Reserved**
9	0h RW	**Average Bits Per Slot Interrupt Enable (ABPSIE):** When this bit is set, the MAC asserts the sbd_intr_o or mci_intr_o interrupt when the average bits per slot status is updated. When this bit is cleared, the interrupt is not asserted for such an event. 0x0 (DISABLE): Average Bits Per Slot Interrupt is disabled. 0x1 (ENABLE): Average Bits Per Slot Interrupt is enabled.
8	0h RW	**Transmit Queue Underflow Interrupt Enable (TXUIE):** When this bit is set, the Transmit Queue Underflow interrupt is enabled. When this bit is reset, the Transmit Queue Underflow interrupt is disabled. 0x0 (DISABLE): Transmit Queue Underflow Interrupt Status is disabled. 0x1 (ENABLE): Transmit Queue Underflow Interrupt Status is enabled.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	**Reserved**
1	0h RW	**Average Bits Per Slot Interrupt Status (ABPSIS):** When set, this bit indicates that the MAC has updated the ABS value. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Average Bits Per Slot Interrupt Status not detected. 0x1 (ACTIVE): Average Bits Per Slot Interrupt Status detected.
0	0h RW	**Transmit Queue Underflow Interrupt Status (TXUNFIS):** This bit indicates that the Transmit Queue had an underflow while transmitting the packet. Transmission is suspended and an Underflow Error TDES3[2] is set. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Queue Underflow Interrupt Status not detected. 0x1 (ACTIVE): Transmit Queue Underflow Interrupt Status detected.

10.2.388 MTL_RXQ1_OPERATION_MODE — Offset D70h

The Queue 1 Receive Operation Mode register establishes the Receive queue operating modes and command.

The RFA and RFD fields are not backward compatible with the RFA and RFD fields of 4.00a release

Type	Size	Offset	Default
MMIO	32 bit	BAR + D70h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved**
26:20	00h RW	**Receive Queue Size (RQS):** This field indicates the size of the allocated Receive queues in blocks of 256 bytes. The RQS field is read-write only if the number of Rx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on, so user should be programming RQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (RQS+1)*256 bytes. When the number of Rx Queues is one, the field is read-only and the configured RX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Rx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
19:14	00h RW	**Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) (RFD):** These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1.5 KB, that is, FULL 1.5 KB - 2: Full minus 2 KB, that is, FULL 2 KB - 3: Full minus 2.5 KB, that is, FULL 2.5 KB - ... - 62: Full minus 32 KB, that is, FULL 32 KB - 63: Full minus 32.5 KB, that is, FULL 32.5 KB The de-assertion is effective only after flow control is asserted. Note: The value must be programmed in such a way to make sure that the threshold is a positive number. When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register. The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13:8	00h RW	**Threshold for Activating Flow Control (in half-duplex and full-duplex (RFA):** These bits control the threshold (fill-level of Rx queue) at which the flow control is activated: For more information on encoding for this field, see RFD.
7	0h RW	**Enable Hardware Flow Control (EHFC):** When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. 0x0 (DISABLE): Hardware Flow Control is disabled. 0x1 (ENABLE): Hardware Flow Control is enabled.
6	0h RW	**Disable Dropping of TCP/IP Checksum Error Packets (DIS_TCP_EF):** When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC. When this bit is reset, all error packets are dropped if the FEP bit is reset. 0x0 (ENABLE): Dropping of TCP/IP Checksum Error Packets is enabled. 0x1 (DISABLE): Dropping of TCP/IP Checksum Error Packets is disabled.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**Receive Queue Store and Forward (RSF):** When this bit is set, the GbE Controller reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register. 0x0 (DISABLE): Receive Queue Store and Forward is disabled. 0x1 (ENABLE): Receive Queue Store and Forward is enabled.
4	0h RW	**Forward Error Packets (FEP):** When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped. When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet might be forwarded to the application or DMA. 0x0 (DISABLE): Forward Error Packets is disabled. 0x1 (ENABLE): Forward Error Packets is enabled.
3	0h RW	**Forward Undersized Good Packets (FUP):** When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. 0x0 (DISABLE): Forward Undersized Good Packets is disabled. 0x1 (ENABLE): Forward Undersized Good Packets is enabled.
2	0h RO	**Reserved**
1:0	0h RW	**Receive Queue Threshold Control (RTC):** These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred. This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1. 0x0 (M_64BYTE): 64. 0x1 (M_32BYTE): 32. 0x2 (M_96BYTE): 96. 0x3 (M_128BYTE): 128.

10.2.389 MTL_RXQ1_MISSED_PACKET_OVERFLOW_CNT — Offset D74h

The Queue 1 Missed Packet and Overflow Counter register contains the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D74h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27	0h RO	**Missed Packet Counter Overflow Bit (MISCNTOVF):** When set, this bit indicates that the Rx Queue Missed Packet Counter crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Missed Packet Counter overflow not detected. 0x1 (ACTIVE): Missed Packet Counter overflow detected.
26:16	000h RO	**Missed Packet Counter (MISPKTCNT):** This field indicates the number of packets missed by the GbE Controller because the application asserted ari_pkt_flush_i[] for this queue. This counter is reset when this register is read with mci_be_i[0] at 1b1. This counter is incremented by 1 when the DMA discards the packet because of buffer unavailability. Access restriction applies. Clears on read. Self-set to 1 on internal event.
15:12	0h RO	**Reserved**
11	0h RO	**Overflow Counter Overflow Bit (OVFCNTOVF):** When set, this bit indicates that the Rx Queue Overflow Packet Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Overflow Counter overflow not detected. 0x1 (ACTIVE): Overflow Counter overflow detected.
10:0	000h RO	**Overflow Packet Counter (OVFPKTCNT):** This field indicates the number of packets discarded by the GbE Controller because of Receive queue overflow. This counter is incremented each time the GbE Controller discards an incoming packet because of overflow. This counter is reset when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

10.2.390 MTL_RXQ1_DEBUG — Offset D78h

The Queue 1 Receive Debug register gives the debug status of various blocks related to the Receive queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D78h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:16	0000h RO	**Number of Packets in Receive Queue (PRXQ):** This field indicates the current number of packets in the Rx Queue. The theoretical maximum value for this field is 256KB/16B = 16K Packets, that is, Max_Queue_Size/ Min_Packet_Size.
15:6	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
5:4	0h RO	**MTL Rx Queue Fill-Level Status (RXQSTS):** This field gives the status of the fill-level of the Rx Queue: 0x0 (EMPTY): Rx Queue empty. 0x1 (BLW_THR): Rx Queue fill-level below flow-control deactivate threshold. 0x2 (ABV_THR): Rx Queue fill-level above flow-control activate threshold. 0x3 (FULL): Rx Queue full.
3	0h RO	**Reserved**
2:1	0h RO	**MTL Rx Queue Read Controller State (RRCSTS):** This field gives the state of the Rx queue Read controller: 0x0 (IDLE): Idle state. 0x1 (READ_DATA): Reading packet data. 0x2 (READ_STS): Reading packet status (or timestamp). 0x3 (FLUSH): Flushing the packet data and status.
0	0h RO	**MTL Rx Queue Write Controller Active Status (RWCSTS):** When high, this bit indicates that the MTL Rx queue Write controller is active, and it is transferring a received packet to the Rx Queue. 0x0 (INACTIVE): MTL Rx Queue Write Controller Active Status not detected. 0x1 (ACTIVE): MTL Rx Queue Write Controller Active Status detected.

10.2.391 MTL_RXQ1_CONTROL — Offset D7Ch

The Queue Receive Control register controls the receive arbitration and passing of received packets to the application.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D7Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**Receive Queue Packet Arbitration (RXQ_FRM_ARBIT):** When this bit is set, the GbE Controller drives the packet data to the ARI interface such that the entire packet data of currently-selected queue is transmitted before switching to other queue. When this bit is reset, the GbE Controller drives the packet data to the ARI interface such that the following amount of data of currently-selected queue is transmitted before switching to other queue: - PBL amount of data (indicated by ari_qN_pbl_i[]) or - Complete data of a packet The status and the timestamp are not a part of the PBL data. Therefore, the GbE Controller drives the complete status (including timestamp status) during first PBL request for the packet (in store-and-forward mode) or the last PBL request for the packet (in Threshold mode). 0x0 (DISABLE): Receive Queue Packet Arbitration is disabled. 0x1 (ENABLE): Receive Queue Packet Arbitration is enabled.
2:0	0h RW	**Receive Queue Weight (RXQ_WEGT):** This field indicates the weight assigned to the Rx Queue 0. This field needs to be programmed with one value less than the required weight, i.e. reset value of 0 indicates weight of 1, value of 1 indicates weight of 2, and so on. The weight is used as the number of continuous PBL or packets requests (depending on the RXQ_FRM_ARBIT) allocated to the queue in one arbitration cycle. Note: The change in value of RXQ_WEGT takes effect only after the completion of current service round or when there is change from RAA=SP to RAA=WSP algorithm. This approach is taken so that there is smooth transition. For the RXQ_WEGT value to take effect at the start, the MTL_RxQ(#i)_Control registers must be programmed before the MTL_Operation_Mode register.

10.2.392 MTL_TXQ2_OPERATION_MODE — Offset D80h

The Queue 2 Transmit Operation Mode register establishes the Transmit queue operating modes and commands.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D80h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:16	00h RW	**Transmit Queue Size (TQS):** This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. The TQS field is read-write only if the number of Tx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on, so user should be programming TQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (TQS+1)*256 bytes. When the number of Tx Queues is one, the field is read-only and the configured TX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Tx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
15:7	0h RO	**Reserved**
6:4	0h RO	**Reserved**
3:2	0h RW	**Transmit Queue Enable (TXQEN):** This field is used to enable/disable the transmit queue 0. - 2'b00: Not enabled - 2'b01: Enable in AV mode - 2'b10: Enabled - 2'b11: Reserved Note: In multiple Tx queues configuration, all the queues are disabled by default. Enable the Tx queue by programming this field. 0x0 (DISABLE): Not enabled. 0x1 (EN_IF_AV): Enable in AV mode (Reserved in non-AV). 0x2 (ENABLE): Enabled. 0x3 (RSVD2): Reserved.
1	0h RW	**Transmit Store and Forward (TSF):** When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped. 0x0 (DISABLE): Transmit Store and Forward is disabled. 0x1 (ENABLE): Transmit Store and Forward is enabled. Note: This bit should always be set as we do not support cut through mode.
0	0h RW	**Flush Transmit Queue (FTQ):** When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the MTL_TxQ1_Operation_Mode register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission. Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (clk_tx_i) should be active. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Flush Transmit Queue is disabled. 0x1 (ENABLE): Flush Transmit Queue is enabled.

10.2.393 MTL_TXQ2_UNDERFLOW — Offset D84h

The Queue 2 Underflow Counter register contains the counter for packets aborted because of Transmit queue underflow and packets missed because of Receive queue packet flush

Type	Size	Offset	Default
MMIO	32 bit	BAR + D84h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RO	**Overflow Bit for Underflow Packet Counter (UFCNTOVF):** This bit is set every time the Tx queue Underflow Packet Counter field overflows, that is, it has crossed the maximum count. In such a scenario, the overflow packet counter is reset to all-zeros and this bit indicates that the rollover happened. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Overflow not detected for Underflow Packet Counter. 0x1 (ACTIVE): Overflow detected for Underflow Packet Counter.
10:0	000h RO	**Underflow Packet Counter (UFFRMCNT):** This field indicates the number of packets aborted by the controller because of Tx Queue Underflow. This counter is incremented each time the MAC aborts outgoing packet because of underflow. The counter is cleared when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

10.2.394 MTL_TXQ2_DEBUG — Offset D88h

The Queue 2 Transmit Debug register gives the debug status of various blocks related to the Transmit queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D88h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:20	0h RO	**Number of Status Words in Tx Status FIFO of Queue (STXSTSF):** This field indicates the current number of status in the Tx Status FIFO of this queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of status words in Tx Status FIFO.
19	0h RO	**Reserved**
18:16	0h RO	**Number of Packets in the Transmit Queue (PTXQ):** This field indicates the current number of packets in the Tx Queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of packets in the Transmit queue.

Bit Range	Default & Access	Field Name (ID): Description
15:6	0h RO	**Reserved**
5	0h RO	**MTL Tx Status FIFO Full Status (TXSTSFSTS):** When high, this bit indicates that the MTL Tx Status FIFO is full. Therefore, the MTL cannot accept any more packets for transmission. 0x0 (INACTIVE): MTL Tx Status FIFO Full status is not detected. 0x1 (ACTIVE): MTL Tx Status FIFO Full status is detected.
4	0h RO	**MTL Tx Queue Not Empty Status (TXQSTS):** When this bit is high, it indicates that the MTL Tx Queue is not empty and some data is left for transmission. 0x0 (INACTIVE): MTL Tx Queue Not Empty status is not detected. 0x1 (ACTIVE): MTL Tx Queue Not Empty status is detected.
3	0h RO	**MTL Tx Queue Write Controller Status (TWCSTS):** When high, this bit indicates that the MTL Tx Queue Write Controller is active, and it is transferring the data to the Tx Queue. 0x0 (INACTIVE): MTL Tx Queue Write Controller status is not detected. 0x1 (ACTIVE): MTL Tx Queue Write Controller status is detected.
2:1	0h RO	**MTL Tx Queue Read Controller Status (TRCSTS):** This field indicates the state of the Tx Queue Read Controller: 0x0 (IDLE): Idle state. 0x1 (READ): Read state (transferring data to the MAC transmitter). 0x2 (WAIT): Waiting for pending Tx Status from the MAC transmitter. 0x3 (FLUSH): Flushing the Tx queue because of the Packet Abort request from the MAC.
0	0h RO	**Transmit Queue in Pause (TXQPAUSED):** When this bit is high and the Rx flow control is enabled, it indicates that the Tx Queue is in the Pause condition (in the full-duplex only mode) because of the following: - Reception of the PFC packet for the priorities assigned to the Tx Queue when PFC is enabled - Reception of 802.3x Pause packet when PFC is disabled 0x0 (INACTIVE): Transmit Queue in Pause status is not detected. 0x1 (ACTIVE): Transmit Queue in Pause status is detected.

10.2.395 MTL_TXQ2_ETS_CONTROL — Offset D90h

The Queue ETS Control register controls the enhanced transmission selection operation.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D90h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:4	0h RW	**Slot Count (SLC):** If the credit-based shaper algorithm is enabled, the software can program the number of slots (of duration programmed in DMA_CH(#i)_Slot_Interval register) over which the average transmitted bits per slot, provided in the MTL_TxQ(#i)_ETS_Status register, need to be computed for Queue. The encoding is as follows: 0x0 (M_1_SLOT): 1 slot. 0x1 (M_2_SLOT): 2 slots. 0x2 (M_4_SLOT): 4 slots. 0x3 (M_8_SLOT): 8 slots. 0x4 (M_16_SLOT): 16 slots. 0x5 (RSVD): Reserved.
3	0h RW	**Credit Control (CC):** When this bit is set, the accumulated credit parameter in the credit-based shaper algorithm logic is not reset to zero when there is positive credit and no packet to transmit in Channel 1. The credit accumulates even when there is no packet waiting in Channel 1 and another channel is transmitting. When this bit is reset, the accumulated credit parameter in the credit-based shaper algorithm logic is set to zero when there is positive credit and no packet to transmit in Channel 1. When there is no packet waiting in Channel 1 and other channel is transmitting, no credit is accumulated. 0x0 (DISABLE): Credit Control is disabled. 0x1 (ENABLE): Credit Control is enabled.
2	0h RW	**AV Algorithm (AVALG):** When Queue 1 is programmed for AV, this field configures the scheduling algorithm for this queue: This bit when set, indicates credit based shaper algorithm (CBS) is selected for Queue 1 traffic. When reset, strict priority is selected. 0x0 (DISABLE): CBS Algorithm is disabled. 0x1 (ENABLE): CBS Algorithm is enabled.
1:0	0h RO	**Reserved**

10.2.396 MTL_TXQ2_ETS_STATUS — Offset D94h

The Queue 2 ETS Status register provides the average traffic transmitted in Queue 2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D94h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RO	**Average Bits per Slot (ABS):** This field contains the average transmitted bits per slot. If AV operation is enabled, this field is computed over number of slots, programmed in the SLC field of MTL_TxQ(#i)_ETS_CONTROL register. The maximum value of this field is 0x6_4000 in 100 Mbps, 0x3E_8000 in 1000 Mbps and 9C_4000 in 2500 Mbps mode respectively. When the DCB operation is enabled for Queue, this field is computed over every 10 million bit times slot (4 ms in 2500 Mbps; 10 ms in 1000 Mbps; 100 ms in 100 Mbps). The maximum value is 0x989680.

10.2.397 MTL_TXQ2_QUANTUM_WEIGHT — Offset D98h

The Queue 2 idleSlopeCredit, Quantum or Weights register provides the average traffic transmitted in Queue 2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved**
20:0	000000h RW	**ISCQW:** idleSlopeCredit, Quantum or Weights - idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns for 100 Mbps; 8 ns for 1000 Mbps; 3.2 ns for 2500 Mbps) when the credit is increasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. Bits[20:14] must be written to zero. - Quantum When the DCB operation is enabled with DWRR algorithm for Queue 1 traffic, this field contains the quantum value in bytes to be added to credit during every queue scanning cycle. The maximum value is 0x1312D0 bytes. - Weights When DCB operation is enabled with WFQ algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x3FFF where weight of 0 indicates 100% bandwidth. Bits[20:14] must be written to zero. When DCB operation or generic queuing operation is enabled with WRR algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x64. Bits [20:7] must be written to zero. - Note 1: In multiple Queue configuration this field in respective per queue register must be programmed to some non-zero value when multiple queues are enabled or single queue other than Q0 is enabled. This field need not be programmed when only Q0 is enabled. In general, when WRR algorithm is selected a non-zero value must be programmed on both Receive and Transmit. In Receive, the register is MTL_Operation_Mode register. - Note 2: For WFQ algorithm, higher the programmed weights lesser the bandwidth allocated for that Transmit Queue. The finish time is not a function of particular packet alone but it is as per the formula: (previous_finish_time of particular Transmit Queue + (weights*packet_size)) - Note 3: The weights programmed do not correspond to the number of packets but the fraction of bandwidth or time allocated for particular queue w.r.t. total BW or time.

10.2.398 MTL_TXQ2_SENDSLOPECREDIT — Offset D9Ch

The sendSlopeCredit register contains the sendSlope credit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13:0	0000h RW	**sendSlopeCredit Value (SSC):** When AV operation is enabled, this field contains the sendSlopeCredit value required for credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns, 8 ns and 3.2 ns for 100 Mbps, 1000 Mbps and 2500 Mbps respectively) when the credit is decreasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. This field should be programmed with absolute sendSlopeCredit value. The credit-based shaper logic subtracts it from the accumulated credit when Channel 1 is selected for transmission.

10.2.399 MTL_TXQ2_HICREDIT — Offset DA0h

The hiCredit register contains the hiCredit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DA0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:0	00000000h RW	**hiCredit Value (HC):** When the AV feature is enabled, this field contains the hiCredit value required for the credit-based shaper algorithm. This is the maximum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1,024. The maximum value is maxInterferenceSize, that is, best-effort maximum packet size (16,384 bytes or 131,072 bits). The value to be specified is 131,072 * 1,024 = 134,217,728 or 0x0800_0000.

10.2.400 MTL_TXQ2_LOCREDIT — Offset DA4h

The loCredit register contains the loCredit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DA4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:0	00000000h RW	**loCredit Value (LC):** When AV operation is enabled, this field contains the loCredit value required for the credit-based shaper algorithm. This is the minimum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1,024. The maximum value to be programmed is corresponds to twice the maxFrameSize transmitted from this queue. If the maxFrameSize is 8192 bytes, then (8192*2) * 8 * 1024 = 134,217,728 or 0x0800_0000. Because it is a negative value, the programmed value is 2's complement of the value, that is, 0x1800_0000.

10.2.401 MTL_Q2_INTERRUPT_CONTROL_STATUS — Offset DACh

This register contains the interrupt enable and status bits for the queue 2 interrupts.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DACh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**Receive Queue Overflow Interrupt Enable (RXOIE):** When this bit is set, the Receive Queue Overflow interrupt is enabled. When this bit is reset, the Receive Queue Overflow interrupt is disabled. 0x0 (DISABLE): Receive Queue Overflow Interrupt is disabled. 0x1 (ENABLE): Receive Queue Overflow Interrupt is enabled.
23:17	0h RO	**Reserved**
16	0h RW	**Receive Queue Overflow Interrupt Status (RXOVFIS):** This bit indicates that the Receive Queue had an overflow while receiving the packet. If a partial packet is transferred to the application, the overflow status is set in RDES3[21]. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Queue Overflow Interrupt Status not detected. 0x1 (ACTIVE): Receive Queue Overflow Interrupt Status detected.
15:10	0h RO	**Reserved**
9	0h RW	**Average Bits Per Slot Interrupt Enable (ABPSIE):** When this bit is set, the MAC asserts the sbd_intr_o or mci_intr_o interrupt when the average bits per slot status is updated. When this bit is cleared, the interrupt is not asserted for such an event. 0x0 (DISABLE): Average Bits Per Slot Interrupt is disabled. 0x1 (ENABLE): Average Bits Per Slot Interrupt is enabled.
8	0h RW	**Transmit Queue Underflow Interrupt Enable (TXUIE):** When this bit is set, the Transmit Queue Underflow interrupt is enabled. When this bit is reset, the Transmit Queue Underflow interrupt is disabled. 0x0 (DISABLE): Transmit Queue Underflow Interrupt Status is disabled. 0x1 (ENABLE): Transmit Queue Underflow Interrupt Status is enabled.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	**Reserved**
1	0h RW	**Average Bits Per Slot Interrupt Status (ABPSIS):** When set, this bit indicates that the MAC has updated the ABS value. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Average Bits Per Slot Interrupt Status not detected. 0x1 (ACTIVE): Average Bits Per Slot Interrupt Status detected.
0	0h RW	**Transmit Queue Underflow Interrupt Status (TXUNFIS):** This bit indicates that the Transmit Queue had an underflow while transmitting the packet. Transmission is suspended and an Underflow Error TDES3[2] is set. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Queue Underflow Interrupt Status not detected. 0x1 (ACTIVE): Transmit Queue Underflow Interrupt Status detected.

10.2.402 MTL_RXQ2_OPERATION_MODE — Offset DB0h

The Queue 2 Receive Operation Mode register establishes the Receive queue operating modes and command.

The RFA and RFD fields are not backward compatible with the RFA and RFD fields of 4.00a release

Type	Size	Offset	Default
MMIO	32 bit	BAR + DB0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved**
26:20	00h RW	**Receive Queue Size (RQS):** This field indicates the size of the allocated Receive queues in blocks of 256 bytes. The RQS field is read-write only if the number of Rx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on, so user should be programming RQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (RQS+1)*256 bytes. When the number of Rx Queues is one, the field is read-only and the configured RX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Rx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
19:14	00h RW	**Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) (RFD):** These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1.5 KB, that is, FULL 1.5 KB - 2: Full minus 2 KB, that is, FULL 2 KB - 3: Full minus 2.5 KB, that is, FULL 2.5 KB - ... - 62: Full minus 32 KB, that is, FULL 32 KB - 63: Full minus 32.5 KB, that is, FULL 32.5 KB The de-assertion is effective only after flow control is asserted. Note: The value must be programmed in such a way to make sure that the threshold is a positive number. When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register. The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13:8	00h RW	**Threshold for Activating Flow Control (in half-duplex and full-duplex (RFA):** These bits control the threshold (fill-level of Rx queue) at which the flow control is activated: For more information on encoding for this field, see RFD.
7	0h RW	**Enable Hardware Flow Control (EHFC):** When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. 0x0 (DISABLE): Hardware Flow Control is disabled. 0x1 (ENABLE): Hardware Flow Control is enabled.
6	0h RW	**Disable Dropping of TCP/IP Checksum Error Packets (DIS_TCP_EF):** When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC. When this bit is reset, all error packets are dropped if the FEP bit is reset. 0x0 (ENABLE): Dropping of TCP/IP Checksum Error Packets is enabled. 0x1 (DISABLE): Dropping of TCP/IP Checksum Error Packets is disabled.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**Receive Queue Store and Forward (RSF):** When this bit is set, the GbE Controller reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register. 0x0 (DISABLE): Receive Queue Store and Forward is disabled. 0x1 (ENABLE): Receive Queue Store and Forward is enabled.
4	0h RW	**Forward Error Packets (FEP):** When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped. When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet might be forwarded to the application or DMA. 0x0 (DISABLE): Forward Error Packets is disabled. 0x1 (ENABLE): Forward Error Packets is enabled.
3	0h RW	**Forward Undersized Good Packets (FUP):** When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. 0x0 (DISABLE): Forward Undersized Good Packets is disabled. 0x1 (ENABLE): Forward Undersized Good Packets is enabled.
2	0h RO	**Reserved**
1:0	0h RW	**Receive Queue Threshold Control (RTC):** These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred. This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1. 0x0 (M_64BYTE): 64. 0x1 (M_32BYTE): 32. 0x2 (M_96BYTE): 96. 0x3 (M_128BYTE): 128.

10.2.403 MTL_RXQ2_MISSED_PACKET_OVERFLOW_CNT — Offset DB4h

The Queue 2 Missed Packet and Overflow Counter register contains the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DB4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27	0h RO	**Missed Packet Counter Overflow Bit (MISCNTOVF):** When set, this bit indicates that the Rx Queue Missed Packet Counter crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Missed Packet Counter overflow not detected. 0x1 (ACTIVE): Missed Packet Counter overflow detected.
26:16	000h RO	**Missed Packet Counter (MISPKTCNT):** This field indicates the number of packets missed by the GbE Controller because the application asserted ari_pkt_flush_i[] for this queue. This counter is reset when this register is read with mci_be_i[0] at 1b1. This counter is incremented by 1 when the DMA discards the packet because of buffer unavailability. Access restriction applies. Clears on read. Self-set to 1 on internal event.
15:12	0h RO	**Reserved**
11	0h RO	**Overflow Counter Overflow Bit (OVFCNTOVF):** When set, this bit indicates that the Rx Queue Overflow Packet Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Overflow Counter overflow not detected. 0x1 (ACTIVE): Overflow Counter overflow detected.
10:0	000h RO	**Overflow Packet Counter (OVFPKTCNT):** This field indicates the number of packets discarded by the GbE Controller because of Receive queue overflow. This counter is incremented each time the GbE Controller discards an incoming packet because of overflow. This counter is reset when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

10.2.404 MTL_RXQ2_DEBUG — Offset DB8h

The Queue 2 Receive Debug register gives the debug status of various blocks related to the Receive queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DB8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:16	0000h RO	**Number of Packets in Receive Queue (PRXQ):** This field indicates the current number of packets in the Rx Queue. The theoretical maximum value for this field is 256KB/16B = 16K Packets, that is, Max_Queue_Size/ Min_Packet_Size.
15:6	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
5:4	0h RO	**MTL Rx Queue Fill-Level Status (RXQSTS):** This field gives the status of the fill-level of the Rx Queue: 0x0 (EMPTY): Rx Queue empty. 0x1 (BLW_THR): Rx Queue fill-level below flow-control deactivate threshold. 0x2 (ABV_THR): Rx Queue fill-level above flow-control activate threshold. 0x3 (FULL): Rx Queue full.
3	0h RO	**Reserved**
2:1	0h RO	**MTL Rx Queue Read Controller State (RRCSTS):** This field gives the state of the Rx queue Read controller: 0x0 (IDLE): Idle state. 0x1 (READ_DATA): Reading packet data. 0x2 (READ_STS): Reading packet status (or timestamp). 0x3 (FLUSH): Flushing the packet data and status.
0	0h RO	**MTL Rx Queue Write Controller Active Status (RWCSTS):** When high, this bit indicates that the MTL Rx queue Write controller is active, and it is transferring a received packet to the Rx Queue. 0x0 (INACTIVE): MTL Rx Queue Write Controller Active Status not detected. 0x1 (ACTIVE): MTL Rx Queue Write Controller Active Status detected.

10.2.405 MTL_RXQ2_CONTROL — Offset DBCh

The Queue Receive Control register controls the receive arbitration and passing of received packets to the application.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DBCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**Receive Queue Packet Arbitration (RXQ_FRM_ARBIT):** When this bit is set, the GbE Controller drives the packet data to the ARI interface such that the entire packet data of currently-selected queue is transmitted before switching to other queue. When this bit is reset, the GbE Controller drives the packet data to the ARI interface such that the following amount of data of currently-selected queue is transmitted before switching to other queue: - PBL amount of data (indicated by ari_qN_pbl_i[]) or - Complete data of a packet The status and the timestamp are not a part of the PBL data. Therefore, the GbE Controller drives the complete status (including timestamp status) during first PBL request for the packet (in store-and-forward mode) or the last PBL request for the packet (in Threshold mode). 0x0 (DISABLE): Receive Queue Packet Arbitration is disabled. 0x1 (ENABLE): Receive Queue Packet Arbitration is enabled.
2:0	0h RW	**Receive Queue Weight (RXQ_WEGT):** This field indicates the weight assigned to the Rx Queue 0. This field needs to be programmed with one value less than the required weight, i.e. reset value of 0 indicates weight of 1, value of 1 indicates weight of 2, and so on. The weight is used as the number of continuous PBL or packets requests (depending on the RXQ_FRM_ARBIT) allocated to the queue in one arbitration cycle. Note: The change in value of RXQ_WEGT takes effect only after the completion of current service round or when there is change from RAA=SP to RAA=WSP algorithm. This approach is taken so that there is smooth transition. For the RXQ_WEGT value to take effect at the start, the MTL_RxQ(#i)_Control registers must be programmed before the MTL_Operation_Mode register.

10.2.406 MTL_TXQ3_OPERATION_MODE — Offset DC0h

The Queue 3 Transmit Operation Mode register establishes the Transmit queue operating modes and commands.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DC0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:16	00h RW	**Transmit Queue Size (TQS):** This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. The TQS field is read-write only if the number of Tx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on, so user should be programming TQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (TQS+1)*256 bytes. When the number of Tx Queues is one, the field is read-only and the configured TX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Tx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
15:7	0h RO	**Reserved**
6:4	0h RO	**Reserved**
3:2	0h RW	**Transmit Queue Enable (TXQEN):** This field is used to enable/disable the transmit queue 0. - 2'b00: Not enabled - 2'b01: Enable in AV mode - 2'b10: Enabled - 2'b11: Reserved Note: In multiple Tx queues configuration, all the queues are disabled by default. Enable the Tx queue by programming this field. 0x0 (DISABLE): Not enabled. 0x1 (EN_IF_AV): Enable in AV mode (Reserved in non-AV). 0x2 (ENABLE): Enabled. 0x3 (RSVD2): Reserved.
1	0h RW	**Transmit Store and Forward (TSF):** When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped. 0x0 (DISABLE): Transmit Store and Forward is disabled. 0x1 (ENABLE): Transmit Store and Forward is enabled. Note: This bit should always be set as we do not support cut through mode.
0	0h RW	**Flush Transmit Queue (FTQ):** When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the MTL_TxQ1_Operation_Mode register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission. Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (clk_tx_i) should be active. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Flush Transmit Queue is disabled. 0x1 (ENABLE): Flush Transmit Queue is enabled.

10.2.407 MTL_TXQ3_UNDERFLOW — Offset DC4h

The Queue 3 Underflow Counter register contains the counter for packets aborted because of Transmit queue underflow and packets missed because of Receive queue packet flush

Type	Size	Offset	Default
MMIO	32 bit	BAR + DC4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RO	**Overflow Bit for Underflow Packet Counter (UFCNTOVF):** This bit is set every time the Tx queue Underflow Packet Counter field overflows, that is, it has crossed the maximum count. In such a scenario, the overflow packet counter is reset to all-zeros and this bit indicates that the rollover happened. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Overflow not detected for Underflow Packet Counter. 0x1 (ACTIVE): Overflow detected for Underflow Packet Counter.
10:0	000h RO	**Underflow Packet Counter (UFFRMCNT):** This field indicates the number of packets aborted by the controller because of Tx Queue Underflow. This counter is incremented each time the MAC aborts outgoing packet because of underflow. The counter is cleared when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

10.2.408 MTL_TXQ3_DEBUG — Offset DC8h

The Queue 3 Transmit Debug register gives the debug status of various blocks related to the Transmit queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DC8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:20	0h RO	**Number of Status Words in Tx Status FIFO of Queue (STXSTSF):** This field indicates the current number of status in the Tx Status FIFO of this queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of status words in Tx Status FIFO.
19	0h RO	**Reserved**
18:16	0h RO	**Number of Packets in the Transmit Queue (PTXQ):** This field indicates the current number of packets in the Tx Queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of packets in the Transmit queue.

Bit Range	Default & Access	Field Name (ID): Description
15:6	0h RO	**Reserved**
5	0h RO	**MTL Tx Status FIFO Full Status (TXSTSFSTS):** When high, this bit indicates that the MTL Tx Status FIFO is full. Therefore, the MTL cannot accept any more packets for transmission. 0x0 (INACTIVE): MTL Tx Status FIFO Full status is not detected. 0x1 (ACTIVE): MTL Tx Status FIFO Full status is detected.
4	0h RO	**MTL Tx Queue Not Empty Status (TXQSTS):** When this bit is high, it indicates that the MTL Tx Queue is not empty and some data is left for transmission. 0x0 (INACTIVE): MTL Tx Queue Not Empty status is not detected. 0x1 (ACTIVE): MTL Tx Queue Not Empty status is detected.
3	0h RO	**MTL Tx Queue Write Controller Status (TWCSTS):** When high, this bit indicates that the MTL Tx Queue Write Controller is active, and it is transferring the data to the Tx Queue. 0x0 (INACTIVE): MTL Tx Queue Write Controller status is not detected. 0x1 (ACTIVE): MTL Tx Queue Write Controller status is detected.
2:1	0h RO	**MTL Tx Queue Read Controller Status (TRCSTS):** This field indicates the state of the Tx Queue Read Controller: 0x0 (IDLE): Idle state. 0x1 (READ): Read state (transferring data to the MAC transmitter). 0x2 (WAIT): Waiting for pending Tx Status from the MAC transmitter. 0x3 (FLUSH): Flushing the Tx queue because of the Packet Abort request from the MAC.
0	0h RO	**Transmit Queue in Pause (TXQPAUSED):** When this bit is high and the Rx flow control is enabled, it indicates that the Tx Queue is in the Pause condition (in the full-duplex only mode) because of the following: - Reception of the PFC packet for the priorities assigned to the Tx Queue when PFC is enabled - Reception of 802.3x Pause packet when PFC is disabled 0x0 (INACTIVE): Transmit Queue in Pause status is not detected. 0x1 (ACTIVE): Transmit Queue in Pause status is detected.

10.2.409 MTL_TXQ3_ETS_CONTROL — Offset DD0h

The Queue ETS Control register controls the enhanced transmission selection operation.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DD0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:4	0h RW	**Slot Count (SLC):** If the credit-based shaper algorithm is enabled, the software can program the number of slots (of duration programmed in DMA_CH(#i)_Slot_Interval register) over which the average transmitted bits per slot, provided in the MTL_TxQ(#i)_ETS_Status register, need to be computed for Queue. The encoding is as follows: 0x0 (M_1_SLOT): 1 slot. 0x1 (M_2_SLOT): 2 slots. 0x2 (M_4_SLOT): 4 slots. 0x3 (M_8_SLOT): 8 slots. 0x4 (M_16_SLOT): 16 slots. 0x5 (RSVD): Reserved.
3	0h RW	**Credit Control (CC):** When this bit is set, the accumulated credit parameter in the credit-based shaper algorithm logic is not reset to zero when there is positive credit and no packet to transmit in Channel 1. The credit accumulates even when there is no packet waiting in Channel 1 and another channel is transmitting. When this bit is reset, the accumulated credit parameter in the credit-based shaper algorithm logic is set to zero when there is positive credit and no packet to transmit in Channel 1. When there is no packet waiting in Channel 1 and other channel is transmitting, no credit is accumulated. 0x0 (DISABLE): Credit Control is disabled. 0x1 (ENABLE): Credit Control is enabled.
2	0h RW	**AV Algorithm (AVALG):** When Queue 1 is programmed for AV, this field configures the scheduling algorithm for this queue: This bit when set, indicates credit based shaper algorithm (CBS) is selected for Queue 1 traffic. When reset, strict priority is selected. 0x0 (DISABLE): CBS Algorithm is disabled. 0x1 (ENABLE): CBS Algorithm is enabled.
1:0	0h RO	**Reserved**

10.2.410 MTL_TXQ3_ETS_STATUS — Offset DD4h

The Queue 3 ETS Status register provides the average traffic transmitted in Queue 3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DD4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RO	**Average Bits per Slot (ABS):** This field contains the average transmitted bits per slot. If AV operation is enabled, this field is computed over number of slots, programmed in the SLC field of MTL_TxQ(#i)_ETS_CONTROL register. The maximum value of this field is 0x6_4000 in 100 Mbps, 0x3E_8000 in 1000 Mbps and 9C_4000 in 2500 Mbps mode respectively. When the DCB operation is enabled for Queue, this field is computed over every 10 million bit times slot (4 ms in 2500 Mbps; 10 ms in 1000 Mbps; 100 ms in 100 Mbps). The maximum value is 0x989680.

10.2.411 MTL_TXQ3_QUANTUM_WEIGHT — Offset DD8h

The Queue 3 idleSlopeCredit, Quantum or Weights register provides the average traffic transmitted in Queue 3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DD8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved**
20:0	000000h RW	**ISCQW:** idleSlopeCredit, Quantum or Weights - idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns for 100 Mbps; 8 ns for 1000 Mbps; 3.2 ns for 2500 Mbps) when the credit is increasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. Bits[20:14] must be written to zero. - Quantum When the DCB operation is enabled with DWRR algorithm for Queue 1 traffic, this field contains the quantum value in bytes to be added to credit during every queue scanning cycle. The maximum value is 0x1312D0 bytes. - Weights When DCB operation is enabled with WFQ algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x3FFF where weight of 0 indicates 100% bandwidth. Bits[20:14] must be written to zero. When DCB operation or generic queuing operation is enabled with WRR algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x64. Bits [20:7] must be written to zero. - Note 1: In multiple Queue configuration this field in respective per queue register must be programmed to some non-zero value when multiple queues are enabled or single queue other than Q0 is enabled. This field need not be programmed when only Q0 is enabled. In general, when WRR algorithm is selected a non-zero value must be programmed on both Receive and Transmit. In Receive, the register is MTL_Operation_Mode register. - Note 2: For WFQ algorithm, higher the programmed weights lesser the bandwidth allocated for that Transmit Queue. The finish time is not a function of particular packet alone but it is as per the formula: (previous_finish_time of particular Transmit Queue + (weights*packet_size)) - Note 3: The weights programmed do not correspond to the number of packets but the fraction of bandwidth or time allocated for particular queue w.r.t. total BW or time.

10.2.412 MTL_TXQ3_SENDSLOPECREDIT — Offset DDCh

The sendSlopeCredit register contains the sendSlope credit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DDCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13:0	0000h RW	**sendSlopeCredit Value (SSC):** When AV operation is enabled, this field contains the sendSlopeCredit value required for credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns, 8 ns and 3.2 ns for 100 Mbps, 1000 Mbps and 2500 Mbps respectively) when the credit is decreasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. This field should be programmed with absolute sendSlopeCredit value. The credit-based shaper logic subtracts it from the accumulated credit when Channel 1 is selected for transmission.

10.2.413 MTL_TXQ3_HICREDIT — Offset DE0h

The hiCredit register contains the hiCredit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DE0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:0	00000000h RW	**hiCredit Value (HC):** When the AV feature is enabled, this field contains the hiCredit value required for the credit-based shaper algorithm. This is the maximum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1,024. The maximum value is maxInterferenceSize, that is, best-effort maximum packet size (16,384 bytes or 131,072 bits). The value to be specified is 131,072 * 1,024 = 134,217,728 or 0x0800_0000.

10.2.414 MTL_TXQ3_LOCREDIT — Offset DE4h

The loCredit register contains the loCredit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DE4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:0	00000000h RW	**loCredit Value (LC):** When AV operation is enabled, this field contains the loCredit value required for the credit-based shaper algorithm. This is the minimum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1,024. The maximum value to be programmed is corresponds to twice the maxFrameSize transmitted from this queue. If the maxFrameSize is 8192 bytes, then (8192*2) * 8 * 1024 = 134,217,728 or 0x0800_0000. Because it is a negative value, the programmed value is 2's complement of the value, that is, 0x1800_0000.

10.2.415 MTL_Q3_INTERRUPT_CONTROL_STATUS — Offset DECh

This register contains the interrupt enable and status bits for the queue 3 interrupts.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DECh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**Receive Queue Overflow Interrupt Enable (RXOIE):** When this bit is set, the Receive Queue Overflow interrupt is enabled. When this bit is reset, the Receive Queue Overflow interrupt is disabled. 0x0 (DISABLE): Receive Queue Overflow Interrupt is disabled. 0x1 (ENABLE): Receive Queue Overflow Interrupt is enabled.
23:17	0h RO	**Reserved**
16	0h RW	**Receive Queue Overflow Interrupt Status (RXOVFIS):** This bit indicates that the Receive Queue had an overflow while receiving the packet. If a partial packet is transferred to the application, the overflow status is set in RDES3[21]. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Queue Overflow Interrupt Status not detected. 0x1 (ACTIVE): Receive Queue Overflow Interrupt Status detected.
15:10	0h RO	**Reserved**
9	0h RW	**Average Bits Per Slot Interrupt Enable (ABPSIE):** When this bit is set, the MAC asserts the sbd_intr_o or mci_intr_o interrupt when the average bits per slot status is updated. When this bit is cleared, the interrupt is not asserted for such an event. 0x0 (DISABLE): Average Bits Per Slot Interrupt is disabled. 0x1 (ENABLE): Average Bits Per Slot Interrupt is enabled.
8	0h RW	**Transmit Queue Underflow Interrupt Enable (TXUIE):** When this bit is set, the Transmit Queue Underflow interrupt is enabled. When this bit is reset, the Transmit Queue Underflow interrupt is disabled. 0x0 (DISABLE): Transmit Queue Underflow Interrupt Status is disabled. 0x1 (ENABLE): Transmit Queue Underflow Interrupt Status is enabled.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	**Reserved**
1	0h RW	**Average Bits Per Slot Interrupt Status (ABPSIS):** When set, this bit indicates that the MAC has updated the ABS value. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Average Bits Per Slot Interrupt Status not detected. 0x1 (ACTIVE): Average Bits Per Slot Interrupt Status detected.
0	0h RW	**Transmit Queue Underflow Interrupt Status (TXUNFIS):** This bit indicates that the Transmit Queue had an underflow while transmitting the packet. Transmission is suspended and an Underflow Error TDES3[2] is set. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Queue Underflow Interrupt Status not detected. 0x1 (ACTIVE): Transmit Queue Underflow Interrupt Status detected.

10.2.416 MTL_RXQ3_OPERATION_MODE — Offset DF0h

The Queue 3 Receive Operation Mode register establishes the Receive queue operating modes and command.

The RFA and RFD fields are not backward compatible with the RFA and RFD fields of 4.00a release

Type	Size	Offset	Default
MMIO	32 bit	BAR + DF0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved**
26:20	00h RW	**Receive Queue Size (RQS):** This field indicates the size of the allocated Receive queues in blocks of 256 bytes. The RQS field is read-write only if the number of Rx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on, so user should be programming RQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (RQS+1)*256 bytes. When the number of Rx Queues is one, the field is read-only and the configured RX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Rx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
19:14	00h RW	**Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) (RFD):** These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1.5 KB, that is, FULL 1.5 KB - 2: Full minus 2 KB, that is, FULL 2 KB - 3: Full minus 2.5 KB, that is, FULL 2.5 KB - ... - 62: Full minus 32 KB, that is, FULL 32 KB - 63: Full minus 32.5 KB, that is, FULL 32.5 KB The de-assertion is effective only after flow control is asserted. Note: The value must be programmed in such a way to make sure that the threshold is a positive number. When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register. The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13:8	00h RW	**Threshold for Activating Flow Control (in half-duplex and full-duplex (RFA):** These bits control the threshold (fill-level of Rx queue) at which the flow control is activated: For more information on encoding for this field, see RFD.
7	0h RW	**Enable Hardware Flow Control (EHFC):** When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. 0x0 (DISABLE): Hardware Flow Control is disabled. 0x1 (ENABLE): Hardware Flow Control is enabled.
6	0h RW	**Disable Dropping of TCP/IP Checksum Error Packets (DIS_TCP_EF):** When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC. When this bit is reset, all error packets are dropped if the FEP bit is reset. 0x0 (ENABLE): Dropping of TCP/IP Checksum Error Packets is enabled. 0x1 (DISABLE): Dropping of TCP/IP Checksum Error Packets is disabled.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**Receive Queue Store and Forward (RSF):** When this bit is set, the GbE Controller reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register. 0x0 (DISABLE): Receive Queue Store and Forward is disabled. 0x1 (ENABLE): Receive Queue Store and Forward is enabled.
4	0h RW	**Forward Error Packets (FEP):** When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped. When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet might be forwarded to the application or DMA. 0x0 (DISABLE): Forward Error Packets is disabled. 0x1 (ENABLE): Forward Error Packets is enabled.
3	0h RW	**Forward Undersized Good Packets (FUP):** When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. 0x0 (DISABLE): Forward Undersized Good Packets is disabled. 0x1 (ENABLE): Forward Undersized Good Packets is enabled.
2	0h RO	**Reserved**
1:0	0h RW	**Receive Queue Threshold Control (RTC):** These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred. This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1. 0x0 (M_64BYTE): 64. 0x1 (M_32BYTE): 32. 0x2 (M_96BYTE): 96. 0x3 (M_128BYTE): 128.

10.2.417 MTL_RXQ3_MISSED_PACKET_OVERFLOW_CNT — Offset DF4h

The Queue 3 Missed Packet and Overflow Counter register contains the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DF4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27	0h RO	**Missed Packet Counter Overflow Bit (MISCNTOVF):** When set, this bit indicates that the Rx Queue Missed Packet Counter crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Missed Packet Counter overflow not detected. 0x1 (ACTIVE): Missed Packet Counter overflow detected.
26:16	000h RO	**Missed Packet Counter (MISPKTCNT):** This field indicates the number of packets missed by the GbE Controller because the application asserted ari_pkt_flush_i[] for this queue. This counter is reset when this register is read with mci_be_i[0] at 1b1. This counter is incremented by 1 when the DMA discards the packet because of buffer unavailability. Access restriction applies. Clears on read. Self-set to 1 on internal event.
15:12	0h RO	**Reserved**
11	0h RO	**Overflow Counter Overflow Bit (OVFCNTOVF):** When set, this bit indicates that the Rx Queue Overflow Packet Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Overflow Counter overflow not detected. 0x1 (ACTIVE): Overflow Counter overflow detected.
10:0	000h RO	**Overflow Packet Counter (OVFPKTCNT):** This field indicates the number of packets discarded by the GbE Controller because of Receive queue overflow. This counter is incremented each time the GbE Controller discards an incoming packet because of overflow. This counter is reset when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

10.2.418 MTL_RXQ3_DEBUG — Offset DF8h

The Queue 3 Receive Debug register gives the debug status of various blocks related to the Receive queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DF8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:16	0000h RO	**Number of Packets in Receive Queue (PRXQ):** This field indicates the current number of packets in the Rx Queue. The theoretical maximum value for this field is 256KB/16B = 16K Packets, that is, Max_Queue_Size/ Min_Packet_Size.
15:6	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
5:4	0h RO	**MTL Rx Queue Fill-Level Status (RXQSTS):** This field gives the status of the fill-level of the Rx Queue: 0x0 (EMPTY): Rx Queue empty. 0x1 (BLW_THR): Rx Queue fill-level below flow-control deactivate threshold. 0x2 (ABV_THR): Rx Queue fill-level above flow-control activate threshold. 0x3 (FULL): Rx Queue full.
3	0h RO	**Reserved**
2:1	0h RO	**MTL Rx Queue Read Controller State (RRCSTS):** This field gives the state of the Rx queue Read controller: 0x0 (IDLE): Idle state. 0x1 (READ_DATA): Reading packet data. 0x2 (READ_STS): Reading packet status (or timestamp). 0x3 (FLUSH): Flushing the packet data and status.
0	0h RO	**MTL Rx Queue Write Controller Active Status (RWCSTS):** When high, this bit indicates that the MTL Rx queue Write controller is active, and it is transferring a received packet to the Rx Queue. 0x0 (INACTIVE): MTL Rx Queue Write Controller Active Status not detected. 0x1 (ACTIVE): MTL Rx Queue Write Controller Active Status detected.

10.2.419 MTL_RXQ3_CONTROL — Offset DFCh

The Queue Receive Control register controls the receive arbitration and passing of received packets to the application.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DFCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**Receive Queue Packet Arbitration (RXQ_FRM_ARBIT):** When this bit is set, the GbE Controller drives the packet data to the ARI interface such that the entire packet data of currently-selected queue is transmitted before switching to other queue. When this bit is reset, the GbE Controller drives the packet data to the ARI interface such that the following amount of data of currently-selected queue is transmitted before switching to other queue: - PBL amount of data (indicated by ari_qN_pbl_i[]) or - Complete data of a packet The status and the timestamp are not a part of the PBL data. Therefore, the GbE Controller drives the complete status (including timestamp status) during first PBL request for the packet (in store-and-forward mode) or the last PBL request for the packet (in Threshold mode). 0x0 (DISABLE): Receive Queue Packet Arbitration is disabled. 0x1 (ENABLE): Receive Queue Packet Arbitration is enabled.
2:0	0h RW	**Receive Queue Weight (RXQ_WEGT):** This field indicates the weight assigned to the Rx Queue 0. This field needs to be programmed with one value less than the required weight, i.e. reset value of 0 indicates weight of 1, value of 1 indicates weight of 2, and so on. The weight is used as the number of continuous PBL or packets requests (depending on the RXQ_FRM_ARBIT) allocated to the queue in one arbitration cycle. Note: The change in value of RXQ_WEGT takes effect only after the completion of current service round or when there is change from RAA=SP to RAA=WSP algorithm. This approach is taken so that there is smooth transition. For the RXQ_WEGT value to take effect at the start, the MTL_RxQ(#i)_Control registers must be programmed before the MTL_Operation_Mode register.

10.2.420 MTL_TXQ4_OPERATION_MODE — Offset E00h

The Queue 4 Transmit Operation Mode register establishes the Transmit queue operating modes and commands.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E00h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:16	00h RW	**Transmit Queue Size (TQS):** This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. The TQS field is read-write only if the number of Tx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on, so user should be programming TQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (TQS+1)*256 bytes. When the number of Tx Queues is one, the field is read-only and the configured TX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Tx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
15:7	0h RO	**Reserved**
6:4	0h RO	**Reserved**
3:2	0h RW	**Transmit Queue Enable (TXQEN):** This field is used to enable/disable the transmit queue 0. - 2'b00: Not enabled - 2'b01: Enable in AV mode - 2'b10: Enabled - 2'b11: Reserved Note: In multiple Tx queues configuration, all the queues are disabled by default. Enable the Tx queue by programming this field. 0x0 (DISABLE): Not enabled. 0x1 (EN_IF_AV): Enable in AV mode (Reserved in non-AV). 0x2 (ENABLE): Enabled. 0x3 (RSVD2): Reserved.
1	0h RW	**Transmit Store and Forward (TSF):** When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped. 0x0 (DISABLE): Transmit Store and Forward is disabled. 0x1 (ENABLE): Transmit Store and Forward is enabled. Note: This bit should always be set as we do not support cut through mode.
0	0h RW	**Flush Transmit Queue (FTQ):** When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the MTL_TxQ1_Operation_Mode register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission. Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (clk_tx_i) should be active. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Flush Transmit Queue is disabled. 0x1 (ENABLE): Flush Transmit Queue is enabled.

10.2.421 MTL_TXQ4_UNDERFLOW — Offset E04h

The Queue 4 Underflow Counter register contains the counter for packets aborted because of Transmit queue underflow and packets missed because of Receive queue packet flush

Type	Size	Offset	Default
MMIO	32 bit	BAR + E04h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RO	**Overflow Bit for Underflow Packet Counter (UFCNTOVF):** This bit is set every time the Tx queue Underflow Packet Counter field overflows, that is, it has crossed the maximum count. In such a scenario, the overflow packet counter is reset to all-zeros and this bit indicates that the rollover happened. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Overflow not detected for Underflow Packet Counter. 0x1 (ACTIVE): Overflow detected for Underflow Packet Counter.
10:0	000h RO	**Underflow Packet Counter (UFFRMCNT):** This field indicates the number of packets aborted by the controller because of Tx Queue Underflow. This counter is incremented each time the MAC aborts outgoing packet because of underflow. The counter is cleared when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

10.2.422 MTL_TXQ4_DEBUG — Offset E08h

The Queue 4 Transmit Debug register gives the debug status of various blocks related to the Transmit queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E08h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:20	0h RO	**Number of Status Words in Tx Status FIFO of Queue (STXSTSF):** This field indicates the current number of status in the Tx Status FIFO of this queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of status words in Tx Status FIFO.
19	0h RO	**Reserved**
18:16	0h RO	**Number of Packets in the Transmit Queue (PTXQ):** This field indicates the current number of packets in the Tx Queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of packets in the Transmit queue.

Bit Range	Default & Access	Field Name (ID): Description
15:6	0h RO	**Reserved**
5	0h RO	**MTL Tx Status FIFO Full Status (TXSTSFSTS):** When high, this bit indicates that the MTL Tx Status FIFO is full. Therefore, the MTL cannot accept any more packets for transmission. 0x0 (INACTIVE): MTL Tx Status FIFO Full status is not detected. 0x1 (ACTIVE): MTL Tx Status FIFO Full status is detected.
4	0h RO	**MTL Tx Queue Not Empty Status (TXQSTS):** When this bit is high, it indicates that the MTL Tx Queue is not empty and some data is left for transmission. 0x0 (INACTIVE): MTL Tx Queue Not Empty status is not detected. 0x1 (ACTIVE): MTL Tx Queue Not Empty status is detected.
3	0h RO	**MTL Tx Queue Write Controller Status (TWCSTS):** When high, this bit indicates that the MTL Tx Queue Write Controller is active, and it is transferring the data to the Tx Queue. 0x0 (INACTIVE): MTL Tx Queue Write Controller status is not detected. 0x1 (ACTIVE): MTL Tx Queue Write Controller status is detected.
2:1	0h RO	**MTL Tx Queue Read Controller Status (TRCSTS):** This field indicates the state of the Tx Queue Read Controller: 0x0 (IDLE): Idle state. 0x1 (READ): Read state (transferring data to the MAC transmitter). 0x2 (WAIT): Waiting for pending Tx Status from the MAC transmitter. 0x3 (FLUSH): Flushing the Tx queue because of the Packet Abort request from the MAC.
0	0h RO	**Transmit Queue in Pause (TXQPAUSED):** When this bit is high and the Rx flow control is enabled, it indicates that the Tx Queue is in the Pause condition (in the full-duplex only mode) because of the following: - Reception of the PFC packet for the priorities assigned to the Tx Queue when PFC is enabled - Reception of 802.3x Pause packet when PFC is disabled 0x0 (INACTIVE): Transmit Queue in Pause status is not detected. 0x1 (ACTIVE): Transmit Queue in Pause status is detected.

10.2.423 MTL_TXQ4_ETS_CONTROL — Offset E10h

The Queue ETS Control register controls the enhanced transmission selection operation.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:4	0h RW	**Slot Count (SLC):** If the credit-based shaper algorithm is enabled, the software can program the number of slots (of duration programmed in DMA_CH(#i)_Slot_Interval register) over which the average transmitted bits per slot, provided in the MTL_TxQ(#i)_ETS_Status register, need to be computed for Queue. The encoding is as follows: 0x0 (M_1_SLOT): 1 slot. 0x1 (M_2_SLOT): 2 slots. 0x2 (M_4_SLOT): 4 slots. 0x3 (M_8_SLOT): 8 slots. 0x4 (M_16_SLOT): 16 slots. 0x5 (RSVD): Reserved.
3	0h RW	**Credit Control (CC):** When this bit is set, the accumulated credit parameter in the credit-based shaper algorithm logic is not reset to zero when there is positive credit and no packet to transmit in Channel 1. The credit accumulates even when there is no packet waiting in Channel 1 and another channel is transmitting. When this bit is reset, the accumulated credit parameter in the credit-based shaper algorithm logic is set to zero when there is positive credit and no packet to transmit in Channel 1. When there is no packet waiting in Channel 1 and other channel is transmitting, no credit is accumulated. 0x0 (DISABLE): Credit Control is disabled. 0x1 (ENABLE): Credit Control is enabled.
2	0h RW	**AV Algorithm (AVALG):** When Queue 1 is programmed for AV, this field configures the scheduling algorithm for this queue: This bit when set, indicates credit based shaper algorithm (CBS) is selected for Queue 1 traffic. When reset, strict priority is selected. 0x0 (DISABLE): CBS Algorithm is disabled. 0x1 (ENABLE): CBS Algorithm is enabled.
1:0	0h RO	**Reserved**

10.2.424 MTL_TXQ4_ETS_STATUS — Offset E14h

The Queue 4 ETS Status register provides the average traffic transmitted in Queue 4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RO	**Average Bits per Slot (ABS):** This field contains the average transmitted bits per slot. If AV operation is enabled, this field is computed over number of slots, programmed in the SLC field of MTL_TxQ(#i)_ETS_CONTROL register. The maximum value of this field is 0x6_4000 in 100 Mbps, 0x3E_8000 in 1000 Mbps and 9C_4000 in 2500 Mbps mode respectively. When the DCB operation is enabled for Queue, this field is computed over every 10 million bit times slot (4 ms in 2500 Mbps; 10 ms in 1000 Mbps; 100 ms in 100 Mbps). The maximum value is 0x989680.

10.2.425 MTL_TXQ4_QUANTUM_WEIGHT — Offset E18h

The Queue 4 idleSlopeCredit, Quantum or Weights register provides the average traffic transmitted in Queue 4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved**
20:0	000000h RW	**ISCQW:** idleSlopeCredit, Quantum or Weights - idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns for 100 Mbps; 8 ns for 1000 Mbps; 3.2 ns for 2500 Mbps) when the credit is increasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. Bits[20:14] must be written to zero. - Quantum When the DCB operation is enabled with DWRR algorithm for Queue 1 traffic, this field contains the quantum value in bytes to be added to credit during every queue scanning cycle. The maximum value is 0x1312D0 bytes. - Weights When DCB operation is enabled with WFQ algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x3FFF where weight of 0 indicates 100% bandwidth. Bits[20:14] must be written to zero. When DCB operation or generic queuing operation is enabled with WRR algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x64. Bits [20:7] must be written to zero. - Note 1: In multiple Queue configuration this field in respective per queue register must be programmed to some non-zero value when multiple queues are enabled or single queue other than Q0 is enabled. This field need not be programmed when only Q0 is enabled. In general, when WRR algorithm is selected a non-zero value must be programmed on both Receive and Transmit. In Receive, the register is MTL_Operation_Mode register. - Note 2: For WFQ algorithm, higher the programmed weights lesser the bandwidth allocated for that Transmit Queue. The finish time is not a function of particular packet alone but it is as per the formula: (previous_finish_time of particular Transmit Queue + (weights*packet_size)) - Note 3: The weights programmed do not correspond to the number of packets but the fraction of bandwidth or time allocated for particular queue w.r.t. total BW or time.

10.2.426 MTL_TXQ4_SENDSLOPECREDIT — Offset E1Ch

The sendSlopeCredit register contains the sendSlope credit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13:0	0000h RW	**sendSlopeCredit Value (SSC):** When AV operation is enabled, this field contains the sendSlopeCredit value required for credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns, 8 ns and 3.2 ns for 100 Mbps, 1000 Mbps and 2500 Mbps respectively) when the credit is decreasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. This field should be programmed with absolute sendSlopeCredit value. The credit-based shaper logic subtracts it from the accumulated credit when Channel 1 is selected for transmission.

10.2.427 MTL_TXQ4_HICREDIT — Offset E20h

The hiCredit register contains the hiCredit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E20h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:0	00000000h RW	**hiCredit Value (HC):** When the AV feature is enabled, this field contains the hiCredit value required for the credit-based shaper algorithm. This is the maximum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1,024. The maximum value is maxInterferenceSize, that is, best-effort maximum packet size (16,384 bytes or 131,072 bits). The value to be specified is 131,072 * 1,024 = 134,217,728 or 0x0800_0000.

10.2.428 MTL_TXQ4_LOCREDIT — Offset E24h

The loCredit register contains the loCredit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E24h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:0	00000000h RW	**loCredit Value (LC):** When AV operation is enabled, this field contains the loCredit value required for the credit-based shaper algorithm. This is the minimum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1,024. The maximum value to be programmed is corresponds to twice the maxFrameSize transmitted from this queue. If the maxFrameSize is 8192 bytes, then (8192*2) * 8 * 1024 = 134,217,728 or 0x0800_0000. Because it is a negative value, the programmed value is 2's complement of the value, that is, 0x1800_0000.

10.2.429 MTL_Q4_INTERRUPT_CONTROL_STATUS — Offset E2Ch

This register contains the interrupt enable and status bits for the queue 4 interrupts.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**Receive Queue Overflow Interrupt Enable (RXOIE):** When this bit is set, the Receive Queue Overflow interrupt is enabled. When this bit is reset, the Receive Queue Overflow interrupt is disabled. 0x0 (DISABLE): Receive Queue Overflow Interrupt is disabled. 0x1 (ENABLE): Receive Queue Overflow Interrupt is enabled.
23:17	0h RO	**Reserved**
16	0h RW	**Receive Queue Overflow Interrupt Status (RXOVFIS):** This bit indicates that the Receive Queue had an overflow while receiving the packet. If a partial packet is transferred to the application, the overflow status is set in RDES3[21]. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Queue Overflow Interrupt Status not detected. 0x1 (ACTIVE): Receive Queue Overflow Interrupt Status detected.
15:10	0h RO	**Reserved**
9	0h RW	**Average Bits Per Slot Interrupt Enable (ABPSIE):** When this bit is set, the MAC asserts the sbd_intr_o or mci_intr_o interrupt when the average bits per slot status is updated. When this bit is cleared, the interrupt is not asserted for such an event. 0x0 (DISABLE): Average Bits Per Slot Interrupt is disabled. 0x1 (ENABLE): Average Bits Per Slot Interrupt is enabled.
8	0h RW	**Transmit Queue Underflow Interrupt Enable (TXUIE):** When this bit is set, the Transmit Queue Underflow interrupt is enabled. When this bit is reset, the Transmit Queue Underflow interrupt is disabled. 0x0 (DISABLE): Transmit Queue Underflow Interrupt Status is disabled. 0x1 (ENABLE): Transmit Queue Underflow Interrupt Status is enabled.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	**Reserved**
1	0h RW	**Average Bits Per Slot Interrupt Status (ABPSIS):** When set, this bit indicates that the MAC has updated the ABS value. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Average Bits Per Slot Interrupt Status not detected. 0x1 (ACTIVE): Average Bits Per Slot Interrupt Status detected.
0	0h RW	**Transmit Queue Underflow Interrupt Status (TXUNFIS):** This bit indicates that the Transmit Queue had an underflow while transmitting the packet. Transmission is suspended and an Underflow Error TDES3[2] is set. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Queue Underflow Interrupt Status not detected. 0x1 (ACTIVE): Transmit Queue Underflow Interrupt Status detected.

10.2.430 MTL_RXQ4_OPERATION_MODE — Offset E30h

The Queue 4 Receive Operation Mode register establishes the Receive queue operating modes and command.

The RFA and RFD fields are not backward compatible with the RFA and RFD fields of 4.00a release

Type	Size	Offset	Default
MMIO	32 bit	BAR + E30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved**
26:20	00h RW	**Receive Queue Size (RQS):** This field indicates the size of the allocated Receive queues in blocks of 256 bytes. The RQS field is read-write only if the number of Rx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on, so user should be programming RQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (RQS+1)*256 bytes. When the number of Rx Queues is one, the field is read-only and the configured RX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Rx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
19:14	00h RW	**Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) (RFD):** These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1.5 KB, that is, FULL 1.5 KB - 2: Full minus 2 KB, that is, FULL 2 KB - 3: Full minus 2.5 KB, that is, FULL 2.5 KB - ... - 62: Full minus 32 KB, that is, FULL 32 KB - 63: Full minus 32.5 KB, that is, FULL 32.5 KB The de-assertion is effective only after flow control is asserted. Note: The value must be programmed in such a way to make sure that the threshold is a positive number. When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register. The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13:8	00h RW	**Threshold for Activating Flow Control (in half-duplex and full-duplex (RFA):** These bits control the threshold (fill-level of Rx queue) at which the flow control is activated: For more information on encoding for this field, see RFD.
7	0h RW	**Enable Hardware Flow Control (EHFC):** When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. 0x0 (DISABLE): Hardware Flow Control is disabled. 0x1 (ENABLE): Hardware Flow Control is enabled.
6	0h RW	**Disable Dropping of TCP/IP Checksum Error Packets (DIS_TCP_EF):** When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC. When this bit is reset, all error packets are dropped if the FEP bit is reset. 0x0 (ENABLE): Dropping of TCP/IP Checksum Error Packets is enabled. 0x1 (DISABLE): Dropping of TCP/IP Checksum Error Packets is disabled.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**Receive Queue Store and Forward (RSF):** When this bit is set, the GbE Controller reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register. 0x0 (DISABLE): Receive Queue Store and Forward is disabled. 0x1 (ENABLE): Receive Queue Store and Forward is enabled.
4	0h RW	**Forward Error Packets (FEP):** When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped. When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet might be forwarded to the application or DMA. 0x0 (DISABLE): Forward Error Packets is disabled. 0x1 (ENABLE): Forward Error Packets is enabled.
3	0h RW	**Forward Undersized Good Packets (FUP):** When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. 0x0 (DISABLE): Forward Undersized Good Packets is disabled. 0x1 (ENABLE): Forward Undersized Good Packets is enabled.
2	0h RO	**Reserved**
1:0	0h RW	**Receive Queue Threshold Control (RTC):** These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred. This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1. 0x0 (M_64BYTE): 64. 0x1 (M_32BYTE): 32. 0x2 (M_96BYTE): 96. 0x3 (M_128BYTE): 128.

10.2.431 MTL_RXQ4_MISSED_PACKET_OVERFLOW_CNT — Offset E34h

The Queue 4 Missed Packet and Overflow Counter register contains the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E34h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27	0h RO	**Missed Packet Counter Overflow Bit (MISCNTOVF):** When set, this bit indicates that the Rx Queue Missed Packet Counter crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Missed Packet Counter overflow not detected. 0x1 (ACTIVE): Missed Packet Counter overflow detected.
26:16	000h RO	**Missed Packet Counter (MISPKTCNT):** This field indicates the number of packets missed by the GbE Controller because the application asserted ari_pkt_flush_i[] for this queue. This counter is reset when this register is read with mci_be_i[0] at 1b1. This counter is incremented by 1 when the DMA discards the packet because of buffer unavailability. Access restriction applies. Clears on read. Self-set to 1 on internal event.
15:12	0h RO	**Reserved**
11	0h RO	**Overflow Counter Overflow Bit (OVFCNTOVF):** When set, this bit indicates that the Rx Queue Overflow Packet Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Overflow Counter overflow not detected. 0x1 (ACTIVE): Overflow Counter overflow detected.
10:0	000h RO	**Overflow Packet Counter (OVFPKTCNT):** This field indicates the number of packets discarded by the GbE Controller because of Receive queue overflow. This counter is incremented each time the GbE Controller discards an incoming packet because of overflow. This counter is reset when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

10.2.432 MTL_RXQ4_DEBUG — Offset E38h

The Queue 4 Receive Debug register gives the debug status of various blocks related to the Receive queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E38h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:16	0000h RO	**Number of Packets in Receive Queue (PRXQ):** This field indicates the current number of packets in the Rx Queue. The theoretical maximum value for this field is 256KB/16B = 16K Packets, that is, Max_Queue_Size/ Min_Packet_Size.
15:6	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
5:4	0h RO	**MTL Rx Queue Fill-Level Status (RXQSTS):** This field gives the status of the fill-level of the Rx Queue: 0x0 (EMPTY): Rx Queue empty. 0x1 (BLW_THR): Rx Queue fill-level below flow-control deactivate threshold. 0x2 (ABV_THR): Rx Queue fill-level above flow-control activate threshold. 0x3 (FULL): Rx Queue full.
3	0h RO	**Reserved**
2:1	0h RO	**MTL Rx Queue Read Controller State (RRCSTS):** This field gives the state of the Rx queue Read controller: 0x0 (IDLE): Idle state. 0x1 (READ_DATA): Reading packet data. 0x2 (READ_STS): Reading packet status (or timestamp). 0x3 (FLUSH): Flushing the packet data and status.
0	0h RO	**MTL Rx Queue Write Controller Active Status (RWCSTS):** When high, this bit indicates that the MTL Rx queue Write controller is active, and it is transferring a received packet to the Rx Queue. 0x0 (INACTIVE): MTL Rx Queue Write Controller Active Status not detected. 0x1 (ACTIVE): MTL Rx Queue Write Controller Active Status detected.

10.2.433 MTL_RXQ4_CONTROL — Offset E3Ch

The Queue Receive Control register controls the receive arbitration and passing of received packets to the application.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E3Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**Receive Queue Packet Arbitration (RXQ_FRM_ARBIT):** When this bit is set, the GbE Controller drives the packet data to the ARI interface such that the entire packet data of currently-selected queue is transmitted before switching to other queue. When this bit is reset, the GbE Controller drives the packet data to the ARI interface such that the following amount of data of currently-selected queue is transmitted before switching to other queue: - PBL amount of data (indicated by ari_qN_pbl_i[]) or - Complete data of a packet The status and the timestamp are not a part of the PBL data. Therefore, the GbE Controller drives the complete status (including timestamp status) during first PBL request for the packet (in store-and-forward mode) or the last PBL request for the packet (in Threshold mode). 0x0 (DISABLE): Receive Queue Packet Arbitration is disabled. 0x1 (ENABLE): Receive Queue Packet Arbitration is enabled.
2:0	0h RW	**Receive Queue Weight (RXQ_WEGT):** This field indicates the weight assigned to the Rx Queue 0. This field needs to be programmed with one value less than the required weight, i.e. reset value of 0 indicates weight of 1, value of 1 indicates weight of 2, and so on. The weight is used as the number of continuous PBL or packets requests (depending on the RXQ_FRM_ARBIT) allocated to the queue in one arbitration cycle. Note: The change in value of RXQ_WEGT takes effect only after the completion of current service round or when there is change from RAA=SP to RAA=WSP algorithm. This approach is taken so that there is smooth transition. For the RXQ_WEGT value to take effect at the start, the MTL_RxQ(#i)_Control registers must be programmed before the MTL_Operation_Mode register.

10.2.434 MTL_TXQ5_OPERATION_MODE — Offset E40h

The Queue 5 Transmit Operation Mode register establishes the Transmit queue operating modes and commands.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E40h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:16	00h RW	**Transmit Queue Size (TQS):** This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. The TQS field is read-write only if the number of Tx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on, so user should be programming TQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (TQS+1)*256 bytes. When the number of Tx Queues is one, the field is read-only and the configured TX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Tx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
15:7	0h RO	**Reserved**
6:4	0h RO	**Reserved**
3:2	0h RW	**Transmit Queue Enable (TXQEN):** This field is used to enable/disable the transmit queue 0. - 2'b00: Not enabled - 2'b01: Enable in AV mode - 2'b10: Enabled - 2'b11: Reserved Note: In multiple Tx queues configuration, all the queues are disabled by default. Enable the Tx queue by programming this field. 0x0 (DISABLE): Not enabled. 0x1 (EN_IF_AV): Enable in AV mode (Reserved in non-AV). 0x2 (ENABLE): Enabled. 0x3 (RSVD2): Reserved.
1	0h RW	**Transmit Store and Forward (TSF):** When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped. 0x0 (DISABLE): Transmit Store and Forward is disabled. 0x1 (ENABLE): Transmit Store and Forward is enabled. Note: This bit should always be set as we do not support cut through mode.
0	0h RW	**Flush Transmit Queue (FTQ):** When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the MTL_TxQ1_Operation_Mode register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission. Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (clk_tx_i) should be active. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Flush Transmit Queue is disabled. 0x1 (ENABLE): Flush Transmit Queue is enabled.

10.2.435 MTL_TXQ5_UNDERFLOW — Offset E44h

The Queue 5 Underflow Counter register contains the counter for packets aborted because of Transmit queue underflow and packets missed because of Receive queue packet flush

Type	Size	Offset	Default
MMIO	32 bit	BAR + E44h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RO	**Overflow Bit for Underflow Packet Counter (UFCNTOVF):** This bit is set every time the Tx queue Underflow Packet Counter field overflows, that is, it has crossed the maximum count. In such a scenario, the overflow packet counter is reset to all-zeros and this bit indicates that the rollover happened. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Overflow not detected for Underflow Packet Counter. 0x1 (ACTIVE): Overflow detected for Underflow Packet Counter.
10:0	000h RO	**Underflow Packet Counter (UFFRMCNT):** This field indicates the number of packets aborted by the controller because of Tx Queue Underflow. This counter is incremented each time the MAC aborts outgoing packet because of underflow. The counter is cleared when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

10.2.436 MTL_TXQ5_DEBUG — Offset E48h

The Queue 5 Transmit Debug register gives the debug status of various blocks related to the Transmit queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E48h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:20	0h RO	**Number of Status Words in Tx Status FIFO of Queue (STXSTSF):** This field indicates the current number of status in the Tx Status FIFO of this queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of status words in Tx Status FIFO.
19	0h RO	**Reserved**
18:16	0h RO	**Number of Packets in the Transmit Queue (PTXQ):** This field indicates the current number of packets in the Tx Queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of packets in the Transmit queue.

Bit Range	Default & Access	Field Name (ID): Description
15:6	0h RO	**Reserved**
5	0h RO	**MTL Tx Status FIFO Full Status (TXSTSFSTS):** When high, this bit indicates that the MTL Tx Status FIFO is full. Therefore, the MTL cannot accept any more packets for transmission. 0x0 (INACTIVE): MTL Tx Status FIFO Full status is not detected. 0x1 (ACTIVE): MTL Tx Status FIFO Full status is detected.
4	0h RO	**MTL Tx Queue Not Empty Status (TXQSTS):** When this bit is high, it indicates that the MTL Tx Queue is not empty and some data is left for transmission. 0x0 (INACTIVE): MTL Tx Queue Not Empty status is not detected. 0x1 (ACTIVE): MTL Tx Queue Not Empty status is detected.
3	0h RO	**MTL Tx Queue Write Controller Status (TWCSTS):** When high, this bit indicates that the MTL Tx Queue Write Controller is active, and it is transferring the data to the Tx Queue. 0x0 (INACTIVE): MTL Tx Queue Write Controller status is not detected. 0x1 (ACTIVE): MTL Tx Queue Write Controller status is detected.
2:1	0h RO	**MTL Tx Queue Read Controller Status (TRCSTS):** This field indicates the state of the Tx Queue Read Controller: 0x0 (IDLE): Idle state. 0x1 (READ): Read state (transferring data to the MAC transmitter). 0x2 (WAIT): Waiting for pending Tx Status from the MAC transmitter. 0x3 (FLUSH): Flushing the Tx queue because of the Packet Abort request from the MAC.
0	0h RO	**Transmit Queue in Pause (TXQPAUSED):** When this bit is high and the Rx flow control is enabled, it indicates that the Tx Queue is in the Pause condition (in the full-duplex only mode) because of the following: - Reception of the PFC packet for the priorities assigned to the Tx Queue when PFC is enabled - Reception of 802.3x Pause packet when PFC is disabled 0x0 (INACTIVE): Transmit Queue in Pause status is not detected. 0x1 (ACTIVE): Transmit Queue in Pause status is detected.

10.2.437 MTL_TXQ5_ETS_CONTROL — Offset E50h

The Queue ETS Control register controls the enhanced transmission selection operation.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E50h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:4	0h RW	**Slot Count (SLC):** If the credit-based shaper algorithm is enabled, the software can program the number of slots (of duration programmed in DMA_CH(#i)_Slot_Interval register) over which the average transmitted bits per slot, provided in the MTL_TxQ(#i)_ETS_Status register, need to be computed for Queue. The encoding is as follows: 0x0 (M_1_SLOT): 1 slot. 0x1 (M_2_SLOT): 2 slots. 0x2 (M_4_SLOT): 4 slots. 0x3 (M_8_SLOT): 8 slots. 0x4 (M_16_SLOT): 16 slots. 0x5 (RSVD): Reserved.
3	0h RW	**Credit Control (CC):** When this bit is set, the accumulated credit parameter in the credit-based shaper algorithm logic is not reset to zero when there is positive credit and no packet to transmit in Channel 1. The credit accumulates even when there is no packet waiting in Channel 1 and another channel is transmitting. When this bit is reset, the accumulated credit parameter in the credit-based shaper algorithm logic is set to zero when there is positive credit and no packet to transmit in Channel 1. When there is no packet waiting in Channel 1 and other channel is transmitting, no credit is accumulated. 0x0 (DISABLE): Credit Control is disabled. 0x1 (ENABLE): Credit Control is enabled.
2	0h RW	**AV Algorithm (AVALG):** When Queue 1 is programmed for AV, this field configures the scheduling algorithm for this queue: This bit when set, indicates credit based shaper algorithm (CBS) is selected for Queue 1 traffic. When reset, strict priority is selected. 0x0 (DISABLE): CBS Algorithm is disabled. 0x1 (ENABLE): CBS Algorithm is enabled.
1:0	0h RO	**Reserved**

10.2.438 MTL_TXQ5_ETS_STATUS — Offset E54h

The Queue 5 ETS Status register provides the average traffic transmitted in Queue 5.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E54h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RO	**Average Bits per Slot (ABS):** This field contains the average transmitted bits per slot. If AV operation is enabled, this field is computed over number of slots, programmed in the SLC field of MTL_TxQ(#i)_ETS_CONTROL register. The maximum value of this field is 0x6_4000 in 100 Mbps, 0x3E_8000 in 1000 Mbps and 9C_4000 in 2500 Mbps mode respectively. When the DCB operation is enabled for Queue, this field is computed over every 10 million bit times slot (4 ms in 2500 Mbps; 10 ms in 1000 Mbps; 100 ms in 100 Mbps). The maximum value is 0x989680.

10.2.439 MTL_TXQ5_QUANTUM_WEIGHT — Offset E58h

The Queue 5 idleSlopeCredit, Quantum or Weights register provides the average traffic transmitted in Queue 5.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E58h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved**
20:0	000000h RW	**ISCQW:** idleSlopeCredit, Quantum or Weights - idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns for 100 Mbps; 8 ns for 1000 Mbps; 3.2 ns for 2500 Mbps) when the credit is increasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. Bits[20:14] must be written to zero. - Quantum When the DCB operation is enabled with DWRR algorithm for Queue 1 traffic, this field contains the quantum value in bytes to be added to credit during every queue scanning cycle. The maximum value is 0x1312D0 bytes. - Weights When DCB operation is enabled with WFQ algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x3FFF where weight of 0 indicates 100% bandwidth. Bits[20:14] must be written to zero. When DCB operation or generic queuing operation is enabled with WRR algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x64. Bits [20:7] must be written to zero. - Note 1: In multiple Queue configuration this field in respective per queue register must be programmed to some non-zero value when multiple queues are enabled or single queue other than Q0 is enabled. This field need not be programmed when only Q0 is enabled. In general, when WRR algorithm is selected a non-zero value must be programmed on both Receive and Transmit. In Receive, the register is MTL_Operation_Mode register. - Note 2: For WFQ algorithm, higher the programmed weights lesser the bandwidth allocated for that Transmit Queue. The finish time is not a function of particular packet alone but it is as per the formula: (previous_finish_time of particular Transmit Queue + (weights*packet_size)) - Note 3: The weights programmed do not correspond to the number of packets but the fraction of bandwidth or time allocated for particular queue w.r.t. total BW or time.

10.2.440 MTL_TXQ5_SENDSLOPECREDIT — Offset E5Ch

The sendSlopeCredit register contains the sendSlope credit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E5Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13:0	0000h RW	**sendSlopeCredit Value (SSC):** When AV operation is enabled, this field contains the sendSlopeCredit value required for credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns, 8 ns and 3.2 ns for 100 Mbps, 1000 Mbps and 2500 Mbps respectively) when the credit is decreasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. This field should be programmed with absolute sendSlopeCredit value. The credit-based shaper logic subtracts it from the accumulated credit when Channel 1 is selected for transmission.

10.2.441 MTL_TXQ5_HICREDIT — Offset E60h

The hiCredit register contains the hiCredit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E60h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:0	00000000h RW	**hiCredit Value (HC):** When the AV feature is enabled, this field contains the hiCredit value required for the credit-based shaper algorithm. This is the maximum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1,024. The maximum value is maxInterferenceSize, that is, best-effort maximum packet size (16,384 bytes or 131,072 bits). The value to be specified is 131,072 * 1,024 = 134,217,728 or 0x0800_0000.

10.2.442 MTL_TXQ5_LOCREDIT — Offset E64h

The loCredit register contains the loCredit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E64h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:0	00000000h RW	**loCredit Value (LC):** When AV operation is enabled, this field contains the loCredit value required for the credit-based shaper algorithm. This is the minimum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1,024. The maximum value to be programmed is corresponds to twice the maxFrameSize transmitted from this queue. If the maxFrameSize is 8192 bytes, then (8192*2) * 8 * 1024 = 134,217,728 or 0x0800_0000. Because it is a negative value, the programmed value is 2's complement of the value, that is, 0x1800_0000.

10.2.443 MTL_Q5_INTERRUPT_CONTROL_STATUS — Offset E6Ch

This register contains the interrupt enable and status bits for the queue 5 interrupts.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E6Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**Receive Queue Overflow Interrupt Enable (RXOIE):** When this bit is set, the Receive Queue Overflow interrupt is enabled. When this bit is reset, the Receive Queue Overflow interrupt is disabled. 0x0 (DISABLE): Receive Queue Overflow Interrupt is disabled. 0x1 (ENABLE): Receive Queue Overflow Interrupt is enabled.
23:17	0h RO	**Reserved**
16	0h RW	**Receive Queue Overflow Interrupt Status (RXOVFIS):** This bit indicates that the Receive Queue had an overflow while receiving the packet. If a partial packet is transferred to the application, the overflow status is set in RDES3[21]. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Queue Overflow Interrupt Status not detected. 0x1 (ACTIVE): Receive Queue Overflow Interrupt Status detected.
15:10	0h RO	**Reserved**
9	0h RW	**Average Bits Per Slot Interrupt Enable (ABPSIE):** When this bit is set, the MAC asserts the sbd_intr_o or mci_intr_o interrupt when the average bits per slot status is updated. When this bit is cleared, the interrupt is not asserted for such an event. 0x0 (DISABLE): Average Bits Per Slot Interrupt is disabled. 0x1 (ENABLE): Average Bits Per Slot Interrupt is enabled.
8	0h RW	**Transmit Queue Underflow Interrupt Enable (TXUIE):** When this bit is set, the Transmit Queue Underflow interrupt is enabled. When this bit is reset, the Transmit Queue Underflow interrupt is disabled. 0x0 (DISABLE): Transmit Queue Underflow Interrupt Status is disabled. 0x1 (ENABLE): Transmit Queue Underflow Interrupt Status is enabled.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	**Reserved**
1	0h RW	**Average Bits Per Slot Interrupt Status (ABPSIS):** When set, this bit indicates that the MAC has updated the ABS value. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Average Bits Per Slot Interrupt Status not detected. 0x1 (ACTIVE): Average Bits Per Slot Interrupt Status detected.
0	0h RW	**Transmit Queue Underflow Interrupt Status (TXUNFIS):** This bit indicates that the Transmit Queue had an underflow while transmitting the packet. Transmission is suspended and an Underflow Error TDES3[2] is set. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Queue Underflow Interrupt Status not detected. 0x1 (ACTIVE): Transmit Queue Underflow Interrupt Status detected.

10.2.444 MTL_RXQ5_OPERATION_MODE — Offset E70h

The Queue 5 Receive Operation Mode register establishes the Receive queue operating modes and command.

The RFA and RFD fields are not backward compatible with the RFA and RFD fields of 4.00a release

Type	Size	Offset	Default
MMIO	32 bit	BAR + E70h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved**
26:20	00h RW	**Receive Queue Size (RQS):** This field indicates the size of the allocated Receive queues in blocks of 256 bytes. The RQS field is read-write only if the number of Rx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on, so user should be programming RQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (RQS+1)*256 bytes. When the number of Rx Queues is one, the field is read-only and the configured RX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Rx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
19:14	00h RW	**Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) (RFD):** These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1.5 KB, that is, FULL 1.5 KB - 2: Full minus 2 KB, that is, FULL 2 KB - 3: Full minus 2.5 KB, that is, FULL 2.5 KB - ... - 62: Full minus 32 KB, that is, FULL 32 KB - 63: Full minus 32.5 KB, that is, FULL 32.5 KB The de-assertion is effective only after flow control is asserted. Note: The value must be programmed in such a way to make sure that the threshold is a positive number. When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register. The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13:8	00h RW	**Threshold for Activating Flow Control (in half-duplex and full-duplex (RFA):** These bits control the threshold (fill-level of Rx queue) at which the flow control is activated: For more information on encoding for this field, see RFD.
7	0h RW	**Enable Hardware Flow Control (EHFC):** When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. 0x0 (DISABLE): Hardware Flow Control is disabled. 0x1 (ENABLE): Hardware Flow Control is enabled.
6	0h RW	**Disable Dropping of TCP/IP Checksum Error Packets (DIS_TCP_EF):** When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC. When this bit is reset, all error packets are dropped if the FEP bit is reset. 0x0 (ENABLE): Dropping of TCP/IP Checksum Error Packets is enabled. 0x1 (DISABLE): Dropping of TCP/IP Checksum Error Packets is disabled.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**Receive Queue Store and Forward (RSF):** When this bit is set, the GbE Controller reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register. 0x0 (DISABLE): Receive Queue Store and Forward is disabled. 0x1 (ENABLE): Receive Queue Store and Forward is enabled.
4	0h RW	**Forward Error Packets (FEP):** When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped. When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet might be forwarded to the application or DMA. 0x0 (DISABLE): Forward Error Packets is disabled. 0x1 (ENABLE): Forward Error Packets is enabled.
3	0h RW	**Forward Undersized Good Packets (FUP):** When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. 0x0 (DISABLE): Forward Undersized Good Packets is disabled. 0x1 (ENABLE): Forward Undersized Good Packets is enabled.
2	0h RO	**Reserved**
1:0	0h RW	**Receive Queue Threshold Control (RTC):** These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred. This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1. 0x0 (M_64BYTE): 64. 0x1 (M_32BYTE): 32. 0x2 (M_96BYTE): 96. 0x3 (M_128BYTE): 128.

10.2.445 MTL_RXQ5_MISSED_PACKET_OVERFLOW_CNT — Offset E74h

The Queue 5 Missed Packet and Overflow Counter register contains the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E74h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27	0h RO	**Missed Packet Counter Overflow Bit (MISCNTOVF):** When set, this bit indicates that the Rx Queue Missed Packet Counter crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Missed Packet Counter overflow not detected. 0x1 (ACTIVE): Missed Packet Counter overflow detected.
26:16	000h RO	**Missed Packet Counter (MISPKTCNT):** This field indicates the number of packets missed by the GbE Controller because the application asserted ari_pkt_flush_i[] for this queue. This counter is reset when this register is read with mci_be_i[0] at 1b1. This counter is incremented by 1 when the DMA discards the packet because of buffer unavailability. Access restriction applies. Clears on read. Self-set to 1 on internal event.
15:12	0h RO	**Reserved**
11	0h RO	**Overflow Counter Overflow Bit (OVFCNTOVF):** When set, this bit indicates that the Rx Queue Overflow Packet Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Overflow Counter overflow not detected. 0x1 (ACTIVE): Overflow Counter overflow detected.
10:0	000h RO	**Overflow Packet Counter (OVFPKTCNT):** This field indicates the number of packets discarded by the GbE Controller because of Receive queue overflow. This counter is incremented each time the GbE Controller discards an incoming packet because of overflow. This counter is reset when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

10.2.446 MTL_RXQ5_DEBUG — Offset E78h

The Queue 5 Receive Debug register gives the debug status of various blocks related to the Receive queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E78h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:16	0000h RO	**Number of Packets in Receive Queue (PRXQ):** This field indicates the current number of packets in the Rx Queue. The theoretical maximum value for this field is 256KB/16B = 16K Packets, that is, Max_Queue_Size/ Min_Packet_Size.
15:6	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
5:4	0h RO	**MTL Rx Queue Fill-Level Status (RXQSTS):** This field gives the status of the fill-level of the Rx Queue: 0x0 (EMPTY): Rx Queue empty. 0x1 (BLW_THR): Rx Queue fill-level below flow-control deactivate threshold. 0x2 (ABV_THR): Rx Queue fill-level above flow-control activate threshold. 0x3 (FULL): Rx Queue full.
3	0h RO	**Reserved**
2:1	0h RO	**MTL Rx Queue Read Controller State (RRCSTS):** This field gives the state of the Rx queue Read controller: 0x0 (IDLE): Idle state. 0x1 (READ_DATA): Reading packet data. 0x2 (READ_STS): Reading packet status (or timestamp). 0x3 (FLUSH): Flushing the packet data and status.
0	0h RO	**MTL Rx Queue Write Controller Active Status (RWCSTS):** When high, this bit indicates that the MTL Rx queue Write controller is active, and it is transferring a received packet to the Rx Queue. 0x0 (INACTIVE): MTL Rx Queue Write Controller Active Status not detected. 0x1 (ACTIVE): MTL Rx Queue Write Controller Active Status detected.

10.2.447 MTL_RXQ5_CONTROL — Offset E7Ch

The Queue Receive Control register controls the receive arbitration and passing of received packets to the application.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E7Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**Receive Queue Packet Arbitration (RXQ_FRM_ARBIT):** When this bit is set, the GbE Controller drives the packet data to the ARI interface such that the entire packet data of currently-selected queue is transmitted before switching to other queue. When this bit is reset, the GbE Controller drives the packet data to the ARI interface such that the following amount of data of currently-selected queue is transmitted before switching to other queue: - PBL amount of data (indicated by ari_qN_pbl_i[]) or - Complete data of a packet The status and the timestamp are not a part of the PBL data. Therefore, the GbE Controller drives the complete status (including timestamp status) during first PBL request for the packet (in store-and-forward mode) or the last PBL request for the packet (in Threshold mode). 0x0 (DISABLE): Receive Queue Packet Arbitration is disabled. 0x1 (ENABLE): Receive Queue Packet Arbitration is enabled.
2:0	0h RW	**Receive Queue Weight (RXQ_WEGT):** This field indicates the weight assigned to the Rx Queue 0. This field needs to be programmed with one value less than the required weight, i.e. reset value of 0 indicates weight of 1, value of 1 indicates weight of 2, and so on. The weight is used as the number of continuous PBL or packets requests (depending on the RXQ_FRM_ARBIT) allocated to the queue in one arbitration cycle. Note: The change in value of RXQ_WEGT takes effect only after the completion of current service round or when there is change from RAA=SP to RAA=WSP algorithm. This approach is taken so that there is smooth transition. For the RXQ_WEGT value to take effect at the start, the MTL_RxQ(#i)_Control registers must be programmed before the MTL_Operation_Mode register.

10.2.448 MTL_TXQ6_OPERATION_MODE — Offset E80h

The Queue 6 Transmit Operation Mode register establishes the Transmit queue operating modes and commands.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E80h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:16	00h RW	**Transmit Queue Size (TQS):** This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. The TQS field is read-write only if the number of Tx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on, so user should be programming TQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (TQS+1)*256 bytes. When the number of Tx Queues is one, the field is read-only and the configured TX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Tx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
15:7	0h RO	**Reserved**
6:4	0h RW	**Reserved**
3:2	0h RW	**Transmit Queue Enable (TXQEN):** This field is used to enable/disable the transmit queue 0. - 2'b00: Not enabled - 2'b01: Enable in AV mode - 2'b10: Enabled - 2'b11: Reserved Note: In multiple Tx queues configuration, all the queues are disabled by default. Enable the Tx queue by programming this field. 0x0 (DISABLE): Not enabled. 0x1 (EN_IF_AV): Enable in AV mode (Reserved in non-AV). 0x2 (ENABLE): Enabled. 0x3 (RSVD2): Reserved.
1	0h RW	**Transmit Store and Forward (TSF):** When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped. 0x0 (DISABLE): Transmit Store and Forward is disabled. 0x1 (ENABLE): Transmit Store and Forward is enabled. Note: This bit should be always be set as we do not support cut through mode.
0	0h RW	**Flush Transmit Queue (FTQ):** When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the MTL_TxQ1_Operation_Mode register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission. Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (clk_tx_i) should be active. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Flush Transmit Queue is disabled. 0x1 (ENABLE): Flush Transmit Queue is enabled.

10.2.449 MTL_TXQ6_UNDERFLOW — Offset E84h

The Queue 6 Underflow Counter register contains the counter for packets aborted because of Transmit queue underflow and packets missed because of Receive queue packet flush

Type	Size	Offset	Default
MMIO	32 bit	BAR + E84h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RO	**Overflow Bit for Underflow Packet Counter (UFCNTOVF):** This bit is set every time the Tx queue Underflow Packet Counter field overflows, that is, it has crossed the maximum count. In such a scenario, the overflow packet counter is reset to all-zeros and this bit indicates that the rollover happened. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Overflow not detected for Underflow Packet Counter. 0x1 (ACTIVE): Overflow detected for Underflow Packet Counter.
10:0	000h RO	**Underflow Packet Counter (UFFRMCNT):** This field indicates the number of packets aborted by the controller because of Tx Queue Underflow. This counter is incremented each time the MAC aborts outgoing packet because of underflow. The counter is cleared when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

10.2.450 MTL_TXQ6_DEBUG — Offset E88h

The Queue 6 Transmit Debug register gives the debug status of various blocks related to the Transmit queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E88h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:20	0h RO	**Number of Status Words in Tx Status FIFO of Queue (STXSTSF):** This field indicates the current number of status in the Tx Status FIFO of this queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of status words in Tx Status FIFO.
19	0h RO	**Reserved**
18:16	0h RO	**Number of Packets in the Transmit Queue (PTXQ):** This field indicates the current number of packets in the Tx Queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of packets in the Transmit queue.

Bit Range	Default & Access	Field Name (ID): Description
15:6	0h RO	**Reserved**
5	0h RO	**MTL Tx Status FIFO Full Status (TXSTSFSTS):** When high, this bit indicates that the MTL Tx Status FIFO is full. Therefore, the MTL cannot accept any more packets for transmission. 0x0 (INACTIVE): MTL Tx Status FIFO Full status is not detected. 0x1 (ACTIVE): MTL Tx Status FIFO Full status is detected.
4	0h RO	**MTL Tx Queue Not Empty Status (TXQSTS):** When this bit is high, it indicates that the MTL Tx Queue is not empty and some data is left for transmission. 0x0 (INACTIVE): MTL Tx Queue Not Empty status is not detected. 0x1 (ACTIVE): MTL Tx Queue Not Empty status is detected.
3	0h RO	**MTL Tx Queue Write Controller Status (TWCSTS):** When high, this bit indicates that the MTL Tx Queue Write Controller is active, and it is transferring the data to the Tx Queue. 0x0 (INACTIVE): MTL Tx Queue Write Controller status is not detected. 0x1 (ACTIVE): MTL Tx Queue Write Controller status is detected.
2:1	0h RO	**MTL Tx Queue Read Controller Status (TRCSTS):** This field indicates the state of the Tx Queue Read Controller: 0x0 (IDLE): Idle state. 0x1 (READ): Read state (transferring data to the MAC transmitter). 0x2 (WAIT): Waiting for pending Tx Status from the MAC transmitter. 0x3 (FLUSH): Flushing the Tx queue because of the Packet Abort request from the MAC.
0	0h RO	**Transmit Queue in Pause (TXQPAUSED):** When this bit is high and the Rx flow control is enabled, it indicates that the Tx Queue is in the Pause condition (in the full-duplex only mode) because of the following: - Reception of the PFC packet for the priorities assigned to the Tx Queue when PFC is enabled - Reception of 802.3x Pause packet when PFC is disabled 0x0 (INACTIVE): Transmit Queue in Pause status is not detected. 0x1 (ACTIVE): Transmit Queue in Pause status is detected.

10.2.451 MTL_TXQ6_ETS_CONTROL — Offset E90h

The Queue ETS Control register controls the enhanced transmission selection operation.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E90h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:4	0h RW	**Slot Count (SLC):** If the credit-based shaper algorithm is enabled, the software can program the number of slots (of duration programmed in DMA_CH(#i)_Slot_Interval register) over which the average transmitted bits per slot, provided in the MTL_TxQ(#i)_ETS_Status register, need to be computed for Queue. The encoding is as follows: 0x0 (M_1_SLOT): 1 slot. 0x1 (M_2_SLOT): 2 slots. 0x2 (M_4_SLOT): 4 slots. 0x3 (M_8_SLOT): 8 slots. 0x4 (M_16_SLOT): 16 slots. 0x5 (RSVD): Reserved.
3	0h RW	**Credit Control (CC):** When this bit is set, the accumulated credit parameter in the credit-based shaper algorithm logic is not reset to zero when there is positive credit and no packet to transmit in Channel 1. The credit accumulates even when there is no packet waiting in Channel 1 and another channel is transmitting. When this bit is reset, the accumulated credit parameter in the credit-based shaper algorithm logic is set to zero when there is positive credit and no packet to transmit in Channel 1. When there is no packet waiting in Channel 1 and other channel is transmitting, no credit is accumulated. 0x0 (DISABLE): Credit Control is disabled. 0x1 (ENABLE): Credit Control is enabled.
2	0h RW	**AV Algorithm (AVALG):** When Queue 1 is programmed for AV, this field configures the scheduling algorithm for this queue: This bit when set, indicates credit based shaper algorithm (CBS) is selected for Queue 1 traffic. When reset, strict priority is selected. 0x0 (DISABLE): CBS Algorithm is disabled. 0x1 (ENABLE): CBS Algorithm is enabled.
1:0	0h RO	**Reserved**

10.2.452 MTL_TXQ6_ETS_STATUS — Offset E94h

The Queue 6 ETS Status register provides the average traffic transmitted in Queue 6.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E94h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RO	**Average Bits per Slot (ABS):** This field contains the average transmitted bits per slot. If AV operation is enabled, this field is computed over number of slots, programmed in the SLC field of MTL_TxQ(#i)_ETS_CONTROL register. The maximum value of this field is 0x6_4000 in 100 Mbps, 0x3E_8000 in 1000 Mbps and 9C_4000 in 2500 Mbps mode respectively. When the DCB operation is enabled for Queue, this field is computed over every 10 million bit times slot (4 ms in 2500 Mbps; 10 ms in 1000 Mbps; 100 ms in 100 Mbps). The maximum value is 0x989680.

10.2.453 MTL_TXQ6_QUANTUM_WEIGHT — Offset E98h

The Queue 6 idleSlopeCredit, Quantum or Weights register provides the average traffic transmitted in Queue 6.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved**
20:0	000000h RW	**ISCQW:** idleSlopeCredit, Quantum or Weights - idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns for 100 Mbps; 8 ns for 1000 Mbps; 3.2 ns for 2500 Mbps) when the credit is increasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. Bits[20:14] must be written to zero. - Quantum When the DCB operation is enabled with DWRR algorithm for Queue 1 traffic, this field contains the quantum value in bytes to be added to credit during every queue scanning cycle. The maximum value is 0x1312D0 bytes. - Weights When DCB operation is enabled with WFQ algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x3FFF where weight of 0 indicates 100% bandwidth. Bits[20:14] must be written to zero. When DCB operation or generic queuing operation is enabled with WRR algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x64. Bits [20:7] must be written to zero. - Note 1: In multiple Queue configuration this field in respective per queue register must be programmed to some non-zero value when multiple queues are enabled or single queue other than Q0 is enabled. This field need not be programmed when only Q0 is enabled. In general, when WRR algorithm is selected a non-zero value must be programmed on both Receive and Transmit. In Receive, the register is MTL_Operation_Mode register. - Note 2: For WFQ algorithm, higher the programmed weights lesser the bandwidth allocated for that Transmit Queue. The finish time is not a function of particular packet alone but it is as per the formula: (previous_finish_time of particular Transmit Queue + (weights*packet_size)) - Note 3: The weights programmed do not correspond to the number of packets but the fraction of bandwidth or time allocated for particular queue w.r.t. total BW or time.

10.2.454 MTL_TXQ6_SENDSLOPECREDIT — Offset E9Ch

The sendSlopeCredit register contains the sendSlope credit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13:0	0000h RW	**sendSlopeCredit Value (SSC):** When AV operation is enabled, this field contains the sendSlopeCredit value required for credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns, 8 ns and 3.2 ns for 100 Mbps, 1000 Mbps and 2500 Mbps respectively) when the credit is decreasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. This field should be programmed with absolute sendSlopeCredit value. The credit-based shaper logic subtracts it from the accumulated credit when Channel 1 is selected for transmission.

10.2.455 MTL_TXQ6_HICREDIT — Offset EA0h

The hiCredit register contains the hiCredit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + EA0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:0	00000000h RW	**hiCredit Value (HC):** When the AV feature is enabled, this field contains the hiCredit value required for the credit-based shaper algorithm. This is the maximum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1,024. The maximum value is maxInterferenceSize, that is, best-effort maximum packet size (16,384 bytes or 131,072 bits). The value to be specified is 131,072 * 1,024 = 134,217,728 or 0x0800_0000.

10.2.456 MTL_TXQ6_LOCREDIT — Offset EA4h

The loCredit register contains the loCredit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + EA4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:0	00000000h RW	**loCredit Value (LC):** When AV operation is enabled, this field contains the loCredit value required for the credit-based shaper algorithm. This is the minimum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1,024. The maximum value to be programmed is corresponds to twice the maxFrameSize transmitted from this queue. If the maxFrameSize is 8192 bytes, then (8192*2) * 8 * 1024 = 134,217,728 or 0x0800_0000. Because it is a negative value, the programmed value is 2's complement of the value, that is, 0x1800_0000.

10.2.457 MTL_Q6_INTERRUPT_CONTROL_STATUS — Offset EACh

This register contains the interrupt enable and status bits for the queue 6 interrupts.

Type	Size	Offset	Default
MMIO	32 bit	BAR + EACh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**Receive Queue Overflow Interrupt Enable (RXOIE):** When this bit is set, the Receive Queue Overflow interrupt is enabled. When this bit is reset, the Receive Queue Overflow interrupt is disabled. 0x0 (DISABLE): Receive Queue Overflow Interrupt is disabled. 0x1 (ENABLE): Receive Queue Overflow Interrupt is enabled.
23:17	0h RO	**Reserved**
16	0h RW	**Receive Queue Overflow Interrupt Status (RXOVFIS):** This bit indicates that the Receive Queue had an overflow while receiving the packet. If a partial packet is transferred to the application, the overflow status is set in RDES3[21]. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Queue Overflow Interrupt Status not detected. 0x1 (ACTIVE): Receive Queue Overflow Interrupt Status detected.
15:10	0h RO	**Reserved**
9	0h RW	**Average Bits Per Slot Interrupt Enable (ABPSIE):** When this bit is set, the MAC asserts the sbd_intr_o or mci_intr_o interrupt when the average bits per slot status is updated. When this bit is cleared, the interrupt is not asserted for such an event. 0x0 (DISABLE): Average Bits Per Slot Interrupt is disabled. 0x1 (ENABLE): Average Bits Per Slot Interrupt is enabled.
8	0h RW	**Transmit Queue Underflow Interrupt Enable (TXUIE):** When this bit is set, the Transmit Queue Underflow interrupt is enabled. When this bit is reset, the Transmit Queue Underflow interrupt is disabled. 0x0 (DISABLE): Transmit Queue Underflow Interrupt Status is disabled. 0x1 (ENABLE): Transmit Queue Underflow Interrupt Status is enabled.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	**Reserved**
1	0h RW	**Average Bits Per Slot Interrupt Status (ABPSIS):** When set, this bit indicates that the MAC has updated the ABS value. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Average Bits Per Slot Interrupt Status not detected. 0x1 (ACTIVE): Average Bits Per Slot Interrupt Status detected.
0	0h RW	**Transmit Queue Underflow Interrupt Status (TXUNFIS):** This bit indicates that the Transmit Queue had an underflow while transmitting the packet. Transmission is suspended and an Underflow Error TDES3[2] is set. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Queue Underflow Interrupt Status not detected. 0x1 (ACTIVE): Transmit Queue Underflow Interrupt Status detected.

10.2.458 MTL_RXQ6_OPERATION_MODE — Offset EB0h

The Queue 6 Receive Operation Mode register establishes the Receive queue operating modes and command.

The RFA and RFD fields are not backward compatible with the RFA and RFD fields of 4.00a release

Type	Size	Offset	Default
MMIO	32 bit	BAR + EB0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved**
26:20	00h RW	**Receive Queue Size (RQS):** This field indicates the size of the allocated Receive queues in blocks of 256 bytes. The RQS field is read-write only if the number of Rx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on, so user should be programming RQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (RQS+1)*256 bytes. When the number of Rx Queues is one, the field is read-only and the configured RX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Rx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
19:14	00h RW	**Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) (RFD):** These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1.5 KB, that is, FULL 1.5 KB - 2: Full minus 2 KB, that is, FULL 2 KB - 3: Full minus 2.5 KB, that is, FULL 2.5 KB - ... - 62: Full minus 32 KB, that is, FULL 32 KB - 63: Full minus 32.5 KB, that is, FULL 32.5 KB The de-assertion is effective only after flow control is asserted. Note: The value must be programmed in such a way to make sure that the threshold is a positive number. When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register. The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13:8	00h RW	**Threshold for Activating Flow Control (in half-duplex and full-duplex (RFA):** These bits control the threshold (fill-level of Rx queue) at which the flow control is activated: For more information on encoding for this field, see RFD.
7	0h RW	**Enable Hardware Flow Control (EHFC):** When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. 0x0 (DISABLE): Hardware Flow Control is disabled. 0x1 (ENABLE): Hardware Flow Control is enabled.
6	0h RW	**Disable Dropping of TCP/IP Checksum Error Packets (DIS_TCP_EF):** When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC. When this bit is reset, all error packets are dropped if the FEP bit is reset. 0x0 (ENABLE): Dropping of TCP/IP Checksum Error Packets is enabled. 0x1 (DISABLE): Dropping of TCP/IP Checksum Error Packets is disabled.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**Receive Queue Store and Forward (RSF):** When this bit is set, the GbE Controller reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register. 0x0 (DISABLE): Receive Queue Store and Forward is disabled. 0x1 (ENABLE): Receive Queue Store and Forward is enabled.
4	0h RW	**Forward Error Packets (FEP):** When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped. When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet might be forwarded to the application or DMA. 0x0 (DISABLE): Forward Error Packets is disabled. 0x1 (ENABLE): Forward Error Packets is enabled.
3	0h RW	**Forward Undersized Good Packets (FUP):** When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. 0x0 (DISABLE): Forward Undersized Good Packets is disabled. 0x1 (ENABLE): Forward Undersized Good Packets is enabled.
2	0h RO	**Reserved**
1:0	0h RW	**Receive Queue Threshold Control (RTC):** These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred. This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1. 0x0 (M_64BYTE): 64. 0x1 (M_32BYTE): 32. 0x2 (M_96BYTE): 96. 0x3 (M_128BYTE): 128.

10.2.459 MTL_RXQ6_MISSED_PACKET_OVERFLOW_CNT — Offset EB4h

The Queue 6 Missed Packet and Overflow Counter register contains the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow.

Type	Size	Offset	Default
MMIO	32 bit	BAR + EB4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27	0h RO	**Missed Packet Counter Overflow Bit (MISCNTOVF):** When set, this bit indicates that the Rx Queue Missed Packet Counter crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Missed Packet Counter overflow not detected. 0x1 (ACTIVE): Missed Packet Counter overflow detected.
26:16	000h RO	**Missed Packet Counter (MISPKTCNT):** This field indicates the number of packets missed by the GbE Controller because the application asserted ari_pkt_flush_i[] for this queue. This counter is reset when this register is read with mci_be_i[0] at 1b1. This counter is incremented by 1 when the DMA discards the packet because of buffer unavailability. Access restriction applies. Clears on read. Self-set to 1 on internal event.
15:12	0h RO	**Reserved**
11	0h RO	**Overflow Counter Overflow Bit (OVFCNTOVF):** When set, this bit indicates that the Rx Queue Overflow Packet Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Overflow Counter overflow not detected. 0x1 (ACTIVE): Overflow Counter overflow detected.
10:0	000h RO	**Overflow Packet Counter (OVFPKTCNT):** This field indicates the number of packets discarded by the GbE Controller because of Receive queue overflow. This counter is incremented each time the GbE Controller discards an incoming packet because of overflow. This counter is reset when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

10.2.460 MTL_RXQ6_DEBUG — Offset EB8h

The Queue 6 Receive Debug register gives the debug status of various blocks related to the Receive queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + EB8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:16	0000h RO	**Number of Packets in Receive Queue (PRXQ):** This field indicates the current number of packets in the Rx Queue. The theoretical maximum value for this field is 256KB/16B = 16K Packets, that is, Max_Queue_Size/ Min_Packet_Size.
15:6	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
5:4	0h RO	**MTL Rx Queue Fill-Level Status (RXQSTS):** This field gives the status of the fill-level of the Rx Queue: 0x0 (EMPTY): Rx Queue empty. 0x1 (BLW_THR): Rx Queue fill-level below flow-control deactivate threshold. 0x2 (ABV_THR): Rx Queue fill-level above flow-control activate threshold. 0x3 (FULL): Rx Queue full.
3	0h RO	**Reserved**
2:1	0h RO	**MTL Rx Queue Read Controller State (RRCSTS):** This field gives the state of the Rx queue Read controller: 0x0 (IDLE): Idle state. 0x1 (READ_DATA): Reading packet data. 0x2 (READ_STS): Reading packet status (or timestamp). 0x3 (FLUSH): Flushing the packet data and status.
0	0h RO	**MTL Rx Queue Write Controller Active Status (RWCSTS):** When high, this bit indicates that the MTL Rx queue Write controller is active, and it is transferring a received packet to the Rx Queue. 0x0 (INACTIVE): MTL Rx Queue Write Controller Active Status not detected. 0x1 (ACTIVE): MTL Rx Queue Write Controller Active Status detected.

10.2.461 MTL_RXQ6_CONTROL — Offset EBCh

The Queue Receive Control register controls the receive arbitration and passing of received packets to the application.

Type	Size	Offset	Default
MMIO	32 bit	BAR + EBCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**Receive Queue Packet Arbitration (RXQ_FRM_ARBIT):** When this bit is set, the GbE Controller drives the packet data to the ARI interface such that the entire packet data of currently-selected queue is transmitted before switching to other queue. When this bit is reset, the GbE Controller drives the packet data to the ARI interface such that the following amount of data of currently-selected queue is transmitted before switching to other queue: - PBL amount of data (indicated by ari_qN_pbl_i[]) or - Complete data of a packet The status and the timestamp are not a part of the PBL data. Therefore, the GbE Controller drives the complete status (including timestamp status) during first PBL request for the packet (in store-and-forward mode) or the last PBL request for the packet (in Threshold mode). 0x0 (DISABLE): Receive Queue Packet Arbitration is disabled. 0x1 (ENABLE): Receive Queue Packet Arbitration is enabled.
2:0	0h RW	**Receive Queue Weight (RXQ_WEGT):** This field indicates the weight assigned to the Rx Queue 0. This field needs to be programmed with one value less than the required weight, i.e. reset value of 0 indicates weight of 1, value of 1 indicates weight of 2, and so on. The weight is used as the number of continuous PBL or packets requests (depending on the RXQ_FRM_ARBIT) allocated to the queue in one arbitration cycle. Note: The change in value of RXQ_WEGT takes effect only after the completion of current service round or when there is change from RAA=SP to RAA=WSP algorithm. This approach is taken so that there is smooth transition. For the RXQ_WEGT value to take effect at the start, the MTL_RxQ(#i)_Control registers must be programmed before the MTL_Operation_Mode register.

10.2.462 MTL_TXQ7_OPERATION_MODE — Offset EC0h

The Queue 7 Transmit Operation Mode register establishes the Transmit queue operating modes and commands.

Type	Size	Offset	Default
MMIO	32 bit	BAR + EC0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:16	00h RW	**Transmit Queue Size (TQS):** This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. The TQS field is read-write only if the number of Tx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on, so user should be programming TQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (TQS+1)*256 bytes. When the number of Tx Queues is one, the field is read-only and the configured TX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Tx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
15:7	0h RO	**Reserved**
6:4	0h RO	**Reserved**
3:2	0h RW	**Transmit Queue Enable (TXQEN):** This field is used to enable/disable the transmit queue 0. - 2'b00: Not enabled - 2'b01: Enable in AV mode - 2'b10: Enabled - 2'b11: Reserved Note: In multiple Tx queues configuration, all the queues are disabled by default. Enable the Tx queue by programming this field. 0x0 (DISABLE): Not enabled. 0x1 (EN_IF_AV): Enable in AV mode (Reserved in non-AV). 0x2 (ENABLE): Enabled. 0x3 (RSVD2): Reserved.
1	0h RW	**Transmit Store and Forward (TSF):** When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped. 0x0 (DISABLE): Transmit Store and Forward is disabled. 0x1 (ENABLE): Transmit Store and Forward is enabled. Note: This bit should always be set as we do not support cut through mode.
0	0h RW	**Flush Transmit Queue (FTQ):** When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the MTL_TxQ1_Operation_Mode register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission. Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (clk_tx_i) should be active. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Flush Transmit Queue is disabled. 0x1 (ENABLE): Flush Transmit Queue is enabled.

10.2.463 MTL_TXQ7_UNDERFLOW — Offset EC4h

The Queue 7 Underflow Counter register contains the counter for packets aborted because of Transmit queue underflow and packets missed because of Receive queue packet flush

Type	Size	Offset	Default
MMIO	32 bit	BAR + EC4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RO	**Overflow Bit for Underflow Packet Counter (UFCNTOVF):** This bit is set every time the Tx queue Underflow Packet Counter field overflows, that is, it has crossed the maximum count. In such a scenario, the overflow packet counter is reset to all-zeros and this bit indicates that the rollover happened. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Overflow not detected for Underflow Packet Counter. 0x1 (ACTIVE): Overflow detected for Underflow Packet Counter.
10:0	000h RO	**Underflow Packet Counter (UFFRMCNT):** This field indicates the number of packets aborted by the controller because of Tx Queue Underflow. This counter is incremented each time the MAC aborts outgoing packet because of underflow. The counter is cleared when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

10.2.464 MTL_TXQ7_DEBUG — Offset EC8h

The Queue 7 Transmit Debug register gives the debug status of various blocks related to the Transmit queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + EC8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:20	0h RO	**Number of Status Words in Tx Status FIFO of Queue (STXSTSF):** This field indicates the current number of status in the Tx Status FIFO of this queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of status words in Tx Status FIFO.
19	0h RO	**Reserved**
18:16	0h RO	**Number of Packets in the Transmit Queue (PTXQ):** This field indicates the current number of packets in the Tx Queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of packets in the Transmit queue.

Bit Range	Default & Access	Field Name (ID): Description
15:6	0h RO	**Reserved**
5	0h RO	**MTL Tx Status FIFO Full Status (TXSTSFSTS):** When high, this bit indicates that the MTL Tx Status FIFO is full. Therefore, the MTL cannot accept any more packets for transmission. 0x0 (INACTIVE): MTL Tx Status FIFO Full status is not detected. 0x1 (ACTIVE): MTL Tx Status FIFO Full status is detected.
4	0h RO	**MTL Tx Queue Not Empty Status (TXQSTS):** When this bit is high, it indicates that the MTL Tx Queue is not empty and some data is left for transmission. 0x0 (INACTIVE): MTL Tx Queue Not Empty status is not detected. 0x1 (ACTIVE): MTL Tx Queue Not Empty status is detected.
3	0h RO	**MTL Tx Queue Write Controller Status (TWCSTS):** When high, this bit indicates that the MTL Tx Queue Write Controller is active, and it is transferring the data to the Tx Queue. 0x0 (INACTIVE): MTL Tx Queue Write Controller status is not detected. 0x1 (ACTIVE): MTL Tx Queue Write Controller status is detected.
2:1	0h RO	**MTL Tx Queue Read Controller Status (TRCSTS):** This field indicates the state of the Tx Queue Read Controller: 0x0 (IDLE): Idle state. 0x1 (READ): Read state (transferring data to the MAC transmitter). 0x2 (WAIT): Waiting for pending Tx Status from the MAC transmitter. 0x3 (FLUSH): Flushing the Tx queue because of the Packet Abort request from the MAC.
0	0h RO	**Transmit Queue in Pause (TXQPAUSED):** When this bit is high and the Rx flow control is enabled, it indicates that the Tx Queue is in the Pause condition (in the full-duplex only mode) because of the following: - Reception of the PFC packet for the priorities assigned to the Tx Queue when PFC is enabled - Reception of 802.3x Pause packet when PFC is disabled 0x0 (INACTIVE): Transmit Queue in Pause status is not detected. 0x1 (ACTIVE): Transmit Queue in Pause status is detected.

10.2.465 MTL_TXQ7_ETS_CONTROL — Offset ED0h

The Queue ETS Control register controls the enhanced transmission selection operation.

Type	Size	Offset	Default
MMIO	32 bit	BAR + ED0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:4	0h RW	**Slot Count (SLC):** If the credit-based shaper algorithm is enabled, the software can program the number of slots (of duration programmed in DMA_CH(#i)_Slot_Interval register) over which the average transmitted bits per slot, provided in the MTL_TxQ(#i)_ETS_Status register, need to be computed for Queue. The encoding is as follows: 0x0 (M_1_SLOT): 1 slot. 0x1 (M_2_SLOT): 2 slots. 0x2 (M_4_SLOT): 4 slots. 0x3 (M_8_SLOT): 8 slots. 0x4 (M_16_SLOT): 16 slots. 0x5 (RSVD): Reserved.
3	0h RW	**Credit Control (CC):** When this bit is set, the accumulated credit parameter in the credit-based shaper algorithm logic is not reset to zero when there is positive credit and no packet to transmit in Channel 1. The credit accumulates even when there is no packet waiting in Channel 1 and another channel is transmitting. When this bit is reset, the accumulated credit parameter in the credit-based shaper algorithm logic is set to zero when there is positive credit and no packet to transmit in Channel 1. When there is no packet waiting in Channel 1 and other channel is transmitting, no credit is accumulated. 0x0 (DISABLE): Credit Control is disabled. 0x1 (ENABLE): Credit Control is enabled.
2	0h RW	**AV Algorithm (AVALG):** When Queue 1 is programmed for AV, this field configures the scheduling algorithm for this queue: This bit when set, indicates credit based shaper algorithm (CBS) is selected for Queue 1 traffic. When reset, strict priority is selected. 0x0 (DISABLE): CBS Algorithm is disabled. 0x1 (ENABLE): CBS Algorithm is enabled.
1:0	0h RO	**Reserved**

10.2.466 MTL_TXQ7_ETS_STATUS — Offset ED4h

The Queue 7 ETS Status register provides the average traffic transmitted in Queue 7.

Type	Size	Offset	Default
MMIO	32 bit	BAR + ED4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RO	**Average Bits per Slot (ABS):** This field contains the average transmitted bits per slot. If AV operation is enabled, this field is computed over number of slots, programmed in the SLC field of MTL_TxQ(#i)_ETS_CONTROL register. The maximum value of this field is 0x6_4000 in 100 Mbps, 0x3E_8000 in 1000 Mbps and 9C_4000 in 2500 Mbps mode respectively. When the DCB operation is enabled for Queue, this field is computed over every 10 million bit times slot (4 ms in 2500 Mbps; 10 ms in 1000 Mbps; 100 ms in 100 Mbps). The maximum value is 0x989680.

10.2.467 MTL_TXQ7_QUANTUM_WEIGHT — Offset ED8h

The Queue 7 idleSlopeCredit, Quantum or Weights register provides the average traffic transmitted in Queue 7.

Type	Size	Offset	Default
MMIO	32 bit	BAR + ED8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved**
20:0	000000h RW	**ISCQW:** idleSlopeCredit, Quantum or Weights - idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns for 100 Mbps; 8 ns for 1000 Mbps; 3.2 ns for 2500 Mbps) when the credit is increasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. Bits[20:14] must be written to zero. - Quantum When the DCB operation is enabled with DWRR algorithm for Queue 1 traffic, this field contains the quantum value in bytes to be added to credit during every queue scanning cycle. The maximum value is 0x1312D0 bytes. - Weights When DCB operation is enabled with WFQ algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x3FFF where weight of 0 indicates 100% bandwidth. Bits[20:14] must be written to zero. When DCB operation or generic queuing operation is enabled with WRR algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x64. Bits [20:7] must be written to zero. - Note 1: In multiple Queue configuration this field in respective per queue register must be programmed to some non-zero value when multiple queues are enabled or single queue other than Q0 is enabled. This field need not be programmed when only Q0 is enabled. In general, when WRR algorithm is selected a non-zero value must be programmed on both Receive and Transmit. In Receive, the register is MTL_Operation_Mode register. - Note 2: For WFQ algorithm, higher the programmed weights lesser the bandwidth allocated for that Transmit Queue. The finish time is not a function of particular packet alone but it is as per the formula: (previous_finish_time of particular Transmit Queue + (weights*packet_size)) - Note 3: The weights programmed do not correspond to the number of packets but the fraction of bandwidth or time allocated for particular queue w.r.t. total BW or time.

10.2.468 MTL_TXQ7_SENDSLOPECREDIT — Offset EDCh

The sendSlopeCredit register contains the sendSlope credit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + EDCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13:0	0000h RW	**sendSlopeCredit Value (SSC):** When AV operation is enabled, this field contains the sendSlopeCredit value required for credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns, 8 ns and 3.2 ns for 100 Mbps, 1000 Mbps and 2500 Mbps respectively) when the credit is decreasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. This field should be programmed with absolute sendSlopeCredit value. The credit-based shaper logic subtracts it from the accumulated credit when Channel 1 is selected for transmission.

10.2.469 MTL_TXQ7_HICREDIT — Offset EE0h

The hiCredit register contains the hiCredit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + EE0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:0	00000000h RW	**hiCredit Value (HC):** When the AV feature is enabled, this field contains the hiCredit value required for the credit-based shaper algorithm. This is the maximum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1,024. The maximum value is maxInterferenceSize, that is, best-effort maximum packet size (16,384 bytes or 131,072 bits). The value to be specified is 131,072 * 1,024 = 134,217,728 or 0x0800_0000.

10.2.470 MTL_TXQ7_LOCREDIT — Offset EE4h

The loCredit register contains the loCredit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + EE4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:0	00000000h RW	**loCredit Value (LC):** When AV operation is enabled, this field contains the loCredit value required for the credit-based shaper algorithm. This is the minimum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1,024. The maximum value to be programmed is corresponds to twice the maxFrameSize transmitted from this queue. If the maxFrameSize is 8192 bytes, then (8192*2) * 8 * 1024 = 134,217,728 or 0x0800_0000. Because it is a negative value, the programmed value is 2's complement of the value, that is, 0x1800_0000.

10.2.471 MTL_Q7_INTERRUPT_CONTROL_STATUS — Offset EECh

This register contains the interrupt enable and status bits for the queue 7 interrupts.

Type	Size	Offset	Default
MMIO	32 bit	BAR + EECh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**Receive Queue Overflow Interrupt Enable (RXOIE):** When this bit is set, the Receive Queue Overflow interrupt is enabled. When this bit is reset, the Receive Queue Overflow interrupt is disabled. 0x0 (DISABLE): Receive Queue Overflow Interrupt is disabled. 0x1 (ENABLE): Receive Queue Overflow Interrupt is enabled.
23:17	0h RO	**Reserved**
16	0h RW	**Receive Queue Overflow Interrupt Status (RXOVFIS):** This bit indicates that the Receive Queue had an overflow while receiving the packet. If a partial packet is transferred to the application, the overflow status is set in RDES3[21]. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Queue Overflow Interrupt Status not detected. 0x1 (ACTIVE): Receive Queue Overflow Interrupt Status detected.
15:10	0h RO	**Reserved**
9	0h RW	**Average Bits Per Slot Interrupt Enable (ABPSIE):** When this bit is set, the MAC asserts the sbd_intr_o or mci_intr_o interrupt when the average bits per slot status is updated. When this bit is cleared, the interrupt is not asserted for such an event. 0x0 (DISABLE): Average Bits Per Slot Interrupt is disabled. 0x1 (ENABLE): Average Bits Per Slot Interrupt is enabled.
8	0h RW	**Transmit Queue Underflow Interrupt Enable (TXUIE):** When this bit is set, the Transmit Queue Underflow interrupt is enabled. When this bit is reset, the Transmit Queue Underflow interrupt is disabled. 0x0 (DISABLE): Transmit Queue Underflow Interrupt Status is disabled. 0x1 (ENABLE): Transmit Queue Underflow Interrupt Status is enabled.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	**Reserved**
1	0h RW	**Average Bits Per Slot Interrupt Status (ABPSIS):** When set, this bit indicates that the MAC has updated the ABS value. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Average Bits Per Slot Interrupt Status not detected. 0x1 (ACTIVE): Average Bits Per Slot Interrupt Status detected.
0	0h RW	**Transmit Queue Underflow Interrupt Status (TXUNFIS):** This bit indicates that the Transmit Queue had an underflow while transmitting the packet. Transmission is suspended and an Underflow Error TDES3[2] is set. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Queue Underflow Interrupt Status not detected. 0x1 (ACTIVE): Transmit Queue Underflow Interrupt Status detected.

10.2.472 MTL_RXQ7_OPERATION_MODE — Offset EF0h

The Queue 7 Receive Operation Mode register establishes the Receive queue operating modes and command.

The RFA and RFD fields are not backward compatible with the RFA and RFD fields of 4.00a release

Type	Size	Offset	Default
MMIO	32 bit	BAR + EF0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved**
26:20	00h RW	**Receive Queue Size (RQS):** This field indicates the size of the allocated Receive queues in blocks of 256 bytes. The RQS field is read-write only if the number of Rx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on, so user should be programming RQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (RQS+1)*256 bytes. When the number of Rx Queues is one, the field is read-only and the configured RX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Rx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
19:14	00h RW	**Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) (RFD):** These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1.5 KB, that is, FULL 1.5 KB - 2: Full minus 2 KB, that is, FULL 2 KB - 3: Full minus 2.5 KB, that is, FULL 2.5 KB - ... - 62: Full minus 32 KB, that is, FULL 32 KB - 63: Full minus 32.5 KB, that is, FULL 32.5 KB The de-assertion is effective only after flow control is asserted. Note: The value must be programmed in such a way to make sure that the threshold is a positive number. When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register. The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13:8	00h RW	**Threshold for Activating Flow Control (in half-duplex and full-duplex (RFA):** These bits control the threshold (fill-level of Rx queue) at which the flow control is activated: For more information on encoding for this field, see RFD.
7	0h RW	**Enable Hardware Flow Control (EHFC):** When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. 0x0 (DISABLE): Hardware Flow Control is disabled. 0x1 (ENABLE): Hardware Flow Control is enabled.
6	0h RW	**Disable Dropping of TCP/IP Checksum Error Packets (DIS_TCP_EF):** When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC. When this bit is reset, all error packets are dropped if the FEP bit is reset. 0x0 (ENABLE): Dropping of TCP/IP Checksum Error Packets is enabled. 0x1 (DISABLE): Dropping of TCP/IP Checksum Error Packets is disabled.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**Receive Queue Store and Forward (RSF):** When this bit is set, the GbE Controller reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register. 0x0 (DISABLE): Receive Queue Store and Forward is disabled. 0x1 (ENABLE): Receive Queue Store and Forward is enabled.
4	0h RW	**Forward Error Packets (FEP):** When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped. When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet might be forwarded to the application or DMA. 0x0 (DISABLE): Forward Error Packets is disabled. 0x1 (ENABLE): Forward Error Packets is enabled.
3	0h RW	**Forward Undersized Good Packets (FUP):** When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. 0x0 (DISABLE): Forward Undersized Good Packets is disabled. 0x1 (ENABLE): Forward Undersized Good Packets is enabled.
2	0h RO	**Reserved**
1:0	0h RW	**Receive Queue Threshold Control (RTC):** These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred. This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1. 0x0 (M_64BYTE): 64. 0x1 (M_32BYTE): 32. 0x2 (M_96BYTE): 96. 0x3 (M_128BYTE): 128.

10.2.473 MTL_RXQ7_MISSED_PACKET_OVERFLOW_CNT — Offset EF4h

The Queue 7 Missed Packet and Overflow Counter register contains the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow.

Type	Size	Offset	Default
MMIO	32 bit	BAR + EF4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27	0h RO	**Missed Packet Counter Overflow Bit (MISCNTOVF):** When set, this bit indicates that the Rx Queue Missed Packet Counter crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Missed Packet Counter overflow not detected. 0x1 (ACTIVE): Missed Packet Counter overflow detected.
26:16	000h RO	**Missed Packet Counter (MISPKTCNT):** This field indicates the number of packets missed by the GbE Controller because the application asserted ari_pkt_flush_i[] for this queue. This counter is reset when this register is read with mci_be_i[0] at 1b1. This counter is incremented by 1 when the DMA discards the packet because of buffer unavailability. Access restriction applies. Clears on read. Self-set to 1 on internal event.
15:12	0h RO	**Reserved**
11	0h RO	**Overflow Counter Overflow Bit (OVFCNTOVF):** When set, this bit indicates that the Rx Queue Overflow Packet Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Overflow Counter overflow not detected. 0x1 (ACTIVE): Overflow Counter overflow detected.
10:0	000h RO	**Overflow Packet Counter (OVFPKTCNT):** This field indicates the number of packets discarded by the GbE Controller because of Receive queue overflow. This counter is incremented each time the GbE Controller discards an incoming packet because of overflow. This counter is reset when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

10.2.474 MTL_RXQ7_DEBUG — Offset EF8h

The Queue 7 Receive Debug register gives the debug status of various blocks related to the Receive queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + EF8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:16	0000h RO	**Number of Packets in Receive Queue (PRXQ):** This field indicates the current number of packets in the Rx Queue. The theoretical maximum value for this field is 256KB/16B = 16K Packets, that is, Max_Queue_Size/ Min_Packet_Size.
15:6	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
5:4	0h RO	**MTL Rx Queue Fill-Level Status (RXQSTS):** This field gives the status of the fill-level of the Rx Queue: 0x0 (EMPTY): Rx Queue empty. 0x1 (BLW_THR): Rx Queue fill-level below flow-control deactivate threshold. 0x2 (ABV_THR): Rx Queue fill-level above flow-control activate threshold. 0x3 (FULL): Rx Queue full.
3	0h RO	**Reserved**
2:1	0h RO	**MTL Rx Queue Read Controller State (RRCSTS):** This field gives the state of the Rx queue Read controller: 0x0 (IDLE): Idle state. 0x1 (READ_DATA): Reading packet data. 0x2 (READ_STS): Reading packet status (or timestamp). 0x3 (FLUSH): Flushing the packet data and status.
0	0h RO	**MTL Rx Queue Write Controller Active Status (RWCSTS):** When high, this bit indicates that the MTL Rx queue Write controller is active, and it is transferring a received packet to the Rx Queue. 0x0 (INACTIVE): MTL Rx Queue Write Controller Active Status not detected. 0x1 (ACTIVE): MTL Rx Queue Write Controller Active Status detected.

10.2.475 MTL_RXQ7_CONTROL — Offset EFCh

The Queue Receive Control register controls the receive arbitration and passing of received packets to the application.

Type	Size	Offset	Default
MMIO	32 bit	BAR + EFCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**Receive Queue Packet Arbitration (RXQ_FRM_ARBIT):** When this bit is set, the GbE Controller drives the packet data to the ARI interface such that the entire packet data of currently-selected queue is transmitted before switching to other queue. When this bit is reset, the GbE Controller drives the packet data to the ARI interface such that the following amount of data of currently-selected queue is transmitted before switching to other queue: - PBL amount of data (indicated by ari_qN_pbl_i[]) or - Complete data of a packet The status and the timestamp are not a part of the PBL data. Therefore, the GbE Controller drives the complete status (including timestamp status) during first PBL request for the packet (in store-and-forward mode) or the last PBL request for the packet (in Threshold mode). 0x0 (DISABLE): Receive Queue Packet Arbitration is disabled. 0x1 (ENABLE): Receive Queue Packet Arbitration is enabled.
2:0	0h RW	**Receive Queue Weight (RXQ_WEGT):** This field indicates the weight assigned to the Rx Queue 0. This field needs to be programmed with one value less than the required weight, i.e. reset value of 0 indicates weight of 1, value of 1 indicates weight of 2, and so on. The weight is used as the number of continuous PBL or packets requests (depending on the RXQ_FRM_ARBIT) allocated to the queue in one arbitration cycle. Note: The change in value of RXQ_WEGT takes effect only after the completion of current service round or when there is change from RAA=SP to RAA=WSP algorithm. This approach is taken so that there is smooth transition. For the RXQ_WEGT value to take effect at the start, the MTL_RxQ(#i)_Control registers must be programmed before the MTL_Operation_Mode register.

10.2.476 DMA_MODE — Offset 1000h

The Bus Mode register establishes the bus operating modes for the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1000h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:22	0h RW	**Rx DMA's Maximum Number of Descriptors to be fetched in a burst (RNDF):** 0x0 (MODE0): 16 0x1 (MODE1): 8 0x2 (MODE2): 4 0x3 (MODE3): 2
21:20	0h RW	**Tx DMA's Maximum Number of Descriptors to be fetched in a burst (TNDF):** 0x0 (MODE0): 16 0x1 (MODE1): 8 0x2 (MODE2): 4 0x3 (MODE3): 2

Bit Range	Default & Access	Field Name (ID): Description
19	0h RW	**Descriptor Cache Enable (DCHE):** When set enables prefetching of descriptors to the Descriptor Cache. When reset descriptor cache feature is disabled. 0x0 (DISABLE): Descriptor Cache Support is disabled. 0x1 (ENABLE): Descriptor Cache Support is enabled.
18	0h RO	**Reserved**
17:16	0h RW	**Interrupt Mode (INTM):** This field defines the interrupt mode of GbE Controller. The behavior of the following outputs changes depending on the following settings: - sbd_perch_tx_intr_o[] (Transmit Per Channel Interrupt) - sbd_perch_rx_intr_o[] (Receive Per Channel Interrupt) - sbd_intr_o (Common Interrupt) It also changes the behavior of the RI/TI bits in the DMA_CH0_Status. - 00: sbd_perch_* are pulse signals for each TX/RX packet transfer completion events (irrespective of whether corresponding interrupts are enabled) for which IOC bits are enabled in descriptor. sbd_intr_o is also asserted when corresponding interrupts are enabled and cleared only when software clears the corresponding RI/TI status bits. - 01: sbd_perch_* are level signals asserted on TX/RX packet transfer completion event when corresponding interrupts are enabled and de-asserted when the software clears the corresponding RI/TI status bits. The sbd_intr_o is not asserted for these TX/RX packet transfer completion events. - 10: sbd_perch_* are level signals asserted on TX/RX packet transfer completion event when corresponding interrupts are enabled and de-asserted when the software clears the corresponding RI/TI status bits. However, the signal is asserted again if the same event occurred again before it was cleared. The sbd_intr_o is not asserted for these TX/RX packet transfer completion events. - 11: Reserved 0x0 (MODE0): See above description. 0x1 (MODE1): See above description. 0x2 (MODE2): See above description. 0x3 (RSVD): Reserved.
15:11	0h RO	**Reserved**
10	0h RW	**Reserved**
9	0h RO	**Reserved**
8	0h RW	**Descriptor Posted Write (DSPW):** When this bit is set to 0, the descriptor writes are always non-posted. When this bit is set to 1, the descriptor writes are non-posted only when IOC (Interrupt on completion) is set in last descriptor, otherwise the descriptor writes are always posted. 0x0 (DISABLE): Descriptor Posted Write is disabled. 0x1 (ENABLE): Descriptor Posted Write is enabled.
7:5	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
4:2	0h RW	**Transmit Arbitration Algorithm (TAA):** This field is used to select the arbitration algorithm for the Transmit side when multiple Tx DMAs are selected. 0x0 (FP): Fixed priority (Channel 0 has the lowest priority and the last channel has the highest priority). 0x1 (WSP): Weighted Strict Priority (WSP). 0x2 (WRR): Weighted Round-Robin (WRR). 0x3 (RSVD): Reserved (for 3'b011 to 3'b111).
1	0h RO	**Reserved**
0	0h RW	**Software Reset (SWR):** When this bit is set, the MAC and the DMA controller reset the logic and all internal registers of the DMA, MTL, and MAC. This bit is automatically cleared after the reset operation is complete in all GbE Controller clock domains. Before reprogramming any GbE Controller register, a value of zero should be read in this bit. This bit must be read at least 4 CSR clock cycles after it is written to 1. Note: The reset operation is complete only when all resets in all active clock domains are de-asserted. Therefore, it is essential that all PHY inputs clocks (applicable for the selected PHY interface) are present for software reset completion. The time to complete the software reset operation depends on the frequency of the slowest active clock. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Software Reset is disabled. 0x1 (ENABLE): Software Reset is enabled.

10.2.477 DMA_SYSBUS_MODE — Offset 1004h

The System Bus mode register controls the behavior of the AHB or AXI master. It mainly controls burst splitting and number of outstanding requests.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1004h	01010000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable Low Power Interface (LPI) (EN_LPI):** When set to 1, this bit enables the LPI mode supported by the EQOS-AXI configuration and accepts the LPI request from the AXI System Clock controller. When set to 0, this bit disables the LPI mode and always denies the LPI request from the AXI System Clock controller. 0x0 (DISABLE): Low Power Interface (LPI) is disabled. 0x1 (ENABLE): Low Power Interface (LPI) is enabled.
30	0h RW	**Unlock on Magic Packet or Remote Wake-Up Packet (LPI_XIT_PKT):** When set to 1, this bit enables the AXI master to come out of the LPI mode only when the magic packet or remote wake-up packet is received. When set to 0, this bit enables the AXI master to come out of the LPI mode when any packet is received. 0x0 (DISABLE): Unlock on Magic Packet or Remote Wake-Up Packet is disabled. 0x1 (ENABLE): Unlock on Magic Packet or Remote Wake-Up Packet is enabled.
29:28	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
27:24	1h RW	**AXI Maximum Write Outstanding Request Limit (WR_OSR_LMT):** This value limits the maximum outstanding request on the AXI write interface. Maximum outstanding requests = WR_OSR_LMT + 1
23:20	0h RO	**Reserved**
19:16	1h RW	**AXI Maximum Read Outstanding Request Limit (RD_OSR_LMT):** This value limits the maximum outstanding request on the AXI read interface. Maximum outstanding requests = RD_OSR_LMT + 1
15:14	0h RO	**Reserved**
13	0h RW	**1 KB Boundary Crossing Enable for the EQOS-AXI Master (ONEKBBE):** When set, the burst transfers performed by the EQOS-AXI master do not cross 1 KB boundary. When reset, the burst transfers performed by the EQOS-AXI master do not cross 4 KB boundary. 0x0 (DISABLE): 1 KB Boundary Crossing for the EQOS-AXI Master Beats is disabled. 0x1 (ENABLE): 1 KB Boundary Crossing for the EQOS-AXI Master Beats is enabled.
12	0h RW	**Address-Aligned Beats (AAL):** When this bit is set to 1, the EQOS-AXI or EQOS-AHB master performs address-aligned burst transfers on Read and Write channels. 0x0 (DISABLE): Address-Aligned Beats is disabled. 0x1 (ENABLE): Address-Aligned Beats is enabled.
11	0h RW	**Enhanced Address Mode Enable. (EAME):** When this bit is set to 1, the DMA master enables the enhanced address mode (40-bit or 48-bit addressing mode). In this mode, the DMA engine uses either the 40- or 48-bit address, depending on the configuration. 0x0 (DISABLE): Enhanced Address Mode is disabled. 0x1 (ENABLE): Enhanced Address Mode is enabled.
10	0h RW	**Automatic AXI LPI enable (AALE):** When set to 1, enables the AXI master to enter into LPI state when there is no activity in the GbE Controller for number of system clock cycles programmed in the LPIEI field of AXI_LPI_Entry_Interval register. 0x0 (DISABLE): Automatic AXI LPI is disabled. 0x1 (ENABLE): Automatic AXI LPI is enabled.
9:8	0h RO	**Reserved**
7	0h RW	**AXI Burst Length 256 (BLEN256):** When this bit is set to 1, the EQOS-AXI master can select a burst length of 256 on the AXI interface. 0x0 (DISABLE): No effect. 0x1 (ENABLE): AXI Burst Length 256.
6	0h RW	**AXI Burst Length 128 (BLEN128):** When this bit is set to 1, the EQOS-AXI master can select a burst length of 128 on the AXI interface. 0x0 (DISABLE): No effect. 0x1 (ENABLE): AXI Burst Length 128.
5	0h RW	**AXI Burst Length 64 (BLEN64):** When this bit is set to 1, the EQOS-AXI master can select a burst length of 64 on the AXI interface. 0x0 (DISABLE): No effect. 0x1 (ENABLE): AXI Burst Length 64.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	**AXI Burst Length 32 (BLEN32):** When this bit is set to 1, the EQOS-AXI master can select a burst length of 32 on the AXI interface. 0x0 (DISABLE): No effect. 0x1 (ENABLE): AXI Burst Length 32.
3	0h RW	**AXI Burst Length 16 (BLEN16):** When this bit is set to 1 or the FB bit is set to 0, the EQOS-AXI master can select a burst length of 16 on the AXI interface. When the FB bit is set to 0, setting this bit has no effect. 0x0 (DISABLE): No effect. 0x1 (ENABLE): AXI Burst Length 16.
2	0h RW	**AXI Burst Length 8 (BLEN8):** When this bit is set to 1 or the FB bit is set to 0, the EQOS-AXI master can select a burst length of 8 on the AXI interface. When the FB bit is set to 0, setting this bit has no effect. 0x0 (DISABLE): No effect. 0x1 (ENABLE): AXI Burst Length 8.
1	0h RW	**AXI Burst Length 4 (BLEN4):** When this bit is set to 1 or the FB bit is set to 0, the EQOS-AXI master can select a burst length of 4 on the AXI interface. When the FB bit is set to 0, setting this bit has no effect. 0x0 (DISABLE): No effect. 0x1 (ENABLE): AXI Burst Length 4.
0	0h RW	**FB:** Fixed Burst Length When this bit is set to 1, the EQOS-AXI master initiates burst transfers of specified lengths as given below. - Burst transfers of fixed burst lengths as indicated by the BLEN256, BLEN128, BLEN64, BLEN32, BLEN16, BLEN8, or BLEN4 field - Burst transfers of length 1 When this bit is set to 0, the EQOS-AXI master initiates burst transfers that are equal to or less than the maximum allowed burst length programmed in Bits[7:1]. 0x0 (DISABLE): Fixed Burst Length is disabled. 0x1 (ENABLE): Fixed Burst Length is enabled.

10.2.478 DMA_INTERRUPT_STATUS — Offset 1008h

The application reads this Interrupt Status register during interrupt service routine or polling to determine the interrupt status of DMA channels, MTL queues, and the MAC.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1008h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17	0h RO	**MAC Interrupt Status (MACIS):** This bit indicates an interrupt event in the MAC. To reset this bit to 1'b0, the software must read the corresponding register in the MAC to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): MAC Interrupt Status not detected. 0x1 (ACTIVE): MAC Interrupt Status detected.
16	0h RO	**MTL Interrupt Status (MTLIS):** This bit indicates an interrupt event in the MTL. To reset this bit to 1'b0, the software must read the corresponding register in the MTL to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): MTL Interrupt Status not detected. 0x1 (ACTIVE): MTL Interrupt Status detected.
15:8	0h RO	**Reserved**
7	0h RO	**DMA Channel 7 Interrupt Status (DC7IS):** This bit indicates an interrupt event in DMA Channel 7. To reset this bit to 1'b0, the software must read the corresponding register in DMA Channel 7 to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): DMA Channel 7 Interrupt Status not detected. 0x1 (ACTIVE): DMA Channel 7 Interrupt Status detected.
6	0h RO	**DMA Channel 6 Interrupt Status (DC6IS):** This bit indicates an interrupt event in DMA Channel 6. To reset this bit to 1'b0, the software must read the corresponding register in DMA Channel 6 to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): DMA Channel 6 Interrupt Status not detected. 0x1 (ACTIVE): DMA Channel 6 Interrupt Status detected.
5	0h RO	**DMA Channel 5 Interrupt Status (DC5IS):** This bit indicates an interrupt event in DMA Channel 5. To reset this bit to 1'b0, the software must read the corresponding register in DMA Channel 5 to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): DMA Channel 5 Interrupt Status not detected. 0x1 (ACTIVE): DMA Channel 5 Interrupt Status detected.
4	0h RO	**DMA Channel 4 Interrupt Status (DC4IS):** This bit indicates an interrupt event in DMA Channel 4. To reset this bit to 1'b0, the software must read the corresponding register in DMA Channel 4 to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): DMA Channel 4 Interrupt Status not detected. 0x1 (ACTIVE): DMA Channel 4 Interrupt Status detected.
3	0h RO	**DMA Channel 3 Interrupt Status (DC3IS):** This bit indicates an interrupt event in DMA Channel 3. To reset this bit to 1'b0, the software must read the corresponding register in DMA Channel 3 to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): DMA Channel 3 Interrupt Status not detected. 0x1 (ACTIVE): DMA Channel 3 Interrupt Status detected.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RO	**DMA Channel 2 Interrupt Status (DC2IS):** This bit indicates an interrupt event in DMA Channel 2. To reset this bit to 1'b0, the software must read the corresponding register in DMA Channel 2 to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): DMA Channel 2 Interrupt Status not detected. 0x1 (ACTIVE): DMA Channel 2 Interrupt Status detected.
1	0h RO	**DMA Channel 1 Interrupt Status (DC1IS):** This bit indicates an interrupt event in DMA Channel 1. To reset this bit to 1'b0, the software must read the corresponding register in DMA Channel 1 to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): DMA Channel 1 Interrupt Status not detected. 0x1 (ACTIVE): DMA Channel 1 Interrupt Status detected.
0	0h RO	**DMA Channel 0 Interrupt Status (DC0IS):** This bit indicates an interrupt event in DMA Channel 0. To reset this bit to 1'b0, the software must read the corresponding register in DMA Channel 0 to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): DMA Channel 0 Interrupt Status not detected. 0x1 (ACTIVE): DMA Channel 0 Interrupt Status detected.

10.2.479 DMA_DEBUG_STATUS0 — Offset 100Ch

The Debug Status 0 register gives the Receive and Transmit process status for DMA Channel 0-Channel 2 for debugging purpose.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 100Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**DMA Channel 2 Transmit Process State (TPS2):** This field indicates the Tx DMA FSM state for Channel 2. The MSB of this field always returns 0. This field does not generate an interrupt. 0x0 (STOP): Stopped (Reset or Stop Transmit Command issued). 0x1 (RUN_FTTD): Running (Fetching Tx Transfer Descriptor). 0x2 (RUN_WS): Running (Waiting for status). 0x3 (RUN_RDS): Running (Reading Data from system memory buffer and queuing it to the Tx buffer (Tx FIFO)). 0x4 (TSTMP_WS): Timestamp write state. 0x5 (RSVD): Reserved for future use. 0x6 (SUSPND): Suspended (Tx Descriptor Unavailable or Tx Buffer Underflow). 0x7 (RUN_CTD): Running (Closing Tx Descriptor).
27:24	0h RO	**DMA Channel 2 Receive Process State (RPS2):** This field indicates the Rx DMA FSM state for Channel 2. The MSB of this field always returns 0. This field does not generate an interrupt. 0x0 (STOP): Stopped (Reset or Stop Receive Command issued). 0x1 (RUN_FRTD): Running (Fetching Rx Transfer Descriptor). 0x2 (RSVD): Reserved for future use. 0x3 (RUN_WRP): Running (Waiting for Rx packet). 0x4 (SUSPND): Suspended (Rx Descriptor Unavailable). 0x5 (RUN_CRD): Running (Closing the Rx Descriptor). 0x6 (TSTMP): Timestamp write state. 0x7 (RUN_TRP): Running (Transferring the received packet data from the Rx buffer to the system memory).
23:20	0h RO	**DMA Channel 1 Transmit Process State (TPS1):** This field indicates the Tx DMA FSM state for Channel 1. The MSB of this field always returns 0. This field does not generate an interrupt. 0x0 (STOP): Stopped (Reset or Stop Transmit Command issued). 0x1 (RUN_FTTD): Running (Fetching Tx Transfer Descriptor). 0x2 (RUN_WS): Running (Waiting for status). 0x3 (RUN_RDS): Running (Reading Data from system memory buffer and queuing it to the Tx buffer (Tx FIFO)). 0x4 (TSTMP_WS): Timestamp write state. 0x5 (RSVD): Reserved for future use. 0x6 (SUSPND): Suspended (Tx Descriptor Unavailable or Tx Buffer Underflow). 0x7 (RUN_CTD): Running (Closing Tx Descriptor).
19:16	0h RO	**DMA Channel 1 Receive Process State (RPS1):** This field indicates the Rx DMA FSM state for Channel 1. The MSB of this field always returns 0. This field does not generate an interrupt. 0x0 (STOP): Stopped (Reset or Stop Receive Command issued). 0x1 (RUN_FRTD): Running (Fetching Rx Transfer Descriptor). 0x2 (RSVD): Reserved for future use. 0x3 (RUN_WRP): Running (Waiting for Rx packet). 0x4 (SUSPND): Suspended (Rx Descriptor Unavailable). 0x5 (RUN_CRD): Running (Closing the Rx Descriptor). 0x6 (TSTMP): Timestamp write state. 0x7 (RUN_TRP): Running (Transferring the received packet data from the Rx buffer to the system memory).

Bit Range	Default & Access	Field Name (ID): Description
15:12	0h RO	**DMA Channel 0 Transmit Process State (TPS0):** This field indicates the Tx DMA FSM state for Channel 0. The MSB of this field always returns 0. This field does not generate an interrupt. 0x0 (STOP): Stopped (Reset or Stop Transmit Command issued). 0x1 (RUN_FTTD): Running (Fetching Tx Transfer Descriptor). 0x2 (RUN_WS): Running (Waiting for status). 0x3 (RUN_RDS): Running (Reading Data from system memory buffer and queuing it to the Tx buffer (Tx FIFO)). 0x4 (TSTMP_WS): Timestamp write state. 0x5 (RSVD): Reserved for future use. 0x6 (SUSPND): Suspended (Tx Descriptor Unavailable or Tx Buffer Underflow). 0x7 (RUN_CTD): Running (Closing Tx Descriptor).
11:8	0h RO	**DMA Channel 0 Receive Process State (RPS0):** This field indicates the Rx DMA FSM state for Channel 0. The MSB of this field always returns 0. This field does not generate an interrupt. 0x0 (STOP): Stopped (Reset or Stop Receive Command issued). 0x1 (RUN_FRTD): Running (Fetching Rx Transfer Descriptor). 0x2 (RSVD): Reserved for future use. 0x3 (RUN_WRP): Running (Waiting for Rx packet). 0x4 (SUSPND): Suspended (Rx Descriptor Unavailable). 0x5 (RUN_CRD): Running (Closing the Rx Descriptor). 0x6 (TSTMP): Timestamp write state. 0x7 (RUN_TRP): Running (Transferring the received packet data from the Rx buffer to the system memory).
7:2	0h RO	**Reserved**
1	0h RO	**AXI Master Read Channel Status (AXRHSTS):** When high, this bit indicates that the read channel of the AXI master is active, and it is transferring the data. 0x0 (INACTIVE): AXI Master Read Channel Status not detected. 0x1 (ACTIVE): AXI Master Read Channel Status detected.
0	0h RO	**AXI Master Write Channel (AXWHSTS):** When high, this bit indicates that the write channel of the AXI master is active, and it is transferring data. 0x0 (INACTIVE): AXI Master Write Channel or AHB Master Status not detected. 0x1 (ACTIVE): AXI Master Write Channel or AHB Master Status detected.

10.2.480 DMA_DEBUG_STATUS1 — Offset 1010h

The Debug Status1 register gives the Receive and Transmit process status for DMA Channel 3-Channel 6.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1010h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**DMA Channel 6 Transmit Process State (TPS6):** This field indicates the Tx DMA FSM state for Channel 6. The MSB of this field always returns 0. This field does not generate an interrupt. 0x0 (STOP): Stopped (Reset or Stop Transmit Command issued). 0x1 (RUN_FTTD): Running (Fetching Tx Transfer Descriptor). 0x2 (RUN_WS): Running (Waiting for status). 0x3 (RUN_RDS): Running (Reading Data from system memory buffer and queuing it to the Tx buffer (Tx FIFO)). 0x4 (TSTMP_WS): Timestamp write state. 0x5 (RSVD): Reserved for future use. 0x6 (SUSPND): Suspended (Tx Descriptor Unavailable or Tx Buffer Underflow). 0x7 (RUN_CTD): Running (Closing Tx Descriptor).
27:24	0h RO	**DMA Channel 6 Receive Process State (RPS6):** This field indicates the Rx DMA FSM state for Channel 6. The MSB of this field always returns 0. This field does not generate an interrupt. 0x0 (STOP): Stopped (Reset or Stop Receive Command issued). 0x1 (RUN_FRTD): Running (Fetching Rx Transfer Descriptor). 0x2 (RSVD): Reserved for future use. 0x3 (RUN_WRP): Running (Waiting for Rx packet). 0x4 (SUSPND): Suspended (Rx Descriptor Unavailable). 0x5 (RUN_CRD): Running (Closing the Rx Descriptor). 0x6 (TSTMP): Timestamp write state. 0x7 (RUN_TRP): Running (Transferring the received packet data from the Rx buffer to the system memory).
23:20	0h RO	**DMA Channel 5 Transmit Process State (TPS5):** This field indicates the Tx DMA FSM state for Channel 5. The MSB of this field always returns 0. This field does not generate an interrupt. 0x0 (STOP): Stopped (Reset or Stop Transmit Command issued). 0x1 (RUN_FTTD): Running (Fetching Tx Transfer Descriptor). 0x2 (RUN_WS): Running (Waiting for status). 0x3 (RUN_RDS): Running (Reading Data from system memory buffer and queuing it to the Tx buffer (Tx FIFO)). 0x4 (TSTMP_WS): Timestamp write state. 0x5 (RSVD): Reserved for future use. 0x6 (SUSPND): Suspended (Tx Descriptor Unavailable or Tx Buffer Underflow). 0x7 (RUN_CTD): Running (Closing Tx Descriptor).
19:16	0h RO	**DMA Channel 5 Receive Process State (RPS5):** This field indicates the Rx DMA FSM state for Channel 5. The MSB of this field always returns 0. This field does not generate an interrupt. 0x0 (STOP): Stopped (Reset or Stop Receive Command issued). 0x1 (RUN_FRTD): Running (Fetching Rx Transfer Descriptor). 0x2 (RSVD): Reserved for future use. 0x3 (RUN_WRP): Running (Waiting for Rx packet). 0x4 (SUSPND): Suspended (Rx Descriptor Unavailable). 0x5 (RUN_CRD): Running (Closing the Rx Descriptor). 0x6 (TSTMP): Timestamp write state. 0x7 (RUN_TRP): Running (Transferring the received packet data from the Rx buffer to the system memory).

Bit Range	Default & Access	Field Name (ID): Description
15:12	0h RO	**DMA Channel 4 Transmit Process State (TPS4):** This field indicates the Tx DMA FSM state for Channel 4. The MSB of this field always returns 0. This field does not generate an interrupt. 0x0 (STOP): Stopped (Reset or Stop Transmit Command issued). 0x1 (RUN_FTTD): Running (Fetching Tx Transfer Descriptor). 0x2 (RUN_WS): Running (Waiting for status). 0x3 (RUN_RDS): Running (Reading Data from system memory buffer and queuing it to the Tx buffer (Tx FIFO)). 0x4 (TSTMP_WS): Timestamp write state. 0x5 (RSVD): Reserved for future use. 0x6 (SUSPND): Suspended (Tx Descriptor Unavailable or Tx Buffer Underflow). 0x7 (RUN_CTD): Running (Closing Tx Descriptor).
11:8	0h RO	**DMA Channel 4 Receive Process State (RPS4):** This field indicates the Rx DMA FSM state for Channel 4. The MSB of this field always returns 0. This field does not generate an interrupt. 0x0 (STOP): Stopped (Reset or Stop Receive Command issued). 0x1 (RUN_FRTD): Running (Fetching Rx Transfer Descriptor). 0x2 (RSVD): Reserved for future use. 0x3 (RUN_WRP): Running (Waiting for Rx packet). 0x4 (SUSPND): Suspended (Rx Descriptor Unavailable). 0x5 (RUN_CRD): Running (Closing the Rx Descriptor). 0x6 (TSTMP): Timestamp write state. 0x7 (RUN_TRP): Running (Transferring the received packet data from the Rx buffer to the system memory).
7:4	0h RO	**DMA Channel 3 Transmit Process State (TPS3):** This field indicates the Tx DMA FSM state for Channel 3. The MSB of this field always returns 0. This field does not generate an interrupt. 0x0 (STOP): Stopped (Reset or Stop Transmit Command issued). 0x1 (RUN_FTTD): Running (Fetching Tx Transfer Descriptor). 0x2 (RUN_WS): Running (Waiting for status). 0x3 (RUN_RDS): Running (Reading Data from system memory buffer and queuing it to the Tx buffer (Tx FIFO)). 0x4 (TSTMP_WS): Timestamp write state. 0x5 (RSVD): Reserved for future use. 0x6 (SUSPND): Suspended (Tx Descriptor Unavailable or Tx Buffer Underflow). 0x7 (RUN_CTD): Running (Closing Tx Descriptor).
3:0	0h RO	**DMA Channel 3 Receive Process State (RPS3):** This field indicates the Rx DMA FSM state for Channel 3. The MSB of this field always returns 0. This field does not generate an interrupt. 0x0 (STOP): Stopped (Reset or Stop Receive Command issued). 0x1 (RUN_FRTD): Running (Fetching Rx Transfer Descriptor). 0x2 (RSVD): Reserved for future use. 0x3 (RUN_WRP): Running (Waiting for Rx packet). 0x4 (SUSPND): Suspended (Rx Descriptor Unavailable). 0x5 (RUN_CRD): Running (Closing the Rx Descriptor). 0x6 (TSTMP): Timestamp write state. 0x7 (RUN_TRP): Running (Transferring the received packet data from the Rx buffer to the system memory).

10.2.481 DMA_DEBUG_STATUS2 — Offset 1014h

The Debug Status Register 2 gives the Receive and Transmit process status for DMA Channel 7.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1014h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:4	0h RO	**DMA Channel 7 Transmit Process State (TPS7):** This field indicates the Tx DMA FSM state for Channel 7. The MSB of this field always returns 0. This field does not generate an interrupt. 0x0 (STOP): Stopped (Reset or Stop Transmit Command issued). 0x1 (RUN_FTTD): Running (Fetching Tx Transfer Descriptor). 0x2 (RUN_WS): Running (Waiting for status). 0x3 (RUN_RDS): Running (Reading Data from system memory buffer and queuing it to the Tx buffer (Tx FIFO)). 0x4 (TSTMP_WS): Timestamp write state. 0x5 (RSVD): Reserved for future use. 0x6 (SUSPND): Suspended (Tx Descriptor Unavailable or Tx Buffer Underflow). 0x7 (RUN_CTD): Running (Closing Tx Descriptor).
3:0	0h RO	**DMA Channel 7 Receive Process State (RPS7):** This field indicates the Rx DMA FSM state for Channel 7. The MSB of this field always returns 0. This field does not generate an interrupt. 0x0 (STOP): Stopped (Reset or Stop Receive Command issued). 0x1 (RUN_FRTD): Running (Fetching Rx Transfer Descriptor). 0x2 (RSVD): Reserved for future use. 0x3 (RUN_WRP): Running (Waiting for Rx packet). 0x4 (SUSPND): Suspended (Rx Descriptor Unavailable). 0x5 (RUN_CRD): Running (Closing the Rx Descriptor). 0x6 (TSTMP): Timestamp write state. 0x7 (RUN_TRP): Running (Transferring the received packet data from the Rx buffer to the system memory).

10.2.482 AXI4_TX_AR_ACE_CONTROL — Offset 1020h

This register is used to control the AXI4 Cache Coherency Signals for read transactions by all the Transmit DMA channels. The following signals of the AXI4 interface are driven with different values as programmed

for corresponding type (descriptor, buffer1, buffer2) of access.

- arcache_m_o[3:0]

- ardomain_m_o[1:0]

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1020h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21:20	0h RW	**Transmit DMA First Packet Buffer or TSO Header Domain Control (THD):** When TSO is NOT enabled, This field is used to drive ardomain_o[1:0] signal when Transmit DMA is accessing First Buffer of the Packet (First valid buffer with FD being set in the TDES3 of the Descriptor). When TSO is enabled, This field is used to drive ardomain_o[1:0] signal when the Transmit DMA is accessing the TSO Header data.
19:16	0h RW	**Transmit DMA First Packet Buffer or TSO Header Cache Control (THC):** When TSO is NOT enabled, This field is used to drive arcache_o[3:0] signal when Transmit DMA is accessing First Buffer of the Packet (First valid buffer with FD being set in the TDES3 of the Descriptor).. When TSO is enabled, This field is used to drive arcache_o[3:0] signal when the Transmit DMA is accessing the TSO Header data.
15:14	0h RO	**Reserved**
13:12	0h RW	**Transmit DMA Extended Packet Buffer or TSO Payload Domain Control (TED):** When TSO is NOT enabled, This field is used to drive ardomain_o[1:0] signal when Transmit DMA is accessing the extended buffers (when packet is distributed across multiple buffers). When TSO is enabled, This field is used to drive ardomain_o[1:0] signal when the Transmit DMA is accessing the TSO payload data.
11:8	0h RW	**Transmit DMA Extended Packet Buffer or TSO Payload Cache Control (TEC):** When TSO is NOT enabled, This field is used to drive arcache_o[3:0] signal when Transmit DMA is accessing the extended buffers (when packet is distributed across multiple buffers). When TSO is enabled, This field is used to drive arcache_o[3:0] signal when the Transmit DMA is accessing the TSO payload data.
7:6	0h RO	**Reserved**
5:4	0h RW	**Transmit DMA Read Descriptor Domain Control (TDRD):** This field is used to drive ardomain_o[1:0] signal when Transmit DMA engines access the Descriptor.
3:0	0h RW	**Transmit DMA Read Descriptor Cache Control (TDRC):** This field is used to drive arcache_o[3:0] signal when Transmit DMA engines access the Descriptor.

10.2.483 AXI4_RX_AW_ACE_CONTROL — Offset 1024h

This register is used to control the AXI4 Cache Coherency Signals for write transactions by all the Receive DMA channels. The following signals of the AXI4 interface are driven with different values as programmed

for corresponding type (descriptor, buffer1, buffer2) of access.

- awcache_m_o[3:0]

- awdomain_m_o[1:0]

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1024h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:28	0h RW	**Receive DMA Buffer Domain Control (RDD):** This field is used to drive the awdomain_o[1:0] signal when Receive DMA is accessing the Buffer when Header and payload are NOT separated.
27:24	0h RW	**Receive DMA Buffer Cache Control (RDC):** This field is used to drive awcache_o[3:0] signal when Receive DMA is accessing the Buffer when Header and payload are NOT separated.
23:22	0h RO	**Reserved**
21:20	0h RW	**Receive DMA Header Domain Control (RHD):** This field is used to drive awdomain_o[1:0] and signal when Receive DMA is accessing the header Buffer when Header and payload are separated.
19:16	0h RW	**Receive DMA Header Cache Control (RHC):** This field is used to drive awcache_o[3:0] and signal when Receive DMA is accessing the header Buffer when Header and payload are separated.
15:14	0h RO	**Reserved**
13:12	0h RW	**Receive DMA Payload Domain Control (RPD):** This field is used to drive awdomain_o[1:0] signal when Receive DMA is accessing the Payload Buffer when Header and payload are separated.
11:8	0h RW	**Receive DMA Payload Cache Control (RPC):** This field is used to drive awcache_o[3:0] signal when Receive DMA is accessing the Payload Buffer when Header and payload are separated.
7:6	0h RO	**Reserved**
5:4	0h RW	**Receive DMA Write Descriptor Domain Control (RDWD):** This field is used to drive awdomain_o[1:0] signal when Receive DMA accesses the Descriptor.
3:0	0h RW	**Receive DMA Write Descriptor Cache Control (RDWC):** This field is used to drive awcache_o[3:0] signal when Receive DMA accesses the Descriptor.

10.2.484 AXI4_TXRX_AWAR_ACE_CONTROL — Offset 1028h

This register is used to control the AXI4 Cache Coherency Signals for Descriptor write transactions by all the TxDMA channels and Descriptor read transactions by all the RxDMA channels. It also controls the values to be driven on awprot_m_o and arprot_m_o.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1028h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:20	0h RW	**DMA Write Protection control (WRP):** This field is used to drive awprot_m_o[2:0] signal on the AXI Write Channel.
19	0h RO	**Reserved**
18:16	0h RW	**DMA Read Protection control (RDP):** This field is used to drive arprot_m_o[2:0] signal during all read requests.
15:14	0h RO	**Reserved**
13:12	0h RW	**Receive DMA Read Descriptor Domain control (RDRD):** This field is used to drive ardomain_o[1:0] signal when Receive DMA engines read the Descriptor.
11:8	0h RW	**Receive DMA Read Descriptor Cache control (RDRC):** This field is used to drive arcache_o[3:0] signal when Receive DMA engines read the Descriptor.
7:6	0h RO	**Reserved**
5:4	0h RW	**Transmit DMA Write Descriptor Domain control (TDWD):** This field is used to drive awdomain_o[1:0] signal when Transmit DMA write to the Descriptor.
3:0	0h RW	**Transmit DMA Write Descriptor Cache control (TDWC):** This field is used to drive awcache_o[3:0] signal when Transmit DMA writes to the Descriptor.

10.2.485 AXI_LPI_ENTRY_INTERVAL — Offset 1040h

This register is used to control the AXI LPI entry interval.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1040h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3:0	0h RW	**LPI Entry Interval (LPIEI):** Contains the number of system clock cycles, multiplied by 64, to wait for an activity in the GbE Controller to enter into the AXI low power state 0 indicates 64 clock cycles

10.2.486 DMA_TBS_CTRL0 — Offset 1050h

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1050h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**Fetch Time Offset (FTOS):** The value in units of 256 nanoseconds, that has to be deducted from the Launch time to compute the Fetch Time. Max value: 999,999,999 ns, additionally should be smaller than CTR-1 value when ESTM mode is set since this value is a modulo CTR value.
7	0h RO	**Reserved**
6:4	0h RW	**Fetch GSN Offset (FGOS):** The number GSN slots that must be deducted from the Launch GSN to compute the Fetch GSN. Value valid only when FTOV is set.
3:1	0h RO	**Reserved**
0	0h RW	**Fetch Time Offset Valid (FTOV):** Valid When set indicates the FTOS field is valid. When not set, indicates the Fetch Offset is not valid and the DMA engine can fetch the frames from host memory without any time restrictions. 0x0 (INVALID): Fetch Time Offset is invalid. 0x1 (VALID): Fetch Time Offset is valid.

10.2.487 DMA_TBS_CTRL1 — Offset 1054h

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1054h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**Fetch Time Offset (FTOS):** The value in units of 256 nanoseconds, that has to be deducted from the Launch time to compute the Fetch Time. Max value: 999,999,999 ns, additionally should be smaller than CTR-1 value when ESTM mode is set since this value is a modulo CTR value.
7	0h RO	**Reserved**
6:4	0h RW	**Fetch GSN Offset (FGOS):** The number GSN slots that must be deducted from the Launch GSN to compute the Fetch GSN. Value valid only when FTOV is set.
3:1	0h RO	**Reserved**
0	0h RW	**Fetch Time Offset Valid (FTOV):** Valid When set indicates the FTOS field is valid. When not set, indicates the Fetch Offset is not valid and the DMA engine can fetch the frames from host memory without any time restrictions. 0x0 (INVALID): Fetch Time Offset is invalid. 0x1 (VALID): Fetch Time Offset is valid.

10.2.488 DMA_TBS_CTRL2 — Offset 1058h

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1058h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**Fetch Time Offset (FTOS):** The value in units of 256 nanoseconds, that has to be deducted from the Launch time to compute the Fetch Time. Max value: 999,999,999 ns, additionally should be smaller than CTR-1 value when ESTM mode is set since this value is a modulo CTR value.
7	0h RO	**Reserved**
6:4	0h RW	**Fetch GSN Offset (FGOS):** The number GSN slots that must be deducted from the Launch GSN to compute the Fetch GSN. Value valid only when FTOV is set.
3:1	0h RO	**Reserved**
0	0h RW	**Fetch Time Offset Valid (FTOV):** Valid When set indicates the FTOS field is valid. When not set, indicates the Fetch Offset is not valid and the DMA engine can fetch the frames from host memory without any time restrictions. 0x0 (INVALID): Fetch Time Offset is invalid. 0x1 (VALID): Fetch Time Offset is valid.

10.2.489 DMA_TBS_CTRL3 — Offset 105Ch

Type	Size	Offset	Default
MMIO	32 bit	BAR + 105Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**Fetch Time Offset (FTOS):** The value in units of 256 nanoseconds, that has to be deducted from the Launch time to compute the Fetch Time. Max value: 999,999,999 ns, additionally should be smaller than CTR-1 value when ESTM mode is set since this value is a modulo CTR value.
7	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
6:4	0h RW	**Fetch GSN Offset (FGOS):** The number GSN slots that must be deducted from the Launch GSN to compute the Fetch GSN. Value valid only when FTOV is set.
3:1	0h RO	**Reserved**
0	0h RW	**Fetch Time Offset Valid (FTOV):** Valid When set indicates the FTOS field is valid. When not set, indicates the Fetch Offset is not valid and the DMA engine can fetch the frames from host memory without any time restrictions. 0x0 (INVALID): Fetch Time Offset is invalid. 0x1 (VALID): Fetch Time Offset is valid.

10.2.490 DMA_SAFETY_INTERRUPT_STATUS — Offset 1080h

This register indicates summary (whether error occured in DMA/MTL/MAC and correctable/uncorrectable) of the Automotive Safety related error interrupts.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1080h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**MAC Safety Uncorrectable Interrupt Status (MCSIS):** Indicates a uncorrectable Safety related Interrupt is set in the MAC module. MAC_DPP_FSM_Interrupt_Status register should be read when this bit is set, to get the cause of the Safety Interrupt in MAC. 0x0 (INACTIVE): MAC Safety Uncorrectable Interrupt Status not detected. 0x1 (ACTIVE): MAC Safety Uncorrectable Interrupt Status detected.
30	0h RO	**Reserved**
29	0h RO	**MTL Safety Uncorrectable error Interrupt Status (MSUIS):** This bit indicates an uncorrectable error interrupt event in MTL. To get exact cause of the interrupt the software should read the MTL_Safety_Interrupt_Status register. 0x0 (INACTIVE): MTL Safety Uncorrectable error Interrupt Status not detected. 0x1 (ACTIVE): MTL Safety Uncorrectable error Interrupt Status detected.
28	0h RO	**MTL Safety Correctable error Interrupt Status (MSCIS):** This bit indicates a correctable error interrupt event in MTL. To get exact cause of the interrupt the software should read the MTL_Safety_Interrupt_Status register. 0x0 (INACTIVE): MTL Safety Correctable error Interrupt Status not detected. 0x1 (ACTIVE): MTL Safety Correctable error Interrupt Status detected.

Bit Range	Default & Access	Field Name (ID): Description
27:2	0h RO	**Reserved**
1	0h RO	**DMA ECC Uncorrectable error Interrupt Status (DEUIS):** This bit indicates an interrupt event in the DMA ECC safety feature. To get the exact cause of the interrupt the application should read the DMA_ECC_Interrupt_Status register. 0x0 (INACTIVE): DMA ECC Uncorrectable error Interrupt Status not detected. 0x1 (ACTIVE): DMA ECC Uncorrectable error Interrupt Status detected.
0	0h RO	**DMA ECC Correctable error Interrupt Status (DECIS):** This bit indicates an interrupt event in the DMA ECC safety feature. To get the exact cause of the interrupt the application should read the DMA_ECC_Interrupt_Status register. 0x0 (INACTIVE): DMA ECC Correctable error Interrupt Status not detected. 0x1 (ACTIVE): DMA ECC Correctable error Interrupt Status detected.

10.2.491 DMA_ECC_INTERRUPT_ENABLE — Offset 1084h

This register is used to enable the Automotive Safety related TSO memory ECC error interrupt.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1084h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**TSO memory Correctable Error Interrupt Enable (TCEIE):** When set, generates an interrupt when a correctable error is detected at the DMA TSO memory interface. It is indicated in the TCES bit of DMA_ECC_Interrupt_Status register. When reset this event does not generates an interrupt. 0x0 (DISABLE): TSO memory Correctable Error Interrupt is disabled. 0x1 (ENABLE): TSO memory Correctable Error Interrupt is enabled.

10.2.492 DMA_ECC_INTERRUPT_STATUS — Offset 1088h

This register indicates the Automotive Safety related TSO memory ECC error interrupt status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1088h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2	0h RW	**DMA TSO memory Uncorrectable Error status (TUES):** When set, indicates that an uncorrectable error is detected at DMA TSO memory interface. 0x0 (INACTIVE): DMA TSO memory Uncorrectable Error status not detected. 0x1 (ACTIVE): DMA TSO memory Uncorrectable Error status detected.
1	0h RW	**DMA TSO memory Address Mismatch status (TAMS):** This bit when set indicates that address mismatch is found for address bus of DMA TSO memory. 0x0 (INACTIVE): DMA TSO memory Address Mismatch status not detected. 0x1 (ACTIVE): DMA TSO memory Address Mismatch status detected.
0	0h RW	**DMA TSO memory Correctable Error status (TCES):** This bit when set indicates that correctable error is detected at DMA TSO memory interface. 0x0 (INACTIVE): DMA TSO memory Correctable Error status not detected. 0x1 (ACTIVE): DMA TSO memory Correctable Error status detected.

10.2.493 DMA_CH0_CONTROL — Offset 1100h

The DMA Channeli Control register specifies the MSS value for segmentation, length to skip between two descriptors, and also the features such as header splitting and 8xPBL mode.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1100h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**Split Headers (SPH):** When this bit is set, the DMA splits the header and payload in the Receive path. The DMA writes the header to the Buffer Address1 of RDES0. The DMA writes the payload to the buffer to which the Buffer Address2 is pointing. The software must ensure that the header fits into the Receive buffers. If the header length exceeds the receive buffer size, the DMA does not split the header and payload. This bit is available only if Enable Split Header Structure option is selected. 0x0 (DISABLE): Split Headers feature is disabled. 0x1 (ENABLE): Split Headers feature is enabled.
23:21	0h RO	**Reserved**
20:18	0h RW	**Descriptor Skip Length (DSL):** This bit specifies the Word, Dword, or Lword number (depending on the 32-bit, 64-bit, or 128-bit bus) to skip between two unchained descriptors. The address skipping starts from the end of the current descriptor to the start of the next descriptor. When the DSL value is equal to zero, the DMA takes the descriptor table as contiguous.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**Reserved**
16	0h RW	**8xPBL mode (PBLX8):** When this bit is set, the PBL value programmed in Bits[21:16] in DMA_CH(#i)_Tx_Control and Bits[21:16] in DMA_CH(#i)_Rx_Control is multiplied by eight times. Therefore, the DMA transfers the data in 8, 16, 32, 64, 128, and 256 beats depending on the PBL value. 0x0 (DISABLE): 8xPBL mode is disabled. 0x1 (ENABLE): 8xPBL mode is enabled.
15:14	0h RO	**Reserved**
13:0	0000h RW	**Maximum Segment Size (MSS):** This field specifies the maximum segment size that should be used while segmenting the packet. This field is valid only if the TSE bit of DMA_CH0_Tx_Control register is set. The value programmed in this field must be more than the configured Datawidth in bytes. It is recommended to use a MSS value of 64 bytes or more.

10.2.494 DMA_CH0_TX_CONTROL — Offset 1104h

The DMA Channeli Transmit Control register controls the Tx features such as PBL, TCP segmentation, and Tx Channel weights.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1104h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:29	0h RW	**Time Select (TFSEL):** Select bits for one of the four DMA_TBS_CTRL register fields (FTOS, FGSN, FTOV) for the channel. 0x0: DMA_TBS_CTRL0 selected. 0x1: DMA_TBS_CTRL1 selected. 0x2: DMA_TBS_CTRL2 selected. 0x3: DMA_TBS_CTRL3 selected.
28	0h RW	**Enhanced Descriptor Enable (EDSE):** When this bit is set, the corresponding channel uses Enhanced Descriptors that are 32 Bytes for both Normal and Context Descriptors. When reset, the corresponding channel uses the descriptors that are 16 Bytes. 0x0 (DISABLE): Enhanced Descriptor is disabled. 0x1 (ENABLE): Enhanced Descriptor is enabled.
27:24	0h RW	**Transmit QOS. (TQOS):** This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Tx Channel0.
23:22	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
21:16	00h RW	**Transmit Programmable Burst Length (TXPBL):** These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in DMA_CH0_Control register. 2. Set the TxPBL. Note: The maximum value of TxPBL must be less than or equal to half the Tx Queue size (TQS field of MTL_TxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. For example, in 64-bit data width configurations the total locations in Tx Queue of size 512 bytes is 64, TxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	0h RW	**Ignore PBL Requirement (IPBL):** When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. If space is not available, the MTL might use handshaking to slow the DMA. Note: This bit/mode must not be used when multiple Transmit DMA Channels are enabled as it might block other Transmit and Receive DMA Channels from accessing the Read Data Channel of AXI bus until space is available in Transmit Queue for current transfer. 0x0 (DISABLE): Ignore PBL Requirement is disabled. 0x1 (ENABLE): Ignore PBL Requirement is enabled.
14:13	0h RW	**TSE_MODE:** TSE Mode - 00: TSO/USO (segmentation functionality is enabled). In this mode, the setting of TSE bit enables the TSO/USO segmentation. - 01: UFO with Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality with Checksum for all the UDP packets. - 10: UFO without Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality without Checksum for all the UDP packets. - 11: Reserved 0x0 (TSO_USO): TSO/USO. 0x1 (UFOWC): UFO with Checksum. 0x2 (UFOWOC): UFO without Checksum. 0x3 (RSVD): Reserved.
12	0h RW	**TCP Segmentation Enabled (TSE):** When this bit is set, the DMA performs the TCP segmentation or UDP Segmentation/ Fragmentation for packets in this channel. The TCP segmentation or UDP packet's segmentation/Fragmentation is done only for those packets for which the TSE bit (TDES0[19]) is set in the Tx Normal descriptor.When this bit is set, the TxPBL value must be greater than 4. 0x0 (DISABLE): TCP Segmentation is disabled. 0x1 (ENABLE): TCP Segmentation is enabled.
11:5	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	**Operate on Second Packet (OSF):** When this bit is set, it instructs the DMA to process the second packet of the Transmit data even before the status for the first packet is obtained. 0x0 (DISABLE): Operate on Second Packet disabled. 0x1 (ENABLE): Operate on Second Packet enabled.
3:1	0h RW	**Transmit Channel Weight (TCW):** This field indicates the weight assigned to the corresponding Transmit channel. When reset is complete, this field is set to 0 for all channels by default, resulting in equal weights to all channels.
0	0h RW	**Start or Stop Transmission Command (ST):** When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the base address of the Transmit list set by the DMA_CH0_TxDesc_List_Address register. - The position at which the transmission was previously stopped If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the DMA_CH0_Status register is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the DMA_CH0_TxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program DMA_CH0_TxDesc_List_Address register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state. 0x0 (STOP): Stop Transmission Command. 0x1 (START): Start Transmission Command.

10.2.495 DMA_CH0_RX_CONTROL — Offset 1108h

The DMA Channeli Receive Control register controls the Rx features such as PBL, buffer size, and extended status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1108h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Rx Packet Flush. (RPF):** When this bit is set to 1, then GbE Controller automatically flushes the packet from the Rx Queues destined to this DMA Rx Channel, when it is stopped. When this bit remains set and the DMA is re-started by the software driver, the packets residing in the Rx Queues that were received when this RxDMA was stopped, get flushed out. The packets that are received by the MAC after the RxDMA is re-started are routed to the RxDMA. The flushing happens on the Read side of the Rx Queue. When this bit is set to 0, the GbE Controller not flush the packet in the Rx Queue destined to this RxDMA Channel when it is STOP state. This might in turn cause head-of-line blocking in the corresponding RxQueue. Note: The stopping of packet flow from a Rx DMA Channel to the application by setting RPF works only when there is one-to-one mapping of Rx Queue to Rx DMA channels. In Dynamic mapping mode, setting RPF bit in any DMA_CH(#i)_Rx_Control register might flush packets from unintended Rx Queues which are destined to the stopped Rx DMA Channel. 0x0 (DISABLE): Rx Packet Flush is disabled. 0x1 (ENABLE): Rx Packet Flush is enabled.
30:28	0h RO	**Reserved**
27:24	0h RW	**Rx AXI4 QOS. (RQOS):** This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Rx Channel0.
23:22	0h RO	**Reserved**
21:16	00h RW	**Receive Programmable Burst Length (RXPBL):** These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in the DMA_CH0_Control register. 2. Set the RxPBL. Note: The maximum value of RxPBL must be less than or equal to half the Rx Queue size (RQS field of MTL_RxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the Rx DMA is transferring a block of data. For example, in 64-bit data width configurations the total locations in Rx Queue of size 512 bytes is 64, so RxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
14:4	000h RW	**Receive Buffer size High (RBSZ_13_Y):** RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. The RBSZ[13:0] field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when split headers are enabled. Note: The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the value of buffer address pointer is not aligned to data bus width. Hence the lower RBSZ_x_0 bits are read-only and the value is considered as all-zero. Thus the RBSZ_13_y indicates the buffer size in terms of locations (with the width same as bus-width).
3:1	0h RO	**Receive Buffer size Low (RBSZ_X_0):** RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. The RBSZ_x_0 is the lower field whose width is based on data bus width of the configuration. This field is of width 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).
0	0h RW	**Start or Stop Receive (SR):** When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the address set by the DMA_CH0_RxDesc_List_Address register. - The position at which the Rx process was previously stopped If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the DMA_CH0_Status register is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the DMA_CH0_RxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state. 0x0 (STOP): Stop Receive. 0x1 (START): Start Receive.

10.2.496 DMA_CH0_TXDESC_LIST_HADDRESS — Offset 1110h

The Channeli Tx Descriptor List HAddress register has the higher 8 or 16 bits of the start address of the Transmit descriptor list.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CHi_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier. This register must be programmed with desired the higher address before programming the DMA_CHi_TxDesc_List_Address register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1110h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Start of Transmit List (TDESHA):** This field contains the most-significant 8 or 16 bits of the 40- or 48-bit base address of the first descriptor in the Transmit descriptor list.

10.2.497 DMA_CH0_TXDESC_LIST_ADDRESS — Offset 1114h

The Channeli Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LSB to low.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CH0_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1114h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Start of Transmit List (TDESLA):** This field contains the base address of the first descriptor in the Transmit descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

10.2.498 DMA_CH0_RXDESC_LIST_HADDRESS — Offset 1118h

The Channeli Rx Descriptor List HAddress register has the higher 8 or 16 bits of the start address of the Receive descriptor list.

Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in the DMA_CHi_RxDesc_List_Address register

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1118h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Start of Receive List (RDESHA):** This field contains the most-significant 8 or 16 bits of the 40-bit or 48-bit base address of the first descriptor in the Rx Descriptor list.

10.2.499 DMA_CH0_RXDESC_LIST_ADDRESS — Offset 111Ch

The Channeli Rx Descriptor List Address register points the DMA to the start of Receive descriptor list.

This register points to the start of the Receive Descriptor List. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in DMA_CH0_Rx_Control register. When stopped, this register can be written with a new descriptor list address.

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 111Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Start of Receive List (RDESLA):** This field contains the base address of the first descriptor in the Rx Descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

10.2.500 DMA_CH0_TXDESC_TAIL_POINTER — Offset 1120h

The Channeli Tx Descriptor Tail Pointer register points to an offset from the base and indicates the location of the last valid descriptor.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1120h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Transmit Descriptor Tail Pointer (TDTP):** This field contains the tail pointer for the Tx descriptor ring. The software writes the tail pointer to add more descriptors to the Tx channel. The hardware tries to transmit all packets referenced by the descriptors between the head and the tail pointer registers. The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

10.2.501 DMA_CH0_RXDESC_TAIL_POINTER — Offset 1128h

The Channeli Rx Descriptor Tail Pointer Points to an offset from the base and indicates the location of the last valid descriptor.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1128h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Receive Descriptor Tail Pointer (RDTP):** This field contains the tail pointer for the Rx descriptor ring. The software writes the tail pointer to add more descriptors to the Rx channel. The hardware tries to write all received packets to the descriptors referenced between the head and the tail pointer registers. The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

10.2.502 DMA_CH0_TXDESC_RING_LENGTH — Offset 112Ch

The Tx Descriptor Ring Length register contains the length of the Transmit descriptor ring.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 112Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:0	000h RW	**Transmit Descriptor Ring Length (TDRL):** This field sets the maximum number of Tx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. Intel recommends a minimum ring descriptor length of 4. For example, You can program any value up to 0x3FF in this field. This field is 10 bits wide, if you program 0x3FF, you can have 1024 descriptors. If you want to have 10 descriptors, program it to a value of 0x9.

10.2.503 DMA_CH0_RXDESC_RING_LENGTH — Offset 1130h

The Channeli Rx Descriptor Ring Length register contains the length of the Receive descriptor circular ring.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1130h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:0	000h RW	**Receive Descriptor Ring Length (RDRL):** This register sets the maximum number of Rx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. For example, You can program any value up to 0x3FF in this field. This field is 10 bits wide, if you program 0x3FF, you can have 1024 descriptors. If you want to have 10 descriptors, program it to a value of 0x9.

10.2.504 DMA_CH0_INTERRUPT_ENABLE — Offset 1134h

The Channeli Interrupt Enable register enables the interrupts reported by the Status register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1134h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW	**Normal Interrupt Summary Enable (NIE):** When this bit is set, the normal interrupt summary is enabled. This bit enables the following interrupts in the DMA_CH0_Status register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt When this bit is reset, the normal interrupt summary is disabled. 0x0 (DISABLE): Normal Interrupt Summary is disabled. 0x1 (ENABLE): Normal Interrupt Summary is enabled.
14	0h RW	**Abnormal Interrupt Summary Enable (AIE):** When this bit is set, the abnormal interrupt summary is enabled. This bit enables the following interrupts in the DMA_CH0_Status register: - Bit 1: Transmit Process Stopped - Bit 7: Rx Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 9: Receive Watchdog Timeout - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error When this bit is reset, the abnormal interrupt summary is disabled. 0x0 (DISABLE): Abnormal Interrupt Summary is disabled. 0x1 (ENABLE): Abnormal Interrupt Summary is enabled.
13	0h RW	**Context Descriptor Error Enable (CDEE):** When this bit is set along with the AIE bit, the Descriptor error interrupt is enabled. When this bit is reset, the Descriptor error interrupt is disabled. 0x0 (DISABLE): Context Descriptor Error is disabled. 0x1 (ENABLE): Context Descriptor Error is enabled.
12	0h RW	**Fatal Bus Error Enable (FBEE):** When this bit is set along with the AIE bit, the Fatal Bus error interrupt is enabled. When this bit is reset, the Fatal Bus Error error interrupt is disabled. 0x0 (DISABLE): Fatal Bus Error is disabled. 0x1 (ENABLE): Fatal Bus Error is enabled.
11	0h RW	**Early Receive Interrupt Enable (ERIE):** When this bit is set along with the NIE bit, the Early Receive interrupt is enabled. When this bit is reset, the Early Receive interrupt is disabled. 0x0 (DISABLE): Early Receive Interrupt is disabled. 0x1 (ENABLE): Early Receive Interrupt is enabled.
10	0h RW	**Early Transmit Interrupt Enable (ETIE):** When this bit is set along with the AIE bit, the Early Transmit interrupt is enabled. When this bit is reset, the Early Transmit interrupt is disabled. 0x0 (DISABLE): Early Transmit Interrupt is disabled. 0x1 (ENABLE): Early Transmit Interrupt is enabled.
9	0h RW	**Receive Watchdog Timeout Enable (RWTE):** When this bit is set along with the AIE bit, the Receive Watchdog Timeout interrupt is enabled. When this bit is reset, the Receive Watchdog Timeout interrupt is disabled. 0x0 (DISABLE): Receive Watchdog Timeout is disabled. 0x1 (ENABLE): Receive Watchdog Timeout is enabled.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**Receive Stopped Enable (RSE):** When this bit is set along with the AIE bit, the Receive Stopped Interrupt is enabled. When this bit is reset, the Receive Stopped interrupt is disabled. 0x0 (DISABLE): Receive Stopped is disabled. 0x1 (ENABLE): Receive Stopped is enabled.
7	0h RW	**Receive Buffer Unavailable Enable (RBUE):** When this bit is set along with the AIE bit, the Receive Buffer Unavailable interrupt is enabled. When this bit is reset, the Receive Buffer Unavailable interrupt is disabled. 0x0 (DISABLE): Receive Buffer Unavailable is disabled. 0x1 (ENABLE): Receive Buffer Unavailable is enabled.
6	0h RW	**Receive Interrupt Enable (RIE):** When this bit is set along with the NIE bit, the Receive Interrupt is enabled. When this bit is reset, the Receive Interrupt is disabled. 0x0 (DISABLE): Receive Interrupt is disabled. 0x1 (ENABLE): Receive Interrupt is enabled.
5:3	0h RO	**Reserved**
2	0h RW	**Transmit Buffer Unavailable Enable (TBUE):** When this bit is set along with the NIE bit, the Transmit Buffer Unavailable interrupt is enabled. When this bit is reset, the Transmit Buffer Unavailable interrupt is disabled. 0x0 (DISABLE): Transmit Buffer Unavailable is disabled. 0x1 (ENABLE): Transmit Buffer Unavailable is enabled.
1	0h RW	**Transmit Stopped Enable (TXSE):** When this bit is set along with the AIE bit, the Transmission Stopped interrupt is enabled. When this bit is reset, the Transmission Stopped interrupt is disabled. 0x0 (DISABLE): Transmit Stopped is disabled. 0x1 (ENABLE): Transmit Stopped is enabled.
0	0h RW	**Transmit Interrupt Enable (TIE):** When this bit is set along with the NIE bit, the Transmit Interrupt is enabled. When this bit is reset, the Transmit Interrupt is disabled. 0x0 (DISABLE): Transmit Interrupt is disabled. 0x1 (ENABLE): Transmit Interrupt is enabled.

10.2.505 DMA_CH0_RX_INTERRUPT_WATCHDOG_TIMER — Offset 1138h

The Receive Interrupt Watchdog Timer register indicates the watchdog timeout for Receive Interrupt (RI) from the DMA. When this register is written with a non-zero value, it enables the watchdog timer for the RI bit of the DMA_CHi_Status register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1138h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17:16	0h RW	**Receive Interrupt Watchdog Timer Count Units (RWTU):** This fields indicates the number of system clock cycles corresponding to one unit in RWT field. - 2'b00: 256 - 2'b01: 512 - 2'b10: 1024 - 2'b11: 2048 For example, when RWT=2 and RWTU=1, the watchdog timer is set for 2*512=1024 system clock cycles.
15:8	0h RO	**Reserved**
7:0	00h RW	**Receive Interrupt Watchdog Timer Count (RWT):** This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. The watchdog timer is triggered with the programmed value after the Rx DMA completes the transfer of a packet for which the RI bit is not set in the DMA_CH(#i)_Status register, because of the setting of Interrupt Enable bit in the corresponding descriptor RDES3[30]. When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per the Interrupt Enable bit RDES3[30] of any received packet.

10.2.506 DMA_CH0_SLOT_FUNCTION_CONTROL_STATUS — Offset 113Ch

The Slot Function Control and Status register contains the control bits for slot function and the status for Transmit path.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 113Ch	000007C0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19:16	0h RO	**Reference Slot Number (RSN):** This field gives the current value of the reference slot number in the DMA. It is used for slot comparison.
15:4	07Ch RW	**Slot Interval Value (SIV):** This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. A value of 0 specifies the slot interval of 1 us while the maximum value 4095 specifies the slot interval of 4096us. The default/reset value is 0x07C which corresponds to slot interval of 125us

Bit Range	Default & Access	Field Name (ID): Description
3:2	0h RO	**Reserved**
1	0h RW	**Advance Slot Check (ASC):** When set, this bit enables the DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the Tx descriptor is - equal to the reference slot number given in the RSN field or - ahead of the reference slot number by up to two slots This bit is applicable only when the ESC bit is set. 0x0 (DISABLE): Advance Slot Check is disabled. 0x1 (ENABLE): Advance Slot Check is enabled.
0	0h RW	**Enable Slot Comparison (ESC):** When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. The DMA fetches the data from the corresponding buffer only when the slot number is - equal to the reference slot number or - ahead of the reference slot number by one slot When reset, this bit disables the checking of the slot numbers. The DMA fetches the data immediately after the descriptor is processed. Note: The UFO (UDP Fragmentation over IPv4)/TSO/USO should not be enabled along with TBS/AVB Slot number check. The UFO/TSO/USO involves multiple packets/segments/fragments transmission for single packet received from application and the slot number check are applicable for fetching of only first segment/fragment. As a result it might be difficult for software to specify slot number for subsequent packets. 0x0 (DISABLE): Slot Comparison is disabled. 0x1 (ENABLE): Slot Comparison is enabled.

10.2.507 DMA_CH0_CURRENT_APP_TXDESC — Offset 1144h

The Channeli Current Application Transmit Descriptor register points to the current Transmit descriptor read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1144h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Transmit Descriptor Address Pointer (CURTDESAPTR):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

10.2.508 DMA_CH0_CURRENT_APP_RXDESC — Offset 114Ch

The Channeli Current Application Receive Descriptor register points to the current Receive descriptor read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 114Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Receive Descriptor Address Pointer (CURRDESAPTR):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

10.2.509 DMA_CH0_CURRENT_APP_TXBUFFER_H — Offset 1150h

The Channeli Current Application Transmit Buffer Address High register has the higher 8 or 16 bits of the current address of the Transmit buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1150h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO	**Application Transmit Buffer Address Pointer (CURTBUFAPTRH):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

10.2.510 DMA_CH0_CURRENT_APP_TXBUFFER — Offset 1154h

The Channeli Current Application Transmit Buffer Address register points to the current Tx buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1154h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Transmit Buffer Address Pointer (CURTBUFAPTR):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

10.2.511 DMA_CH0_CURRENT_APP_RXBUFFER_H — Offset 1158h

The Channeli Current Application Receive Buffer Address High register has the higher 8 or 16 bits of the current address of the Receive buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1158h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO	**Application Receive Buffer Address Pointer (CURRBUFAPTRH):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

10.2.512 DMA_CH0_CURRENT_APP_RXBUFFER — Offset 115Ch

The Channel 0 Current Application Receive Buffer Address register points to the current Rx buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 115Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Receive Buffer Address Pointer (CURRBUFAPTR):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

10.2.513 DMA_CH0_STATUS — Offset 1160h

The software driver (application) reads the Status register during interrupt service routine or polling to determine the status of the DMA.

Note: The number of DMA_CH(#i)_Status register in the configuration is the higher of number of Rx DMA Channels and Tx DMA Channels.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1160h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21:19	0h RO	**Rx DMA Error Bits (REB):** This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 21 -- 1'b1: Error during data transfer by Rx DMA -- 1'b0: No Error during data transfer by Rx DMA - Bit 20 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 19 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
18:16	0h RO	**Tx DMA Error Bits (TEB):** This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 18 -- 1'b1: Error during data transfer by Tx DMA -- 1'b0: No Error during data transfer by Tx DMA - Bit 17 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 16 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
15	0h RW	**Normal Interrupt Summary (NIS):** Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in DMA_CH0_Interrupt_Enable register) affect the Normal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit which causes NIS to be set is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Normal Interrupt Summary status not detected. 0x1 (ACTIVE): Normal Interrupt Summary status detected.

Bit Range	Default & Access	Field Name (ID): Description
14	0h RW	**Abnormal Interrupt Summary (AIS):** Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Abnormal Interrupt Summary status not detected. 0x1 (ACTIVE): Abnormal Interrupt Summary status detected.
13	0h RW	**Context Descriptor Error (CDE):** This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Context Descriptor Error status not detected. 0x1 (ACTIVE): Context Descriptor Error status detected.
12	0h RW	**Fatal Bus Error (FBE):** This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Fatal Bus Error status not detected. 0x1 (ACTIVE): Fatal Bus Error status detected.
11	0h RW	**Early Receive Interrupt (ERI):** This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. In configs supporting ERIC, When ERIC=0, this bit is set only after the Rx DMA has filled up a complete receive buffer with packet data. When ERIC=1, this bit is set after every burst transfer of data from the Rx DMA to the buffer. The setting of RI bit automatically clears this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Receive Interrupt status not detected. 0x1 (ACTIVE): Early Receive Interrupt status detected.
10	0h RW	**Early Transmit Interrupt (ETI):** This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. In configs supporting ERIC: When ETIC=0, this bit is set only after the Tx DMA has transferred a complete packet to MTL. When ETIC=1, this bit is set after completion of (partial) packet data transfer from buffers in the Transmit descriptor in which IOC=1. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Transmit Interrupt status not detected. 0x1 (ACTIVE): Early Transmit Interrupt status detected.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**Receive Watchdog Timeout (RWT):** This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received. 0x0 (INACTIVE): Receive Watchdog Timeout status not detected. 0x1 (ACTIVE): Receive Watchdog Timeout status detected.
8	0h RW	**Receive Process Stopped (RPS):** This bit is asserted when the Rx process enters the Stopped state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Process Stopped status not detected. 0x1 (ACTIVE): Receive Process Stopped status detected.
7	0h RW	**Receive Buffer Unavailable (RBU):** This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode, the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Buffer Unavailable status not detected. 0x1 (ACTIVE): Receive Buffer Unavailable status detected.
6	0h RW	**Receive Interrupt (RI):** This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. The reception remains in the Running state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Interrupt status not detected. 0x1 (ACTIVE): Receive Interrupt status detected.
5:3	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Transmit Buffer Unavailable (TBU):** This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPS0 field of the DMA_Debug_Status0 register explains the Transmit Process state transitions. To resume processing the Transmit descriptors, the application should do the following: 1. Change the ownership of the descriptor by setting Bit 31 of TDES3. 2. Issue a Transmit Poll Demand command. For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Buffer Unavailable status not detected. 0x1 (ACTIVE): Transmit Buffer Unavailable status detected.
1	0h RW	**Transmit Process Stopped (TPS):** This bit is set when the transmission is stopped. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Process Stopped status not detected. 0x1 (ACTIVE): Transmit Process Stopped status detected.
0	0h RW	**Transmit Interrupt (TI):** This bit indicates that the packet transmission is complete. When transmission is complete, Bit 31 of TDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Interrupt status not detected. 0x1 (ACTIVE): Transmit Interrupt status detected.

10.2.514 DMA_CH0_MISS_FRAME_CNT — Offset 1164h

This register has the number of packet counter that got dropped by the DMA either due to Bus Error or due to programming RPF field in DMA_CH${i}_Rx_Control register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1164h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Overflow status of the MFC Counter (MFCO):** When this bit is set then the MFC counter does not get incremented further. The bit gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Miss Frame Counter overflow not occurred. 0x1 (ACTIVE): Miss Frame Counter overflow occurred.
14:11	0h RO	**Reserved**
10:0	000h RO	**Dropped Packet Counters (MFC):** This counter indicates the number of packet counters that are dropped by the DMA either because of bus error or because of programing RPF field in DMA_CH${i}_Rx_Control register. The counter gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event.

10.2.515 DMA_CH0_RXP_ACCEPT_CNT — Offset 1168h

The DMA_CH(#i)_RXP_Accept_Cnt registers provides the count of the number of frames accepted by Rx Parser.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1168h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Rx Parser Accept Counter Overflow Bit (RXPACOF):** When set, this bit indicates that the RXPAC Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Rx Parser Accept Counter overflow not occurred. 0x1 (ACTIVE): Rx Parser Accept Counter overflow occurred.
30:0	00000000h RO	**Rx Parser Accept Counter (RXPAC):** This 31-bit counter is implemented whenever a Rx Parser Accept a packet due to AF =1. The counter is cleared when the register is read.

10.2.516 DMA_CH0_RX_ERI_CNT — Offset 116Ch

The DMA_CH(#i)_RX_ERI_Cnt registers provides the count of the number of times ERI was asserted.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 116Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11:0	000h RO	**ERI Counter (ECNT):** When ERIC bit of DMA_CH(#i)_RX_Control register is set, this counter increments for burst transfer completed by the Rx DMA from the start of packet transfer. This counter is reset at the start of new packet.

10.2.517 DMA_CH1_CONTROL — Offset 1180h

The DMA Channeli Control register specifies the MSS value for segmentation, length to skip between two descriptors, and also the features such as header splitting and 8xPBL mode.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1180h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**Split Headers (SPH):** When this bit is set, the DMA splits the header and payload in the Receive path. The DMA writes the header to the Buffer Address1 of RDES0. The DMA writes the payload to the buffer to which the Buffer Address2 is pointing. The software must ensure that the header fits into the Receive buffers. If the header length exceeds the receive buffer size, the DMA does not split the header and payload. This bit is available only if Enable Split Header Structure option is selected. 0x0 (DISABLE): Split Headers feature is disabled. 0x1 (ENABLE): Split Headers feature is enabled.
23:21	0h RO	**Reserved**
20:18	0h RW	**Descriptor Skip Length (DSL):** This bit specifies the Word, Dword, or Lword number (depending on the 32-bit, 64-bit, or 128-bit bus) to skip between two unchained descriptors. The address skipping starts from the end of the current descriptor to the start of the next descriptor. When the DSL value is equal to zero, the DMA takes the descriptor table as contiguous.
17	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**8xPBL mode (PBLX8):** When this bit is set, the PBL value programmed in Bits[21:16] in DMA_CH(#i)_Tx_Control and Bits[21:16] in DMA_CH(#i)_Rx_Control is multiplied by eight times. Therefore, the DMA transfers the data in 8, 16, 32, 64, 128, and 256 beats depending on the PBL value. 0x0 (DISABLE): 8xPBL mode is disabled. 0x1 (ENABLE): 8xPBL mode is enabled.
15:14	0h RO	**Reserved**
13:0	0000h RW	**Maximum Segment Size (MSS):** This field specifies the maximum segment size that should be used while segmenting the packet. This field is valid only if the TSE bit of DMA_CH0_Tx_Control register is set. The value programmed in this field must be more than the configured Datawidth in bytes. It is recommended to use a MSS value of 64 bytes or more.

10.2.518 DMA_CH1_TX_CONTROL — Offset 1184h

The DMA Channeli Transmit Control register controls the Tx features such as PBL, TCP segmentation, and Tx Channel weights.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1184h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:29	0h RW	**Time Select (TFSEL):** Select bits for one of the four DMA_TBS_CTRL register fields (FTOS, FGSN, FTOV) for the channel. 0x0: DMA_TBS_CTRL0 selected. 0x1: DMA_TBS_CTRL1 selected. 0x2: DMA_TBS_CTRL2 selected. 0x3: DMA_TBS_CTRL3 selected.
28	0h RW	**Enhanced Descriptor Enable (EDSE):** When this bit is set, the corresponding channel uses Enhanced Descriptors that are 32 Bytes for both Normal and Context Descriptors. When reset, the corresponding channel uses the descriptors that are 16 Bytes. 0x0 (DISABLE): Enhanced Descriptor is disabled. 0x1 (ENABLE): Enhanced Descriptor is enabled.
27:24	0h RW	**Transmit QOS. (TQOS):** This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Tx Channel0.
23:22	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
21:16	00h RW	**Transmit Programmable Burst Length (TXPBL):** These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in DMA_CH0_Control register. 2. Set the TxPBL. Note: The maximum value of TxPBL must be less than or equal to half the Tx Queue size (TQS field of MTL_TxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. For example, in 64-bit data width configurations the total locations in Tx Queue of size 512 bytes is 64, TxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	0h RW	**Ignore PBL Requirement (IPBL):** When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. If space is not available, the MTL might use handshaking to slow the DMA. Note: This bit/mode must not be used when multiple Transmit DMA Channels are enabled as it might block other Transmit and Receive DMA Channels from accessing the Read Data Channel of AXI bus until space is available in Transmit Queue for current transfer. 0x0 (DISABLE): Ignore PBL Requirement is disabled. 0x1 (ENABLE): Ignore PBL Requirement is enabled.
14:13	0h RW	**TSE_MODE:** TSE Mode - 00: TSO/USO (segmentation functionality is enabled). In this mode, the setting of TSE bit enables the TSO/USO segmentation. - 01: UFO with Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality with Checksum for all the UDP packets. - 10: UFO without Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality without Checksum for all the UDP packets. - 11: Reserved 0x0 (TSO_USO): TSO/USO. 0x1 (UFOWC): UFO with Checksum. 0x2 (UFOWOC): UFO without Checksum. 0x3 (RSVD): Reserved.
12	0h RW	**TCP Segmentation Enabled (TSE):** When this bit is set, the DMA performs the TCP segmentation or UDP Segmentation/ Fragmentation for packets in this channel. The TCP segmentation or UDP packet's segmentation/Fragmentation is done only for those packets for which the TSE bit (TDES0[19]) is set in the Tx Normal descriptor.When this bit is set, the TxPBL value must be greater than 4. 0x0 (DISABLE): TCP Segmentation is disabled. 0x1 (ENABLE): TCP Segmentation is enabled.
11:5	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	**Operate on Second Packet (OSF):** When this bit is set, it instructs the DMA to process the second packet of the Transmit data even before the status for the first packet is obtained. 0x0 (DISABLE): Operate on Second Packet disabled. 0x1 (ENABLE): Operate on Second Packet enabled.
3:1	0h RW	**Transmit Channel Weight (TCW):** This field indicates the weight assigned to the corresponding Transmit channel. When reset is complete, this field is set to 0 for all channels by default, resulting in equal weights to all channels.
0	0h RW	**Start or Stop Transmission Command (ST):** When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the base address of the Transmit list set by the DMA_CH0_TxDesc_List_Address register. - The position at which the transmission was previously stopped If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the DMA_CH0_Status register is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the DMA_CH0_TxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program DMA_CH0_TxDesc_List_Address register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state. 0x0 (STOP): Stop Transmission Command. 0x1 (START): Start Transmission Command.

10.2.519 DMA_CH1_RX_CONTROL — Offset 1188h

The DMA Channeli Receive Control register controls the Rx features such as PBL, buffer size, and extended status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1188h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Rx Packet Flush. (RPF):** When this bit is set to 1, then GbE Controller automatically flushes the packet from the Rx Queues destined to this DMA Rx Channel, when it is stopped. When this bit remains set and the DMA is re-started by the software driver, the packets residing in the Rx Queues that were received when this RxDMA was stopped, get flushed out. The packets that are received by the MAC after the RxDMA is re-started are routed to the RxDMA. The flushing happens on the Read side of the Rx Queue. When this bit is set to 0, the GbE Controller not flush the packet in the Rx Queue destined to this RxDMA Channel when it is STOP state. This might in turn cause head-of-line blocking in the corresponding RxQueue. Note: The stopping of packet flow from a Rx DMA Channel to the application by setting RPF works only when there is one-to-one mapping of Rx Queue to Rx DMA channels. In Dynamic mapping mode, setting RPF bit in any DMA_CH(#i)_Rx_Control register might flush packets from unintended Rx Queues which are destined to the stopped Rx DMA Channel. 0x0 (DISABLE): Rx Packet Flush is disabled. 0x1 (ENABLE): Rx Packet Flush is enabled.
30:28	0h RO	**Reserved**
27:24	0h RW	**Rx AXI4 QOS. (RQOS):** This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Rx Channel0.
23:22	0h RO	**Reserved**
21:16	00h RW	**Receive Programmable Burst Length (RXPBL):** These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in the DMA_CH0_Control register. 2. Set the RxPBL. Note: The maximum value of RxPBL must be less than or equal to half the Rx Queue size (RQS field of MTL_RxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the Rx DMA is transferring a block of data. For example, in 64-bit data width configurations the total locations in Rx Queue of size 512 bytes is 64, so RxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
14:4	000h RW	**Receive Buffer size High (RBSZ_13_Y):** RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. The RBSZ[13:0] field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when split headers are enabled. Note: The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the value of buffer address pointer is not aligned to data bus width. Hence the lower RBSZ_x_0 bits are read-only and the value is considered as all-zero. Thus the RBSZ_13_y indicates the buffer size in terms of locations (with the width same as bus-width).
3:1	0h RO	**Receive Buffer size Low (RBSZ_X_0):** RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. The RBSZ_x_0 is the lower field whose width is based on data bus width of the configuration. This field is of width 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).
0	0h RW	**Start or Stop Receive (SR):** When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the address set by the DMA_CH0_RxDesc_List_Address register. - The position at which the Rx process was previously stopped If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the DMA_CH0_Status register is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the DMA_CH0_RxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state. 0x0 (STOP): Stop Receive. 0x1 (START): Start Receive.

10.2.520 DMA_CH1_TXDESC_LIST_HADDRESS — Offset 1190h

The Channeli Tx Descriptor List HAddress register has the higher 8 or 16 bits of the start address of the Transmit descriptor list.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CHi_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier. This register must be programmed with desired the higher address before programming the DMA_CHi_TxDesc_List_Address register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1190h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Start of Transmit List (TDESHA):** This field contains the most-significant 8 or 16 bits of the 40- or 48-bit base address of the first descriptor in the Transmit descriptor list.

10.2.521 DMA_CH1_TXDESC_LIST_ADDRESS — Offset 1194h

The Channeli Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LSB to low.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CH0_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1194h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Start of Transmit List (TDESLA):** This field contains the base address of the first descriptor in the Transmit descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

10.2.522 DMA_CH1_RXDESC_LIST_HADDRESS — Offset 1198h

The Channeli Rx Descriptor List HAddress register has the higher 8 or 16 bits of the start address of the Receive descriptor list.

Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in the DMA_CHi_RxDesc_List_Address register

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1198h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Start of Receive List (RDESHA):** This field contains the most-significant 8 or 16 bits of the 40-bit or 48-bit base address of the first descriptor in the Rx Descriptor list.

10.2.523 DMA_CH1_RXDESC_LIST_ADDRESS — Offset 119Ch

The Channeli Rx Descriptor List Address register points the DMA to the start of Receive descriptor list.

This register points to the start of the Receive Descriptor List. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in DMA_CH0_Rx_Control register. When stopped, this register can be written with a new descriptor list address.

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 119Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Start of Receive List (RDESLA):** This field contains the base address of the first descriptor in the Rx Descriptor list. 1	0h RW	**Transmit Stopped Enable (TXSE):** When this bit is set along with the AIE bit, the Transmission Stopped interrupt is enabled. When this bit is reset, the Transmission Stopped interrupt is disabled. 0x0 (DISABLE): Transmit Stopped is disabled. 0x1 (ENABLE): Transmit Stopped is enabled.
0	0h RW	**Transmit Interrupt Enable (TIE):** When this bit is set along with the NIE bit, the Transmit Interrupt is enabled. When this bit is reset, the Transmit Interrupt is disabled. 0x0 (DISABLE): Transmit Interrupt is disabled. 0x1 (ENABLE): Transmit Interrupt is enabled.

10.2.529 DMA_CH1_RX_INTERRUPT_WATCHDOG_TIMER — Offset 11B8h

The Receive Interrupt Watchdog Timer register indicates the watchdog timeout for Receive Interrupt (RI) from the DMA. When this register is written with a non-zero value, it enables the watchdog timer for the RI bit of the DMA_CHi_Status register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11B8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17:16	0h RW	**Receive Interrupt Watchdog Timer Count Units (RWTU):** This fields indicates the number of system clock cycles corresponding to one unit in RWT field. - 2'b00: 256 - 2'b01: 512 - 2'b10: 1024 - 2'b11: 2048 For example, when RWT=2 and RWTU=1, the watchdog timer is set for 2*512=1024 system clock cycles.
15:8	0h RO	**Reserved**
7:0	00h RW	**Receive Interrupt Watchdog Timer Count (RWT):** This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. The watchdog timer is triggered with the programmed value after the Rx DMA completes the transfer of a packet for which the RI bit is not set in the DMA_CH(#i)_Status register, because of the setting of Interrupt Enable bit in the corresponding descriptor RDES3[30]. When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per the Interrupt Enable bit RDES3[30] of any received packet.

10.2.530 DMA_CH1_SLOT_FUNCTION_CONTROL_STATUS — Offset 11BCh

The Slot Function Control and Status register contains the control bits for slot function and the status for Transmit path.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11BCh	000007C0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19:16	0h RO	**Reference Slot Number (RSN):** This field gives the current value of the reference slot number in the DMA. It is used for slot comparison.
15:4	07Ch RW	**Slot Interval Value (SIV):** This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. A value of 0 specifies the slot interval of 1 us while the maximum value 4095 specifies the slot interval of 4096us. The default/reset value is 0x07C which corresponds to slot interval of 125us

Bit Range	Default & Access	Field Name (ID): Description
3:2	0h RO	**Reserved**
1	0h RW	**Advance Slot Check (ASC):** When set, this bit enables the DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the Tx descriptor is - equal to the reference slot number given in the RSN field or - ahead of the reference slot number by up to two slots This bit is applicable only when the ESC bit is set. 0x0 (DISABLE): Advance Slot Check is disabled. 0x1 (ENABLE): Advance Slot Check is enabled.
0	0h RW	**Enable Slot Comparison (ESC):** When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. The DMA fetches the data from the corresponding buffer only when the slot number is - equal to the reference slot number or - ahead of the reference slot number by one slot When reset, this bit disables the checking of the slot numbers. The DMA fetches the data immediately after the descriptor is processed. Note: The UFO (UDP Fragmentation over IPv4)/TSO/USO should not be enabled along with TBS/AVB Slot number check. The UFO/TSO/USO involves multiple packets/segments/fragments transmission for single packet received from application and the slot number check are applicable for fetching of only first segment/fragment. As a result it might be difficult for software to specify slot number for subsequent packets. 0x0 (DISABLE): Slot Comparison is disabled. 0x1 (ENABLE): Slot Comparison is enabled.

10.2.531 DMA_CH1_CURRENT_APP_TXDESC — Offset 11C4h

The Channeli Current Application Transmit Descriptor register points to the current Transmit descriptor read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11C4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Transmit Descriptor Address Pointer (CURTDESAPTR):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

10.2.532 DMA_CH1_CURRENT_APP_RXDESC — Offset 11CCh

The Channeli Current Application Receive Descriptor register points to the current Receive descriptor read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11CCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Receive Descriptor Address Pointer (CURRDESAPTR):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

10.2.533 DMA_CH1_CURRENT_APP_TXBUFFER_H — Offset 11D0h

The Channeli Current Application Transmit Buffer Address High register has the higher 8 or 16 bits of the current address of the Transmit buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11D0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description

10.2.534 DMA_CH1_CURRENT_APP_TXBUFFER — Offset 11D4h

The Channeli Current Application Transmit Buffer Address register points to the current Tx buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Transmit Buffer Address Pointer (CURTBUFAPTR):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

10.2.535 DMA_CH1_CURRENT_APP_RXBUFFER_H — Offset 11D8h

The Channeli Current Application Receive Buffer Address High register has the higher 8 or 16 bits of the current address of the Receive buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO	**Application Receive Buffer Address Pointer (CURRBUFAPTRH):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

10.2.536 DMA_CH1_CURRENT_APP_RXBUFFER — Offset 11DCh

The Channel 0 Current Application Receive Buffer Address register points to the current Rx buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11DCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Receive Buffer Address Pointer (CURRBUFAPTR):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

10.2.537 DMA_CH1_STATUS — Offset 11E0h

The software driver (application) reads the Status register during interrupt service routine or polling to determine the status of the DMA.

Note: The number of DMA_CH(#i)_Status register in the configuration is the higher of number of Rx DMA Channels and Tx DMA Channels.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11E0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21:19	0h RO	**Rx DMA Error Bits (REB):** This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 21 -- 1'b1: Error during data transfer by Rx DMA -- 1'b0: No Error during data transfer by Rx DMA - Bit 20 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 19 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
18:16	0h RO	**Tx DMA Error Bits (TEB):** This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 18 -- 1'b1: Error during data transfer by Tx DMA -- 1'b0: No Error during data transfer by Tx DMA - Bit 17 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 16 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
15	0h RW	**Normal Interrupt Summary (NIS):** Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in DMA_CH0_Interrupt_Enable register) affect the Normal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit which causes NIS to be set is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Normal Interrupt Summary status not detected. 0x1 (ACTIVE): Normal Interrupt Summary status detected.

Bit Range	Default & Access	Field Name (ID): Description
14	0h RW	**Abnormal Interrupt Summary (AIS):** Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Abnormal Interrupt Summary status not detected. 0x1 (ACTIVE): Abnormal Interrupt Summary status detected.
13	0h RW	**Context Descriptor Error (CDE):** This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Context Descriptor Error status not detected. 0x1 (ACTIVE): Context Descriptor Error status detected.
12	0h RW	**Fatal Bus Error (FBE):** This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Fatal Bus Error status not detected. 0x1 (ACTIVE): Fatal Bus Error status detected.
11	0h RW	**Early Receive Interrupt (ERI):** This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. In configs supporting ERIC, When ERIC=0, this bit is set only after the Rx DMA has filled up a complete receive buffer with packet data. When ERIC=1, this bit is set after every burst transfer of data from the Rx DMA to the buffer. The setting of RI bit automatically clears this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Receive Interrupt status not detected. 0x1 (ACTIVE): Early Receive Interrupt status detected.
10	0h RW	**Early Transmit Interrupt (ETI):** This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. In configs supporting ERIC: When ETIC=0, this bit is set only after the Tx DMA has transferred a complete packet to MTL. When ETIC=1, this bit is set after completion of (partial) packet data transfer from buffers in the Transmit descriptor in which IOC=1. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Transmit Interrupt status not detected. 0x1 (ACTIVE): Early Transmit Interrupt status detected.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**Receive Watchdog Timeout (RWT):** This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received. 0x0 (INACTIVE): Receive Watchdog Timeout status not detected. 0x1 (ACTIVE): Receive Watchdog Timeout status detected.
8	0h RW	**Receive Process Stopped (RPS):** This bit is asserted when the Rx process enters the Stopped state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Process Stopped status not detected. 0x1 (ACTIVE): Receive Process Stopped status detected.
7	0h RW	**Receive Buffer Unavailable (RBU):** This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode, the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Buffer Unavailable status not detected. 0x1 (ACTIVE): Receive Buffer Unavailable status detected.
6	0h RW	**Receive Interrupt (RI):** This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. The reception remains in the Running state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Interrupt status not detected. 0x1 (ACTIVE): Receive Interrupt status detected.
5:3	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Transmit Buffer Unavailable (TBU):** This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPS0 field of the DMA_Debug_Status0 register explains the Transmit Process state transitions. To resume processing the Transmit descriptors, the application should do the following: 1. Change the ownership of the descriptor by setting Bit 31 of TDES3. 2. Issue a Transmit Poll Demand command. For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Buffer Unavailable status not detected. 0x1 (ACTIVE): Transmit Buffer Unavailable status detected.
1	0h RW	**Transmit Process Stopped (TPS):** This bit is set when the transmission is stopped. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Process Stopped status not detected. 0x1 (ACTIVE): Transmit Process Stopped status detected.
0	0h RW	**Transmit Interrupt (TI):** This bit indicates that the packet transmission is complete. When transmission is complete, Bit 31 of TDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Interrupt status not detected. 0x1 (ACTIVE): Transmit Interrupt status detected.

10.2.538 DMA_CH1_MISS_FRAME_CNT — Offset 11E4h

This register has the number of packet counter that got dropped by the DMA either due to Bus Error or due to programming RPF field in DMA_CH${i}_Rx_Control register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Overflow status of the MFC Counter (MFCO):** When this bit is set then the MFC counter does not get incremented further. The bit gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Miss Frame Counter overflow not occurred. 0x1 (ACTIVE): Miss Frame Counter overflow occurred.
14:11	0h RO	**Reserved**
10:0	000h RO	**Dropped Packet Counters (MFC):** This counter indicates the number of packet counters that are dropped by the DMA either because of bus error or because of programing RPF field in DMA_CH${i}_Rx_Control register. The counter gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event.

10.2.539 DMA_CH1_RXP_ACCEPT_CNT — Offset 11E8h

The DMA_CH(#i)_RXP_Accept_Cnt registers provides the count of the number of frames accepted by Rx Parser.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11E8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Rx Parser Accept Counter Overflow Bit (RXPACOF):** When set, this bit indicates that the RXPAC Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Rx Parser Accept Counter overflow not occurred. 0x1 (ACTIVE): Rx Parser Accept Counter overflow occurred.
30:0	00000000h RO	**Rx Parser Accept Counter (RXPAC):** This 31-bit counter is implemented whenever a Rx Parser Accept a packet due to AF =1. The counter is cleared when the register is read.

10.2.540 DMA_CH1_RX_ERI_CNT — Offset 11ECh

The DMA_CH(#i)_RX_ERI_Cnt registers provides the count of the number of times ERI was asserted.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11ECh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11:0	000h RO	**ERI Counter (ECNT):** When ERIC bit of DMA_CH(#i)_RX_Control register is set, this counter increments for burst transfer completed by the Rx DMA from the start of packet transfer. This counter is reset at the start of new packet.

10.2.541 DMA_CH2_CONTROL — Offset 1200h

The DMA Channeli Control register specifies the MSS value for segmentation, length to skip between two descriptors, and also the features such as header splitting and 8xPBL mode.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1200h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**Split Headers (SPH):** When this bit is set, the DMA splits the header and payload in the Receive path. The DMA writes the header to the Buffer Address1 of RDES0. The DMA writes the payload to the buffer to which the Buffer Address2 is pointing. The software must ensure that the header fits into the Receive buffers. If the header length exceeds the receive buffer size, the DMA does not split the header and payload. This bit is available only if Enable Split Header Structure option is selected. 0x0 (DISABLE): Split Headers feature is disabled. 0x1 (ENABLE): Split Headers feature is enabled.
23:21	0h RO	**Reserved**
20:18	0h RW	**Descriptor Skip Length (DSL):** This bit specifies the Word, Dword, or Lword number (depending on the 32-bit, 64-bit, or 128-bit bus) to skip between two unchained descriptors. The address skipping starts from the end of the current descriptor to the start of the next descriptor. When the DSL value is equal to zero, the DMA takes the descriptor table as contiguous.
17	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**8xPBL mode (PBLX8):** When this bit is set, the PBL value programmed in Bits[21:16] in DMA_CH(#i)_Tx_Control and Bits[21:16] in DMA_CH(#i)_Rx_Control is multiplied by eight times. Therefore, the DMA transfers the data in 8, 16, 32, 64, 128, and 256 beats depending on the PBL value. 0x0 (DISABLE): 8xPBL mode is disabled. 0x1 (ENABLE): 8xPBL mode is enabled.
15:14	0h RO	**Reserved**
13:0	0000h RW	**Maximum Segment Size (MSS):** This field specifies the maximum segment size that should be used while segmenting the packet. This field is valid only if the TSE bit of DMA_CH0_Tx_Control register is set. The value programmed in this field must be more than the configured Datawidth in bytes. It is recommended to use a MSS value of 64 bytes or more.

10.2.542 DMA_CH2_TX_CONTROL — Offset 1204h

The DMA Channeli Transmit Control register controls the Tx features such as PBL, TCP segmentation, and Tx Channel weights.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1204h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:29	0h RW	**Time Select (TFSEL):** Select bits for one of the four DMA_TBS_CTRL register fields (FTOS, FGSN, FTOV) for the channel. 0x0: DMA_TBS_CTRL0 selected. 0x1: DMA_TBS_CTRL1 selected. 0x2: DMA_TBS_CTRL2 selected. 0x3: DMA_TBS_CTRL3 selected.
28	0h RW	**Enhanced Descriptor Enable (EDSE):** When this bit is set, the corresponding channel uses Enhanced Descriptors that are 32 Bytes for both Normal and Context Descriptors. When reset, the corresponding channel uses the descriptors that are 16 Bytes. 0x0 (DISABLE): Enhanced Descriptor is disabled. 0x1 (ENABLE): Enhanced Descriptor is enabled.
27:24	0h RW	**Transmit QOS. (TQOS):** This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Tx Channel0.
23:22	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
21:16	00h RW	**Transmit Programmable Burst Length (TXPBL):** These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in DMA_CH0_Control register. 2. Set the TxPBL. Note: The maximum value of TxPBL must be less than or equal to half the Tx Queue size (TQS field of MTL_TxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. For example, in 64-bit data width configurations the total locations in Tx Queue of size 512 bytes is 64, TxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	0h RW	**Ignore PBL Requirement (IPBL):** When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. If space is not available, the MTL might use handshaking to slow the DMA. Note: This bit/mode must not be used when multiple Transmit DMA Channels are enabled as it might block other Transmit and Receive DMA Channels from accessing the Read Data Channel of AXI bus until space is available in Transmit Queue for current transfer. 0x0 (DISABLE): Ignore PBL Requirement is disabled. 0x1 (ENABLE): Ignore PBL Requirement is enabled.
14:13	0h RW	**TSE_MODE:** TSE Mode - 00: TSO/USO (segmentation functionality is enabled). In this mode, the setting of TSE bit enables the TSO/USO segmentation. - 01: UFO with Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality with Checksum for all the UDP packets. - 10: UFO without Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality without Checksum for all the UDP packets. - 11: Reserved 0x0 (TSO_USO): TSO/USO. 0x1 (UFOWC): UFO with Checksum. 0x2 (UFOWOC): UFO without Checksum. 0x3 (RSVD): Reserved.
12	0h RW	**TCP Segmentation Enabled (TSE):** When this bit is set, the DMA performs the TCP segmentation or UDP Segmentation/ Fragmentation for packets in this channel. The TCP segmentation or UDP packet's segmentation/Fragmentation is done only for those packets for which the TSE bit (TDES0[19]) is set in the Tx Normal descriptor.When this bit is set, the TxPBL value must be greater than 4. 0x0 (DISABLE): TCP Segmentation is disabled. 0x1 (ENABLE): TCP Segmentation is enabled.
11:5	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	**Operate on Second Packet (OSF):** When this bit is set, it instructs the DMA to process the second packet of the Transmit data even before the status for the first packet is obtained. 0x0 (DISABLE): Operate on Second Packet disabled. 0x1 (ENABLE): Operate on Second Packet enabled.
3:1	0h RW	**Transmit Channel Weight (TCW):** This field indicates the weight assigned to the corresponding Transmit channel. When reset is complete, this field is set to 0 for all channels by default, resulting in equal weights to all channels.
0	0h RW	**Start or Stop Transmission Command (ST):** When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the base address of the Transmit list set by the DMA_CH0_TxDesc_List_Address register. - The position at which the transmission was previously stopped If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the DMA_CH0_Status register is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the DMA_CH0_TxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program DMA_CH0_TxDesc_List_Address register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state. 0x0 (STOP): Stop Transmission Command. 0x1 (START): Start Transmission Command.

10.2.543 DMA_CH2_RX_CONTROL — Offset 1208h

The DMA Channeli Receive Control register controls the Rx features such as PBL, buffer size, and extended status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1208h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Rx Packet Flush. (RPF):** When this bit is set to 1, then GbE Controller automatically flushes the packet from the Rx Queues destined to this DMA Rx Channel, when it is stopped. When this bit remains set and the DMA is re-started by the software driver, the packets residing in the Rx Queues that were received when this RxDMA was stopped, get flushed out. The packets that are received by the MAC after the RxDMA is re-started are routed to the RxDMA. The flushing happens on the Read side of the Rx Queue. When this bit is set to 0, the GbE Controller not flush the packet in the Rx Queue destined to this RxDMA Channel when it is STOP state. This might in turn cause head-of-line blocking in the corresponding RxQueue. Note: The stopping of packet flow from a Rx DMA Channel to the application by setting RPF works only when there is one-to-one mapping of Rx Queue to Rx DMA channels. In Dynamic mapping mode, setting RPF bit in any DMA_CH(#i)_Rx_Control register might flush packets from unintended Rx Queues which are destined to the stopped Rx DMA Channel. 0x0 (DISABLE): Rx Packet Flush is disabled. 0x1 (ENABLE): Rx Packet Flush is enabled.
30:28	0h RO	**Reserved**
27:24	0h RW	**Rx AXI4 QOS. (RQOS):** This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Rx Channel0.
23:22	0h RO	**Reserved**
21:16	00h RW	**Receive Programmable Burst Length (RXPBL):** These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in the DMA_CH0_Control register. 2. Set the RxPBL. Note: The maximum value of RxPBL must be less than or equal to half the Rx Queue size (RQS field of MTL_RxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the Rx DMA is transferring a block of data. For example, in 64-bit data width configurations the total locations in Rx Queue of size 512 bytes is 64, so RxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
14:4	000h RW	**Receive Buffer size High (RBSZ_13_Y):** RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. The RBSZ[13:0] field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when split headers are enabled. Note: The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the value of buffer address pointer is not aligned to data bus width. Hence the lower RBSZ_x_0 bits are read-only and the value is considered as all-zero. Thus the RBSZ_13_y indicates the buffer size in terms of locations (with the width same as bus-width).
3:1	0h RO	**Receive Buffer size Low (RBSZ_X_0):** RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. The RBSZ_x_0 is the lower field whose width is based on data bus width of the configuration. This field is of width 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).
0	0h RW	**Start or Stop Receive (SR):** When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the address set by the DMA_CH0_RxDesc_List_Address register. - The position at which the Rx process was previously stopped If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the DMA_CH0_Status register is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the DMA_CH0_RxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state. 0x0 (STOP): Stop Receive. 0x1 (START): Start Receive.

10.2.544 DMA_CH2_TXDESC_LIST_HADDRESS — Offset 1210h

The Channeli Tx Descriptor List HAddress register has the higher 8 or 16 bits of the start address of the Transmit descriptor list.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CHi_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier. This register must be programmed with desired the higher address before programming the DMA_CHi_TxDesc_List_Address register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1210h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Start of Transmit List (TDESHA):** This field contains the most-significant 8 or 16 bits of the 40- or 48-bit base address of the first descriptor in the Transmit descriptor list.

10.2.545 DMA_CH2_TXDESC_LIST_ADDRESS — Offset 1214h

The Channeli Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LSB to low.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CH0_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1214h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Start of Transmit List (TDESLA):** This field contains the base address of the first descriptor in the Transmit descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

10.2.546 DMA_CH2_RXDESC_LIST_HADDRESS — Offset 1218h

The Channeli Rx Descriptor List HAddress register has the higher 8 or 16 bits of the start address of the Receive descriptor list.

Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in the DMA_CHi_RxDesc_List_Address register

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1218h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Start of Receive List (RDESHA):** This field contains the most-significant 8 or 16 bits of the 40-bit or 48-bit base address of the first descriptor in the Rx Descriptor list.

10.2.547 DMA_CH2_RXDESC_LIST_ADDRESS — Offset 121Ch

The Channeli Rx Descriptor List Address register points the DMA to the start of Receive descriptor list.

This register points to the start of the Receive Descriptor List. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in DMA_CH0_Rx_Control register. When stopped, this register can be written with a new descriptor list address.

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 121Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Start of Receive List (RDESLA):** This field contains the base address of the first descriptor in the Rx Descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

10.2.548 DMA_CH2_TXDESC_TAIL_POINTER — Offset 1220h

The Channeli Tx Descriptor Tail Pointer register points to an offset from the base and indicates the location of the last valid descriptor.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1220h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Transmit Descriptor Tail Pointer (TDTP):** This field contains the tail pointer for the Tx descriptor ring. The software writes the tail pointer to add more descriptors to the Tx channel. The hardware tries to transmit all packets referenced by the descriptors between the head and the tail pointer registers. The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

10.2.549 DMA_CH2_RXDESC_TAIL_POINTER — Offset 1228h

The Channeli Rx Descriptor Tail Pointer Points to an offset from the base and indicates the location of the last valid descriptor.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1228h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Receive Descriptor Tail Pointer (RDTP):** This field contains the tail pointer for the Rx descriptor ring. The software writes the tail pointer to add more descriptors to the Rx channel. The hardware tries to write all received packets to the descriptors referenced between the head and the tail pointer registers. The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

10.2.550 DMA_CH2_TXDESC_RING_LENGTH — Offset 122Ch

The Tx Descriptor Ring Length register contains the length of the Transmit descriptor ring.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 122Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:0	000h RW	**Transmit Descriptor Ring Length (TDRL):** This field sets the maximum number of Tx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. Intel recommends a minimum ring descriptor length of 4. For example, You can program any value up to 0x3FF in this field. This field is 10 bits wide, if you program 0x3FF, you can have 1024 descriptors. If you want to have 10 descriptors, program it to a value of 0x9.

10.2.551 DMA_CH2_RXDESC_RING_LENGTH — Offset 1230h

The Channeli Rx Descriptor Ring Length register contains the length of the Receive descriptor circular ring.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1230h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:0	000h RW	**Receive Descriptor Ring Length (RDRL):** This register sets the maximum number of Rx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. For example, You can program any value up to 0x3FF in this field. This field is 10 bits wide, if you program 0x3FF, you can have 1024 descriptors. If you want to have 10 descriptors, program it to a value of 0x9.

10.2.552 DMA_CH2_INTERRUPT_ENABLE — Offset 1234h

The Channeli Interrupt Enable register enables the interrupts reported by the Status register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1234h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW	**Normal Interrupt Summary Enable (NIE):** When this bit is set, the normal interrupt summary is enabled. This bit enables the following interrupts in the DMA_CH0_Status register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt When this bit is reset, the normal interrupt summary is disabled. 0x0 (DISABLE): Normal Interrupt Summary is disabled. 0x1 (ENABLE): Normal Interrupt Summary is enabled.
14	0h RW	**Abnormal Interrupt Summary Enable (AIE):** When this bit is set, the abnormal interrupt summary is enabled. This bit enables the following interrupts in the DMA_CH0_Status register: - Bit 1: Transmit Process Stopped - Bit 7: Rx Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 9: Receive Watchdog Timeout - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error When this bit is reset, the abnormal interrupt summary is disabled. 0x0 (DISABLE): Abnormal Interrupt Summary is disabled. 0x1 (ENABLE): Abnormal Interrupt Summary is enabled.
13	0h RW	**Context Descriptor Error Enable (CDEE):** When this bit is set along with the AIE bit, the Descriptor error interrupt is enabled. When this bit is reset, the Descriptor error interrupt is disabled. 0x0 (DISABLE): Context Descriptor Error is disabled. 0x1 (ENABLE): Context Descriptor Error is enabled.
12	0h RW	**Fatal Bus Error Enable (FBEE):** When this bit is set along with the AIE bit, the Fatal Bus error interrupt is enabled. When this bit is reset, the Fatal Bus Error error interrupt is disabled. 0x0 (DISABLE): Fatal Bus Error is disabled. 0x1 (ENABLE): Fatal Bus Error is enabled.
11	0h RW	**Early Receive Interrupt Enable (ERIE):** When this bit is set along with the NIE bit, the Early Receive interrupt is enabled. When this bit is reset, the Early Receive interrupt is disabled. 0x0 (DISABLE): Early Receive Interrupt is disabled. 0x1 (ENABLE): Early Receive Interrupt is enabled.
10	0h RW	**Early Transmit Interrupt Enable (ETIE):** When this bit is set along with the AIE bit, the Early Transmit interrupt is enabled. When this bit is reset, the Early Transmit interrupt is disabled. 0x0 (DISABLE): Early Transmit Interrupt is disabled. 0x1 (ENABLE): Early Transmit Interrupt is enabled.
9	0h RW	**Receive Watchdog Timeout Enable (RWTE):** When this bit is set along with the AIE bit, the Receive Watchdog Timeout interrupt is enabled. When this bit is reset, the Receive Watchdog Timeout interrupt is disabled. 0x0 (DISABLE): Receive Watchdog Timeout is disabled. 0x1 (ENABLE): Receive Watchdog Timeout is enabled.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**Receive Stopped Enable (RSE):** When this bit is set along with the AIE bit, the Receive Stopped Interrupt is enabled. When this bit is reset, the Receive Stopped interrupt is disabled. 0x0 (DISABLE): Receive Stopped is disabled. 0x1 (ENABLE): Receive Stopped is enabled.
7	0h RW	**Receive Buffer Unavailable Enable (RBUE):** When this bit is set along with the AIE bit, the Receive Buffer Unavailable interrupt is enabled. When this bit is reset, the Receive Buffer Unavailable interrupt is disabled. 0x0 (DISABLE): Receive Buffer Unavailable is disabled. 0x1 (ENABLE): Receive Buffer Unavailable is enabled.
6	0h RW	**Receive Interrupt Enable (RIE):** When this bit is set along with the NIE bit, the Receive Interrupt is enabled. When this bit is reset, the Receive Interrupt is disabled. 0x0 (DISABLE): Receive Interrupt is disabled. 0x1 (ENABLE): Receive Interrupt is enabled.
5:3	0h RO	**Reserved**
2	0h RW	**Transmit Buffer Unavailable Enable (TBUE):** When this bit is set along with the NIE bit, the Transmit Buffer Unavailable interrupt is enabled. When this bit is reset, the Transmit Buffer Unavailable interrupt is disabled. 0x0 (DISABLE): Transmit Buffer Unavailable is disabled. 0x1 (ENABLE): Transmit Buffer Unavailable is enabled.
1	0h RW	**Transmit Stopped Enable (TXSE):** When this bit is set along with the AIE bit, the Transmission Stopped interrupt is enabled. When this bit is reset, the Transmission Stopped interrupt is disabled. 0x0 (DISABLE): Transmit Stopped is disabled. 0x1 (ENABLE): Transmit Stopped is enabled.
0	0h RW	**Transmit Interrupt Enable (TIE):** When this bit is set along with the NIE bit, the Transmit Interrupt is enabled. When this bit is reset, the Transmit Interrupt is disabled. 0x0 (DISABLE): Transmit Interrupt is disabled. 0x1 (ENABLE): Transmit Interrupt is enabled.

10.2.553 DMA_CH2_RX_INTERRUPT_WATCHDOG_TIMER — Offset 1238h

The Receive Interrupt Watchdog Timer register indicates the watchdog timeout for Receive Interrupt (RI) from the DMA. When this register is written with a non-zero value, it enables the watchdog timer for the RI bit of the DMA_CHi_Status register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1238h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17:16	0h RW	**Receive Interrupt Watchdog Timer Count Units (RWTU):** This fields indicates the number of system clock cycles corresponding to one unit in RWT field. - 2'b00: 256 - 2'b01: 512 - 2'b10: 1024 - 2'b11: 2048 For example, when RWT=2 and RWTU=1, the watchdog timer is set for 2*512=1024 system clock cycles.
15:8	0h RO	**Reserved**
7:0	00h RW	**Receive Interrupt Watchdog Timer Count (RWT):** This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. The watchdog timer is triggered with the programmed value after the Rx DMA completes the transfer of a packet for which the RI bit is not set in the DMA_CH(#i)_Status register, because of the setting of Interrupt Enable bit in the corresponding descriptor RDES3[30]. When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per the Interrupt Enable bit RDES3[30] of any received packet.

10.2.554 DMA_CH2_SLOT_FUNCTION_CONTROL_STATUS — Offset 123Ch

The Slot Function Control and Status register contains the control bits for slot function and the status for Transmit path.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 123Ch	000007C0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19:16	0h RO	**Reference Slot Number (RSN):** This field gives the current value of the reference slot number in the DMA. It is used for slot comparison.
15:4	07Ch RW	**Slot Interval Value (SIV):** This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. A value of 0 specifies the slot interval of 1 us while the maximum value 4095 specifies the slot interval of 4096us. The default/reset value is 0x07C which corresponds to slot interval of 125us

Bit Range	Default & Access	Field Name (ID): Description
3:2	0h RO	**Reserved**
1	0h RW	**Advance Slot Check (ASC):** When set, this bit enables the DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the Tx descriptor is - equal to the reference slot number given in the RSN field or - ahead of the reference slot number by up to two slots This bit is applicable only when the ESC bit is set. 0x0 (DISABLE): Advance Slot Check is disabled. 0x1 (ENABLE): Advance Slot Check is enabled.
0	0h RW	**Enable Slot Comparison (ESC):** When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. The DMA fetches the data from the corresponding buffer only when the slot number is - equal to the reference slot number or - ahead of the reference slot number by one slot When reset, this bit disables the checking of the slot numbers. The DMA fetches the data immediately after the descriptor is processed. Note: The UFO (UDP Fragmentation over IPv4)/TSO/USO should not be enabled along with TBS/AVB Slot number check. The UFO/TSO/USO involves multiple packets/segments/fragments transmission for single packet received from application and the slot number check are applicable for fetching of only first segment/fragment. As a result it might be difficult for software to specify slot number for subsequent packets. 0x0 (DISABLE): Slot Comparison is disabled. 0x1 (ENABLE): Slot Comparison is enabled.

10.2.555 DMA_CH2_CURRENT_APP_TXDESC — Offset 1244h

The Channeli Current Application Transmit Descriptor register points to the current Transmit descriptor read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1244h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Transmit Descriptor Address Pointer (CURTDESAPTR):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

10.2.556 DMA_CH2_CURRENT_APP_RXDESC — Offset 124Ch

The Channeli Current Application Receive Descriptor register points to the current Receive descriptor read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 124Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Receive Descriptor Address Pointer (CURRDESAPTR):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

10.2.557 DMA_CH2_CURRENT_APP_TXBUFFER_H — Offset 1250h

The Channeli Current Application Transmit Buffer Address High register has the higher 8 or 16 bits of the current address of the Transmit buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1250h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO	**Application Transmit Buffer Address Pointer (CURTBUFAPTRH):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

10.2.558 DMA_CH2_CURRENT_APP_TXBUFFER — Offset 1254h

The Channeli Current Application Transmit Buffer Address register points to the current Tx buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1254h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Transmit Buffer Address Pointer (CURTBUFAPTR):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

10.2.559 DMA_CH2_CURRENT_APP_RXBUFFER_H — Offset 1258h

The Channeli Current Application Receive Buffer Address High register has the higher 8 or 16 bits of the current address of the Receive buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1258h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO	**Application Receive Buffer Address Pointer (CURRBUFAPTRH):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

10.2.560 DMA_CH2_CURRENT_APP_RXBUFFER — Offset 125Ch

The Channel 0 Current Application Receive Buffer Address register points to the current Rx buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 125Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Receive Buffer Address Pointer (CURRBUFAPTR):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

10.2.561 DMA_CH2_STATUS — Offset 1260h

The software driver (application) reads the Status register during interrupt service routine or polling to determine the status of the DMA.

Note: The number of DMA_CH(#i)_Status register in the configuration is the higher of number of Rx DMA Channels and Tx DMA Channels.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1260h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21:19	0h RO	**Rx DMA Error Bits (REB):** This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 21 -- 1'b1: Error during data transfer by Rx DMA -- 1'b0: No Error during data transfer by Rx DMA - Bit 20 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 19 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
18:16	0h RO	**Tx DMA Error Bits (TEB):** This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 18 -- 1'b1: Error during data transfer by Tx DMA -- 1'b0: No Error during data transfer by Tx DMA - Bit 17 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 16 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
15	0h RW	**Normal Interrupt Summary (NIS):** Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in DMA_CH0_Interrupt_Enable register) affect the Normal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit which causes NIS to be set is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Normal Interrupt Summary status not detected. 0x1 (ACTIVE): Normal Interrupt Summary status detected.

Bit Range	Default & Access	Field Name (ID): Description
14	0h RW	**Abnormal Interrupt Summary (AIS):** Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Abnormal Interrupt Summary status not detected. 0x1 (ACTIVE): Abnormal Interrupt Summary status detected.
13	0h RW	**Context Descriptor Error (CDE):** This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Context Descriptor Error status not detected. 0x1 (ACTIVE): Context Descriptor Error status detected.
12	0h RW	**Fatal Bus Error (FBE):** This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Fatal Bus Error status not detected. 0x1 (ACTIVE): Fatal Bus Error status detected.
11	0h RW	**Early Receive Interrupt (ERI):** This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. In configs supporting ERIC, When ERIC=0, this bit is set only after the Rx DMA has filled up a complete receive buffer with packet data. When ERIC=1, this bit is set after every burst transfer of data from the Rx DMA to the buffer. The setting of RI bit automatically clears this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Receive Interrupt status not detected. 0x1 (ACTIVE): Early Receive Interrupt status detected.
10	0h RW	**Early Transmit Interrupt (ETI):** This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. In configs supporting ERIC: When ETIC=0, this bit is set only after the Tx DMA has transferred a complete packet to MTL. When ETIC=1, this bit is set after completion of (partial) packet data transfer from buffers in the Transmit descriptor in which IOC=1. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Transmit Interrupt status not detected. 0x1 (ACTIVE): Early Transmit Interrupt status detected.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**Receive Watchdog Timeout (RWT):** This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received. 0x0 (INACTIVE): Receive Watchdog Timeout status not detected. 0x1 (ACTIVE): Receive Watchdog Timeout status detected.
8	0h RW	**Receive Process Stopped (RPS):** This bit is asserted when the Rx process enters the Stopped state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Process Stopped status not detected. 0x1 (ACTIVE): Receive Process Stopped status detected.
7	0h RW	**Receive Buffer Unavailable (RBU):** This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode, the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Buffer Unavailable status not detected. 0x1 (ACTIVE): Receive Buffer Unavailable status detected.
6	0h RW	**Receive Interrupt (RI):** This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. The reception remains in the Running state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Interrupt status not detected. 0x1 (ACTIVE): Receive Interrupt status detected.
5:3	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Transmit Buffer Unavailable (TBU):** This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPS0 field of the DMA_Debug_Status0 register explains the Transmit Process state transitions. To resume processing the Transmit descriptors, the application should do the following: 1. Change the ownership of the descriptor by setting Bit 31 of TDES3. 2. Issue a Transmit Poll Demand command. For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Buffer Unavailable status not detected. 0x1 (ACTIVE): Transmit Buffer Unavailable status detected.
1	0h RW	**Transmit Process Stopped (TPS):** This bit is set when the transmission is stopped. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Process Stopped status not detected. 0x1 (ACTIVE): Transmit Process Stopped status detected.
0	0h RW	**Transmit Interrupt (TI):** This bit indicates that the packet transmission is complete. When transmission is complete, Bit 31 of TDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Interrupt status not detected. 0x1 (ACTIVE): Transmit Interrupt status detected.

10.2.562 DMA_CH2_MISS_FRAME_CNT — Offset 1264h

This register has the number of packet counter that got dropped by the DMA either due to Bus Error or due to programming RPF field in DMA_CH${i}_Rx_Control register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1264h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Overflow status of the MFC Counter (MFCO):** When this bit is set then the MFC counter does not get incremented further. The bit gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Miss Frame Counter overflow not occurred. 0x1 (ACTIVE): Miss Frame Counter overflow occurred.
14:11	0h RO	**Reserved**
10:0	000h RO	**Dropped Packet Counters (MFC):** This counter indicates the number of packet counters that are dropped by the DMA either because of bus error or because of programing RPF field in DMA_CH${i}_Rx_Control register. The counter gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event.

10.2.563 DMA_CH2_RXP_ACCEPT_CNT — Offset 1268h

The DMA_CH(#i)_RXP_Accept_Cnt registers provides the count of the number of frames accepted by Rx Parser.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1268h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Rx Parser Accept Counter Overflow Bit (RXPACOF):** When set, this bit indicates that the RXPAC Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Rx Parser Accept Counter overflow not occurred. 0x1 (ACTIVE): Rx Parser Accept Counter overflow occurred.
30:0	00000000h RO	**Rx Parser Accept Counter (RXPAC):** This 31-bit counter is implemented whenever a Rx Parser Accept a packet due to AF =1. The counter is cleared when the register is read.

10.2.564 DMA_CH2_RX_ERI_CNT — Offset 126Ch

The DMA_CH(#i)_RX_ERI_Cnt registers provides the count of the number of times ERI was asserted.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 126Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11:0	000h RO	**ERI Counter (ECNT):** When ERIC bit of DMA_CH(#i)_RX_Control register is set, this counter increments for burst transfer completed by the Rx DMA from the start of packet transfer. This counter is reset at the start of new packet.

10.2.565 DMA_CH3_CONTROL — Offset 1280h

The DMA Channeli Control register specifies the MSS value for segmentation, length to skip between two descriptors, and also the features such as header splitting and 8xPBL mode.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1280h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**Split Headers (SPH):** When this bit is set, the DMA splits the header and payload in the Receive path. The DMA writes the header to the Buffer Address1 of RDES0. The DMA writes the payload to the buffer to which the Buffer Address2 is pointing. The software must ensure that the header fits into the Receive buffers. If the header length exceeds the receive buffer size, the DMA does not split the header and payload. This bit is available only if Enable Split Header Structure option is selected. 0x0 (DISABLE): Split Headers feature is disabled. 0x1 (ENABLE): Split Headers feature is enabled.
23:21	0h RO	**Reserved**
20:18	0h RW	**Descriptor Skip Length (DSL):** This bit specifies the Word, Dword, or Lword number (depending on the 32-bit, 64-bit, or 128-bit bus) to skip between two unchained descriptors. The address skipping starts from the end of the current descriptor to the start of the next descriptor. When the DSL value is equal to zero, the DMA takes the descriptor table as contiguous.
17	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**8xPBL mode (PBLX8):** When this bit is set, the PBL value programmed in Bits[21:16] in DMA_CH(#i)_Tx_Control and Bits[21:16] in DMA_CH(#i)_Rx_Control is multiplied by eight times. Therefore, the DMA transfers the data in 8, 16, 32, 64, 128, and 256 beats depending on the PBL value. 0x0 (DISABLE): 8xPBL mode is disabled. 0x1 (ENABLE): 8xPBL mode is enabled.
15:14	0h RO	**Reserved**
13:0	0000h RW	**Maximum Segment Size (MSS):** This field specifies the maximum segment size that should be used while segmenting the packet. This field is valid only if the TSE bit of DMA_CH0_Tx_Control register is set. The value programmed in this field must be more than the configured Datawidth in bytes. It is recommended to use a MSS value of 64 bytes or more.

10.2.566 DMA_CH3_TX_CONTROL — Offset 1284h

The DMA Channeli Transmit Control register controls the Tx features such as PBL, TCP segmentation, and Tx Channel weights.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1284h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:29	0h RW	**Time Select (TFSEL):** Select bits for one of the four DMA_TBS_CTRL register fields (FTOS, FGSN, FTOV) for the channel. 0x0: DMA_TBS_CTRL0 selected. 0x1: DMA_TBS_CTRL1 selected. 0x2: DMA_TBS_CTRL2 selected. 0x3: DMA_TBS_CTRL3 selected.
28	0h RW	**Enhanced Descriptor Enable (EDSE):** When this bit is set, the corresponding channel uses Enhanced Descriptors that are 32 Bytes for both Normal and Context Descriptors. When reset, the corresponding channel uses the descriptors that are 16 Bytes. 0x0 (DISABLE): Enhanced Descriptor is disabled. 0x1 (ENABLE): Enhanced Descriptor is enabled.
27:24	0h RW	**Transmit QOS. (TQOS):** This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Tx Channel0.
23:22	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
21:16	00h RW	**Transmit Programmable Burst Length (TXPBL):** These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in DMA_CH0_Control register. 2. Set the TxPBL. Note: The maximum value of TxPBL must be less than or equal to half the Tx Queue size (TQS field of MTL_TxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. For example, in 64-bit data width configurations the total locations in Tx Queue of size 512 bytes is 64, TxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	0h RW	**Ignore PBL Requirement (IPBL):** When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. If space is not available, the MTL might use handshaking to slow the DMA. Note: This bit/mode must not be used when multiple Transmit DMA Channels are enabled as it might block other Transmit and Receive DMA Channels from accessing the Read Data Channel of AXI bus until space is available in Transmit Queue for current transfer. 0x0 (DISABLE): Ignore PBL Requirement is disabled. 0x1 (ENABLE): Ignore PBL Requirement is enabled.
14:13	0h RW	**TSE_MODE:** TSE Mode - 00: TSO/USO (segmentation functionality is enabled). In this mode, the setting of TSE bit enables the TSO/USO segmentation. - 01: UFO with Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality with Checksum for all the UDP packets. - 10: UFO without Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality without Checksum for all the UDP packets. - 11: Reserved 0x0 (TSO_USO): TSO/USO. 0x1 (UFOWC): UFO with Checksum. 0x2 (UFOWOC): UFO without Checksum. 0x3 (RSVD): Reserved.
12	0h RW	**TCP Segmentation Enabled (TSE):** When this bit is set, the DMA performs the TCP segmentation or UDP Segmentation/ Fragmentation for packets in this channel. The TCP segmentation or UDP packet's segmentation/Fragmentation is done only for those packets for which the TSE bit (TDES0[19]) is set in the Tx Normal descriptor.When this bit is set, the TxPBL value must be greater than 4. 0x0 (DISABLE): TCP Segmentation is disabled. 0x1 (ENABLE): TCP Segmentation is enabled.
11:5	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	**Operate on Second Packet (OSF):** When this bit is set, it instructs the DMA to process the second packet of the Transmit data even before the status for the first packet is obtained. 0x0 (DISABLE): Operate on Second Packet disabled. 0x1 (ENABLE): Operate on Second Packet enabled.
3:1	0h RW	**Transmit Channel Weight (TCW):** This field indicates the weight assigned to the corresponding Transmit channel. When reset is complete, this field is set to 0 for all channels by default, resulting in equal weights to all channels.
0	0h RW	**Start or Stop Transmission Command (ST):** When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the base address of the Transmit list set by the DMA_CH0_TxDesc_List_Address register. - The position at which the transmission was previously stopped If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the DMA_CH0_Status register is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the DMA_CH0_TxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program DMA_CH0_TxDesc_List_Address register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state. 0x0 (STOP): Stop Transmission Command. 0x1 (START): Start Transmission Command.

10.2.567 DMA_CH3_RX_CONTROL — Offset 1288h

The DMA Channeli Receive Control register controls the Rx features such as PBL, buffer size, and extended status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1288h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Rx Packet Flush. (RPF):** When this bit is set to 1, then GbE Controller automatically flushes the packet from the Rx Queues destined to this DMA Rx Channel, when it is stopped. When this bit remains set and the DMA is re-started by the software driver, the packets residing in the Rx Queues that were received when this RxDMA was stopped, get flushed out. The packets that are received by the MAC after the RxDMA is re-started are routed to the RxDMA. The flushing happens on the Read side of the Rx Queue. When this bit is set to 0, the GbE Controller not flush the packet in the Rx Queue destined to this RxDMA Channel when it is STOP state. This might in turn cause head-of-line blocking in the corresponding RxQueue. Note: The stopping of packet flow from a Rx DMA Channel to the application by setting RPF works only when there is one-to-one mapping of Rx Queue to Rx DMA channels. In Dynamic mapping mode, setting RPF bit in any DMA_CH(#i)_Rx_Control register might flush packets from unintended Rx Queues which are destined to the stopped Rx DMA Channel. 0x0 (DISABLE): Rx Packet Flush is disabled. 0x1 (ENABLE): Rx Packet Flush is enabled.
30:28	0h RO	**Reserved**
27:24	0h RW	**Rx AXI4 QOS. (RQOS):** This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Rx Channel0.
23:22	0h RO	**Reserved**
21:16	00h RW	**Receive Programmable Burst Length (RXPBL):** These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in the DMA_CH0_Control register. 2. Set the RxPBL. Note: The maximum value of RxPBL must be less than or equal to half the Rx Queue size (RQS field of MTL_RxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the Rx DMA is transferring a block of data. For example, in 64-bit data width configurations the total locations in Rx Queue of size 512 bytes is 64, so RxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
14:4	000h RW	**Receive Buffer size High (RBSZ_13_Y):** RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. The RBSZ[13:0] field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when split headers are enabled. Note: The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the value of buffer address pointer is not aligned to data bus width. Hence the lower RBSZ_x_0 bits are read-only and the value is considered as all-zero. Thus the RBSZ_13_y indicates the buffer size in terms of locations (with the width same as bus-width).
3:1	0h RO	**Receive Buffer size Low (RBSZ_X_0):** RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. The RBSZ_x_0 is the lower field whose width is based on data bus width of the configuration. This field is of width 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).
0	0h RW	**Start or Stop Receive (SR):** When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the address set by the DMA_CH0_RxDesc_List_Address register. - The position at which the Rx process was previously stopped If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the DMA_CH0_Status register is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the DMA_CH0_RxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state. 0x0 (STOP): Stop Receive. 0x1 (START): Start Receive.

10.2.568 DMA_CH3_TXDESC_LIST_HADDRESS — Offset 1290h

The Channeli Tx Descriptor List HAddress register has the higher 8 or 16 bits of the start address of the Transmit descriptor list.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CHi_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier. This register must be programmed with desired the higher address before programming the DMA_CHi_TxDesc_List_Address register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1290h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Start of Transmit List (TDESHA):** This field contains the most-significant 8 or 16 bits of the 40- or 48-bit base address of the first descriptor in the Transmit descriptor list.

10.2.569 DMA_CH3_TXDESC_LIST_ADDRESS — Offset 1294h

The Channeli Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LSB to low.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CH0_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1294h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Start of Transmit List (TDESLA):** This field contains the base address of the first descriptor in the Transmit descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

10.2.570 DMA_CH3_RXDESC_LIST_HADDRESS — Offset 1298h

The Channeli Rx Descriptor List HAddress register has the higher 8 or 16 bits of the start address of the Receive descriptor list.

Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in the DMA_CHi_RxDesc_List_Address register

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1298h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Start of Receive List (RDESHA):** This field contains the most-significant 8 or 16 bits of the 40-bit or 48-bit base address of the first descriptor in the Rx Descriptor list.

10.2.571 DMA_CH3_RXDESC_LIST_ADDRESS — Offset 129Ch

The Channeli Rx Descriptor List Address register points the DMA to the start of Receive descriptor list.

This register points to the start of the Receive Descriptor List. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in DMA_CH0_Rx_Control register. When stopped, this register can be written with a new descriptor list address.

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 129Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Start of Receive List (RDESLA):** This field contains the base address of the first descriptor in the Rx Descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

10.2.572 DMA_CH3_TXDESC_TAIL_POINTER — Offset 12A0h

The Channeli Tx Descriptor Tail Pointer register points to an offset from the base and indicates the location of the last valid descriptor.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12A0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Transmit Descriptor Tail Pointer (TDTP):** This field contains the tail pointer for the Tx descriptor ring. The software writes the tail pointer to add more descriptors to the Tx channel. The hardware tries to transmit all packets referenced by the descriptors between the head and the tail pointer registers. The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

10.2.573 DMA_CH3_RXDESC_TAIL_POINTER — Offset 12A8h

The Channeli Rx Descriptor Tail Pointer Points to an offset from the base and indicates the location of the last valid descriptor.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12A8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Receive Descriptor Tail Pointer (RDTP):** This field contains the tail pointer for the Rx descriptor ring. The software writes the tail pointer to add more descriptors to the Rx channel. The hardware tries to write all received packets to the descriptors referenced between the head and the tail pointer registers. The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

10.2.574 DMA_CH3_TXDESC_RING_LENGTH — Offset 12ACh

The Tx Descriptor Ring Length register contains the length of the Transmit descriptor ring.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12ACh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:0	000h RW	**Transmit Descriptor Ring Length (TDRL):** This field sets the maximum number of Tx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. Intel recommends a minimum ring descriptor length of 4. For example, You can program any value up to 0x3FF in this field. This field is 10 bits wide, if you program 0x3FF, you can have 1024 descriptors. If you want to have 10 descriptors, program it to a value of 0x9.

10.2.575 DMA_CH3_RXDESC_RING_LENGTH — Offset 12B0h

The Channeli Rx Descriptor Ring Length register contains the length of the Receive descriptor circular ring.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:0	000h RW	**Receive Descriptor Ring Length (RDRL):** This register sets the maximum number of Rx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. For example, You can program any value up to 0x3FF in this field. This field is 10 bits wide, if you program 0x3FF, you can have 1024 descriptors. If you want to have 10 descriptors, program it to a value of 0x9.

10.2.576 DMA_CH3_INTERRUPT_ENABLE — Offset 12B4h

The Channeli Interrupt Enable register enables the interrupts reported by the Status register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12B4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW	**Normal Interrupt Summary Enable (NIE):** When this bit is set, the normal interrupt summary is enabled. This bit enables the following interrupts in the DMA_CH0_Status register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt When this bit is reset, the normal interrupt summary is disabled. 0x0 (DISABLE): Normal Interrupt Summary is disabled. 0x1 (ENABLE): Normal Interrupt Summary is enabled.
14	0h RW	**Abnormal Interrupt Summary Enable (AIE):** When this bit is set, the abnormal interrupt summary is enabled. This bit enables the following interrupts in the DMA_CH0_Status register: - Bit 1: Transmit Process Stopped - Bit 7: Rx Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 9: Receive Watchdog Timeout - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error When this bit is reset, the abnormal interrupt summary is disabled. 0x0 (DISABLE): Abnormal Interrupt Summary is disabled. 0x1 (ENABLE): Abnormal Interrupt Summary is enabled.
13	0h RW	**Context Descriptor Error Enable (CDEE):** When this bit is set along with the AIE bit, the Descriptor error interrupt is enabled. When this bit is reset, the Descriptor error interrupt is disabled. 0x0 (DISABLE): Context Descriptor Error is disabled. 0x1 (ENABLE): Context Descriptor Error is enabled.
12	0h RW	**Fatal Bus Error Enable (FBEE):** When this bit is set along with the AIE bit, the Fatal Bus error interrupt is enabled. When this bit is reset, the Fatal Bus Error error interrupt is disabled. 0x0 (DISABLE): Fatal Bus Error is disabled. 0x1 (ENABLE): Fatal Bus Error is enabled.
11	0h RW	**Early Receive Interrupt Enable (ERIE):** When this bit is set along with the NIE bit, the Early Receive interrupt is enabled. When this bit is reset, the Early Receive interrupt is disabled. 0x0 (DISABLE): Early Receive Interrupt is disabled. 0x1 (ENABLE): Early Receive Interrupt is enabled.
10	0h RW	**Early Transmit Interrupt Enable (ETIE):** When this bit is set along with the AIE bit, the Early Transmit interrupt is enabled. When this bit is reset, the Early Transmit interrupt is disabled. 0x0 (DISABLE): Early Transmit Interrupt is disabled. 0x1 (ENABLE): Early Transmit Interrupt is enabled.
9	0h RW	**Receive Watchdog Timeout Enable (RWTE):** When this bit is set along with the AIE bit, the Receive Watchdog Timeout interrupt is enabled. When this bit is reset, the Receive Watchdog Timeout interrupt is disabled. 0x0 (DISABLE): Receive Watchdog Timeout is disabled. 0x1 (ENABLE): Receive Watchdog Timeout is enabled.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**Receive Stopped Enable (RSE):** When this bit is set along with the AIE bit, the Receive Stopped Interrupt is enabled. When this bit is reset, the Receive Stopped interrupt is disabled. 0x0 (DISABLE): Receive Stopped is disabled. 0x1 (ENABLE): Receive Stopped is enabled.
7	0h RW	**Receive Buffer Unavailable Enable (RBUE):** When this bit is set along with the AIE bit, the Receive Buffer Unavailable interrupt is enabled. When this bit is reset, the Receive Buffer Unavailable interrupt is disabled. 0x0 (DISABLE): Receive Buffer Unavailable is disabled. 0x1 (ENABLE): Receive Buffer Unavailable is enabled.
6	0h RW	**Receive Interrupt Enable (RIE):** When this bit is set along with the NIE bit, the Receive Interrupt is enabled. When this bit is reset, the Receive Interrupt is disabled. 0x0 (DISABLE): Receive Interrupt is disabled. 0x1 (ENABLE): Receive Interrupt is enabled.
5:3	0h RO	**Reserved**
2	0h RW	**Transmit Buffer Unavailable Enable (TBUE):** When this bit is set along with the NIE bit, the Transmit Buffer Unavailable interrupt is enabled. When this bit is reset, the Transmit Buffer Unavailable interrupt is disabled. 0x0 (DISABLE): Transmit Buffer Unavailable is disabled. 0x1 (ENABLE): Transmit Buffer Unavailable is enabled.
1	0h RW	**Transmit Stopped Enable (TXSE):** When this bit is set along with the AIE bit, the Transmission Stopped interrupt is enabled. When this bit is reset, the Transmission Stopped interrupt is disabled. 0x0 (DISABLE): Transmit Stopped is disabled. 0x1 (ENABLE): Transmit Stopped is enabled.
0	0h RW	**Transmit Interrupt Enable (TIE):** When this bit is set along with the NIE bit, the Transmit Interrupt is enabled. When this bit is reset, the Transmit Interrupt is disabled. 0x0 (DISABLE): Transmit Interrupt is disabled. 0x1 (ENABLE): Transmit Interrupt is enabled.

10.2.577 DMA_CH3_RX_INTERRUPT_WATCHDOG_TIMER — Offset 12B8h

The Receive Interrupt Watchdog Timer register indicates the watchdog timeout for Receive Interrupt (RI) from the DMA. When this register is written with a non-zero value, it enables the watchdog timer for the RI bit of the DMA_CHi_Status register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12B8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17:16	0h RW	**Receive Interrupt Watchdog Timer Count Units (RWTU):** This fields indicates the number of system clock cycles corresponding to one unit in RWT field. - 2'b00: 256 - 2'b01: 512 - 2'b10: 1024 - 2'b11: 2048 For example, when RWT=2 and RWTU=1, the watchdog timer is set for 2*512=1024 system clock cycles.
15:8	0h RO	**Reserved**
7:0	00h RW	**Receive Interrupt Watchdog Timer Count (RWT):** This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. The watchdog timer is triggered with the programmed value after the Rx DMA completes the transfer of a packet for which the RI bit is not set in the DMA_CH(#i)_Status register, because of the setting of Interrupt Enable bit in the corresponding descriptor RDES3[30]. When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per the Interrupt Enable bit RDES3[30] of any received packet.

10.2.578 DMA_CH3_SLOT_FUNCTION_CONTROL_STATUS — Offset 12BCh

The Slot Function Control and Status register contains the control bits for slot function and the status for Transmit path.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12BCh	000007C0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19:16	0h RO	**Reference Slot Number (RSN):** This field gives the current value of the reference slot number in the DMA. It is used for slot comparison.
15:4	07Ch RW	**Slot Interval Value (SIV):** This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. A value of 0 specifies the slot interval of 1 us while the maximum value 4095 specifies the slot interval of 4096us. The default/reset value is 0x07C which corresponds to slot interval of 125us

Bit Range	Default & Access	Field Name (ID): Description
3:2	0h RO	**Reserved**
1	0h RW	**Advance Slot Check (ASC):** When set, this bit enables the DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the Tx descriptor is - equal to the reference slot number given in the RSN field or - ahead of the reference slot number by up to two slots This bit is applicable only when the ESC bit is set. 0x0 (DISABLE): Advance Slot Check is disabled. 0x1 (ENABLE): Advance Slot Check is enabled.
0	0h RW	**Enable Slot Comparison (ESC):** When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. The DMA fetches the data from the corresponding buffer only when the slot number is - equal to the reference slot number or - ahead of the reference slot number by one slot When reset, this bit disables the checking of the slot numbers. The DMA fetches the data immediately after the descriptor is processed. Note: The UFO (UDP Fragmentation over IPv4)/TSO/USO should not be enabled along with TBS/AVB Slot number check. The UFO/TSO/USO involves multiple packets/segments/fragments transmission for single packet received from application and the slot number check are applicable for fetching of only first segment/fragment. As a result it might be difficult for software to specify slot number for subsequent packets. 0x0 (DISABLE): Slot Comparison is disabled. 0x1 (ENABLE): Slot Comparison is enabled.

10.2.579 DMA_CH3_CURRENT_APP_TXDESC — Offset 12C4h

The Channeli Current Application Transmit Descriptor register points to the current Transmit descriptor read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12C4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Transmit Descriptor Address Pointer (CURTDESAPTR):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

10.2.580 DMA_CH3_CURRENT_APP_RXDESC — Offset 12CCh

The Channeli Current Application Receive Descriptor register points to the current Receive descriptor read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12CCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Receive Descriptor Address Pointer (CURRDESAPTR):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

10.2.581 DMA_CH3_CURRENT_APP_TXBUFFER_H — Offset 12D0h

The Channeli Current Application Transmit Buffer Address High register has the higher 8 or 16 bits of the current address of the Transmit buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12D0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO	**Application Transmit Buffer Address Pointer (CURTBUFAPTRH):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

10.2.582 DMA_CH3_CURRENT_APP_TXBUFFER — Offset 12D4h

The Channeli Current Application Transmit Buffer Address register points to the current Tx buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Transmit Buffer Address Pointer (CURTBUFAPTR):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

10.2.583 DMA_CH3_CURRENT_APP_RXBUFFER_H — Offset 12D8h

The Channeli Current Application Receive Buffer Address High register has the higher 8 or 16 bits of the current address of the Receive buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO	**Application Receive Buffer Address Pointer (CURRBUFAPTRH):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

10.2.584 DMA_CH3_CURRENT_APP_RXBUFFER — Offset 12DCh

The Channel 0 Current Application Receive Buffer Address register points to the current Rx buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12DCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Receive Buffer Address Pointer (CURRBUFAPTR):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

10.2.585 DMA_CH3_STATUS — Offset 12E0h

The software driver (application) reads the Status register during interrupt service routine or polling to determine the status of the DMA.

Note: The number of DMA_CH(#i)_Status register in the configuration is the higher of number of Rx DMA Channels and Tx DMA Channels.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12E0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21:19	0h RO	**Rx DMA Error Bits (REB):** This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 21 -- 1'b1: Error during data transfer by Rx DMA -- 1'b0: No Error during data transfer by Rx DMA - Bit 20 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 19 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
18:16	0h RO	**Tx DMA Error Bits (TEB):** This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 18 -- 1'b1: Error during data transfer by Tx DMA -- 1'b0: No Error during data transfer by Tx DMA - Bit 17 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 16 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
15	0h RW	**Normal Interrupt Summary (NIS):** Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in DMA_CH0_Interrupt_Enable register) affect the Normal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit which causes NIS to be set is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Normal Interrupt Summary status not detected. 0x1 (ACTIVE): Normal Interrupt Summary status detected.

Bit Range	Default & Access	Field Name (ID): Description
14	0h RW	**Abnormal Interrupt Summary (AIS):** Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Abnormal Interrupt Summary status not detected. 0x1 (ACTIVE): Abnormal Interrupt Summary status detected.
13	0h RW	**Context Descriptor Error (CDE):** This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Context Descriptor Error status not detected. 0x1 (ACTIVE): Context Descriptor Error status detected.
12	0h RW	**Fatal Bus Error (FBE):** This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Fatal Bus Error status not detected. 0x1 (ACTIVE): Fatal Bus Error status detected.
11	0h RW	**Early Receive Interrupt (ERI):** This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. In configs supporting ERIC, When ERIC=0, this bit is set only after the Rx DMA has filled up a complete receive buffer with packet data. When ERIC=1, this bit is set after every burst transfer of data from the Rx DMA to the buffer. The setting of RI bit automatically clears this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Receive Interrupt status not detected. 0x1 (ACTIVE): Early Receive Interrupt status detected.
10	0h RW	**Early Transmit Interrupt (ETI):** This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. In configs supporting ERIC: When ETIC=0, this bit is set only after the Tx DMA has transferred a complete packet to MTL. When ETIC=1, this bit is set after completion of (partial) packet data transfer from buffers in the Transmit descriptor in which IOC=1. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Transmit Interrupt status not detected. 0x1 (ACTIVE): Early Transmit Interrupt status detected.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**Receive Watchdog Timeout (RWT):** This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received. 0x0 (INACTIVE): Receive Watchdog Timeout status not detected. 0x1 (ACTIVE): Receive Watchdog Timeout status detected.
8	0h RW	**Receive Process Stopped (RPS):** This bit is asserted when the Rx process enters the Stopped state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Process Stopped status not detected. 0x1 (ACTIVE): Receive Process Stopped status detected.
7	0h RW	**Receive Buffer Unavailable (RBU):** This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode, the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Buffer Unavailable status not detected. 0x1 (ACTIVE): Receive Buffer Unavailable status detected.
6	0h RW	**Receive Interrupt (RI):** This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. The reception remains in the Running state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Interrupt status not detected. 0x1 (ACTIVE): Receive Interrupt status detected.
5:3	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Transmit Buffer Unavailable (TBU):** This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPS0 field of the DMA_Debug_Status0 register explains the Transmit Process state transitions. To resume processing the Transmit descriptors, the application should do the following: 1. Change the ownership of the descriptor by setting Bit 31 of TDES3. 2. Issue a Transmit Poll Demand command. For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Buffer Unavailable status not detected. 0x1 (ACTIVE): Transmit Buffer Unavailable status detected.
1	0h RW	**Transmit Process Stopped (TPS):** This bit is set when the transmission is stopped. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Process Stopped status not detected. 0x1 (ACTIVE): Transmit Process Stopped status detected.
0	0h RW	**Transmit Interrupt (TI):** This bit indicates that the packet transmission is complete. When transmission is complete, Bit 31 of TDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Interrupt status not detected. 0x1 (ACTIVE): Transmit Interrupt status detected.

10.2.586 DMA_CH3_MISS_FRAME_CNT — Offset 12E4h

This register has the number of packet counter that got dropped by the DMA either due to Bus Error or due to programming RPF field in DMA_CH${i}_Rx_Control register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Overflow status of the MFC Counter (MFCO):** When this bit is set then the MFC counter does not get incremented further. The bit gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Miss Frame Counter overflow not occurred. 0x1 (ACTIVE): Miss Frame Counter overflow occurred.
14:11	0h RO	**Reserved**
10:0	000h RO	**Dropped Packet Counters (MFC):** This counter indicates the number of packet counters that are dropped by the DMA either because of bus error or because of programing RPF field in DMA_CH${i}_Rx_Control register. The counter gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event.

10.2.587 DMA_CH3_RXP_ACCEPT_CNT — Offset 12E8h

The DMA_CH(#i)_RXP_Accept_Cnt registers provides the count of the number of frames accepted by Rx Parser.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12E8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Rx Parser Accept Counter Overflow Bit (RXPACOF):** When set, this bit indicates that the RXPAC Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Rx Parser Accept Counter overflow not occurred. 0x1 (ACTIVE): Rx Parser Accept Counter overflow occurred.
30:0	00000000h RO	**Rx Parser Accept Counter (RXPAC):** This 31-bit counter is implemented whenever a Rx Parser Accept a packet due to AF =1. The counter is cleared when the register is read.

10.2.588 DMA_CH3_RX_ERI_CNT — Offset 12ECh

The DMA_CH(#i)_RX_ERI_Cnt registers provides the count of the number of times ERI was asserted.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12ECh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11:0	000h RO	**ERI Counter (ECNT):** When ERIC bit of DMA_CH(#i)_RX_Control register is set, this counter increments for burst transfer completed by the Rx DMA from the start of packet transfer. This counter is reset at the start of new packet.

10.2.589 DMA_CH4_CONTROL — Offset 1300h

The DMA Channeli Control register specifies the MSS value for segmentation, length to skip between two descriptors, and also the features such as header splitting and 8xPBL mode.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1300h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**Split Headers (SPH):** When this bit is set, the DMA splits the header and payload in the Receive path. The DMA writes the header to the Buffer Address1 of RDES0. The DMA writes the payload to the buffer to which the Buffer Address2 is pointing. The software must ensure that the header fits into the Receive buffers. If the header length exceeds the receive buffer size, the DMA does not split the header and payload. This bit is available only if Enable Split Header Structure option is selected. 0x0 (DISABLE): Split Headers feature is disabled. 0x1 (ENABLE): Split Headers feature is enabled.
23:21	0h RO	**Reserved**
20:18	0h RW	**Descriptor Skip Length (DSL):** This bit specifies the Word, Dword, or Lword number (depending on the 32-bit, 64-bit, or 128-bit bus) to skip between two unchained descriptors. The address skipping starts from the end of the current descriptor to the start of the next descriptor. When the DSL value is equal to zero, the DMA takes the descriptor table as contiguous.
17	0h RO	**Reserved**
16	0h RW	**8xPBL mode (PBLX8):** When this bit is set, the PBL value programmed in Bits[21:16] in DMA_CH(#i)_Tx_Control and Bits[21:16] in DMA_CH(#i)_Rx_Control is multiplied by eight times. Therefore, the DMA transfers the data in 8, 16, 32, 64, 128, and 256 beats depending on the PBL value. 0x0 (DISABLE): 8xPBL mode is disabled. 0x1 (ENABLE): 8xPBL mode is enabled.
15:0	0h RO	**Reserved**

10.2.590 DMA_CH4_TX_CONTROL — Offset 1304h

The DMA Channeli Transmit Control register controls the Tx features such as PBL, TCP segmentation, and Tx Channel weights.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1304h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:29	0h RW	**Time Select (TFSEL):** Select bits for one of the four DMA_TBS_CTRL register fields (FTOS, FGSN, FTOV) for the channel. 0x0: DMA_TBS_CTRL0 selected. 0x1: DMA_TBS_CTRL1 selected. 0x2: DMA_TBS_CTRL2 selected. 0x3: DMA_TBS_CTRL3 selected.
28	0h RW	**Enhanced Descriptor Enable (EDSE):** When this bit is set, the corresponding channel uses Enhanced Descriptors that are 32 Bytes for both Normal and Context Descriptors. When reset, the corresponding channel uses the descriptors that are 16 Bytes. 0x0 (DISABLE): Enhanced Descriptor is disabled. 0x1 (ENABLE): Enhanced Descriptor is enabled.
27:24	0h RW	**Transmit QOS. (TQOS):** This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Tx Channel0.
23:22	0h RO	**Reserved**
21:16	00h RW	**Transmit Programmable Burst Length (TXPBL):** These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in DMA_CH0_Control register. 2. Set the TxPBL. Note: The maximum value of TxPBL must be less than or equal to half the Tx Queue size (TQS field of MTL_TxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. For example, in 64-bit data width configurations the total locations in Tx Queue of size 512 bytes is 64, TxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	0h RW	**Ignore PBL Requirement (IPBL):** When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. If space is not available, the MTL might use handshaking to slow the DMA. Note: This bit/mode must not be used when multiple Transmit DMA Channels are enabled as it might block other Transmit and Receive DMA Channels from accessing the Read Data Channel of AXI bus until space is available in Transmit Queue for current transfer. 0x0 (DISABLE): Ignore PBL Requirement is disabled. 0x1 (ENABLE): Ignore PBL Requirement is enabled.

Bit Range	Default & Access	Field Name (ID): Description
14:13	0h RW	**TSE_MODE:** TSE Mode - 00: TSO/USO (segmentation functionality is enabled). In this mode, the setting of TSE bit enables the TSO/USO segmentation. - 01: UFO with Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality with Checksum for all the UDP packets. - 10: UFO without Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality without Checksum for all the UDP packets. - 11: Reserved 0x0 (TSO_USO): TSO/USO. 0x1 (UFOWC): UFO with Checksum. 0x2 (UFOWOC): UFO without Checksum. 0x3 (RSVD): Reserved.
12	0h RW	**TCP Segmentation Enabled (TSE):** When this bit is set, the DMA performs the TCP segmentation or UDP Segmentation/ Fragmentation for packets in this channel. The TCP segmentation or UDP packet's segmentation/Fragmentation is done only for those packets for which the TSE bit (TDES0[19]) is set in the Tx Normal descriptor.When this bit is set, the TxPBL value must be greater than 4. 0x0 (DISABLE): TCP Segmentation is disabled. 0x1 (ENABLE): TCP Segmentation is enabled.
11:5	0h RO	**Reserved**
4	0h RW	**Operate on Second Packet (OSF):** When this bit is set, it instructs the DMA to process the second packet of the Transmit data even before the status for the first packet is obtained. 0x0 (DISABLE): Operate on Second Packet disabled. 0x1 (ENABLE): Operate on Second Packet enabled.
3:1	0h RW	**Transmit Channel Weight (TCW):** This field indicates the weight assigned to the corresponding Transmit channel. When reset is complete, this field is set to 0 for all channels by default, resulting in equal weights to all channels.
0	0h RW	**Start or Stop Transmission Command (ST):** When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the base address of the Transmit list set by the DMA_CH0_TxDesc_List_Address register. - The position at which the transmission was previously stopped If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the DMA_CH0_Status register is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the DMA_CH0_TxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program DMA_CH0_TxDesc_List_Address register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state. 0x0 (STOP): Stop Transmission Command. 0x1 (START): Start Transmission Command.

10.2.591 DMA_CH4_RX_CONTROL — Offset 1308h

The DMA Channeli Receive Control register controls the Rx features such as PBL, buffer size, and extended status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1308h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Rx Packet Flush. (RPF):** When this bit is set to 1, then GbE Controller automatically flushes the packet from the Rx Queues destined to this DMA Rx Channel, when it is stopped. When this bit remains set and the DMA is re-started by the software driver, the packets residing in the Rx Queues that were received when this RxDMA was stopped, get flushed out. The packets that are received by the MAC after the RxDMA is re-started are routed to the RxDMA. The flushing happens on the Read side of the Rx Queue. When this bit is set to 0, the GbE Controller not flush the packet in the Rx Queue destined to this RxDMA Channel when it is STOP state. This might in turn cause head-of-line blocking in the corresponding RxQueue. Note: The stopping of packet flow from a Rx DMA Channel to the application by setting RPF works only when there is one-to-one mapping of Rx Queue to Rx DMA channels. In Dynamic mapping mode, setting RPF bit in any DMA_CH(#i)_Rx_Control register might flush packets from unintended Rx Queues which are destined to the stopped Rx DMA Channel. 0x0 (DISABLE): Rx Packet Flush is disabled. 0x1 (ENABLE): Rx Packet Flush is enabled.
30:28	0h RO	**Reserved**
27:24	0h RW	**Rx AXI4 QOS. (RQOS):** This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Rx Channel0.
23:22	0h RO	**Reserved**
21:16	00h RW	**Receive Programmable Burst Length (RXPBL):** These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in the DMA_CH0_Control register. 2. Set the RxPBL. Note: The maximum value of RxPBL must be less than or equal to half the Rx Queue size (RQS field of MTL_RxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the Rx DMA is transferring a block of data. For example, in 64-bit data width configurations the total locations in Rx Queue of size 512 bytes is 64, so RxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
14:4	000h RW	**Receive Buffer size High (RBSZ_13_Y):** RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. The RBSZ[13:0] field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when split headers are enabled. Note: The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the value of buffer address pointer is not aligned to data bus width. Hence the lower RBSZ_x_0 bits are read-only and the value is considered as all-zero. Thus the RBSZ_13_y indicates the buffer size in terms of locations (with the width same as bus-width).
3:1	0h RO	**Receive Buffer size Low (RBSZ_X_0):** RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. The RBSZ_x_0 is the lower field whose width is based on data bus width of the configuration. This field is of width 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).
0	0h RW	**Start or Stop Receive (SR):** When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the address set by the DMA_CH0_RxDesc_List_Address register. - The position at which the Rx process was previously stopped If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the DMA_CH0_Status register is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the DMA_CH0_RxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state. 0x0 (STOP): Stop Receive. 0x1 (START): Start Receive.

10.2.592 DMA_CH4_TXDESC_LIST_HADDRESS — Offset 1310h

The Channeli Tx Descriptor List HAddress register has the higher 8 or 16 bits of the start address of the Transmit descriptor list.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CHi_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier. This register must be programmed with desired the higher address before programming the DMA_CHi_TxDesc_List_Address register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1310h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Start of Transmit List (TDESHA):** This field contains the most-significant 8 or 16 bits of the 40- or 48-bit base address of the first descriptor in the Transmit descriptor list.

10.2.593 DMA_CH4_TXDESC_LIST_ADDRESS — Offset 1314h

The Channeli Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LSB to low.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CH0_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1314h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Start of Transmit List (TDESLA):** This field contains the base address of the first descriptor in the Transmit descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

10.2.594 DMA_CH4_RXDESC_LIST_HADDRESS — Offset 1318h

The Channeli Rx Descriptor List HAddress register has the higher 8 or 16 bits of the start address of the Receive descriptor list.

Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in the DMA_CHi_RxDesc_List_Address register

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1318h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Start of Receive List (RDESHA):** This field contains the most-significant 8 or 16 bits of the 40-bit or 48-bit base address of the first descriptor in the Rx Descriptor list.

10.2.595 DMA_CH4_RXDESC_LIST_ADDRESS — Offset 131Ch

The Channeli Rx Descriptor List Address register points the DMA to the start of Receive descriptor list.

This register points to the start of the Receive Descriptor List. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in DMA_CH0_Rx_Control register. When stopped, this register can be written with a new descriptor list address.

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

This field is 10 bits wide, if you program 0x3FF, you can have 1024 descriptors. If you want to have 10 descriptors, program it to a value of 0x9.

10.2.600 DMA_CH4_INTERRUPT_ENABLE — Offset 1334h

The Channeli Interrupt Enable register enables the interrupts reported by the Status register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1334h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW	**Normal Interrupt Summary Enable (NIE):** When this bit is set, the normal interrupt summary is enabled. This bit enables the following interrupts in the DMA_CH0_Status register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt When this bit is reset, the normal interrupt summary is disabled. 0x0 (DISABLE): Normal Interrupt Summary is disabled. 0x1 (ENABLE): Normal Interrupt Summary is enabled.
14	0h RW	**Abnormal Interrupt Summary Enable (AIE):** When this bit is set, the abnormal interrupt summary is enabled. This bit enables the following interrupts in the DMA_CH0_Status register: - Bit 1: Transmit Process Stopped - Bit 7: Rx Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 9: Receive Watchdog Timeout - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error When this bit is reset, the abnormal interrupt summary is disabled. 0x0 (DISABLE): Abnormal Interrupt Summary is disabled. 0x1 (ENABLE): Abnormal Interrupt Summary is enabled.
13	0h RW	**Context Descriptor Error Enable (CDEE):** When this bit is set along with the AIE bit, the Descriptor error interrupt is enabled. When this bit is reset, the Descriptor error interrupt is disabled. 0x0 (DISABLE): Context Descriptor Error is disabled. 0x1 (ENABLE): Context Descriptor Error is enabled.
12	0h RW	**Fatal Bus Error Enable (FBEE):** When this bit is set along with the AIE bit, the Fatal Bus error interrupt is enabled. When this bit is reset, the Fatal Bus Error error interrupt is disabled. 0x0 (DISABLE): Fatal Bus Error is disabled. 0x1 (ENABLE): Fatal Bus Error is enabled.
11	0h RW	**Early Receive Interrupt Enable (ERIE):** When this bit is set along with the NIE bit, the Early Receive interrupt is enabled. When this bit is reset, the Early Receive interrupt is disabled. 0x0 (DISABLE): Early Receive Interrupt is disabled. 0x1 (ENABLE): Early Receive Interrupt is enabled.
10	0h RW	**Early Transmit Interrupt Enable (ETIE):** When this bit is set along with the AIE bit, the Early Transmit interrupt is enabled. When this bit is reset, the Early Transmit interrupt is disabled. 0x0 (DISABLE): Early Transmit Interrupt is disabled. 0x1 (ENABLE): Early Transmit Interrupt is enabled.
9	0h RW	**Receive Watchdog Timeout Enable (RWTE):** When this bit is set along with the AIE bit, the Receive Watchdog Timeout interrupt is enabled. When this bit is reset, the Receive Watchdog Timeout interrupt is disabled. 0x0 (DISABLE): Receive Watchdog Timeout is disabled. 0x1 (ENABLE): Receive Watchdog Timeout is enabled.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**Receive Stopped Enable (RSE):** When this bit is set along with the AIE bit, the Receive Stopped Interrupt is enabled. When this bit is reset, the Receive Stopped interrupt is disabled. 0x0 (DISABLE): Receive Stopped is disabled. 0x1 (ENABLE): Receive Stopped is enabled.
7	0h RW	**Receive Buffer Unavailable Enable (RBUE):** When this bit is set along with the AIE bit, the Receive Buffer Unavailable interrupt is enabled. When this bit is reset, the Receive Buffer Unavailable interrupt is disabled. 0x0 (DISABLE): Receive Buffer Unavailable is disabled. 0x1 (ENABLE): Receive Buffer Unavailable is enabled.
6	0h RW	**Receive Interrupt Enable (RIE):** When this bit is set along with the NIE bit, the Receive Interrupt is enabled. When this bit is reset, the Receive Interrupt is disabled. 0x0 (DISABLE): Receive Interrupt is disabled. 0x1 (ENABLE): Receive Interrupt is enabled.
5:3	0h RO	**Reserved**
2	0h RW	**Transmit Buffer Unavailable Enable (TBUE):** When this bit is set along with the NIE bit, the Transmit Buffer Unavailable interrupt is enabled. When this bit is reset, the Transmit Buffer Unavailable interrupt is disabled. 0x0 (DISABLE): Transmit Buffer Unavailable is disabled. 0x1 (ENABLE): Transmit Buffer Unavailable is enabled.
1	0h RW	**Transmit Stopped Enable (TXSE):** When this bit is set along with the AIE bit, the Transmission Stopped interrupt is enabled. When this bit is reset, the Transmission Stopped interrupt is disabled. 0x0 (DISABLE): Transmit Stopped is disabled. 0x1 (ENABLE): Transmit Stopped is enabled.
0	0h RW	**Transmit Interrupt Enable (TIE):** When this bit is set along with the NIE bit, the Transmit Interrupt is enabled. When this bit is reset, the Transmit Interrupt is disabled. 0x0 (DISABLE): Transmit Interrupt is disabled. 0x1 (ENABLE): Transmit Interrupt is enabled.

10.2.601 DMA_CH4_RX_INTERRUPT_WATCHDOG_TIMER — Offset 1338h

The Receive Interrupt Watchdog Timer register indicates the watchdog timeout for Receive Interrupt (RI) from the DMA. When this register is written with a non-zero value, it enables the watchdog timer for the RI bit of the DMA_CHi_Status register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1338h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17:16	0h RW	**Receive Interrupt Watchdog Timer Count Units (RWTU):** This fields indicates the number of system clock cycles corresponding to one unit in RWT field. - 2'b00: 256 - 2'b01: 512 - 2'b10: 1024 - 2'b11: 2048 For example, when RWT=2 and RWTU=1, the watchdog timer is set for 2*512=1024 system clock cycles.
15:8	0h RO	**Reserved**
7:0	00h RW	**Receive Interrupt Watchdog Timer Count (RWT):** This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. The watchdog timer is triggered with the programmed value after the Rx DMA completes the transfer of a packet for which the RI bit is not set in the DMA_CH(#i)_Status register, because of the setting of Interrupt Enable bit in the corresponding descriptor RDES3[30]. When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per the Interrupt Enable bit RDES3[30] of any received packet.

10.2.602 DMA_CH4_SLOT_FUNCTION_CONTROL_STATUS — Offset 133Ch

The Slot Function Control and Status register contains the control bits for slot function and the status for Transmit path.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 133Ch	000007C0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19:16	0h RO	**Reference Slot Number (RSN):** This field gives the current value of the reference slot number in the DMA. It is used for slot comparison.
15:4	07Ch RW	**Slot Interval Value (SIV):** This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. A value of 0 specifies the slot interval of 1 us while the maximum value 4095 specifies the slot interval of 4096us. The default/reset value is 0x07C which corresponds to slot interval of 125us

Bit Range	Default & Access	Field Name (ID): Description
3:2	0h RO	**Reserved**
1	0h RW	**Advance Slot Check (ASC):** When set, this bit enables the DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the Tx descriptor is - equal to the reference slot number given in the RSN field or - ahead of the reference slot number by up to two slots This bit is applicable only when the ESC bit is set. 0x0 (DISABLE): Advance Slot Check is disabled. 0x1 (ENABLE): Advance Slot Check is enabled.
0	0h RW	**Enable Slot Comparison (ESC):** When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. The DMA fetches the data from the corresponding buffer only when the slot number is - equal to the reference slot number or - ahead of the reference slot number by one slot When reset, this bit disables the checking of the slot numbers. The DMA fetches the data immediately after the descriptor is processed. Note: The UFO (UDP Fragmentation over IPv4)/TSO/USO should not be enabled along with TBS/AVB Slot number check. The UFO/TSO/USO involves multiple packets/segments/fragments transmission for single packet received from application and the slot number check are applicable for fetching of only first segment/fragment. As a result it might be difficult for software to specify slot number for subsequent packets. 0x0 (DISABLE): Slot Comparison is disabled. 0x1 (ENABLE): Slot Comparison is enabled.

10.2.603 DMA_CH4_CURRENT_APP_TXDESC — Offset 1344h

The Channeli Current Application Transmit Descriptor register points to the current Transmit descriptor read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1344h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Transmit Descriptor Address Pointer (CURTDESAPTR):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

10.2.604 DMA_CH4_CURRENT_APP_RXDESC — Offset 134Ch

The Channeli Current Application Receive Descriptor register points to the current Receive descriptor read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 134Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Receive Descriptor Address Pointer (CURRDESAPTR):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

10.2.605 DMA_CH4_CURRENT_APP_TXBUFFER_H — Offset 1350h

The Channeli Current Application Transmit Buffer Address High register has the higher 8 or 16 bits of the current address of the Transmit buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1350h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO	**Application Transmit Buffer Address Pointer (CURTBUFAPTRH):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

10.2.606 DMA_CH4_CURRENT_APP_TXBUFFER — Offset 1354h

The Channeli Current Application Transmit Buffer Address register points to the current Tx buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1354h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Transmit Buffer Address Pointer (CURTBUFAPTR):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

10.2.607 DMA_CH4_CURRENT_APP_RXBUFFER_H — Offset 1358h

The Channeli Current Application Receive Buffer Address High register has the higher 8 or 16 bits of the current address of the Receive buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1358h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO	**Application Receive Buffer Address Pointer (CURRBUFAPTRH):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

10.2.608 DMA_CH4_CURRENT_APP_RXBUFFER — Offset 135Ch

The Channel 0 Current Application Receive Buffer Address register points to the current Rx buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 135Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Receive Buffer Address Pointer (CURRBUFAPTR):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

10.2.609 DMA_CH4_STATUS — Offset 1360h

The software driver (application) reads the Status register during interrupt service routine or polling to determine the status of the DMA.

Note: The number of DMA_CH(#i)_Status register in the configuration is the higher of number of Rx DMA Channels and Tx DMA Channels.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1360h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21:19	0h RO	**Rx DMA Error Bits (REB):** This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 21 -- 1'b1: Error during data transfer by Rx DMA -- 1'b0: No Error during data transfer by Rx DMA - Bit 20 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 19 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
18:16	0h RO	**Tx DMA Error Bits (TEB):** This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 18 -- 1'b1: Error during data transfer by Tx DMA -- 1'b0: No Error during data transfer by Tx DMA - Bit 17 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 16 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
15	0h RW	**Normal Interrupt Summary (NIS):** Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in DMA_CH0_Interrupt_Enable register) affect the Normal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit which causes NIS to be set is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Normal Interrupt Summary status not detected. 0x1 (ACTIVE): Normal Interrupt Summary status detected.

Bit Range	Default & Access	Field Name (ID): Description
14	0h RW	**Abnormal Interrupt Summary (AIS):** Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Abnormal Interrupt Summary status not detected. 0x1 (ACTIVE): Abnormal Interrupt Summary status detected.
13	0h RW	**Context Descriptor Error (CDE):** This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Context Descriptor Error status not detected. 0x1 (ACTIVE): Context Descriptor Error status detected.
12	0h RW	**Fatal Bus Error (FBE):** This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Fatal Bus Error status not detected. 0x1 (ACTIVE): Fatal Bus Error status detected.
11	0h RW	**Early Receive Interrupt (ERI):** This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. In configs supporting ERIC, When ERIC=0, this bit is set only after the Rx DMA has filled up a complete receive buffer with packet data. When ERIC=1, this bit is set after every burst transfer of data from the Rx DMA to the buffer. The setting of RI bit automatically clears this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Receive Interrupt status not detected. 0x1 (ACTIVE): Early Receive Interrupt status detected.
10	0h RW	**Early Transmit Interrupt (ETI):** This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. In configs supporting ERIC: When ETIC=0, this bit is set only after the Tx DMA has transferred a complete packet to MTL. When ETIC=1, this bit is set after completion of (partial) packet data transfer from buffers in the Transmit descriptor in which IOC=1. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Transmit Interrupt status not detected. 0x1 (ACTIVE): Early Transmit Interrupt status detected.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**Receive Watchdog Timeout (RWT):** This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received. 0x0 (INACTIVE): Receive Watchdog Timeout status not detected. 0x1 (ACTIVE): Receive Watchdog Timeout status detected.
8	0h RW	**Receive Process Stopped (RPS):** This bit is asserted when the Rx process enters the Stopped state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Process Stopped status not detected. 0x1 (ACTIVE): Receive Process Stopped status detected.
7	0h RW	**Receive Buffer Unavailable (RBU):** This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode, the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Buffer Unavailable status not detected. 0x1 (ACTIVE): Receive Buffer Unavailable status detected.
6	0h RW	**Receive Interrupt (RI):** This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. The reception remains in the Running state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Interrupt status not detected. 0x1 (ACTIVE): Receive Interrupt status detected.
5:3	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Transmit Buffer Unavailable (TBU):** This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPS0 field of the DMA_Debug_Status0 register explains the Transmit Process state transitions. To resume processing the Transmit descriptors, the application should do the following: 1. Change the ownership of the descriptor by setting Bit 31 of TDES3. 2. Issue a Transmit Poll Demand command. For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Buffer Unavailable status not detected. 0x1 (ACTIVE): Transmit Buffer Unavailable status detected.
1	0h RW	**Transmit Process Stopped (TPS):** This bit is set when the transmission is stopped. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Process Stopped status not detected. 0x1 (ACTIVE): Transmit Process Stopped status detected.
0	0h RW	**Transmit Interrupt (TI):** This bit indicates that the packet transmission is complete. When transmission is complete, Bit 31 of TDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Interrupt status not detected. 0x1 (ACTIVE): Transmit Interrupt status detected.

10.2.610 DMA_CH4_MISS_FRAME_CNT — Offset 1364h

This register has the number of packet counter that got dropped by the DMA either due to Bus Error or due to programming RPF field in DMA_CH${i}_Rx_Control register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1364h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Overflow status of the MFC Counter (MFCO):** When this bit is set then the MFC counter does not get incremented further. The bit gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Miss Frame Counter overflow not occurred. 0x1 (ACTIVE): Miss Frame Counter overflow occurred.
14:11	0h RO	**Reserved**
10:0	000h RO	**Dropped Packet Counters (MFC):** This counter indicates the number of packet counters that are dropped by the DMA either because of bus error or because of programing RPF field in DMA_CH${i}_Rx_Control register. The counter gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event.

10.2.611 DMA_CH4_RXP_ACCEPT_CNT — Offset 1368h

The DMA_CH(#i)_RXP_Accept_Cnt registers provides the count of the number of frames accepted by Rx Parser.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1368h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Rx Parser Accept Counter Overflow Bit (RXPACOF):** When set, this bit indicates that the RXPAC Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Rx Parser Accept Counter overflow not occurred. 0x1 (ACTIVE): Rx Parser Accept Counter overflow occurred.
30:0	00000000h RO	**Rx Parser Accept Counter (RXPAC):** This 31-bit counter is implemented whenever a Rx Parser Accept a packet due to AF =1. The counter is cleared when the register is read.

10.2.612 DMA_CH4_RX_ERI_CNT — Offset 136Ch

The DMA_CH(#i)_RX_ERI_Cnt registers provides the count of the number of times ERI was asserted.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 136Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11:0	000h RO	**ERI Counter (ECNT):** When ERIC bit of DMA_CH(#i)_RX_Control register is set, this counter increments for burst transfer completed by the Rx DMA from the start of packet transfer. This counter is reset at the start of new packet.

10.2.613 DMA_CH5_CONTROL — Offset 1380h

The DMA Channeli Control register specifies the MSS value for segmentation, length to skip between two descriptors, and also the features such as header splitting and 8xPBL mode.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1380h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**Split Headers (SPH):** When this bit is set, the DMA splits the header and payload in the Receive path. The DMA writes the header to the Buffer Address1 of RDES0. The DMA writes the payload to the buffer to which the Buffer Address2 is pointing. The software must ensure that the header fits into the Receive buffers. If the header length exceeds the receive buffer size, the DMA does not split the header and payload. This bit is available only if Enable Split Header Structure option is selected. 0x0 (DISABLE): Split Headers feature is disabled. 0x1 (ENABLE): Split Headers feature is enabled.
23:21	0h RO	**Reserved**
20:18	0h RW	**Descriptor Skip Length (DSL):** This bit specifies the Word, Dword, or Lword number (depending on the 32-bit, 64-bit, or 128-bit bus) to skip between two unchained descriptors. The address skipping starts from the end of the current descriptor to the start of the next descriptor. When the DSL value is equal to zero, the DMA takes the descriptor table as contiguous.
17	0h RO	**Reserved**
16	0h RW	**8xPBL mode (PBLX8):** When this bit is set, the PBL value programmed in Bits[21:16] in DMA_CH(#i)_Tx_Control and Bits[21:16] in DMA_CH(#i)_Rx_Control is multiplied by eight times. Therefore, the DMA transfers the data in 8, 16, 32, 64, 128, and 256 beats depending on the PBL value. 0x0 (DISABLE): 8xPBL mode is disabled. 0x1 (ENABLE): 8xPBL mode is enabled.
15:0	0h RO	**Reserved**

10.2.614 DMA_CH5_TX_CONTROL — Offset 1384h

The DMA Channeli Transmit Control register controls the Tx features such as PBL, TCP segmentation, and Tx Channel weights.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1384h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:29	0h RW	**Time Select (TFSEL):** Select bits for one of the four DMA_TBS_CTRL register fields (FTOS, FGSN, FTOV) for the channel. 0x0: DMA_TBS_CTRL0 selected. 0x1: DMA_TBS_CTRL1 selected. 0x2: DMA_TBS_CTRL2 selected. 0x3: DMA_TBS_CTRL3 selected.
28	0h RW	**Enhanced Descriptor Enable (EDSE):** When this bit is set, the corresponding channel uses Enhanced Descriptors that are 32 Bytes for both Normal and Context Descriptors. When reset, the corresponding channel uses the descriptors that are 16 Bytes. 0x0 (DISABLE): Enhanced Descriptor is disabled. 0x1 (ENABLE): Enhanced Descriptor is enabled.
27:24	0h RW	**Transmit QOS. (TQOS):** This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Tx Channel0.
23:22	0h RO	**Reserved**
21:16	00h RW	**Transmit Programmable Burst Length (TXPBL):** These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in DMA_CH0_Control register. 2. Set the TxPBL. Note: The maximum value of TxPBL must be less than or equal to half the Tx Queue size (TQS field of MTL_TxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. For example, in 64-bit data width configurations the total locations in Tx Queue of size 512 bytes is 64, TxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	0h RW	**Ignore PBL Requirement (IPBL):** When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. If space is not available, the MTL might use handshaking to slow the DMA. Note: This bit/mode must not be used when multiple Transmit DMA Channels are enabled as it might block other Transmit and Receive DMA Channels from accessing the Read Data Channel of AXI bus until space is available in Transmit Queue for current transfer. 0x0 (DISABLE): Ignore PBL Requirement is disabled. 0x1 (ENABLE): Ignore PBL Requirement is enabled.

Bit Range	Default & Access	Field Name (ID): Description
14:13	0h RW	**TSE_MODE:** TSE Mode - 00: TSO/USO (segmentation functionality is enabled). In this mode, the setting of TSE bit enables the TSO/USO segmentation. - 01: UFO with Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality with Checksum for all the UDP packets. - 10: UFO without Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality without Checksum for all the UDP packets. - 11: Reserved 0x0 (TSO_USO): TSO/USO. 0x1 (UFOWC): UFO with Checksum. 0x2 (UFOWOC): UFO without Checksum. 0x3 (RSVD): Reserved.
12	0h RW	**TCP Segmentation Enabled (TSE):** When this bit is set, the DMA performs the TCP segmentation or UDP Segmentation/ Fragmentation for packets in this channel. The TCP segmentation or UDP packet's segmentation/Fragmentation is done only for those packets for which the TSE bit (TDES0[19]) is set in the Tx Normal descriptor.When this bit is set, the TxPBL value must be greater than 4. 0x0 (DISABLE): TCP Segmentation is disabled. 0x1 (ENABLE): TCP Segmentation is enabled.
11:5	0h RO	**Reserved**
4	0h RW	**Operate on Second Packet (OSF):** When this bit is set, it instructs the DMA to process the second packet of the Transmit data even before the status for the first packet is obtained. 0x0 (DISABLE): Operate on Second Packet disabled. 0x1 (ENABLE): Operate on Second Packet enabled.
3:1	0h RW	**Transmit Channel Weight (TCW):** This field indicates the weight assigned to the corresponding Transmit channel. When reset is complete, this field is set to 0 for all channels by default, resulting in equal weights to all channels.
0	0h RW	**Start or Stop Transmission Command (ST):** When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the base address of the Transmit list set by the DMA_CH0_TxDesc_List_Address register. - The position at which the transmission was previously stopped If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the DMA_CH0_Status register is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the DMA_CH0_TxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program DMA_CH0_TxDesc_List_Address register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state. 0x0 (STOP): Stop Transmission Command. 0x1 (START): Start Transmission Command.

10.2.615 DMA_CH5_RX_CONTROL — Offset 1388h

The DMA Channeli Receive Control register controls the Rx features such as PBL, buffer size, and extended status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1388h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Rx Packet Flush. (RPF):** When this bit is set to 1, then GbE Controller automatically flushes the packet from the Rx Queues destined to this DMA Rx Channel, when it is stopped. When this bit remains set and the DMA is re-started by the software driver, the packets residing in the Rx Queues that were received when this RxDMA was stopped, get flushed out. The packets that are received by the MAC after the RxDMA is re-started are routed to the RxDMA. The flushing happens on the Read side of the Rx Queue. When this bit is set to 0, the GbE Controller not flush the packet in the Rx Queue destined to this RxDMA Channel when it is STOP state. This might in turn cause head-of-line blocking in the corresponding RxQueue. Note: The stopping of packet flow from a Rx DMA Channel to the application by setting RPF works only when there is one-to-one mapping of Rx Queue to Rx DMA channels. In Dynamic mapping mode, setting RPF bit in any DMA_CH(#i)_Rx_Control register might flush packets from unintended Rx Queues which are destined to the stopped Rx DMA Channel. 0x0 (DISABLE): Rx Packet Flush is disabled. 0x1 (ENABLE): Rx Packet Flush is enabled.
30:28	0h RO	**Reserved**
27:24	0h RW	**Rx AXI4 QOS. (RQOS):** This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Rx Channel0.
23:22	0h RO	**Reserved**
21:16	00h RW	**Receive Programmable Burst Length (RXPBL):** These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in the DMA_CH0_Control register. 2. Set the RxPBL. Note: The maximum value of RxPBL must be less than or equal to half the Rx Queue size (RQS field of MTL_RxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the Rx DMA is transferring a block of data. For example, in 64-bit data width configurations the total locations in Rx Queue of size 512 bytes is 64, so RxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
14:4	000h RW	**Receive Buffer size High (RBSZ_13_Y):** RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. The RBSZ[13:0] field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when split headers are enabled. Note: The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the value of buffer address pointer is not aligned to data bus width. Hence the lower RBSZ_x_0 bits are read-only and the value is considered as all-zero. Thus the RBSZ_13_y indicates the buffer size in terms of locations (with the width same as bus-width).
3:1	0h RO	**Receive Buffer size Low (RBSZ_X_0):** RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. The RBSZ_x_0 is the lower field whose width is based on data bus width of the configuration. This field is of width 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).
0	0h RW	**Start or Stop Receive (SR):** When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the address set by the DMA_CH0_RxDesc_List_Address register. - The position at which the Rx process was previously stopped If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the DMA_CH0_Status register is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the DMA_CH0_RxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state. 0x0 (STOP): Stop Receive. 0x1 (START): Start Receive.

10.2.616 DMA_CH5_TXDESC_LIST_HADDRESS — Offset 1390h

The Channeli Tx Descriptor List HAddress register has the higher 8 or 16 bits of the start address of the Transmit descriptor list.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CHi_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier. This register must be programmed with desired the higher address before programming the DMA_CHi_TxDesc_List_Address register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1390h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Start of Transmit List (TDESHA):** This field contains the most-significant 8 or 16 bits of the 40- or 48-bit base address of the first descriptor in the Transmit descriptor list.

10.2.617 DMA_CH5_TXDESC_LIST_ADDRESS — Offset 1394h

The Channeli Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LSB to low.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CH0_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1394h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Start of Transmit List (TDESLA):** This field contains the base address of the first descriptor in the Transmit descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

10.2.618 DMA_CH5_RXDESC_LIST_HADDRESS — Offset 1398h

The Channeli Rx Descriptor List HAddress register has the higher 8 or 16 bits of the start address of the Receive descriptor list.

Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in the DMA_CHi_RxDesc_List_Address register

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1398h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Start of Receive List (RDESHA):** This field contains the most-significant 8 or 16 bits of the 40-bit or 48-bit base address of the first descriptor in the Rx Descriptor list.

10.2.619 DMA_CH5_RXDESC_LIST_ADDRESS — Offset 139Ch

The Channeli Rx Descriptor List Address register points the DMA to the start of Receive descriptor list.

This register points to the start of the Receive Descriptor List. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in DMA_CH0_Rx_Control register. When stopped, this register can be written with a new descriptor list address.

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 139Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Start of Receive List (RDESLA):** This field contains the base address of the first descriptor in the Rx Descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

10.2.620 DMA_CH5_TXDESC_TAIL_POINTER — Offset 13A0h

The Channeli Tx Descriptor Tail Pointer register points to an offset from the base and indicates the location of the last valid descriptor.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13A0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Transmit Descriptor Tail Pointer (TDTP):** This field contains the tail pointer for the Tx descriptor ring. The software writes the tail pointer to add more descriptors to the Tx channel. The hardware tries to transmit all packets referenced by the descriptors between the head and the tail pointer registers. The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

10.2.621 DMA_CH5_RXDESC_TAIL_POINTER — Offset 13A8h

The Channeli Rx Descriptor Tail Pointer Points to an offset from the base and indicates the location of the last valid descriptor.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13A8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Receive Descriptor Tail Pointer (RDTP):** This field contains the tail pointer for the Rx descriptor ring. The software writes the tail pointer to add more descriptors to the Rx channel. The hardware tries to write all received packets to the descriptors referenced between the head and the tail pointer registers. The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

10.2.622 DMA_CH5_TXDESC_RING_LENGTH — Offset 13ACh

The Tx Descriptor Ring Length register contains the length of the Transmit descriptor ring.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13ACh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:0	000h RW	**Transmit Descriptor Ring Length (TDRL):** This field sets the maximum number of Tx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. Intel recommends a minimum ring descriptor length of 4. For example, You can program any value up to 0x3FF in this field. This field is 10 bits wide, if you program 0x3FF, you can have 1024 descriptors. If you want to have 10 descriptors, program it to a value of 0x9.

10.2.623 DMA_CH5_RXDESC_RING_LENGTH — Offset 13B0h

The Channeli Rx Descriptor Ring Length register contains the length of the Receive descriptor circular ring.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:0	000h RW	**Receive Descriptor Ring Length (RDRL):** This register sets the maximum number of Rx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. For example, You can program any value up to 0x3FF in this field. This field is 10 bits wide, if you program 0x3FF, you can have 1024 descriptors. If you want to have 10 descriptors, program it to a value of 0x9.

10.2.624 DMA_CH5_INTERRUPT_ENABLE — Offset 13B4h

The Channeli Interrupt Enable register enables the interrupts reported by the Status register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13B4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW	**Normal Interrupt Summary Enable (NIE):** When this bit is set, the normal interrupt summary is enabled. This bit enables the following interrupts in the DMA_CH0_Status register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt When this bit is reset, the normal interrupt summary is disabled. 0x0 (DISABLE): Normal Interrupt Summary is disabled. 0x1 (ENABLE): Normal Interrupt Summary is enabled.
14	0h RW	**Abnormal Interrupt Summary Enable (AIE):** When this bit is set, the abnormal interrupt summary is enabled. This bit enables the following interrupts in the DMA_CH0_Status register: - Bit 1: Transmit Process Stopped - Bit 7: Rx Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 9: Receive Watchdog Timeout - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error When this bit is reset, the abnormal interrupt summary is disabled. 0x0 (DISABLE): Abnormal Interrupt Summary is disabled. 0x1 (ENABLE): Abnormal Interrupt Summary is enabled.
13	0h RW	**Context Descriptor Error Enable (CDEE):** When this bit is set along with the AIE bit, the Descriptor error interrupt is enabled. When this bit is reset, the Descriptor error interrupt is disabled. 0x0 (DISABLE): Context Descriptor Error is disabled. 0x1 (ENABLE): Context Descriptor Error is enabled.
12	0h RW	**Fatal Bus Error Enable (FBEE):** When this bit is set along with the AIE bit, the Fatal Bus error interrupt is enabled. When this bit is reset, the Fatal Bus Error error interrupt is disabled. 0x0 (DISABLE): Fatal Bus Error is disabled. 0x1 (ENABLE): Fatal Bus Error is enabled.
11	0h RW	**Early Receive Interrupt Enable (ERIE):** When this bit is set along with the NIE bit, the Early Receive interrupt is enabled. When this bit is reset, the Early Receive interrupt is disabled. 0x0 (DISABLE): Early Receive Interrupt is disabled. 0x1 (ENABLE): Early Receive Interrupt is enabled.
10	0h RW	**Early Transmit Interrupt Enable (ETIE):** When this bit is set along with the AIE bit, the Early Transmit interrupt is enabled. When this bit is reset, the Early Transmit interrupt is disabled. 0x0 (DISABLE): Early Transmit Interrupt is disabled. 0x1 (ENABLE): Early Transmit Interrupt is enabled.
9	0h RW	**Receive Watchdog Timeout Enable (RWTE):** When this bit is set along with the AIE bit, the Receive Watchdog Timeout interrupt is enabled. When this bit is reset, the Receive Watchdog Timeout interrupt is disabled. 0x0 (DISABLE): Receive Watchdog Timeout is disabled. 0x1 (ENABLE): Receive Watchdog Timeout is enabled.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**Receive Stopped Enable (RSE):** When this bit is set along with the AIE bit, the Receive Stopped Interrupt is enabled. When this bit is reset, the Receive Stopped interrupt is disabled. 0x0 (DISABLE): Receive Stopped is disabled. 0x1 (ENABLE): Receive Stopped is enabled.
7	0h RW	**Receive Buffer Unavailable Enable (RBUE):** When this bit is set along with the AIE bit, the Receive Buffer Unavailable interrupt is enabled. When this bit is reset, the Receive Buffer Unavailable interrupt is disabled. 0x0 (DISABLE): Receive Buffer Unavailable is disabled. 0x1 (ENABLE): Receive Buffer Unavailable is enabled.
6	0h RW	**Receive Interrupt Enable (RIE):** When this bit is set along with the NIE bit, the Receive Interrupt is enabled. When this bit is reset, the Receive Interrupt is disabled. 0x0 (DISABLE): Receive Interrupt is disabled. 0x1 (ENABLE): Receive Interrupt is enabled.
5:3	0h RO	**Reserved**
2	0h RW	**Transmit Buffer Unavailable Enable (TBUE):** When this bit is set along with the NIE bit, the Transmit Buffer Unavailable interrupt is enabled. When this bit is reset, the Transmit Buffer Unavailable interrupt is disabled. 0x0 (DISABLE): Transmit Buffer Unavailable is disabled. 0x1 (ENABLE): Transmit Buffer Unavailable is enabled.
1	0h RW	**Transmit Stopped Enable (TXSE):** When this bit is set along with the AIE bit, the Transmission Stopped interrupt is enabled. When this bit is reset, the Transmission Stopped interrupt is disabled. 0x0 (DISABLE): Transmit Stopped is disabled. 0x1 (ENABLE): Transmit Stopped is enabled.
0	0h RW	**Transmit Interrupt Enable (TIE):** When this bit is set along with the NIE bit, the Transmit Interrupt is enabled. When this bit is reset, the Transmit Interrupt is disabled. 0x0 (DISABLE): Transmit Interrupt is disabled. 0x1 (ENABLE): Transmit Interrupt is enabled.

10.2.625 DMA_CH5_RX_INTERRUPT_WATCHDOG_TIMER — Offset 13B8h

The Receive Interrupt Watchdog Timer register indicates the watchdog timeout for Receive Interrupt (RI) from the DMA. When this register is written with a non-zero value, it enables the watchdog timer for the RI bit of the DMA_CHi_Status register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13B8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17:16	0h RW	**Receive Interrupt Watchdog Timer Count Units (RWTU):** This fields indicates the number of system clock cycles corresponding to one unit in RWT field. - 2'b00: 256 - 2'b01: 512 - 2'b10: 1024 - 2'b11: 2048 For example, when RWT=2 and RWTU=1, the watchdog timer is set for 2*512=1024 system clock cycles.
15:8	0h RO	**Reserved**
7:0	00h RW	**Receive Interrupt Watchdog Timer Count (RWT):** This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. The watchdog timer is triggered with the programmed value after the Rx DMA completes the transfer of a packet for which the RI bit is not set in the DMA_CH(#i)_Status register, because of the setting of Interrupt Enable bit in the corresponding descriptor RDES3[30]. When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per the Interrupt Enable bit RDES3[30] of any received packet.

10.2.626 DMA_CH5_SLOT_FUNCTION_CONTROL_STATUS — Offset 13BCh

The Slot Function Control and Status register contains the control bits for slot function and the status for Transmit path.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13BCh	000007C0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19:16	0h RO	**Reference Slot Number (RSN):** This field gives the current value of the reference slot number in the DMA. It is used for slot comparison.
15:4	07Ch RW	**Slot Interval Value (SIV):** This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. A value of 0 specifies the slot interval of 1 us while the maximum value 4095 specifies the slot interval of 4096us. The default/reset value is 0x07C which corresponds to slot interval of 125us

Bit Range	Default & Access	Field Name (ID): Description
3:2	0h RO	**Reserved**
1	0h RW	**Advance Slot Check (ASC):** When set, this bit enables the DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the Tx descriptor is - equal to the reference slot number given in the RSN field or - ahead of the reference slot number by up to two slots This bit is applicable only when the ESC bit is set. 0x0 (DISABLE): Advance Slot Check is disabled. 0x1 (ENABLE): Advance Slot Check is enabled.
0	0h RW	**Enable Slot Comparison (ESC):** When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. The DMA fetches the data from the corresponding buffer only when the slot number is - equal to the reference slot number or - ahead of the reference slot number by one slot When reset, this bit disables the checking of the slot numbers. The DMA fetches the data immediately after the descriptor is processed. Note: The UFO (UDP Fragmentation over IPv4)/TSO/USO should not be enabled along with TBS/AVB Slot number check. The UFO/TSO/USO involves multiple packets/segments/fragments transmission for single packet received from application and the slot number check are applicable for fetching of only first segment/fragment. As a result it might be difficult for software to specify slot number for subsequent packets. 0x0 (DISABLE): Slot Comparison is disabled. 0x1 (ENABLE): Slot Comparison is enabled.

10.2.627 DMA_CH5_CURRENT_APP_TXDESC — Offset 13C4h

The Channeli Current Application Transmit Descriptor register points to the current Transmit descriptor read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13C4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Transmit Descriptor Address Pointer (CURTDESAPTR):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

10.2.628 DMA_CH5_CURRENT_APP_RXDESC — Offset 13CCh

The Channeli Current Application Receive Descriptor register points to the current Receive descriptor read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13CCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Receive Descriptor Address Pointer (CURRDESAPTR):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

10.2.629 DMA_CH5_CURRENT_APP_TXBUFFER_H — Offset 13D0h

The Channeli Current Application Transmit Buffer Address High register has the higher 8 or 16 bits of the current address of the Transmit buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13D0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO	**Application Transmit Buffer Address Pointer (CURTBUFAPTRH):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

10.2.630 DMA_CH5_CURRENT_APP_TXBUFFER — Offset 13D4h

The Channeli Current Application Transmit Buffer Address register points to the current Tx buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Transmit Buffer Address Pointer (CURTBUFAPTR):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

10.2.631 DMA_CH5_CURRENT_APP_RXBUFFER_H — Offset 13D8h

The Channeli Current Application Receive Buffer Address High register has the higher 8 or 16 bits of the current address of the Receive buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO	**Application Receive Buffer Address Pointer (CURRBUFAPTRH):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

10.2.632 DMA_CH5_CURRENT_APP_RXBUFFER — Offset 13DCh

The Channel 0 Current Application Receive Buffer Address register points to the current Rx buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13DCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Receive Buffer Address Pointer (CURRBUFAPTR):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

10.2.633 DMA_CH5_STATUS — Offset 13E0h

The software driver (application) reads the Status register during interrupt service routine or polling to determine the status of the DMA.

Note: The number of DMA_CH(#i)_Status register in the configuration is the higher of number of Rx DMA Channels and Tx DMA Channels.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13E0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21:19	0h RO	**Rx DMA Error Bits (REB):** This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 21 -- 1'b1: Error during data transfer by Rx DMA -- 1'b0: No Error during data transfer by Rx DMA - Bit 20 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 19 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
18:16	0h RO	**Tx DMA Error Bits (TEB):** This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 18 -- 1'b1: Error during data transfer by Tx DMA -- 1'b0: No Error during data transfer by Tx DMA - Bit 17 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 16 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
15	0h RW	**Normal Interrupt Summary (NIS):** Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in DMA_CH0_Interrupt_Enable register) affect the Normal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit which causes NIS to be set is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Normal Interrupt Summary status not detected. 0x1 (ACTIVE): Normal Interrupt Summary status detected.

Bit Range	Default & Access	Field Name (ID): Description
14	0h RW	**Abnormal Interrupt Summary (AIS):** Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Abnormal Interrupt Summary status not detected. 0x1 (ACTIVE): Abnormal Interrupt Summary status detected.
13	0h RW	**Context Descriptor Error (CDE):** This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Context Descriptor Error status not detected. 0x1 (ACTIVE): Context Descriptor Error status detected.
12	0h RW	**Fatal Bus Error (FBE):** This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Fatal Bus Error status not detected. 0x1 (ACTIVE): Fatal Bus Error status detected.
11	0h RW	**Early Receive Interrupt (ERI):** This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. In configs supporting ERIC, When ERIC=0, this bit is set only after the Rx DMA has filled up a complete receive buffer with packet data. When ERIC=1, this bit is set after every burst transfer of data from the Rx DMA to the buffer. The setting of RI bit automatically clears this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Receive Interrupt status not detected. 0x1 (ACTIVE): Early Receive Interrupt status detected.
10	0h RW	**Early Transmit Interrupt (ETI):** This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. In configs supporting ERIC: When ETIC=0, this bit is set only after the Tx DMA has transferred a complete packet to MTL. When ETIC=1, this bit is set after completion of (partial) packet data transfer from buffers in the Transmit descriptor in which IOC=1. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Transmit Interrupt status not detected. 0x1 (ACTIVE): Early Transmit Interrupt status detected.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**Receive Watchdog Timeout (RWT):** This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received. 0x0 (INACTIVE): Receive Watchdog Timeout status not detected. 0x1 (ACTIVE): Receive Watchdog Timeout status detected.
8	0h RW	**Receive Process Stopped (RPS):** This bit is asserted when the Rx process enters the Stopped state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Process Stopped status not detected. 0x1 (ACTIVE): Receive Process Stopped status detected.
7	0h RW	**Receive Buffer Unavailable (RBU):** This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode, the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Buffer Unavailable status not detected. 0x1 (ACTIVE): Receive Buffer Unavailable status detected.
6	0h RW	**Receive Interrupt (RI):** This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. The reception remains in the Running state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Interrupt status not detected. 0x1 (ACTIVE): Receive Interrupt status detected.
5:3	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Transmit Buffer Unavailable (TBU):** This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPS0 field of the DMA_Debug_Status0 register explains the Transmit Process state transitions. To resume processing the Transmit descriptors, the application should do the following: 1. Change the ownership of the descriptor by setting Bit 31 of TDES3. 2. Issue a Transmit Poll Demand command. For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Buffer Unavailable status not detected. 0x1 (ACTIVE): Transmit Buffer Unavailable status detected.
1	0h RW	**Transmit Process Stopped (TPS):** This bit is set when the transmission is stopped. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Process Stopped status not detected. 0x1 (ACTIVE): Transmit Process Stopped status detected.
0	0h RW	**Transmit Interrupt (TI):** This bit indicates that the packet transmission is complete. When transmission is complete, Bit 31 of TDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Interrupt status not detected. 0x1 (ACTIVE): Transmit Interrupt status detected.

10.2.634 DMA_CH5_MISS_FRAME_CNT — Offset 13E4h

This register has the number of packet counter that got dropped by the DMA either due to Bus Error or due to programming RPF field in DMA_CH${i}_Rx_Control register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Overflow status of the MFC Counter (MFCO):** When this bit is set then the MFC counter does not get incremented further. The bit gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Miss Frame Counter overflow not occurred. 0x1 (ACTIVE): Miss Frame Counter overflow occurred.
14:11	0h RO	**Reserved**
10:0	000h RO	**Dropped Packet Counters (MFC):** This counter indicates the number of packet counters that are dropped by the DMA either because of bus error or because of programing RPF field in DMA_CH${i}_Rx_Control register. The counter gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event.

10.2.635 DMA_CH5_RXP_ACCEPT_CNT — Offset 13E8h

The DMA_CH(#i)_RXP_Accept_Cnt registers provides the count of the number of frames accepted by Rx Parser.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13E8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Rx Parser Accept Counter Overflow Bit (RXPACOF):** When set, this bit indicates that the RXPAC Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Rx Parser Accept Counter overflow not occurred. 0x1 (ACTIVE): Rx Parser Accept Counter overflow occurred.
30:0	00000000h RO	**Rx Parser Accept Counter (RXPAC):** This 31-bit counter is implemented whenever a Rx Parser Accept a packet due to AF =1. The counter is cleared when the register is read.

10.2.636 DMA_CH5_RX_ERI_CNT — Offset 13ECh

The DMA_CH(#i)_RX_ERI_Cnt registers provides the count of the number of times ERI was asserted.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13ECh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11:0	000h RO	**ERI Counter (ECNT):** When ERIC bit of DMA_CH(#i)_RX_Control register is set, this counter increments for burst transfer completed by the Rx DMA from the start of packet transfer. This counter is reset at the start of new packet.

10.2.637 DMA_CH6_CONTROL — Offset 1400h

The DMA Channeli Control register specifies the MSS value for segmentation, length to skip between two descriptors, and also the features such as header splitting and 8xPBL mode.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1400h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**Split Headers (SPH):** When this bit is set, the DMA splits the header and payload in the Receive path. The DMA writes the header to the Buffer Address1 of RDES0. The DMA writes the payload to the buffer to which the Buffer Address2 is pointing. The software must ensure that the header fits into the Receive buffers. If the header length exceeds the receive buffer size, the DMA does not split the header and payload. This bit is available only if Enable Split Header Structure option is selected. 0x0 (DISABLE): Split Headers feature is disabled. 0x1 (ENABLE): Split Headers feature is enabled.
23:21	0h RO	**Reserved**
20:18	0h RW	**Descriptor Skip Length (DSL):** This bit specifies the Word, Dword, or Lword number (depending on the 32-bit, 64-bit, or 128-bit bus) to skip between two unchained descriptors. The address skipping starts from the end of the current descriptor to the start of the next descriptor. When the DSL value is equal to zero, the DMA takes the descriptor table as contiguous.
17	0h RO	**Reserved**
16	0h RW	**8xPBL mode (PBLX8):** When this bit is set, the PBL value programmed in Bits[21:16] in DMA_CH(#i)_Tx_Control and Bits[21:16] in DMA_CH(#i)_Rx_Control is multiplied by eight times. Therefore, the DMA transfers the data in 8, 16, 32, 64, 128, and 256 beats depending on the PBL value. 0x0 (DISABLE): 8xPBL mode is disabled. 0x1 (ENABLE): 8xPBL mode is enabled.
15:0	0h RO	**Reserved**

10.2.638 DMA_CH6_TX_CONTROL — Offset 1404h

The DMA Channeli Transmit Control register controls the Tx features such as PBL, TCP segmentation, and Tx Channel weights.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1404h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:29	0h RW	**Time Select (TFSEL):** Select bits for one of the four DMA_TBS_CTRL register fields (FTOS, FGSN, FTOV) for the channel. 0x0: DMA_TBS_CTRL0 selected. 0x1: DMA_TBS_CTRL1 selected. 0x2: DMA_TBS_CTRL2 selected. 0x3: DMA_TBS_CTRL3 selected.
28	0h RW	**Enhanced Descriptor Enable (EDSE):** When this bit is set, the corresponding channel uses Enhanced Descriptors that are 32 Bytes for both Normal and Context Descriptors. When reset, the corresponding channel uses the descriptors that are 16 Bytes. 0x0 (DISABLE): Enhanced Descriptor is disabled. 0x1 (ENABLE): Enhanced Descriptor is enabled.
27:24	0h RW	**Transmit QOS. (TQOS):** This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Tx Channel0.
23:22	0h RO	**Reserved**
21:16	00h RW	**Transmit Programmable Burst Length (TXPBL):** These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in DMA_CH0_Control register. 2. Set the TxPBL. Note: The maximum value of TxPBL must be less than or equal to half the Tx Queue size (TQS field of MTL_TxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. For example, in 64-bit data width configurations the total locations in Tx Queue of size 512 bytes is 64, TxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	0h RW	**Ignore PBL Requirement (IPBL):** When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. If space is not available, the MTL might use handshaking to slow the DMA. Note: This bit/mode must not be used when multiple Transmit DMA Channels are enabled as it might block other Transmit and Receive DMA Channels from accessing the Read Data Channel of AXI bus until space is available in Transmit Queue for current transfer. 0x0 (DISABLE): Ignore PBL Requirement is disabled. 0x1 (ENABLE): Ignore PBL Requirement is enabled.

Bit Range	Default & Access	Field Name (ID): Description
14:13	0h RW	**TSE_MODE:** TSE Mode - 00: TSO/USO (segmentation functionality is enabled). In this mode, the setting of TSE bit enables the TSO/USO segmentation. - 01: UFO with Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality with Checksum for all the UDP packets. - 10: UFO without Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality without Checksum for all the UDP packets. - 11: Reserved 0x0 (TSO_USO): TSO/USO. 0x1 (UFOWC): UFO with Checksum. 0x2 (UFOWOC): UFO without Checksum. 0x3 (RSVD): Reserved.
12	0h RW	**TCP Segmentation Enabled (TSE):** When this bit is set, the DMA performs the TCP segmentation or UDP Segmentation/ Fragmentation for packets in this channel. The TCP segmentation or UDP packet's segmentation/Fragmentation is done only for those packets for which the TSE bit (TDES0[19]) is set in the Tx Normal descriptor.When this bit is set, the TxPBL value must be greater than 4. 0x0 (DISABLE): TCP Segmentation is disabled. 0x1 (ENABLE): TCP Segmentation is enabled.
11:5	0h RO	**Reserved**
4	0h RW	**Operate on Second Packet (OSF):** When this bit is set, it instructs the DMA to process the second packet of the Transmit data even before the status for the first packet is obtained. 0x0 (DISABLE): Operate on Second Packet disabled. 0x1 (ENABLE): Operate on Second Packet enabled.
3:1	0h RW	**Transmit Channel Weight (TCW):** This field indicates the weight assigned to the corresponding Transmit channel. When reset is complete, this field is set to 0 for all channels by default, resulting in equal weights to all channels.
0	0h RW	**Start or Stop Transmission Command (ST):** When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the base address of the Transmit list set by the DMA_CH0_TxDesc_List_Address register. - The position at which the transmission was previously stopped If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the DMA_CH0_Status register is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the DMA_CH0_TxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program DMA_CH0_TxDesc_List_Address register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state. 0x0 (STOP): Stop Transmission Command. 0x1 (START): Start Transmission Command.

10.2.639 DMA_CH6_RX_CONTROL — Offset 1408h

The DMA Channeli Receive Control register controls the Rx features such as PBL, buffer size, and extended status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1408h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Rx Packet Flush. (RPF):** When this bit is set to 1, then GbE Controller automatically flushes the packet from the Rx Queues destined to this DMA Rx Channel, when it is stopped. When this bit remains set and the DMA is re-started by the software driver, the packets residing in the Rx Queues that were received when this RxDMA was stopped, get flushed out. The packets that are received by the MAC after the RxDMA is re-started are routed to the RxDMA. The flushing happens on the Read side of the Rx Queue. When this bit is set to 0, the GbE Controller not flush the packet in the Rx Queue destined to this RxDMA Channel when it is STOP state. This might in turn cause head-of-line blocking in the corresponding RxQueue. Note: The stopping of packet flow from a Rx DMA Channel to the application by setting RPF works only when there is one-to-one mapping of Rx Queue to Rx DMA channels. In Dynamic mapping mode, setting RPF bit in any DMA_CH(#i)_Rx_Control register might flush packets from unintended Rx Queues which are destined to the stopped Rx DMA Channel. 0x0 (DISABLE): Rx Packet Flush is disabled. 0x1 (ENABLE): Rx Packet Flush is enabled.
30:28	0h RO	**Reserved**
27:24	0h RW	**Rx AXI4 QOS. (RQOS):** This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Rx Channel0.
23:22	0h RO	**Reserved**
21:16	00h RW	**Receive Programmable Burst Length (RXPBL):** These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in the DMA_CH0_Control register. 2. Set the RxPBL. Note: The maximum value of RxPBL must be less than or equal to half the Rx Queue size (RQS field of MTL_RxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the Rx DMA is transferring a block of data. For example, in 64-bit data width configurations the total locations in Rx Queue of size 512 bytes is 64, so RxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
14:4	000h RW	**Receive Buffer size High (RBSZ_13_Y):** RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. The RBSZ[13:0] field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when split headers are enabled. Note: The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the value of buffer address pointer is not aligned to data bus width. Hence the lower RBSZ_x_0 bits are read-only and the value is considered as all-zero. Thus the RBSZ_13_y indicates the buffer size in terms of locations (with the width same as bus-width).
3:1	0h RO	**Receive Buffer size Low (RBSZ_X_0):** RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. The RBSZ_x_0 is the lower field whose width is based on data bus width of the configuration. This field is of width 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).
0	0h RW	**Start or Stop Receive (SR):** When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the address set by the DMA_CH0_RxDesc_List_Address register. - The position at which the Rx process was previously stopped If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the DMA_CH0_Status register is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the DMA_CH0_RxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state. 0x0 (STOP): Stop Receive. 0x1 (START): Start Receive.

10.2.640 DMA_CH6_TXDESC_LIST_HADDRESS — Offset 1410h

The Channeli Tx Descriptor List HAddress register has the higher 8 or 16 bits of the start address of the Transmit descriptor list.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CHi_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier. This register must be programmed with desired the higher address before programming the DMA_CHi_TxDesc_List_Address register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1410h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Start of Transmit List (TDESHA):** This field contains the most-significant 8 or 16 bits of the 40- or 48-bit base address of the first descriptor in the Transmit descriptor list.

10.2.641 DMA_CH6_TXDESC_LIST_ADDRESS — Offset 1414h

The Channeli Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LSB to low.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CH0_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1414h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Start of Transmit List (TDESLA):** This field contains the base address of the first descriptor in the Transmit descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

10.2.642 DMA_CH6_RXDESC_LIST_HADDRESS — Offset 1418h

The Channeli Rx Descriptor List HAddress register has the higher 8 or 16 bits of the start address of the Receive descriptor list.

Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in the DMA_CHi_RxDesc_List_Address register

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1418h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Start of Receive List (RDESHA):** This field contains the most-significant 8 or 16 bits of the 40-bit or 48-bit base address of the first descriptor in the Rx Descriptor list.

10.2.643 DMA_CH6_RXDESC_LIST_ADDRESS — Offset 141Ch

The Channeli Rx Descriptor List Address register points the DMA to the start of Receive descriptor list.

This register points to the start of the Receive Descriptor List. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in DMA_CH0_Rx_Control register. When stopped, this register can be written with a new descriptor list address.

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 141Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Start of Receive List (RDESLA):** This field contains the base address of the first descriptor in the Rx Descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration

2:0	0h RO	**Reserved**

10.2.645 DMA_CH6_RXDESC_TAIL_POINTER — Offset 1428h

The Channeli Rx Descriptor Tail Pointer Points to an offset from the base and indicates the location of the last valid descriptor.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1428h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Receive Descriptor Tail Pointer (RDTP):** This field contains the tail pointer for the Rx descriptor ring. The software writes the tail pointer to add more descriptors to the Rx channel. The hardware tries to write all received packets to the descriptors referenced between the head and the tail pointer registers. The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

10.2.646 DMA_CH6_TXDESC_RING_LENGTH — Offset 142Ch

The Tx Descriptor Ring Length register contains the length of the Transmit descriptor ring.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 142Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:0	000h RW	**Transmit Descriptor Ring Length (TDRL):** This field sets the maximum number of Tx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. Intel recommends a minimum ring descriptor length of 4. For example, You can program any value up to 0x3FF in this field. This field is 10 bits wide, if you program 0x3FF, you can have 1024 descriptors. If you want to have 10 descriptors, program it to a value of 0x9.

10.2.647 DMA_CH6_RXDESC_RING_LENGTH — Offset 1430h

The Channeli Rx Descriptor Ring Length register contains the length of the Receive descriptor circular ring.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1430h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:0	000h RW	**Receive Descriptor Ring Length (RDRL):** This register sets the maximum number of Rx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. For example, You can program any value up to 0x3FF in this field. This field is 10 bits wide, if you program 0x3FF, you can have 1024 descriptors. If you want to have 10 descriptors, program it to a value of 0x9.

10.2.648 DMA_CH6_INTERRUPT_ENABLE — Offset 1434h

The Channeli Interrupt Enable register enables the interrupts reported by the Status register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1434h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW	**Normal Interrupt Summary Enable (NIE):** When this bit is set, the normal interrupt summary is enabled. This bit enables the following interrupts in the DMA_CH0_Status register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt When this bit is reset, the normal interrupt summary is disabled. 0x0 (DISABLE): Normal Interrupt Summary is disabled. 0x1 (ENABLE): Normal Interrupt Summary is enabled.
14	0h RW	**Abnormal Interrupt Summary Enable (AIE):** When this bit is set, the abnormal interrupt summary is enabled. This bit enables the following interrupts in the DMA_CH0_Status register: - Bit 1: Transmit Process Stopped - Bit 7: Rx Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 9: Receive Watchdog Timeout - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error When this bit is reset, the abnormal interrupt summary is disabled. 0x0 (DISABLE): Abnormal Interrupt Summary is disabled. 0x1 (ENABLE): Abnormal Interrupt Summary is enabled.
13	0h RW	**Context Descriptor Error Enable (CDEE):** When this bit is set along with the AIE bit, the Descriptor error interrupt is enabled. When this bit is reset, the Descriptor error interrupt is disabled. 0x0 (DISABLE): Context Descriptor Error is disabled. 0x1 (ENABLE): Context Descriptor Error is enabled.
12	0h RW	**Fatal Bus Error Enable (FBEE):** When this bit is set along with the AIE bit, the Fatal Bus error interrupt is enabled. When this bit is reset, the Fatal Bus Error error interrupt is disabled. 0x0 (DISABLE): Fatal Bus Error is disabled. 0x1 (ENABLE): Fatal Bus Error is enabled.
11	0h RW	**Early Receive Interrupt Enable (ERIE):** When this bit is set along with the NIE bit, the Early Receive interrupt is enabled. When this bit is reset, the Early Receive interrupt is disabled. 0x0 (DISABLE): Early Receive Interrupt is disabled. 0x1 (ENABLE): Early Receive Interrupt is enabled.
10	0h RW	**Early Transmit Interrupt Enable (ETIE):** When this bit is set along with the AIE bit, the Early Transmit interrupt is enabled. When this bit is reset, the Early Transmit interrupt is disabled. 0x0 (DISABLE): Early Transmit Interrupt is disabled. 0x1 (ENABLE): Early Transmit Interrupt is enabled.
9	0h RW	**Receive Watchdog Timeout Enable (RWTE):** When this bit is set along with the AIE bit, the Receive Watchdog Timeout interrupt is enabled. When this bit is reset, the Receive Watchdog Timeout interrupt is disabled. 0x0 (DISABLE): Receive Watchdog Timeout is disabled. 0x1 (ENABLE): Receive Watchdog Timeout is enabled.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**Receive Stopped Enable (RSE):** When this bit is set along with the AIE bit, the Receive Stopped Interrupt is enabled. When this bit is reset, the Receive Stopped interrupt is disabled. 0x0 (DISABLE): Receive Stopped is disabled. 0x1 (ENABLE): Receive Stopped is enabled.
7	0h RW	**Receive Buffer Unavailable Enable (RBUE):** When this bit is set along with the AIE bit, the Receive Buffer Unavailable interrupt is enabled. When this bit is reset, the Receive Buffer Unavailable interrupt is disabled. 0x0 (DISABLE): Receive Buffer Unavailable is disabled. 0x1 (ENABLE): Receive Buffer Unavailable is enabled.
6	0h RW	**Receive Interrupt Enable (RIE):** When this bit is set along with the NIE bit, the Receive Interrupt is enabled. When this bit is reset, the Receive Interrupt is disabled. 0x0 (DISABLE): Receive Interrupt is disabled. 0x1 (ENABLE): Receive Interrupt is enabled.
5:3	0h RO	**Reserved**
2	0h RW	**Transmit Buffer Unavailable Enable (TBUE):** When this bit is set along with the NIE bit, the Transmit Buffer Unavailable interrupt is enabled. When this bit is reset, the Transmit Buffer Unavailable interrupt is disabled. 0x0 (DISABLE): Transmit Buffer Unavailable is disabled. 0x1 (ENABLE): Transmit Buffer Unavailable is enabled.
1	0h RW	**Transmit Stopped Enable (TXSE):** When this bit is set along with the AIE bit, the Transmission Stopped interrupt is enabled. When this bit is reset, the Transmission Stopped interrupt is disabled. 0x0 (DISABLE): Transmit Stopped is disabled. 0x1 (ENABLE): Transmit Stopped is enabled.
0	0h RW	**Transmit Interrupt Enable (TIE):** When this bit is set along with the NIE bit, the Transmit Interrupt is enabled. When this bit is reset, the Transmit Interrupt is disabled. 0x0 (DISABLE): Transmit Interrupt is disabled. 0x1 (ENABLE): Transmit Interrupt is enabled.

10.2.649 DMA_CH6_RX_INTERRUPT_WATCHDOG_TIMER — Offset 1438h

The Receive Interrupt Watchdog Timer register indicates the watchdog timeout for Receive Interrupt (RI) from the DMA. When this register is written with a non-zero value, it enables the watchdog timer for the RI bit of the DMA_CHi_Status register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1438h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17:16	0h RW	**Receive Interrupt Watchdog Timer Count Units (RWTU):** This fields indicates the number of system clock cycles corresponding to one unit in RWT field. - 2'b00: 256 - 2'b01: 512 - 2'b10: 1024 - 2'b11: 2048 For example, when RWT=2 and RWTU=1, the watchdog timer is set for 2*512=1024 system clock cycles.
15:8	0h RO	**Reserved**
7:0	00h RW	**Receive Interrupt Watchdog Timer Count (RWT):** This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. The watchdog timer is triggered with the programmed value after the Rx DMA completes the transfer of a packet for which the RI bit is not set in the DMA_CH(#i)_Status register, because of the setting of Interrupt Enable bit in the corresponding descriptor RDES3[30]. When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per the Interrupt Enable bit RDES3[30] of any received packet.

10.2.650 DMA_CH6_SLOT_FUNCTION_CONTROL_STATUS — Offset 143Ch

The Slot Function Control and Status register contains the control bits for slot function and the status for Transmit path.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 143Ch	000007C0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19:16	0h RO	**Reference Slot Number (RSN):** This field gives the current value of the reference slot number in the DMA. It is used for slot comparison.
15:4	07Ch RW	**Slot Interval Value (SIV):** This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. A value of 0 specifies the slot interval of 1 us while the maximum value 4095 specifies the slot interval of 4096us. The default/reset value is 0x07C which corresponds to slot interval of 125us

Bit Range	Default & Access	Field Name (ID): Description
3:2	0h RO	**Reserved**
1	0h RW	**Advance Slot Check (ASC):** When set, this bit enables the DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the Tx descriptor is - equal to the reference slot number given in the RSN field or - ahead of the reference slot number by up to two slots This bit is applicable only when the ESC bit is set. 0x0 (DISABLE): Advance Slot Check is disabled. 0x1 (ENABLE): Advance Slot Check is enabled.
0	0h RW	**Enable Slot Comparison (ESC):** When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. The DMA fetches the data from the corresponding buffer only when the slot number is - equal to the reference slot number or - ahead of the reference slot number by one slot When reset, this bit disables the checking of the slot numbers. The DMA fetches the data immediately after the descriptor is processed. Note: The UFO (UDP Fragmentation over IPv4)/TSO/USO should not be enabled along with TBS/AVB Slot number check. The UFO/TSO/USO involves multiple packets/segments/fragments transmission for single packet received from application and the slot number check are applicable for fetching of only first segment/fragment. As a result it might be difficult for software to specify slot number for subsequent packets. 0x0 (DISABLE): Slot Comparison is disabled. 0x1 (ENABLE): Slot Comparison is enabled.

10.2.651 DMA_CH6_CURRENT_APP_TXDESC — Offset 1444h

The Channeli Current Application Transmit Descriptor register points to the current Transmit descriptor read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1444h	00000000h

Bit Range	Default & Access	Field Name (ID): Description

10.2.654 DMA_CH6_CURRENT_APP_TXBUFFER — Offset 1454h

The Channeli Current Application Transmit Buffer Address register points to the current Tx buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1454h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Transmit Buffer Address Pointer (CURTBUFAPTR):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

10.2.655 DMA_CH6_CURRENT_APP_RXBUFFER_H — Offset 1458h

The Channeli Current Application Receive Buffer Address High register has the higher 8 or 16 bits of the current address of the Receive buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1458h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO	**Application Receive Buffer Address Pointer (CURRBUFAPTRH):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

10.2.656 DMA_CH6_CURRENT_APP_RXBUFFER — Offset 145Ch

The Channel 0 Current Application Receive Buffer Address register points to the current Rx buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 145Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Receive Buffer Address Pointer (CURRBUFAPTR):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

10.2.657 DMA_CH6_STATUS — Offset 1460h

The software driver (application) reads the Status register during interrupt service routine or polling to determine the status of the DMA.

Note: The number of DMA_CH(#i)_Status register in the configuration is the higher of number of Rx DMA Channels and Tx DMA Channels.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1460h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21:19	0h RO	**Rx DMA Error Bits (REB):** This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 21 -- 1'b1: Error during data transfer by Rx DMA -- 1'b0: No Error during data transfer by Rx DMA - Bit 20 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 19 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
18:16	0h RO	**Tx DMA Error Bits (TEB):** This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 18 -- 1'b1: Error during data transfer by Tx DMA -- 1'b0: No Error during data transfer by Tx DMA - Bit 17 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 16 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
15	0h RW	**Normal Interrupt Summary (NIS):** Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in DMA_CH0_Interrupt_Enable register) affect the Normal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit which causes NIS to be set is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Normal Interrupt Summary status not detected. 0x1 (ACTIVE): Normal Interrupt Summary status detected.

Bit Range	Default & Access	Field Name (ID): Description
14	0h RW	**Abnormal Interrupt Summary (AIS):** Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Abnormal Interrupt Summary status not detected. 0x1 (ACTIVE): Abnormal Interrupt Summary status detected.
13	0h RW	**Context Descriptor Error (CDE):** This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Context Descriptor Error status not detected. 0x1 (ACTIVE): Context Descriptor Error status detected.
12	0h RW	**Fatal Bus Error (FBE):** This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Fatal Bus Error status not detected. 0x1 (ACTIVE): Fatal Bus Error status detected.
11	0h RW	**Early Receive Interrupt (ERI):** This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. In configs supporting ERIC, When ERIC=0, this bit is set only after the Rx DMA has filled up a complete receive buffer with packet data. When ERIC=1, this bit is set after every burst transfer of data from the Rx DMA to the buffer. The setting of RI bit automatically clears this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Receive Interrupt status not detected. 0x1 (ACTIVE): Early Receive Interrupt status detected.
10	0h RW	**Early Transmit Interrupt (ETI):** This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. In configs supporting ERIC: When ETIC=0, this bit is set only after the Tx DMA has transferred a complete packet to MTL. When ETIC=1, this bit is set after completion of (partial) packet data transfer from buffers in the Transmit descriptor in which IOC=1. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Transmit Interrupt status not detected. 0x1 (ACTIVE): Early Transmit Interrupt status detected.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**Receive Watchdog Timeout (RWT):** This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received. 0x0 (INACTIVE): Receive Watchdog Timeout status not detected. 0x1 (ACTIVE): Receive Watchdog Timeout status detected.
8	0h RW	**Receive Process Stopped (RPS):** This bit is asserted when the Rx process enters the Stopped state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Process Stopped status not detected. 0x1 (ACTIVE): Receive Process Stopped status detected.
7	0h RW	**Receive Buffer Unavailable (RBU):** This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode, the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Buffer Unavailable status not detected. 0x1 (ACTIVE): Receive Buffer Unavailable status detected.
6	0h RW	**Receive Interrupt (RI):** This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. The reception remains in the Running state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Interrupt status not detected. 0x1 (ACTIVE): Receive Interrupt status detected.
5:3	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Transmit Buffer Unavailable (TBU):** This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPS0 field of the DMA_Debug_Status0 register explains the Transmit Process state transitions. To resume processing the Transmit descriptors, the application should do the following: 1. Change the ownership of the descriptor by setting Bit 31 of TDES3. 2. Issue a Transmit Poll Demand command. For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Buffer Unavailable status not detected. 0x1 (ACTIVE): Transmit Buffer Unavailable status detected.
1	0h RW	**Transmit Process Stopped (TPS):** This bit is set when the transmission is stopped. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Process Stopped status not detected. 0x1 (ACTIVE): Transmit Process Stopped status detected.
0	0h RW	**Transmit Interrupt (TI):** This bit indicates that the packet transmission is complete. When transmission is complete, Bit 31 of TDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Interrupt status not detected. 0x1 (ACTIVE): Transmit Interrupt status detected.

10.2.658 DMA_CH6_MISS_FRAME_CNT — Offset 1464h

This register has the number of packet counter that got dropped by the DMA either due to Bus Error or due to programming RPF field in DMA_CH${i}_Rx_Control register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1464h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Overflow status of the MFC Counter (MFCO):** When this bit is set then the MFC counter does not get incremented further. The bit gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Miss Frame Counter overflow not occurred. 0x1 (ACTIVE): Miss Frame Counter overflow occurred.
14:11	0h RO	**Reserved**
10:0	000h RO	**Dropped Packet Counters (MFC):** This counter indicates the number of packet counters that are dropped by the DMA either because of bus error or because of programing RPF field in DMA_CH${i}_Rx_Control register. The counter gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event.

10.2.659 DMA_CH6_RXP_ACCEPT_CNT — Offset 1468h

The DMA_CH(#i)_RXP_Accept_Cnt registers provides the count of the number of frames accepted by Rx Parser.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1468h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Rx Parser Accept Counter Overflow Bit (RXPACOF):** When set, this bit indicates that the RXPAC Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Rx Parser Accept Counter overflow not occurred. 0x1 (ACTIVE): Rx Parser Accept Counter overflow occurred.
30:0	00000000h RO	**Rx Parser Accept Counter (RXPAC):** This 31-bit counter is implemented whenever a Rx Parser Accept a packet due to AF =1. The counter is cleared when the register is read.

10.2.660 DMA_CH6_RX_ERI_CNT — Offset 146Ch

The DMA_CH(#i)_RX_ERI_Cnt registers provides the count of the number of times ERI was asserted.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 146Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11:0	000h RO	**ERI Counter (ECNT):** When ERIC bit of DMA_CH(#i)_RX_Control register is set, this counter increments for burst transfer completed by the Rx DMA from the start of packet transfer. This counter is reset at the start of new packet.

10.2.661 DMA_CH7_CONTROL — Offset 1480h

The DMA Channeli Control register specifies the MSS value for segmentation, length to skip between two descriptors, and also the features such as header splitting and 8xPBL mode.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1480h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**Split Headers (SPH):** When this bit is set, the DMA splits the header and payload in the Receive path. The DMA writes the header to the Buffer Address1 of RDES0. The DMA writes the payload to the buffer to which the Buffer Address2 is pointing. The software must ensure that the header fits into the Receive buffers. If the header length exceeds the receive buffer size, the DMA does not split the header and payload. This bit is available only if Enable Split Header Structure option is selected. 0x0 (DISABLE): Split Headers feature is disabled. 0x1 (ENABLE): Split Headers feature is enabled.
23:21	0h RO	**Reserved**
20:18	0h RW	**Descriptor Skip Length (DSL):** This bit specifies the Word, Dword, or Lword number (depending on the 32-bit, 64-bit, or 128-bit bus) to skip between two unchained descriptors. The address skipping starts from the end of the current descriptor to the start of the next descriptor. When the DSL value is equal to zero, the DMA takes the descriptor table as contiguous.
17	0h RO	**Reserved**
16	0h RW	**8xPBL mode (PBLX8):** When this bit is set, the PBL value programmed in Bits[21:16] in DMA_CH(#i)_Tx_Control and Bits[21:16] in DMA_CH(#i)_Rx_Control is multiplied by eight times. Therefore, the DMA transfers the data in 8, 16, 32, 64, 128, and 256 beats depending on the PBL value. 0x0 (DISABLE): 8xPBL mode is disabled. 0x1 (ENABLE): 8xPBL mode is enabled.
15:0	0h RO	**Reserved**

10.2.662 DMA_CH7_TX_CONTROL — Offset 1484h

The DMA Channel Transmit Control register controls the Tx features such as PBL, TCP segmentation, and Tx Channel weights.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1484h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:29	0h RW	**TFSEL:**
28	0h RW	**Enhanced Descriptor Enable (EDSE):** When this bit is set, the corresponding channel uses Enhanced Descriptors that are 32 Bytes for both Normal and Context Descriptors. When reset, the corresponding channel uses the descriptors that are 16 Bytes. 0x0 (DISABLE): Enhanced Descriptor is disabled. 0x1 (ENABLE): Enhanced Descriptor is enabled.
27:24	0h RW	**Transmit QOS. (TQOS):** This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Tx Channel0.
23:22	0h RO	**Reserved**
21:16	00h RW	**Transmit Programmable Burst Length (TXPBL):** These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in DMA_CH0_Control register. 2. Set the TxPBL. Note: The maximum value of TxPBL must be less than or equal to half the Tx Queue size (TQS field of MTL_TxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. For example, in 64-bit data width configurations the total locations in Tx Queue of size 512 bytes is 64, TxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	0h RW	**Ignore PBL Requirement (IPBL):** When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. If space is not available, the MTL might use handshaking to slow the DMA. Note: This bit/mode must not be used when multiple Transmit DMA Channels are enabled as it might block other Transmit and Receive DMA Channels from accessing the Read Data Channel of AXI bus until space is available in Transmit Queue for current transfer. 0x0 (DISABLE): Ignore PBL Requirement is disabled. 0x1 (ENABLE): Ignore PBL Requirement is enabled.

Bit Range	Default & Access	Field Name (ID): Description
14:13	0h RW	**TSE_MODE:** TSE Mode - 00: TSO/USO (segmentation functionality is enabled). In this mode, the setting of TSE bit enables the TSO/USO segmentation. - 01: UFO with Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality with Checksum for all the UDP packets. - 10: UFO without Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality without Checksum for all the UDP packets. - 11: Reserved 0x0 (TSO_USO): TSO/USO. 0x1 (UFOWC): UFO with Checksum. 0x2 (UFOWOC): UFO without Checksum. 0x3 (RSVD): Reserved.
12	0h RW	**TCP Segmentation Enabled (TSE):** When this bit is set, the DMA performs the TCP segmentation or UDP Segmentation/ Fragmentation for packets in this channel. The TCP segmentation or UDP packet's segmentation/Fragmentation is done only for those packets for which the TSE bit (TDES0[19]) is set in the Tx Normal descriptor.When this bit is set, the TxPBL value must be greater than 4. 0x0 (DISABLE): TCP Segmentation is disabled. 0x1 (ENABLE): TCP Segmentation is enabled.
11:5	0h RO	**Reserved**
4	0h RW	**Operate on Second Packet (OSF):** When this bit is set, it instructs the DMA to process the second packet of the Transmit data even before the status for the first packet is obtained. 0x0 (DISABLE): Operate on Second Packet disabled. 0x1 (ENABLE): Operate on Second Packet enabled.
3:1	0h RW	**Transmit Channel Weight (TCW):** This field indicates the weight assigned to the corresponding Transmit channel. When reset is complete, this field is set to 0 for all channels by default, resulting in equal weights to all channels.
0	0h RW	**Start or Stop Transmission Command (ST):** When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the base address of the Transmit list set by the DMA_CH0_TxDesc_List_Address register. - The position at which the transmission was previously stopped If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the DMA_CH0_Status register is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the DMA_CH0_TxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program DMA_CH0_TxDesc_List_Address register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state. 0x0 (STOP): Stop Transmission Command. 0x1 (START): Start Transmission Command.

10.2.663 DMA_CH7_RX_CONTROL — Offset 1488h

The DMA Channeli Receive Control register controls the Rx features such as PBL, buffer size, and extended status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1488h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Rx Packet Flush. (RPF):** When this bit is set to 1, then GbE Controller automatically flushes the packet from the Rx Queues destined to this DMA Rx Channel, when it is stopped. When this bit remains set and the DMA is re-started by the software driver, the packets residing in the Rx Queues that were received when this RxDMA was stopped, get flushed out. The packets that are received by the MAC after the RxDMA is re-started are routed to the RxDMA. The flushing happens on the Read side of the Rx Queue. When this bit is set to 0, the GbE Controller not flush the packet in the Rx Queue destined to this RxDMA Channel when it is STOP state. This might in turn cause head-of-line blocking in the corresponding RxQueue. Note: The stopping of packet flow from a Rx DMA Channel to the application by setting RPF works only when there is one-to-one mapping of Rx Queue to Rx DMA channels. In Dynamic mapping mode, setting RPF bit in any DMA_CH(#i)_Rx_Control register might flush packets from unintended Rx Queues which are destined to the stopped Rx DMA Channel. 0x0 (DISABLE): Rx Packet Flush is disabled. 0x1 (ENABLE): Rx Packet Flush is enabled.
30:28	0h RO	**Reserved**
27:24	0h RW	**Rx AXI4 QOS. (RQOS):** This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Rx Channel0.
23:22	0h RO	**Reserved**
21:16	00h RW	**Receive Programmable Burst Length (RXPBL):** These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in the DMA_CH0_Control register. 2. Set the RxPBL. Note: The maximum value of RxPBL must be less than or equal to half the Rx Queue size (RQS field of MTL_RxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the Rx DMA is transferring a block of data. For example, in 64-bit data width configurations the total locations in Rx Queue of size 512 bytes is 64, so RxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
14:4	000h RW	**Receive Buffer size High (RBSZ_13_Y):** RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. The RBSZ[13:0] field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when split headers are enabled. Note: The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the value of buffer address pointer is not aligned to data bus width. Hence the lower RBSZ_x_0 bits are read-only and the value is considered as all-zero. Thus the RBSZ_13_y indicates the buffer size in terms of locations (with the width same as bus-width).
3:1	0h RO	**Receive Buffer size Low (RBSZ_X_0):** RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. The RBSZ_x_0 is the lower field whose width is based on data bus width of the configuration. This field is of width 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).
0	0h RW	**Start or Stop Receive (SR):** When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the address set by the DMA_CH0_RxDesc_List_Address register. - The position at which the Rx process was previously stopped If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the DMA_CH0_Status register is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the DMA_CH0_RxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state. 0x0 (STOP): Stop Receive. 0x1 (START): Start Receive.

10.2.664 DMA_CH7_TXDESC_LIST_HADDRESS — Offset 1490h

The Channeli Tx Descriptor List HAddress register has the higher 8 or 16 bits of the start address of the Transmit descriptor list.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CHi_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier. This register must be programmed with desired the higher address before programming the DMA_CHi_TxDesc_List_Address register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1490h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Start of Transmit List (TDESHA):** This field contains the most-significant 8 or 16 bits of the 40- or 48-bit base address of the first descriptor in the Transmit descriptor list.

10.2.665 DMA_CH7_TXDESC_LIST_ADDRESS — Offset 1494h

The Channeli Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LSB to low.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CH0_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1494h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Start of Transmit List (TDESLA):** This field contains the base address of the first descriptor in the Transmit descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

10.2.666 DMA_CH7_RXDESC_LIST_HADDRESS — Offset 1498h

The Channeli Rx Descriptor List HAddress register has the higher 8 or 16 bits of the start address of the Receive descriptor list.

Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in the DMA_CHi_RxDesc_List_Address register

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1498h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Start of Receive List (RDESHA):** This field contains the most-significant 8 or 16 bits of the 40-bit or 48-bit base address of the first descriptor in the Rx Descriptor list.

10.2.667 DMA_CH7_RXDESC_LIST_ADDRESS — Offset 149Ch

The Channeli Rx Descriptor List Address register points the DMA to the start of Receive descriptor list.

This register points to the start of the Receive Descriptor List. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in DMA_CH0_Rx_Control register. When stopped, this register can be written with a new descriptor list address.

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 149Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Start of Receive List (RDESLA):** This field contains the base address of the first descriptor in the Rx Descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

10.2.668 DMA_CH7_TXDESC_TAIL_POINTER — Offset 14A0h

The Channeli Tx Descriptor Tail Pointer register points to an offset from the base and indicates the location of the last valid descriptor.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14A0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Transmit Descriptor Tail Pointer (TDTP):** This field contains the tail pointer for the Tx descriptor ring. The software writes the tail pointer to add more descriptors to the Tx channel. The hardware tries to transmit all packets referenced by the descriptors between the head and the tail pointer registers. The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

10.2.669 DMA_CH7_RXDESC_TAIL_POINTER — Offset 14A8h

The Channeli Rx Descriptor Tail Pointer Points to an offset from the base and indicates the location of the last valid descriptor.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14A8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Receive Descriptor Tail Pointer (RDTP):** This field contains the tail pointer for the Rx descriptor ring. The software writes the tail pointer to add more descriptors to the Rx channel. The hardware tries to write all received packets to the descriptors referenced between the head and the tail pointer registers. 2:0	0h RO	**Reserved**

10.2.670 DMA_CH7_TXDESC_RING_LENGTH — Offset 14ACh

The Tx Descriptor Ring Length register contains the length of the Transmit descriptor ring.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14ACh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:0	000h RW	**Transmit Descriptor Ring Length (TDRL):** This field sets the maximum number of Tx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. Intel recommends a minimum ring descriptor length of 4. For example, You can program any value up to 0x3FF in this field. This field is 10 bits wide, if you program 0x3FF, you can have 1024 descriptors. If you want to have 10 descriptors, program it to a value of 0x9.

10.2.671 DMA_CH7_RXDESC_RING_LENGTH — Offset 14B0h

The Channeli Rx Descriptor Ring Length register contains the length of the Receive descriptor circular ring.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:0	000h RW	**Receive Descriptor Ring Length (RDRL):** This register sets the maximum number of Rx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. For example, You can program any value up to 0x3FF in this field. This field is 10 bits wide, if you program 0x3FF, you can have 1024 descriptors. If you want to have 10 descriptors, program it to a value of 0x9.

10.2.672 DMA_CH7_INTERRUPT_ENABLE — Offset 14B4h

The Channeli Interrupt Enable register enables the interrupts reported by the Status register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14B4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW	**Normal Interrupt Summary Enable (NIE):** When this bit is set, the normal interrupt summary is enabled. This bit enables the following interrupts in the DMA_CH0_Status register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt When this bit is reset, the normal interrupt summary is disabled. 0x0 (DISABLE): Normal Interrupt Summary is disabled. 0x1 (ENABLE): Normal Interrupt Summary is enabled.
14	0h RW	**Abnormal Interrupt Summary Enable (AIE):** When this bit is set, the abnormal interrupt summary is enabled. This bit enables the following interrupts in the DMA_CH0_Status register: - Bit 1: Transmit Process Stopped - Bit 7: Rx Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 9: Receive Watchdog Timeout - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error When this bit is reset, the abnormal interrupt summary is disabled. 0x0 (DISABLE): Abnormal Interrupt Summary is disabled. 0x1 (ENABLE): Abnormal Interrupt Summary is enabled.
13	0h RW	**Context Descriptor Error Enable (CDEE):** When this bit is set along with the AIE bit, the Descriptor error interrupt is enabled. When this bit is reset, the Descriptor error interrupt is disabled. 0x0 (DISABLE): Context Descriptor Error is disabled. 0x1 (ENABLE): Context Descriptor Error is enabled.
12	0h RW	**Fatal Bus Error Enable (FBEE):** When this bit is set along with the AIE bit, the Fatal Bus error interrupt is enabled. When this bit is reset, the Fatal Bus Error error interrupt is disabled. 0x0 (DISABLE): Fatal Bus Error is disabled. 0x1 (ENABLE): Fatal Bus Error is enabled.
11	0h RW	**Early Receive Interrupt Enable (ERIE):** When this bit is set along with the NIE bit, the Early Receive interrupt is enabled. When this bit is reset, the Early Receive interrupt is disabled. 0x0 (DISABLE): Early Receive Interrupt is disabled. 0x1 (ENABLE): Early Receive Interrupt is enabled.
10	0h RW	**Early Transmit Interrupt Enable (ETIE):** When this bit is set along with the AIE bit, the Early Transmit interrupt is enabled. When this bit is reset, the Early Transmit interrupt is disabled. 0x0 (DISABLE): Early Transmit Interrupt is disabled. 0x1 (ENABLE): Early Transmit Interrupt is enabled.
9	0h RW	**Receive Watchdog Timeout Enable (RWTE):** When this bit is set along with the AIE bit, the Receive Watchdog Timeout interrupt is enabled. When this bit is reset, the Receive Watchdog Timeout interrupt is disabled. 0x0 (DISABLE): Receive Watchdog Timeout is disabled. 0x1 (ENABLE): Receive Watchdog Timeout is enabled.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**Receive Stopped Enable (RSE):** When this bit is set along with the AIE bit, the Receive Stopped Interrupt is enabled. When this bit is reset, the Receive Stopped interrupt is disabled. 0x0 (DISABLE): Receive Stopped is disabled. 0x1 (ENABLE): Receive Stopped is enabled.
7	0h RW	**Receive Buffer Unavailable Enable (RBUE):** When this bit is set along with the AIE bit, the Receive Buffer Unavailable interrupt is enabled. When this bit is reset, the Receive Buffer Unavailable interrupt is disabled. 0x0 (DISABLE): Receive Buffer Unavailable is disabled. 0x1 (ENABLE): Receive Buffer Unavailable is enabled.
6	0h RW	**Receive Interrupt Enable (RIE):** When this bit is set along with the NIE bit, the Receive Interrupt is enabled. When this bit is reset, the Receive Interrupt is disabled. 0x0 (DISABLE): Receive Interrupt is disabled. 0x1 (ENABLE): Receive Interrupt is enabled.
5:3	0h RO	**Reserved**
2	0h RW	**Transmit Buffer Unavailable Enable (TBUE):** When this bit is set along with the NIE bit, the Transmit Buffer Unavailable interrupt is enabled. When this bit is reset, the Transmit Buffer Unavailable interrupt is disabled. 0x0 (DISABLE): Transmit Buffer Unavailable is disabled. 0x1 (ENABLE): Transmit Buffer Unavailable is enabled.
1	0h RW	**Transmit Stopped Enable (TXSE):** When this bit is set along with the AIE bit, the Transmission Stopped interrupt is enabled. When this bit is reset, the Transmission Stopped interrupt is disabled. 0x0 (DISABLE): Transmit Stopped is disabled. 0x1 (ENABLE): Transmit Stopped is enabled.
0	0h RW	**Transmit Interrupt Enable (TIE):** When this bit is set along with the NIE bit, the Transmit Interrupt is enabled. When this bit is reset, the Transmit Interrupt is disabled. 0x0 (DISABLE): Transmit Interrupt is disabled. 0x1 (ENABLE): Transmit Interrupt is enabled.

10.2.673 DMA_CH7_RX_INTERRUPT_WATCHDOG_TIMER — Offset 14B8h

The Receive Interrupt Watchdog Timer register indicates the watchdog timeout for Receive Interrupt (RI) from the DMA. When this register is written with a non-zero value, it enables the watchdog timer for the RI bit of the DMA_CHi_Status register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14B8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17:16	0h RW	**Receive Interrupt Watchdog Timer Count Units (RWTU):** This fields indicates the number of system clock cycles corresponding to one unit in RWT field. - 2'b00: 256 - 2'b01: 512 - 2'b10: 1024 - 2'b11: 2048 For example, when RWT=2 and RWTU=1, the watchdog timer is set for 2*512=1024 system clock cycles.
15:8	0h RO	**Reserved**
7:0	00h RW	**Receive Interrupt Watchdog Timer Count (RWT):** This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. The watchdog timer is triggered with the programmed value after the Rx DMA completes the transfer of a packet for which the RI bit is not set in the DMA_CH(#i)_Status register, because of the setting of Interrupt Enable bit in the corresponding descriptor RDES3[30]. When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per the Interrupt Enable bit RDES3[30] of any received packet.

10.2.674 DMA_CH7_SLOT_FUNCTION_CONTROL_STATUS — Offset 14BCh

The Slot Function Control and Status register contains the control bits for slot function and the status for Transmit path.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14BCh	000007C0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19:16	0h RO	**Reference Slot Number (RSN):** This field gives the current value of the reference slot number in the DMA. It is used for slot comparison.
15:4	07Ch RW	**Slot Interval Value (SIV):** This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. A value of 0 specifies the slot interval of 1 us while the maximum value 4095 specifies the slot interval of 4096us. The default/reset value is 0x07C which corresponds to slot interval of 125us

Bit Range	Default & Access	Field Name (ID): Description
3:2	0h RO	**Reserved**
1	0h RW	**Advance Slot Check (ASC):** When set, this bit enables the DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the Tx descriptor is - equal to the reference slot number given in the RSN field or - ahead of the reference slot number by up to two slots This bit is applicable only when the ESC bit is set. 0x0 (DISABLE): Advance Slot Check is disabled. 0x1 (ENABLE): Advance Slot Check is enabled.
0	0h RW	**Enable Slot Comparison (ESC):** When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. The DMA fetches the data from the corresponding buffer only when the slot number is - equal to the reference slot number or - ahead of the reference slot number by one slot When reset, this bit disables the checking of the slot numbers. The DMA fetches the data immediately after the descriptor is processed. Note: The UFO (UDP Fragmentation over IPv4)/TSO/USO should not be enabled along with TBS/AVB Slot number check. The UFO/TSO/USO involves multiple packets/segments/fragments transmission for single packet received from application and the slot number check are applicable for fetching of only first segment/fragment. As a result it might be difficult for software to specify slot number for subsequent packets. 0x0 (DISABLE): Slot Comparison is disabled. 0x1 (ENABLE): Slot Comparison is enabled.

10.2.675 DMA_CH7_CURRENT_APP_TXDESC — Offset 14C4h

The Channeli Current Application Transmit Descriptor register points to the current Transmit descriptor read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14C4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Transmit Descriptor Address Pointer (CURTDESAPTR):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

10.2.676 DMA_CH7_CURRENT_APP_RXDESC — Offset 14CCh

The Channeli Current Application Receive Descriptor register points to the current Receive descriptor read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14CCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Receive Descriptor Address Pointer (CURRDESAPTR):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

10.2.677 DMA_CH7_CURRENT_APP_TXBUFFER_H — Offset 14D0h

The Channeli Current Application Transmit Buffer Address High register has the higher 8 or 16 bits of the current address of the Transmit buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14D0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO	**Application Transmit Buffer Address Pointer (CURTBUFAPTRH):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

10.2.678 DMA_CH7_CURRENT_APP_TXBUFFER — Offset 14D4h

The Channeli Current Application Transmit Buffer Address register points to the current Tx buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Transmit Buffer Address Pointer (CURTBUFAPTR):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

10.2.679 DMA_CH7_CURRENT_APP_RXBUFFER_H — Offset 14D8h

The Channeli Current Application Receive Buffer Address High register has the higher 8 or 16 bits of the current address of the Receive buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO	**Application Receive Buffer Address Pointer (CURRBUFAPTRH):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

10.2.680 DMA_CH7_CURRENT_APP_RXBUFFER — Offset 14DCh

The Channel 0 Current Application Receive Buffer Address register points to the current Rx buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14DCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Receive Buffer Address Pointer (CURRBUFAPTR):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

10.2.681 DMA_CH7_STATUS — Offset 14E0h

The software driver (application) reads the Status register during interrupt service routine or polling to determine the status of the DMA.

Note: The number of DMA_CH(#i)_Status register in the configuration is the higher of number of Rx DMA Channels and Tx DMA Channels.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14E0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21:19	0h RO	**Rx DMA Error Bits (REB):** This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 21 -- 1'b1: Error during data transfer by Rx DMA -- 1'b0: No Error during data transfer by Rx DMA - Bit 20 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 19 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
18:16	0h RO	**Tx DMA Error Bits (TEB):** This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 18 -- 1'b1: Error during data transfer by Tx DMA -- 1'b0: No Error during data transfer by Tx DMA - Bit 17 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 16 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
15	0h RW	**Normal Interrupt Summary (NIS):** Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in DMA_CH0_Interrupt_Enable register) affect the Normal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit which causes NIS to be set is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Normal Interrupt Summary status not detected. 0x1 (ACTIVE): Normal Interrupt Summary status detected.

Bit Range	Default & Access	Field Name (ID): Description
14	0h RW	**Abnormal Interrupt Summary (AIS):** Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Abnormal Interrupt Summary status not detected. 0x1 (ACTIVE): Abnormal Interrupt Summary status detected.
13	0h RW	**Context Descriptor Error (CDE):** This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Context Descriptor Error status not detected. 0x1 (ACTIVE): Context Descriptor Error status detected.
12	0h RW	**Fatal Bus Error (FBE):** This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Fatal Bus Error status not detected. 0x1 (ACTIVE): Fatal Bus Error status detected.
11	0h RW	**Early Receive Interrupt (ERI):** This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. In configs supporting ERIC, When ERIC=0, this bit is set only after the Rx DMA has filled up a complete receive buffer with packet data. When ERIC=1, this bit is set after every burst transfer of data from the Rx DMA to the buffer. The setting of RI bit automatically clears this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Receive Interrupt status not detected. 0x1 (ACTIVE): Early Receive Interrupt status detected.
10	0h RW	**Early Transmit Interrupt (ETI):** This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. In configs supporting ERIC: When ETIC=0, this bit is set only after the Tx DMA has transferred a complete packet to MTL. When ETIC=1, this bit is set after completion of (partial) packet data transfer from buffers in the Transmit descriptor in which IOC=1. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Transmit Interrupt status not detected. 0x1 (ACTIVE): Early Transmit Interrupt status detected.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**Receive Watchdog Timeout (RWT):** This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received. 0x0 (INACTIVE): Receive Watchdog Timeout status not detected. 0x1 (ACTIVE): Receive Watchdog Timeout status detected.
8	0h RW	**Receive Process Stopped (RPS):** This bit is asserted when the Rx process enters the Stopped state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Process Stopped status not detected. 0x1 (ACTIVE): Receive Process Stopped status detected.
7	0h RW	**Receive Buffer Unavailable (RBU):** This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode, the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Buffer Unavailable status not detected. 0x1 (ACTIVE): Receive Buffer Unavailable status detected.
6	0h RW	**Receive Interrupt (RI):** This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. The reception remains in the Running state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Interrupt status not detected. 0x1 (ACTIVE): Receive Interrupt status detected.
5:3	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Transmit Buffer Unavailable (TBU):** This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPS0 field of the DMA_Debug_Status0 register explains the Transmit Process state transitions. To resume processing the Transmit descriptors, the application should do the following: 1. Change the ownership of the descriptor by setting Bit 31 of TDES3. 2. Issue a Transmit Poll Demand command. For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Buffer Unavailable status not detected. 0x1 (ACTIVE): Transmit Buffer Unavailable status detected.
1	0h RW	**Transmit Process Stopped (TPS):** This bit is set when the transmission is stopped. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Process Stopped status not detected. 0x1 (ACTIVE): Transmit Process Stopped status detected.
0	0h RW	**Transmit Interrupt (TI):** This bit indicates that the packet transmission is complete. When transmission is complete, Bit 31 of TDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Interrupt status not detected. 0x1 (ACTIVE): Transmit Interrupt status detected.

10.2.682 DMA_CH7_MISS_FRAME_CNT — Offset 14E4h

This register has the number of packet counter that got dropped by the DMA either due to Bus Error or due to programming RPF field in DMA_CH${i}_Rx_Control register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Overflow status of the MFC Counter (MFCO):** When this bit is set then the MFC counter does not get incremented further. The bit gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Miss Frame Counter overflow not occurred. 0x1 (ACTIVE): Miss Frame Counter overflow occurred.
14:11	0h RO	**Reserved**
10:0	000h RO	**Dropped Packet Counters (MFC):** This counter indicates the number of packet counters that are dropped by the DMA either because of bus error or because of programing RPF field in DMA_CH${i}_Rx_Control register. The counter gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event.

10.2.683 DMA_CH7_RXP_ACCEPT_CNT — Offset 14E8h

The DMA_CH(#i)_RXP_Accept_Cnt registers provides the count of the number of frames accepted by Rx Parser.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14E8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Rx Parser Accept Counter Overflow Bit (RXPACOF):** When set, this bit indicates that the RXPAC Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Rx Parser Accept Counter overflow not occurred. 0x1 (ACTIVE): Rx Parser Accept Counter overflow occurred.
30:0	00000000h RO	**Rx Parser Accept Counter (RXPAC):** This 31-bit counter is implemented whenever a Rx Parser Accept a packet due to AF =1. The counter is cleared when the register is read.

10.2.684 DMA_CH7_RX_ERI_CNT — Offset 14ECh

The DMA_CH(#i)_RX_ERI_Cnt registers provides the count of the number of times ERI was asserted.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14ECh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11:0	000h RO	**ERI Counter (ECNT):** When ERIC bit of DMA_CH(#i)_RX_Control register is set, this counter increments for burst transfer completed by the Rx DMA from the start of packet transfer. This counter is reset at the start of new packet.

10.3 PHY Sublayer Registers Accessible via the MDIO Interface Controller

The Management Data Input/Output (MDIO) Interface is defined in IEEE Standard 802.3-2018:

Clause 22 – Chapter 22.2.4 of the IEEE standard specifies the MDIO interface and registers. The MAC device controlling the MDIO is called the Station Management (STA) entity. The STA issues MDIO frames that have the 2-bit, start-of-frame Symbol Time (ST) code of 01 to access registers. See Table below for the Clause 22 frame format and terminology.

Clause 45 – See Chapter 45 of the IEEE standard. This MDIO interface and register format are extensions to the two-signal MDIO Interface specified in Clause 22. For Clause 45, additional registers are added to the address space by defining MDIO frames that use a start-of-frame Symbol Time (ST) code of 00. See Table below for the Clause 45 frame format and terminology.

The TSN-GbE Controller supports both formats. The C45E bit (bit 1) of the MAC_MDIO_Address register at MMIO offset 200h can be programmed to select the Clause 22 or Clause 45 mode of operation of the STA for the particular MDIO frame. The C45E bit must be programmed to support the capability of the PHY that is connected to MDIO.

The PHY sublayer, or grouping of sublayers, is an individually manageable entity referred to as an MDIO Manageable Device (MMD).

Table 10-3. MDIO Clause 22 Management Frame Format

Operation	32-bit Preamble (1's)	Start of Frame (ST)	Operation Code (OP)	PHY Address (PHYAD)	PHY Register Address (REGAD)	2-Bit Turn-around (TA) Time	Data (16 bits)	High-Z (Idle)
Write	1111...1	01	01	AAAAA	RRRRR	10	16-bit Data to be written to the register	Z
Read	1111...1	01	10	AAAAA	RRRRR	Z0	16-bit Data read from the register	Z

For the Clause 22 frame, the PHY Address (PHYAD) selects one of 32 PHYs attached to the MDIO interface. The PHY Register Address (REGAD) selects one of 32 16-bit registers within each MMD.

Table 10-4. MDIO Clause 45 Management Frame Format

Operation	32-bit Preamble (1's)	Start of Frame (ST)	Operation Code (OP)	Port Address (PRTAD)	Device Address (DEVAD)	2-Bit Turn-around (TA) Time	Address /Data (16 bits)	High-Z (Idle)
Address	1111...1	00	00	PPPPP	EEEEE	Z0	16-bit Address of the register to be accessed on the next cycle	Z
Write	1111...1	00	01	PPPPP	EEEEE	Z0	16-bit Data to be written to the register	Z
Post-Read-Increment Address	1111...1	00	10	PPPPP	EEEEE	Z0	16-bit Data read from the register	Z
Read	1111...1	00	11	PPPPP	EEEEE	Z0	16-bit Data read from the register	Z

For the Clause 45 frame, the Port Address (PRTAD) selects one of 32 Ports attached to the MDIO interface. The Device Address (DEVAD) selects one of 32 unique MDDs per Port. Notice that the register address and register data are separate MDIO frames.

10.3.1 MDIO – PCS PHY Sublayer Registers – PHY Port Address 16h

The MAC uses the GMII as the data interface to the PHY sublayers of the Ethernet LAN Controller including the Physical Coding Sublayer (PCS). The MAC uses the MDIO as the configuration and management interface to the PHY sublayers. This section describes the PCS MDIO registers which follow the IEEE 802.3 standard register sets for the different MMIO Management Devices (MMD).

The PCS PHY sublayer is an IEEE Std 802.3 Clause-45-capable MDIO entity with the following IEEE 802.3 MDIO frame fields:

- Start-of-Frame Symbol Time (ST) 2-bit code: 00b – Indicates a Clause 45 MDIO frame.
- Port Address (PRTAD) 5-bit ID: 10110b (16h) – This Port contains two MMDs:

- MMD (DEVAD) 5-bit ID: 11110b (1Eh) – Vendor-Specific MMD with 65,535 addressable 16-bit registers. The valid register addresses range from 0000h though 000Fh. This MMD is named Vendor-Specific 1 (Control MMD). The registers are used to control the other MMDs of the LAN Controller.
- MMD (DEVAD) 5-bit ID: 11111b (1Fh) – Vendor-Specific MMD with 65,535 addressable 16-bit registers. The valid register addresses range from 0000h though 0E2h. This MMD is named Vendor-Specific MII MMD (VR MII MMD).

Table 10-5. Summary of PCS MDIO Registers, PRTAD = 16h, DEVAD = 1Eh

Register Address (Hex)	Data Size (Bits)	Register Name (Register Symbol)	Default Value [15:0]
0000	16	SR Control MMD PMA Device Identifier Register 1 (SR_VSMMD_PMA_ID1)	0000h
0001	16	SR Control MMD PMA Device Identifier Register 2 (SR_VSMMD_PMA_ID2)	0000h
0002	16	SR Control MMD Device Identifier Register 1 (SR_VSMMD_DEV_ID1)	0000h
0003	16	SR Control MMD Device Identifier Register 2 (SR_VSMMD_DEV_ID2)	000h
0004	16	SR Control MMD PCS Device Identifier Register 1 (SR_VSMMD_PCS_ID1)	7996h
0005	16	SR Control MMD PCS Device Identifier Register 2 (SR_VSMMD_PCS_ID2)	CED0h
0006	16	SR Control MMD AN Device Identifier Register 1 (SR_VSMMD_AN_ID1)	0000h
0007	16	SR Control MMD AN Device Identifier Register 2 (SR_VSMMD_AN_ID2)	0000h
0008	16	SR Control MMD Status Register (SR_VSMMD_STS)	8000h
0009	16	SR Control MMD Control Register (SR_VSMMD_CTRL)	0004h
000E	16	SR Control MMD Package Identifier Register 1 (SR_VSMMD_PKGID1)	0000h
000F	16	SR Control MMD Package Identifier Register 2 (SR_VSMMD_PKGID2)	0000h

Table 10-6. Summary of PCS MDIO Registers, PRTAD = 16h, DEVAD = 1Fh

Register Address (Hex)	Data Size (Bits)	Register Name (Register Symbol)	Default Value [15:0]
0000	16	SR MII MMD Control Register (SR_MII_CTRL)	1140h
0001	16	SR MII MMD Status Register (SR_MII_STS)	0189h
0002	16	SR MII MMD Device Identifier Register 1 (SR_MII_DEV_ID1)	7996h
0003	16	SR MII MMD Device Identifier Register 2 (SR_MII_DEV_ID2)	CED0h
0004	16	SR MII MMD AN Advertisement Register (SR_MII_AN_ADV)	0020h
0005	16	SR MII MMD AN Link Partner Base Ability Register (SR_MII_LP_BABL)	0000h

Table 10-6. Summary of PCS MDIO Registers, PRTAD = 16h, DEVAD = 1Fh

Register Address (Hex)	Data Size (Bits)	Register Name (Register Symbol)	Default Value [15:0]
0006	16	SR MII MMD AN Expansion Register (SR_MII_AN_EXPN)	0000h
000F	16	SR MII MMD Extended Status Register (SR_MII_EXT_STS)	C000h
0708	16	SR MII MMD Time Sync Capability Register (SR_MII_TIME_SYNC_ABL)	0003h
0709	16	SR MII MMD Time Sync Tx Max Delay Lower Register (SR_MII_TIME_SYNC_TX_MAX_DLY_LWR)	0038h
070A	16	SR MII MMD Time Sync Tx Max Delay Upper Register (SR_MII_TIME_SYNC_TX_MAX_DLY_UPR)	0000h
070B	16	SR MII MMD Time Sync Tx Min Delay Lower Register (SR_MII_TIME_SYNC_TX_MIN_DLY_LWR)	0038h
070C	16	SR MII MMD Time Sync Tx Min Delay Upper Register (SR_MII_TIME_SYNC_TX_MIN_DLY_UPR)	0000h
070D	16	SR MII MMD Time Sync Rx Max Delay Lower Register (SR_MII_TIME_SYNC_RX_MAX_DLY_LWR)	00B8h
070E	16	SR MII MMD Time Sync Rx Max Delay Upper Register (SR_MII_TIME_SYNC_RX_MAX_DLY_UPR)	0000h
070F	16	SR MII MMD Time Sync Rx Min Delay Lower Register (SR_MII_TIME_SYNC_RX_MIN_DLY_LWR)	0088h
0710	16	SR MII MMD Time Sync Rx Min Delay Upper Register (SR_MII_TIME_SYNC_RX_MIN_DLY_UPR)	0000h
8000	16	VR MII MMD Digital Control1 Register (VR_MII_DIG_CTRL1)	2400h
8001	16	VR MII MMD AN Control Register (VR_MII_AN_CTRL)	0000h
8002	16	VR MII MMD AN Interrupt and Status Register (VR_MII_AN_INTR_STS)	000Ah
8003	16	VR MII MMD Test Control Register (VR_MII_TC)	0000h
8005	16	VR MII MMD Debug Control Register (VR_MII_DBG_CTRL)	0000h
8006	16	VR MII MMD EEE Mode Control Register (VR_MII_EEE_MCTRL0)	899Ch
8008	16	VR MII MMD EEE Tx Timer Register (VR_MII_EEE_TXTIMER)	0000h
8009	16	VR MII MMD EEE Rx Timer Register (VR_MII_EEE_RXTIMER)	0000h
800A	16	VVR MII MMD Link Timer Control Register (VR_MII_LINK_TIMER_CTRL)	0000h
800B	16	VR MII MMD EEE Mode Control 1 Register (VR_MII_EEE_MCTRL1)	0000h
8010	16	VR MII MMD Digital Status Register (VR_MII_DIG_STS)	0000h
8011	16	VR MII MMD Invalid Code Group Error Count1 Register (VR_MII_ICG_ERRCNT1)	0000h
8018	16	VR MII MMD Miscellaneous Status Register (VR_MII_MISC_STS)	0000h
8020	16	VR MII PHY Rx Lane Status Register (VR_MII_RX_LSTS)	0000h
80E1	16	VR MII MMD Digital Control2 Register (VR_MII_DIG_CTRL2)	0000h
80E2	16	VR MII MMD Digital Error Count Select Register (VR_MII_DIG_ERRCNT_SEL)	0000h

10.3.1.1 SR Control MMD PMA Device Identifier Register 1 (SR_VSMMD_PMA_ID1) - 1Eh, Address 0000h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Eh** **Register Address: 0000h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RO	0000h	Reserved

10.3.1.2 SR Control MMD PMA Device Identifier Register 2 (SR_VSMMD_PMA_ID2) - 1Eh, Address 0001h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Eh** **Register Address: 0001h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RO	0000h	Reserved

10.3.1.3 SR Control MMD Device Identifier Register 1(SR_VSMMD_DEV_ID1) - 1Eh, Address 0002h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Eh** **Register Address: 0002h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RW	0000h	Organizationally Unique Identifier [3:18] for Vendor-Specific MMD1 (VSDOUI_3_18): Bits 18:3 of the 24-bit Device Organizationally Unique Identifier (OUI) for the vendor-specific MMD1 for identifying the device manufacturer.

10.3.1.4 SR Control MMD Device Identifier Register 2 (SR_VSMMD_DEV_ID2) - 1Eh, Address 0003h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Eh** **Register Address: 0003h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:10	RW	00h	Organizationally Unique Identifier[19:24] for Vendor-Specific MMD1 (VSDOUI_19_24): Bits 24:19 of the 24-bit Device Organizationally Unique Identifier (OUI) for the vendor-specific MMD1 for identifying the device manufacturer.
9:4	RW	00h	Model Number for Vendor-Specific MMD1 (VSDMMN_5_0): 6-bit Model number of the vendor-specific MMD1.
3:0	RW	0h	Revision Number for Vendor-Specific MMD1 (VSDRN_3_0): 4-bit Revision number of the vendor-specific MMD1.

10.3.1.5 SR Control MMD PCS Device Identifier Register 1 (SR_VSMMD_PCS_ID1) - 1Eh, Address 0004h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Eh** **Register Address: 0004h**

Default: 7996h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RW	7996h	Organizationally Unique Identifier[3:18] for PCS MMD (PCSDOUI_3_18): Bits 18:3 of the 24-bit Device Organizationally Unique Identifier (OUI) for the vendor-specific PCS MMD for identifying the device manufacturer.

10.3.1.6 SR Control MMD PCS Device Identifier Register 2 (SR_VSMMD_PCS_ID2) - 1Eh, Address 0005h

This register is RW by software via the MDIO interface. The 24-bit Device Organizationally Unique Identifier (OUI) is default-set to CDA679h. The Model Number default value is 2Dh and the Revision Number default is 0.SR Control MMD AN Device.

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Eh** **Register Address: 0005h**

Default: CED0h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:10	RW	33h	Organizationally Unique Identifier[19:24] for PCS MMD (PCSDOUI_19_24): Bits 24:19 of the 24-bit Device Organizationally Unique Identifier (OUI) for the vendor-specific PCS MMD for identifying the device manufacturer.
9:4	RW	2Dh	Model Number for PCS MMD (PCSDMMN_5_0): 6-bit Model number of the vendor-specific PCS MMD.
3:0	RW	0h	Revision Number for PCS MMD (PCSDRN_3_0): 4-bit Revision number of the vendor-specific PCS MMD.

10.3.1.7 SR Control MMD AN Device Identifier Register 1 (SR_VSMMD_AN_ID1) - 1Eh, Address 0006h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Eh** **Register Address: 0006h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RW	0000h	Organizationally Unique Identifier [3:18] for Vendor-Specific MMD1 (VSDOUI_3_18): Bits 18:3 of the 24-bit Device Organizationally Unique Identifier (OUI) for the vendor-specific MMD1 for identifying the device manufacturer.

10.3.1.8 SR Control MMD AN Device Identifier Register 2 (SR_VSMMD_AN_ID2) - 1Eh, Address 0007h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Eh** **Register Address: 0007h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RO	0000h	Reserved

10.3.1.9 SR Control MMD Status Register (SR_VSMMD_STS) - 1Eh, Address 0008h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Eh** **Register Address: 0008h**

Default: 8000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:14	RO/V	10b	Control MMD Device Present (VSDP): This field indicates if the control MMD device is present and responding to this address: 10: Device responding at this address 11, 01, or 00: No device responding at this address
13:0	RO	0000h	Reserved

10.3.1.10 SR Control MMD Control Register (SR_VSMMD_CTRL) - 1Eh, Address 0009hSR Control MMD

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Eh** **Register Address: 0009h**

Default: 0004h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:6	RO	0000h	Reserved
5	RW	0b	Power Down Control (PD_CTRL): This bit is used to control the output port 'xpcs_pdown_o'. If this bit is set, xpcs_pdown_o port will NOT be asserted when LPM (Low Power Enable) bit is programmed to 1. If this bit is low, xpcs_down_o port will be asserted when LPM (Low Power Enable) bit is programmed to 1.
4	RW	0b	Fast Simulation Enable (FASTSIM): When set, this bit indicates that the Fast simulation is enabled. When this bit is set to 1, all IEEE Std 802.3 defined long timers that are implemented are reduced to shorter time period in order to reduce the simulation time. The long timers are implemented in Clause 73 and Clause 37 auto-negotiation modules and also EEE Tx and Rx modules.
3	RO	0b	Reserved
2	RW	1b	VS MMD Enable (MII_MMD_EN): When set, this bit indicates that the vendor-specific MMD1 device is accessible. When reset, this bit indicates that the vendor-specific MMD2 (MII MMD) device is not accessible.
1:0	RO	00b	Reserved

10.3.1.11 SR Control MMD Package Identifier Register 1 (SR_VSMMD_PKGID1) - 1Eh, Address 000Eh

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Eh** **Register Address: 000Eh**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RO	00h	Reserved

10.3.1.12 SR Control MMD Package Identifier Register 2 (SR_VSMMD_PKGID2) - 1Eh, Address 000Fh

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Eh** **Register Address: 000Fh**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RO	00h	Reserved

10.3.1.13 SR MII MMD Control Register (SR_MII_CTRL) - 1Fh, Address 0000h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 0000h**

Default: 1140h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15	RW	0b	Soft Reset (RST): When the host sets this bit, it triggers the software reset process in which all internal blocks of the PCS are reset, except the Management Interface block. The registers are reset to their default values. When this bit is set, it also resets the PHY. This bit is Self-Cleared by the PCS after 1 MDC clock period of the MDIO interface.
14	RW	0b	Loopback Enable (LBE): This register bit is not used by the design.
13	RW	0b	Speed Selection - LSB (SS13): This bit, along with SS6 (bit 6) of this register, indicates the SGMII speed: SS6 SS13 SGMII Speed 1 0 1000 Mbps 0 1 100 Mbps 0 0 10 Mbps
12	RW	1b	Enable Auto-Negotiation (AN_ENABLE): When set to 1, this bit enables the Clause 37 auto-negotiation process. Default setting is 1.
11	RW	0b	Power-Down Mode (LPM): This bit controls the power-down mode of the PCS. When 0, the PCS operates as normal. When 1, the PCS goes to the Power-Down Mode and clearing this bit resumes PCS normal operation.
10	RO	0b	Reserved
9	RW	0b	Restart Auto-Negotiation (RESTART_AN): When the host writes this bit, the PCS initiates the Auto-Negotiation process. This bit is used to restart the Auto-Negotiation which is already initiated by setting AN_ENABLE (bit 12). The PCS clears this bit after restarting the Auto-Negotiation.
8	RW	1b	Duplex Mode (DUPLEX_MODE): This bit specifies the duplex mode of the PCS. Programming to 0 indicates Half Duplex and 1 (the default value) indicates Full Duplex. For the PHY Link Duplex Mode: If AN_ENABLE (bit 12) is set to 0, this bit determines the PHY Link Duplex Mode. If AN_ENABLE is set to 1, then the PHY Link Duplex Mode is independent of this bit (although the host can write any value) and is determined by the outcome of the Clause 37 Auto-Negotiation process.
7	RO	0b	Reserved
6	RW	1b	Speed Selection – MSB (SS6): This bit, along with SS13 (bit 23) of this register, indicates the SGMII speed. Default value is 1. See SS13 description.
5:0	RO	000000b	Reserved

10.3.1.14 SR MII MMD Status Register (SR_MII_STS) - 1Fh, Address 0001h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 0001h**

Default: 0189h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15	RO	0b	100BASE-T4 Ability (ABL100T4): Not supported. Hardwired to 0.
14	RO	0b	100BASE-X Full-Duplex Ability (FD100ABL): Not supported. Hardwired to 0.
13	RO	0b	100BASE-X Half-Duplex Ability (HD100ABL): Not supported. Hardwired to 0.
12	RO	0b	10 Mbps Full-Duplex Ability (FD10ABL): Not supported. Hardwired to 0.
11	RO	0b	10 Mbps Half-Duplex Ability (HD10ABL): Not supported. Hardwired to 0.
10	RO	0b	100BASE-T2 Full-Duplex Ability (FD100T): Not supported. Hardwired to 0.
9	RO	0b	100BASE-T2 Half-Duplex Ability (HD100T): Not supported. Hardwired to 0.
8	RO/V	1b	Extended Status Information (EXT_STS_ABL): Hardwired to 1 indicating that Extended Status information is present at register address 16'h000F of this MMD device (DEVAD 1Fh).
7	RO	1b	Unidirectional Ability (UN_DIR_ABL): Hardwired to 1 indicating that the PCS is able to transmit GMII irrespective of whether the device has determined the valid link or not.
6	RO	0b	MF Preamble Suppression (MF_PRE_SUP): Hardwired to 0 indicating that The PCS does not accept the MDIO frames with the preamble suppressed.
5	RO	0b	Auto-negotiation Complete (AN_CMPL): When this bit is set to 1, the contents of the AN MMD Advertisement, AN MMD Link partner Ability, and AN MMD Expansion registers are valid. This bit returns 0 if AN_ENABLE is set to 0.
4	RO	0b	Remote Fault (RF): When set to 1, this bit indicates that the PCS detected that the receive link of the link partner is down. This bit is set based on the auto-negotiated (1000BASE-X Auto-Negotiation) information from the link partner. When 0, this bit indicates that the PCS did not detect a Remote Fault.
3	RO	1b	Auto-negotiation Ability (AN_ABL): The PCS always returns this bit as 1 indicating that the PCS is able to perform Auto-Negotiation.
2	RO	0b	Link Status (LINK_STS): When the PCS sets this bit to 1, it indicates that the Rx link is up. If the link goes down, as indicated by 0, this bit is latched by the PCS until the host performs the read operation to this register.
1	RO	0b	Reserved
0	RO	1b	Extended Register Capability (EXT_REG_CAP): The PCS always returns this bit as 1 indicating that the Extended Register Capability exists.

10.3.1.15 SR MII MMD Device Identifier Register 1 (SR_MII_DEV_ID1) - 1Fh, Address 0002h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 0002h**

Default: 7996h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RO/V	7996h	Organizationally Unique Identifier[3:18] for PCS MMD (VS_MII_DEV_OUI_3_18): Bits 18:3 of the 24-bit Device Organizationally Unique Identifier (OUI) of the device manufacturer. Writing to bits 15:0 of the vendor-specific PCS MMD Device Identifier Register 1 (SR_VSMMD_PCS_ID1) modifies the content of this register.

10.3.1.16 SR MII MMD Device Identifier Register 2 (SR_MII_DEV_ID2) - 1Fh, Address 0003h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 0003h**

Default: CED0h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:10	RO/V	33h	Organizationally Unique Identifier [19:24] (VS_MMD_DEV_OUI_19_24): Bits 24:19 of the 24-bit Device Organizationally Unique Identifier (OUI) of the device manufacturer. Writing to bits 15:0 of the vendor-specific PCS MMD Device Identifier Register 2 (SR_VSMMD_PCS_ID2) modifies the content of this register.
9:4	RO/V	2Dh	Model Number (VS_MMD_DEV_MMN_5_0): 6-bit Model number of the vendor-specific PCS MMD. Writing to bits 9:4 of the vendor-specific PCS MMD Device Identifier Register 2 (SR_VSMMD_PCS_ID2) modifies the content of this register.
3:0	RO/V	0h	Revision Number (VS_MMD_DEV_RN_3_0): 4-bit Revision number of the vendor-specific PCS MMD. Writing to bits 3:0 of the vendor-specific PCS MMD Device Identifier Register 2 (SR_VSMMD_PCS_ID2) modifies the content of this register.

10.3.1.17 SR MII MMD AN Advertisement Register (SR_MII_AN_ADV) - 1Fh, Address 0004h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 0004h**

Default: 0020h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15	RO/V	0b	Next Page (NP): Not supported. Hardwired to 0.
14	RO	0b	Reserved
13:12	RW	00b	Remote Fault (RF): This field indicates the fault signaling of the local device to be communicated to the link partner. 00: No Error 01: Offline 10: Link Failure 11: Auto-negotiation Error
11:9	RO	000b	Reserved
8:7	RW	00b	Pause Ability (PAUSE): This field indicates the Pause ability of the device: 00: No Pause 01: Asymmetric Pause towards the link partner 10: Symmetric Pause 11: Symmetric Pause and Asymmetric Pause towards the local device. Software can program suitable values based on the capability of the MAC.
6	RW	0b	Half Duplex (HD): When this bit is set, it indicates that the device can operate in the half-duplex mode.
5	RW	1b	Full Duplex (FD): When this bit is set, it indicates that the device can operate in the full-duplex mode.
4:0	R0	00000b	Reserved

10.3.1.18 SR MII MMD AN Link Partner Base Ability Register (SR_MII_LP_BABL) - 1Fh, Address 0005h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 0005h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15	RO/V	0b	Next Page (LP_NP): This bit indicates that the link partner can handle Next Page. Note: To exchange information through Next Page, both devices (local and remote) should have the capability to handle Next Page. The PCS does not support Next Page. Therefore, the Next Page exchange does not happen.
14	RO/V	0b	ACK bit from the Link Partner (LP_ACK): This bit indicates that the link partner has successfully received the page sent by the local device.
13:12	RO/V	00b	Remote Fault (LP_RF): This field indicates the fault signaling of the link partner: 00: No Error 01: Offline 10: Link Failure 11: Auto-negotiation Error
11:9	RO	000b	Reserved
8:7	RO/V	00b	Pause Ability (LP_PAUSE): This field indicates the Pause ability of the link partner: 00: No Pause 01: Asymmetric Pause towards the link partner 10: Symmetric Pause 11: Both Symmetric Pause and Asymmetric Pause towards the local device
6	RO/V	0b	Half Duplex (LP_HD): When this bit is set, it indicates that the link partner is capable of operating in the half-duplex mode.
5	RO/V	0b	Full Duplex (LP_FD): When this bit is set, it indicates that the link partner is capable of operating in the full-duplex mode.
4:0	RO	00000b	Reserved

10.3.1.19 SR MII MMD AN Expansion Register (SR_MII_AN_EXPN) - 1Fh, Address 0006h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 0006h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:3	RO	00h	Reserved
2	RO/V	00h	Local Device NP Able (LD_NP_ABL): The local device (the PCS) always returns this bit as 0 because it does not support Next Page.
1	RO/V	00h	Page Received (PG_RCVD): This bit indicates that the local device (the PCS) received a page from the link partner. 1: The local device received a new page 0: The local device did not receive a new page
0	RO	00h	Reserved

10.3.1.20 SR MII MMD Extended Status Register (SR_MII_EXT_STS) - 1Fh, Address 000Fh

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 000Fh**

Default: C000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15	RO/V	1b	1000BASE-X Full-Duplex Capable (CAP_1G_X_FD): The PCS always returns 1 because it supports this feature.
14	RO/V	1b	1000BASE-X Half-Duplex Capable (CAP_1G_X_HD): The PCS always returns 1 because it supports this feature.
13	RO/V	0b	1000BASE-T Full-Duplex Capable (CAP_1G_T_FD): The PCS always returns 0 because it does not supports this feature.
12	RO/V	0b	1000BASE-T Half-Duplex Capable (CAP_1G_T_HD): The PCS always returns 0 because it does not supports this feature.
11:0	RO	000h	Reserved

10.3.1.21 SR MII MMD Time Sync Capability Register (SR_MII_TIME_SYNC_ABL) - 1Fh, Address 0708h

Type: MDIO Register PRTAD: 16h DEVAD: 1Fh Register Address: 0708h

Default: 0003h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:2	RO	00h	Reserved
1	RO/V	1b	1000BASE-X Half-Duplex Capable (CAP_1G_X_HD): The PCS always returns 1 because it supports this feature.
0	RO/V	1b	1000BASE-T Full-Duplex Capable (CAP_1G_T_FD): The PCS always returns 0 because it does not supports this feature.

10.3.1.22 SR MII MMD Time Sync Tx Max Delay Lower Register (SR_MII_TIME_SYNC_TX_MAX_DLY_LWR) - 1Fh, Address 0709h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 0709h**

Default: 0038h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RO/V	38h	Transmit Path Maximum Data Delay, Lower (MII_TX_MAX_DLY_LWR): This field indicates the lower 16-bit of the 32-bit value which indicates the Maximum Data Delay in the Transmit Path of the XPCS in nanoseconds.

10.3.1.23 SR MII MMD Time Sync Tx Max Delay Upper Register (SR_MII_TIME_SYNC_TX_MAX_DLY_UPR) - 1Fh, Address 070Ah

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 070Ah**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RO/V	00h	Transmit Path Maximum Data Delay, Upper (MII_TX_MAX_DLY_UPR): This field indicates the upper 16-bit of the 32-bit value which indicates the Maximum Data Delay in the Transmit Path of the XPCS in nanoseconds.

10.3.1.24 SR MII MMD Time Sync Tx Min Delay Lower Register (SR_MII_TIME_SYNC_TX_MIN_DLY_LWR) - 1Fh, Address 070Bh

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 070Bh**

Default: 0038h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RO/V	38h	Transmit Path Minimum Data Delay, Lower (MII_TX_MIN_DLY_LWR): This field indicates the lower 16-bit of the 32-bit value which indicates the Minimum Data Delay in the Transmit Path of the XPCS in nanoseconds.

10.3.1.25 SR MII MMD Time Sync Tx Min Delay Upper Register (SR_MII_TIME_SYNC_TX_MIN_DLY_UPR) - 1Fh, Address 070Ch

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 070Ch**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RO/V	00h	Transmit Path Minimum Data Delay, Upper (MII_TX_MIN_DLY_UPR): This field indicates the upper 16-bit of the 32-bit value which indicates the Minimum Data Delay in the Transmit Path of the XPCS in nanoseconds.

10.3.1.26 SR MII MMD Time Sync Rx Max Delay Lower Register (SR_MII_TIME_SYNC_RX_MAX_DLY_LWR) - 1Fh, Address 070Dh

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 070Dh**

Default: 00B8h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RO/V	B8h	Receive Path Maximum Data Delay, Lower (MII_RX_MAX_DLY_LWR): This field indicates the lower 16-bit of the 32-bit value which indicates the Maximum Data Delay in the Receive Path of the XPCS in nanoseconds.

10.3.1.27 SR MII MMD Time Sync Rx Max Delay Upper Register (SR_MII_TIME_SYNC_RX_MAX_DLY_UPR) - 1Fh, Address 070Eh

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 070Eh**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RO/V	00h	Receive Path Maximum Data Delay, Upper (MII_RX_MAX_DLY_UPR): This field indicates the upper 16-bit of the 32-bit value which indicates the Maximum Data Delay in the Receive Path of the XPCS in nanoseconds.

10.3.1.28 SR MII MMD Time Sync Rx Min Delay Lower Register (SR_MII_TIME_SYNC_RX_MIN_DLY_LWR) - 1Fh, Address 070Fh

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 070Fh**

Default: 0088h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RO/V	88h	Receive Path Minimum Data Delay, Lower (MII_RX_MIN_DLY_LWR): This field indicates the lower 16-bit of the 32-bit value which indicates the Minimum Data Delay in the Receive Path of the XPCS in nanoseconds.

10.3.1.29 SR MII MMD Time Sync Rx Min Delay Upper Register (SR_MII_TIME_SYNC_RX_MIN_DLY_UPR) - 1Fh, Address 0710h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 0710h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RO/V	00h	Receive Path Minimum Data Delay, Upper (MII_RX_MIN_DLY_UPR): This field indicates the upper 16-bit of the 32-bit value which indicates the Minimum Data Delay in the Receive Path of the XPCS in nanoseconds.

10.3.1.30 VR MII MMD Digital Control1 Register (VR_MII_DIG_CTRL1) - 1Fh, Address 8000h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 8000h**

Default: 2400h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15	RW	0b	Vendor-Specific Soft Reset (VR_RST): When the host sets this bit, it triggers a vendor-specific software reset process in which all internal blocks of the PCS, except the Management Interface block and CSR block, are reset. When this bit is set, it also resets the PHY. This bit is Self-Cleared by the PCS after 1 MDC clock period for the MDIO interface.
14	RW	0b	Rx to Tx Loopback Enable (R2TLBE): This bit controls the loopback path from the GMII Rx to the GMII Tx at the GMII interface. 0: Loopback path is disabled 1: Loopback path is enabled
13	RW	1b	Enable Vendor-Specific MMD1 (EN_VSMMD1): When this bit is set to 1 (default value), the vendor-specific MMD1 (VSMMD1) is enabled. When this bit is set to zero, VSMMD1 is disabled.
12	RO/V	0b	Enable Clause 37 AN in Backplane Configuration (CL37_BP): Does not apply.
11	RO	0b	Reserved

Bits	Access Type	Default	Field Name and Description
10	RW	1b	Clock Stop Enable (CS_EN): This bit should be programmed based on the capability of the MAC during Rx LPI mode. Programming this bit to 1 allows the PHY to stop the clock during LPI mode. Programming to 0, the clock cannot be stopped during LPI mode.
9	RW	0b	Automatic Speed Mode Change after CL37 AN (MAC_AUTO_SW): When this field is set to 1, the PCS automatically switches to the negotiated SGMII after the completion of CL37 AN. This mode is valid only when the PCS is configured as MAC-side SGMII and should be set only when Auto-Negotiation is enabled (AN_ENABLE bit is set to 1). If this bit is set to 0, the PCS will operate at the speed/duplex mode as per the values programmed to SR MII MMD Control Register. After the completion of CL37 AN, the application has to read the negotiated Speed/Duplex Mode from VR MII MMD AN Interrupt and Status Register and then program SR MII MMD Control Register appropriately. Note: This bit should be set only when the PCS is configured as SGMII MAC, i.e., TX_CONFIG=0.
8	RW	0b	Datapath Initialization Control (INIT): This bit can be set to flush/initialize the various FIFOs implemented inside the PCS. This is Self-Clear bit. After writing 1 to this bit, software should poll this bit continuously. Only after reading this bit as 0 should software proceed to any other operation. When this bit is programmed to 1, RXFIFO_OVF/RXFIFO_UNF bits of the VR MII MMD Digital Status Register might get set incorrectly. Hence, read these register bits (RXFIFO_OVF and RXFIFO_UNF) so that they get cleared. Thereafter, RXFIOF_UNF and RXFIFO_UNF bits would be reliable.
7	RO/V	0b	Mask Running Disparity Error (MSK_RD_ERR): When this bit is set, running disparity errors are ignored by XPCS receiver in evaluating the validity of received code-groups.
6	RW	0b	Pre-emption Packet Enable (PRE_EMP): When this bit is set, it allows the XPCS to properly receive/transmit IEEE Std 802.3br pre-emption packets in SGMII 10M/100M Modes.
5	RO	0b	Reserved
4	RW	0b	Tx Lane 0 Disable (DTXLANED_0): When this bit is set, the PCS disables the Tx Lane 0 of the PHY. When reset, the PCS enables the Tx Lane 0 of the PHY.
3	RW	0b	Over-Ride Control for CL37 Link Timer (CL37_TMR_OVR_RIDE): This bit can be set to over-ride the default value of Clause 37 link timer used by the PCS for auto-negotiation. If this bit is set, the value programmed to the VR MII MMD Link Timer Control Register will be used to compute the duration of Link Timer. This bit should be set only after programming the appropriate value to the VR MII MMD Link Timer Control Register.

Bits	Access Type	Default	Field Name and Description
2	RW	0b	Enable 2.5G GMII Mode (EN_2_5G_MODE): Setting this bit 1 enables the 2.5G GMII Mode of operation. This bit drives the hardware pertaining to 2.5 Gbps SGMII operation.
1	RO	0b	Reserved
0	RW	0b	SGMII PHY Mode Control (PHY_MODE_CTRL): This bit controls the CL37_AN when operating in SGMII (Port 0) PHY mode. When this bit is set to 1, the PCS advertises the values of input ports xpcs_sgmii_link_sts_i, xpcs_sgmii_link_speed_i and xpcs_sgmii_full_duplex_i during SGMII (Port 0) Auto-Negotiation. When this bit is set to 0, SGMII (Port0) Auto-Negotiation will advertise the values programmed to all of these: SGMII_LINK_STS (bit 4) of the VR MII MMD AN Control Register SS13 (bit 13) and SS6 (bit 6) of the SR MII MMD Control Register FD (bit 5) of the SR MII MMD AN Advertisement Register Note: This bit should be set only when the PCS is configured as SGMII PHY, i.e., TX_CONFIG (bit 3 of the VR_MII_AN_CTRL register) = 1.

10.3.1.31 VR MII MMD AN Control Register (VR_MII_AN_CTRL) - 1Fh, Address 8001h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 8001h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:9	RO	00h	Reserved
8	RO/V	0b	MII Control (MII_CTRL): This bit controls the width of the MAC interface when operating at SGMII speed modes of 10 Mbps or 100 Mbps. 0: 4-bit MII 1: 8-bit MII
7:5	RO	000b	Reserved
4	RW	0b	SGMII Link Status (SGMII_LINK_STS): This bit is used in Bit 15 of the Config_Reg during IEEE 802.3 Clause 37 Auto-Negotiation when the TX_CONFIG bit of this register is set to 1 in the SGMII/QSGMII/USXGMII mode and when the PHY_MODE_CTRL bit of VR MII MMD Digital Control 1 Register is 0. 0: Link Down 1: Link Up

Bits	Access Type	Default	Field Name and Description
3	RW	0b	Transmit Configuration (TX_CONFIG): This bit controls the Config_Reg value to be used during the IEEE 802.3 Clause 37 Auto-Negotiation in the SGMII/QSGMII/USXGMII mode. 1: Configures the PCS as the PHY side SGMII/QSGMII/USXGMII 0: Configures the PCS as the MAC side SGMII/QSGMII/USXGMII
2:1	RW	00b	PCS Mode (PCS_MODE): This field controls the auto-negotiation (and operating) mode. 00: 1000BASE-X mode (Clause 37 Auto-Negotiation is as per 1000BASEX). 10: SGMII mode (Clause 37 Auto-Negotiation is as per SGMII). 11: QSGMII mode (Clause 37 Auto-Negotiation conforms to QSGMII). Note: The default value is 00. Must be programmed to 10 for SGMII-mode Auto-Negotiation.
0	RW	0b	Clause 37 AN Complete Interrupt Enable (MII_AN_INTR_EN): When set to 1, this bit enables the generation of the IEEE 802.3 Clause 37 Auto-Negotiation Complete interrupt output. When set to 0, it disables the generation of Clause 37 Auto-Negotiation Complete interrupt.

10.3.1.32 VR MII MMD AN Interrupt and Status Register (VR_MII_AN_INTR_STS) - 1Fh, Address 8002h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 8002h**

Default: 000Ah Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:5	RO	000h	Reserved
4:1	RO/V	5h	Clause 37 AN SGMII Status/QSGMII Port 0 Status (CL37_ANSGM_STS): This field is valid only when the PCS_MODE[1:0] is set to the SGMII/QSGMII mode and the auto-negotiation is complete. It indicates the status received from remote link after the SGMII/QSGMII (Port 0) Auto-Negotiation is complete. CL37_ANSGM_STS[0] 0: Half Duplex 1: Full Duplex (default value) CL37_ANSGM_STS[2:1] 00: 10 Mbps speed link 01: 100 Mbps speed link 10: 1000 Mbps speed link (default value) CL37_ANSGM_STS[3] 0: Link is Down (default value) 1: Link is Up
0	RW	0b	Clause 37 AN Complete Interrupt (CL37_ANCMPLT_INTR): The PCS sets this bit when IEEE 802.3 Clause 37 Auto-Negotiation is complete. The host must clear this bit by writing 0 to it.

10.3.1.33 VR MII MMD Test Control Register (VR_MII_TC) - 1Fh, Address 8003h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 8003h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:3	RO	0000h	Reserved
2	RW	0b	Test Pattern Enable Lanes (TPE): This bit indicates that a test pattern can be enabled in the Tx path after the current normal frame transmission is complete. 0: Test pattern disabled 1: Test pattern enabled The specific test pattern that is generated is based on bits 1:0 of this register.
1:0	RW	2'b00	Test Pattern Select (TP): This field indicates the pattern type that is enabled with Bit 2 of this register. The following are the supported test patterns: 00: High Frequency Test Pattern (default value) 01: Low Frequency Test Pattern 10: Mixed Frequency Test Pattern 11: Reserved The definitions of these test patterns are specified in Annex 48A of IEEE 802.3.

10.3.1.34 VR MII MMD Debug Control Register (VR_MII_DBG_CTRL) - 1Fh, Address 8005h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 8005h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:9	RO	7'h0	Reserved
8	RW	1'h0	Transmit Preamble Control (TX_PMBL_CTL): This bit can be set to 1 to prevent possible preamble truncation in the PCS transmitter when operating in 1000BASE-X Mode or 2.5G Mode over GMII. As per IEEE spec, it is permissible for a compliant 1000BASE-X PCS transmit process to truncate the first byte of preamble in order to align the start of the packet on the EVEN boundary. If this bit is set to 1, the XPCS does not delete any preamble bytes (received from GMII Tx interface) and passes on the same number of preamble bytes to its output. The XPCS out this operation by adjusting the IPG. This mode is a deviation from Clause 36 of IEEE Std 802.3, but it can prove useful when operating at 2.5G Mode (over clocked SGMII Mode) and the far-end device is compliant to IEEE Std 802.3bz/cb.
7	RO	1'h0	Reserved
6	RO	1'h0	Reserved

Bits	Access Type	Default	Field Name and Description
5	RW	1'h0	Suppress EEE Loss of Signal Detection (SUPRESS_EEE_LOS_DET): When this field is set to 1, Loss of Signal indicated by the PHY is ignored by the PCS while evaluating the Receive link when operating in EEE mode. Receive link will be purely evaluated based the on data received by the PCS from the PHY. When this field is set to 0, Loss of signal indicated by the PHY will be considered by the PCS while evaluating the Receive link status in EEE mode.
4	RW	1'h0	Suppress Loss of Signal Detection (SUPRESS_LOS_DET): When this field is set to 1, Loss of Signal indicated by the PHY is ignored by the PCS while evaluating the Receive link. Receive link will be purely evaluated based the Rx data received on the port of the PCS. When this field is set to 0, Loss of signal indicated by the PHY will be considered by the PCS while evaluating the Receive link status.
3:1	RO	3'h0	Reserved
0	RW	1'h0	Restart Synchronization (RESTAR_SYNC_0): When set to 1, this bit restarts the Rx Synchronization State machine on Lane 0. The host must clear this bit to 0 before setting it to 1 next time.

10.3.1.35 VR MII MMD EEE Mode Control Register (VR_MII_EEE_MCTRL0)- 1Fh, Address 8006h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 8006h**

Default: 899Ch Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:12	RW	4'h8	Clock Stop (CLKSTOP): This field holds the count value after which the Rx clock to the MAC can be stopped. The default value is 8. The host should program this value depending on the capability of the MAC.
11:8	RW	4'h9	100 ns Clock Tic Multiplying Factor (MULT_FACT_100NS): This bit is the multiplying factor to the clk_eee_i clock time period to make it closer to 100 ns. For example, if the clk_eee_i clock time period (clk_eee_i_time_period) is 10 ns, the value of this field is 9, that is, 1 less than 10. This value should be programmed such that the clk_eee_i_time_period * (MULT_FACT_100NS + 1) should be within 80 ns to 120 ns. The default value of this register is 9, assuming that the default clk_eee_i time period to be 10 ns.
7	RW	1'h1	Rx Control Enable (RX_EN_CTRL): This bit controls the generation of the xpcs_rx_en_o{lane} signal. When this bit is set to 1, the xpcs_rx_en_o{lane} signal is deasserted when the EEE receive controller reaches the Quiet state. When this bit set to 0, the xpcs_rx_en_o{lane} signal is not deasserted when the EEE transmit controller reaches the Quiet state.
6	RW	1'h0	Effective 100ns Tic Value (SIGN_BIT): The host should use this bit to fine-tune the EEE timing requirement. The host should set this bit to 0 when the clk_eee_i_time_period * (MULT_FACT_100NS + 1) value is more than 100 ns. The host should set this bit to 1 when the clk_eee_i clock period * MULT_FACT_100NS + 1) value is less than or equal to 100ns.
5	RO	1'h0	Reserved

Bits	Access Type	Default	Field Name and Description
4	RW	1'h1	Tx Control Enable (TX_EN_CTRL): This bit controls the generation of the signals xpcs_tx_en_o {lane}. When this bit is set to 1, the xgxs_tx{lane}_en_o or xpcs_tx_en_o{lane} signal is de-asserted when the EEE transmit controller reaches the Quiet state. When this bit set to 0, the xgxs_tx{lane}_en_o or xpcs_tx_en_o{lane} signal is not deasserted when the EEE transmit controller reaches the Quiet state.
3	RW	1'h1	Rx Quiet Enable (RX_QUIET_EN): This bit controls the generation of the xpcs_lpitx_quiet_o output. When this bit is set to 1, the xpcs_lpitx_quiet_o output is set to 1 when the EEE receive controller reaches the Quiet state. When this bit set to 0, the xpcs_lpitx_quiet_o output is not set to 1.
2	RW	1'h1	Tx Quiet Enable (TX_QUIET_EN): This bit controls the generation of the xpcs_lpitx_quiet_o output. When this bit is set to 1, the xpcs_lpitx_quiet_o output is set to 1 when the EEE transmit controller reaches the Quiet state. When this bit set to 0, the xpcs_lpitx_quiet_o output is not set to 1.
1	RW	1'h0	LPI Rx Enable (LRX_EN): When set to 1, this bit enables the Energy Efficient Ethernet support in the PCS receive path. When set to 0, it disables the support for Energy Efficient Ethernet in the PCS receive path.
0	RW	1'h0	LPI Tx Enable (LTX_EN): When set to 1, this bit enables the Energy Efficient Ethernet support in the PCS Transmit path. When set to 0, it disables the support for Energy Efficient Ethernet in the PCS Transmit path.

10.3.1.36 VR MII MMD EEE Tx Timer Register (VR_MII_EEE_TXTIMER) - 1Fh, Address 8008h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 8008h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:6	RO	10'h000	Reserved
5:0	RW	6'h00	TSL Resolution (TSL_RES): This field stores the resolution value for the Local Sleep Time (TSL) timer. When the generated 100ns tic timer is not exactly 100ns, this field is programmed with the required value. The programmed value is equivalent to the number of more (SIGN_BIT is low) or less (SIGN_BIT is high) counts than the ideal count to meet the range of the TSL timer. The PCS maintains the default value of the TSL timer as 199, assuming clk_eee_i_time_period * (MULT_FACT_100NS + 1) is equal to 100ns to produce 19900ns (19.9 us) as per the TSL requirement in the IEEE standard. If clk_eee_i_time_period * (MULT_FACT_100NS + 1) is 90, the default TSL timer produces 17910ns (17.91 us) which is lesser than the standard 19.9 us. To make it 19.9 us, you should program this register such that (199 +/- TSL_RES) * ((MULT_FACT_100NS + 1) * clk_eee_i_time_period) is greater than 19.9 us and less than 20.1 us (max limit), that is, (199 + TSL_RES)*90 = 19.9 us. TWL_RES = 23 meets the requirement which produces 19.98 us. The SIGN_BIT should be programmed as 1.

10.3.1.37 VR MII MMD EEE Rx Timer Register (VR_MII_EEE_RXTIMER) - 1Fh, Address 8009h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 8009h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:14	RO	2'h0	Reserved
13:8	RW	6'h00	TWR Resolution (TWR_RES): This field stores the resolution value for the TWR timer. When the generated 100ns tic timer is not exactly 100ns, this field is programmed with the required value. The programmed value is equivalent to the number of more (SIGN_BIT is low) or less (SIGN_BIT is high) counts than the ideal count to meet the range of the TWR timer. The default value is 11 us for the PCS in this design. This value is as per the requirements specified in the standard assuming that clk_eee_i_time_period * (MULT_FACT_100NS + 1) produces 100ns tick.
7:0	RW	8'h00	100 us Resolution (RES_100U): This field stores the resolution value for the 100 us timer. If the generated 100ns tic timer is not exactly 100ns, this field is programmed with the required value. The programmed value is equivalent to the number of more (SIGN_BIT is low) or less (SIGN_BIT is high) counts than the ideal count to meet the range of the 100 us timer. This field is used to control the generation of 100 us time tick using the clk_eee_i clock and MULT_FACT_100NS field. By default, the 100 us timer is generated assuming clk_eee_i_time_period * (MULT_FACT_100NS + 1) is equal to 100ns. Therefore, the PCS maintains the default value of the 100 us timer as 1000 to achieve 100000ns (100 us). You should use this field if clk_eee_i_time_period * (MULT_FACT_100NS + 1) is not equal to 100ns. To program this field, use the following equation: (1000 +/- RES_100US)* ((MULT_FACT_100NS + 1) * clk_eee_i_time_period) = 100 us. The SIGN_BIT should be programmed as 1 for (+) and 0 for (-).

10.3.1.38 VR MII MMD Link Timer Control Register (VR_MII_LINK_TIMER_CTRL) - 1Fh, Address 800Ah

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 800Ah**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RW	16'h0000	Programmable Link Timer Value for Clause 37 Auto-Negotiation (CL37_LINK_TIME): This field can be programmed to desired value if application wishes to over-ride the standard specified values for Link Timer used during CL37 Auto negotiation. The PCS has a 24-bit timer that runs at the frequency of clk_xgxs_rx0_i clock. The value programmed to this field will be used as the upper 16-bit of the value to be loaded to this timer. The lower 8-bits are hardcoded as 8'h7D After programming this register, application should perform either of the following two steps, so that the new values takes effect: Set CL37_TMR_OVR_RIDE bit (bit 3) of the VR MII MMD Digital Control 1 Register to 1. FAST_SIM bit of SR Control MMD Control Register should be cleared (if already set) and then set back to 1.

10.3.1.39 VR MII MMD EEE Mode Control 1 Register (VR_MII_EEE_MCTRL1) - 1Fh, Address 800Bh

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 800Bh**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:1	RO	15'h0000	Reserved
0	RW	1'h0	Transparent Tx LPI Mode Enable (TRN_LPI): When set to 1 (along with LTX_EN=1), transparent LPI mode gets activated in the XPCS Transmit path. In this mode the transmit LPI state-machine doesn't move to the TX_QUIET state. On detecting Lower-Power Idle on the GMII Tx interface, the XPCS goes to the TX_SLEEP state and remains in this state until the MAC stops sending LPI. In this mode, the XPCS merely sends the encoded LPI pattern to the serdes. This mode does not involve gating-off of any of the clocks to the XPCS. In addition, the serdes transmitter is not disabled. The MAC should ensure that it does not gate-off the GMII Tx clock to the XPCS during this mode of operation.

10.3.1.40 VR MII MMD Digital Status Register (VR_MII_DIG_STS) - 1Fh, Address 8010h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 8010h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:13	RO/V	3'h0	LPI Transmit State (LTX_STATE): This field indicates the current state of the LPI Transmit state Machine: 000: LTX_ACTIVE 001: LTX_SLEEP 010: LTX_QUIET 011: LTX_REF_WAKE 100: LTX_ALERT (does not apply to the PCS design) 101: LTX_SCR_BYP (does not apply to the PCS design)
12:10	RO/V	3'h0	LPI Receive State (LRX_STATE): This field indicates the current state of the LPI Receive State Machine: 000: LRX_ACTIVE (default) 001: LRX_SLEEP 010: LRX_QUIET 011: LRX_WAKE 100: LRX_WTF 101: LRX_LINK_FAIL 110: LRX_LPI_K
9:7	RO	3'h0	Reserved
6	RO/V	1'h0	Rx FIFO Overflow (RXFIFO_OVF): This bit indicates the clock rate compensation FIFO overflow. 0 indicates normal operation and 1 indicates FIFO overflow.
5	RO/V	1'h0	Rx FIFO Underflow (RXFIFO_UNDF): This bit indicates the clock rate compensation FIFO underflow. 0 indicates normal operation and 1 indicates FIFO underflow.
4:0	RO	5'h0	Reserved

10.3.1.41 VR MII MMD Invalid Code Group Error Count1 Register (VR_MII_ICG_ERRCNT1) - 1Fh, Address 8011h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 8011h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:8	RO	8'h00	Reserved
7:0	RO/V	8'h00	Invalid Code Group Count Lane 0 (EC0): This field gives the invalid code group count in Lane 0 when bit 4 of VR MII MMD Digital Error Count Select Register is set to 1.

10.3.1.42 VR MII MMD Miscellaneous Status Register (VR_MII_MISC_STS) - 1Fh, Address 8018h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 8018h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:4	RO	12'h000	Reserved
7:0	RO/V	4'h0	Bit Shift (BIT_SFT): This field indicates the number of bit-shifts carried-out by the comma-detect logic so as to align the incoming 10-bit XGXS Rx data. The default value of this field can be any value, depending on the status of comma-detect logic.

10.3.1.43 VR MII PHY Rx Lane Status Register (VR_MII_RX_LSTS) - 1Fh, Address 8020h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 8020h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:13	RO/V	3'h0	DPLL Lock Status for Lanes [3:1] (RX_VALID_3_1): This field indicates that the DPLL in the PHY is locked on the serial data in the corresponding lane. xx1: Lane 1 DPLL bit locked x1x: Lane 2 DPLL bit locked 1xx: Lane 3 DPLL bit locked (x indicates don't care)
12	RO/V	1'h0	DPLL Lock Status for Lane 0 (RX_VALID_0): This field indicates that the DPLL in the PHY is locked on the serial data in Lane 0. The value 1'b1 indicates that Lane 0 DPLL bit is locked.
11:5	RO	2'h0	Reserved
4	RO/V	1'h0	Rx Signal Detect for Lane 0 (SIG_DET_0): This bit indicates that the Rx detected the signal on Lane 0. This bit is the complement value of the signals input from the PHY on Lane 0. The value 1'b1 indicates that Lane 0 signal is detected.
3:0	RO	4'h0	Reserved

10.3.1.44 VR MII MMD Digital Control2 Register (VR_MII_DIG_CTRL2) - 1Fh, Address 80E1h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 80E1h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:5	RO	11'h000	Reserved
4	RW	1'h0	Tx Polarity Invert on Lane 0 (TX_POL_INV_0): When set to 1, this bit reverses the data polarity on the Tx differential lines of Lane 0.
3:1	RO	3'h0	Reserved
0	RW	1'h0	Rx Polarity Invert on Lane 0 (ABL100T4): When set, the bits within this field indicate that the data received on Rx serial line is inverted on Lane 0. This reverses the polarity on the data received from the PHY core. The value 1 indicates that Rx data on Lane 0 is inverted.

10.3.1.45 VR MII MMD Digital Error Count Select Register (VR_MII_DIG_ERRCNT_SEL) - 1Fh, Address 80E2h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 80E2h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:5	RO	11'h000	Reserved
4	RW	1'h0	Invalid Code Group Error Counter Enable (INV_EC_EN): When this bit is set, the counting of invalid code group errors is enabled. 0: The counting of errors is disabled 1: The counting of errors is enabled For information about the fields containing the number of errors counted, see VR MII MMD Invalid Code Group Error Count1 Register.
3:1	RO	3'h0	Reserved
0	RW	1'h0	Clear on Read (COR): When this bit is set and the host reads any error counter, that counter is cleared after the read cycle. 0: Normal operation 1: Clear any error counter that is read

10.3.2 MDIO – Adhoc PHY Sublayer Registers – PHY Address 15h

The Adhoc Registers are accessible as an IEEE Std 802.3 Clause 22 capable PHY MDIO Manageable Device (MMD). Its 5-bit PHY Address (PHYAD) is 15h. Its 32 16-bit data registers are accessible using the 5-bit PHY Register Address (REGAD).

The Adhoc Registers consist of a PHY Global Configuration Register (GCR), one captured 64-bit Always Running Timer (ART) Time Stamp, one six-byte, unique MAC Address provided by the Intel product customer via the system Flash Device, and various status registers and configuration registers related to the PCH internal PHY sublayer circuitry and debug circuity.

Table 10-7. Summary of Adhoc MDIO Registers, PHYAD = 15h

Register Address (Hex)	Data Size (Bits)	Register Name (Register Symbol)	Default Value [15:0]
00h	16	Global Configuration Register (GCR)	0826h
01h	16	PMC ART Time Capture Register 0 (PMC_ART0)	0000h
02h	16	PMC ART Time Capture Register 1 (PMC_ART1)	0000h
03h	16	PMC ART Time Capture Register 2 (PMC_ART2)	0000h
04h	16	PMC ART Time Capture Register 3 (PMC_ART3)	0000h
05h	16	General Purpose Status Register 0 (GPSR0)	0000h
06h	16	General Purpose Status Register 1 (GPSR1)	0000h
07h	16	General Purpose Status Register 2 (GPSR2)	0000h
08h	16	General Purpose Status Register 3 (GPSR3)	0000h
09h	16	General Purpose Status Register 4 (GPSR4)	0000h
0Ah	16	General Purpose Status Register 5 (GPSR5)	0000h
0Bh	16	General Purpose Configuration Register 0 (GPCR0)	1020h
0Ch	16	General Purpose Configuration Register 1 (GPCR1)	0001h
0Dh	16	General Purpose Configuration Register 2 (GPCR2)	0050h
0Eh	16	General Purpose Configuration Register 3 (GPCR3)	0000h
0Fh	16	General Purpose Configuration Register 4 (GPCR4)	0000h
10h	16	General Purpose Configuration Register 5 (GPCR5)	0000h
11h	16	General Purpose Configuration Register 6 (GPCR6)	0000h
12h	16	General Purpose Configuration Register 7 (GPCR7)	0000h
13h	16	MAC Address Strap Value 0 (MACADDR0)	0000h
14h	16	MAC Address Strap Value 1 (MACADDR1)	0000h
15h	16	MAC Address Strap Value 2 (MACADDR2)	0000h
16h	16	MGBE Hammock Harbor Status (MGBE_HH_STATUS)	0000h
17h	16	MGBE RGMII DLL Status (MGBE_STATUS1)	0000h
18h	16	MGBE STATUS Register2 (MGBE_STATUS2)	0000h
19h	16	MGBE STATUS Register3 (MGBE_STATUS3)	0000h
1Ah	16	MGBE RGMII DLL Configuration Register 1 (MGBE_CONFIG1)	0000h
1Bh	16	MGBE RGMII DLL Configuration Register 2 (MGBE_CONFIG2)	0000h
1Ch	16	MGBE CONFIG Register3 (MGBE_CONFIG3)	0000h

Table 10-7. Summary of Adhoc MDIO Registers, PHYAD = 15h

Register Address (Hex)	Data Size (Bits)	Register Name (Register Symbol)	Default Value [15:0]
1Dh	16	MGBE CONFIG Register4 (MGBE_CONFIG4)	0000h
1Eh	16	MGBE CONFIG Register5 (MGBE_CONFIG5)	0000h
1Fh	16	MGBE CONFIG Register6 (MGBE_CONFIG6)	0000h

10.3.2.1 Global Configuration Register (GCR) - Address 00h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 00h**

Default: 0826h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:12	RW	4'h0	Reserved
11:8	RW	4'h8	Always Running Timer Capture Skew (ART_SKEW): The skew is provided as a number of clock cycles. Default value is 8 cycles for the 19.2-MHz ART Clock.
7	RW	1'b0	Reserved
6	RW	1'b0	PHY to MAC Interrupt Polarity (PHY2MAC_INTR_POL): When programmed to 1, the polarity of the interrupt signal that comes from an external PHY is inverted.
5	RW	1'b1	MAC Function Level Reset Enable (MAC_FLR_ENABLE): When programmed to 1, the Function Level Reset (FLR) mechanism is enabled. When programmed to 0, the FLR mechanism is disabled.
4	RW	1'b0	PHY Interface Mode Override (PHYIF_STRAPOVR): Overrides the PHY interface mode established by Soft Straps or system Fuses: 0: Override is disabled 1: Override is enabled
3	RW	1'b0	PHY Interface Mode (PHYIF_MODE): When the PHYIF_STRAPOVR bit of this register is 1, these bits determine the PHY Interface Mode as follows: 0: RGMII Mode 1: SGMII mode
2:1	RW	2'b11	Link Speed Mode (LINK_MODE): This field configures the Link-Speed Mode when the AUTONEG_DISABLE bit of this register is 1: 11: 2.5 Gbps (this is applicable only in SGMII Mode) 10: 1 Gbps 01: 100 Mbps 00: 10 Mbps
0	RW	1'b0	Auto-Negotiation Disable (AUTONEG_DISABLE): When this bit is 1, the Link Speed is determined by the LINK_MODE bits of this register instead of the PCS Auto-Negotiation value.

10.3.2.2 PMC ART Time Capture Register 0 (PMC_ART0) - Address 01h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 01h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RO/V	16'h0000	PMC ART Value 0 (PMC_ART0_FLD): Bits 15:0 of the captured 64-bit Always Running Timer (ART) from the PCH Power Management Controller.

10.3.2.3 PMC ART Time Capture Register 1 (PMC_ART1) - Address 02h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 02h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RO/V	16'h0000	PMC ART Value 1 (PMC_ART1_FLD): Bits 31:16 of the captured 64-bit Always Running Timer (ART) from the PCH Power Management Controller.

10.3.2.4 PMC ART Time Capture Register 2 (PMC_ART2) - Address 03h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 03h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RO/V	16'h0000	PMC ART Value 2 (PMC_ART2_FLD): Bits 47:32 of the captured 64-bit Always Running Timer (ART) from the PCH Power Management Controller.

10.3.2.5 PMC ART Time Capture Register 3 (PMC_ART3) - Address 04h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 04h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RO/V	16'h0000	PMC ART Value 3 (PMC_ART3_FLD): Bits 63:48 of the captured 64-bit Always Running Timer (ART) from the PCH Power Management Controller.

10.3.2.6 General Purpose Status Register 0 (GPSR0) - Address 05h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 05h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15	RO	1'b0	Reserved
14	RO/V	1'b0	RXSTANDBY_STATUS_FLD (RXSTANDBY_STATUS_FLD): Indicates the value of the fia_tsn_rxstandbystatus signal.
13	RO	1'b0	Reserved
12	RO/V	1'b0	RXELECIDLE_SUS_FLD (RXELECIDLE_SUS_FLD): Indicates the value of the fia_tsn_rxelecidle_sus signal.
11	RO/V	1'b0	PCLKIN_CHG_OK_FLD (PCLKIN_CHG_OK_FLD): Indicates the value of the fia_tsn_pclkin_chg_ok signal.
10:7	RO	3'b000	Reserved
6:4	RO/V	3'b000	POWERDOWN_SUS_FLD (POWERDOWN_SUS_FLD): Indicates the value of the tsn_fia_powerdown_sus_reg[2:0] signals.
3	RO	1'b0	Reserved
2	RO/V	1'b0	PHY_POWER_STATE_FLD (PHY_POWER_STATE_FLD): When this bit is 1, PHY is out of reset state
1	RO	1'b0	Reserved
0	RO/V	1'b0	PLL_CLK_VLD_FLD (PLL_CLK_VLD_FLD): When this bit is 1, it indicates that the PLL Clock to be used by the GBE-TSN is valid. This can either be the MODPHY SATA PLL Clock or the MIPI PLL Clock depending on the FIA lane on which the GBE-TSN is implemented.

10.3.2.7 General Purpose Status Register 1 (GPSR1) - Address 06h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 06h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RO	16'h0000	Reserved

10.3.2.8 General Purpose Status Register 2 (GPSR2) - Address 07h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 07h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RO	16'h0000	Reserved

10.3.2.9 General Purpose Status Register 3 (GPSR3) - Address 08h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 08h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RO	16'h0000	Reserved

10.3.2.10 General Purpose Status Register 4 (GPSR4) - Address 09h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 09h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:8	RO/V	8'h00	FIA_STATUS_SEL2_FLD MGBE_MDIO (FIA_STATUS_SEL2_FLD): Various signals are multiplexed into status bits based on the bits GPCR4[13:8].
7:0	RO/V	8'h00	FIA_STATUS_SEL1_FLD MGBE_MDIO (FIA_STATUS_SEL1_FLD): Various signals are multiplexed into status bits based on the bits GPCR4[5:0].

10.3.2.11 General Purpose Status Register 5 (GPSR5) - Address 0Ah

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 0Ah**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RO	16'h0000	Reserved

10.3.2.12 General Purpose Configuration Register 0 (GPCR0) - Address 0Bh

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 0Bh**

Default: 1020h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15	RO	1'b0	Reserved
14:12	RW	3'b001	MODPHY_PCLK_RATE_FLD MGBE_MDIO (MODPHY_PCLK_RATE_FLD): Destination is MODPHY signals i_pclkrate[2:0]. This determines the rate of PCLK being sent to the PHY. Used by PHY to determine PCLK:DATA Rate for TX/RX Data valid signaling. When MODPHY is in SATA Mode: 000: 37.5 MHz 001: 75 MHz (default) 010: 150 MHz 011: 300 MHz 100: 600 MHz
11	RW	1'b0	PCLKIN_CHG_ACK_FLD MGBE_MDIO (PCLKIN_CHG_ACK_FLD): Destination is MODPHY signal fia_pclkin_chg_ack.
10	RO	1'b0	Reserved
9:8	RW	2'b00	MODPHY_RATE_FLD MGBE_MDIO (MODPHY_RATE_FLD): Destination is MODPHY signals i_rate[1:0]. For SerDes Mode, the choices are: 00: PCI Express Gen 1 01: PCI Express Gen 2 10: PCI Express Gen 3 11: KX Mode, half rate for GbE (default)
7	RO	1'b0	Reserved

Bits	Access Type	Default	Field Name and Description
6:4	RW	3'b010	MODPHY_POWERDOWN_SIGNL_FLD MGBE_MDIO (MODPHY_POWERDOWN_SIGNL_FLD): Destination is MODPHY signals i_powerdown_sus[2:0]. These signals control the power management state of the MODPHY. The MODPHY Power States: 000: P0 - PHY TX is transmitting data. MAC is providing data bytes to be sent every clock cycle. PHY RX may or may not be receiving data. 001: P1 - PHY TX is not transmitting data and is in electrical idle. PHY behavior is undefined if tx_elecidle is deasserted in this state. PHY RX may or may not be receiving data. 010: P2 - PHY does a receiver detection operation. PHY behavior is undefined if tx_elecidle is deasserted in this state. 011: P3 – (default) PHY is in low power state and is in electrical idle. TX is High-Z state. 100: P4 - PHY is in low power state and is in electrical idle. TX pads sit in common mode. 101: P5 - PHY is in low power state and is in electrical idle. TX pad is in strong pull down. 110: P6 - PHY is in low power state and is in electrical idle. TX pads are in common mode with clock hub bias on. 111: Reserved.
3	RO	1'b0	Reserved
2	RW	1'b0	MODPHY_RST_DATAPATH_INT_FLD MGBE_MDIO (MODPHY_RST_DATAPATH_INT_FLD): Destination is MODPHY signal i_reset_l. Active-low reset signal for both the PIPE and SerDes interface. This signal is equivalent to a lane disable signal.
1	RO	1'b0	Reserved
0	RW	1'b0	PLL_CLK_REQUEST_FLD MGBE_MDIO (PLL_CLK_REQUEST_FLD): Depending on the PLL configuration, MIPI PLL or SATA PLL, this bit provides a signal much like mgbe_mii_refclkreq.

10.3.2.13 General Purpose Configuration Register 1 (GPCR1) - Address 0Ch

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 0Ch**

Default: 0001h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:13	RO	7'h00	Reserved
12	RW	1'b0	MODPHY_TX_DATA_SEL_FLD MGBE_MDIO (TX_DATA_SEL_FLD): Used as mux select for selecting tsn_fia_txdata[9:0], directly or bit reversed.
11	RW	1'b0	MODPHY_STATUSREG1_BIT_SEL_FLD MGBE_MDIO (STATUSREG1_BIT_SEL_FLD): Used as mux select for selecting bits of status register 1, directly or synchronized.
10:9	RO	2'b00	Reserved

Bits	Access Type	Default	Field Name and Description
8	RW	1'b0	MODPHY_TX_DET_RX_LPBK_FLD MGBE_MDIO (MODPHY_TX_DET_RX_LPBK_FLD): Destination is MODPHY signal i_txdetrxlpbk_sus. Used to tell the PHY to begin a RX detect operation or loopback to signal LFPS during MODPHY power state P0 for USB polling state. Function of this pin depends on the power state and the i_txelecidle signal.
7	RO	1'b0	Reserved
6:4	RW	3'b000	MODPHY_TX_MRGN_FLD MGBE_MDIO (MODPHY_TX_MRGN_FLD): Destination is MODPHY signals i_txmargin[2:0]. Selects the transmitter voltage levels. 000: TxMargin value 0 = ~1Vdiffp2p (Normal operating range).
3	RW	1'b0	MODPHY_TX_SWING_FLD MGBE_MDIO (TX_SWING_FLD): Drives an output signal fia_tx_swing.
2	RO	1'b0	Reserved
1:0	RW	2'b01	MODPHY_TX_DE_EMP_FLD MGBE_MDIO (MODPHY_TX_DE_EMP_FLD): General Purpose Configuration Register2[15:0]. 00: the de-emphasis is -6dB 01: the de-emphasis -3.5 dB 10: the de-emphasis 0dB 11: the de-emphasis -9.5dB

10.3.2.14 General Purpose Configuration Register 2 (GPCR2) - Address 0Dh

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 0Dh**

Default: 0050h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:9	RO	7'h00	Reserved
8	RW	1'b0	MODPHY_HALT_PHY_RDY_FLD MGBE_MDIO (HALT_PHY_RDY_FLD): additional output signal to halt xpcs_phy_rdy, in addition to powerdown state machine.
7	RO	1'b0	Reserved
6	RW	1'b1	MODPHY_RX_INTFLTREN_FLD MGBE_MDIO (RX_INTFLTREN_FLD): Drives an output signal tsn_fia_rxintfltren_l.
5	RO	1'b0	Reserved
4	RW	1'b1	MODPHY_RXTERMEN_H_AON_FLD MGBE_MDIO (MODPHY_RXTERMEN_H_AON_FLD): Destination is MODPHY signal i_rxtermen_h_aon. This signal controls the presence of the RX termination resistors. 1: Terminations are present 0: Terminations are removed from the circuit
3	RO	1'b0	Reserved

Bits	Access Type	Default	Field Name and Description
2	RW	1'b0	MODPHY_RX_SQUELCH_EN_FLD MGBE_MDIO (MODPHY_RX_SQUELCH_EN_FLD): Destination is MODPHY signal i_rxsquelchen. Used in PCIE P2/USB3 P3/ SATA Slumber power states to cycle the squelch and monitor for activity.
1	RO	1'b0	Reserved
0	RW	1'b0	MODPHY_RX_POLARITY_FLD MGBE_MDIO (MODPHY_RX_POLARITY_FLD): Destination is MODPHY signal i_rxpolarity. Configures the PHY to perform polarity inversion on the received data. 0: PHY does no polarity inversion 1: PHY does polarity inversion

10.3.2.15 General Purpose Configuration Register 3 (GPCR3) - Address 0Eh

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 0Eh**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RW	16'h0000	Reserved

10.3.2.16 General Purpose Configuration Register 4 (GPCR4) - Address 0Fh

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 0Fh**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:14	RO	2'b00	Reserved
13:8	RW	6'b000000	MODPHY_STATUS_SIGNL_SEL2_FLD MGBE_MDIO (MODPHY_STATUS_SIGNL_SEL2_FLD): Based on these bits various FIA signals are multiplexed into the GPSR4[15:8].
7:6	RO	2'b00	Reserved
5:0	RW	6'b000000	MODPHY_STATUS_SIGNL_SEL1_FLD MGBE_MDIO (MODPHY_STATUS_SIGNL_SEL1_FLD): Based on these bits various FIA signals are multiplexed into the GPSR4[7:0].

10.3.2.17 General Purpose Configuration Register 5 (GPCR5) - Address 10h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 10h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RW	16'h0000	Reserved

10.3.2.18 General Purpose Configuration Register 6 (GPCR6) - Address 11h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 11h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:6	RW	10'h000	MODPHY_FIA_OUTPUT_SEL_FLD MGBE_MDIO (MODPHY_FIA_OUTPUT_SEL_FLD): Used to replace various FIA output signals based on GPCR6[5:0] and GPCR7[5:0] bits.
5:0	RW	6'h00	MODPHY_CONFIG_SIGNL_SEL1_FLD MGBE_MDIO (MODPHY_CONFIG_SIGNL_SEL1_FLD): Selects one of 49 sets of internal signal values to be sent to the FIA and Used as MUX select for selecting values for various output FIA signals.

10.3.2.19 General Purpose Configuration Register 7 (GPCR7) - Address 12h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 12h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:6	RW	10'h000	MODPHY_TX_DATA_FLD MGBE_MDIO (TX_DATA_FLD): Used for replacing FIA Tx data, and some other FIA signals too, based on GPCR7[5:0] configuration.
5:0	RW	6'h00	MODPHY_CONFIG_SIGNL_SEL2_FLD MGBE_MDIO (MODPHY_CONFIG_SIGNL_SEL2_FLD): Used as MUX select for selecting values for various output FIA signals.

10.3.2.20 MAC Address Strap Value 0 (MACADDR0) - Address 13h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 13h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RO/V	16'h0000	MAC_ADDR_STRAP0_FLD MGBE_MDIO (MAC_ADDR_STRAP0_FLD): MAC address strap values [15:0] This is a write-only-once register, and the value is loaded on iosf2axi_fuse_valid low to high transition.

10.3.2.21 MAC Address Strap Value 1 (MACADDR1) - Address 14h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 14h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RO/V	16'h0000	MAC_ADDR_STRAP0_FLD MGBE_MDIO (MAC_ADDR_STRAP0_FLD): MAC address strap values [31:16] This is a write-only-once register, and the value is loaded on iosf2axi_fuse_valid low to high transition.

10.3.2.22 MAC Address Strap Value 2 (MACADDR2) - Address 15h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 15h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RO/V	16'h0000	MAC_ADDR_STRAP0_FLD MGBE_MDIO (MAC_ADDR_STRAP0_FLD): MAC address strap values [47:32] This is a write-only-once register, and the value is loaded on iosf2axi_fuse_valid low to high transition.

10.3.2.23 MGBE Hammock Harbor Status (MGBE_HH_STATUS) - Address 16h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 16h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:4	RO	12'h000	Reserved
3	RW	1'b0	MMGBE_SBD_SFTY_UE (MGBE_SBD_SFTY_UE): MAC Safety Uncorrectable error status: This bit is set on ac_sbd_ue_intr and cleared by software.
2	RW	1'b0	MGBE_SBD_SFTY_CE (MGBE_SBD_SFTY_CE): MAC Safety Correctable error status: This bit is set on mac_sbd_ce_intr and cleared by software.
1	RW	1'b0	MGBE_TSW_ERR (MGBE_TSW_ERROR): Timestamp error status: Iosf2axi_hh_tsw_status output from bridge latched on avail.
0	RW	1'b0	MGBE_SNAPSHOT_DONE (MGBE_SNAPSHOT_DONE): Snapshot done bit: Set when MGBE received LocalSync for tsw sync timestamp from iosf2axibr (opcode = 51). Cleared when new request gpo1 is initiated.

10.3.2.24 MGBE RGMII DLL Status (MGBE_STATUS1) - Address 17h

This Read-Only Status Register is available to subsystems that are configured to provide the RGMII rather than the PCS module as the external interface. It provides information concerning the Master/Slave DLL module used for RGMII.

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 17h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15	RO/V	1'b0	Master DLL Lock (MDLL_LOCK): Indicates that the Master DDL for RGMII is locked.
14:8	RO	7'h00	Reserved
7:4	RO/V	4'h0	Master DLL Coarse Tuning Value (MDLL_COARSE_TUNE): Indicates the value used for the Master DLL Coarse Tuning for RGMII.
3:0	RO/V	4'h0	Master DLL Fine Tuning Value (MDLL_FINE_TUNE): Indicates the value used for the Master DLL Fine Tuning for RGMII.

10.3.2.25 MGBE STATUS Register2 (MGBE_STATUS2) - Address 18h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 18h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RO	16'h0000	Reserved

10.3.2.26 MGBE STATUS Register3 (MGBE_STATUS3) - Address 19h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 19h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RO	16'h0000	Reserved

10.3.2.27 MGBE RGMII DLL Configuration Register 1 (MGBE_CONFIG1) - Address 1Ah

This Read-Write Configuration Register is used to configure the Master/Slave DLL module used for RGMII.

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 1Ah**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15	RW	1'b0	Override Master DLL Tuning Values (SW_OVR): 1 -> SW override is enabled. When set, the coarse and fine values to the slave DLLs will be jammed by configA register values. The master DLL coarse and fine values will be bypassed.
14	RW	1'b0	Software Reset (SW_RESETB): Active-low software reset. Resets the master DLL when asserted low.
13	RW	1'b0	MGBE_DLLRX_BYPASS (MGBE_DLLRX_BYPASS): DLL Bypass option for RGMII RX Clock.
12	RW	1'b0	MGBE_DLLTX_BYPASS (MGBE_DLLTX_BYPASS): DLL Bypass option for RGMII TX Clock.
11	RO	1'b0	Reserved
10:8	RW	3'b000	Observe Master DLL Values (MDLL_DFT): DFT inputs for observing various master DLL values.
7:4	RW	4'h0	Override Slave DLL Coarse Tuning Delay (SDLL_COARSE_OVER): Slave DLL coarse tuning delay override value used when the SW_OVR bit of this register is one.
3:0	RW	4'h0	Override Slave DLL Fine Tuning Delay (SDLL_FINE_OVER): Slave DLL fine tuning delay override value used when the SW_OVR bit of this register is one.

10.3.2.28 MGBE RGMII DLL Configuration Register 2 (MGBE_CONFIG2) - Address 1Bh

This Read-Write Configuration Register is used to configure the Master/Slave DLL module used for RGMII.

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 1Bh**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:14	RO	2'b00	Reserved
13:8	RW	6'h00	RX Slave DLL Tap Value (RX_SLAVE_TAP_VALUE): The taps are binary coded. Each tap gives 250-ps resolution. Valid values are: 6'b00_0000 -> 0 ns 6'b00_0001 -> 250 ps through… 6'b10_1000 -> 10 ns All other values are reserved.
7:6	RO	2'b00	Reserved
5:0	RW	6'h00	TX Slave DLL Tap Value (TX_SLAVE_TAP_VALUE): The taps are binary coded. Each tap gives 250 ps resolution. For example: 6'b00_0000 -> 0 ns 6'b00_0001 -> 250 ps through… 6'b10_1000 -> 10 ns All other values are reserved.

10.3.2.29 MGBE CONFIG Register3 (MGBE_CONFIG3) - Address 1Ch

This Read-Write Configuration Register is for VC1 mapping.

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 1Ch**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RW	16'h0000	VC1 Mapping Register (MGBE_CONFIG3_FLD): VC1 mapping register for 8 Tx and 8 Rx DMA channels.

10.3.2.30 MGBE CONFIG Register4 (MGBE_CONFIG4) - Address 1Dh

This Read-Write Configuration Register is reserved by Intel for possible future use.

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 1Dh**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RW	16'h0000	Reserved

10.3.2.31 MGBE CONFIG Register5 (MGBE_CONFIG5) - Address 1Eh

This Read-Write Configuration Register is reserved by Intel for possible future use.

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 1Eh**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RW	16'h0000	Reserved

10.3.2.32 MGBE CONFIG Register6 (MGBE_CONFIG6) - Address 1Fh

This Read-Write Configuration Register is reserved by Intel for possible future use.

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 1Fh**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RW	16'h0000	Reserved

10.3.3 MDIO – External PHY Sublayer Registers

The MDIO Controller provides the MDIO interface to PHY components that are external to the PCH component. Both Clause 22 capable and Clause 45 capable PHY components are supported. See IEEE Std 802.3-2015 for the MDIO interface and electrical specifications.

11 PCI Express (PCIe*)

11.1 PCIe* Configuration Registers Summary

This chapter documents the registers of the PCIe* device. The device contains multiple PCIe* controller:

- PCIe* Root Port #0 - Bus: 0, Device: 28, Function: 0
- PCIe* Root Port #1 - Bus: 0, Device: 28, Function: 1
- PCIe* Root Port #2 - Bus: 0, Device: 28, Function: 2
- PCIe* Root Port #3 - Bus: 0, Device: 28, Function: 3
- PCIe* Root Port #4 - Bus: 0, Device: 28, Function: 4
- PCIe* Root Port #5 - Bus: 0, Device: 28, Function: 5
- PCIe* Root Port #6 - Bus: 0, Device: 28, Function: 6

DID Values:

- PCIe* Root Port #0:- D28: F0 - 4B38h
- PCIe* Root Port #1:- D28: F1 - 4B39h
- PCIe* Root Port #2:- D28: F2 - 4B3Ah
- PCIe* Root Port #3:- D28: F3 - 4B3Bh
- PCIe* Root Port #4:- D28: F4 - 4B3Ch
- PCIe* Root Port #5:- D28: F5 - 4B3Dh
- PCIe* Root Port #6:- D28: F6 - 4B3Eh

Table 11-1. Summary of Bus: 0, Device: 28, Function: 0 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	ID	4B388086h
4h	4	Device Command And Primary Status (CMD_PSTS)	00100000h
8h	4	Revision ID And Class Code (RID_CC)	060400F0h
Ch	4	Cache Line Size, Primary Latency Timer And Header Type (CLS_PLT_HTYPE)	00810000h
18h	4	Bus Numbers And Secondary Latency Timer (BNUM_SLT)	00000000h
1Ch	4	I/O Base And Limit And Secondary Status (IOBL_SSTS)	00000000h
20h	4	Memory Base And Limit (MBL)	00000000h
24h	4	Prefetchable Memory Base And Limit (PMBL)	00010001h
28h	4	Prefetchable Memory Base Upper 32 Bits (PMBU32)	00000000h
2Ch	4	Prefetchable Memory Limit Upper 32 Bits (PMLU32)	00000000h
34h	4	Capabilities List Pointer (CAPP)	00000040h
3Ch	4	Interrupt Information And Bridge Control (INTR_BCTRL)	00000000h
40h	4	Capabilities List And PCI Express Capabilities (CLIST_XCAP)	00428010h
44h	4	Device Capabilities (DCAP)	00008001h
48h	4	Device Control And Device Status (DCTL_DSTS)	00100000h
4Ch	4	Link Capabilities (LCAP)	00710C00h
50h	4	Link Control And Link Status (LCTL_LSTS)	00010000h
54h	4	Slot Capabilities (SLCAP)	00040060h
58h	4	Slot Control And Slot Status (SLCTL_SLSTS)	00000000h
5Ch	4	Root Control (RCTL)	00000000h
60h	4	Root Status (RSTS)	00000000h
64h	4	Device Capabilities 2 (DCAP2)	00080837h
68h	4	Device Control 2 And Device Status 2 (DCTL2_DSTS2)	00000000h
6Ch	4	Link Capabilities 2 (LCAP2)	00000000h
70h	4	Link Control 2 And Link Status 2 (LCTL2_LSTS2)	00000001h
80h	4	Message Signaled Interrupt Identifiers And Message Signaled Interrupt Message Control (MID_MC)	00009005h
84h	4	Message Signaled Interrupt Message Address (MA)	00000000h
88h	4	Message Signaled Interrupt Message Data (MD)	00000000h
90h	4	Subsystem Vendor Capability (SVCAP)	0000A00Dh
94h	4	Subsystem Vendor IDs (SVID)	00000000h
A0h	4	Power Management Capability And PCI Power Management Capabilities (PMCAP_PMC)	C8030001h
A4h	4	PCI Power Management Control And Status (PMCS)	00000008h
100h	4	Advanced Error Extended Reporting Capability Header (AECH)	00000000h
104h	4	Uncorrectable Error Status (UES)	00000000h
108h	4	Uncorrectable Error Mask (UEM)	00000000h
10Ch	4	Uncorrectable Error Severity (UEV)	00060011h
110h	4	Correctable Error Status (CES)	00000000h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
114h	4	Correctable Error Mask (CEM)	00002000h
118h	4	Advanced Error Capabilities And Control (AECC)	00000000h
11Ch	4	Header Log DW1 (HL_DW1)	00000000h
120h	4	Header Log DW2 (HL_DW2)	00000000h
124h	4	Header Log DW3 (HL_DW3)	00000000h
128h	4	Header Log DW4 (HL_DW4)	00000000h
12Ch	4	Root Error Command (REC)	00000000h
130h	4	Root Error Status (RES)	00000000h
134h	4	Error Source Identification (ESID)	00000000h
150h	4	PTM Extended Capability Header (PTMECH)	00000000h
154h	4	PTM Capability Register (PTMCAPR)	00000400h
158h	4	PTM Control Register (PTMCTLR)	00000000h
200h	4	L1 Sub-States Extended Capability Header (L1SECH)	00000000h
204h	4	L1 Sub-States Capabilities (L1SCAP)	0028281Fh
208h	4	L1 Sub-States Control 1 (L1SCTL1)	00000000h
20Ch	4	L1 Sub-States Control 2 (L1SCTL2)	00000028h
220h	4	ACS Extended Capability Header (ACSECH)	00000000h
224h	4	ACS Capability Register And ACS Control Register (ACSCAPR_ACSCTLR)	0000001Fh
A00h	4	DPC Extended Capability Header (DPCECH)	00000000h
A04h	4	DPC Capability Register And DPC Control Register (DPCCAPR_DPCCTLR)	000014E0h
A08h	4	DPC Status Register And DPC Error Source ID Register (DPCSR_DPCESIDR)	00001F00h
A0Ch	4	RP PIO Status Register (RPPIOSR)	00000000h
A10h	4	RP PIO Mask Register (RPPIOMR)	00070707h
A14h	4	RP PIO Severity Register (RPPIOVR)	00000000h
A18h	4	RP PIO SysError Register (RPPIOSER)	00000000h
A1Ch	4	RP PIO Exception Register (RPPIOER)	00000000h
A20h	4	RP PIO Header Log Register DW1 (RPPIOHLR_DW1)	00000000h
A24h	4	RP PIO Header Log Register DW2 (RPPIOHLR_DW2)	00000000h
A28h	4	RP PIO Header Log Register DW3 (RPPIOHLR_DW3)	00000000h
A2Ch	4	RP PIO Header Log Register DW4 (RPPIOHLR_DW4)	00000000h
A30h	4	Secondary PCI Express Extended Capability Header (SPEECH)	00000000h
A34h	4	Link Control 3 (LCTL3)	00000000h
A38h	4	Lane Error Status (LES)	00000000h
A3Ch	4	Lane 0 And Lane 1 Equalization Control (L01EC)	7F7F7F7Fh
A40h	4	Lane 2 And Lane 3 Equalization Control (L23EC)	7F7F7F7Fh

11.1.1 ID - Offset 0h

This is Identifiers register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 0h	4B388086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	4B38h RO/V	**Device Identification (DID):** See the Device ID table in the SoC documentation Note: DID[lb]15:7[rb] are received through ID Broadcast and DID[lb]6:0[rb] are received through Fuse Pull.
15:0	8086h RO	**Vendor Identification (VID):** Indicates Intel

11.1.2 Device Command And Primary Status (CMD_PSTS) - Offset 4h

This is Device Command and Primary Status register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 4h	00100000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**DPE - Detected Parity Error (DPE):** Set when the root port receives a command or data from the backbone with a parity error. This is set even if PCMD.PERE is not set.
30	0h RW/1C/V	**Signaled System Error (SSE):** Set when the root port signals a system error to the internal SERR# logic.
29	0h RW/1C/V	**Received Master Abort (RMA):** Set when the root port receives a completion with unsupported request status from the backbone.
28	0h RW/1C/V	**Received Target Abort (RTA):** Set when the root port receives a completion with completer abort from the backbone.
27	0h RW/1C/V	**Signaled Target Abort (STA):** Set whenever the root port forwards a target abort received from the downstream device onto the backbone.
26:25	0h RO	**Primary DEVSEL# Timing Status (PDTS):** Reserved
24	0h RW/1C/V	**Master Data Parity Error Detected (DPD):** Set when the root port receives a completion with a data parity error on the backbone and PCMD.PERE is set.
23	0h RO	**Primary Fast Back to Back Capable (PFBC):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
22	0h RO	**Reserved**
21	0h RO	**Primary 66 MHz Capable (PC66):** Reserved
20	1h RO	**Capabilities List (CLIST):** Indicates the presence of a capabilities list.
19	0h RO/V	**Interrupt Status (IS):** Indicates status of hot plug and power management interrupts on the root port that result in INTx# message generation. This bit is not set if MSI is enabled. If MSI is not enabled, this bit is set regardless of the state of CMD.ID.
18:11	0h RO	**Reserved**
10	0h RW/V2	**Interrupt Disable (ID):** This disables pin-based INTx# interrupts on enabled hot plug and power management events. This bit has no effect on MSI operation. When set, internal INTx# messages will not be generated. When cleared, internal INTx# messages are generated if there is an interrupt for hot plug or power management and MSI is not enabled. This bit does not affect interrupt forwarding from devices connected to the root port. Assert_INTx and Deassert_INTx messages will still be forwarded to the internal interrupt controllers if this bit is set. For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register is RO and returns a value of 0 when read, else it is RW with the functionality described above.
9	0h RO	**Fast Back to Back Enable (FBE):** Reserved
8	0h RW	**SERR# Enable (SEE):** When set, enables the root port to generate an SERR# message when PSTS.SSE is set.
7	0h RO	**Wait Cycle Control (WCC):** Reserved
6	0h RW	**Parity Error Response Enable (PERE):** Indicates that the device is capable of reporting parity errors as a master on the backbone.
5	0h RO	**VGA Palette Snoop (VGA_PSE):** Reserved
4	0h RO	**Memory Write and Invalidate Enable (MWIE):** Reserved
3	0h RO	**Special Cycle Enable (SCE):** Reserved
2	0h RW	**Bus Master Enable (BME):** When set, allows the root port to forward Memory and I/O Read/Write cycles onto the backbone from a PCI-Express device. When this bit is 0b, Memory and I/O request received at a Root Port must be handled as Unsupported Requests (UR). This bit does not affect forwarding of Completions in either the Upstream or Downstream direction. The forwarding of Requests other than Memory or I/O requests is not controlled by this bit.
1	0h RW	**Memory Space Enable (MSE):** When set, memory cycles within the range specified by the memory base and limit registers can be forwarded to the PCI-Express device. When cleared, these memory cycles are master aborted on the backbone.
0	0h RW	**I/O Space Enable (IOSE):** When set, I/O cycles within the range specified by the I/O base and limit registers can be forwarded to the PCI-Express device. When cleared, these cycles are master aborted on the backbone..

11.1.3 Revision ID And Class Code (RID_CC) - Offset 8h

This is Revision ID and Class Code register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 8h	060400F0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	06h RO	**Base Class Code (BCC):** Indicates the device is a bridge device.
23:16	04h RO/V	**Sub-Class Code (SCC):** The default indicates the device is a PCI-to-PCI bridge. If the MPC.Bridge Type register is set to a '1' for a Host Bridge, this register reads 00h.
15:8	00h RO/V	**Programming Interface (PI):** PCI-to-PCI bridge.
7:0	F0h RO/V	**Revision ID (RID):** Indicates the revision of the bridge. The upper nibble, RID[lb]7:4[rb] of this register is hard wired to 4'hF. The lower nibble, RID[lb]3:0[rb] of this register tracks the Revision ID of the SoC

11.1.4 Cache Line Size, Primary Latency Timer And Header Type (CLS_PLT_HTYPE) - Offset Ch

This is Cache Line Size, Primary Latency Timer and Header Type register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + Ch	00810000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	1h RO	**Multi-function Device (MFD):** This bit is '1' to indicate a multi-function device.
22:16	01h RO/V	**Header Type (HTYPE):** The default mode identifies the header layout of the configuration space, which is a PCI-to-PCI bridge. If the MPC.Bridge Type register is set to a '1' for a Host Bridge, this register reads 00h.
15:11	00h RO	**Latency Count (CT):** Reserved
10:8	0h RO	**Reserved**
7:0	00h RW	**Line Size (LS):** This is read/write but contains no functionality, per PCI-Express spec

11.1.5 Bus Numbers And Secondary Latency Timer (BNUM_SLT) - Offset 18h

This is Bus Numbers and Secondary Latency Timer register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RW/V2	**Secondary Latency Timer (SLT):** For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register is a RW register; else this register is RO and returns 0. This register does not affect the behavior of any HW logic.
23:16	00h RW	**Subordinate Bus Number (SBBN):** Indicates the highest PCI bus number below the bridge.
15:8	00h RW	**Secondary Bus Number (SCBN):** Indicates the bus number the port.
7:0	00h RW	**Primary Bus Number (PBN):** Indicates the bus number of the backbone.

11.1.6 I/O Base And Limit And Secondary Status (IOBL_SSTS) - Offset 1Ch

This is I/O Base and Limit and Secondary Status register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**Detected Parity Error (DPE):** Set when the port receives a poisoned TLP.
30	0h RW/1C/V	**Received System Error (RSE):** Set when the port receives an ERR_FATAL or ERR_NONFATAL message from the device.
29	0h RW/1C/V	**Received Master Abort (RMA):** Set when the port receives a completion with *"Unsupported Request"* status to the device.
28	0h RW/1C/V	**Received Target Abort (RTA):** Set when the port receives a completion with *"Completion Abort"* status to the device.
27	0h RW/1C/V	**Signaled Target Abort (STA):** Set when the port generates a completion with *"Completion Abort"* status to the device.
26:25	0h RO/V	**Secondary DEVSEL# Timing Status (SDTS):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW/1C/V	**Data Parity Error Detected (DPD):** Set when the BCTRL.PERE, and either of the following two conditions occurs: Port receives completion marked poisoned. Port poisons a write request to the secondary side.
23	0h RO/V	**Secondary Fast Back to Back Capable (SFBC):** Reserved
22	0h RO	**Reserved**
21	0h RO	**Secondary 66 MHz Capable (SC66):** Reserved
20:16	0h RO	**Reserved**
15:12	0h RW	**I/O Address Limit (IOLA):** I/O Base bits corresponding to address lines 15:12 for 4KB alignment. Bits 11:0 are assumed to be padded to FFFh.
11:8	0h RO	**I/O Limit Address Capability (IOLC):** Indicates that the bridge does not support 32-bit I/O addressing.
7:4	0h RW	**I/O Base Address (IOBA):** I/O Base bits corresponding to address lines 15:12 for 4KB alignment. Bits 11:0 are assumed to be padded to 000h.
3:0	0h RO	**I/O Base Address Capability (IOBC):** Indicates that the bridge does not support 32-bit I/O addressing.

11.1.7 Memory Base And Limit (MBL) - Offset 20h

Accesses that are within the ranges specified in this register will be sent to the attached device if CMD.MSE is set. Accesses from the attached device that are outside the ranges specified will be forwarded to the backbone if CMD.BME is set. The comparison performed is MB [gt]= AD[lb]31:20[rb] [lt]= ML.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 20h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	000h RW	**Memory Limit (ML):** These bits are compared with bits 31:20 of the incoming address to determine the upper 1MB aligned value of the range.
19:16	0h RO	**Reserved**
15:4	000h RW	**Memory Base (MB):** These bits are compared with bits 31:20 of the incoming address to determine the lower 1MB aligned value of the range.
3:0	0h RO	**Reserved**

11.1.8 Prefetchable Memory Base And Limit (PMBL) - Offset 24h

Accesses that are within the ranges specified in this register will be sent to the device if CMD.MSE is set. Accesses from the device that are outside the ranges specified will be forwarded to the backbone if CMD.BME is set. The comparison performed is PMBU32:PMB [gt]= AD[lb]63:32[rb]:AD[lb]31:20[rb] [lt]= PMLU32:PML.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 24h	00010001h

Bit Range	Default & Access	Field Name (ID): Description
31:20	000h RW	**Prefetchable Memory Limit (PML):** These bits are compared with bits 31:20 of the incoming address to determine the upper 1MB aligned value of the range.
19:16	1h RO	**64-bit Indicator (I64L):** Indicates support for 64-bit addressing.
15:4	000h RW	**Prefetchable Memory Base (PMB):** These bits are compared with bits 31:20 of the incoming address to determine the lower 1MB aligned value of the range.
3:0	1h RO	**64-bit Indicator (I64B):** Indicates support for 64-bit addressing.

11.1.9 Prefetchable Memory Base Upper 32 Bits (PMBU32) - Offset 28h

Size: 32 bits

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 28h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Prefetchable Memory Base Upper Portion (PMBU):** Upper 32-bits of the prefetchable address base.

11.1.10 Prefetchable Memory Limit Upper 32 Bits (PMLU32) - Offset 2Ch

Size: 32 bits

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Prefetchable Memory Limit Upper Portion (PMLU):** Upper 32-bits of the prefetchable address limit.

11.1.11 Capabilities List Pointer (CAPP) - Offset 34h

This is Capabilities List Pointer register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 34h	00000040h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	40h RW/O	**Capabilities Pointer (PTR):** Indicates that the pointer for the first entry in the capabilities list. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value. Capability Linked List (Default Settings) Offset Capability Next Pointer 40h PCI Express 80h 80h Message Signaled Interrupt (MSI)90h 90h Subsystem Vendor A0h PCI Power Management 00h Extended PCIe Capability Linked List Offset Capability Next Pointer 100h Advanced Error Reporting 000h

11.1.12 Interrupt Information And Bridge Control (INTR_BCTRL) - Offset 3Ch

This is Interrupt Information and Bridge Control register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 3Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27	0h RW/V2	**Discard Timer SERR# Enable (DTSE):** Reserved
26	0h RO	**Discard Timer Status (DTS):** Reserved
25	0h RW/V2	**Secondary Discard Timer (SDT):** Reserved
24	0h RW/V2	**Primary Discard Timer (PDT):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
23	0h RO	**Fast Back to Back Enable (FBE):** Reserved
22	0h RW	**Secondary Bus Reset (SBR):** Triggers a Hot Reset on the PCI-Express port.
21	0h RW/V2	**Master Abort Mode (MAM):** Reserved
20	0h RW	**VGA 16-Bit Decode (V16):** When set, indicates that the I/O aliases of the VGA range (see BCTRL:VE definition below), are not enabled. 0: Execute 10-bit address decode on VGA I/O accesses. 1: Execute 16-bit address decode on VGA I/O accesses.
19	0h RW	**VGA Enable (VE):** When set, the following ranges will be claimed off the backbone by the root port: Memory ranges A0000h-BFFFFh I/O ranges 3B0h 3BBh and 3C0h 3DFh, and all aliases of bits 15:10 in any combination of 1's
18	0h RW	**ISA Enable (IE):** This bit only applies to I/O addresses that are enabled by the I/O Base and I/O Limit registers and are in the first 64KB of PCI I/O space. If this bit is set, the root port will block any forwarding from the backbone to the device of I/O transactions addressing the last 768 bytes in each 1KB block (offsets 100h to 3FFh).
17	0h RW	**SERR# Enable (SE):** When set, ERR_COR, ERR_NONFATAL, and ERR_FATAL messages received are forwarded to the backbone. When cleared, they are not.
16	0h RW	**Parity Error Response Enable (PERE):** When set, poisoned write TLPs and completions indicating poisoned TLPs will set the SSTS.DPD.
15:8	00h RO/V	**Interrupt Pin (IPIN):** Indicates the interrupt pin driven by the root port. At reset, this register takes on the following values, which reflect the reset state of the STRPFUSECFG.PxIP field: Port Bits[lb]15:12[rb] Bits[lb]11:08[rb] 1 0h STRPFUSECFG.P1IP 2 0h STRPFUSECFG.P2IP 3 0h STRPFUSECFG.P3IP 4 0h STRPFUSECFG.P4IP 5 0h STRPFUSECFG.P5IP 6 0h STRPFUSECFG.P6IP 7 0h STRPFUSECFG.P7IP 8 0h STRPFUSECFG.P8IP: : x ohSTRPFUSECFG.PxIP The value that is programmed into STRPFUSECFG.PxIP is always reflected in this register. For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register returns a value of 00h when read, else this register returns the value from the table above. Note: Depending on the platform, the number of Root Ports supported may vary. In this case, the encodings defined in this register will be scaled accordingly.
7:0	00h RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this register.

11.1.13 Capabilities List And PCI Express Capabilities (CLIST_XCAP) - Offset 40h

This is Capabilities List and PCI Express Capabilities register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 40h	00428010h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:25	00h RO	**Interrupt Message Number (IMN):** The Root Port does not have multiple MSI interrupt numbers.
24	0h RW/O	**Slot Implemented (SI):** Indicates whether the root port is connected to a slot. Slot support is platform specific. BIOS programs this field, and it is maintained until a platform reset.
23:20	4h RO	**Device / Port Type (DT):** Indicates this is a PCI-Express root port
19:16	2h RO	**Capability Version (CV):** Version 2.0 indicates devices compliant to the PCI Express 2.0 and 3.0 specification which incorporates the Register Expansion ECN.
15:8	80h RW/O	**Next Capability (NEXT):** Indicates the location of the next capability. The default value of this register is 80h which points to the MSI Capability structure. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value.
7:0	10h RO	**Capability ID (CID):** Indicates this is a PCI Express capability

11.1.14 Device Capabilities (DCAP) - Offset 44h

This is Device Capabilities register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 44h	00008001h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RO	**Function Level Reset Capable (FLRC):** Not supported in Root Ports
27:26	0h RO	**Captured Slot Power Limit Scale (CSPS):** Not supported
25:18	00h RO	**Captured Slot Power Limit Value (CSPV):** Not supported
17:16	0h RO	**Reserved**
15	1h RO	**Role Based Error Reporting (RBER):** Indicates that this device implements the functionality defined in the Error Reporting ECN as required by the PCI Express 1.1 spec.
14:12	0h RO	**Reserved**
11:9	0h RO	**Endpoint L1 Acceptable Latency (E1AL):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
8:6	0h RO	**Endpoint L0 Acceptable Latency (E0AL):** Reserved
5	0h RO	**Extended Tag Field Supported (ETFS):** The Root Port never needs to initiate a transaction as a Requester with the Extended Tag bits being set. This bit does not affect the root port's ability to forward requests as a bridge as the root port always supports forwarding requests with extended tags.
4:3	0h RO	**Phantom Functions Supported (PFS):** No phantom functions supported
2:0	1h RW/O	**Max Payload Size Supported (MPS):** BIOS should write to this field during system initialization. Max Payload Size of up to 256B is supported. Programming this field to any values other than 128B or 256B max payload size will result in aliasing to 128B max payload size. 000b: 128 bytes max payload size. 001b: 256 bytes max payload size. 010b: 512 bytes max payload size. 011b: 1024 bytes max payload size. 100b: 2048 bytes max payload size. 101b: 4096 bytes max payload size. 110b: Reserved. 111b: Reserved. This field applies only to the PCIe link interface. A separate register is defined for the IOSF interface. Register Attribute: Static

11.1.15 Device Control And Device Status (DCTL_DSTS) - Offset 48h

This is Device Control and Device Status register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 48h	00100000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21	0h RO	**Transactions Pending (TDP):** This bit has no meaning for the root port since it never initiates a non-posted request with its own Requester ID.
20	1h RO	**AUX Power Detected (APD):** The root port contains AUX power for wakeup
19	0h RW/1C/V	**Unsupported Request Detected (URD):** Indicates an unsupported request was detected.
18	0h RW/1C/V	**Fatal Error Detected (FED):** Indicates a fatal error was detected. Set when a fatal error occurred on from a data link protocol error, buffer overflow, or malformed tlp
17	0h RW/1C/V	**Non-Fatal Error Detected (NFED):** Indicates a non-fatal error was detected. Set when a received a non-fatal error occurred from a poisoned tlp, unexpected completions, unsupported requests, completer abort, or completer timeout
16	0h RW/1C/V	**Correctable Error Detected (CED):** Indicates a correctable error was detected. Set when received an internal correctable error from receiver errors / framing errors, tlp crc error, dllp crc error, replay num rollover, replay timeout.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14:12	0h RO	**Max Read Request Size (MRRS):** Hardwired to 0. This field applies only to the PCIe link interface. A separate register is defined for the IOSF interface.
11	0h RO	**Enable No Snoop (ENS):** Not supported. The root port will never issue non-snoop requests.
10	0h RW/P	**Aux Power PM Enable (APME):** Must be RW for OS testing. The OS will set this bit to '1' if the device connected has detected aux power. It has no effect on the root port otherwise.
9	0h RO	**Phantom Functions Enable (PFE):** Not supported
8	0h RO	**Extended Tag Field Enable (ETFE):** Not supported
7:5	0h RW	**Max Payload Size (MPS):** The root port only supports up to 256B max payload. Programming this field to any values greater than DCAP.MPS will result in aliasing to 128B max payload size. 000b: 128 bytes max payload size. 001b: 256 bytes max payload size. 010b: 512 bytes max payload size. 011b: 1024 bytes max payload size. 100b: 2048 bytes max payload size. 101b: 4096 bytes max payload size. 110b: Reserved. 111b: Reserved. This field applies only to the PCIe link interface. A separate register is defined for the IOSF interface.Note: Software should ensure that the system is quiescent and no TLP is in progress prior to changing this field. BIOS should program this field prior to enabling BME. Register Attribute: Static.
4	0h RO	**Enable Relaxed Ordering (ERO):** Not supported
3	0h RW	**Unsupported Request Reporting Enable (URE):** When set, allows signaling ERR_NONFATAL, ERR_FATAL, or ERR_COR to the Root Control register when detecting an unmasked Unsupported Request (UR). An ERR_COR is signaled when an unmasked Advisory Non-Fatal UR is received. An ERR_FATAL, ERR_or NONFATAL, is sent to the Root Control Register when an uncorrectable non-Advisory UR is received with the severity set by the Uncorrectable Error Severity register.
2	0h RW	**Fatal Error Reporting Enable (FEE):** Enables signaling of ERR_FATAL to the Root Control register due to internally detected errors or error messages received across the link. Other bits also control the full scope of related error reporting.
1	0h RW	**Non-Fatal Error Reporting Enable (NFE):** When set, enables signaling of ERR_NONFATAL to the Root Control register due to internally detected errors or error messages received across the link. Other bits also control the full scope of related error reporting.
0	0h RW	**Correctable Error Reporting Enable (CEE):** When set, enables signaling of ERR_CORR to the Root Control register due to internally detected errors or error messages received across the link. Other bits also control the full scope of related error reporting.

11.1.16 Link Capabilities (LCAP) - Offset 4Ch

This is Link Capabilities register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 4Ch	00710C00h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO/V	**Port Number (PN):** Indicates the port number for the root port. This value is different for each implemented port: Port # Value of PN field 1 01h 2 02h 3 03h 4 04h: : x 0Xh Note: Depending on the platform, the number of Root Ports supported may vary. In this case, the encodings defined in this register will be scaled accordingly.
23	0h RO	**Reserved**
22	1h RW/O	**ASPM Optionality Compliance (ASPMOC):** ASPM Optionality Compliance (ASPMOC): This bit must be set to 1b for PCIe 3.0 compliant port. Components implemented against certain earlier versions of this specification will have this bit set to 0b. Software is permitted to use the value of this bit to help determine whether to enable ASPM or whether to run ASPM compliance tests.
21	1h RO	**Link Bandwidth Notification Capability (LBNC):** This port supports Link Bandwidth Notification status and interrupt mechanisms.
20	1h RO	**Link Active Reporting Capable (LARC):** This port supports the optional capability of reporting the DL_Active state of the Data Link Control and Management State Machine.
19	0h RO	**Surprise Down Error Reporting Capable (SDERC):** Set to '0' to indicate the Root Port does not support Surprise Down Error Reporting
18	0h RO	**Clock Power Management (CPM):** '0' Indicates that root ports do not support the CLKREQ# mechanism.
17:15	2h RW/O	**L1 Exit Latency (EL1):** Indicates an exit latency of 2us to 4us. 000b Less than 1 us 001b 1 us to less than 2 us 010b 2 us to less than 4 us 011b 4 us to less than 8 us 100b 8 us to less than 16 us 101b 16 us to less than 32 us 110b 32 us to 64 us 111b More than 64 us Note: If PXP PLL shutdown is enabled, BIOS should program this latency to comprehend PLL lock latency.
14:12	0h RO/V	**L0s Exit Latency (EL0):** Indicates an exit latency based upon common-clock configuration: LCTL.CCC Value 0 MPC.UCEL 1 MPC.CCEL
11:10	3h RW/O	**Active State Link PM Support (APMS):** Indicates the level of active state power management on this link Bits Definition 00 No ASPM Supported 01 L0s Supported 10 L1 Supported 11 L0s and L1 supported Note: If STRPFUSECFG.ASPMDIS is 1, the default of this field is *"01"*. Otherwise, the default of this field is *"11"*. If STRPFUSECFG.ASPMDIS is 1, BIOS writing *"11"* to this field will have the same effect as writing *"01"*. *"01"* will be reflected on this register when read the register will turn to Read-Only once written.

<table>
<tr><th>Bit Range</th><th>Default & Access</th><th>Field Name (ID): Description</th></tr>

<tr><td>3:0</td><td>0h
RO/V</td><td>Max Link Speeds (MLS):
This field indicates the maximum Link speed of the associated Port. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the maximum Link speed. Defined encodings are: “0001b”: Supported Link Speeds Vector field bit 0. “0010b”: Supported Link Speeds Vector field bit 1. “0011b”: Supported Link Speeds Vector field bit 2. “0100b”: Supported Link Speeds Vector field bit 3. “0101b”: Supported Link Speeds Vector field bit 4. “0110b”: Supported Link Speeds Vector field bit 5. “0111b”: Supported Link Speeds Vector field bit 6. All other encodings are reserved. When operating as PCI Express: This field reports a value of 0001b if GEN1 data rate is supported but both GEN 2 and GEN3 data rate support are disabled through PCI Express Speed Limit Fuse or MPC.PCIESD register. This field reports a value of 0010b if both GEN1 and GEN2 data rate are supported but GEN3 data rate support is disabled through PCI Express Speed Limit Fuse or MPC.PCIESD register. Otherwise, this field reports a value of 0011b. Register Attribute: Static.</td></tr>
</table>

11.1.17 Link Control And Link Status (LCTL_LSTS) - Offset 50h

This is Link Control and Link Status register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 50h	00010000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**Link Autonomous Bandwidth Status (LABS):** This bit is Set by hardware to indicate that hardware has autonomously changed Link speed or width, without the Port transitioning through DL_Down status, for reasons other than to attempt to correct unreliable Link operation. This bit must be set if the Physical Layer reports a speed or width change was initiated by the Downstream component that was indicated as an autonomous change. The default value of this bit is 0b.
30	0h RW/1C/V	**Link Bandwidth Management Status (LBMS):** This bit is Set by hardware to indicate that either of the following has occurred without the Port transitioning through DL_Down status: - A Link retraining has completed following a write of 1b to the Retrain Link bit Note: This bit is Set following any write of 1b to the Retrain Link bit, including when the Link is in the process of retraining for some other reason. - Hardware has changed Link speed or width to attempt to correct unreliable Link operation, either through an LTSSM timeout or a higher level process. This bit must be set if the Physical Layer reports a speed or width change was initiated by the Downstream component that was not indicated as an autonomous change. The default value of this bit is 0b.
29	0h RO/V	**Link Active (LA):** Set to 1b when the Data Link Control and Management State Machine is in the DL_Active state, 0b otherwise.
28	0h RO/V	**Slot Clock Configuration (SCC):** In normal mode, root port uses the same reference clock as on the platform and does not generate its own clock. Note: When operating in PCI Express mode, the default of this register bit is dependent on the *"PCIe Non-Common Clock With SSC Mode Enable Strap"*. If the strap enables non-common clock with SSC support, this bit shall default to '0'. Otherwise, this bit shall default to '1'.
27	0h RO/V	**Link Training (LT):** The root port sets this bit whenever link training is occurring, or that 1b was written to the Retrain Link bit but Link training has not yet begun. It clears the bit upon completion of link training.
26	0h RO	**Reserved**
25:20	00h RO/V	**Negotiated Link Width (NLW):** For the root ports, this register could take on several values: Port # Value of PN field RPC 00 01 10 11 1 01h 02h 02h 04h 2 01h 01h 01h 01h 3 01h 01h 02h 01h 4 01h 01h 01h 01h. The value of this register is undefined if the link has not successfully trained.
19:16	1h RO/V	**Current Link Speed (CLS):** 0001b Link is 2.5Gb/s Link 0010b 5.0 GT/s Link. This field indicates the negotiated Link speed of the given link. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the current Link speed. Defined encodings are: 0001b: Supported Link Speeds Vector field bit 0. 0010b: Supported Link Speeds Vector field bit 1. 0011b: Supported Link Speeds Vector field bit 2. 0100b: Supported Link Speeds Vector field bit 3. 0101b: Supported Link Speeds Vector field bit 4. 0110b: Supported Link Speeds Vector field bit 5. 0111b: Supported Link Speeds Vector field bit 6. All other encodings are reserved. The value of this field is undefined if the link is not up. Register Attribute: Static
15:12	0h RO	**Reserved**
11	0h RW	**Link Autonomous Bandwidth Interrupt Enable (LABIE):** Link Autonomous Bandwidth Interrupt Enable - When Set, this bit enables the generation of an interrupt to indicate that the Link Autonomous Bandwidth Status bit has been Set.

Bit Range	Default & Access	Field Name (ID): Description
10	0h RW	**Link Bandwidth Management Interrupt Enable (LBMIE):** When Set, this bit enables the generation of an interrupt to indicate that the Link Bandwidth Management Status bit has been Set. This bit is not applicable and is reserved for Endpoints, PCI Express-to-PCI/PCI-X bridges, and Upstream Ports of Switches. Functions that do not implement the Link Bandwidth Notification Capability must hardwire this bit to 0b. Default value of this bit is 0b.
9	0h RW	**Hardware Autonomous Width Disable (HAWD):** When Set, this bit disables hardware from changing the Link width for reasons other than attempting to correct unreliable Link operation by reducing Link width. Default value of this bit is 0b. Note: When operating as PCI Express, this bit defines the value of the Link Up configure Capability in TS2 Ordered Sets.
8	0h RO	**Enable Clock Power Management (ECPM):** Reserved
7	0h RW	**Extended Synch (ES):** When set, forces extended transmission of FTS ordered sets in FTS and extra TS2 at exit from L1 prior to entering L0. Note: This functionality is not applicable for Mobile Express.
6	0h RW	**Common Clock Configuration (CCC):** When set, indicates that the Root Port and device are operating with a distributed common reference clock.
5	0h WO	**Retrain Link (RL):** When set, the root port will train its downstream link. This bit always returns '0' when read. Software uses LSTS.LT and LSTS.LTE to check the status of training. It is permitted to write 1b to this bit while simultaneously writing modified values to other fields in this register. If the LTSSM is not already in Recovery or Configuration, the resulting Link training must use the modified values. If the LTSSM is already in Recovery or Configuration, the modified values are not required to affect the Link training that's already in progress.
4	0h RW	**Link Disable (LD):** When set, the root port will disable the link by directing the LTSSM to the Disabled state.
3	0h RW/O	**Read Completion Boundary Control (RCBC):** Indicates the read completion boundary is 64 bytes.
2	0h RO	**Reserved**
1:0	0h RW	**Active State Link PM Control (ASPM):** Indicates whether the root port should enter L0s or L1 or both. Bits Definition 00 Disabled 01 L0s Entry Enabled 10 L1 Entry Enabled 11 L0s and L1 Entry Enabled The value of this register is used unless the Root Port ASPM Control Override Enable register is set, in which case the Root Port ASPM Control Override value is used. Note: If STRPFUSECFG.ASPMDIS is '1', hardware will always see *"00"* as an output from this register. BIOS reading this register should always return the correct value.

11.1.18 Slot Capabilities (SLCAP) - Offset 54h

This is Slot Capabilities register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 54h	00040060h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RW/O	**Physical Slot Number (PSN__31_24):** This is a value that is unique to the slot number. BIOS sets this field and it remains set until a platform reset.
23:19	00h RW/O	**Physical Slot Number (PSN__23_19):** This is a value that is unique to the slot number. BIOS sets this field and it remains set until a platform reset.
18	1h RO	**No Command Completed Support (NCCS):** Set to '1' as this port does not implement a Hot Plug controller and can handle back-2-back writes to all fields of the slot control register without delay between successive writes.
17	0h RO	**Electromechanical Interlock Present (EMIP):** Set to 0 to indicate that no electro-mechanical interlock is implemented.
16:15	0h RW/O	**Slot Power Limit Scale (SLS):** Specifies the scale used for the slot power limit value. BIOS sets this field and it remains set until a platform reset.
14:8	00h RW/O	**Slot Power Limit Value (SLV__14_8):** Specifies the upper limit (in conjunction with SLS value), on the upper limit on power supplied by the slot. The two values together indicate the amount of power in watts allowed for the slot. BIOS sets this field and it remains set until a platform reset.
7	0h RW/O	**Slot Power Limit Value (SLV__7_7):** Specifies the upper limit (in conjunction with SLS value), on the upper limit on power supplied by the slot. The two values together indicate the amount of power in watts allowed for the slot. BIOS sets this field and it remains set until a platform reset.
6	1h RW/O	**Hot Plug Capable (HPC):** When set, Indicates that hot plug is supported.
5	1h RW/O	**Hot Plug Surprise (HPS):** When set, indicates the device may be removed from the slot without prior notification.
4	0h RO	**Power Indicator Present (PIP):** Indicates that a power indicator LED is not present for this slot.
3	0h RO	**Attention Indicator Present (AIP):** Indicates that an attention indicator LED is not present for this slot.
2	0h RO	**MRL Sensor Present (MSP):** Indicates that an MRL sensor is not present
1	0h RO	**Power Controller Present (PCP):** Indicates that a power controller is not implemented for this slot
0	0h RO	**Attention Button Present (ABP):** Indicates that an attention button is not implemented for this slot.

11.1.19 Slot Control And Slot Status (SLCTL_SLSTS) - Offset 58h

This is Slot Control and Slot Status register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 58h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW/1C/V	**Data Link Layer State Changed (DLLSC):** This bit is set when the value reported in Data Link Layer Link Active field of the Link Status register is changed. In response to a Data Link Layer State Changed event, software must read Data Link Layer Link Active field of the Link Status register to determine if the link is active before initiating configuration cycles to the hot plugged device.
23	0h RO	**Electromechanical Interlock Status (EMIS):** Reserved
22	0h RO/V	**Presence Detect State (PDS):** If XCAP.SI is set (indicating that this root port spawns a slot), then this bit indicates whether a device is connected ('1') or empty ('0'). If XCAP.SI is cleared, this bit is a '1'.
21	0h RO	**MRL Sensor State (MS):** Reserved
20	0h RO	**Command Completed (CC):** This register is RO as this port does not implement a Hot Plug Controller..
19	0h RW/1C/V	**Presence Detect Changed (PDC):** This bit is set by the root port when the PDS bit changes state.
18	0h RO	**MRL Sensor Changed (MSC):** Reserved
17	0h RO	**Power Fault Detected (PFD):** Reserved
16	0h RO	**Attention Button Pressed (ABP):** This register is RO as this port does not implement an attention button
15:14	0h RO	**Reserved**
13	0h RW	**Auto Slot Power Limit Disable (ASPLD):** When set, this bit disables automatic sending of Set_Slot_Power_Limit message when the link transitions from non-DL_Up status to DL_Up status. Register Attribute: Dynamic.
12	0h RW	**Data Link Layer State Changed Enable (DLLSCE):** When set, this field enables generation of a hot plug interrupt when the Data Link Layer Link Active field is changed
11	0h RO	**Electromechanical Interlock Control (EMIC):** Reserved
10	0h RO	**Power Controller Control (PCC):** This bit has no meaning for module based hot plug.
9:8	0h RO	**Power Indicator Control (PIC):** This register is RO as this port does not implement a Hot Plug Controller..
7:6	0h RO	**Attention Indicator Control (AIC):** This register is RO as this port does not implement a Hot Plug Controller..
5	0h RW	**Hot Plug Interrupt Enable (HPE):** When set, enables generation of a hot plug interrupt on enabled hot plug events.
4	0h RO	**Command Completed Interrupt Enable (CCE):** This register is RO as this port does not implement a Hot Plug Controller..

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Presence Detect Changed Enable (PDE):** When set, enables the generation of a hot plug interrupt or wake message when the presence detects logic changes state.
2	0h RO	**MRL Sensor Changed Enable (MSE):** This register is RO as this port does not implement a Hot Plug Controller.
1	0h RO	**Power Fault Detected Enable (PFE):** This register is RO as this port does not implement a Hot Plug Controller.
0	0h RO	**Attention Button Pressed Enable (ABE):** This register is RO as this port does not implement a Hot Plug Controller.

11.1.20 Root Control (RCTL) - Offset 5Ch

This is Root Control register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 5Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**PME Interrupt Enable (PIE):** When set, enables interrupt generation when RSTS.PS is in a set state (either due to a '0' to '1' transition, or due to this bit being set with RSTS.PS already set).
2	0h RW	**System Error on Fatal Error Enable (SFE):** When set, an SERR# will be generated if a fatal error is reported by any of the devices in the hierarchy of this root port, including fatal errors in this root port. This register is not dependent on CMD.SEE being set.
1	0h RW	**System Error on Non-Fatal Error Enable (SNE):** When set, an SERR# will be generated if a non-fatal error is reported by any of the devices in the hierarchy of this root port, including non-fatal errors in this root port. This register is not dependent on CMD.SEE being set.
0	0h RW	**System Error on Correctable Error Enable (SCE):** When set, an SERR# will be generated if a correctable error is reported by any of the devices in the hierarchy of this root port, including correctable errors in this root port. This register is not dependent on CMD.SEE being set.

11.1.21 Root Status (RSTS) - Offset 60h

This is Root Status register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 60h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17	0h RO/V	**PME Pending (PP):** Indicates another PME is pending when the PME status bit is set. When the original PME is cleared by software, it will be set again, the requestor ID will be updated, and this bit will be cleared. Root ports have a one deep PME pending queue.
16	0h RW/1C/V	**PME Status (PS):** Indicates that PME was asserted by the requestor ID in RID. Subsequent PMEs are kept pending until this bit is cleared.
15:0	0000h RO/V	**PME Requestor ID (RID):** Indicates the PCI requestor ID of the last PME requestor. Valid only when PS is set. Root ports are capable of storing the requester ID for two PM_PME messages, with one active (this register) and a one deep pending queue. Subsequent PM_PME messages will be dropped.

11.1.22 Device Capabilities 2 (DCAP2) - Offset 64h

This is Device Capabilities 2 register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 64h	00080837h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19:18	2h RW/O	**Optimized Buffer Flush/Fill Supported (OBFFS):** 00b - OBFF is not supported. 01b - OBFF is supported using Message signaling only. 10b - OBFF is supported using WAKE# signaling only. 11b - OBFF is supported using WAKE# and Message signaling. BIOS should program this field to 00b or 10b during system initialization to advertise the level of hardware OBFF support to software. BIOS should never program this field to 01b or 11b since OBFF messaging is not supported. Note: OBFF is not supported. BIOS should program this field to *"00b"*.
17:12	0h RO	**Reserved**
11	1h RW/O	**LTR Mechanism Supported (LTRMS):** A value of 1b indicates support for the optional Latency Tolerance Reporting (LTR) mechanism capability. BIOS must write to this register with either a '1' or a '0' to enable/disable the root port from declaring support for the LTR capability.
10:6	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
5	1h RO	**ARI Forwarding Supported (AFS):** ARI Forwarding Supported (AFS): Applicable only to Switch Downstream Ports and Root Ports; must be 0b for other Function types. This bit must be set to 1b if a Switch Downstream Port or Root Port supports this optional capability. Note: This bit is not made RWO to simplify implementation, since there is a requirement that the ARI Forwarding Enable bit must be hardwired to 0b if ARI Forwarding Supported bit is 0b. It is low risk to keep this risk 1b. Register Attribute: Static.
4	1h RO	**Completion Timeout Disable Supported (CTDS):** A value of 1b indicates support for the Completion Timeout Disable mechanism.
3:0	7h RO	**Completion Timeout Ranges Supported (CTRS):** This field indicates device support for the optional Completion Timeout programmability mechanism. This mechanism allows system software to modify the Completion Timeout value. This field is applicable only to Root Ports, Endpoints that issue requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of requests issued on PCI Express. For all other devices this field is reserved and must be hardwired to 0000b. Four time value ranges are defined: Range A: 50us to 10ms Range B: 10ms to 250ms Range C: 250ms to 4s Range D: 4s to 64s Bits are set according to the table below to show timeout value ranges supported. 0000b Completion Timeout programming not supported. 0001b Range A 0010b Range B 0011b Ranges A [amp] B 0110b Ranges B [amp] C 0111b Ranges A, B [amp] C [lt]-- This is what PCH supports 1110b Ranges B, C [amp] D 1111b Ranges A, B, C [amp] D All other values are reserved.

11.1.23 Device Control 2 And Device Status 2 (DCTL2_DSTS2) - Offset 68h

This is Device Control 2 and Device Status 2 register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 68h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	**Reserved**
14:13	0h RW	**Optimized Buffer Flush/Fill Enable (OBFFEN):** 00b Disable OBFF mechanism. 01b Enable OBFF mechanism using Message signaling (Variation A). 10b Enable OBFF mechanism using Message signaling (Variation B). 11b Enable OBFF using WAKE# signaling. Note: Only encoding 00b and 11b are supported. The encoding of 01b or 10b would be aliased to 00b. If DCAP2.OBFFS is clear, programming this field to any non-zero values will have no effect.
12:11	0h RO	**Reserved**
10	0h RW	**LTR Mechanism Enable (LTREN):** When Set to 1b, this bit enables the Latency Tolerance Reporting (LTR) mechanism. For Downstream Ports, this bit must be reset to the default value if the Port goes to DL_Down status. If DCAP2.LTRMS is clear, programming this field to any non-zero values will have no effect.
9:6	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**ARI Forwarding Enable (AFE):** ARI Forwarding Enable (AFE): When set, the Downstream Port disables its traditional Device Number field being 0b enforcement when turning a Type 1 Configuration Request into a Type 0 Configuration Request, permitting access to Extended Functions in an ARI Device immediately below the Port. Register Attribute: Dynamic.
4	0h RW	**Completion Timeout Disable (CTD):** When set to 1b, this bit disables the Completion Timeout mechanism. This field is required for all devices that support the Completion Timeout Disable Capability. Software is permitted to set or clear this bit at any time. When set, the Completion Timeout detection mechanism is disabled. If there are outstanding requests when the bit is cleared, it is permitted but not required for hardware to apply the completion timeout mechanism to the outstanding requests. If this is done, it is permitted to base the start time for each request on either the time this bit was cleared or the time each request was issued.
3:0	0h RW	**Completion Timeout Value (CTV):** In Devices that support Completion Timeout programmability, this field allows system software to modify the Completion Timeout value. This field is applicable to Root Ports, Endpoints that issue requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of requests issued on PCI Express. For all other devices this field is reserved and must be hardwired to 0000b. A Device that does not support this optional capability must hardwire this field to 0000b and is required to implement a timeout value in the range 50us to 50ms. Devices that support Completion Timeout programmability must support the values given below corresponding to the programmability ranges indicated in the Completion Timeout Values Supported field. The root port targeted configurable ranges are listed below, along with the range allowed by the PCI Express 2.0 specification. Defined encodings: 0000b Default range: 40-50ms (spec range 50us to 50ms) Values available if Range A (50us to 10 ms) programmability range is supported: 0001b 90-100us (spec range is 50 us to 100 us) 0010b 9-10ms (spec range is 1ms to 10 ms) Values available if Range B (10ms to 250ms) programmability range is supported: 0101b 40-50ms (spec range is 16ms to 55ms) 0110b 160-170ms (spec range is 65ms to 210ms) Values available if Range C (250ms to 4s) programmability range is supported: 1001b 400-500ms (spec range is 260ms to 900ms) 1010b 1.6-1.7s (spec range is 1s to 3.5s) Values not defined above are Reserved. Software is permitted to change the value in this field at any time. For requests already pending when the Completion Timeout Value is changed, hardware is permitted to use either the new or the old value for the outstanding requests, and is permitted to base the start time for each request either on when this value was changed or on when each request was issued.

11.1.24 Link Capabilities 2 (LCAP2) - Offset 6Ch

This is Link Capabilities 2 register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 6Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:16	00h RO	**Lower SKP OS Reception Supported Speeds Vector (LSOSRSS):** Lower SKP OS Reception Supported Speeds Vector (LSOSRSS): If this field is non-zero, it indicates that the Port, when operating at the indicated speed(s) supports SRIS and also supports receiving SKP OS at the rate defined for SRNS while running in SRIS. Bit definitions within this field are: Bit 0 2.5 GT/s Bit 1 5.0 GT/s Bit 2 8.0 GT/s Bits 6:3 RsvdP Behavior is undefined if a bit is set in this field and the corresponding bit is not set in the Supported Link Speeds Vector.
15:9	00h RO	**Lower SKP OS Generation Supported Speeds Vector (LSOSGSSV):** Lower SKP OS Generation Supported Speeds Vector (LSOSGSSV): If this field is non-zero, it indicates that the Port, when operating at the indicated speed(s) supports SRIS and also supports software control of the SKP Ordered Set transmission scheduling rate. Bit definitions within this field are: Bit 0 2.5 GT/s Bit 1 5.0 GT/s Bit 2 8.0 GT/s Bits 6:3 RsvdP Behavior is undefined if a bit is set in this field and the corresponding bit is not set in the Supported Link Speeds Vector.
8	0h RO	**Crosslink Supported (CS):** Crosslink Supported (CS): No support for Crosslink. Register Attribute: Static.
7:1	00h RO/V	**Supported Link Speeds Vector (SLSV):** Supported Link Speeds Vector (SLSV): This field indicates the supported Link speed of the associated Port. For each bit, a value of 1b indicates that the corresponding Link speed is supported; otherwise, the Link speed is not supported. Bit definitions within this field for PCI Express are: Bit 0: 2.5 GT/s. Bit 1: 5.0 GT/s. Bit 2: 8.0 GT/s. Bits 6:3: Reserved. This register reports a value of 0000001b if GEN1 data rate is supported but both GEN2 and GEN3 data rate support are disabled through PCI Express Speed Limit Fuse or MPC.PCIESD register. This register reports a value of 0000011b if both GEN1 and GEN2 data rate are supported but GEN3 data rate support is disabled through PCI Express Speed Limit Fuse or MPC.PCIESD register. Otherwise, this field reports 0000111b. Register Attribute: Static.
0	0h RO	**Reserved**

11.1.25 Link Control 2 And Link Status 2 (LCTL2_LSTS2) - Offset 70h

This is Link Control 2 and Link Status 2 register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 70h	00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21	0h RW/1C/V/P	**Link Equalization Request (LER):** Link Equalization Request (LER): This bit is set by hardware to request the Link equalization process to be performed on the Link. Register Attribute: Dynamic.
20	0h RO/V/P	**Equalization Phase 3 Successful (EQP3S):** Equalization Phase 3 Successful (EQP3S): When set to 1, this bit indicates that Phase 3 of the Transmitter Equalization procedure has successfully completed.

Bit Range	Default & Access	Field Name (ID): Description
19	0h RO/V/P	**Equalization Phase 2 Successful (EQP2S):** Equalization Phase 2 Successful (EQP2S): When set to 1, this bit indicates that Phase 2 of the Transmitter Equalization procedure has successfully completed.
18	0h RO/V/P	**Equalization Phase 1 Successful (EQP1S):** Equalization Phase 1 Successful (EQP1S): When set to 1, this bit indicates that Phase 1 of the Transmitter Equalization procedure has successfully completed.
17	0h RO/V/P	**Equalization Complete (EQC):** Equalization Complete (EC): When set to 1, this bit indicates that the Transmitter Equalization procedure has completed
16	0h RO/V	**Current De-emphasis Level (CDL):** When the Link is operating at 5.0 GT/s speed, this bit reflects the level of de-emphasis. Encodings: 1b -3.5 dB 0b -6 dB The value in this bit is undefined when the Link is not operating at 5.0 GT/s speed.
15:12	0h RW/P	**Compliance Preset/De-emphasis (CD):** For 8.0 GT/s Data Rate: This field sets the Transmitter Preset in Polling.Compliance state if the entry occurred due to the Enter Compliance bit being 1b. Results are undefined if a reserved preset encoding is used when entering Polling.Compliance in this way. For 5.0 GT/s Data Rate: This bit sets the de-emphasis level in Polling.Compliance state if the entry occurred due to the Enter Compliance bit being 1b. Encodings: 0001b -3.5 dB 0000b -6 dB When the Link is not operating at 2.5 GT/s speed, the setting of this bit has no effect. The default value of this field is 0000b. This bit is intended for debug, compliance testing purposes. System firmware and software are allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this field is set to the default value.
11	0h RW/P	**Compliance SOS (CSOS):** When set to 1b, the LTSSM is required to send SKP Ordered Sets periodically in between the (modified) compliance patterns. The default value of this bit is 0b. This bit is applicable when the Link is operating at 2.5 GT/s or 5.0 GT/s data rates only. Register Attribute: Static.
10	0h RW/P	**Enter Modified Compliance (EMC):** When this bit is set to 1b, the device transmits Modified Compliance Pattern if the LTSSM enters Polling.Compliance substate. Default value of this bit is 0b. This register is intended for debug, compliance testing purposes only. System firmware and software are allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value.
9:7	0h RW/P	**Transmit Margin (TM):** This field controls the value of the non-deemphasized voltage level at the Transmitter pins. This field is reset to 000b on entry to the LTSSM Polling. Encodings: 000b Normal operating range 001b 800-1200 mV for full swing and 400-700 mV for half-swing 010b - (n-1) Values must be monotonic with a non-zero slope. The value of n must be greater than 3 and less than 7. At least two of these must be below the normal operating range of n: 200-400 mV for full-swing and 100-200 mV for half-swing n - 111b reserved For a Multi-Function device associated with an Upstream Port, the field in Function 0 is of type RWS, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this field is of type RsvdP. Default value of this field is 000b. Components that support only the 2.5 GT/s speed are permitted to hardwire this bit to 000b. This register is intended for debug, compliance testing purposes only. System firmware and software are allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value.
6	0h RW/P	**Selectable De-emphasis (SD):** When the Link is operating at 5.0 GT/s speed, this bit selects the level of de-emphasis for an Upstream component. Encodings: 1b -3.5 dB 0b -6 dB When the Link is not operating at 5.0 GT/s speed, the setting of this bit has no effect. When the Link is operating at 2.5 GT/s speed, the setting of this bit has no effect.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RO	**Hardware Autonomous Speed Disable (HASD):** Reserved
4	0h RW/P	**Enter Compliance (EC):** Software is permitted to force a Link to enter Compliance mode at the speed indicated in the Target Link Speed field by setting this bit to 1b in both components on a Link and then initiating a hot reset on the Link. Default value of this bit following Fundamental Reset is 0b. This bit is intended for debug, compliance testing purposes only. System firmware and software are allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this bit is set to the default value. Register Attribute: Static.
3:0	1h RW/V/P	**Target Link Speed (TLS):** Target Link Speed (TLS): This field sets an upper limit on Link operational speed by restricting the values advertised by the upstream component in its training sequences. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the current Link speed. Defined encodings are: 0001b: Supported Link Speeds Vector field bit 0. 0010b: Supported Link Speeds Vector field bit 1. 0011b: Supported Link Speeds Vector field bit 2. 0100b: Supported Link Speeds Vector field bit 3. 0101b: Supported Link Speeds Vector field bit 4. 0110b: Supported Link Speeds Vector field bit 5. 0111b: Supported Link Speeds Vector field bit 6. All other encodings are reserved. If a value is written to this field that does not correspond to a supported speed, as indicated by the Supported Link Speeds Vector, the result is undefined. The default value of this field is GEN1. Note: This register field could be used by REUT software to limit the link speed to 2.5 GT/s or 5 GT/s data rate. Register Attribute: Dynamic.

11.1.26 Message Signaled Interrupt Identifiers And Message Signaled Interrupt Message Control (MID_MC) - Offset 80h

This is Message Signaled Interrupt Identifiers and Message Signaled Interrupt Message Control register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 80h	00009005h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	0h RO	**64-Bit Address Capable (C64):** Capable of generating a 32-bit message only.
22:20	0h RW	**Multiple Message Enable (MME):** These bits are RW for software compatibility, but only one message is ever sent by the root port.
19:17	0h RO	**Multiple Message Capable (MMC):** Only one message is required.

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**MSI Enable (MSIE):** If set, MSI is enabled and traditional interrupt pins are not used to generate interrupts. CMD.BME must be set for an MSI to be generated. If CMD.BME is cleared, and this bit is set, no interrupts (not even pin based) are generated.
15:8	90h RW/O	**Next Pointer (NEXT):** Indicates the location of the next capability in the list. The default value of this register is 90h which points to the Subsystem Vendor capability structure. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value.
7:0	05h RO	**Capability ID (CID):** Capabilities ID indicates MSI.

11.1.27 Message Signaled Interrupt Message Address (MA) - Offset 84h

This is Message Signaled Interrupt Message Address register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 84h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RW	**ADDR:** Lower 32 bits of the system specified message address, always DW aligned.
1:0	0h RO	**Reserved**

11.1.28 Message Signaled Interrupt Message Data (MD) - Offset 88h

This is Message Signaled Interrupt Message Data register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 88h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0000h RW	**DATA:** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word (PCI AD[lb]15:0[rb]) during the data phase of the MSI memory write transaction.

11.1.29 Subsystem Vendor Capability (SVCAP) - Offset 90h

This is Subsystem Vendor Capability register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 90h	0000A00Dh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:8	A0h RW/O	**Next Capability (NEXT):** Indicates the location of the next capability in the list. The default value of this register is A0h which points to the PCI Power Management capability structure. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value.
7:0	0Dh RO	**Capability Identifier (CID):** Value of 0Dh indicates this is a PCI bridge subsystem vendor capability.

11.1.30 Subsystem Vendor IDs (SVID) - Offset 94h

Size: 32 bits

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 94h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O	**Subsystem Identifier (SID):** Indicates the subsystem as identified by the vendor. This field is written once and is locked down until a bridge reset occurs (not the PCI bus reset).
15:0	0000h RW/O	**Subsystem Vendor Identifier (SVID):** Indicates the manufacturer of the subsystem. This field is written once and is locked down until a bridge reset occurs (not the PCI bus reset).

11.1.31 Power Management Capability And PCI Power Management Capabilities (PMCAP_PMC) - Offset A0h

Size: 32 bits

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + A0h	C8030001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	19h RO	**PME Support (PMES):** Indicates PME# is supported for states D0, D3HOT and D3COLD. The root port does not generate PME#, but reporting that it does is necessary for legacy operating systems to enable PME# in devices connected behind this root port.
26	0h RO	**D2S:** The D2 state is not supported.
25	0h RO	**D1S:** The D1 state is not supported.
24:22	0h RO	**AC:** Reports 375mA maximum suspend well current required when in the D3COLD state.
21	0h RO	**Device Specific Initialization (DSI):** Indicates that no device-specific initialization is required.
20	0h RO	**Reserved**
19	0h RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
18:16	3h RO	**VS:** Indicates support for Revision 1.2 of the PCI Power Management Specification.
15:8	00h RO	**Next Capability (NEXT):** Indicates this is the last item in the list.
7:0	01h RO	**Capability Identifier (CID):** Value of 01h indicates this is a PCI power management capability.

11.1.32 PCI Power Management Control And Status (PMCS) - Offset A4h

This is PCI Power Management Control And Status register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + A4h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**DTA:** Reserved
23	0h RO	**Bus Power / Clock Control Enable (BPCE):** Reserved
22	0h RO	**B2/B3 Support (B23S):** Reserved
21:16	0h RO	**Reserved**
15	0h RO	**PME Status (PMES):** Indicates a PME was received on the downstream link.

Bit Range	Default & Access	Field Name (ID): Description
14:13	0h RO	**Data Scale (DSC):** Reserved
12:9	0h RO	**Data Select (DSEL):** Reserved
8	0h RW/P	**PME Enable (PMEE):** Indicates PME is enabled. The root port takes no action on this bit, but it must be RW for legacy operating systems to enable PME# on devices connected to this root port.
7:4	0h RO	**Reserved**
3	1h RW/O	**No Soft Reset (NSR):** When set to 1 this bit indicates that devices transitioning from D3hot to D0 because of Power State commands do not perform an internal reset. Configuration context is preserved. Upon transition from D3hot to D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the Power State bits. When clear, devices do perform an internal reset upon transitioning from D3hot to D0 via software control of the Power State bits. Configuration Context is lost when performing the soft reset. Upon transition from D3hot to D0 state, full reinitialization sequence is needed to return the device to D0 Initialized. Regardless of this bit, devices that transition from D3hot to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled.
2	0h RO	**Reserved**
1:0	0h RW	**Power State (PS):** This field is used both to determine the current power state of the root port and to set a new power state. The values are: 00 - D0 state 11 - D3HOT state When in the D3HOT state, the controller's configuration space is available, but the I/O and memory spaces are not. Type 1 configuration cycles are also not accepted. Interrupts are not required to be blocked as software will disable interrupts prior to placing the port into D3HOT. If software attempts to write a '10' or '01' to these bits, the write will be ignored. **Locked by:** PMCS.PS

11.1.33 Advanced Error Extended Reporting Capability Header (AECH) - Offset 100h

Size: 32 bits The AER capability can optionally be included or excluded from the capabilities list. The full AER is supported.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 100h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	000h RW/O	**Next Capability Offset (NCO):** Set to 000h as this is the last capability in the list. Point to the next capability.
19:16	0h RW/O	**Capability Version (CV):** For systems that support AER, BIOS should write a 1h to this register else it should write 0
15:0	0000h RW/O	**Capability ID (CID):** For systems that support AER, BIOS should write a 0001h to this register else it should write 0

11.1.34 Uncorrectable Error Status (UES) - Offset 104h

This register must maintain its state through a platform reset. It loses its state upon loss of core power.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 104h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved**
26	0h RW/1C/V/P	**Poisoned TLP Egress Blocked Status (PTLPEBS):** Indicates that poisoned TLP Egress Blocked error has occurred. ***Note***: This bit can only be set if DPCCAPR.PTLPEBS = 1 and DPCCTLR.PTLPEBE = 1. Register Attribute: Dynamic.
25:22	0h RO	**Reserved**
21	0h RW/1C/V/P	**ACS Violation Status (AVS):** Indicates an ACS Violation is logged
20	0h RW/1C/V/P	**Unsupported Request Error Status (URE):** Indicates an unsupported request was received.
19	0h RO	**ECRC Error Status (EE):** ECRC is not supported.
18	0h RW/1C/V/P	**Malformed TLP Status (MT):** Indicates a malformed TLP was received.
17	0h RW/1C/V/P	**Receiver Overflow Status (RO):** Indicates a receiver overflow occurred.
16	0h RW/1C/V/P	**Unexpected Completion Status (UC):** Indicates an unexpected completion was received.
15	0h RW/1C/V/P	**Completor Abort Status (CA):** Indicates a completer abort was received
14	0h RW/1C/V/P	**Completion Timeout Status (CT):** Indicates a completion timed out. This is signaled if Completion Timeout is enabled and a completion fails to return within the amount of time specified by the Completion Timeout Value
13	0h RO	**Flow Control Protocol Error Status (FCPE):** Not supported.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW/1C/V/P	**Poisoned TLP Status (PT):** Indicates a poisoned TLP was received.
11:6	0h RO	**Reserved**
5	0h RO	**Surprise Down Error Status (SDE):** Surprise Down is not supported.
4	0h RW/1C/V/P	**Data Link Protocol Error Status (DLPE):** Indicates a data link protocol error occurred.
3:1	0h RO	**Reserved**
0	0h RO	**Training Error Status (TE):** Not supported.

11.1.35 Uncorrectable Error Mask (UEM) - Offset 108h

When set, the corresponding error in the UES register is masked, and the logged error will cause no action. When cleared, the corresponding error is enabled. This register is only reset by a loss of core power.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 108h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved**
26	0h RW/P	**Poisoned TLP Egress Blocked Mask (PTLPEBM):** Mask for Poisoned TLP Egress Blocked error. Register Attribute: Dynamic.
25:22	0h RO	**Reserved**
21	0h RW/P	**ACS Violation Mask (AVM):** Mask for ACS Violation errors
20	0h RW/P	**Unsupported Request Error Mask (URE):** Mask for uncorrectable errors.
19	0h RO	**ECRC Error Mask (EE):** ECRC is not supported.
18	0h RW/P	**Malformed TLP Mask (MT):** Mask for malformed TLPs
17	0h RW/P	**Receiver Overflow Mask (RO):** Mask for receiver overflows.
16	0h RW/P	**Unexpected Completion Mask (UC):** Mask for unexpected completions.
15	0h RW/P	**Completor Abort Mask (CM):** Mask for completer abort.

Bit Range	Default & Access	Field Name (ID): Description
14	0h RW/P	**Completion Timeout Mask (CT):** Mask for completion timeouts.
13	0h RO	**Flow Control Protocol Error Mask (FCPE):** Not supported.
12	0h RW/P	**Poisoned TLP Mask (PT):** Mask for poisoned TLPs.
11:6	0h RO	**Reserved**
5	0h RO	**Surprise Down Error Mask (SDE):** Surprise Down is not supported.
4	0h RW/P	**Data Link Protocol Error Mask (DLPE):** Mask for data link protocol errors.
3:1	0h RO	**Reserved**
0	0h RO	**Training Error Mask (TE):** Not supported.

11.1.36 Uncorrectable Error Severity (UEV) - Offset 10Ch

This register gives the option to make an uncorrectable error fatal or non-fatal. An error is fatal if the bit is set. An error is non-fatal if the bit is cleared. This register is only reset by a loss of core power.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 10Ch	00060011h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved**
26	0h RW/P	**Poisoned TLP Egress Blocked Severity (PTLPEBS):** Severity for Poisoned TLP Egress Blocked error. Register Attribute: Dynamic.
25:22	0h RO	**Reserved**
21	0h RW/P	**ACS Violation Severity (AVS):** Severity for ACS violation.
20	0h RW/P	**Unsupported Request Error Severity (URE):** Severity for unsupported request reception.
19	0h RO	**ECRC Error Severity (EE):** ECRC is not supported.
18	1h RW/P	**Malformed TLP Severity (MT):** Severity for malformed TLP reception.
17	1h RW/P	**Receiver Overflow Severity (RO):** Severity for receiver overflow occurrences.

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW/P	**Unexpected Completion Severity (UC):** Severity for unexpected completion reception.
15	0h RW/P	**Completor Abort Severity (CA):** Severity for completer abort.
14	0h RW/P	**Completion Timeout Severity (CT):** Severity for completion timeout.
13	0h RO	**Flow Control Protocol Error Severity (FCPE):** Not supported.
12	0h RW/P	**Poisoned TLP Severity (PT):** Severity for poisoned TLP reception.
11:6	0h RO	**Reserved**
5	0h RO	**Surprise Down Error Severity (SDE):** Surprise Down is not supported.
4	1h RW/P	**Data Link Protocol Error Severity (DLPE):** Severity for data link protocol errors.
3:1	0h RO	**Reserved**
0	1h RO	**Training Error Severity (TE):** TE not supported. This bit is left as RO='1' for ease of implementation..

11.1.37 Correctable Error Status (CES) - Offset 110h

This register is only reset by a loss of core power

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 110h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13	0h RW/1C/V/P	**Advisory Non-Fatal Error Status (ANFES):** When set, indicates that an Advisory Non-Fatal Error occurred.
12	0h RW/1C/V/P	**Replay Timer Timeout Status (RTT):** Indicates the replay timer timed out.
11:9	0h RO	**Reserved**
8	0h RW/1C/V/P	**Replay Number Rollover Status (RNR):** Indicates the replay number rolled over.
7	0h RW/1C/V/P	**Bad DLLP Status (BD):** Indicates a bad DLLP was received.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW/1C/V/P	**Bad TLP Status (BT):** Indicates a bad TLP was received.
5:1	0h RO	**Reserved**
0	0h RW/1C/V/P	**Receiver Error Status (RE):** Indicates a receiver error occurred.

11.1.38 Correctable Error Mask (CEM) - Offset 114h

When set, the corresponding error in the CES register is masked, and the logged error will cause no action. When cleared, the corresponding error is enabled. This register is only reset by a loss of core power.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 114h	00002000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13	1h RW/P	**Advisory Non-Fatal Error Mask (ANFEM):** When set, masks Advisory Non-Fatal errors from (a) signaling ERR_COR to the device control register and (b) updating the Uncorrectable Error Status register. This register is set by default to enable compatibility with software that does not comprehend Role-Based Error Reporting.
12	0h RW/P	**Replay Timer Timeout Mask (RTT):** Mask for replay timer timeout.
11:9	0h RO	**Reserved**
8	0h RW/P	**Replay Number Rollover Mask (RNR):** Mask for replay number rollover.
7	0h RW/P	**Bad DLLP Mask (BD):** Mask for bad DLLP reception.
6	0h RW/P	**Bad TLP Mask (BT):** Mask for bad TLP reception.
5:1	0h RO	**Reserved**
0	0h RW/P	**Receiver Error Mask (RE):** Mask for receiver errors.

11.1.39 Advanced Error Capabilities And Control (AECC) - Offset 118h

This register is only reset by a loss of core power.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 118h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	**Reserved**
12	0h RO	**Completion Timeout Prefix/Header Log Capable (CTPHLC):** If set, this bit indicates that port records the prefix/header of Request TLPs that experience a Completion Timeout error. Note: BIOS should program this bit before enable the Completion Timeout mechanism. Register Attribute: Static.
11:9	0h RO	**Reserved**
8	0h RO	**ECRC Check Enable (ECE):** ECRC is not supported.
7	0h RO	**ECRC Check Capable (ECC):** ECRC is not supported.
6	0h RO	**ECRC Generation Enable (EGE):** ECRC is not supported.
5	0h RO	**ECRC Generation Capable (EGC):** ECRC is not supported.
4:0	00h RO/V/P	**First Error Pointer (FEP):** Identifies the bit position of the first error reported in the Uncorrectable Error Status Register.

11.1.40 Header Log DW1 (HL_DW1) - Offset 11Ch

Size: 32 bits These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 11Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V/P	**1st dWord of TLP (DW1):** Byte0 [amp][amp] Byte1 [amp][amp] Byte2 [amp][amp] Byte3

11.1.41 Header Log DW2 (HL_DW2) - Offset 120h

Size: 32 bits These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 120h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V/P	**2nd dWord of TLP (DW2):** Byte4 [amp][amp] Byte5 [amp][amp] Byte6 [amp][amp] Byte7

11.1.42 Header Log DW3 (HL_DW3) - Offset 124h

Size: 32 bits These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 124h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V/P	**3rd dWord of TLP (DW3):** Byte8 [amp][amp] Byte9 [amp][amp] Byte10 [amp][amp] Byte11

11.1.43 Header Log DW4 (HL_DW4) - Offset 128h

Size: 32 bits These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 128h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V/P	**4th dWord of TLP (DW4):** Byte12 [amp][amp] Byte13 [amp][amp] Byte14 [amp][amp] Byte15

11.1.44 Root Error Command (REC) - Offset 12Ch

This register allows errors to generate interrupts.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 12Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2	0h RW	**Fatal Error Reporting Enable (FERE):** When set, the root port will generate an interrupt when a fatal error is reported by the attached device.
1	0h RW	**Non-fatal Error Reporting Enable (NERE):** When set, the root port will generate an interrupt when a non-fatal error is reported by the attached device.
0	0h RW	**Correctable Error Reporting Enable (CERE):** When set, the root port will generate an interrupt when a correctable error is reported by the attached device.

11.1.45 Root Error Status (RES) - Offset 130h

This register can track more than one error and set the *"multiple"* bits if a second or subsequent error occurs and the first has not been serviced. This register is only reset by a loss of core power.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 130h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	00h RO	**Advanced Error Interrupt Message Number (AEMN):** Reserved
26:7	0h RO	**Reserved**
6	0h RW/1C/V/P	**Fatal Error Message Received (FEMR):** Set when one or more Fatal Uncorrectable Error Messages have been received.
5	0h RW/1C/V/P	**Non-Fatal Error Messages Received (NFEMR):** Set when one or more Non-Fatal Uncorrectable error messages have been received
4	0h RW/1C/V/P	**First Uncorrectable Fatal (FUF):** Set when the first Uncorrectable Error message received is for a fatal error.
3	0h RW/1C/V/P	**Multiple ERR_FATAL/NONFATAL Received (MENR):** Set when either a fatal or a non-fatal error is received and the ENR bit is already set.
2	0h RW/1C/V/P	**ERR_FATAL/NONFATAL Received (ENR):** Set when either a fatal or a non-fatal error message is received.
1	0h RW/1C/V/P	**Multiple ERR_COR Received (MCR):** Set when a correctable error message is received and the CR bit is already set.
0	0h RW/1C/V/P	**ERR_COR Received (CR):** Set when a correctable error message is received.

11.1.46 Error Source Identification (ESID) - Offset 134h

Size: 32 bits Identifies the source (Requester ID) of the first correctable and uncorrectable (Non-Fatal/ Fatal) errors reported in the Root Error Status register. This register is only reset by a loss of core power.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 134h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO/V/P	**ERR_FATAL/NONFATAL Source Identification (EFNFSID):** Loaded with the Requester ID indicated in the received ERR_FATAL or ERR_NONFATAL Message with the ERR_FATAL/NONFATAL Received register is not already set.
15:0	0000h RO/V/P	**ERR_COR Source Identification (ECSID):** Loaded with the Requester ID indicated in the received ERR_COR Message with the ERR_COR Received register is not already set.

11.1.47 PTM Extended Capability Header (PTMECH) - Offset 150h

Size: 32 bits

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 150h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	000h RW/O	**Next Capability Offset (NCO):** Next Capability Offset (NCO): Points to the next capability.
19:16	0h RW/O	**Capability Version (CV):** Capability Version (CV): For systems that support PTM Extended Capability, BIOS should write a 1h to this register else it should write 0.
15:0	0000h RW/O	**Capability ID (CID):** Capability ID (CID): For systems that support PTM Extended Capability, BIOS should write a 001Fh to this register else it should write 0.

11.1.48 PTM Capability Register (PTMCAPR) - Offset 154h

This is PTM Capability register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 154h	00000400h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:8	04h RW/O	**Local Clock Granularity (LCG):** Local Clock Granularity (LCG): 0000 0000b - Time Source does not implement a local clock. It simply propagates timing information obtained from further Upstream in the PTM Hierarchy when responding to PTM Request messages. 0000 0001b - 1111 1110b: Indicates the period of this Time Sources local clock in ns. 1111 1111b: Indicates the period of this Time Sources local clock is greater than 254 ns. If the PTM Root Select bit is Set, this local clock is used to provide PTM Master Time. Otherwise, the Time Source uses this local clock to locally track PTM Master Time received from further Upstream within a PTM Hierarchy.
7:3	0h RO	**Reserved**
2	0h RW/O	**PTM Root Capable (PTMRC):** PTM Root Capable (PTMRC): Root Ports must set this bit to 1b.
1	0h RW/O	**PTM Responder Capable (PTMRSPC):** PTM Responder Capable (PTMRSPC): Root Ports are permitted to set this bit to 1b to indicate that they implement the PTM Responder role.
0	0h RO	**PTM Requester Capable (PTMREQC):** PTM Requester Capable (PTMREQC): PTM Requester Role is not supported by Root Port.

11.1.49 PTM Control Register (PTMCTLR) - Offset 158h

This is PTM Control register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 158h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:8	00h RO	**Effective Granularity (EG):** Effective Granularity (EG): Root Port does not support PTM Requester role.
7:2	0h RO	**Reserved**
1	0h RW	**Root Select (RS):** Root Select (RS): When Set, if the PTM Enable bit is also Set, this Time Source is the PTM Root. Within each PTM Hierarchy, it is recommended that system software select only the furthest Upstream Time Source to be the PTM Root.
0	0h RW	**PTM Enable (PTME):** PTM Enable (PTME): When Set, this Function is permitted to participate in the PTM mechanism according to its selected role. Software must not have the PTM Enable bit Set in the PTM Control register on a Function associated with an Upstream Port unless the associated Downstream Port on the Link already has the PTM Enable bit Set in its associated PTM Control register. Register Attribute: Static.

11.1.50 L1 Sub-States Extended Capability Header (L1SECH) - Offset 200h

Size: 32 bits

Note: When operating in Mobile Express mode, this capability should not be enabled.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 200h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	000h RW/O	**Next Capability Offset (NCO):** This field contains the offset to the next PCI Express Capability structure or 000h if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. The bottom 2 bits of this offset are Reserved and must be implemented as 00b and software must mask them to allow for future uses of these bits.
19:16	0h RW/O	**Capability Version (CV):** This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. Must be 1h for this version of the specification. For systems that support L1 Sub-State Extended Capability, BIOS should set this field to 1h
15:0	0000h RW/O	**PCI Express Extended Capability ID (PCIEEC):** This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. For systems that support L1 Sub-State Extended Capability, BIOS should set this field to 001Eh.

11.1.51 L1 Sub-States Capabilities (L1SCAP) - Offset 204h

This is L1 Sub-States Capabilities register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 204h	0028281Fh

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:19	05h RW/O	**Port Tpower_on Value (PTV):** Along with the Port T_POWER_ON Scale Field in the L1 Substate Capabilities register sets theTime (in us) that this Port requires the port on the opposite side of Link to wait in L1.OFF_EXIT after sampling CLKREQ# asserted before actively driving the interface. Port Tpower_on is calculated by multiplying the value in this field by the value in the Port Tpower_on scale field in the L1 Sub-States Capabilities 2 register. Required for all Ports that support L1.OFF.
18	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
17:16	0h RW/O	**Port Tpower_on Scale (PTPOS):** Specifies the scale used for Tpower_on value field in the L1 Substate Capabilities register. *"00b"*: 2us *"01b"*: 10us *"10b"*: 100us *"11b"*: Reserved Required for all Ports that support L1.OFF.
15:8	28h RW/O	**Port Common Mode Restore Time (PCMRT):** This is the time (in us) required for this Port to re-establish common mode. Required for all ports that support L1.OFF.
7	0h RO	**Reserved**
6	0h RW/1C/V	**L1-Substate Exit Interrupt Status (L1SSEIS):** CLKREQ# Acceleration Interrupt Status - For a Downstream Port that has both the CLKREQ# Acceleration Supported and CLKREQ# Acceleration Interrupt Enable bits Set, when set this bit indicates that the Port has completed the CLKREQ# Acceleration Link Activation process, and that the Link has reached L0. Software must then clear this bit by writing a 1b to this bit. Must be hardwired to 0b for Upstream Ports. Default value is 0b.
5	0h RW/O	**L1-Substate Exit Supported (L1SSES):** CLKREQ# Acceleration Supported - When set this bit indicates that this Port supports CLKREQ# Acceleration
4	1h RW/O	**L1 PM Substate Supported (L1PSS):** When Set this bit indicates that this Port supports L1 PM Substate. For compatibility with possible future extensions, software must not enable L1 PM Substate unless this bit is set. This RWO field must be programmed prior to enabling ASPM. Required for both Upstream and Downstream Ports.
3	1h RW/O	**ASPM L1.1 Substate Supported (AL11S):** When set, this bit indicates that this port supports L1 Substate for ASPM L1.SNOOZ is supported. Required for both Upstream and Downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static
2	1h RW/O	**ASPM L1.2 Supported (AL12S):** When set, this bit indicates that ASPM_L1.OFF is supported. Required for both Upstream and Downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static
1	1h RW/O	**PCI-PM L1.1 Supported (PPL11S):** When set, this bit indicates that L1.SNOOZ sub-state is supported and this bit must be set by all ports implementing L1 Sub-States. A port that supports L1.OFF must support L1.SNOOZ. Required for both upstream and downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static
0	1h RW/O	**PCI-PM L1.2 Supported (PPL12S):** When set, this bit indicates that PCI-PM L1.OFF power management feature is supported. Required for both upstream and downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static

11.1.52 L1 Sub-States Control 1 (L1SCTL1) - Offset 208h

This is L1 Sub-States Control 1 register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 208h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RW	**L1.2 LTR Threshold Latency Scale Value (L12LTRTLSV):** This field contains the L1.OFF LTR Threshold Latency Scale Value for this particular PCIe Root Port. The value in this field, together with L12LTRTLV is compared against both the snoop and non-snoop LTR values of the device. 000: L12LTRSTLV times 1 ns 001: L12LTRSTLV times 32 ns 010: L12LTRSTLV times 1024 ns 011: L12LTRSTLV times 32768 ns 100: L12LTRSTLV times 1048576 ns 101: L12LTRSTLV times 33554432 ns Others: Not Permitted. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
28:26	0h RO	**Reserved**
25:16	000h RW	**L1.2 LTR Threshold Latency Value (L12OFFLTRTLV):** This field contains the L1.2 LTR Threshold Latency Value for this particular PCIe Root Port. The value in this field, together with L12LTRTLSV is compared against both the snoop and non-snoop LTR values of the device. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
15:8	00h RW	**Common Mode Restore Time (CMRT):** This is the Tcommon_mode time (in us) the PCIe Root Port needs to continue sending TS1 and refrain from sending TS2 in Recovery state to allow the TX common mode to be established prior to sending TS2. The timer starts from the time when the first TS1 has been sent and the receiver has detected un-squelch. The value in this field defines the time in micro-seconds. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
7:6	0h RO	**Reserved**
5	0h RW	**L1-Substate Exit Control (L1SSEC):** L1 Substate Exit Control - For a Downstream Port, when any one or more of the PCI-PM L1.2 Enable, PCI-PM L1.1 Enable, {ASPM L1.2 Enable, ASPM L1.1 Enable } bit are Set, then when this bit is Set, the Port must initiate the CLKREQ# Acceleration Link Activation process, and once the Link reaches L0, the Port must continue to attempt to maintain the Link in L0 for as long as this bit remains Set. Must be hardwired to 0b for Upstream Ports. Default value is 0b.If this bit is set, and the link is in L1 Substate, the downstream port will initiate L1 Substate exit to L0. This includes asserting the CLKREQ# pin to trigger L1 Substate exit, and sending Training Sequence to bring the LTSSM back to L0 through Recovery state. The CLKREQ# pin will continue to be asserted as long as this bit is set even after the LTSSM has reached L0, until this bit is cleared.
4	0h RW	**L1-Substate Exit Interrupt Enable (L1SSEIE):** CLKREQ# Acceleration Interrupt Enable - When set this bit enables the generation of an interrupt to indicate the completion of the CLKREQ# Acceleration Link Activation process. Required for Downstream Ports when the CLKREQ# Acceleration Supported bit is Set. Must be hardwired to 0b for Upstream Ports. Default value is 0b.
3	0h RW	**ASPM L1.1 Enabled (AL11E):** When set, this bit indicates that ASPM L1.SNOOZ Substate are enabled for ASPM. Required for both upstream and downstream ports. Register Attribute: Dynamic Note: If STRPFUSECFG.mPHYIOPMDIS is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**ASPM L1.2 Enable (AL12E):** When set, this bit indicates that ASPM L1.OFF substates are enabled for PCI-PM. Required for both upstream and downstream ports. Register Attribute: Dynamic. Note: If STRPFUSECFG.mPHYIOPMDIS is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.
1	0h RW	**PCI-PM L1.SNOOZ Enable (PPL11E):** When set, this bit indicates that PCI-PM L1.SNOOZ power management feature is enabled. If L1.OFF is enabled, L1.SNOOZ must also be enabled. This field must be programmed prior to enabling ASPM L1. Register Attribute: Dynamic Note: If STRPFUSECFG.mPHYIOPMDIS is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.
0	0h RW	**PCI-PM L1.2 Enabled (PPL12E):** When set, this bit indicates that PCI-PM L1.OFF power management feature is enabled. L1.OFF can only be enabled if the platform supports bi-directional CLKREQPLUS#. This field must be programmed prior to enabling ASPM L1. Ports that support L1.OFF shall support Latency Tolerance Reporting. Register Attribute: Dynamic Note: If STRPFUSECFG.mPHYIOPMDIS is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.

11.1.53 L1 Sub-States Control 2 (L1SCTL2) - Offset 20Ch

This is L1 Sub-States Control 2 register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 20Ch	00000028h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:3	05h RW	**Power On Wait Time (POWT):** Along with the Tpower_on Scale sets the minimum amount of time (in us) that the Port must wait in L1.OFF EXIT after sampling CLKREQPLUS# asserted before actively driving the interface. The timer starts counting when CLKREQPLUS# is sampled asserts in L1.OFF state. Tpower_on value is calculated by multiplying the value in this field by the value in the TPOS field. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
2	0h RO	**Reserved**
1:0	0h RW	**Tpower_on Scale (TPOS):** Specifies the scale used for Tpower_on value. *"00b"*: 2 us *"01b"*: 10 us *"10b"*: 100us *"11b"*: Reserved. Required for all Ports that support L1.OFF. Register Attribute: Static

11.1.54 ACS Extended Capability Header (ACSECH) - Offset 220h

Size: 32 bits

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 220h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	000h RW/O	**Next Capability Offset (NCO):** Next Capability Offset (NCO): Points to the next capability.
19:16	0h RW/O	**Capability Version (CV):** Capability Version (CV): For systems that support ACS Extended Capability, BIOS should write a 1h to this register else it should write 0.
15:0	0000h RW/O	**Capability ID (CID):** Capability ID (CID): For systems that support ACS Extended Capability, BIOS should write a 000Dh to this register else it should write 0.

11.1.55 ACS Capability Register And ACS Control Register (ACSCAPR_ACSCTLR) - Offset 224h

This is ACS Capability Register and ACS Control register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + 224h	0000001Fh

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22	0h RO	**ACS Direct Translated P2P Enable (TE):** ACS Direct Translated P2P Enable (T): ACS Direct Translated P2P is not supported.
21	0h RO	**ACS P2P Egress Control Enable (EE):** ACS P2P Egress Control Enable (E): ACS P2P Egress Control is not supported.
20	0h RW	**ACS Upstream Forwarding Enable (UE):** When set, the component forwards upstream any Request or Completion TLPs it receives that were redirected upstream by a component lower in the hierarchy. Note that the U bit only applies to upstream TLPs arriving at a Downstream Port, and whose normal routing targets the same Downstream Port. Upstream I/O, Configuration, VDM Message, Message are never affected by ACS Upstream Forwarding Enable. Register Attribute: Static
19	0h RW	**ACS P2P Completion Redirect Enable (CE):** ACS P2P Completion Redirect (C): Determines when the component redirects peer-to-peer Completions upstream; applicable only to Read Completions whose Relaxed Ordering Attribute is clear. Requests are never affected by ACS P2P Completion Redirect. Default value of this field is 0b. Register Attribute: Static.
18	0h RW	**ACS P2P Request Redirect Enable (RE):** ACS P2P Request Redirect Enable (R): Determines when the component redirects peer-to-peer memory Requests targeting another peer port upstream. I/O, Configuration, VDM Messages and Completions are never affected by ACS P2P Request Redirect. Default value of this field is 0b. Register Attribute: Static.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**ACS Translation Blocking Enable (BE):** ACS Translation Blocking Enable (B): When set, the component blocks all upstream Memory Requests whose Address Translation (AT) field is not set to the default value. I/O, Configuration, Completions and Messages are never affected by ACS Translation Blocking. Default value of this field is 0b. Register Attribute: Static.
16	0h RW	**ACS Source Validation Enable (VE):** ACS Source Validation Enable (V): When set, the component validates the Bus Number from the Requester ID of upstream Requests against the secondary / subordinate Bus Numbers. I/O, Configuration and Completions are never affected by ACS Source Validation. Default value of this field is 0b. Register Attribute: Static.
15:7	0h RO	**Reserved**
6	0h RO	**ACS Direct Translated P2P (T):** ACS Direct Translated P2P (T): ACS Direct Translated P2P is not supported.
5	0h RO	**ACS P2P Egress Control (E):** ACS P2P Egress Control (E): ACS P2P Egress Control is not supported
4	1h RW/O	**ACS Upstream Forwarding (U):** Required for Root Ports if the RC supports Redirected Request Validation: required for Switch Downstream Ports: must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS Upstream Forwarding Register Attribute: Static
3	1h RW/O	**ACS P2P Completion Redirect (C):** ACS P2P Completion Redirect (C): Required for all Functions that support ACS P2P Request Redirect; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS P2P Completion Redirect. Register Attribute: Static.
2	1h RW/O	**ACS P2P Request Redirect (R):** ACS P2P Request Redirect (R): Required for Root Ports that support peer-to-peer traffic with other Root Ports; required for Switch Downstream Ports; required for multi-function device Functions that support peer-to-peer traffic with other Functions; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS P2P Request Redirect. Register Attribute: Static.
1	1h RW/O	**ACS Translation Blocking (B):** ACS Translation Blocking (B): Required for Root Ports and Switch Downstream Ports; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS Translation Blocking. Register Attribute: Static.
0	1h RW/O	**ACS Source Validation (V):** ACS Source Validation (V): Required for Root Ports and Switch Downstream Ports; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS Source Validation. Register Attribute: Static.

11.1.56 DPC Extended Capability Header (DPCECH) - Offset A00h

Size: 32 bits

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + A00h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	000h RW/O	**Next Capability Offset (NCO):** Points to the next capability.
19:16	0h RW/O	**Capability Version (CV):** For systems that support DPC Extended Capability, BIOS should write a 1h to this register else it should write 0.
15:0	0000h RW/O	**Capability ID (CID):** For systems that support DPC Extended Capability, BIOS should write a 001Dh to this register else it should write 0.

11.1.57 DPC Capability Register And DPC Control Register (DPCCAPR_DPCCTLR) - Offset A04h

This is DPC Capability Register and DPC Control register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + A04h	000014E0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	0h RW	**DL_Active ERR_COR Enable (DLAECE):** This bit when set, enables the downstream port to signal ERR_COR when the link transitions to the DL_Active state. Register Attribute: Dynamic.
22	0h RW	**DPC Software Trigger (DPCST):** If DPC Trigger is enabled and the DPC Trigger Status bit is clear, software writing a 1b to this bit will cause DPC to be triggered. If DPC Trigger is not enabled or DPC Trigger Status is set, software writing a 1b to this bit has no effect. ***Note***: It is permitted to write 1b to this bit while simultaneously writing updated values to other fields in this register, notably the DPC Trigger Enable field. For this case, the DPC Software Trigger semantics are based on the updated value of the DPC Trigger Enable field. ****Note***: This bit always return 0b when read. Register Attribute: Dynamic.
21	0h RW	**Poisoned TLP Egress Blocking Enable (PTLPEBE):** This bit, when set, enables the associated Egress Port to block the transmission of poisoned TLP. Register Attribute: Dynamic.
20	0h RW	**DPC ERR_COR Enable (DPCECE):** When set, this bit enables the generation of an interrupt to indicate that DPC has been triggered. Register Attribute: Dynamic.
19	0h RW	**DPC Interrupt Enable (DPCIE):** When set, this bit enables the generation of an interrupt to indicate that DPC has been triggered. Register Attribute: Dynamic.
18	0h RW	**DPC Completion Control (DPCCC):** This bit controls the Completion Status for completions formed during DPC. 0b: Completer Abort (CA) Completion Status. 1b: Unsupported Request (UR) Completion Status. Register Attribute: Dynamic.

Bit Range	Default & Access	Field Name (ID): Description
17:16	0h RW	**DPC Trigger Enable (DPCTE):** This field enables DPC and controls the conditions that cause DPC to be triggered.00b: DPC is disabled. 01b: DPC is enabled and is triggered when the Downstream Port detects an unmasked uncorrectable error or when the Downstream Port receives an ERR_FATAL message. 10b: DPC is enabled and is triggered when the Downstream Port detects an unmasked uncorrectable error or when the Downstream Port receives an ERR_NONFATAL or ERR_FATAL message. 11b: Reserved. Register Attribute: Dynamic.
15:13	0h RO	**Reserved**
12	1h RW/O	**DL_Active ERR_COR Signaling Supported (DLAECSS):** This field when set, indicates that the Root Port supports the ability to signal with ERR_COR when the link transitions to the DL_Active state. Root Port that supports RP Extensions for DPC must set this bit. Register Attribute: Static.
11:8	4h RW/O	**RP PIO Log Size (RPPIOLS):** This field indicates how many DWORDs are allocated for the RP PIO log registers, comprised by the RP PIO Header Log, RP PIO ImpSpec Log and RP PIO TLP Prefix Log. If the Root Port supports RP Extensions for DPC, the value of this field must be 4 or greater; otherwise the value of this field must be 0. Register Attribute: Static.
7	1h RW/O	**DPC Software Triggering Supported (DPCSTS):** This field when set, indicates that the Root Port supports the ability for software to trigger DPC. Root Ports that support RP Extensions for DPC must set this bit. Register Attribute: Static.
6	1h RW/O	**Poisoned TLP Egress Blocking Supported (PTLPEBS):** This field when set, indicates that the Root Port supports the ability to block the transmission of a poisoned TLP from its Egress port. Root Ports that support RP Extensions for DPC must set this bit. Register Attribute: Static.
5	1h RW/O	**RP Extensions For DPC (RPEFDPC):** This field when set, indicates that a Root Port supports a defined set of DPC Extensions that are specific to Root Ports. Register Attribute: Static.
4:0	00h RW/O	**DPC Interrupt Message Number (DPCIMN):** This field indicates which MSI/MSI-X vector is used for the interrupt message generated in association with the DPC Capability structure. For MSI, the value in this field indicates the offset between the base Message Data and the interrupt message that is generated. Hardware is required to update this field so that it is correct if the number of MSI Messages assigned to the Function changes when software writes to the Multiple Message Enable field in the MSI Message Control register. For MSI-X, the value in this field indicates which MSI-X Table entry is used to generate the interrupt message. The entry must be one of the first 32 entries even if the Function implements more than 32 entries. For a given MSI-X implementation, the entry must remain constant. If both MSI and MSI-X are implemented, they are permitted to use different vectors, though software is permitted to enable only one mechanism at a time. If MSI-X is enabled, the value in this field must indicate the vector for MSI-X. If MSI is enabled or neither is enabled, the value in this field must indicate the vector for MSI. If software enables both MSI and MSI-X at the same time, the value in this field is undefined. ***Note***: BIOS is expected to update this field with the right value before enabling DPC interrupt. Register Attribute: Static.

11.1.58 DPC Status Register And DPC Error Source ID Register (DPCSR_DPCESIDR) - Offset A08h

This is DPC Status Register and DPC Error Source ID register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + A08h	00001F00h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO/V/P	**DPC Error Source ID (DPCESID):** When the DPC Trigger Reason field indicates that DPC was triggered due to the reception of an ERR_NONFATAL or ERR_FATAL message, this register field contains the Requester ID of the received messages. Otherwise, the value of this register is undefined. Register Attribute: Static.
15:13	0h RO	**Reserved**
12:8	1Fh RO/V/P	**RP PIO First Error Pointer (RPPIOFEP):** The value of this field identifies a bit position in the RP PIO Status register, and this field is considered valid when that bit is set. When this field is valid, and software writes a 1b to the indicated RP PIO Status bit (thus clearing it), this field must revert to its default value. This field is applicable only for Root Ports that support RP Extensions for DPC, and is otherwise reserved. If this field is not reserved, the default value is 11111b. Register Attribute: Dynamic.
7	0h RO	**Reserved**
6:5	0h RO/V/P	**DPC Trigger Extension (DPCTE):** This field serves as an extension to the DPC Trigger Reason field. When that field is valid and has a value of 11b, this field indicates why DPC has been triggered. 00b: DPC was triggered due to RP PIO error. 01b: DPC was triggered due to DPC Software Trigger bit. 10b: Reserved. 11b: Reserved. This field is valid only when the DPC Trigger Status bit is set and the value of the DPC Trigger Reason field is 11b. Otherwise the value of this field is undefined. Register Attribute: Dynamic.
4	0h RO	**DPC RP Busy (DPCRPB):** When the DPC Trigger Status bit is Set and this bit is Set, the Root Port is busy with internal activity that must complete before software is permitted to clear the DPC Trigger Status bit. If software Clears the DPC Trigger Status bit while this bit is set, the behavior is undefined. This field is valid only when the DPC Trigger Status bit is Set; otherwise the value of this field is undefined. This bit is applicable only for Root Ports that support RP Extensions for DPC, and is Reserved otherwise. Register Attribute: Dynamic.
3	0h RW/1C/V/P	**DPC Interrupt Status (DPCIS):** This bit is set if DPC is triggered while the DPC Interrupt Enable bit is set. Register Attribute: Dynamic.
2:1	0h RO/V/P	**DPC Trigger Reason (DPCTR):** This field indicates why DPC has been triggered. 00b: DPC was triggered due to an unmasked uncorrectable error. 01b: DPC was triggered due to receiving an ERR_NONFATAL. 10b: DPC was triggered due to receiving an ERR_FATAL. 11b: DPC was triggered due to a reason that is indicated by the DPC Trigger Reason Extension field. ***Note***: This field is only valid when DPC Trigger Status bit is set; otherwise the value of this field is undefined. Register Attribute: Dynamic.
0	0h RW/1C/V/P	**DPC Trigger Status (DPCTS):** When set, indicates that DPC has been triggered. DPC is event triggered. While this bit is set, hardware must direct the LTSSM to the Disabled state. This bit must be cleared before the LTSSM can be released from Disabled state. Once the requirements for how long software must leave the downstream port in DPC is met, software is permitted to clear this bit regardless of the state of other status bits associated with the triggering event.

11.1.59 RP PIO Status Register (RPPIOSR) - Offset A0Ch

This is RP PIO Status register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + A0Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	**Reserved**
18	0h RW/1C/V/P	**Memory Completion Timeout Status (MCTS):** Non-posted memory request completion times out. Register Attribute: Dynamic.
17	0h RW/1C/V/P	**Memory Completer Abort Completion Status (MCACS):** Non-posted memory request received CA completion. Register Attribute: Dynamic.
16	0h RW/1C/V/P	**Memory Unsupported Request Completion Status (MURCS):** Non-posted Memory request received UR completion. Register Attribute: Dynamic.
15:11	0h RO	**Reserved**
10	0h RW/1C/V/P	**I/O Completion Timeout Status (IOCTS):** I/O request completion times out. Register Attribute: Dynamic.
9	0h RW/1C/V/P	**I/O Completer Abort Completion Status (IOCACS):** I/O request received CA completion. Register Attribute: Dynamic.
8	0h RW/1C/V/P	**I/O Unsupported Request Completion Status (IOURCS):** I/O request received UR completion. Register Attribute: Dynamic.
7:3	0h RO	**Reserved**
2	0h RW/1C/V/P	**Configuration Completion Timeout Status (CCTS):** Configuration request completion times out. Register Attribute: Dynamic.
1	0h RW/1C/V/P	**Configuration Completer Abort Completion Status (CCACS):** Configuration request received CA completion. Register Attribute: Dynamic.
0	0h RW/1C/V/P	**Configuration Unsupported Request Completion Status (CURCS):** Configuration request received UR completion. Register Attribute: Dynamic.

11.1.60 RP PIO Mask Register (RPPIOMR) - Offset A10h

This is RP PIO Mask register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + A10h	00070707h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	**Reserved**
18	1h RW/P	**Memory Completion Timeout Mask (MCTM):** Mask bit for Memory Completion Timeout Status. Register Attribute: Dynamic.
17	1h RW/P	**Memory Completer Abort Completion Mask (MCACM):** Mask bit for Memory Completer Abort Completion Status. Register Attribute: Dynamic.
16	1h RW/P	**Memory Unsupported Request Completion Mask (MURCM):** Mask bit for Memory Unsupported Request Completion Status. Register Attribute: Dynamic.
15:11	0h RO	**Reserved**
10	1h RW/P	**I/O Completion Timeout Mask (IOCTM):** Mask bit for I/O Completion Timeout Status. Register Attribute: Dynamic.
9	1h RW/P	**I/O Completer Abort Completion Mask (IOCACM):** Mask bit for I/O Completer Abort Completion Status. Register Attribute: Dynamic.
8	1h RW/P	**I/O Unsupported Request Completion Mask (IOURCM):** Mask bit for I/O Unsupported Request Completion Status. Register Attribute: Dynamic.
7:3	0h RO	**Reserved**
2	1h RW/P	**Configuration Completion Timeout Mask (CCTM):** Mask bit for Configuration Completion Timeout Status. Register Attribute: Dynamic.
1	1h RW/P	**Configuration Completer Abort Completion Mask (CCACM):** Mask bit for Configuration Completer Abort Completion Status. Register Attribute: Dynamic.
0	1h RW/P	**Configuration Unsupported Request Completion Mask (CURCM):** Mask bit for Configuration Unsupported Request Completion Status. Register Attribute: Dynamic.

11.1.61 RP PIO Severity Register (RPPIOVR) - Offset A14h

This is RP PIO Severity register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + A14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	**Reserved**
18	0h RW/P	**Memory Completion Timeout Severity (MCTSV):** Severity bit for Memory Completion Timeout Status. Register Attribute: Dynamic.
17	0h RW/P	**Memory Completer Abort Completion Severity (MCACSV):** Severity bit for Memory Completer Abort Completion Status. Register Attribute: Dynamic.

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW/P	**Memory Unsupported Request Completion Severity (MURCSV):** Severity bit for Memory Unsupported Request Completion Status. Register Attribute: Dynamic.
15:11	0h RO	**Reserved**
10	0h RW/P	**I/O Completion Timeout Severity (IOCTSV):** Severity bit for I/O Completion Timeout Status. Register Attribute: Dynamic.
9	0h RW/P	**I/O Completer Abort Completion Severity (IOCACSV):** Severity bit for I/O Completer Abort Completion Status. Register Attribute: Dynamic.
8	0h RW/P	**I/O Unsupported Request Completion Severity (IOURCSV):** Severity bit for I/O Unsupported Request Completion Status. Register Attribute: Dynamic.
7:3	0h RO	**Reserved**
2	0h RW/P	**Configuration Completion Timeout Severity (CCTSV):** Severity bit for Configuration Completion Timeout Status. Register Attribute: Dynamic.
1	0h RW/P	**Configuration Completer Abort Completion Severity (CCACSV):** Severity bit for Configuration Completer Abort Completion Status. Register Attribute: Dynamic.
0	0h RW/P	**Configuration Unsupported Request Completion Severity (CURCSV):** Severity bit for Configuration Unsupported Request Completion Status. Register Attribute: Dynamic.

11.1.62 RP PIO SysError Register (RPPIOSER) - Offset A18h

This is RP PIO SysError register. Refer to register field for more details

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + A18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	**Reserved**
18	0h RW/P	**Memory Completion Timeout SysErr (MCTSE):** SysErr bit for Memory Completion Timeout Status. Register Attribute: Dynamic.
17	0h RW/P	**Memory Completer Abort Completion SysErr (MCACSE):** SysErr bit for Memory Completer Abort Completion Status. Register Attribute: Dynamic.
16	0h RW/P	**Memory Unsupported Request Completion SysErr (MURCSE):** SysErr bit for Memory Unsupported Request Completion Status. Register Attribute: Dynamic.
15:11	0h RO	**Reserved**
10	0h RW/P	**I/O Completion Timeout SysErr (IOCTSE):** SysErr bit for I/O Completion Timeout Status. Register Attribute: Dynamic.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW/P	**I/O Completer Abort Completion SysErr (IOCACSE):** SysErr bit for I/O Completer Abort Completion Status. Register Attribute: Dynamic.
8	0h RW/P	**I/O Unsupported Request Completion SysErr (IOURCSE):** SysErr bit for I/O Unsupported Request Completion Status. Register Attribute: Dynamic.
7:3	0h RO	**Reserved**
2	0h RW/P	**Configuration Completion Timeout SysErr (CCTSE):** SysErr bit for Configuration Completion Timeout Status. Register Attribute: Dynamic.
1	0h RW/P	**Configuration Completer Abort Completion SysErr (CCACSE):** SysErr bit for Configuration Completer Abort Status. Register Attribute: Dynamic.
0	0h RW/P	**Configuration Unsupported Request Completion SysErr (CURCSE):** SysErr bit for Configuration Unsupported Request Completion Status. Register Attribute: Dynamic.

11.1.63 RP PIO Exception Register (RPPIOER) - Offset A1Ch

This is RP PIO Exception register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + A1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	**Reserved**
18	0h RW/P	**Memory Completion Timeout Exception (MCTE):** Exception bit for Memory Completion Timeout Status. Register Attribute: Dynamic.
17	0h RW/P	**Memory Completer Abort Completion Exception (MCACE):** Exception bit for Memory Completer Abort Completion Status. Register Attribute: Dynamic.
16	0h RW/P	**Memory Unsupported Request Completion Exception (MURCE):** Exception bit for Memory Unsupported Request Completion Status. Register Attribute: Dynamic.
15:11	0h RO	**Reserved**
10	0h RW/P	**I/O Completion Timeout Exception (IOCTE):** Exception bit for I/O Completion Timeout Status. Register Attribute: Dynamic.
9	0h RW/P	**I/O Completer Abort Completion Exception (IOCACE):** Exception bit for I/O Completer Abort Completion Status. Register Attribute: Dynamic.
8	0h RW/P	**I/O Unsupported Request Completion Exception (IOURCE):** Exception bit for I/O Unsupported Request Completion Status. Register Attribute: Dynamic.

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	**Reserved**
2	0h RW/P	**Configuration Completion Timeout Exception (CCTE):** Exception bit for Configuration Completion Timeout Status. Register Attribute: Dynamic.
1	0h RW/P	**Configuration Completer Abort Completion Exception (CCACE):** Exception bit for Configuration Completer Abort Completion Status. Register Attribute: Dynamic.
0	0h RW/P	**Configuration Unsupported Request Completion Exception (CURCE):** Exception bit for Configuration Unsupported Request Completion Status. Register Attribute: Dynamic.

11.1.64 RP PIO Header Log Register DW1 (RPPIOHLR_DW1) - Offset A20h

Size: 32 bits

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + A20h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V/P	**1st dWord of TLP (DW1):** Byte0 [amp][amp] Byte1 [amp][amp] Byte2 [amp][amp] Byte3. Register Attribute: Dynamic.

11.1.65 RP PIO Header Log Register DW2 (RPPIOHLR_DW2) - Offset A24h

Size: 32 bits

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + A24h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V/P	**2nd dWord of TLP (DW2):** Byte4 [amp][amp] Byte5 [amp][amp] Byte6 [amp][amp] Byte7. Register Attribute: Dynamic.

11.1.66 RP PIO Header Log Register DW3 (RPPIOHLR_DW3) - Offset A28h

Size: 32 bits

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + A28h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V/P	**3rd dWord of TLP (DW3):** Byte8 [amp][amp] Byte9 [amp][amp] Byte10 [amp][amp] Byte11. Register Attribute: Dynamic.

11.1.67 RP PIO Header Log Register DW4 (RPPIOHLR_DW4) - Offset A2Ch

Size: 32 bits

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + A2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V/P	**4th dWord of TLP (DW4):** Byte12 [amp][amp] Byte13 [amp][amp] Byte14 [amp][amp] Byte15. Register Attribute: Dynamic.

11.1.68 Secondary PCI Express Extended Capability Header (SPEECH) - Offset A30h

Size: 32 bits

Note: When operating in Mobile Express mode, this capability should not be enabled.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + A30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	000h RW/O	**Next Capability Offset (NCO):** Next Capability Offset (NCO): This field contains the offset to the next PCI Express Capability structure or 000h if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. The bottom 2 bits of this offset are Reserved and must be implemented as 00b and software must mask them to allow for future uses of these bits.
19:16	0h RW/O	**Capability Version (CV):** Capability Version (CV): This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. For systems that support Secondary PCI Express Extended Capability, BIOS should write a 1h to this register else it should write 0
15:0	0000h RW/O	**PCI Express Extended Capability ID (PCIEECID):** PCI Express Extended Capability ID (PCIEECID): This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. PCI Express Extended Capability ID for the Secondary PCI Express Extended Capability is 0019h. For systems that support Secondary PCI Express Extended Capability, BIOS should write a 0019h to this register else it should write 0.

11.1.69 Link Control 3 (LCTL3) - Offset A34h

This is Link Control 3 register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + A34h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:9	00h RO	**Enable Lower SKP OS Generation Vector (ELSOSGV):** Enable Lower SKP OS Generation Vector (ELSOSGV): When the Link is in L0 and the bit in this field corresponding to the current Link speed is Set, SKP Ordered Sets are scheduled at the rate defined for SRNS, overriding the rate required based on the clock tolerance architecture. Bit definitions within this field are: Bit 0 2.5 GT/s Bit 1 5.0 GT/s Bit 2 8.0 GT/s Bits 6:3 RsvdP Behavior is undefined if a bit is Set in this field and the corresponding bit in the Lower SKP OS Generation Supported Speeds Vector is not set.
8:2	0h RO	**Reserved**
1	0h RW	**Link Equalization Request Interrupt Enable (LERIE):** Link Equalization Request Interrupt Enable (LERIE): When set, this bit enables the generation of an interrupt to indicate that the Link Equalization Request bit has been set.
0	0h RW	**Perform Equalization (PE):** Perform Equalization (PE): When this bit is 1b and Link Retrain bit is set with the Target Link Speed field set to 8 GT/s, the Downstream Port must perform Link Equalization. This bit is cleared by Root Port upon entry to Link Equalization.

11.1.70 Lane Error Status (LES) - Offset A38h

The Lane number is the default Lane number which is invariant to Link width and Lane reversal negotiation that occurs during training. Based on the Port Configuration setting, if the maximum link width of the port is less than x4, the upper lane status bits should be ignored.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + A38h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW/1C/V/P	**Lane 3 Error Status (L3ES):** Lane 3 Error Status (L3ES): Lane 3 detected a Lane-based error.
2	0h RW/1C/V/P	**Lane 2 Error Status (L2ES):** Lane 2 Error Status (L2ES): Lane 2 detected a Lane-based error.
1	0h RW/1C/V/P	**Lane 1 Error Status (L1ES):** Lane 1 Error Status (L1ES): Lane 1 detected a Lane-based error.
0	0h RW/1C/V/P	**Lane 0 Error Status (L0ES):** Lane 0 Error Status (L0ES): Lane 0 detected a Lane-based error.

11.1.71 Lane 0 And Lane 1 Equalization Control (L01EC) - Offset A3Ch

Each entry contains the values for the Lane with the corresponding default Lane number which is invariant to Link width and Lane reversal negotiation that occurs during Link training. Based on the Port Configuration setting, if the maximum link width of the port is less than x4, the upper lane status bits should be ignored

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + A3Ch	7F7F7F7Fh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:28	7h RW	**Upstream Port Lane 1 Receiver Preset Hint (UPL1RPH):** Upstream Port Lane 1 Receiver Preset Hint (UPL1RPH): Field contains the Receiver Preset Hint value sent or received during Link Equalizatio
27:24	Fh RW	**Upstream Port Lane 1 Transmitter Preset (UPL1TP):** Upstream Port Lane 1 Transmitter Preset (UPL1TP): Field contains the Transmit Preset value sent or received during Link Equalization.
23	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
22:20	7h RW	**Downstream Port Lane 1 Receiver Preset Hint (DPL1RPH):** Downstream Port Lane 1 Receiver Preset Hint (DPL1RPH): Receiver Preset Hint may be used as a hint for receiver equalization by this Port when the Port is operating as a Downstream Port.
19:16	Fh RW	**Downstream Port Lane 1 Transmitter Preset (DPL1TP):** Downstream Port Lane 1 Transmitter Preset (DPL1TP): Transmitter Preset used for equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port.
15	0h RO	**Reserved**
14:12	7h RW	**Upstream Port Lane 0 Receiver Preset Hint (UPL0RPH):** Upstream Port Lane 0 Receiver Preset Hint (UPL0RPH): Field contains the Receiver Preset Hint value sent or received during Link Equalization.
11:8	Fh RW	**Upstream Port Lane 0 Transmitter Preset (UPL0TP):** Upstream Port Lane 0 Transmitter Preset (UPL0TP): Field contains the Transmit Preset value sent or received during Link Equalization.
7	0h RO	**Reserved**
6:4	7h RW	**Downstream Port Lane 0 Receiver Preset Hint (DPL0RPH):** Downstream Port Lane 0 Receiver Preset Hint (DPL0RPH): Receiver Preset Hint may be used as a hint for receiver equalization by this Port when the Port is operating as a Downstream Port.
3:0	Fh RW	**Downstream Port Lane 0 Transmitter Preset (DPL0TP):** Downstream Port Lane 0 Transmitter Preset (DPL0TP): Transmitter Preset used for equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port.

11.1.72 Lane 2 And Lane 3 Equalization Control (L23EC) - Offset A40h

Each entry contains the values for the Lane with the corresponding default Lane number which is invariant to Link width and Lane reversal negotiation that occurs during Link training. Based on the Port Configuration setting, if the maximum link width of the port is less than x4, the upper lane status bits should be ignored

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:28, F:0] + A40h	7F7F7F7Fh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:28	7h RW	**Upstream Port Lane 3 Receiver Preset Hint (UPL3RPH):** Upstream Port Lane 3 Receiver Preset Hint (UPL3RPH): Field contains the Receiver Preset Hint value sent or received during Link Equalization.
27:24	Fh RW	**Upstream Port Lane 3 Transmitter Preset (UPL3TP):** Upstream Port Lane 3 Transmitter Preset (UPL3TP): Field contains the Transmit Preset value sent or received during Link Equalization.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RO	**Reserved**
22:20	7h RW	**Downstream Port Lane 3 Receiver Preset Hint (DPL3RPH):** Downstream Port Lane 3 Receiver Preset Hint (DPL3RPH): Receiver Preset Hint may be used as a hint for receiver equalization by this Port when the Port is operating as a Downstream Port.
19:16	Fh RW	**Downstream Port Lane 3 Transmitter Preset (DPL3TP):** Downstream Port Lane 3 Transmitter Preset (DPL3TP): Transmitter Preset used for equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port.
15	0h RO	**Reserved**
14:12	7h RW	**Upstream Port Lane 2 Receiver Preset Hint (UPL2RPH):** Upstream Port Lane 2 Receiver Preset Hint (UPL2RPH): Field contains the Receiver Preset Hint value sent or received during Link Equalization.
11:8	Fh RW	**Upstream Port Lane 2 Transmitter Preset (UPL2TP):** Upstream Port Lane 2 Transmitter Preset (UPL2TP): Field contains the Transmit Preset value sent or received during Link Equalization.
7	0h RO	**Reserved**
6:4	7h RW	**Downstream Port Lane 2 Receiver Preset Hint (DPL2RPH):** Downstream Port Lane 2 Receiver Preset Hint (DPL2RPH): Receiver Preset Hint may be used as a hint for receiver equalization by this Port when the Port is operating as a Downstream Port.
3:0	Fh RW	**Downstream Port Lane 2 Transmitter Preset (DPL2TP):** Downstream Port Lane 2 Transmitter Preset (DPL2TP): Transmitter Preset used for equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port.

12 embedded Multi Media Card (eMMC) Controller

12.1 eMMC Configuration Registers Summary

This chapter records the registers in Bus: 0, Device 26, Function 0.

Table 12-1. Summary of Bus: 0, Device: 26, Function: 0 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	REG DEVVENDID (DEVVENDID)	4B478086h
4h	4	REG STATUSCOMMAND (STATUSCOMMAND)	00100000h
8h	4	REG REVCLASSCODE (REVCLASSCODE)	08050100h
Ch	4	REG CLLATHEADERBIST (CLLATHEADERBIST)	00800000h
10h	4	REG BAR (BAR)	00000004h
14h	4	REG BAR_HIGH (BAR_HIGH)	00000000h
18h	4	REG BAR1 (BAR1)	00000004h
1Ch	4	REG BAR1_HIGH (BAR1_HIGH)	00000000h
2Ch	4	REG SUBSYSTEMID (SUBSYSTEMID)	00000000h
30h	4	REG EXPANSION_ROM_BASEADDR (EXPANSION_ROM_BASEADDR)	00000000h
34h	4	REG CAPABILITYPTR (CAPABILITYPTR)	00000080h

80h	4	REG POWERCAPID (POWERCAPID)	00039001h
84h	4	REG PMECTRLSTATUS (PMECTRLSTATUS)	00000008h
90h	4	REG PCIDEVIDLE_CAP_RECORD (PCIDEVIDLE_CAP_RECORD)	F0140009h
94h	4	REG DEVID_VEND_SPECIFIC_REG (DEVID_VEND_SPECIFIC_REG)	01400010h
98h	4	REG D0I3_CONTROL_SW_LTR_MMIO_REG (D0I3_CONTROL_SW_LTR_MMIO_REG)	00008041h
9Ch	4	REG DEVICE_IDLE_POINTER_REG (DEVICE_IDLE_POINTER_REG)	000081C1h
A0h	4	REG D0I3_MAX_POW_LAT_PG_CONFIG (D0I3_MAX_POW_LAT_PG_CONFIG)	00290800h
B0h	4	REG GEN_REGRW1 (GEN_REGRW1)	00000000h
B4h	4	REG GEN_REGRW2 (GEN_REGRW2)	00000000h
B8h	4	REG GEN_REGRW3 (GEN_REGRW3)	00000000h
BCh	4	REG GEN_REGRW4 (GEN_REGRW4)	00000000h
C0h	4	REG GEN_INPUT_REG (GEN_INPUT_REG)	00000000h
F8h	4	REG MANID (MANID)	0000000Fh

12.1.1 REG DEVVENDID (DEVVENDID) - Offset 0h

Vendor ID Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 0h	4B478086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	4B47h RO	**DEVICEID:** DEVICEID
15:0	8086h RO	**VENDORID:** VENDORID

12.1.2 REG STATUSCOMMAND (STATUSCOMMAND) - Offset 4h

PCI Command Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 4h	00100000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29	0h RW/1C	**RMA:** RMA
28	0h RW/1C	**RTA:** RTA
27:21	0h RO	**Reserved**
20	1h RO	**CAPLIST:** CAPLIST
19	0h RO	**INTR_STATUS:** INTR_STATUS
18:11	0h RO	**Reserved**
10	0h RW	**INTR_DISABLE:** INTR_DISABLE
9	0h RO	**Reserved**
8	0h RW	**SERR_ENABLE:** SERR_ENABLE
7:3	0h RO	**Reserved**
2	0h RW	**BME:** BME
1	0h RW	**MSE:** MSE
0	0h RO	**Reserved**

12.1.3 REG REVCLASSCODE (REVCLASSCODE) - Offset 8h

Revision Id Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 8h	08050100h

Bit Range	Default & Access	Field Name (ID): Description
31:8	080501h RO	**CLASS_CODES:** CLASS_CODES
7:0	00h RO	**RID:** RID

12.1.4 REG CLLATHEADERBIST (CLLATHEADERBIST) - Offset Ch

Cache Line Latency Header and BIST Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + Ch	00800000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	1h RO	**MULFNDEV:** MULFNDEV
22:16	00h RO	**HEADERTYPE:** HEADERTYPE
15:8	00h RO	**LATTIMER:** LATTIMER
7:0	00h RW	**CACHELINE_SIZE:** CACHELINE_SIZE

12.1.5 REG BAR (BAR) - Offset 10h

BAR - Base Address Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 10h	00000004h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**BASEADDR:** BASEADDR
11:4	00h RO	**SIZEINDICATOR:** SIZEINDICATOR
3	0h RO	**PREFETCHABLE:** PREFETCHABLE
2:1	2h RO	**TYPE:** TYPE
0	0h RO	**MESSAGE_SPACE:** MESSAGE_SPACE

12.1.6 REG BAR_HIGH (BAR_HIGH) - Offset 14h

BAR - Base Address Register High

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**BASEADDR_HIGH:** BASEADDR_HIGH

12.1.7 REG BAR1 (BAR1) - Offset 18h

BAR1 - Base Address Register1

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 18h	00000004h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**BASEADDR1:** BASEADDR1
11:4	00h RO	**SIZEINDICATOR1:** SIZEINDICATOR1
3	0h RO	**PREFETCHABLE1:** PREFETCHABLE1
2:1	2h RO	**TYPE1:** TYPE1
0	0h RO	**MESSAGE_SPACE1:** MESSAGE_SPACE1

12.1.8 REG BAR1_HIGH (BAR1_HIGH) - Offset 1Ch

BAR1 - Base Address Register1 High

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**BASEADDR1_HIGH:** BASEADDR1_HIGH

12.1.9 REG SUBSYSTEMID (SUBSYSTEMID) - Offset 2Ch

SUBSYSTEMID - Subsystem Vendor and Subsystem ID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O	**SUBSYSTEMID:** SUBSYSTEMID
15:0	0000h RW/O	**SUBSYSTEMVENDORID:** SUBSYSTEMVENDORID

12.1.10 REG EXPANSION_ROM_BASEADDR (EXPANSION_ROM_BASEADDR) - Offset 30h

Expansion ROM Base Address Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**EXPANSION_ROM_BASE:** EXPANSION_ROM_BASE

12.1.11 REG CAPABILITYPTR (CAPABILITYPTR) - Offset 34h

Capabilities Pointer Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 34h	00000080h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	80h RO	**CAPPTR_POWER:** CAPPTR_POWER

12.1.12 REG INTERRUPTREG (INTERRUPTREG) - Offset 3Ch

Interrupt Line Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 3Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**MAX_LAT:** MAX_LAT
23:16	00h RO	**MIN_GNT:** MIN_GNT
15:12	0h RO	**Reserved**
11:8	0h RO	**INTPIN:** INTPIN
7:0	00h RW	**INTLINE:** INTLINE

12.1.13 REG POWERCAPID (POWERCAPID) - Offset 80h

Power Management Capability ID Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 80h	00039001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	00h RO	**PMESUPPORT:** PMESUPPORT
26:19	0h RO	**Reserved**
18:16	3h RO	**VERSION:** VERSION
15:8	90h RO	**NXTCAP:** NXTCAP
7:0	01h RO	**POWER_CAP:** POWER_CAP

12.1.14 REG PMECTRLSTATUS (PMECTRLSTATUS) - Offset 84h

Power Management Control and Status Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 84h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW/1C	**PMESTATUS:** PMESTATUS
14:9	0h RO	**Reserved**
8	0h RW	**PMEENABLE:** PMEENABLE
7:4	0h RO	**Reserved**
3	1h RO	**NO_SOFT_RESET:** NO_SOFT_RESET
2	0h RO	**Reserved**
1:0	0h RW	**POWERSTATE:** POWERSTATE

12.1.15 REG PCIDEVIDLE_CAP_RECORD (PCIDEVIDLE_CAP_RECORD) - Offset 90h

PCI Device Idle Capability Record Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 90h	F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**VEND_CAP:** VEND_CAP
27:24	0h RO	**REVID:** REVID
23:16	14h RO	**CAP_LENGTH:** CAP_LENGTH
15:8	00h RO	**NEXT_CAP:** NEXT_CAP
7:0	09h RO	**CAPID:** CAPID

12.1.16 REG DEVID_VEND_SPECIFIC_REG (DEVID_VEND_SPECIFIC_REG) - Offset 94h

Device ID Vendor Specific Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 94h	01400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	014h RO	**VSEC_LENGTH:** VSEC_LENGTH
19:16	0h RO	**VSEC_REV:** VSEC_REV
15:0	0010h RO	**VSECID:** VSECID

12.1.17 REG D0I3_CONTROL_SW_LTR_MMIO_REG (D0I3_CONTROL_SW_LTR_MMIO_REG) - Offset 98h

SW LTR Update MMIO Location Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 98h	00008041h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000804h RO	**SW_LAT_DWORD_OFFSET:** SW_LAT_DWORD_OFFSET
3:1	0h RO	**SW_LAT_BAR_NUM:** SW_LAT_BAR_NUM
0	1h RO	**SW_LAT_VALID:** SW_LAT_VALID

12.1.18 REG DEVICE_IDLE_POINTER_REG (DEVICE_IDLE_POINTER_REG) - Offset 9Ch

Device IDLE Pointer Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 9Ch	000081C1h

Bit Range	Default & Access	Field Name (ID): Description
31:4	000081Ch RO	**DWORD_OFFSET:** DWORD_OFFSET
3:1	0h RO	**BAR_NUM:** BAR_NUM
0	1h RO	**VALID:** VALID

12.1.19 REG D0I3_MAX_POW_LAT_PG_CONFIG (D0I3_MAX_POW_LAT_PG_CONFIG) - Offset A0h

Doi3 Max Power On Latency

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + A0h	00290800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21	1h RW	**HAE:** HAE
20	0h RO	**Reserved**
19	1h RW	**SLEEP_EN:** SLEEP_EN

Bit Range	Default & Access	Field Name (ID): Description
18	0h RW	**PGE:** PGE
17	0h RW	**I3_ENABLE:** I3_ENABLE
16	1h RW	**PMCRE:** PMCRE
15:13	0h RO	**Reserved**
12:10	2h RW/O	**POW_LAT_SCALE:** POW_LAT_SCALE
9:0	000h RW/O	**POW_LAT_VALUE:** POW_LAT_VALUE

12.1.20 REG GEN_REGRW1 (GEN_REGRW1) - Offset B0h

General Purpose PCI RW Register1

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GEN_REG_RW1:** GEN_REG_RW1

12.1.21 REG GEN_REGRW2 (GEN_REGRW2) - Offset B4h

General Purpose PCI RW Register2

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + B4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GEN_REG_RW2:** GEN_REG_RW2

12.1.22 REG GEN_REGRW3 (GEN_REGRW3) - Offset B8h

General Purpose PCI RW Register3

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + B8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GEN_REG_RW3:** GEN_REG_RW3

12.1.23 REG GEN_REGRW4 (GEN_REGRW4) - Offset BCh

General Purpose PCI RW Register4

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + BCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GEN_REG_RW4:** GEN_REG_RW4

12.1.24 REG GEN_INPUT_REG (GEN_INPUT_REG) - Offset C0h

General Input Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**GEN_REG_INPUT_RW:** GEN_REG_INPUT_RW

12.1.25 REG MANID (MANID) - Offset F8h

Manufacturers ID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + F8h	0000000Fh

Bit Range	Default & Access	Field Name (ID): Description
31:0	0000000Fh RO	**MANID:** MANID

12.2 eMMC Memory Mapped Registers Summary

Table 12-2. Summary of eMMC Memory Mapped Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	SDMASYSADDR Reg (SDMASYSADDR)	00000000h
4h	2	BLOCKSIZE Reg (BLOCKSIZE)	0000h
6h	2	BLOCKCOUNT Reg (BLOCKCOUNT)	0000h
8h	4	ARGUMENT1 Reg (ARGUMENT1)	00000000h
Ch	2	TRANSFERMODE Reg (TRANSFERMODE)	0000h
Eh	2	COMMAND Reg (COMMAND)	0000h
10h	4	RESPONSE01 Reg (RESPONSE01)	00000000h
14h	2	RESPONSE2 Reg (RESPONSE2)	0000h
16h	2	RESPONSE3 Reg (RESPONSE3)	0000h
18h	2	RESPONSE4 Reg (RESPONSE4)	0000h
1Ah	2	RESPONSE5 Reg (RESPONSE5)	0000h
1Ch	2	RESPONSE6 Reg (RESPONSE6)	0000h
1Eh	2	RESPONSE7 Reg (RESPONSE7)	0000h
20h	4	DATAPORT Reg (DATAPORT)	00000000h
24h	4	PRESENTSTATE Reg (PRESENTSTATE)	1FF00000h
28h	1	HOSTCONTROL1 Reg (HOSTCONTROL1)	00h
29h	1	POWERCONTROL Reg (POWERCONTROL)	00h
2Ah	1	BLOCKGAPCONTROL Reg (BLOCKGAPCONTROL)	80h
2Bh	1	WAKEUPCONTROL Reg (WAKEUPCONTROL)	00h
2Ch	2	CLOCKCONTROL Reg (CLOCKCONTROL)	0000h
2Eh	1	TIMEOUTCONTROL Reg (TIMEOUTCONTROL)	00h
2Fh	1	SOFTWARERESET Reg (SOFTWARERESET)	00h
30h	2	NORMALINTRSTS Reg (NORMALINTRSTS)	0000h
32h	2	ERRORINSTRSTS Reg (ERRORINSTRSTS)	0000h
34h	2	NORMALINTRSTSENA Reg (NORMALINTRSTSENA)	0000h
36h	2	ERRORINTRSTSENA Reg (ERRORINTRSTSENA)	0000h
38h	2	NORMALINTRSIGENA Reg (NORMALINTRSIGENA)	0000h
3Ah	2	ERRORINTRSIGENA Reg (ERRORINTRSIGENA)	0000h
3Ch	2	AUTOCMDERRSTS Reg (AUTOCMDERRSTS)	0000h
3Eh	2	HOSTCONTROL2 Reg (HOSTCONTROL2)	0000h
40h	8	CAPABILITIES Reg (CAPABILITIES)	800000075 46EC881h
48h	8	MAXCURRENTCAP Reg (MAXCURRENTCAP)	000000000 0000000h
50h	2	FORCEVENTFORAUTOCMDERRORSTATUS Reg (FORCEVENTFORAUTOCMDERRORSTATUS)	0000h
52h	2	FORCEEVENTFORERRINTSTS Reg (FORCEEVENTFORERRINTSTS)	0000h
54h	1	ADMAERRSTS Reg (ADMAERRSTS)	00h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
58h	4	ADMASYSADDR1 Reg (ADMASYSADDR1)	00000000h
5Ch	2	ADMASYSADDR2 Reg (ADMASYSADDR2)	0000h
60h	2	PRESETVALUE0 Reg (PRESETVALUE0)	0004h
62h	2	PRESETVALUE1 Reg (PRESETVALUE1)	0004h
64h	2	PRESETVALUE2 Reg (PRESETVALUE2)	0002h
66h	2	PRESETVALUE3 Reg (PRESETVALUE3)	0004h
68h	2	PRESETVALUE4 Reg (PRESETVALUE4)	0002h
6Ah	2	PRESETVALUE5 Reg (PRESETVALUE5)	0001h
6Ch	2	PRESETVALUE6 Reg (PRESETVALUE6)	0000h
6Eh	2	PRESETVALUE7 Reg (PRESETVALUE7)	0002h
70h	4	BOOTTIMEOUTCNT Reg (BOOTTIMEOUTCNT)	00000000h
FCh	2	SLOTINTRSTS Reg (SLOTINTRSTS)	0000h

12.2.1 SDMASYSADDR Reg (SDMASYSADDR) - Offset 0h

SDMA_SYSADDRESS

Type	Size	Offset	Default
MMIO	32 bit	BAR + 0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SDMA_SYSADDRESS:** SDMA_SYSADDRESS

12.2.2 BLOCKSIZE Reg (BLOCKSIZE) - Offset 4h

Type	Size	Offset	Default
MMIO	16 bit	BAR + 4h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14:12	0h RW	**HOST_SDMA_BUF_SIZE:** HOST_SDMA_BUF_SIZE
11:0	000h RW	**XFER_BLOCKSIZE:** XFER_BLOCKSIZE

12.2.3 BLOCKCOUNT Reg (BLOCKCOUNT) - Offset 6h

BLOCK_CNT_16BIT

Type	Size	Offset	Default
MMIO	16 bit	BAR + 6h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW	**BLOCK_CNT_16BIT:** BLOCK_CNT_16BIT

12.2.4 ARGUMENT1 Reg (ARGUMENT1) - Offset 8h

COMMAND_ARGUMENT1

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**COMMAND_ARGUMENT1:** COMMAND_ARGUMENT1

12.2.5 TRANSFERMODE Reg (TRANSFERMODE) - Offset Ch

Type	Size	Offset	Default
MMIO	16 bit	BAR + Ch	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:6	0h RO	**Reserved**
5	0h RW	**XFERMODE_MULTIBLKSEL:** XFERMODE_MULTIBLKSEL
4	0h RW	**XFERMODE_DATAXFERDIR:** XFERMODE_DATAXFERDIR
3:2	0h RW	**XFERMODE_AUTOCMDENA:** XFERMODE_AUTOCMDENA
1	0h RW	**XFERMODE_BLKCNTENA:** XFERMODE_BLKCNTENA
0	0h RW	**XFERMODE_DMAENABLE:** XFERMODE_DMAENABLE

12.2.6 COMMAND Reg (COMMAND) - Offset Eh

Type	Size	Offset	Default
MMIO	16 bit	BAR + Eh	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	**Reserved**
13:8	00h RW	**COMMAND_CMDINDEX:** COMMAND_CMDINDEX
7:6	0h RW	**COMMAND_CMDTYPE:** COMMAND_CMDTYPE
5	0h RW	**COMMAND_DATAPRESENT:** COMMAND_DATAPRESENT
4	0h RW	**COMMAND_INDEXCHKENA:** COMMAND_INDEXCHKENA
3	0h RW	**COMMAND_CRCCHKENA:** COMMAND_CRCCHKENA
2	0h RO	**Reserved**
1:0	0h RW	**COMMAND_RESPONSETYPE:** COMMAND_RESPONSETYPE

12.2.7 RESPONSE01 Reg (RESPONSE01) - Offset 10h

COMMAND_RESPONSE_31_0

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**COMMAND_RESPONSE_31_0:** COMMAND_RESPONSE_31_0

12.2.8 RESPONSE2 Reg (RESPONSE2) - Offset 14h

COMMAND_RESPONSE_47_32

Type	Size	Offset	Default
MMIO	16 bit	BAR + 14h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RO/V	**COMMAND_RESPONSE_47_32:** COMMAND_RESPONSE_47_32

12.2.9 RESPONSE3 Reg (RESPONSE3) - Offset 16h

COMMAND_RESPONSE_63_48

Type	Size	Offset	Default
MMIO	16 bit	BAR + 16h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RO/V	**COMMAND_RESPONSE_63_48:** COMMAND_RESPONSE_63_48

12.2.10 RESPONSE4 Reg (RESPONSE4) - Offset 18h

COMMAND_RESPONSE_79_64

Type	Size	Offset	Default
MMIO	16 bit	BAR + 18h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RO/V	**COMMAND_RESPONSE_79_64:** COMMAND_RESPONSE_79_64

12.2.11 RESPONSE5 Reg (RESPONSE5) - Offset 1Ah

COMMAND_RESPONSE_95_80

Type	Size	Offset	Default
MMIO	16 bit	BAR + 1Ah	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RO/V	**COMMAND_RESPONSE_95_80:** COMMAND_RESPONSE_95_80

12.2.12 RESPONSE6 Reg (RESPONSE6) - Offset 1Ch

COMMAND_RESPONSE_111_96

Type	Size	Offset	Default
MMIO	16 bit	BAR + 1Ch	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RO/V	**COMMAND_RESPONSE_111_96:** COMMAND_RESPONSE_111_96

12.2.13 RESPONSE7 Reg (RESPONSE7) - Offset 1Eh

COMMAND_RESPONSE_127_112

Type	Size	Offset	Default
MMIO	16 bit	BAR + 1Eh	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RO/V	**COMMAND_RESPONSE_127_112:** COMMAND_RESPONSE_127_112

12.2.14 DATAPORT Reg (DATAPORT) - Offset 20h

SDHCDMACTRL_PIOBUFRDDATA

Type	Size	Offset	Default
MMIO	32 bit	BAR + 20h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SDHCDMACTRL_PIOBUFRDDATA:** SDHCDMACTRL_PIOBUFRDDATA

12.2.15 PRESENTSTATE Reg (PRESENTSTATE) - Offset 24h

Type	Size	Offset	Default
MMIO	32 bit	BAR + 24h	1FF00000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:25	Fh RO/V	**SDIF_DAT4IN_DSYNC:** SDIF_DAT4IN_DSYNC
24	1h RO/V	**SDIF_CMDIN_DSYNC:** SDIF_CMDIN_DSYNC
23:20	Fh RO/V	**SDIF_DAT0IN_DSYNC:** SDIF_DAT0IN_DSYNC
19	0h RO/V	**SDIF_WP_DSYNC:** SDIF_WP_DSYNC
18	0h RO/V	**SDIF_CD_N_DSYNC:** SDIF_CD_N_DSYNC
17	0h RO/V	**SDHCCARDDET_STATESTABLE_DSYNC:** SDHCCARDDET_STATESTABLE_DSYNC
16	0h RO/V	**SDHCCARDDET_INSERTED_DSYNC:** SDHCCARDDET_INSERTED_DSYNC
15:12	0h RO	**Reserved**
11	0h RO/V	**SDHCDMACTRL_PIOBUFRDENA:** SDHCDMACTRL_PIOBUFRDENA
10	0h RO/V	**SDHCDMACTRL_PIOBUFWRENA:** SDHCDMACTRL_PIOBUFWRENA
9	0h RO/V	**SDHCDMACTRL_RDXFERACTIVE:** SDHCDMACTRL_RDXFERACTIVE
8	0h RO/V	**SDHCDMACTRL_WRXFERACTIVE:** SDHCDMACTRL_WRXFERACTIVE
7:4	0h RO	**Reserved**
3	0h RO/V	**SDHCSDCTRL_RETUNINGREQ_DSYNC:** SDHCSDCTRL_RETUNINGREQ_DSYNC
2	0h RO/V	**SDHCDMACTRL_DATALINEACTIVE:** SDHCDMACTRL_DATALINEACTIVE
1	0h RO/V	**PRESENTSTATE_INHIBITDAT:** PRESENTSTATE_INHIBITDAT
0	0h RO/V	**PRESENTSTATE_INHIBITCMD:** PRESENTSTATE_INHIBITCMD

12.2.16 HOSTCONTROL1 Reg (HOSTCONTROL1) - Offset 28h

HOSTCTRL1_CDSIGSELECT

Type	Size	Offset	Default
MMIO	8 bit	BAR + 28h	00h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**HOSTCTRL1_CDSIGSELECT:** HOSTCTRL1_CDSIGSELECT
6	0h RW	**HOSTCTRL1_CDTESTLEVEL:** HOSTCTRL1_CDTESTLEVEL
5	0h RW	**HOSTCTRL1_EXTDATAWIDTH:** HOSTCTRL1_EXTDATAWIDTH
4:3	0h RW	**HOSTCTRL1_DMASELECT:** HOSTCTRL1_DMASELECT
2	0h RW	**HOSTCTRL1_HIGHSPEEDENA:** HOSTCTRL1_HIGHSPEEDENA
1	0h RW	**HOSTCTRL1_DATAWIDTH:** HOSTCTRL1_DATAWIDTH
0	0h RW	**HOSTCTRL1_LEDCONTROL:** HOSTCTRL1_LEDCONTROL

12.2.17 POWERCONTROL Reg (POWERCONTROL) - Offset 29h

Type	Size	Offset	Default
MMIO	8 bit	BAR + 29h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	**Reserved**
4	0h RW	**EMMC_HWRESET:** EMMC_HWRESET
3:1	0h RW	**PWRCTRL_SDBUSVOLTAGE:** PWRCTRL_SDBUSVOLTAGE
0	0h RW	**PWRCTRL_SDBUSPOWER:** PWRCTRL_SDBUSPOWER

12.2.18 BLOCKGAPCONTROL Reg (BLOCKGAPCONTROL) - Offset 2Ah

BOOT_ACK_CHK

Type	Size	Offset	Default
MMIO	8 bit	BAR + 2Ah	80h

Bit Range	Default & Access	Field Name (ID): Description
7	1h RW	**BOOT_ACK_CHK:** BOOT_ACK_CHK
6	0h RW	**ALT_BOOT_EN:** ALT_BOOT_EN
5	0h RW	**BOOT_EN:** BOOT_EN
4	0h RW	**SPI_MODE:** SPI_MODE
3	0h RW	**INTR_AT_BLOCK_GAP:** INTR_AT_BLOCK_GAP
2	0h RW	**RD_WAIT_CTRL:** RD_WAIT_CTRL
1	0h RW	**CONTINUE_REQ:** CONTINUE_REQ
0	0h RW	**STOPATBLKGAP_REQ:** STOPATBLKGAP_REQ

12.2.19 WAKEUPCONTROL Reg (WAKEUPCONTROL) - Offset 2Bh

Type	Size	Offset	Default
MMIO	8 bit	BAR + 2Bh	00h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	**Reserved**
2	0h RW	**WKUPCTRL_CARDREMOVAL:** WKUPCTRL_CARDREMOVAL
1	0h RW	**WKUPCTRL_CARDINSERTION:** WKUPCTRL_CARDINSERTION
0	0h RW	**WKUPCTRL_CARDINTERRUPT:** WKUPCTRL_CARDINTERRUPT

12.2.20 CLOCKCONTROL Reg (CLOCKCONTROL) - Offset 2Ch

CLKCTRL_SDCLKFREQSEL

Type	Size	Offset	Default
MMIO	16 bit	BAR + 2Ch	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:8	00h RW	**CLKCTRL_SDCLKFREQSEL:** CLKCTRL_SDCLKFREQSEL
7:6	0h RW	**CLKCTRL_SDCLKFREQSEL_UPPERBITS:** CLKCTRL_SDCLKFREQSEL_UPPERBITS
5	0h RW	**CLKCTRL_CLKGENSEL:** CLKCTRL_CLKGENSEL
4:3	0h RO	**Reserved**
2	0h RW	**CLKCTRL_SDCLKENA:** CLKCTRL_SDCLKENA
1	0h RO/V	**SDHCCLKGEN_INTCLKSTABLE_DSYNC:** SDHCCLKGEN_INTCLKSTABLE_DSYNC
0	0h RW	**CLKCTRL_INTCLKENA:** CLKCTRL_INTCLKENA

12.2.21 TIMEOUTCONTROL Reg (TIMEOUTCONTROL) - Offset 2Eh

Type	Size	Offset	Default
MMIO	8 bit	BAR + 2Eh	00h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0h RO	**Reserved**
3:0	0h RW	**TIMEOUT_CTRVALUE:** TIMEOUT_CTRVALUE

12.2.22 SOFTWARERESET Reg (SOFTWARERESET) - Offset 2Fh

Type	Size	Offset	Default
MMIO	8 bit	BAR + 2Fh	00h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	**Reserved**
2	0h RW	**SWRESET_FOR_DAT:** SWRESET_FOR_DAT
1	0h RW	**SWRESET_FOR_CMD:** SWRESET_FOR_CMD
0	0h RW	**SWRESET_FOR_ALL:** SWRESET_FOR_ALL

12.2.23 NORMALINTRSTS Reg (NORMALINTRSTS) - Offset 30h

REG_ERRORINTRSTS

Type	Size	Offset	Default
MMIO	16 bit	BAR + 30h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**REG_ERRORINTRSTS:** REG_ERRORINTRSTS
14	0h RW/1C	**NORMALINTRSTS_BOOTCOMPLETE:** NORMALINTRSTS_BOOTCOMPLETE
13	0h RW/1C	**NORMALINTRSTS_RCVBOOTACK:** NORMALINTRSTS_RCVBOOTACK
12	0h RO	**NORMALINTRSTS_RETUNINGEVENT:** NORMALINTRSTS_RETUNINGEVENT
11	0h RO	**NORMALINTRSTS_INTC:** NORMALINTRSTS_INTC
10	0h RO	**NORMALINTRSTS_INTB:** NORMALINTRSTS_INTB
9	0h RO	**NORMALINTRSTS_INTA:** NORMALINTRSTS_INTA
8	0h RO	**NORMALINTRSTS_CARDINTSTS:** NORMALINTRSTS_CARDINTSTS
7	0h RW/1C	**NORMALINTRSTS_CARDREMSTS:** NORMALINTRSTS_CARDREMSTS
6	0h RW/1C	**NORMALINTRSTS_CARDINSSTS:** NORMALINTRSTS_CARDINSSTS
5	0h RW/1C	**NORMALINTRSTS_BUFRDREADY:** NORMALINTRSTS_BUFRDREADY
4	0h RW/1C	**NORMALINTRSTS_BUFWRREADY:** NORMALINTRSTS_BUFWRREADY
3	0h RW/1C	**NORMALINTRSTS_DMAINTERRUPT:** NORMALINTRSTS_DMAINTERRUPT

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW/1C	**NORMALINTRSTS_BLKGAPEVENT:** NORMALINTRSTS_BLKGAPEVENT
1	0h RW/1C	**NORMALINTRSTS_XFERCOMPLETE:** NORMALINTRSTS_XFERCOMPLETE
0	0h RW/1C	**NORMALINTRSTS_CMDCOMPLETE:** NORMALINTRSTS_CMDCOMPLETE

12.2.24 ERRORINSTRSTS Reg (ERRORINSTRSTS) - Offset 32h

Type	Size	Offset	Default
MMIO	16 bit	BAR + 32h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	**Reserved**
12	0h RW/1C	**ERRORINTRSTS_HOSTERROR:** ERRORINTRSTS_HOSTERROR
11:10	0h RO	**Reserved**
9	0h RW/1C	**ERRORINTRSTS_ADMAERROR:** ERRORINTRSTS_ADMAERROR
8	0h RW/1C	**ERRORINTRSTS_AUTOCMDERROR:** ERRORINTRSTS_AUTOCMDERROR
7	0h RW/1C	**ERRORINTRSTS_CURRLIMITERROR:** ERRORINTRSTS_CURRLIMITERROR
6	0h RW/1C	**ERRORINTRSTS_DATAENDBITERROR:** ERRORINTRSTS_DATAENDBITERROR
5	0h RW/1C	**ERRORINTRSTS_DATACRCERROR:** ERRORINTRSTS_DATACRCERROR
4	0h RW/1C	**ERRORINTRSTS_DATATIMEOUTERROR:** ERRORINTRSTS_DATATIMEOUTERROR
3	0h RW/1C	**ERRORINTRSTS_CMDINDEXERROR:** ERRORINTRSTS_CMDINDEXERROR
2	0h RW/1C	**ERRORINTRSTS_CMDENDBITERROR:** ERRORINTRSTS_CMDENDBITERROR
1	0h RW/1C	**ERRORINTRSTS_CMDCRCERROR:** ERRORINTRSTS_CMDCRCERROR
0	0h RW/1C	**ERRORINTRSTS_CMDTIMEOUTERROR:** ERRORINTRSTS_CMDTIMEOUTERROR

12.2.25 NORMALINTRSTSENA Reg (NORMALINTRSTSENA) - Offset 34h

Type	Size	Offset	Default
MMIO	16 bit	BAR + 34h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW	**BOOTINTR_ENA:** BOOTINTR_ENA
13	0h RW	**BOOTACK_RCVENA:** BOOTACK_RCVENA
12	0h RW	**RETUNE_EVENTSTSENA:** RETUNE_EVENTSTSENA
11	0h RW	**INT_C_STSENA:** INT_C_STSENA
10	0h RW	**INT_B_STSENA:** INT_B_STSENA
9	0h RW	**INT_A_STSENA:** INT_A_STSENA
8	0h RW	**SDHCREGSET_CARDINTSTSENA:** SDHCREGSET_CARDINTSTSENA

12.2.30 HOSTCONTROL2 Reg (HOSTCONTROL2) - Offset 3Eh

HOSTCTRL2_PRESETVALUEENABLE

Type	Size	Offset	Default
MMIO	16 bit	BAR + 3Eh	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**HOSTCTRL2_PRESETVALUEENABLE:** Preset Value Enable Host Controller Version 3.00 supports this bit. As the operating SDCLK frequency and I/O driver strength depend on the Host System implementation, it is difficult to determine these parameters in the Standard Host Driver. When Preset Value Enable is set to automatic. This bit enables the functions defined in the Preset Value registers. 1 Automatic Selection by Preset Value are Enabled 0 SDCLK and Driver Strength are controlled by Host Driver If this bit is set to 0, SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select in Host Control 2 register are set by Host Driver. If this bit is set to 1, SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select in Host Control 2 register are set by Host Controller as specified in the Preset Value registers
14	0h RW	**HOSTCTRL2_ASYNCHINTRENABLE:** Asynchronous Interrupt Enable This bit can be set to 1 if a card support asynchronous interrupt and Asynchronous Interrupt Support is set to 1 in the Capabilities register. Asynchronous interrupt is effective when DAT[1] interrupt is used in 4-bit SD mode (and zero is set to Interrupt Pin Select in the Shared Bus Control register). If this bit is set to 1, the Host Driver can stop the SDCLK during asynchronous interrupt period to save power. During this period, the Host Controller continues to deliver Card Interrupt to the host when it is asserted by the Card. 0 – Disabled 1 – Enabled
13:10	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**HOSTCTRL2_DRIVERSTRENGTH:** Driver Strength This is the programmed Drive Strength output and it[2] of the sdhccore_drivestrength value
8	0h RO	**Reserved**
7	0h RW	**HOSTCTRL2_SAMPLINGCLKSELECT:** Sampling Clock Select This bit is set by tuning procedure when Execute Tuning is cleared. Writing 1 to this bit is meaningless and ignored. Setting 1 means that tuning is completed successfully and setting 0 means that tuning is failed. Host Controller uses this bit to select sampling clock to receive CMD and DAT. This bit is cleared by writing 0. Change of this bit is not allowed while the Host Controller is receiving response or a read data block. 0 - Fixed clock is used to sample data 1 - Tuned clock is used to sample data
6	0h RW	**HOSTCTRL2_EXECUTETUNING:** Execute Tuning This bit is set to 1 to start tuning procedure and automatically cleared when tuning procedure is completed. The result of tuning is indicated to Sampling Clock Select. Tuning procedure is aborted by writing 0 for more detail about tuning procedure. 0 - Not Tuned or Tuning Completed 1 - Execute Tuning

Bit Range	Default & Access	Field Name (ID): Description
5:4	0h RW	**HOSTCTRL2_DRIVERSTRENGTHSEL:** Driver Strength Select Host Controller output driver in 1.8V signaling is selected by this bit. In 3.3V signaling, this field is not effective. This field can be set depends on Driver Type A, C and D support bits in the Capabilities register. This bit depends on setting of Preset Value Enable. If Preset Value Enable = 0, this field is set by Host Driver. If Preset Value Enable = 1, this field is automatically set by a value specified in the one of Preset Value registers. 00b Driver Type B is Selected (Default) 01b Driver Type A is Selected 10b Driver Type C is Selected 11b Driver Type D is Selected
3	0h RW	**HOSTCTRL2_1P8VSIGNALLINGENA:** 1.8V Signaling Enable This bit controls voltage regulator for I/O cell. 3.3V is supplied to the card regardless of signaling voltage. Setting this bit from 0 to 1 starts changing signal voltage from 3.3V to 1.8V. 1.8V regulator output shall be stable within 5ms. Host Controller clears this bit if switching to 1.8V signaling fails. Clearing this bit from 1 to 0 starts changing signal voltage from 1.8V to 3.3V. 3.3V regulator output shall be stable within 5ms. Host Driver can set this bit to 1 when Host Controller supports 1.8V signaling (One of support bits is set to 1: SDR50, SDR104 or DDR50 in the Capabilities register) and the card or device supports UHS-I 1 - 1.8V Signaling 0 - 3.3V Signaling
2:0	0h RW	**HOSTCTRL2_UHSMODESELECT:** UHS Mode Select This field is used to select one of UHS-I modes and effective when 1.8V Signaling Enable is set to 1. If Preset Value Enable in the Host Control 2 register is set to 1, Host Controller sets SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select according to Preset Value registers. In this case, one of preset value registers is selected by this field. Host Driver needs to reset SD Clock Enable before changing this field to avoid generating clock glitch. After setting this field, Host Driver sets SD Clock Enable again. 000b - SDR12 001b - SDR25 010b - SDR50 011b - SDR104 100b - DDR50 101b - HS400 110b - 111 Reserved When SDR50, SDR104 or DDR50 is selected for SDIO card, interrupt detection at the block gap shall not be used. Read Wait timing is changed for these modes. Refer to the SDIO Specification Version 3.00 for more detail

12.2.31 CAPABILITIES Reg (CAPABILITIES) - Offset 40h

CAPREG_HS400_SUPPORT

Type	Size	Offset	Default

1	0h RW	**MSE:** MSE
0	0h RO	**Reserved**

13.1.3 REG REVCLASSCODE (REVCLASSCODE) - Offset 8h

Revision ID Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:1] + 8h	08050100h

Bit Range	Default & Access	Field Name (ID): Description
31:8	080501h RO	**CLASS_CODES:** CLASS_CODES
7:0	00h RO	**RID:** RID

13.1.4 REG CLLATHEADERBIST (CLLATHEADERBIST) - Offset Ch

Cache Line Latency Header and BIST Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:1] + Ch	00800000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	1h RO	**MULFNDEV:** MULFNDEV
22:16	00h RO	**HEADERTYPE:** HEADERTYPE
15:8	00h RO	**LATTIMER:** LATTIMER
7:0	00h RW	**CACHELINE_SIZE:** CACHELINE_SIZE

13.1.5 REG BAR (BAR) - Offset 10h

BAR - Base Address Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:1] + 10h	00000004h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**BASEADDR:** BASEADDR
11:4	00h RO	**SIZEINDICATOR:** SIZEINDICATOR
3	0h RO	**PREFETCHABLE:** PREFETCHABLE
2:1	2h RO	**TYPE:** TYPE
0	0h RO	**MESSAGE_SPACE:** MESSAGE_SPACE

13.1.6 REG BAR_HIGH (BAR_HIGH) - Offset 14h

BAR - Base Address Register High

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:1] + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**BASEADDR_HIGH:** BASEADDR_HIGH

13.1.7 REG BAR1 (BAR1) - Offset 18h

BAR1 - Base Address Register1

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:1] + 18h	00000004h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**BASEADDR1:** BASEADDR1
11:4	00h RO	**SIZEINDICATOR1:** SIZEINDICATOR1
3	0h RO	**PREFETCHABLE1:** PREFETCHABLE1
2:1	2h RO	**TYPE1:** TYPE1
0	0h RO	**MESSAGE_SPACE1:** MESSAGE_SPACE1

13.1.8 REG BAR1_HIGH (BAR1_HIGH) - Offset 1Ch

BAR1 - Base Address Register1 High

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:1] + 1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**BASEADDR1_HIGH:** BASEADDR1_HIGH

13.1.9 REG SUBSYSTEMID (SUBSYSTEMID) - Offset 2Ch

SUBSYSTEMID -Subsystem Vendor and Subsystem ID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:1] + 2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O	**SUBSYSTEMID:** SUBSYSTEMID
15:0	0000h RW/O	**SUBSYSTEMVENDORID:** SUBSYSTEMVENDORID

13.1.10 REG EXPANSION_ROM_BASEADDR (EXPANSION_ROM_BASEADDR) - Offset 30h

Expansion ROM Base Address Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:1] + 30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**EXPANSION_ROM_BASE:** EXPANSION_ROM_BASE

13.1.11 REG CAPABILITYPTR (CAPABILITYPTR) - Offset 34h

Capabilities Pointer Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:1] + 34h	00000080h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	80h RO	**CAPPTR_POWER:** CAPPTR_POWER

13.1.12 REG INTERRUPTREG (INTERRUPTREG) - Offset 3Ch

Interrupt Line Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:1] + 3Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**MAX_LAT:** MAX_LAT
23:16	00h RO	**MIN_GNT:** MIN_GNT
15:12	0h RO	**Reserved**
11:8	0h RO	**INTPIN:** INTPIN
7:0	00h RW	**INTLINE:** INTLINE

13.1.13 REG POWERCAPID (POWERCAPID) - Offset 80h

Power Management Capability ID Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:1] + 80h	00039001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	00h RO	**PMESUPPORT:** PMESUPPORT
26:19	0h RO	**Reserved**
18:16	3h RO	**VERSION:** VERSION
15:8	90h RO	**NXTCAP:** NXTCAP
7:0	01h RO	**POWER_CAP:** POWER_CAP

13.1.14 REG PMECTRLSTATUS (PMECTRLSTATUS) - Offset 84h

Power Management Control and Status Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:1] + 84h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW/1C	**PMESTATUS:** PMESTATUS
14:9	0h RO	**Reserved**
8	0h RW	**PMEENABLE:** PMEENABLE
7:4	0h RO	**Reserved**
3	1h RO	**NO_SOFT_RESET:** NO_SOFT_RESET
2	0h RO	**Reserved**
1:0	0h RW	**POWERSTATE:** POWERSTATE

13.1.15 REG PCIDEVIDLE_CAP_RECORD (PCIDEVIDLE_CAP_RECORD) - Offset 90h

PCI Device Idle Capability Record Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:1] + 90h	F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**VEND_CAP:** VEND_CAP
27:24	0h RO	**REVID:** REVID
23:16	14h RO	**CAP_LENGTH:** CAP_LENGTH
15:8	00h RO	**NEXT_CAP:** NEXT_CAP
7:0	09h RO	**CAPID:** CAPID

13.1.16 REG DEVID_VEND_SPECIFIC_REG (DEVID_VEND_SPECIFIC_REG) - Offset 94h

Device ID Vendor Specific Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:1] + 94h	01400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	014h RO	**VSEC_LENGTH:** VSEC_LENGTH
19:16	0h RO	**VSEC_REV:** VSEC_REV
15:0	0010h RO	**VSECID:** VSECID

13.1.17 REG D0I3_CONTROL_SW_LTR_MMIO_REG (D0I3_CONTROL_SW_LTR_MMIO_REG) - Offset 98h

SW LTR Update MMIO Location Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:1] + 98h	00008041h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000804h RO	**SW_LAT_DWORD_OFFSET:** SW_LAT_DWORD_OFFSET
3:1	0h RO	**SW_LAT_BAR_NUM:** SW_LAT_BAR_NUM
0	1h RO	**SW_LAT_VALID:** SW_LAT_VALID

13.1.18 REG DEVICE_IDLE_POINTER_REG (DEVICE_IDLE_POINTER_REG) - Offset 9Ch

Device IDLE Pointer Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:1] + 9Ch	000081C1h

Bit Range	Default & Access	Field Name (ID): Description
31:4	000081Ch RO	**DWORD_OFFSET:** DWORD_OFFSET
3:1	0h RO	**BAR_NUM:** BAR_NUM
0	1h RO	**VALID:** VALID

13.1.19 REG D0I3_MAX_POW_LAT_PG_CONFIG (D0I3_MAX_POW_LAT_PG_CONFIG) - Offset A0h

Doi3 Max Power On Latency

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:1] + A0h	00290800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21	1h RW	**HAE:** HAE
20	0h RO	**Reserved**
19	1h RW	**SLEEP_EN:** SLEEP_EN

Bit Range	Default & Access	Field Name (ID): Description
18	0h RW	**PGE:** PGE
17	0h RW	**I3_ENABLE:** I3_ENABLE
16	1h RW	**PMCRE:** PMCRE
15:13	0h RO	**Reserved**
12:10	2h RW/O	**POW_LAT_SCALE:** POW_LAT_SCALE
9:0	000h RW/O	**POW_LAT_VALUE:** POW_LAT_VALUE

13.1.20 REG GEN_REGRW1 (GEN_REGRW1) - Offset B0h

General Purpose PCI RW Register1

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:1] + B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GEN_REG_RW1:** GEN_REG_RW1

13.1.21 REG GEN_REGRW2 (GEN_REGRW2) - Offset B4h

General Purpose PCI RW Register2

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:1] + B4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GEN_REG_RW2:** GEN_REG_RW2

13.1.22 REG GEN_REGRW3 (GEN_REGRW3) - Offset B8h

General Purpose PCI RW Register3

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:1] + B8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GEN_REG_RW3:** GEN_REG_RW3

13.1.23 REG GEN_REGRW4 (GEN_REGRW4) - Offset BCh

General Purpose PCI RW Register4

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:1] + BCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GEN_REG_RW4:** GEN_REG_RW4

13.1.24 REG GEN_INPUT_REG (GEN_INPUT_REG) - Offset C0h

General Input Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:1] + C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**GEN_REG_INPUT_RW:** GEN_REG_INPUT_RW

13.1.25 REG MANID (MANID) - Offset F8h

Manufacturers ID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:1] + F8h	0000000Fh

Bit Range	Default & Access	Field Name (ID): Description
31:0	0000000Fh RO	**MANID:** MANID

13.2 SDIO Memory Mapped Registers Summary

Table 13-2. Summary of SDIO Memory Mapped Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	REG SDMASYSADDR (SDMASYSADDR)	00000000h
4h	2	REG BLOCKSIZE (BLOCKSIZE)	0000h

FEh	2	REG HOSTCONTROLLERVER (HOSTCONTROLLERVER)	1002h

13.2.1 REG SDMASYSADDR (SDMASYSADDR) - Offset 0h

32-bit Block Count (SDMA System Address) Register (High)

Type	Size	Offset	Default
MMIO	32 bit	BAR + 0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SDMA_SYSADDRESS:** sdma_sysaddress

13.2.2 REG BLOCKSIZE (BLOCKSIZE) - Offset 4h

BlockSize

Type	Size	Offset	Default
MMIO	16 bit	BAR + 4h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14:12	0h RW	**SDMA_BUFBOUNDARY:** sdma_bufboundary
11:0	000h RW	**XFER_BLOCKSIZE:** xfer_blocksize

13.2.3 REG BLOCKCOUNT (BLOCKCOUNT) - Offset 6h

BlockCount

Type	Size	Offset	Default
MMIO	16 bit	BAR + 6h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW	**BLOCK_CNT_16BIT:** block_cnt_16bit

13.2.4 REG ARGUMENT1 (ARGUMENT1) - Offset 8h

Argument1

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**COMMAND_ARGUMENT1:** command_argument1

13.2.5 REG TRANSFERMODE (TRANSFERMODE) - Offset Ch

TransferMode

Type	Size	Offset	Default
MMIO	16 bit	BAR + Ch	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:9	0h RO	**Reserved**
8	0h RW	**XFERMODE_RESP_INTR_DISABLE:** xfermode_resp_intr_disable
7	0h RW	**XFER_RESP_ERR_CHK_ENB:** xfer_resp_err_chk_enb
6	0h RW	**XFER_RESP_TYPE_R1_R5:** xfer_resp_type_r1_r5
5	0h RW	**XFERMODE_MULTIBLKSEL:** xfermode_multiblksel
4	0h RW	**XFERMODE_DATAXFERDIR:** xfermode_dataxferdir
3:2	0h RW	**XFERMODE_AUTOCMDENA:** xfermode_autocmdena
1	0h RW	**XFERMODE_BLKCNTENA:** xfermode_blkcntena
0	0h RW	**XFERMODE_DMAENABLE:** xfermode_dmaenable

13.2.6 REG COMMAND (COMMAND) - Offset Eh

Command

Type	Size	Offset	Default
MMIO	16 bit	BAR + Eh	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	**Reserved**
13:8	00h RW	**COMMAND_CMDINDEX:** command_cmdindex
7:6	0h RW	**COMMAND_CMDTYPE:** command_cmdtype
5	0h RW	**COMMAND_DATAPRESENT:** command_datapresent
4	0h RW	**COMMAND_INDEXCHKENA:** command_indexchkena
3	0h RW	**COMMAND_CRCCHKENA:** command_crcchkena
2	0h RW	**COMMAND_SUB_FLAG:** command_sub_flag
1:0	0h RW	**COMMAND_RESPONSETYPE:** command_responsetype

13.2.7 REG RESPONSE01 (RESPONSE01) - Offset 10h

Response Register 1

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**COMMAND_RESPONSE_31_0:** command_response_31_0

13.2.8 REG RESPONSE2 (RESPONSE2) - Offset 14h

Response Register 2

Type	Size	Offset	Default
MMIO	16 bit	BAR + 14h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RO/V	**COMMAND_RESPONSE_47_32:** command_response_47_32

13.2.9 REG RESPONSE3 (RESPONSE3) - Offset 16h

Response Register 3

Type	Size	Offset	Default
MMIO	16 bit	BAR + 16h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RO/V	**COMMAND_RESPONSE_63_48:** command_response_63_48

13.2.10 REG RESPONSE4 (RESPONSE4) - Offset 18h

Response Register 4

Type	Size	Offset	Default
MMIO	16 bit	BAR + 18h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RO/V	**COMMAND_RESPONSE_79_64:** command_response_79_64

13.2.11 REG RESPONSE5 (RESPONSE5) - Offset 1Ah

Response Register 5

Type	Size	Offset	Default
MMIO	16 bit	BAR + 1Ah	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RO/V	**COMMAND_RESPONSE_95_80:** command_response_95_80

13.2.12 REG RESPONSE6 (RESPONSE6) - Offset 1Ch

Response Register 6

Type	Size	Offset	Default
MMIO	16 bit	BAR + 1Ch	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RO/V	**COMMAND_RESPONSE_111_96:** command_response_111_96

13.2.13 REG RESPONSE7 (RESPONSE7) - Offset 1Eh

Response Register 7

Type	Size	Offset	Default
MMIO	16 bit	BAR + 1Eh	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RO/V	**COMMAND_RESPONSE_127_112:** command_response_127_112

13.2.14 REG DATAPORT (DATAPORT) - Offset 20h

Buffer DataPort

Type	Size	Offset	Default
MMIO	32 bit	BAR + 20h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SDHCDMACTRL_PIOBUFRDDATA:** sdhcdmactrl_piobufrddata

13.2.15 REG PRESENTSTATE (PRESENTSTATE) - Offset 24h

PresentState

Type	Size	Offset	Default
MMIO	32 bit	BAR + 24h	01F00000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**UHS2_INTF_DETECT:** uhs2_intf_detect
30	0h RO/V	**UHS2_LANE_SYNCH:** uhs2_lane_synch
29	0h RO/V	**UHS2_INDORMANTSTE:** uhs2_indormantste
28	0h RO/V	**SUB_CMND_STS:** sub_cmnd_sts
27	0h RO/V	**CMND_NOTISSUE_BYERR:** cmnd_notissue_byerr
26	0h RO	**Reserved**
25	0h RO/V	**HOST_REGU_VOL_STB:** host_regu_vol_stb
24	1h RO/V	**SDIF_CMDIN_DSYNC:** sdif_cmdin_dsync
23:20	Fh RO/V	**SDIF_DAT0IN_DSYNC:** sdif_dat0in_dsync
19	0h RO/V	**SDIF_WP_DSYNC:** sdif_wp_dsync
18	0h RO/V	**SDIF_CD_N_DSYNC:** sdif_cd_n_dsync
17	0h RO/V	**SDHCCARDDET_STATESTABLE_DSYNC:** sdhccarddet_statestable_dsync
16	0h RO/V	**SDHCCARDDET_INSERTED_DSYNC:** sdhccarddet_inserted_dsync
15:12	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
11	0h RO/V	**SDHCDMACTRL_PIOBUFRDENA:** sdhcdmactrl_piobufrdena
10	0h RO/V	**SDHCDMACTRL_PIOBUFWRENA:** sdhcdmactrl_piobufwrena
9	0h RO/V	**SDHCDMACTRL_RDXFERACTIVE:** sdhcdmactrl_rdxferactive
8	0h RO/V	**SDHCDMACTRL_WRXFERACTIVE:** sdhcdmactrl_wrxferactive
7:4	0h RO/V	**DAT7_4_LINE_SIGLEVEL:** dat7_4_line_siglevel
3	0h RO/V	**SDHCSDCTRL_RETUNINGREQ_DSYNC:** sdhcsdctrl_retuningreq_dsync
2	0h RO/V	**SDHCDMACTRL_DATALINEACTIVE:** sdhcdmactrl_datalineactive
1	0h RO/V	**PRESENTSTATE_INHIBITDAT:** presentstate_inhibitdat
0	0h RO/V	**PRESENTSTATE_INHIBITCMD:** presentstate_inhibitcmd

13.2.16 REG HOSTCONTROL1 (HOSTCONTROL1) - Offset 28h

HostControl1

Type	Size	Offset	Default
MMIO	8 bit	BAR + 28h	00h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**HOSTCTRL1_CDSIGSELECT:** hostctrl1_cdsigselect
6	0h RW	**HOSTCTRL1_CDTESTLEVEL:** hostctrl1_cdtestlevel
5	0h RW	**HOSTCTRL1_EXTDATAWIDTH:** hostctrl1_extdatawidth
4:3	0h RW	**HOSTCTRL1_DMASELECT:** hostctrl1_dmaselect
2	0h RW	**HOSTCTRL1_HIGHSPEEDENA:** hostctrl1_highspeedena
1	0h RW	**HOSTCTRL1_DATAWIDTH:** hostctrl1_datawidth
0	0h RW	**HOSTCTRL1_LEDCONTROL:** hostctrl1_ledcontrol

13.2.17 REG POWERCONTROL (POWERCONTROL) - Offset 29h

PowerControl

Type	Size	Offset	Default
MMIO	8 bit	BAR + 29h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RW	**SDBUS_VOLTAGE_SEL_VDD2:** sdbus_voltage_sel_vdd2
4	0h RW	**SDBUS_POWER_VDD2:** sdbus_power_vdd2

13:11	0h RO	**Reserved**
10	0h RO	**CLOCKGENERATORSELECTVALUE:** ClockGeneratorSelectValue
9:0	001h RO	**SDCLKFREQUENCYSELECTVALUE:** SDCLKFrequencySelectValue

13.2.45 REG PRESETVALUE6 (PRESETVALUE6) - Offset 6Ch

Preset Value Register for SDR104

Type	Size	Offset	Default
MMIO	16 bit	BAR + 6Ch	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	**DRIVERSTRENGTHSELECTVALUE:** DriverStrengthSelectValue
13:11	0h RO	**Reserved**
10	0h RO	**CLOCKGENERATORSELECTVALUE:** ClockGeneratorSelectValue
9:0	000h RO	**SDCLKFREQUENCYSELECTVALUE:** SDCLKFrequencySelectValue

13.2.46 REG PRESETVALUE7 (PRESETVALUE7) - Offset 6Eh

Preset Value Register for DDR50

Type	Size	Offset	Default
MMIO	16 bit	BAR + 6Eh	0002h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	**DRIVERSTRENGTHSELECTVALUE:** DriverStrengthSelectValue
13:11	0h RO	**Reserved**
10	0h RO	**CLOCKGENERATORSELECTVALUE:** ClockGeneratorSelectValue
9:0	002h RO	**SDCLKFREQUENCYSELECTVALUE:** SDCLKFrequencySelectValue

13.2.47 REG BOOTTIMEOUTCNT (BOOTTIMEOUTCNT) - Offset 70h

Boot Timeout Control

Type	Size	Offset	Default
MMIO	32 bit	BAR + 70h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**BOOT_TIMEOUTCNT:** boot_timeoutcnt

13.2.48 REG PRESETVALUE8 (PRESETVALUE8) - Offset 74h

Preset Value for UHS2

Type	Size	Offset	Default
MMIO	16 bit	BAR + 74h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	**DRIVERSTRENGTHSELECTVALUE:** DriverStrengthSelectValue
13:11	0h RO	**Reserved**
10	0h RO	**CLOCKGENERATORSELECTVALUE:** ClockGeneratorSelectValue
9:0	000h RO	**SDCLKFREQUENCYSELECTVALUE:** SDCLKFrequencySelectValue

13.2.49 REG ADMA3_LOW (ADMA3_LOW) - Offset 78h

ADMA3 Integrated Descriptor Address Low

Type	Size	Offset	Default
MMIO	32 bit	BAR + 78h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**ADMA3_DESC_ADDR_LOW:** adma3_desc_addr_low

13.2.50 REG SLOTINTRSTS (SLOTINTRSTS) - Offset FCh

Slot Interrupt Status

Type	Size	Offset	Default
MMIO	16 bit	BAR + FCh	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved**
7:1	00h RO	**SDHCHOSTIF_SLOTINTRSTSSLOT1TO8:** sdhchostif_slotintrstsslot1to8
0	0h RO	**SDHCHOSTIF_SLOTINTRSTSSLOT0:** sdhchostif_slotintrstsslot0

13.2.51 REG HOSTCONTROLLERVER (HOSTCONTROLLERVER) - Offset FEh

Host Controller Version

Type	Size	Offset	Default
MMIO	16 bit	BAR + FEh	1002h

Bit Range	Default & Access	Field Name (ID): Description
15:8	10h RO	**SDHC_VENVERNUM:** SDHC_VENVERNUM
7:0	02h RO	**HOSTCTRL_SPECIFICATIONVERSIONNUMBER:** hostctrl_SpecificationVersionNumber

13.3 SDIO Converge Layer Registers Summary

Table 13-3. Summary of SDIO Converge Layer Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
804h	2	REG SDCARD_SW_LTR_VAL_REG (SW_LTR_VAL)	0000h
808h	2	REG SDCARD_AUTO_LTR_VAL_REG (AUTO_LTR_VAL)	0000h
810h	4	REG SDCARD_CAP_BYP_CTRL_REG (CAP_BYPS)	00000000h
814h	4	REG SDCARD_CAP_BYP_REG_I (CAP_BYPS_REG1)	00000000h
818h	4	REG SDCARD_CAP_BYP_REG_II (CAP_BYPS_REG2)	00000000h
81Ch	4	REG SDCARD_D0I3_CTRL (REG_D0I3)	00000000h
820h	4	REG SDCARD_TX_CMD_DELAY_CONTROL (TX_CMD_DLY)	00000000h
824h	4	REG SDCARD_TX_DELAY_CONTROL_1 (TX_DATA_DLY_1)	00000000h
828h	4	REG SDCARD_TX_DELAY_CONTROL_2 (TX_DATA_DLY_2)	00000000h
82Ch	4	REG SDCARD_RX_DATA_PATH_DELAY_CONTROL_1 (RX_CMD_DATA_DLY_1)	00000000h
834h	4	REG SDCARD_RX_DATA_PATH_DELAY_CONTROL_2 (RX_CMD_DATA_DLY_2)	00000000h
838h	4	REG SDCARD_MASTER_DLL_SW_CTRL (MASTER_DLL)	00000000h
840h	4	REG SDCARD_AUTO_TUNING_VALUE (AUTO_TUNING)	00000000h

13.3.1 REG SDCARD_SW_LTR_VAL_REG (SW_LTR_VAL) — Offset 804h

Software LTR VAL_REG Register

Type	Size	Offset	Default
MMIO	16 bit	BAR + 804h	0000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO	**Reserved**

13.3.2 REG SDCARD_AUTO_LTR_VAL_REG (AUTO_LTR_VAL) — Offset 808h

Auto LTR VAL_REG Register

Note: **NOTE:** Bit definitions are the same as SW_LTR_VAL, offset 804h.

13.3.3 REG SDCARD_CAP_BYP_CTRL_REG (CAP_BYPS) — Offset 810h

Capabilities Bypass Control Register

Note: **NOTE:** Bit definitions are the same as SW_LTR_VAL, offset 804h.

13.3.4 REG SDCARD_CAP_BYP_REG_I (CAP_BYPS_REG1) — Offset 814h

Capabilities Bypass Register I

Note: **NOTE:** Bit definitions are the same as SW_LTR_VAL, offset 804h.

13.3.5 REG SDCARD_CAP_BYP_REG_II (CAP_BYPS_REG2) — Offset 818h

Capabilities Bypass Register II

Note: **NOTE:** Bit definitions are the same as SW_LTR_VAL, offset 804h.

13.3.6 REG SDCARD_D0I3_CTRL (REG_D0I3) — Offset 81Ch

Device Idle D0i3 Register

Note: **NOTE:** Bit definitions are the same as SW_LTR_VAL, offset 804h.

13.3.7 REG SDCARD_TX_CMD_DELAY_CONTROL (TX_CMD_DLY) — Offset 820h

Tx CMD Delay Control Register

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	**Reserved**
14:8	04h RW	**DDR Mode**: Tx CMD Delay (DDR Mode). 0-39: Select number of active delay elements. Each = 125pSec. 40-127: Reserved
7	0h RO	**Reversed**
6:0	00h RW	**SDR_MODE**: Tx CMD Delay (SDR Mode). 0-39: Select number of active delay elements. Each = 125pSec. 40-127: Reserved

Note: **NOTE:** Bit definitions are the same as SW_LTR_VAL, offset 804h.

<Enter text here>

13.3.8 REG SDCARD_TX_DELAY_CONTROL_1 (TX_DATA_DLY_1) — Offset 824h

Tx Delay Control 1 Register

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	**Reserved**
14:8	0Ah RW	**HS400_MODE**: Tx Data Delay (HS400 Mode). 0-78: Select number of active delay elements. Each = 125pSec. 79-127: Reserved
7	0h RO	**Reversed**
6:0	18h RW	**SDR104_HS200_MODE:** Tx Data Delay (SDR104/HS200 Mode) 0-79: Select number of active delay elements. Each = 125pSec. 80-127: Reserved

Note: **NOTE:** Bit definitions are the same as SW_LTR_VAL, offset 804h.

<Enter text here>

13.3.9 REG SDCARD_TX_DELAY_CONTROL_2 (TX_DATA_DLY_2) — Offset 828h

Tx Delay Control 2 Register

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:24	1Ch RW	**SDR50_MODE**: Tx Data Delay (SDR50 Mode). 0-79: Select number of active delay elements. Each = 125pSec. 80-127: Reserved
23	0h RO	**Reversed**
22:16	1Ch RW	**DDR50_MODE:** Tx Data Delay (DDR50 Mode). 0-78: Select number of active delay elements. Each = 125pSec. 79-127: Reserved
15	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
14:8	1Ch RW	**SDR25_HS50_MODE:** Tx Data Delay (SDR25/HS50 Mode). 0-79: Select number of active delay elements. Each = 125pSec. 80-127: Reserved
7	0h RO	**Reserved**
6:0	00h RW	**SDR12_COMP_MODE:** Tx Data Delay (SDR12/Compatibility Mode). 0-79: Select number of active delay elements. Each = 125pSec. 80-127: Reserved

Note: **NOTE:** Bit definitions are the same as SW_LTR_VAL, offset 804h.

13.3.10 REG SDCARD_RX_DATA_PATH_DELAY_CONTROL_1 (RX_CMD_DATA_DLY_1) — Offset 82Ch

Rx CMD Data Delay Control 1 Register

Note: **NOTE:** Bit definitions are the same as SW_LTR_VAL, offset 804h.

13.3.11 REG SDCARD_RX_DATA_PATH_DELAY_CONTROL_2 (RX_CMD_DATA_DLY_2) — Offset 834h

Rx CMD Data Path Delay Control 2 Register

<Enter text here>

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17:16	0h RW	**CLK_SOURCE**: Clock Source for Rx Path 00: Rx Clock after Output Buffer 01: Rx Clock before Output Buffer 10: Automatic Selection based on mode (HS 200 before buffer, all others after buffer) 11: Reserved
15:14	0h RO	**Reversed**
13:8	18h RW	**PATH_PLL:** Rx Path PLL #3 Delay value For Auto Tuning Mode 0-39: Select the required delay, as a multiple of 125pSec. 40-63: Reserved
7	0h RO	**Reserved**
6:0	1Ch RW	**CMD_DATA_SDR104_HS200:** Rx CMD + Data Delay (SDR104/HS200 Mode) 0-79: Select the required delay, as a multiple of 125pSec. 80-127: Reserved

Note: **NOTE:** Bit definitions are the same as SW_LTR_VAL, offset 804h.

13.3.12 REG SDCARD_MASTER_DLL_SW_CTRL (MASTER_DLL) — Offset 838h

Master DLL Software CTRL Register

Note: **NOTE:** Bit definitions are the same as SW_LTR_VAL, offset 804h.

13.3.13 REG SDCARD_AUTO_TUNING_VALUE (AUTO_TUNING) — Offset 840h

Auto Tuning Value Register

Note: **NOTE:** Bit definitions are the same as SW_LTR_VAL, offset 804h.

14 Inter-Integrated Circuit (I^2C) Controller

14.1 I^2C Configuration Registers Summary

This chapter records the registers of the I^2C device. The device contains multiple I^2C controller:

- I^2C Controller #0 - Bus: 0, Device: 21, Function 0
- I^2C Controller #1 - Bus: 0, Device: 21, Function 1
- I^2C Controller #2 - Bus: 0, Device: 21, Function 2
- I^2C Controller #3 - Bus: 0, Device: 21, Function 3
- I^2C Controller #4 - Bus: 0, Device: 25, Function 0
- I^2C Controller #5 - Bus: 0, Device: 25, Function 1
- I^2C Controller #6 - Bus: 0, Device: 16, Function 0
- I^2C Controller #7 - Bus: 0, Device: 16, Function 1

DID Values:

- I^2C Controller #0:- D21:F0 - 4B78h
- I^2C Controller #1:- D21:F1 - 4B79h
- I^2C Controller #2:- D21:F2 - 4B7Ah
- I^2C Controller #3:- D21:F3 - 4B7Bh
- I^2C Controller #4:- D25:F0 - 4B4Bh
- I^2C Controller #5:- D25:F1 - 4B4Ch
- I^2C Controller #6:- D16:F0 - 4B44h
- I^2C Controller #7:- D16:F1 - 4B45h

Table 14-1. Summary of Bus: 0, Device: 21, Function: 0 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	Device ID And Vendor ID Register (DEVVENDID)	4B788086h
4h	4	Status And Command (STATUSCOMMAND)	00100000h
8h	4	Revision ID And Class Code (REVCLASSCODE)	0C800000h
Ch	4	Cache Line Latency Header And BIST (CLLATHEADERBIST)	00800000h
10h	4	Base Address Register (BAR)	00000000h
14h	4	Base Address Register High (BAR_HIGH)	00000000h
18h	4	Base Address Register1 (BAR1)	00000004h
1Ch	4	Base Address Register1 High (BAR1_HIGH)	00000000h
2Ch	4	Subsystem Vendor And Subsystem ID (SUBSYSTEMID)	00000000h
30h	4	Expansion ROM Base Address (EXPANSION_ROM_BASEADDR)	00000000h
34h	4	Capabilities Pointer Register (CAPABILITYPTR)	00000080h
3Ch	4	Interrupt Register (INTERRUPTREG)	00000000h
80h	4	PowerManagement Capability ID (POWERCAPID)	00039001h
84h	4	Power Management Control And Status Register (PMECTRLSTATUS)	00000008h
90h	4	PCI Device Idle Vendor Capability Register (PCIDEVIDLE_CAP_RECORD)	F0140009h
94h	4	Vendor Specific Extended Capability Register (DEVID_VEND_SPECIFIC_REG)	01400010h
98h	4	Software LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG)	00002101h
9Ch	4	Device Idle Pointer Register (DEVICE_IDLE_POINTER_REG)	000024C1h
A0h	4	D0i3 And Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG)	000F0800h
B0h	4	General Purpose Read Write Register1 (GEN_REGRW1)	00000000h
B4h	4	General Purpose Read Write Register2 (GEN_REGRW2)	00000000h
B8h	4	General Purpose Read Write Register3 (GEN_REGRW3)	00000000h
BCh	4	General Purpose Read Write Register4 (GEN_REGRW4)	00000000h
C0h	4	General Purpose Input Register (GEN_INPUT_REG)	00000000h
F8h	4	Manufacturers ID (MANID)	00000000h

14.1.1 Device ID And Vendor ID Register (DEVVENDID) - Offset 0h

Device ID and Vendor ID.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:21, F:0] + 0h	4B788086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	4B78h RO/P	**Device ID Field (DEVICEID):** Device ID identifies the particular PCI device
15:0	8086h RO	**Vendor ID Field (VENDORID):** Vendor ID is a unique ID provided by the PCI SIG which identifies the manufacturer of the device

14.1.2 Status And Command (STATUSCOMMAND) - Offset 4h

Command register and Status register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:21, F:0] + 4h	00100000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29	0h RW/1C	**RMA Field (RMA):** Received Master Abort
28	0h RW/1C	**RTA Field (RTA):** Received Target Abort
27:21	0h RO	**Reserved**
20	1h RO	**Cap List Field (CAPLIST):** Capabilities List: Indicates that the controller contains a capabilities pointer list
19	0h RO	**Interrupt Status Field (INTR_STATUS):** Interrupt Status: This bit reflects state of interrupt in the device
18:11	0h RO	**Reserved**
10	0h RW	**Interrupt Disable Field (INTR_DISABLE):** Interrupt Disable
9	0h RO	**Reserved**
8	0h RW	**SERR Enable Field (SERR_ENABLE):** SERR Enable Not implemented
7:3	0h RO	**Reserved**
2	0h RW	**BME Field (BME):** Bus Master Enable
1	0h RW	**MSE Field (MSE):** Memory Space Enable
0	0h RO	**Reserved**

14.1.3 Revision ID And Class Code (REVCLASSCODE) - Offset 8h

Revision ID register and Class Code register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:21, F:0] + 8h	0C800000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0C8000h RO	**Revision ID Field (CLASS_CODES):** Class Code register is read-only and is used to identify the generic function of the device and in some cases a specific register-level programming interface
7:0	00h RO/P	**Class Code Field (RID):** Revision ID identifies the revision of particular PCI device.

14.1.4 Cache Line Latency Header And BIST (CLLATHEADERBIST) - Offset Ch

Cache Line size as RW with def 0 Latency timer RW with def 0 Header type with Type 0 configuration header and Reserved BIST register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:21, F:0] + Ch	00800000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	1h RO	**Multi Function Device Field (MULFNDEV):** Multi-Function Device
22:16	00h RO	**Header Type Field (HEADERTYPE):** Header Type: Implements Type 0 Configuration header
15:8	00h RO	**Latency Timer Field (LATTIMER):** Latency Timer:. This register is implemented as R/W with default as 0
7:0	00h RW/P	**Cache Line Size Field (CACHELINE_SIZE):** Cache line Size

14.1.5 Base Address Register (BAR) - Offset 10h

Base Address Register Low [31:2] type[2:1] in 32bit or 64bit address range and memory space indicator [0].

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:21, F:0] + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR):** Base Address Register Low Base address of the OCP fabric memory space. Taken from Strap values as ones
11:4	00h RO	**Size Field (SIZEINDICATOR):** Size Indicator RO Always returns 0 The size of this register depends on the size of the memory space
3	0h RO	**Prefetchable Field (PREFETCHABLE):** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**Type Field (TYPE0):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE):** Memory Space Indicator: 0 indicates this BAR is present in the memory space.

14.1.6 Base Address Register High (BAR_HIGH) - Offset 14h

Base Address Register High enabled if [2:1] of BAR is 10.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:21, F:0] + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR_HIGH):** Base Address High - MSB

14.1.7 Base Address Register1 (BAR1) - Offset 18h

Base Address Register1 accesses to PCI configuration space and is always 4K type in [2:1] and Memory Space Indicator in [0].

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:21, F:0] + 18h	00000004h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR1):** Base Address1 This field is present if BAR1 is enabled through private configuration space.
11:4	00h RO	**Size Field (SIZEINDICATOR1):** Always is 0 as minimum size is 4K

Bit Range	Default & Access	Field Name (ID): Description
3	0h RO	**Prefetchable Field (PREFETCHABLE1):** Prefetchable: Indicates that this BAR is not prefetchable.
2:1	2h RO	**Type Field (TYPE1):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE1):** Memory Space Indicator: 0 Indicates this BAR is present in the memory space

14.1.8 Base Address Register1 High (BAR1_HIGH) - Offset 1Ch

Base Address Register1 High enabled only if [2:1] of BAR1 register is 10.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:21, F:0] + 1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR1_HIGH):** Base Address: Base address of the OCP fabric memory space. Taken from Strap values as ones

14.1.9 Subsystem Vendor And Subsystem ID (SUBSYSTEMID) - Offset 2Ch

SVID register along with SID register is to distinguish subsystem from another.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:21, F:0] + 2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O/P	**Subsystem ID Field (SUBSYSTEMID):** Subsystem ID: This register is implemented for any function that can be instantiated more than once in a given system.
15:0	0000h RW/O/P	**Subsystem Vendor Field (SUBSYSTEMVENDORID):** Subsystem Vendor ID: This register must be implemented for any function that can be instantiated more than once in a given system

14.1.10 Expansion ROM Base Address (EXPANSION_ROM_BASEADDR) - Offset 30h

Expansion ROM Base Address register is a RO indicates support for Expansion ROMs.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:21, F:0] + 30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**EXPANSION ROM base address field (EXPANSION_ROM_BASE):** Expansion ROM Base Address: Value of all zeros indicates no support for Expansion ROM

14.1.11 Capabilities Pointer Register (CAPABILITYPTR) - Offset 34h

Capabilities Pointer register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:21, F:0] + 34h	00000080h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	80h RO	**Capabilities Pointer Field (CAPPTR_POWER):** Capabilities Pointer: Indicates what the next capability is.

14.1.12 Interrupt Register (INTERRUPTREG) - Offset 3Ch

Interrupt line Register isn't used in Bridge directly Interrupt Pin register reflects the IPIN value in private configuration space. Min_GNT register indicating the requirements of latency timers and Max_LAT register max latency.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:21, F:0] + 3Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Max Latency Field (MAX_LAT):** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	00h RO	**Min GNT Field (MIN_GNT):** Value of 0 indicates device has no major requirements for the settings of latency timers // Re-Check Desc Padma

Bit Range	Default & Access	Field Name (ID): Description
15:12	0h RO	**Reserved**
11:8	0h RO	**Interrupt Pin Field (INTPIN):** Interrupt Pin: Value in this register is reflected from the IPIN value in the private configuration space.
7:0	00h RW/P	**Int Line Field (INTLINE):** Interrupt Line: It is used to communicate to software the interrupt line to which the interrupt pin is connected

14.1.13 Power Management Capability ID (POWERCAPID) - Offset 80h

Power Management Capability ID register points to Next Capability Structure and Power Management Capability with Power Management Capabilities register for PME Support and Version.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:21, F:0] + 80h	00039001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	00h RO	**PME Support Field (PMESUPPORT):** This 5-bit field indicates the power states in which the function can assert the PME#
26:19	0h RO	**Reserved**
18:16	3h RO	**Version Field (VERSION):** Indicates support for Revision 1.2 of the PCI Power Management Specification
15:8	90h RO	**Next Cap Field (NXTCAP):** Next Capability: Points to the next capability structure.
7:0	01h RO	**Power Capability ID Field (POWER_CAP):** Power Management Capability: Indicates this is power management capability

14.1.14 Power Management Control And Status Register (PMECTRLSTATUS) - Offset 84h

Power Management Control and Status register to set and read PME Status, PME Enable, No Soft Reset and Power State.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:21, F:0] + 84h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW/1C/P	**PME Status Field (PMESTATUS):** PME Status
14:9	0h RO	**Reserved**
8	0h RW/P	**PME Enable Field (PMEENABLE):** PME Enable
7:4	0h RO	**Reserved**
3	1h RO	**No Soft Reset Field (NO_SOFT_RESET):** This bit indicates that devices transitioning from D3hot to D0 because of Power State commands do not perform an internal reset
2	0h RO	**Reserved**
1:0	0h RW	**Power State Field (POWERSTATE):** Power State: This field is used both to determine the current Power State and to set a new Power State

14.1.15 PCI Device Idle Vendor Capability Register (PCIDEVIDLE_CAP_RECORD) - Offset 90h

PCI Device Vendor Specific Capability register defines Vendor Specific Capability ID, Revision, Length, Next Capability and CAPID.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:21, F:0] + 90h	F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**Vendor Cap Field (VEND_CAP):** Vendor Specific Capability ID
27:24	0h RO	**Revision ID Field (REVID):** Revision ID of capability structure
23:16	14h RO	**Cap Length Field (CAP_LENGTH):** Vendor Specific Capability Length
15:8	00h RO	**Next Capability Field (NEXT_CAP):** Next Capability
7:0	09h RO	**Capability ID Field (CAPID):** Capability ID

14.1.16 Vendor Specific Extended Capability Register (DEVID_VEND_SPECIFIC_REG) - Offset 94h

Extended Vendor Capability register for VSEC Length, Revision and ID.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:21, F:0] + 94h	01400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	014h RO	**Vendor Specific ID Field (VSEC_LENGTH):** Vendor Specific Extended Capability Length
19:16	0h RO	**Vendor Specific Revision Field (VSEC_REV):** Vendor specific Extended Capability revision
15:0	0010h RO	**Vendor Specific Length Field (VSECID):** Vendor Specific Extended Capability ID

14.1.17 Software LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG) - Offset 98h

Software location pointer in MMIO space as an offset specified by BAR.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:21, F:0] + 98h	00002101h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000210h RO	**SW LTR Dword Offset Field (SW_LAT_DWORD_OFFSET):** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**SW LTR BAR Number Field (SW_LAT_BAR_NUM):** Indicates that the SW LTR update MMIO location is always at BAR0
0	1h RO	**SW LTR Valid Field (SW_LAT_VALID):** This value is reflected from the SW LTR valid strap at the top level

14.1.18 Device Idle Pointer Register (DEVICE_IDLE_POINTER_REG) - Offset 9Ch

Device IDLE Pointer register giving details on Device MMIO Offset Location, BAR NUM and D0i3 Valid Strap.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:21, F:0] + 9Ch	000024C1h

Bit Range	Default & Access	Field Name (ID): Description
31:4	000024Ch RO	**D0i3 Dword Offset Field (DWORD_OFFSET):** Contains the location pointer to the SW LTR register in MMIO space as an offset from the specified BAR
3:1	0h RO	**BAR NUM Field (BAR_NUM):** BAR Num: Indicates that the D0i3 MMIO location is always at BAR0
0	1h RO	**D0i3 Valid Field (VALID):** Valid: This value is reflected from the D0i3 valid strap at the top level.

14.1.19 D0i3 And Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG) - Offset A0h

D0idle_Max_Power_On_Latency register set at boot and power control enable register to enable communication with the PGCB block below the Bridge.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:21, F:0] + A0h	000F0800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21	0h RW/P	**HAE Field (HAE):** Hardware Autonomous Enable
20	0h RO	**Reserved**
19	1h RW/P	**Sleep Enable Field (SLEEP_EN):** Sleep Enable
18	1h RW/P	**D3 Hen Field (PGE):** DEVIDLE Enable (DEVIDLEN): If '1', then the function will power gate when idle and the DevIdle register (DevIdleC[2] = '1') is set.
17	1h RW/P	**Device Idle En Field (I3E):** PMCRE: PMC Request Enable
16	1h RW/P	**PMC Request Enable Field (PMCRE):** D3-Hot Enable (D3HEN): If '1', then function will power gate when idle and the PMCSR[1:0] register in the function = '11' (D3).
15:13	0h RO	**Reserved**
12:10	2h RW/O/P	**Power Latency Scale Field (POW_LAT_SCALE):** Power On Latency Scale
9:0	000h RW/O/P	**Power Latency Value Field (POW_LAT_VALUE):** Power On Latency value

14.1.20 General Purpose Read Write Register1 (GEN_REGRW1) - Offset B0h

General Purpose PCI Read Write Register1.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:21, F:0] + B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Read Write Field (GEN_REG_RW1):** General Purpose I2C Register: This register value is brought out as GEN_REG_RW1

14.1.21 General Purpose Read Write Register2 (GEN_REGRW2) - Offset B4h

General Purpose PCI Read Write Register2.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:21, F:0] + B4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Read Write Field (GEN_REG_RW2):** General Purpose I2C Register: This register value is brought out as GEN_REG_RW2

14.1.22 General Purpose Read Write Register3 (GEN_REGRW3) - Offset B8h

General Purpose PCI Read Write Register3.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:21, F:0] + B8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Read Write Field (GEN_REG_RW3):** General Purpose I2C Register: This register value is brought out as GEN_REG_RW3

14.1.23 General Purpose Read Write Register4 (GEN_REGRW4) - Offset BCh

General Purpose PCI Read Write Register4.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:21, F:0] + BCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Read Write Field (GEN_REG_RW4):** General Purpose I2C Register: This register value is brought out as GEN_REG_RW4

14.1.24 General Purpose Input Register (GEN_INPUT_REG) - Offset C0h

General Purpose Input Register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:21, F:0] + C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**General Purpose Input Field (GEN_REG_INPUT_RW):** General Purpose I2C Register: This register value is brought out as GEN_REG_INPUT_RW

14.1.25 Manufacturers ID (MANID) - Offset F8h

Manufacturers ID register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:21, F:0] + F8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/P	**Manufacturers ID Field (MANID):** Manufacturer ID: Default value comes from straps.

14.2 I²C Memory Mapped Registers Summary

Table 14-2. Summary of I²C Memory Mapped Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	REG IC_CON (IC_CON)	00000077h
4h	4	REG IC_TAR (IC_TAR)	00001055h
Ch	4	REG IC_HS_MADDR (IC_HS_MADDR)	00000001h
10h	4	REG IC_DATA_CMD (IC_DATA_CMD)	00000000h
14h	4	REG IC_SS_SCL_HCNT (IC_SS_SCL_HCNT)	000001F4h
18h	4	REG IC_SS_SCL_LCNT (IC_SS_SCL_LCNT)	0000024Ch
1Ch	4	REG IC_FS_SCL_HCNT (IC_FS_SCL_HCNT)	0000004Bh
20h	4	REG IC_FS_SCL_LCNT (IC_FS_SCL_LCNT)	000000A3h
24h	4	REG IC_HS_SCL_HCNT (IC_HS_SCL_HCNT)	00000008h
28h	4	REG IC_HS_SCL_LCNT (IC_HS_SCL_LCNT)	00000014h

B58h	4	REG ClearErr (CLEARERR)	00000000h
B60h	4	REG StatusInt (STATUSINT)	00000000h
B98h	4	REG DmaCfgReg (DMACFGREG)	00000000h
BA0h	4	REG ChEnReg (CHENREG)	00000000h

14.2.1 REG IC_CON (IC_CON) - Offset 0h

I2C Control Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 0h	00000077h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9	0h RW	**RX_FIFO_FULL_HLD_CTRL:** This bit controls whether DW_apb_i2c should hold the bus when the Rx FIFO is physically full to its RX_BUFFER_DEPTH, as in the IC_RX_FULL_HLD_BUS_EN parameter.
8	0h RW	**TX_EMPTY_CTRL:** This bit controls the generation of the TX_EMPTY interrupt, as in the IC_RAW_INTR_STAT register .

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**STOP_DET_IFADDRESSED:** Dependencies: This register bit value is applicable in the slave mode only (MASTER_MODE = 1b0) In slave mode: 1b1 issues the STOP_DET interrupt only when it is addressed. 1b0 issues the STOP_DET irrespective of whether it's addressed or not.
6	1h RW	**IC_SLAVE_DISABLE:** This bit controls whether I2C has its slave disabled. If this bit is set (slave is disabled), the function only works as a master and does not perform any action that requires a slave. 0:Reserved 1: slave is disabled
5	1h RW	**IC_RESTART_EN:** Determines whether RESTART conditions may be sent when I2C is acting as a master. 0: Restart disable 1: Restart enable When the RESTART is disabled, the IP is incapable of performing the following functions: Sending a START BYTE Performing any high-speed mode operation Performing direction changes in combined format mode Performing a read operation with a 10-bit address By replacing RESTART condition followed by a STOP and a subsequent START condition, split operations are broken down into multiple transfers. If the above operations are performed, it will result in setting bit 6 (TX_ABRT) of the IC_RAW_INTR_STAT register
4	1h RO	**IC_10BITADDR_MASTER_RD_ONLY:** Identifies if I2C operates in 7 or 10 bit addressing, 0: 7-bit addressing 1: 10-bit addressing
3	0h RW	**IC_10BITADDR_SLAVE:** When acting as a slave, this bit controls whether the DW_apb_i2c responds to 7-bit or 10-bit addresses.
2:1	3h RW	**SPEED:** These bits controls at which speed the I2C operates; its setting is relevant only if one is operating the I2C in master mode. 01: standard mode (0 to 100 kbit/s) 10: fast mode (<= 400 kbit/s) 11: High Speed Mode (<= 3.4 Mbit/s)
0	1h RW	**MASTER_MODE:** This bit controls whether I2C master is enabled. 0 = Reserved 1 = Master Enabled Note: For Master Device Configuration Software must ensure that this bit is set to 1, and bit 6 must also be set to 1. Else this will result in configuration error.

14.2.2 REG IC_TAR (IC_TAR) - Offset 4h

I2C Target Address Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4h	00001055h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	**Reserved**
12	1h RW	**IC_10BITADDR_MASTER:** This bit controls whether the I2C starts its transfers in 7-or 10-bit addressing mode when acting as a master. 0: 7 bit addressing 1: 10-bit addressing
11	0h RW	**SPECIAL:** This bit indicates whether software performs a General Call or START BYTE command. 0: ignore bit 10 GC_OR_START and use IC_TAR normally. 1: perform special I2C command as specified in GC_OR_START bit
10	0h RW	**GC_OR_START:** If bit 11 (SPECIAL) is set to 1, then this bit indicates whether a General Call or START byte command is to be performed by the I2C. 0: General Call Address after issuing a General Call, only writes may be performed. Attempting to issue a read command results in setting bit 6 (TX_ABRT) of the IC_RAW_INTR_STAT register. The I2C remains in General Call mode until the SPECIAL bit value (bit 11) is cleared. 1: START BYTE
9:0	055h RW	**IC_TAR:** This is the target address for any master transaction. When transmitting a General Call, these bits are ignored. To generate a START BYTE, the CPU needs to write only once into these bits. Note: If the IC_TAR and IC_SAR are the same, loopback exists but the FIFOs are shared between master and slave, so full loopback is not feasible. Only one direction loopback mode is supported (simplex), not duplex. A master cannot transmit to itself; it can transmit to only a slave.

14.2.3 REG IC_HS_MADDR (IC_HS_MADDR) - Offset Ch

I2C High Speed Master Mode Code Address Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + Ch	00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2:0	1h RW	**IC_HS_MAR:** This bit field holds the value of the I2C HS mode master code. HS-mode master codes are reserved 8-bit codes (00001xxx) that are not used for slave addressing or other purposes. Each master has its unique master code; up to eight high speed mode masters can be present on the same I2C bus system. Valid values are from 0 to 7. This register goes away and becomes read-only returning 0s if the IC_MAX_SPEED_MODE configuration parameter is set to either Standard (1) or Fast (2).

14.2.4 REG IC_DATA_CMD (IC_DATA_CMD) - Offset 10h

I2C Data Command Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved**
10	0h WO	**RESTART:** This bit controls whether a RESTART is issued before the byte is sent or received. 1 RESTART is issued before the data is sent/received (according to the value of CMD), regardless of whether or not the transfer direction is changing from the previous command; 0 - RESTART is issued only if the transfer direction is changing from the previous command

Bit Range	Default & Access	Field Name (ID): Description
9	0h WO	**STOP:** This bit controls whether a STOP is issued after the byte is sent or received. 1 - STOP is issued after this byte, regardless of whether or not the Tx FIFO is empty. If the Tx FIFO is not empty, the master immediately tries to start a new transfer by issuing a START and arbitrating for the bus. 0 - STOP is not issued after this byte, regardless of whether or not the Tx FIFO is empty. If the Tx FIFO is not empty, the master continues the current transfer by sending/receiving data bytes according to the value of the CMD bit. If the Tx FIFO is empty, the master holds the SCL line low and stalls the bus until a new command is available in the Tx FIFO.
8	0h WO	**CMD:** This bit controls whether a read or a write is performed. This bit does not control the direction when the I2C acts as a slave. It controls only the direction when it acts as a master. 1 = Read. 0 = Write When a command is entered in the TX FIFO, this bit distinguishes the write and read commands. In slave-receiver mode, this bit is a don't care because writes to this register are not required. In slave-transmitter mode, a 0 indicates that the data in IC_DATA_CMD is to be transmitted. When programming this bit, you should remember the following: attempting to perform a read operation after a General Call command has been sent results in a TX_ABRT interrupt (bit 6 of the IC_RAW_INTR_STAT register), unless bit 11 (SPECIAL) in the IC_TAR register has been cleared. If a 1 is written to this bit after receiving a RD_REQ interrupt, then a TX_ABRT interrupt occurs.
7:0	00h RW	**DAT:** This register contains the data to be transmitted or received on the I2C bus. If you are writing to this register and want to perform a read, bits 7:0 (DAT) are ignored by the I2C. However, when you read this register, these bits return the value of data received on the I2C interface.

14.2.5 REG IC_SS_SCL_HCNT (IC_SS_SCL_HCNT) - Offset 14h

Standard Speed I2C Clock SCL High Count Register. This register sets the SCL clock high-period count for standard speed. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect. The register is only used in Master mode.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14h	000001F4h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	01F4h RW	**IC_SS_SCL_HCNT:** This register sets the SCL clock high-period count for standard speed. The value of the registers should be within the range {6,65525}.

14.2.6 REG IC_SS_SCL_LCNT (IC_SS_SCL_LCNT) - Offset 18h

Standard Speed I2C Clock SCL Low Count Register. This register sets the SCL clock low-period count for standard speed. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect. The register is only used in Master mode.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 18h	0000024Ch

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	024Ch RW	**IC_SS_SCL_LCNT:** Standard Speed I2C Clock SCL Low Count Register. The register value should always be >= 8

14.2.7 REG IC_FS_SCL_HCNT (IC_FS_SCL_HCNT) - Offset 1Ch

Fast Speed I2C Clock SCL High Count Register. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1Ch	0000004Bh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	004Bh RW	**IC_FS_SCL_HCNT:** This register sets the SCL clock high-period count for fast speed. It is used in high-speed mode to send the Master Code and STARTBYTE or General CALL. The minimum value of this field is 6.

14.2.8 REG IC_FS_SCL_LCNT (IC_FS_SCL_LCNT) - Offset 20h

Fast Speed I2C Clock SCL Low Count Register. This register must be set before any I2C bus transaction can take place to ensure proper I/O timing.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 20h	000000A3h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	00A3h RW	**IC_FS_SCL_LCNT:** This register sets the SCL clock low period count for fast speed. It is used in high-speed mode to send the Master Code and START BYTE or General CALL. The register should be programmed with a minimum value of 8.

14.2.9 REG IC_HS_SCL_HCNT (IC_HS_SCL_HCNT) - Offset 24h

High Speed I2C Clock SCL High Count Register. This register must be set before any I2C bus transaction can take place to ensure proper I/O timing.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 24h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0008h RW	**IC_HS_SCL_HCNT:** IC_HS_SCL_HCNT_Field

14.2.10 REG IC_HS_SCL_LCNT (IC_HS_SCL_LCNT) - Offset 28h

High Speed I2C Clock SCL Low Count Register. This register must be set before any I2C bus transaction can take place to ensure proper I/O timing.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 28h	00000014h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0014h RW	**IC_HS_SCL_LCNT:** IC_HS_SCL_LCNT_Field

14.2.11 REG IC_INTR_STAT (IC_INTR_STAT) - Offset 2Ch

I2C Interrupt Status Register. Each bit in this register has a corresponding mask bit in the IC_INTR_MASK register. These bits are cleared by reading the matching interrupt clear register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13	0h RO	**R_MASTER_ON_HOLD:** Indicates whether a master is holding the bus and the TX FIFO is empty. Enabled only when I2C_DYNAMIC_TAR_UPDATE = 1 and IC_EMPTYFIFO_HOLD_MASTER_EN = 1
12	0h RO	**R_RESTART_DET:** Indicates whether a RESTART condition has occurred on the I2C interface when DW_apb_i2c is operating in slave mode and the slave is the addressed slave. Enabled only when IC_SLV_RESTART_DET_EN = 1 NOTE: However, in high-speed mode or during a START BYTE transfer, the RESTART comes before the address field as per the I2C protocol. In this case, the slave is not the addressed slave when the RESTART is issued, therefore DW_apb_i2c does not generate the RESTART_DET interrupt.
11	0h RO	**R_GEN_CALL:** Set only when a General Call address is received and it is acknowledged. It stays set until it is cleared either by disabling DW_apb_i2c or when the CPU reads bit 0 of the IC_CLR_GEN_CALL register.
10	0h RO	**R_START_DET:** Indicates whether a START or RESTART condition has occurred on the I2C interface regardless of whether DW_apb_i2c is operating in slave or master mode.
9	0h RO	**R_STOP_DET:** Indicates whether a STOP condition has occurred on the I2C interface regardless of whether DW_apb_i2c is operating in slave or master mode
8	0h RO	**R_ACTIVITY:** This bit captures DW_apb_i2c activity and stays set until it is cleared. There are four ways to clear it: Disabling the DW_apb_i2c, Reading the IC_CLR_ACTIVITY register, Reading the IC_CLR_INTR register, System reset
7	0h RO	**R_RX_DONE:** When the DW_apb_i2c is acting as a slave-transmitter, this bit is set to 1 if the master does not acknowledge a transmitted byte. This occurs on the last byte of the transmission, indicating that the transmission is done.
6	0h RO	**R_TX_ABRT:** This bit indicates if DW_apb_i2c, as an I2C transmitter, is unable to complete the intended actions on the contents of the transmit FIFO. This situation can occur both as an I2C master or an I2C slave, as a transmit abort. When this bit is set to 1, the IC_TX_ABRT_SOURCE register indicates the reason why the transmit abort takes places. NOTE: The DW_apb_i2c flushes/resets/empties the TX FIFO whenever this bit is set. The TX FIFO remains in this flushed state until the register IC_CLR_TX_ABRT is read. Once this read is performed, the TX FIFO is then ready to accept more data bytes from the APB interface.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RO	**R_RD_REQ:** This bit is set to 1 when DW_apb_i2c is acting as a slave and another I2C master is attempting to read data from DW_apb_i2c. The DW_apb_i2c holds the I2C bus in a wait state (SCL=0) until this interrupt is serviced, which means that the slave has been addressed by a remote master that is asking for data to be transferred. The processor must respond to this interrupt and then write the requested data to the IC_DATA_CMD register. This bit is set to 0 just after the processor reads the IC_CLR_RD_REQ register
4	0h RO	**R_TX_EMPTY:** The behavior of the TX_EMPTY interrupt status differs based on the TX_EMPTY_CTRL selection in the IC_CON register. When TX_EMPTY_CTRL = 0: This bit is set to 1 when the transmit buffer is at or below the threshold value set in the IC_TX_TL register. When TX_EMPTY_CTRL = 1: This bit is set to 1 when the transmit buffer is at or below the threshold value set in the IC_TX_TL register and the transmission of the address/data from the internal shift register for the most recently popped command is completed. It is automatically cleared by hardware when the buffer level goes above the threshold. When IC_ENABLE[0] is set to 0, the TX FIFO is flushed and held in reset. There the TX FIFO looks like it has no data within it, so this bit is set to 1, provided there is activity in the master or slave state machines. When there is no longer any activity, then with ic_en=0, this bit is set to 0.
3	0h RO	**R_TX_OVER:** Set during transmit if the transmit buffer is filled to IC_TX_BUFFER_DEPTH and the processor attempts to issue another I2C command by writing to the IC_DATA_CMD register. When the module is disabled, this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared.
2	0h RO	**R_RX_FULL:** Set when the receive buffer reaches or goes above the RX_TL threshold in the IC_RX_TL register. It is automatically cleared by hardware when buffer level goes below the threshold. If the module is disabled (IC_ENABLE[0]=0), the RX FIFO is flushed and held in reset; therefore the RX FIFO is not full. So this bit is cleared once the IC_ENABLE bit 0 is programmed with a 0, regardless of the activity that continues.
1	0h RO	**R_RX_OVER:** Set if the receive buffer is completely filled to IC_RX_BUFFER_DEPTH and an additional byte is received from an external I2C device. The DW_apb_i2c acknowledges this, but any data bytes received after the FIFO is full are lost. If the module is disabled (IC_ENABLE[0]=0), this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared.
0	0h RO	**R_RX_UNDER:** Set if the processor attempts to read the receive buffer when it is empty by reading from the IC_DATA_CMD register. If the module is disabled (IC_ENABLE[0]=0), this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared.

14.2.12 REG IC_INTR_MASK (IC_INTR_MASK) - Offset 30h

I2C Interrupt Mask Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 30h	000008FFh

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13	0h RW	**M_MASTER_ON_HOLD:** This bit masks the R_MST_ON_HOLD interrupt bit in the IC_INTR_STAT register.
12	0h RO	**M_RESTART_DET_READ_ONLY:** This bit masks the R_RESTART_DET interrupt status bit in the IC_INTR_STAT register.
11	1h RW	**M_GEN_CALL:** M_GEN_CALL_Field
10	0h RW	**M_START_DET:** M_START_DET_Field
9	0h RW	**M_STOP_DET:** M_STOP_DET_Field
8	0h RW	**M_ACTIVITY:** M_ACTIVITY_Field
7	1h RW	**M_RX_DONE:** M_RX_DONE_Field
6	1h RW	**M_TX_ABRT:** M_TX_ABRT_Field
5	1h RW	**M_RD_REQ:** M_RD_REQ_Field
4	1h RW	**M_TX_EMPTY:** M_TX_EMPTY_Field
3	1h RW	**M_TX_OVER:** M_TX_OVER_Field
2	1h RW	**M_RX_FULL:** M_RX_FULL_Field
1	1h RW	**M_RX_OVER:** M_RX_OVER_Field
0	1h RW	**M_RX_UNDER:** M_RX_UNDER_Field

14.2.13 REG IC_RAW_INTR_STAT (IC_RAW_INTR_STAT) - Offset 34h

I2C Raw Interrupt Status Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 34h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13	0h RO	**MASTER_ON_HOLD:** Same as in Reg_IC_INTR_STAT
12	0h RO	**RESTART_DET:** Same as in Reg_IC_INTR_STAT
11	0h RO	**GEN_CALL:** Same as in Reg_IC_INTR_STAT
10	0h RO	**START_DET:** Same as in Reg_IC_INTR_STAT
9	0h RO	**STOP_DET:** Same as in Reg_IC_INTR_STAT
8	0h RO	**RAW_INTR_ACTIVITY:** Same as in Reg_IC_INTR_STAT
7	0h RO	**RX_DONE:** Same as in Reg_IC_INTR_STAT
6	0h RO	**TX_ABRT:** Same as in Reg_IC_INTR_STAT
5	0h RO	**RD_REQ:** Same as in Reg_IC_INTR_STAT
4	0h RO	**TX_EMPTY:** Same as in Reg_IC_INTR_STAT
3	0h RO	**TX_OVER:** Same as in Reg_IC_INTR_STAT
2	0h RO	**RX_FULL:** Same as in Reg_IC_INTR_STAT
1	0h RO	**RX_OVER:** Same as in Reg_IC_INTR_STAT
0	0h RO	**RX_UNDER:** Same as in Reg_IC_INTR_STAT

14.2.14 REG IC_RX_TL (IC_RX_TL) - Offset 38h

I2C Receive FIFO Threshold Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 38h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**RX_TL:** Receive FIFO Threshold Level. Controls the level of entries (or above) that triggers the RX_FULL interrupt (bit 2 in IC_RAW_INTR_STAT register). The valid range is 0-0x3F. (Values > 0x3F are set to depth of the buffer). A value of 0 sets the threshold for 1 entry, and a value of 63 sets the threshold for 64 entries.

14.2.15 REG IC_TX_TL (IC_TX_TL) - Offset 3Ch

I2C Transmit FIFO Threshold Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 3Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**TX_TL:** Transmit FIFO Threshold Level Controls the level of entries (or below) that trigger the TX_EMPTY interrupt (bit 4 in IC_RAW_INTR_STAT register). The valid range is 0-255, with the additional restriction that it may not be set to value larger than the depth of the buffer. If an attempt is made to do that, the actual value set will be the maximum depth of the buffer. A value of 0 sets the threshold for 0 entries, and a value of 255 sets the threshold for 255 entries.

14.2.16 REG IC_CLR_INTR (IC_CLR_INTR) - Offset 40h

Clear Combined and Individual Interrupt Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 40h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO	**CLR_INTR:** Read this register to clear the combined interrupt, all individual interrupts, and the IC_TX_ABRT_SOURCE register. This bit does not clear hardware clearable interrupts but software clearable interrupts. For an exception to clearing IC_TX_ABRT_SOURCE through Bit 9 of the IC_TX_ABRT_SOURCE register.

14.2.17 REG IC_CLR_RX_UNDER (IC_CLR_RX_UNDER) - Offset 44h

Clear RX_UNDER Interrupt Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 44h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO	**CLR_RX_UNDER:** Read this register to clear the RX_UNDER interrupt (bit 0) of the IC_RAW_INTR_STAT register.

14.2.18 REG IC_CLR_RX_OVER (IC_CLR_RX_OVER) - Offset 48h

Clear RX_OVER Interrupt Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 48h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO	**CLR_RX_OVER:** Read this register to clear the RX_OVER interrupt (bit 1) of the IC_RAW_INTR_STAT register.

14.2.19 REG IC_CLR_TX_OVER (IC_CLR_TX_OVER) - Offset 4Ch

Clear TX_OVER Interrupt Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO	**CLR_TX_OVER:** Read this register to clear the TX_OVER interrupt (bit 3) of the IC_RAW_INTR_STAT register.

14.2.20 REG IC_CLR_RD_REQ (IC_CLR_RD_REQ) - Offset 50h

Clear RD_REQ Interrupt Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 50h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO	**CLR_RD_REQ:** Read this register to clear the RD_REQ interrupt (bit 5) of the IC_RAW_INTR_STAT register.

14.2.21 REG IC_CLR_TX_ABRT (IC_CLR_TX_ABRT) - Offset 54h

Clear TX_ABRT Interrupt Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 54h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO	**CLR_TX_ABRT:** Read this register to clear the TX_ABRT interrupt (bit 6) of the IC_RAW_INTR_STAT register, and the IC_TX_ABRT_SOURCE register. This also releases the TX FIFO from the flushed/reset state, allowing more writes to the TX FIFO. For an exception to clearing IC_TX_ABRT_SOURCE through Bit 9 of the IC_TX_ABRT_SOURCE register.

14.2.22 REG IC_CLR_RX_DONE (IC_CLR_RX_DONE) - Offset 58h

Clear RX_DONE Interrupt Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 58h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO	**CLR_RX_DONE:** Read this register to clear the RX_DONE interrupt (bit 7) of the IC_RAW_INTR_STAT register.

14.2.23 REG IC_CLR_ACTIVITY (IC_CLR_ACTIVITY) - Offset 5Ch

Clear ACTIVITY Interrupt Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO	**CLR_ACTIVITY:** Reading this register clears the ACTIVITY interrupt if the I2C is not active anymore. If the I2C module is still active on the bus, the ACTIVITY interrupt bit continues to be set. It is automatically cleared by hardware if the module is disabled and if there is no further activity on the bus. The value read from this register to get status of the ACTIVITY interrupt (bit 8) of the IC_RAW_INTR_STAT register.

14.2.24 REG IC_CLR_STOP_DET (IC_CLR_STOP_DET) - Offset 60h

Clear STOP_DET Interrupt Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 60h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO	**CLR_STOP_DET:** Read this register to clear the STOP_DET interrupt (bit 9) of the IC_RAW_INTR_STAT register.

14.2.25 REG IC_CLR_START_DET (IC_CLR_START_DET) - Offset 64h

Clear START_DET Interrupt Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 64h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO	**CLR_START_DET:** Read this register to clear the START_DET interrupt (bit 10) of the IC_RAW_INTR_STAT register.

14.2.26 REG IC_CLR_GEN_CALL (IC_CLR_GEN_CALL) - Offset 68h

Clear GEN_CALL Interrupt Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 68h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO	**CLR_GEN_CALL:** Read this register to clear the GEN_CALL interrupt (bit 11) of IC_RAW_INTR_STAT register.

14.2.27 REG IC_ENABLE (IC_ENABLE) - Offset 6Ch

I2C Enable Register. The register IC_ENABLE_STATUS is added to allow software to unambiguously determine when the hardware has completely shutdown in response to the IC_ENABLE register being set from 1 to 0. Procedure to disable I2C:

1. Define a timer interval (ti2c_poll) equal to the 10 times the signaling period for the highest I2C transfer speed used in the system and supported by DW_apb_i2c. For example, if the highest I2C transfer mode is 400 kb/s, then this ti2c_poll is 25us.

2. Define a maximum time-out parameter, MAX_T_POLL_COUNT, such that if any repeated polling operation exceeds this maximum value, an error is reported.

3. Execute a blocking thread/process/function that prevents any further I2C master transactions to be a started by software, but allows any pending transfers to be completed. This is only needed for master mode.

4. The variable POLL_COUNT is initialized to zero.

5. Set IC_ENABLE to 0.

6. Read the IC_ENABLE_STATUS register and test the IC_EN bit (bit 0). Increment POLL_COUNT by one. If POLL_COUNT >= MAX_T_POLL_COUNT, exit with the relevant error code.

7. If IC_ENABLE_STATUS[0] is 1, then sleep for ti2c_poll and proceed to the previous step. Otherwise, exit with a relevant success code.

Abort control bit:

Will override every other command. It will produce a Stop condition, even if the IC_DATA_CMD[9] register is not set. Will not be set or enabled as the system comes out of reset.

Can be written at any time; however should not be written unless active transactions are taking place.

Applicable only when DW_apb_i2c is programmed to act as a master, i.e., IC_CON[0] == 1 or Master_mode == 1

Force Stop sequence:

IC_ENABLE register will have a bit USER_ABORT (which is a write-only bit). The user can set this bit only when eIC_ENABLE[0] is set. Otherwise, the controller will ignore the USER_ABORT bit.

In response to the USER_ABORT request, the controller will issue STOP and flush the Tx FIFO during the safe period as in:

Issues NACK+STOP when ABORT is seen in HOLD_RX_BYTE state OR

Issues STOP when ABORT is seen in HOLD_TX_BYTE state OR

Issues STOP after RX/TX completion when ABORT is not seen in HOLD_RX_BYTE / HOLD_TX_BYTE states.

Then the controller flushes the TX FIFO and sets the TX_ABORT interrupt after the abort operation.

In response to the TX_ABORT interrupt, the user must read the IC_TX_ABRT_SOURCE register to find out the cause for TX_ABORT (USER_ABORT will be an additional status bit) and then read the IC_CLR_TX_ABRT register to clear the interrupt.

The controller will latch the TXFLR value just before the Tx FIFO flush and outputs in the IC_CLR_ABRT register (Read only register).

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1	0h RW	**ABORT:** Software can abort I2C transfer by setting this bit. Hardware will clear this ABORT bit once the STOP has been detected.
0	0h RW	**ENABLE:** Controls whether the DW_apb_i2c is enabled. 0: Disables DW_apb_i2c (TX and RX FIFOs are held in an erased state) 1: Enables DW_apb_i2c Software can disable DW_apb_i2c while it is active. However, it is important that care be taken to ensure that DW_apb_i2c is disabled properly. When DW_apb_i2c is disabled, the following occurs: The TX FIFO and RX FIFO get flushed. Status bits in the IC_INTR_STAT register are still active until DW_apb_i2c goes into IDLE state. If the module is transmitting, it stops as well as deletes the contents of the transmit buffer after the current transfer is complete. If the module is receiving, the DW_apb_i2c stops the current transfer at the end of the current byte and does not acknowledge the transfer.

14.2.28 REG IC_STATUS (IC_STATUS) - Offset 70h

I2C Status Register. This is a read-only register used to indicate the current transfer status and FIFO status. The status register may be read at any time. None of the bits in this register request an interrupt.

When the I2C is disabled by writing 0 in bit 0 of the IC_ENABLE register:

- Bits 1 and 2 are set to 1

- Bits 3 and 4 are set to 0

When the master or slave state machines goes to idle and IC_ENABLE=0:

- Bits 5 and 6 are set to 0

Type	Size	Offset	Default
MMIO	32 bit	BAR + 70h	00000006h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6	0h RO	**SLV_ACTIVITY:** Slave FSM Activity Status. When the Slave Finite State Machine (FSM) is not in the IDLE state, this bit is set. 0: Slave FSM is in IDLE state so the Slave part of DW_apb_i2c is not Active 1: Slave FSM is not in IDLE state so the Slave part of DW_apb_i2c is Active. Note: IC_STATUS[0] that is, ACTIVITY bit is the OR of SLV_ACTIVITY and MST_ACTIVITY bits.
5	0h RO	**MST_ACTIVITY:** Master FSM Activity Status. When the Master Finite State Machine (FSM) is not in the IDLE state, this bit is set. 0: Master FSM is in IDLE state so the Master part of DW_apb_i2c is not Active 1: Master FSM is not in IDLE state so the Master part of DW_apb_i2c is Active Note: IC_STATUS[0] that is, ACTIVITY bit is the OR of SLV_ACTIVITY and MST_ACTIVITY bits
4	0h RO	**RFF:** Receive FIFO Completely Full. When the receive FIFO is completely full, this bit is set. When the receive FIFO contains one or more empty locations, this bit is cleared. 0: Receive FIFO is not full 1: Receive FIFO is full
3	0h RO	**RFNE:** Receive FIFO Not Empty. This bit is set when the receive FIFO contains one or more entries; it is cleared when the receive FIFO is empty. 0: Receive FIFO is empty 1: Receive FIFO is not empty
2	1h RO	**TFE:** Transmit FIFO Completely Empty. When the transmit FIFO is completely empty, this bit is set. When it contains one or more valid entries, this bit is cleared. This bit field does not request an interrupt. 0: Transmit FIFO is not empty 1: Transmit FIFO is empty
1	1h RO	**TFNF:** Transmit FIFO Not Full. Set when the transmit FIFO contains one or more empty locations, and is cleared when the FIFO is full. 0: Transmit FIFO is full 1: Transmit FIFO is not full
0	0h RO	**IC_STATUS_ACTIVITY:** I2C Activity Status

14.2.29 REG IC_TXFLR (IC_TXFLR) - Offset 74h

I2C Transmit FIFO Level Register. This register contains the number of valid data entries in the transmit FIFO buffer. It is cleared whenever:

- The I2C is disabled

- There is a transmit abort that is, TX_ABRT bit is set in the IC_RAW_INTR_STAT register

- The slave bulk transmit mode is aborted

The register increments whenever data is placed into the transmit FIFO and decrements when data is taken from the transmit FIFO.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 74h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:0	00h RO	**TXFLR:** Transmit FIFO Level. Contains the number of valid data entries in the transmit FIFO

14.2.30 REG IC_RXFLR (IC_RXFLR) - Offset 78h

I2C Receive FIFO Level Register. This register contains the number of valid data entries in the receive FIFO buffer. It is cleared whenever:

- The I2C is disabled

- Whenever there is a transmit abort caused by any of the events tracked in IC_TX_ABRT_SOURCE

The register increments whenever data is placed into the receive FIFO and decrements when data is taken from the receive FIFO.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 78h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:0	00h RO	**RXFLR:** Receive FIFO Level. Contains the number of valid data entries in the receive FIFO.

14.2.31 REG IC_SDA_HOLD (IC_SDA_HOLD) - Offset 7Ch

I2C SDA Hold Time Length Register. This register controls the amount of hold time on the SDA signal after a negative edge of SCL in both master and slave mode, in units of ic_clk period (10Mhz). The value programmed must be greater than the minimum hold time in each mode for the value to be implemented one cycle in master mode, seven cycles in slave mode. Writes to this register succeed only when IC_ENABLE=0.

The programmed SDA hold time cannot exceed at any time the duration of the low part of SCL. Therefore the programmed value cannot be larger than N_SCL_LOW-2, where N_SCL_LOW is the duration of the low part of the SCL period measured in ic_clk cycles.

The bits [15:0] of this register are used to control the hold time of SDA during transmit in both slave and master mode (after SCL goes from HIGH to LOW).

The bits [23:16] of this register are used to extend the SDA transition (if any) whenever SCL is HIGH in the receiver.

Writes to this register succeed only when IC_ENABLE[0]=0.

The values in this register are in units of ic_clk period. The value programmed in IC_SDA_TX_HOLD must be greater than the minimum hold time in each mode one cycle in master mode, seven cycles in slave mode for the value to be implemented.

The programmed SDA hold time during transmit (IC_SDA_TX_HOLD) cannot exceed at any time the duration of the low part of SCL. Therefore the programmed value cannot be larger than N_SCL_LOW-2, where N_SCL_LOW is the duration of the low part of the scl period measured in ic_clk cycles.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7Ch	00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:16	00h RW	**IC_SDA_RX_HOLD:** Sets the required SDA hold time in units of ic_clk period, when the I2C Host Controller acts as a receiver
15:0	0001h RW	**IC_SDA_TX_HOLD:** Sets the required SDA hold time in units of ic_clk period, when the I2C Host Controller acts as a transmitter

14.2.32 REG IC_TX_ABRT_SOURCE (IC_TX_ABRT_SOURCE) - Offset 80h

This register has 32 bits that indicate the source of the TX_ABRT bit. Except for Bit 9, this register is cleared whenever the IC_CLR_TX_ABRT register or the IC_CLR_INTR register is read. To clear Bit 9, the source of the ABRT_SBYTE_NORSTRT must be fixed first; RESTART must be enabled (IC_CON[5]=1), the SPECIAL bit must be cleared (IC_TAR[11]), or the GC_OR_START bit must be cleared (IC_TAR[10]).

Once the source of the ABRT_SBYTE_NORSTRT is fixed, then this bit can be cleared in the same manner as other bits in this register. If the source of the ABRT_SBYTE_NORSTRT is not fixed before attempting to clear this bit, Bit 9 clears for one cycle and is then re-asserted.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 80h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	000h RO	**TX_FLUSH_CNT:** This field preserves the TXFLR value prior to the last TX_ABRT event. It is cleared whenever I2C is disabled. Mode Applicable: Master-Transmitter
22:17	0h RO	**Reserved**
16	0h RO	**ABRT_USER_ABRT:** This is a master-mode-only bit. Master has detected the user initiated transfer abort (IC_ENABLE[1]) Mode Applicable: Master-Transmitter
15	0h RO	**ABRT_SLVRD_INTX:** 1: When the processor side responds to a slave mode request for data to be transmitted to a remote master and user writes a 1 in CMD (bit 8) of IC_DATA_CMD register. Mode Applicable: Slave Transmitter 14 RO 1'h0
14	0h RO	**ABRT_SLV_ARBLOST:** 1: Slave lost the bus while transmitting data to a remote master. IC_TX_ABRT_SOURCE[12] is set at the same time. Note: Even though the slave never owns the bus, something could go wrong on the bus. This is a fail safe check. For instance, during a data transmission at the low-to-high transition of SCL, if what is on the data bus is not what is supposed to be transmitted, then DW_apb_i2c no longer own the bus. Mode Applicable: Slave Transmitter
13	0h RO	**ABRT_SLVFLUSH_TXFIFO:** 1: Slave has received a read command and some data exists in the TX FIFO so the slave issues a TX_ABRT interrupt to flush old data in TX FIFO. Mode Applicable: Slave Transmitter
12	0h RO	**ARB_LOST:** 1: Master has lost arbitration, or if IC_TX_ABRT_SOURCE[14] is also set, then the slave transmitter has lost arbitration. Mode Applicable: Master or Slave Transmitter
11	0h RO	**ABRT_MASTER_DIS:** 1: User tries to initiate a Master operation with the Master mode disabled. Mode Applicable: Master Transmitter or Receiver
10	0h RO	**ABRT_10B_RD_NORSTRT:** 1: The restart is disabled (IC_RESTART_EN bit (IC_CON[5]) = 0) and the master sends a read command in 10-bit addressing mode. Mode Applicable: Master Receiver
9	0h RO	**ABRT_SBYTE_NORSTRT:** 1: The restart is disabled (IC_RESTART_EN bit (IC_CON[5]) = 0) and the user is trying to send a START Byte. To clear Bit 9, the source of the ABRT_SBYTE_NORSTRT must be fixed first; restart must be enabled (IC_CON[5]=1), the SPECIAL bit must be cleared (IC_TAR[11]), OR the GC_OR_START bit must be cleared (IC_TAR[10]). Once the source of the ABRT_SBYTE_NORSTRT is fixed, then this bit can be cleared in the same manner as other bits in this register. If the source of the ABRT_SBYTE_NORSTRT is not fixed before attempting to clear this bit, bit 9 clears for one cycle and then gets re-asserted. Mode Applicable: Master

Bit Range	Default & Access	Field Name (ID): Description
8	0h RO	**ABRT_HS_NORSTRT:** 1: The restart is disabled (IC_RESTART_EN bit (IC_CON[5]) = 0) and the user is trying to use the master to transfer data in High Speed mode. Mode Applicable: Master Transmitter or Receiver
7	0h RO	**ABRT_SBYTE_ACKDET:** 1: Master has sent a START Byte and the START Byte was acknowledged (wrong behavior). Mode Applicable: Master
6	0h RO	**ABRT_HS_ACKDET:** 1: Master is in High Speed mode and the High Speed Master code was acknowledged (wrong behavior). Mode Applicable: Master
5	0h RO	**ABRT_GCALL_READ:** 1: DW_apb_i2c in master mode sent a General Call but the user programmed the byte following the General Call to be a read from the bus (IC_DATA_CMD[9] is set to 1). Mode Applicable: Master Transmitter
4	0h RO	**ABRT_GCALL_NOACK:** 1: DW_apb_i2c in master mode sent a General Call and no slave on the bus acknowledged the General Call. Mode Applicable: Master Transmitter
3	0h RO	**ABRT_TXDATA_NOACK:** 1: This is a master-mode only bit. Master has received an acknowledgment for the address, but when it sent data byte(s) following the address, it did not receive an acknowledge from the remote slave(s). Mode Applicable: Master Transmitter
2	0h RO	**ABRT_10ADDR2_NOACK:** 1: Master is in 10-bit address mode and the second address byte of the 10-bit address was not acknowledged by any slave. Mode Applicable: Master Transmitter or Receiver
1	0h RO	**ABRT_10ADDR1_NOACK:** 1: Master is in 10-bit address mode and the first 10-bit address byte was not acknowledged by any slave. Mode Applicable: Master Transmitter or Receiver
0	0h RO	**ABRT_7B_ADDR_NOACK:** 1: Master is in 7-bit addressing mode and the address sent was not acknowledged by any slave. Mode Applicable: Master Transmitter or Receiver

14.2.33 REG IC_DMA_CR (IC_DMA_CR) - Offset 88h

DMA Control Register. This register is only valid when DW_apb_i2c is configured with a set of DMA Controller interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist and writing to the registers address has no effect and reading from this register address will return zero. The register is used to enable the DMA Controller interface operation. There is a separate bit for transmit and receive. This can be programmed regardless of the state of IC_ENABLE.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 88h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1	0h RW	**TDMAE:** Transmit DMA Enable. This bit enables/disables the transmit FIFO DMA channel. 0 = Transmit DMA disabled 1 = Transmit DMA enabled
0	0h RW	**RDMAE:** Receive DMA Enable. This bit enables/disables the receive FIFO DMA channel. 0 = Receive DMA disabled 1 = Receive DMA enabled

14.2.34 REG IC_DMA_TDLR (IC_DMA_TDLR) - Offset 8Ch

DMA Transmit Data Level Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:0	00h RW	**DMATDL:** Transmit Data Level. This bit field controls the level at which a DMA request is made by the transmit logic. It is equal to the watermark level; that is, the dma_tx_req signal is generated when the number of valid data entries in the transmit FIFO is equal to or below this field value, and TDMAE = 1.

14.2.35 REG IC_DMA_RDLR (IC_DMA_RDLR) - Offset 90h

I2C Receive Data Level Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 90h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:0	00h RW	**DMARDL:** Receive Data Level. This bit field controls the level at which a DMA request is made by the receive logic. The watermark level = DMARDL+1; that is, dma_rx_req is generated when the number of valid data entries in the receive FIFO is equal to or more than this field value + 1, and RDMAE =1. For instance, when DMARDL is 0, then dma_rx_req is asserted when 1 or more data entries are present in the receive FIFO.

14.2.36 REG IC_SDA_SETUP (IC_SDA_SETUP) - Offset 94h

I2C SDA Setup Register. This register controls the amount of time delay (in terms of number of ic_clk clock periods 100Mhz) introduced in the rising edge of SCL relative to SDA changing by holding SCL low when DW_apb_i2c services a read request while operating as a slave-transmitter. The relevant I2C requirement is tSU:DAT (note 4) as detailed in the I2C Bus Specification. This register must be programmed with a value equal to or greater than 2.

Note: The length of setup time is calculated using [(IC_SDA_SETUP - 1) * (ic_clk_period)], so if the user requires 10 ic_clk periods of setup time, they should program a value of 11. The IC_SDA_SETUP register is only used by the DW_apb_i2c when operating as a slave transmitter.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 94h	00000064h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	64h RW	**SDA_SETUP:** SDA Setup in terms of ic_clk cycles.

14.2.37 REG IC_ACK_GENERAL_CALL (IC_ACK_GENERAL_CALL) - Offset 98h

I2C ACK General Call Register. The register controls whether DW_apb_i2c responds with a ACK or NACK when it receives an I2C General Call address.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 98h	00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	1h RW	**ACK_GEN_CALL:** ACK General Call. When set to 1, DW_apb_i2c responds with a ACK (by asserting ic_data_oe) when it receives a General Call. When set to 0, the DW_apb_i2c does not generate General Call interrupts.

14.2.38 REG IC_ENABLE_STATUS (IC_ENABLE_STATUS) - Offset 9Ch

I2C Enable Status Register. The register is used to report the DW_apb_i2c hardware status when the IC_ENABLE register is set from 1 to 0; that is, when DW_apb_i2c is disabled.

If IC_ENABLE has been set to 1, bits 2:1 are forced to 0, and bit 0 is forced to 1.

If IC_ENABLE has been set to 0, bits 2:1 is only been valid as soon as bit 0 is read as 0.

When IC_ENABLE has been written with 0 a delay occurs for bit 0 to be read as 0 because disabling the DW_apb_i2c depends on I2C bus activities.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2	0h RO	**SLV_RX_DATA_LOST:** This bit indicates if a Slave-Receiver operation has been aborted with at least one data byte received from an I2C transfer due to the setting of IC_ENABLE from 1 to 0. When read as 1, DW_apb_i2c is deemed to have been actively engaged in an aborted I2C transfer (with matching address) and the data phase of the I2C transfer has been entered, even though a data byte has been responded with a NACK. NOTE: If the remote I2C master terminates the transfer with a STOP condition before the DW_apb_i2c has a chance to NACK a transfer, and IC_ENABLE has been set to 0, then this bit is also set to 1. When read as 0, DW_apb_i2c is deemed to have been disabled without being actively involved in the data phase of a Slave-Receiver transfer.
1	0h RO	**SLV_DISABLED_WHILE_BUSY:** This bit indicates if a potential or active Slave operation has been aborted due to the setting of the IC_ENABLE register from 1 to 0. This bit is set when the CPU writes a 0 to the IC_ENABLE register while: (a) DW_apb_i2c is receiving the address byte of the Slave-Transmitter operation from a remote master; OR, (b) address and data bytes of the Slave-Receiver operation from a remote master. When read as 1, DW_apb_i2c is deemed to have forced a NACK during any part of an I2C transfer, irrespective of whether the I2C address matches the slave address set in DW_apb_i2c (IC_SAR register) OR if the transfer is completed before IC_ENABLE is set to 0 but has not taken effect. When read as 0, DW_apb_i2c is deemed to have been disabled when there is master activity, or when the I2C bus is idle.
0	0h RO	**IC_EN:** ic_en Status. This bit always reflects the value driven on the output port ic_en. When read as 1, DW_apb_i2c is deemed to be in an enabled state. When read as 0, DW_apb_i2c is deemed completely inactive.

14.2.39 REG IC_FS_SPKLEN (IC_FS_SPKLEN) - Offset A0h

I2C SS and FS Spike Suppression Limit Register.

This register is used to store the duration, measured in ic_clk cycles, of the longest spike that is filtered out by the spike suppression logic when the component is operating in SS or FS modes. The relevant I2C requirement is tSP as detailed in the I2C Bus Specification. This register must be programmed with a minimum value of 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + A0h	00000007h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	07h RW	**IC_FS_SPKLEN:** This register must be set before any I2C bus transaction can take place to ensure stable operation. This register sets the duration, measured in ic_clk cycles, of the longest spike in the SCL or SDA lines that are filtered out by the spike suppression logic. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect. The minimum valid value is 1; hardware prevents values less than this being written, and if attempted results in 2 being set.

14.2.40 REG RESETS (RESETS) - Offset 204h

Soft reset register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 204h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2	0h RW	**RESET_DMA:** iDMA Software Reset Control 0 IP is in reset (Reset Asserted) 1 IP is NOT at reset (Reset Released)
1:0	0h RW	**RESET_IP:** reset_i2c (reset_i2c) I2C Host Controller reset. Used to reset the I2C Host Controller by SW control. All I2C Configuration State and Operational State will be forced to the Default state. There is no timing requirement (SW can assert and de-assert in back to back transactions). This reset does NOT impact the LPSS cluster level settings by BIOS, the PCI configuration header information, DMA channel configuration and interrupt assignment/mapping/etc. Driver should re-initialize registers related to Driver context following an I2C host controller reset. 00 = I2C Host Controller is in reset (Reset Asserted) 01 = Reserved 10 = Reserved 11 = I2C Host Controller is NOT at reset (Reset Released)

14.2.41 REG ACTIVELTR_VALUE (ACTIVELTR_VALUE) - Offset 210h

ACTIVELTR_VALUE

Type	Size	Offset	Default
MMIO	32 bit	BAR + 210h	00000800h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW	**SNOOP_REQUIRMENT:** If the Requirement (bit 15) is clear, that indicates that the device has no LTR requirement for this type of traffic (i.e. it can wait for service indefinitely). If the 10 -bit latency value is zero it indicates that the device cannot tolerate any delay and needs the best possible service/response time.
14:13	0h RO	**Reserved**
12:10	2h RW	**I2C_SW_LTR_SNOOP_SCALE_REG_12_10:** Support for codes 010 (1us) or 011 (32us) for Snoop Latency Scale(1us -> 32ms total span) only. Writes to this CSR which don't match those values will be dropped completely, next read will return previous value.
9:0	000h RW	**SNOOP_VALUE:** 10-bit latency value

14.2.42 REG IDLELTR_VALUE (IDLELTR_VALUE) - Offset 214h

IDLELTR_VALUE

Type	Size	Offset	Default
MMIO	32 bit	BAR + 214h	00000800h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW	**SNOOP_REQUIRMENT:** If the Requirement (bit 15) is clear, that indicates that the device has no LTR requirement for this type of traffic (i.e. it can wait for service indefinitely). If the 10 -bit latency value is zero it indicates that the device cannot tolerate any delay and needs the best possible service/response time
14:13	0h RO	**Reserved**
12:10	2h RW	**SNOOP_LATENCY_SCALE:** Support for codes 010 (1us) or 011 (32us) for Snoop Latency Scale(1us -> 32ms total span) only. Writes to this CSR which don't match those values will be dropped completely, next read will return previous value.
9:0	000h RW	**SNOOP_VALUE:** SNOOP_VALUE, 10-bit latency value

14.2.43 REG TX_ACK_COUNT (TX_ACK_COUNT) - Offset 218h

TX_ACK_COUNT

Type	Size	Offset	Default
MMIO	32 bit	BAR + 218h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**TX_ACK_COUNT_OVERFLOW:** Count overflow indication; 0= count valid 1= count overflow/invalid
30:24	0h RO	**Reserved**
23:0	000000h RO	**TX_ACK_COUNT:** Count ACK seen on Write commands, 24-bit up-counter which counts the number of TX ACKs on the I2C bus. The Counter is forced to be cleared by software Read.

14.2.44 REG RX_BYTE_COUNT (RX_BYTE_COUNT) - Offset 21Ch

RX_ACK_COUNT

Type	Size	Offset	Default
MMIO	32 bit	BAR + 21Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**RX_ACK_COUNT_OVERFLOW:** count overflow indication; 0= count valid 1= count overflow/invalid
30:24	0h RO	**Reserved**
23:0	000000h RO	**RX_ACK_COUNT:** Counts ACK seen on Read commands, 24-bit readable (MMIO) up-counter which counts the number of RX bytes received on the I2C bus. The Counter is forced to be cleared by software Read

14.2.45 REG TX_COMPLETE_INTR_STAT (TX_COMPLETE_INTR_STAT) - Offset 220h

Interrupt status register for Tx Complete

Type	Size	Offset	Default
MMIO	32 bit	BAR + 220h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1	0h RW	**TX_INTR_STAT_MASK:** I2C Tx completion interrupt mask, 0 = Unmask 1= Mask
0	0h RO	**TX_INTR_STAT:** I2C Tx completion interrupt status indication, 0 = Low 1 = High

14.2.46 REG TX_COMPLETE_INTR_CLR (TX_COMPLETE_INTR_CLR) - Offset 224h

I2C Tx complete interrupt clear indication

Type	Size	Offset	Default
MMIO	32 bit	BAR + 224h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO	**I2C_TX_COMPLETE_INTR_CLR_0:** I2C Tx completion interrupt clear indication

14.2.47 REG SW_SCRATCH_0 (SW_SCRATCH_0) - Offset 228h

SW Scratch Register 0

Type	Size	Offset	Default
MMIO	32 bit	BAR + 228h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SW_SCRATCH_0:** SW scratch reg 0, Scratch Pad Register for SW to generated Local CMD or DATA for iDMA

14.2.48 REG SW_SCRATCH_1 (SW_SCRATCH_1) - Offset 22Ch

SW Scratch Register 1

Type	Size	Offset	Default
MMIO	32 bit	BAR + 22Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SW_SCRATCH_1:** SW scratch reg 1, Scratch Pad Register for SW to generated Local CMD or DATA for iDMA

14.2.49 REG SW_SCRATCH_2 (SW_SCRATCH_2) - Offset 230h

SW Scratch Register 2

Type	Size	Offset	Default
MMIO	32 bit	BAR + 230h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SW_SCRATCH_2:** SW scratch reg 2, Scratch Pad Register for SW to generated Local CMD or DATA for iDMA

14.2.50 REG SW_SCRATCH_3 (SW_SCRATCH_3) - Offset 234h

SW Scratch Register 3

Type	Size	Offset	Default
MMIO	32 bit	BAR + 234h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SW_SCRATCH_3:** SW scratch reg 3, Scratch Pad Register for SW to generated Local CMD or DATA for iDMA

14.2.51 REG CLOCK_GATE (CLOCK_GATE) - Offset 238h

CLOCK_GATE_Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 238h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3:2	0h RW	**SW_DMA_CLK_CTL:** DMA clock gate control bits, iDMA Clock Control 00 = Dynamic Clock Gate Enable 01 = Reserved 10 = Force iDMA Clock off 11 = Force iDMA Clock on
1:0	0h RW	**SW_IP_CLK_CTL:** IP clock gate control bits, IP Clock Control 00 = Dynamic Clock Gate Enable 01 = Reserved 10 = Force IP Clocks off 11 = Force IP Clocks on

14.2.52 REG REMAP_ADDR_LO (REMAP_ADDR_LO) - Offset 240h

I2C Remap Address Lo Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 240h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**I2C_REMAP_ADDR_LO_REG:** Remap Address Low Must be programed to the same value as low 32 bits (0x 010 BAR Low) Note: Must be programed for all Slice configurations (iDMA or PIO only)

14.2.53 REG REMAP_ADDR_HI (REMAP_ADDR_HI) - Offset 244h

I2C Remap Address Hi Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 244h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**I2C_REMAP_ADDR_HI:** Remap Address High Must be programmed to the same value as low 32 bits (0x 014 BAR High)

14.2.54 REG DEVIDLE_CONTROL (DEVIDLE_CONTROL) - Offset 24Ch

I2C Dev Idle Control Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 24Ch	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4	0h RO	**INTR_REQ_CAPABLE:** INTR_REQ_CAPABLE, Set to 1 by HW if it is capable of generating an interrupt on command completion, else 0
3	1h RW/1C	**RESTORE_REQUIRED:** When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up. Note: If SW is setting bit 3 together with any other bit of this register, only bit 3 is written; SW is required to do 2 writes in this case : bit 3 first and all other bits second. This (Restore Required) field of the D0i3C register needs to be preserved during the S0ix restore window even though the D0i3C register is being restored (during restore window, RR bit should be restored to 1
2	0h RW	**DEVIDLE:** DEVIDLE, SW sets this bit to 1 to move the function into the DevIdle state. Writing this bit to 0 will return the function to the fully active D0 state (D0i0)
1	0h NA	**INTR_REQ:** INTR_REQ, Reserved
0	0h RO	**CMD_IN_PROGRESS:** CMD_IN_PROGRESS, HW sets this bit on a 1->0 or 0->1 transition of DEVIDLE. While set, the other bits in this register are not valid and it is illegal for SW to write to any bit in this register. HW clears this bit upon completing the DevIdle transition command. When clear, all the other bits in the register are valid and SW may write to any bit. If Interrupt Request (IR) was set for the current command, HW may clear this bit before the interrupt has been made visible to SW, since when SW actually handles a particular interrupt is not visible to the HW. SW writes to this bit have no effect.

14.2.55 REG I2C_HVM_MISR_CRCOUT (I2C_HVM_MISR_CRCOUT) - Offset 280h

I2C HVM MISR CRCOUT

Type	Size	Offset	Default
MMIO	32 bit	BAR + 280h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	FFFFh RO	**I2C_HVM_MISR_CRCOUT:** I2C MISR Output for HVM

14.2.56 REG CAPABLITIES (CAPABLITIES) - Offset 2FCh

I2C Capabilities Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 2FCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9	0h RO	**SERIAL_CLK_FREQ**
8	0h RO	**IDMA_PRESENT:** 0= DMA present 1= DMA not present
7:4	0h RO	**INSTANCE_TYPE:** I2C, SPI or UART, Instance Type: 0000 = IC2 0001 = UART 0010 = SPI 0011 1111 = Reserved
3:0	0h RO	**INSTANCE_NUMBER:** i2c0 - 000 i2c1 - 001 ... i2c5- 101

14.2.57 REG SAR_LO0 (SAR_LO0) - Offset 800h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer. Source Address Register for lower 32-bits for Channels 0-1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 800h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SAR_LO:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported.

14.2.58 REG SAR_HI0 (SAR_HI0) - Offset 804h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer. Source Address Register for upper 32-bits for Channels 0-1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 804h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SAR_HI:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported.

14.2.59 REG DAR_LO0 (DAR_LO0) - Offset 808h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer. Destination Address Register for Channels 0-1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 808h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DAR_LO:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported.

14.2.60 REG DAR_HI0 (DAR_HI0) - Offset 80Ch

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer. Destination Address Register for Upper 32-bits for Channels 0-1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 80Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DAR_HI:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported.

14.2.61 REG LLP_LO0 (LLP_LO0) - Offset 810h

You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled. The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. It shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists. The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 810h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0h RO	**Reserved**

14.2.62 REG LLP_HI0 (LLP_HI0) - Offset 814h

You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled. The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. It shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists. The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 814h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.

14.2.63 REG CTL_LO0 (CTL_LO0) - Offset 818h

This register contains fields that control the DMA transfer. The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 818h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0h RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
21:20	0h RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Reserved (00) Memory to Peripheral (01) Peripheral to Memory (10) Reserved (11) Flow Control is always assigned to the DMA.
19	0h RO	**Reserved**
18	0h RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0h RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control
16:14	0h RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. Source BURST SIZE (in DW) = (2 ^ SRC_TR_WIDTH)
13:11	0h RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination.
10	0h RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0h RO	**Reserved**
8	0h RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
6:4	0h RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE (IN DW) = (2^ MSIZE) (i.e. 2 to-the-power-of MSIZE) 1.Transferred Bytes Per Burst = BURST_SIZE * (2 ^ TR_WIDTH) Since Max Burst Length is limited by the OCP fabric to 16 DW, encodings 101 (32 DW), 110 (64 DW) and 111 (128 DW) are not supported by the fabric. 2.For incrementing addresses and (Transfer_Width < 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations)
3:1	0h RW	**DST_TR_WIDTH:** BURST SIZE (in DW) = (2^ MSIZE) (i.e. 2 to-the-power-of MSIZE) Transferred Bytes Per Burst = BURST_SIZE * (2 ^ TR_WIDTH) Since Max Burst Length is limited by the South-Complex OCP fabric to 16 DW, encodings 101 (32 DW), 110 (64 DW) and 111 (128 DW) are not supported by the fabric. For incrementing addresses and (Transfer_Width < 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations)
0	0h RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

14.2.64 REG CTL_HI0 (CTL_HI0) - Offset 81Ch

This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled. If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 81Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior.

Bit Range	Default & Access	Field Name (ID): Description
28:18	0h RO	**Reserved**
17	0h RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	00000h RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesn't mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register.

14.2.65 REG SSTAT0 (SSTAT0) - Offset 820h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 820h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

14.2.66 REG DSTAT0 (DSTAT0) - Offset 828h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI.

Note: This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information

should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 828h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

14.2.67 REG SSTATAR_LO0 (SSTATAR_LO0) - Offset 830h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 830h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SSTATAR_LO:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

14.2.68 REG SSTATAR_HI0 (SSTATAR_HI0) - Offset 834h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 834h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SSTATAR_HI:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block

14.2.69 REG DSTATAR_LO0 (DSTATAR_LO0) - Offset 838h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 838h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DSTATAR_LO:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

14.2.70 REG DSTATAR_HI0 (DSTATAR_HI0) - Offset 83Ch

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 83Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DSTATAR_HI:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

14.2.71 REG CFG_LO0 (CFG_LO0) - Offset 840h

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 840h	00000203h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0h RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0h RO	**Reserved**
21	0h RW	**SRC_OPT_BL:** Optimize Source Burst Length: 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE))
20	0h RW	**DST_OPT_BL:** Optimize Destination Burst Length: 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE))
19	0h RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0h RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17:11	0h RO	**Reserved**
10	0h RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit affects only when CH_SUSPEND is asserted
9	1h RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0h RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0h RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0h RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0h RO	**Reserved**
3	0h RW	**HSHAKE_NP_WR:** 0x1: Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0: Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of block writes which will be Non-Posted)
2	0h RW	**ALL_NP_WR:** 0x1: Forces ALL writes to be Non-Posted on DMA Write Port 0x0: Non-Posted Writes will only be used at end of block transfers and in HW Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used
1	1h RW	**SRC_BURST_ALIGN:** 0x1: SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0: SRC Burst Transfers are not broken at a Burst Length aligned boundary
0	1h RW	**DST_BURST_ALIGN:** 0x1: DST Burst Transfers are broken at a Burst Length aligned boundary 0x0: DST Burst Transfers are not broken at a Burst Length aligned boundary

14.2.72 REG CFG_HI0 (CFG_HI0) - Offset 844h

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 844h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27:18	000h RW	**WR_ISSUE_THD:** Write Issue Threshold. Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.

Bit Range	Default & Access	Field Name (ID): Description
17:8	000h RW	**RD_ISSUE_THD:** Read Issue Threshold. Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.
7:4	0h RW	**DST_PER:** Destination Peripheral ID: Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface.
3:0	0h RW	**SRC_PER:** Source Peripheral ID: Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface.

14.2.73 REG SGR0 (SGR0) - Offset 848h

The Source Gather register contains two fields: Source gathers count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gathers interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 848h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	000h RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	00000h RW	**SGI:** Source gather interval.

14.2.74 REG DSR0 (DSR0) - Offset 850h

The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC). Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI). Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 850h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	000h RW	**DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries
19:0	00000h RW	**DSI:** Destination scatter interval

14.2.75 REG RawTfr (RAWTFR) - Offset AC0h

Interrupt events are stored in this Raw Interrupt Status registers before masking: RawBlock, RawDstTran, RawErr, RawSrcTran, and RawTfr. Each Raw Interrupt Status register has a bit allocated per channel, for example, RawTfr(2) is the Channel 2 raw transfer complete interrupt. Each bit in these registers is cleared by writing a 1 to the corresponding location in the ClearTfr, ClearBlock, ClearSrcTran, ClearDstTran, ClearErr registers.

Type	Size	Offset	Default
MMIO	32 bit	BAR + AC0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RO	**RAW:** Raw interrupt status for ch1 and ch0

14.2.76 REG RawBlock (RAWBLOCK) - Offset AC8h

RawBlock - Raw Status for Block Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + AC8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RO	**RAW:** Raw interrupt status for ch 1 and ch0

14.2.77 REG RawSrcTran (RAWSRCTRAN) - Offset AD0h

RawSrcTran - Raw Status for Source Transaction Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + AD0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RO	**RAW:** Raw interrupt status for ch1 and ch0

14.2.78 REG RawDstTran (RAWDSTTRAN) - Offset AD8h

RawDstTran - Raw Status for Destination Transaction Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + AD8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RO	**RAW:** Raw interrupt status for ch1 and ch0

14.2.79 REG RawErr (RAWERR) - Offset AE0h

RawErr - Raw Status for Error Interrupts Register Error interrupt will be asserted by the DMA in the following cases:

IOSF Fabric returns an Unsuccessful Completion with UR Completion Status for a Non-Posted transaction issued by the DMA to Memory. This error occurs when an invalid address range is programed into the DMA SRC/Dest Field outside of the Host memory region on the memory side of the DMA transaction IOSF2OCP bridge will return error (triggering error interrupt from DMA) if the IOSF2OCP Bridge is programmed incorrectly.

Peripheral side transactions where invalid addressing can result in an OCP fabric error which will be translated into an Error Interrupt.

The SW should view this error as a serious programming error and handle it according to the specified error handling procedures for the product and OS.

Type	Size	Offset	Default
MMIO	32 bit	BAR + AE0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RO	**RAW:** Raw interrupt status for ch1 and ch0

14.2.80 REG StatusTfr (STATUSTFR) - Offset AE8h

Status for Transfer Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + AE8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RO	**STATUS:** Status for interrupt for ch1 and ch0

14.2.81 REG StatusBlock (STATUSBLOCK) - Offset AF0h

StatusBlock: Status for Block Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + AF0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RO	**STATUS:** Status for interrupt for ch1 and ch0

14.2.82 REG StatusSrcTran (STATUSSRCTRAN) - Offset AF8h

StatusSrcTran: Status for Source Transaction Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + AF8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RO	**STATUS:** Status for interrupt for ch1 and ch0

14.2.83 REG StatusDstTran (STATUSDSTTRAN) - Offset B00h

StatusDstTran: Status for Destination Transaction Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B00h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RO	**STATUS:** Status for interrupt for ch 1 and ch0

14.2.84 REG StatusErr (STATUSERR) - Offset B08h

StatusErr: Status for Error Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B08h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RO	**STATUS:** Status for interrupt for ch1 and ch0

14.2.85 REG MaskTfr (MASKTFR) - Offset B10h

Mask for Transfer Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:8	0h WO	**INT_MASK_WE:** Interrupt Mask Write Enable ch1 and ch0. 0 = write disabled 1 = write enabled
7:2	0h RO	**Reserved**
1:0	0h RW	**INT_MASK:** Interrupt mask per ch1 and ch0. 0 - mask 1 - unmask

14.2.86 REG MaskBlock (MASKBLOCK) - Offset B18h

MaskBlock: Mask for Block Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:8	0h WO	**INT_MASK_WE:** Interrupt Mask Write Enable ch1 and ch0. 0 = write disabled 1 = write enabled
7:2	0h RO	**Reserved**
1:0	0h RW	**INT_MASK:** Interrupt mask ch1 and ch0. 0 - mask 1 - unmask

14.2.87 REG MaskSrcTran (MASKSRCTRAN) - Offset B20h

Mask for Source Transaction Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B20h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:8	0h WO	**INT_MASK_WE:** Interrupt Mask Write Enable ch1 and ch0. 0 = write disabled 1 = write enabled
7:2	0h RO	**Reserved**
1:0	0h RW	**INT_MASK:** Interrupt mask ch1 and ch0. 0 - mask 1 - unmask

14.2.88 REG MaskDstTran (MASKDSTTRAN) - Offset B28h

Mask for Destination Transaction Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B28h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:8	0h WO	**INT_MASK_WE:** Interrupt Mask Write Enable ch1 and ch0. 0 = write disabled 1 = write enabled
7:2	0h RO	**Reserved**
1:0	0h RW	**INT_MASK:** Interrupt mask ch1 and ch0. 0 - mask 1 - unmask

14.2.89 REG MaskErr (MASKERR) - Offset B30h

Mask for Error Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:8	0h WO	**INT_MASK_WE:** Interrupt Mask Write Enable ch1 and ch0. 0 = write disabled 1 = write enabled
7:2	0h RO	**Reserved**
1:0	0h RW	**INT_MASK:** Interrupt mask ch1 and ch0. 0 - mask 1 - unmask

14.2.90 REG ClearTfr (CLEARTFR) - Offset B38h

Clear for Transfer Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B38h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h WO	**CLEAR:** Interrupt clear ch1 and ch0. 0 = no effect 1 = clear interrupt

14.2.91 REG ClearBlock (CLEARBLOCK) - Offset B40h

Clear for Block Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B40h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h WO	**CLEAR:** Interrupt clear ch1 and ch0. 0 = no effect 1 = clear interrupt

14.2.92 REG ClearSrcTran (CLEARSRCTRAN) - Offset B48h

Clear for Source Transaction Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B48h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h WO	**CLEAR:** Interrupt clear ch1 and ch0. 0 = no effect 1 = clear interrupt

14.2.93 REG ClearDstTran (CLEARDSTTRAN) - Offset B50h

Clear for Destination Transaction Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B50h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h WO	**CLEAR:** Interrupt clear ch1 and ch0. 0 = no effect 1 = clear interrupt

14.2.94 REG ClearErr (CLEARERR) - Offset B58h

Clear for Error Interrupts Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B58h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h WO	**CLEAR:** Interrupt clear ch1 and ch0. 0 = no effect 1 = clear interrupt

14.2.95 REG StatusInt (STATUSINT) - Offset B60h

The contents of each of the five Status registers StatusTfr, StatusBlock, StatusSrcTran, StatusDstTran, StatusErr is Ored to produce a single bit for each interrupt type in the Combined Status register (StatusInt). This register is read-only.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B60h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4	0h RO	**ERR:** OR of the contents of StatusErr register.
3	0h RO	**DSTT:** OR of the contents of StatusDst register.
2	0h RO	**SRCT:** OR of the contents of StatusSrcTran register
1	0h RO	**BLOCK:** OR of the contents of StatusBlock register.
0	0h RO	**TFR:** OR of the contents of StatusTfr register.

14.2.96 REG DmaCfgReg (DMACFGREG) - Offset B98h

This register is used to enable the DMA, which must be done before any channel activity can begin. If the global channel enable bit is cleared while any channel is still active, then DmaCfgReg.DMA_EN still returns 1 to indicate that there are channels still active until hardware has terminated all activity on all channels, at which point the DmaCfgReg.DMA_EN bit returns 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**DMA_EN:** DMA Enable bit. 0 = DMA Disabled 1 = DMA Enabled

14.2.97 REG ChEnReg (CHENREG) - Offset BA0h

This is the DMA Channel Enable Register. If software needs to set up a new channel, then it can read this register in order to find out which channels are currently inactive, it can then enable an inactive channel with the required priority.

All bits of this register are cleared to 0 when the global DMA channel enable bit, DmaCfgReg(0), is 0. When the global channel enable bit is 0, then a write to the ChEnReg register is ignored and a read will always read back 0. The channel enable bit, ChEnReg.CH_EN, is written only if the corresponding channel writes enable bit, ChEnReg.CH_EN_WE, is asserted on the same OCP write transfer.

Type	Size	Offset	Default
MMIO	32 bit	BAR + BA0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:8	0h WO	**CH_EN_WE:** Channel enable write enable.
7:2	0h RO	**Reserved**
1:0	0h RW	**CH_EN:** Enables/Disables the channel. Setting this bit enables a channel, clearing this bit disables the channel. 0 = Disable the Channel 1 = Enable the Channel The ChEnReg.CH_EN bit is automatically cleared by hardware to disable the channel after the last OCP transfer of the DMA transfer to the destination has completed. Software can therefore poll this bit to determine when this channel is free for a new DMA transfer.

14.3 I²C PCR Registers Summary

Table 14-3. Summary of I²C PCR Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
200h	4	PCICFGCTR1 PCI Configuration Control 1 Register (PCICFGCTR1)	00000100h
204h	4	PCICFGCTR2 PCI Configuration Control 2 Register (PCICFGCTR2)	00000100h
208h	4	PCICFGCTR3 PCI Configuration Control 3 Register (PCICFGCTR3)	00000100h
20Ch	4	PCICFGCTR4 PCI Configuration Control 4 Register (PCICFGCTR4)	00000100h
210h	4	PCICFGCTR5 PCI Configuration Control 5 Register (PCICFGCTR5)	00000100h
214h	4	PCICFGCTR6 PCI Configuration Control 6 Register (PCICFGCTR6)	00000100h
218h	4	PCICFGCTR7 PCI Configuration Control 7 Register (PCICFGCTR7)	00000100h
21Ch	4	PCICFGCTR8 PCI Configuration Control 8 Register (PCICFGCTR8)	00000100h

14.3.1 PCICFGCTR1 PCI Configuration Control 1 Register (PCICFGCTR1) - Offset 200h

Controls The PCI Configuration Space

Type	Size	Offset	Default
MMIO	32 bit	FDCD0000h + 200h	00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**DIS_PCI_IDLE_CAP1:** This is a bit to disable the PCI Device Idle capability structure.
27:20	00h RW	**PCI_IRQ1:** IRQ number to be sent in the message with data field for PCI Assert_IRQ and PCI_Deassert_IRQ message
19:12	00h RW	**ACPI_IRQ1:** IRQ number to be sent in the message with data field for ACPI Assert_IRQ and ACPI_Deassert_IRQ message
11:8	1h RW	**IPIN1:** Interrupt Pin: This register indicates the values to be used for Global Interrupts.
7	0h RW	**BAR1_DISABLE1:** BAR1_Disable: BAR1 register in the PCOS space becomes Read only when this bit is set.
6:2	00h RW	**PME_SUPPORT1:** The value in this register is XOR with the value in the PME_support strap and reflected in the PME_Support register in the PCI configuration space
1	0h RW	**ACPI_INTR_EN1:** When set, the Bridge uses ACPI Sideband opcodes for messages When cleared, the Bridge uses global IOSF opcodes
0	0h RW	**PCI_CFG_DIS1:** When set, PCI configuration accesses return UR response When 0, PCI configuration accesses are supported

14.3.2 PCICFGCTR2 PCI Configuration Control 2 Register (PCICFGCTR2) - Offset 204h

Controls the PCI configuration space

Type	Size	Offset	Default
MMIO	32 bit	FDCD0000h + 204h	00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**DIS_PCI_IDLE_CAP2:** This is a bit to disable the PCI Device Idle capability structure.
27:20	00h RW	**PCI_IRQ2:** IRQ number to be sent in the message with data field for PCI Assert_IRQ and PCI_Deassert_IRQ message
19:12	00h RW	**ACPI_IRQ2:** IRQ number to be sent in the message with data field for ACPI Assert_IRQ and ACPI_Deassert_IRQ message
11:8	1h RW	**IPIN2:** Interrupt Pin: This register indicates the values to be used for Global Interrupts.
7	0h RW	**BAR1_DISABLE2:** BAR1_Disable: BAR1 register in the PCOS space becomes Read only when this bit is set.
6:2	00h RW	**PME_SUPPORT2:** The value in this register is XOR with the value in the PME_support strap and reflected in the PME_Support register in the PCI configuration space
1	0h RW	**ACPI_INTR_EN2:** When set, the Bridge uses ACPI Sideband opcodes for messages When cleared, the Bridge uses global IOSF opcodes
0	0h RW	**PCI_CFG_DIS2:** When set, PCI configuration accesses return UR response When 0, PCI configuration accesses are supported

14.3.3 PCICFGCTR3 PCI Configuration Control 3 Register (PCICFGCTR3) - Offset 208h

Controls the PCI configuration space

Type	Size	Offset	Default
MMIO	32 bit	FDCD0000h + 208h	00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**Reserved**
27:20	00h RW	**PCI_IRQ3:** IRQ number to be sent in the message with data field for PCI Assert_IRQ and PCI_Deassert_IRQ message
19:12	00h RW	**ACPI_IRQ3:** IRQ number to be sent in the message with data field for ACPI Assert_IRQ and ACPI_Deassert_IRQ message
11:8	1h RW	**IPIN3:** Interrupt Pin: This register indicates the values to be used for Global Interrupts.
7	0h RW	**BAR1_DISABLE3:** BAR1_Disable: BAR1 register in the PCOS space becomes Read only when this bit is set.
6:2	00h RW	**PME_SUPPORT3:** The value in this register is XOR with the value in the PME_support strap and reflected in the PME_Support register in the PCI configuration space
1	0h RW	**ACPI_INTR_EN3:** When set, the Bridge uses ACPI Sideband opcodes for messages When cleared, the Bridge uses global IOSF opcodes
0	0h RW	**PCI_CFG_DIS3:** When set, PCI configuration accesses return UR response When 0, PCI configuration accesses are supported

14.3.4 PCICFGCTR4 PCI Configuration Control 4 Register (PCICFGCTR4) - Offset 20Ch

Controls The PCI Configuration Space

Type	Size	Offset	Default
MMIO	32 bit	FDCD0000h + 20Ch	00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**Reserved**
27:20	00h RW	**PCI_IRQ4:** IRQ number to be sent in the message with data field for PCI Assert_IRQ and PCI_Deassert_IRQ message
19:12	00h RW	**ACPI_IRQ4:** IRQ number to be sent in the message with data field for ACPI Assert_IRQ and ACPI_Deassert_IRQ message
11:8	1h RW	**IPIN4:** Interrupt Pin: This register indicates the values to be used for Global Interrupts.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**BAR1_DISABLE4:** BAR1_Disable: BAR1 register in the PCOS space becomes Read only when this bit is set.
6:2	00h RW	**PME_SUPPORT4:** The value in this register is XOR with the value in the PME_support strap and reflected in the PME_Support register in the PCI configuration space
1	0h RW	**ACPI_INTR_EN4:** When set, the Bridge uses ACPI Sideband opcodes for messages When cleared, the Bridge uses global IOSF opcodes
0	0h RW	**PCI_CFG_DIS4:** When set, PCI configuration accesses return UR response When 0, PCI configuration accesses are supported

14.3.5 PCICFGCTR5 PCI Configuration Control 5 Register (PCICFGCTR5) - Offset 210h

Controls the PCI configuration space

Type	Size	Offset	Default
MMIO	32 bit	FDCD0000h + 210h	00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**Reserved**
27:20	00h RW	**PCI_IRQ5:** IRQ number to be sent in the message with data field for PCI Assert_IRQ and PCI_Deassert_IRQ message
19:12	00h RW	**ACPI_IRQ5:** IRQ number to be sent in the message with data field for ACPI Assert_IRQ and ACPI_Deassert_IRQ message
11:8	1h RW	**IPIN5:** Interrupt Pin: This register indicates the values to be used for Global Interrupts.
7	0h RW	**BAR1_DISABLE5:** BAR1_Disable: BAR1 register in the PCOS space becomes Read only when this bit is set.
6:2	00h RW	**PME_SUPPORT5:** The value in this register is XOR with the value in the PME_support strap and reflected in the PME_Support register in the PCI configuration space
1	0h RW	**ACPI_INTR_EN5:** When set, the Bridge uses ACPI Sideband opcodes for messages When cleared, the Bridge uses global IOSF opcodes
0	0h RW	**PCI_CFG_DIS5:** When set, PCI configuration accesses return UR response When 0, PCI configuration accesses are supported

14.3.6 PCICFGCTR6 PCI Configuration Control 6 Register (PCICFGCTR6) - Offset 214h

Controls the PCI configuration space

Type	Size	Offset	Default
MMIO	32 bit	FDCD0000h + 214h	00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**Reserved**
27:20	00h RW	**PCI_IRQ6:** IRQ number to be sent in the message with data field for PCI Assert_IRQ and PCI_Deassert_IRQ message
19:12	00h RW	**ACPI_IRQ6:** IRQ number to be sent in the message with data field for ACPI Assert_IRQ and ACPI_Deassert_IRQ message
11:8	1h RW	**IPIN6:** Interrupt Pin: This register indicates the values to be used for Global Interrupts.
7	0h RW	**BAR1_DISABLE6:** BAR1_Disable: BAR1 register in the PCOS space becomes Read only when this bit is set.
6:2	00h RW	**PME_SUPPORT6:** The value in this register is XOR with the value in the PME_support strap and reflected in the PME_Support register in the PCI configuration space
1	0h RW	**ACPI_INTR_EN6:** When set, the Bridge uses ACPI Sideband opcodes for messages When cleared, the Bridge uses global IOSF opcodes
0	0h RW	**PCI_CFG_DIS6:** When set, PCI configuration accesses return UR response When 0, PCI configuration accesses are supported

14.3.7 PCICFGCTR7 PCI Configuration Control 7 Register (PCICFGCTR7) - Offset 218h

Controls The PCI Configuration Space

Type	Size	Offset	Default
MMIO	32 bit	FDCD0000h + 218h	00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**Reserved**
27:20	00h RW	**PCI_IRQ7:** IRQ number to be sent in the message with data field for PCI Assert_IRQ and PCI_Deassert_IRQ message
19:12	00h RW	**ACPI_IRQ7:** IRQ number to be sent in the message with data field for ACPI Assert_IRQ and ACPI_Deassert_IRQ message
11:8	1h RW	**IPIN7:** Interrupt Pin: This register indicates the values to be used for Global Interrupts.
7	0h RW	**BAR1_DISABLE7:** BAR1_Disable: BAR1 register in the PCOS space becomes Read only when this bit is set.
6:2	00h RW	**PME_SUPPORT7:** The value in this register is XOR with the value in the PME_support strap and reflected in the PME_Support register in the PCI configuration space
1	0h RW	**ACPI_INTR_EN7:** When set, the Bridge uses ACPI Sideband opcodes for messages When cleared, the Bridge uses global IOSF opcodes
0	0h RW	**PCI_CFG_DIS7:** When set, PCI configuration accesses return UR response When 0, PCI configuration accesses are supported

14.3.8 PCICFGCTR8 PCI Configuration Control 8 Register (PCICFGCTR8) - Offset 21Ch

Controls The PCI Configuration Space

Type	Size	Offset	Default
MMIO	32 bit	FDCD0000h + 21Ch	00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**Reserved**
27:20	00h RW	**PCI_IRQ8:** IRQ number to be sent in the message with data field for PCI Assert_IRQ and PCI_Deassert_IRQ message
19:12	00h RW	**ACPI_IRQ8:** IRQ number to be sent in the message with data field for ACPI Assert_IRQ and ACPI_Deassert_IRQ message
11:8	1h RW	**IPIN8:** Interrupt Pin: This register indicates the values to be used for Global Interrupts.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**BAR1_DISABLE8:** BAR1_Disable: BAR1 register in the PCOS space becomes Read only when this bit is set.
6:2	00h RW	**PME_SUPPORT8:** The value in this register is XOR with the value in the PME_support strap and reflected in the PME_Support register in the PCI configuration space
1	0h RW	**ACPI_INTR_EN8:** When set, the Bridge uses ACPI Sideband opcodes for messages When cleared, the Bridge uses global IOSF opcodes
0	0h RW	**PCI_CFG_DIS8:** When set, PCI configuration accesses return UR response When 0, PCI configuration accesses are supported

15 SATA Controller

15.1 SATA Configuration Registers Summary

This chapter records the registers in Bus: 0, Device 23, Function 0.

Table 15-1. Summary of Bus: 0, Device: 23, Function: 0 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	ID	4B608086h
4h	2	CMD	0000h
6h	2	Device Status (STS)	0210h
8h	1	Revision ID (RID)	00h
9h	1	Programming Interface (PI)	01h
Ah	2	Class Code (CC)	0106h
Ch	1	Cache Line Size (CLS)	00h
Dh	1	Master Latency Timer (MLT)	00h
Eh	1	Header Type (HTYPE)	00h
10h	4	MSI-X Table Base Address (MXTBA)	00000000h
14h	4	MSI-X Pending Bit Array Base Address (MXPBA)	00000000h

C0h	4	Scratch Pad (SP)	00000000h
D0h	2	MSI-X Identifiers (MXID)	0011h
D2h	2	MSI-X Message Control (MXC)	0000h
D4h	4	MSI-X Table Offset And Table BIR (MXT)	00000000h
D8h	4	MSI-X PBA Offset And PBA BIR (MXP)	00000001h
E0h	4	BIST FIS Control/Status (BFCS)	00000000h
E4h	4	BIST FIS Transmit Data 1 (BFTD1)	00000000h
E8h	4	BIST FIS Transmit Data 2 (BFTD2)	00000000h

15.1.1 ID - Offset 0h

When the MMIO RUN.RUNE=1, read access to this double-word is return with UR.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:23, F:0] + 0h	4B608086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	4B60h RO	**Device ID (DID):** The specific value is dependent on config bits and fuses.
15:0	8086h RO	**Vendor ID (VID):** 16-bit field which indicates the company vendor as Intel.

15.1.2 CMD - Offset 4h

Command.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:23, F:0] + 4h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	**Reserved**
10	0h RW	**Interrupt Disable (ID):** This disables pin-based INTx# interrupts. This bit has no effect on MSI operation. When set, internal INTx# will not be generated. When cleared, internal INTx# are generated if there is an interrupt and MSI is not enabled.
9	0h RO	**Reserved**
8	0h RW	**SERR# Enable (SEE):** When set to 1, the HBA is allowed to generate SERR# on DPD or SATAGC.URD event that is enabled for SERR# generation. When cleared to 0, it is not.
7	0h RO	**Reserved**
6	0h RW	**Parity Error Response Enable (PEE):** When set, the SATA Controller will corrupt the outbound DATA FIS CRC if a forwarded data parity error is indicated.
5:3	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Bus Master Enable (BME):** Controls the SATA Controller's ability to act as a master for data transfers. This bit does not impact the generation of completions for split transaction commands.
1	0h RW	**Memory Space Enable (MSE):** Controls access to the SATA Controller's target memory space (for AHCI). If Fabric Decoding scheme is used, this register bit is shadowed by the Fabric Decoder.
0	0h RW	**I/O Space Enable (IOSE):** Controls access to the SATA Controller's target I/O space. If Fabric Decoding scheme is used, this register bit is shadowed by the Fabric Decoder.

15.1.3 Device Status (STS) - Offset 6h

Device Status.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:23, F:0] + 6h	0210h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C/V	**Detected Parity Error (DPE):** Set when the SATA Controller detects a parity error on its interface.
14	0h RW/1C/V	**Signalled System Error (SSE):** Set when SATA Controller generates an SERR#.
13	0h RW/1C/V	**Received Master-Abort Status (RMA):** Set when the SATA Controller receives a master abort to a cycle it generated.
12	0h RW/1C/V	**Received Target-Abort Status (RTA):** Set when the SATA Controller receives a target abort to a cycle it generated.
11	0h RW/1C/V	**Signalled Target-Abort Status (STA):** This bit must be set by a target device whenever it terminates a transaction with Target-Abort. Devices that will never signal Target-Abort do not need to implement this bit.
10:9	1h RO	**DEVSEL# Timing Status (DEVT):** Controls the device select time for the SATA Controller's PCI interface.
8	0h RW/1C/V	**Master Data Parity Error Detected (DPD):** Set when the SATA Controller, as a master, either detects a parity error or sees the parity error line asserted, and the parity error response bit (bit 6 of the command register) is set. This bit can only be set on read completions received from the backbone where there is a parity error.
7:5	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
4	1h RO	**Capabilities List (CL):** Indicates the presence of a capabilities list. The minimum requirement for the capabilities list must be PCI power management for the SATA Controller.
3	0h RO/V	**Interrupt Status (IS):** Reflects the state of INTx# messages. This bit is set when the interrupt is to be asserted. This bit is a 0 after the interrupt is cleared (independent of the state of CMD.ID).
2:0	0h RO	**Reserved**

15.1.4 Revision ID (RID) - Offset 8h

Revision ID.

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:23, F:0] + 8h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RO	**Revision ID (RID):** Indicates stepping of the host controller hardware.

15.1.5 Programming Interface (PI) - Offset 9h

Programming Interface.

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:23, F:0] + 9h	01h

Bit Range	Default & Access	Field Name (ID): Description
7:0	01h RO	**IF:** If CC.SCC=06h(AHCI mode), it indicates that this is an AHCI HBA that has a major revision of 1 (as specified in the AHCI Version register). If CC.SCC=04h(RAID mode), it indicates that there is no programming interface(IF=00h). Internally, under this condition, the SATA controller is in native mode and its I/O spaces are only accessible through the I/O BARs.

15.1.6 Class Code (CC) - Offset Ah

Class Code.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:23, F:0] + Ah	0106h

Bit Range	Default & Access	Field Name (ID): Description
15:8	01h RO	**Base Class Code (BCC):** Indicates that this is a mass storage device.
7:0	06h RO	**Sub Class Code (SCC):** The value reported in this field is dependent on SATAGC.SMS and various fuses and configuration bits.

15.1.7 Cache Line Size (CLS) - Offset Ch

Cache Line Size.

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:23, F:0] + Ch	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RO	**Cache Line Size (CLS):** This register has no meaning for the SATA controller.

15.1.8 Master Latency Timer (MLT) - Offset Dh

Master Latency Timer.

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:23, F:0] + Dh	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RO	**Master Latency Timer (MLT):** This register has no meaning for the SATA controller.

15.1.9 Header Type (HTYPE) - Offset Eh

Header Type.

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:23, F:0] + Eh	00h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Multi-function Device (MFD):** 1 indicates this controller is part of a multi-function device. 0 indicates this controller is a single function device. The value of this bit depends on the wire strap istrap_c1_MultiFunctionDevice at the SATA Host Controller top level, driven by SoC.
6:0	00h RO	**Header Layout (HL):** Indicates that the controller uses a target device layout.

15.1.10 MSI-X Table Base Address (MXTBA) - Offset 10h

This BAR is used to allocate 32K, 16K or 8K Memory space for the MSI-X Table. The Memory space size is determined by BIOS by making bit-14 and bit-13 Read-Only '1' or Read-Write '0' based on SATAGC.MSS[1:0].

Note: If Fabric Decoding scheme is used, this register is shadowed by the Fabric Decoder.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:23, F:0] + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:15	00000h RW	**Base Address (BA):** Base address of memory space.
14	0h RW	**Base Address Bit 14 (BAB14):** When SATAGC.MSS[1:0]=00, this bit is Read Only '0' else it's Read Write '0'.
13	0h RW	**Base Address Bit 13 (BAB13):** When SATAGC.MSS[1:0]=00 or 01, this bit is Read Only '0' else it's Read Write '0'.
12:4	0h RO	**Reserved**
3	0h RO	**PF:** Indicates that this range is not pre-fetchable.
2:1	0h RO	**TP:** Indicates that this range can be mapped anywhere in 32-bit address space.
0	0h RO	**Resource Type Indicator (RTE):** Indicates a request for Memory space.

15.1.11 MSI-X Pending Bit Array Base Address (MXPBA) - Offset 14h

This BAR is used to allocate 256-byte Memory space for the MSI-X PBA. If Fabric Decoding scheme is used, this register is shadowed by the Fabric Decoder.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:23, F:0] + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RW	**Base Address (BA):** Base address of memory space (aligned to 256B).
7:4	0h RO	**Reserved**
3	0h RO	**PF:** Indicates that this range is not pre-fetchable.
2:1	0h RO	**TP:** Indicates that this range can be mapped anywhere in 32-bit address space.
0	0h RO	**Resource Type Indicator (RTE):** Indicates a request for Memory space.

15.1.12 AHCI Index Data Pair Base Address (AIDPBA) - Offset 20h

This BAR is used to allocate I/O space for the AHCI index/data pair mechanism. If the Fabric Decoding scheme is used, this register is shadowed by the Fabric Decoder.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:23, F:0] + 20h	00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:5	000h RW	**Base Address (BA):** Base address of the I/O space.
4:1	0h RO	**Reserved**
0	1h RO	**Resource Type Indicator (RTE):** Indicates a request for IO space.

15.1.13 AHCI Base Address (ABAR) - Offset 24h

This register represents a memory BAR allocating space for the AHCI memory registers. If the Fabric Decoding scheme is used, this register is shadowed by the Fabric Decoder. Note that Bit[31:16] of this register must be programmed to a value greater than 0 to ensure the memory is mapped to an address of 1 MBytes and greater (i.e. ABAR must be 00010000h or greater). Otherwise, memory cycle targeting the ABAR range may not be accepted. The Memory space size is determined by BIOS by making bit 15:11 Read-Only 1 or Read-Write 0 based on SATAGC.ASSEL[1:0].

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:23, F:0] + 24h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0000h RW	**Base Address (BA):** Base address of register memory space.
18	0h RW	**Base Address Bit 18 (BAB18):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 256K, this bit is Read Only '0' else it's Read Write '0'.
17	0h RW	**Base Address Bit 17 (BAB17):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 128K, this bit is Read Only '0' else it's Read Write '0'.
16	0h RW	**Base Address Bit 16 (BAB16):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 64K, this bit is Read Only '0' else it's Read Write '0'.
15	0h RW	**Base Address Bit 15 (BAB15):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 32K, this bit is Read Only '0' else it's Read Write '0'.
14	0h RW	**Base Address Bit 14 (BAB14):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 16K, this bit is Read Only '0' else it's Read Write '0'.
13:11	0h RW	**Base Address Bit 13-11 (BAB1311):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 2K, this bit is Read Only '0' else it's Read Write '0'.
10:4	0h RO	**Reserved**
3	0h RO	**PF:** Indicates that this range is not pre-fetchable
2:1	0h RO	**TP:** Indicates that this range can be mapped anywhere in 32-bit address space
0	0h RO	**Resource Type Indicator (RTE):** Indicates a request for register memory space.

15.1.14 Sub System Identifiers (SS) - Offset 2Ch

This register is initialized to logic 0 by the assertion of PLTRST#. This register can be written only once after PLTRST# de-assertion.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:23, F:0] + 2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O	**Subsystem ID (SSID):** This is written by BIOS. No hardware action taken on this value.
15:0	0000h RW/O	**Subsystem Vendor ID (SSVID):** This is written by BIOS. No hardware action taken on this value.

15.1.15 Capabilities Pointer (CAP) - Offset 34h

Capabilities Pointer.

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:23, F:0] + 34h	80h

Bit Range	Default & Access	Field Name (ID): Description
7:0	80h RW/L	**Capability Pointer (CP):** Indicates that the first capability pointer offset is offset 80h. Note: Refer to SATAGC.REGLOCK description in order to lock the register to become RO. This register is not reset by FLR. **Locked by:** SATAGC.REGLOCK

15.1.16 Interrupt Information (INTR) - Offset 3Ch

Interrupt Information.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:23, F:0] + 3Ch	0100h

Bit Range	Default & Access	Field Name (ID): Description
15:8	01h RW/O	**Interrupt Pin (IPIN):** This register tells which interrupt pin the device function uses. A value of 1 corresponds to INTA#. A value of 2 corresponds to INTB#. A value of 3 corresponds to INTC#. A value of 4 corresponds to INTD#. This register is not reset by FLR.
7:0	00h RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this register. Interrupt Line register is not reset by FLR.

15.1.17 PCI Power Management Capability ID (PID) - Offset 70h

PCI Power Management Capability ID.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:23, F:0] + 70h	A801h

Bit Range	Default & Access	Field Name (ID): Description
15:8	A8h RW/L	**Next Capability (NEXT):** A8h is location of the Serial ATA Capability structure. Note: Refer to SATAGC.REGLOCK description in order to lock the register to become RO. This register is not reset by FLR. **Locked by:** SATAGC.REGLOCK
7:0	01h RO	**Cap ID (CID):** Indicates that this pointer is a PCI power management capability.

15.1.18 PCI Power Management Capabilities (PC) - Offset 72h

PCI Power Management Capabilities.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:23, F:0] + 72h	4003h

Bit Range	Default & Access	Field Name (ID): Description
15:11	08h RO	**PME_SUPPORT:** The default value 01000 which indicates PME# can be generated from the D3HOT state in the SATA controller.
10	0h RO	**D2_SUPPORT:** The D2 state is not supported.
9	0h RO	**D1_SUPPORT:** The D1 state is not supported.
8:6	0h RO	**AUX_CURRENT:** PME# from D3COLD state is not supported, therefore this field is 000b.
5	0h RO	**Device Specific Initialization (DSI):** Indicates that no device-specific initialization is required.
4	0h RO	**Reserved**
3	0h RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
2:0	3h RO	**VS:** Indicates support for Revision 1.2 of the PCI Power Management Specification.

15.1.19 PCI Power Management Control And Status (PMCS) - Offset 74h

PCI Power Management Control And Status.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:23, F:0] + 74h	0008h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C/V	**PME Status (PMES):** This bit is set when a PME event is to be requested, and if this bit is set and PMEE is set, a PME# will be generated. This register field is not reset by FLR.
14:9	0h RO	**Reserved**
8	0h RW	**PME Enable (PMEE):** When set, the SATA controller generates PME# from D3HOT on a wake event. ***Note:*** Software is advised to clear PMEE together with PMES prior to changing CC.SCC thru SATAGC.SMS. This register field is not reset by FLR.

Bit Range	Default & Access	Field Name (ID): Description
7:4	0h RO	**Reserved**
3	1h RO	**No Soft Reset (NSFRST):** A 1 indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration context is preserved. Upon transition from the D3hot to the D0 state initialized state, no additional operating system intervention is required to preserve configuration context beyond writing to the PowerState bits. Regardless of this bit, the controller transition from D3hot to the D0 by a system or bus segment reset will return to the state D0 uninitialized with only PME context preserved if PME is supported and enabled.
2	0h RO	**Reserved**
1:0	0h RW	**Power State (PS):** This field is used both to determine the current power state of the SATA Controller and to set a new power state. The values are: 00 = D0 state; 11 = D3HOT state. When in the D3HOT state, the controller's configuration space is available, but the I/O and memory spaces are not. Additionally, interrupts are blocked. If software attempts to write a 10 or 01 to these bits, the write will be ignored. If Fabric Decoding scheme is used, this register bit is shadowed by the Fabric Decoder.

15.1.20 Message Signalled Interrupt Identifier (MID) - Offset 80h

Message Signalled Interrupt Identifier.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:23, F:0] + 80h	7005h

Bit Range	Default & Access	Field Name (ID): Description
15:8	70h RW/L	**Next Pointer (NEXT):** Indicates the next item in the list is the PCI power management pointer. This is the recommended value. BIOS may program this field to A8h indicating that the next item is Serial ATA Capability structure. Note: Refer to SATAGC.REGLOCK description in order to lock the register to become RO. This register is not reset by FLR. **Locked by:** SATAGC.REGLOCK
7:0	05h RO	**Capability ID (CID):** Capabilities ID indicates MSI.

15.1.21 Message Signalled Interrupt Message Control (MC) - Offset 82h

Message Signalled Interrupt Message Control.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:23, F:0] + 82h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved**
7	0h RO	**64-Bit Address Capable (C64):** Capable of generating a 32-bit message only.
6:4	0h RO	**Multiple Message Enable (MME):** When this field is cleared to 000 (and MSIE is set), only a single MSI message will be generated for all SATA ports, and bits [15:0] of the message vector will be driven from MD[15:0].
3:1	0h RO	**Multiple Message Capable (MMC):** Not supported.
0	0h RW	**MSI Enable (MSIE):** If set, MSI is enabled and traditional interrupt pins are not used to generate interrupts. Note that CMD.ID bit has not effect on MSI. Software must clear this bit to 0 to disable MSI first before changing the number of messages allocated in the MMC field.

15.1.22 Message Signalled Interrupt Message Address (MA) - Offset 84h

Message Signalled Interrupt Message Address.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:23, F:0] + 84h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RW	**ADDR:** Lower 32 bits of the system specified message address, always DWORD aligned.
1:0	0h RO	**Reserved**

15.1.23 Message Signalled Interrupt Message Data (MD) - Offset 88h

Message Signalled Interrupt Message Data.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:23, F:0] + 88h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW	**DATA:** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word of the data bus of the MSI memory write transaction.

15.1.24 Port Mapping Register (MAP) - Offset 90h

Port Mapping Register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:23, F:0] + 90h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	0h RW/O	**SATA Port 7 Disable (SPD7):** Similar to SPD0 but for port 7. This bit is only applicable to project(s) that has port 7 physically.
22	0h RW/O	**SATA Port 6 Disable (SPD6):** Similar to SPD0 but for port 6. This bit is only applicable to project(s) that has port 6 physically.
21	0h RW/O	**SATA Port 5 Disable (SPD5):** Similar to SPD0 but for port 5. This bit is only applicable to project(s) that has port 5 physically.
20	0h RW/O	**SATA Port 4 Disable (SPD4):** Similar to SPD0 but for port 4. This bit is only applicable to project(s) that has port 4 physically.
19	0h RW/O	**SATA Port 3 Disable (SPD3):** Similar to SPD0 but for port 3. This bit is only applicable to project(s) that has port 3 physically.
18	0h RW/O	**SATA Port 2 Disable (SPD2):** Similar to SPD0 but for port 2. This bit is only applicable to project(s) that has port 2 physically.
17	0h RW/O	**SATA Port 1 Disable (SPD1):** Similar to SPD0 but for port 1. This bit is only applicable to project(s) that has port 1 physically.
16	0h RW/O	**SATA Port 0 Disable (SPD0):** A 1 prevents the SATA port from being enabled via config PCS.PxE. Write of 1 to PCS.PxE has no effect when the corresponding SPD[x] bit is 1. In preventing a port(s) from being enabled, BIOS shall first configure MAP.SPDx. And only then BIOS configures the PCS.PxE. This bit is only applicable to project(s) that has port 0 physically.
15:8	0h RO	**Reserved**
7:0	00h RW	**Port Clock Disable (PCD):** When any of these bits is set to 1, the backbone clock driven to the associated port logic is gated and will not toggle. When this bit is cleared to 0, all clocks to the associated port logic will operate normally. Assignment of the bits is: Bit 7: Port 7, this bit is applicable to projects that have port 7 physically; Bit 6: Port 6, this bit is only applicable to project(s) that has port 6 physically; Bit 5: Port 5, this bit is only applicable to project(s) that has port 5 physically; Bit 4: Port 4, this bit is only applicable to project(s) that has port 4 physically; Bit 3: Port 3, this bit is only applicable to project(s) that has port 3 physically; Bit 2: Port 2, this bit is only applicable to project(s) that has port 2 physically; Bit 1: Port 1, this bit is only applicable to project(s) that has port 1 physically; Bit 0: Port 0, this bit is only applicable to project(s) that has port 0 physically. Software cannot set the PCD[port x]=1 if the corresponding config PCS.PxE=1 or AHCI MMIO GHC.PI[x]=1. TM.PCD[x] statically gates clock into a SATA port hardware when set to 1. This renders the port non-functional.

15.1.25 Port Control And Status (PCS) - Offset 94h

By default, the SATA ports are set (by hardware) to the disabled state (e.g. bits[5:0] == '0') as a result of an initial power on reset. When enabled by software, the ports can transition between the on, partial, and slumber states and can detect devices. When disabled, the port is in the off state and cannot detect any devices.

Note: This register is not reset by FLR.

AHCI specific notes: If an AHCI-aware or RAID enabled operating system is being booted then system BIOS shall insure that all supported SATA ports are enabled prior to passing control to the OS. Once the AHCI aware OS is booted it becomes the enabling/disabling policy owner for the individual SATA ports. This is accomplished by manipulating a port's PxSCTL.DET and PxCMD.SUD fields. Because an AHCI or RAID aware OS will typically not have knowledge of the PxE bits and because the PxE bits act as master on/off switches for the ports, pre-boot software must insure that these bits are set to '1' prior to booting the OS, regardless as to whether or not a device is currently on the port.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:23, F:0] + 94h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	0h RO/V	**Port 7 Present (P7P):** Same as P0P, except for port 7. This bit is only applicable to project(s) that has port 7 physically.
22	0h RO/V	**Port 6 Present (P6P):** Same as P0P, except for port 6. This bit is only applicable to project(s) that has port 6 physically.
21	0h RO/V	**Port 5 Present (P5P):** Same as P0P, except for port 5. This bit is only applicable to project(s) that has port 5 physically.
20	0h RO/V	**Port 4 Present (P4P):** Same as P0P, except for port 4. This bit is only applicable to project(s) that has port 4 physically.
19	0h RO/V	**Port 3 Present (P3P):** Same as P0P, except for port 3. This bit is only applicable to project(s) that has port 3 physically.
18	0h RO/V	**Port 2 Present (P2P):** Same as P0P, except for port 2. This bit is only applicable to project(s) that has port 2 physically.
17	0h RO/V	**Port 1 Present (P1P):** Same as P0P, except for port 1. This bit is only applicable to project(s) that has port 1 physically.

Bit Range	Default & Access	Field Name (ID): Description
16	0h RO/V	**Port 0 Present (P0P):** This bit is set when COMINIT is received as a response to COMRESET. When set, the SATA controller has detected the presence of a device on port 0. It may change at any time. Clearing P0E bit leads to clearing of this bit after implementation delay. Software that intends to clear all PCS.PxE bits that are previously 1 to 0 and then to 1 again in two consecutive write cycles, software shall poll on this bit being 0 before setting P0E bit to 1. This bit is only applicable to project(s) that has port 0 physically.
15:8	0h RO	**Reserved**
7	0h RW/V	**Port 7 Enabled (P7E):** When MAP.SPD[7] is 1, this bit is reserved and is read-only 0. Otherwise this field is RW and the definition of this bit is same as P0E, except for port 7. This bit takes precedence over P7CMD.SUD. BIOS shall program the P7E to 1 prior to starting the AHCI initialization flow. RO-zero condition: MAP.SPD[7] is 1, OR SATA PORT muxing for port 7 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s) that has port 7 physically.
6	0h RW/V	**Port 6 Enabled (P6E):** When MAP.SPD[6] is 1, this bit is reserved and is read-only 0. Otherwise this field is RW and the definition of this bit is the same as P0E, except for port 6. This bit takes precedence over P6CMD.SUD. BIOS shall program the P6E to 1 prior to starting the AHCI initialization flow. RO-zero condition: MAP.SPD[6] is 1, OR SATA PORT muxing for port 6 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s) that have port 6 physically.
5	0h RW/V	**Port 5 Enabled (P5E):** When MAP.SPD[5] is 1, this bit is reserved and is read-only 0. Otherwise this field is RW and the definition of this bit is the same as P0E, except for port 5. This bit takes precedence over P5CMD.SUD. BIOS shall program the P5E to 1 prior to starting the AHCI initialization flow. RO-zero condition: MAP.SPD[5] is 1, OR SATA PORT muxing for port 5 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s) that has port 5 physically.
4	0h RW/V	**Port 4 Enabled (P4E):** When MAP.SPD[4] is 1, this bit is reserved and is read-only 0. Otherwise this bit is RW and same as P0E but for port 4 and takes precedence over P4CMD.SUD. BIOS shall program the P4E to 1 prior to starting the AHCI initialization flow. RO-zero condition: MAP.SPD[4] is 1, OR SATA PORT muxing for port 4 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s) that has port 4 physically.
3	0h RW/V	**Port 3 Enabled (P3E):** When MAP.SPD[3] is 1, this bit is reserved and is read-only 0. Otherwise this bit is RW and same as P0E but for port 3 and takes precedence over P3CMD.SUD. BIOS shall program the P3E to 1 prior to starting the AHCI initialization flow. RO-zero condition: MAP.SPD[3] is 1, OR SATA PORT muxing for port 3 based on fuses, soft straps and GPIO does not select SATA, OR Fuse FFSATA7 (disable port 2 & 3) is 1, OR Fuse FFSATA8 (disable port 1 & 3) is 1. This bit is only applicable to project(s) that has port 3 physically.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW/V	**Port 2 Enabled (P2E):** When MAP.SPD[2] is 1, this bit is reserved and is read-only 0. Otherwise this bit is RW and same as P0E but for port 2 and takes precedence over P2CMD.SUD. . BIOS shall program the P2E to 1 prior to starting the AHCI initialization flow. RO-zero condition: MAP.SPD[2] is 1, OR SATA PORT muxing for port 2 based on fuses, soft straps and GPIO does not select SATA, OR Fuse FFSATA7 (disable port 2 & 3) is 1. This bit is only applicable to project(s) that has port 2 physically.
1	0h RW/V	**Port 1 Enabled (P1E):** When MAP.SPD[1] is 1, this bit is reserved and read-only 0. Otherwise this bit is RW and same as P0E but for port 1 and takes precedence over P1CMD.SUD. BIOS shall program the P1E to 1 prior to starting the AHCI initialization flow. RO-zero condition: MAP.SPD[1] is 1, OR SATA PORT muxing for port 1 based on fuses, soft straps and GPIO does not select SATA, OR Fuse FFSATA8 (disable port 1 & 3) is 1. This bit is only applicable to project(s) that has port 1 physically.
0	0h RW/V	**Port 0 Enabled (P0E):** When MAP.SPD[0] is 1, this bit is reserved and read-only 0. When set, the port is enabled. When cleared, the port is disabled. When enabled, the port can transition between the on, partial, and slumber states and can detect devices. When disabled, the port is in the off state and cannot detect any devices. This bit takes precedence over P0CMD.SUD. BIOS shall program the P0E to 1 prior to starting the AHCI initialization flow. RO-zero condition: MAP.SPD[0] is 1, OR SATA PORT muxing for port 0 based on fuses, soft straps and GPIO does not select SATA. The recommendation for software code that intends to clear all PCS.PxE bits that are previously 1 to 0 and then to 1 again immediately as in the polling requirement from P0P register bit. At any time that BIOS or software is clearing PCS.PxE from 1 to 0, due to time needed for port staggering hardware process (up to 8 ports) to complete, BIOS and software shall delay the write to set the TM.PCD register by 1.4us. This bit is only applicable to project(s) that has port 0 physically.

15.1.26 SATA General Configuration (SATAGC) - Offset 9Ch

SATA General Configuration.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:23, F:0] + 9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/O	**Register Lock (REGLOCK):** BIOS can set this bit to 1 to lock the following registers with RW/L attribute: CAP, CP, MID.NEXT, PIE.NEXT, SATACR0.NEXT. BIOS is required to program this field to 1 prior to handle off to OS. If BIOS needs the SATA host controller to change operation a few times (i.e. changing CC.SCC mode) and need different capability structures for each specific operation mode, BIOS needs not activate the lock until BIOS is ready to hand off to OS. BIOS may need to separate write access to this byte offset (x9Fh) from write to the lower 3-byte of the dword (x9C-9Eh) if there is a need to program the lower 3-byte dword location early during boot process. This field is not reset by FLR.
30:18	0h RO	**Reserved**
17	0h RW	**Do_Serr Disable (DOSERRD):** When 1, SERR reporting is disabled (DO_SERR Sideband message sending is disabled or SERR# Wire is suppressed. STS.SSE setting is not governed by this policy bit). When 0, SERR reporting is enabled (DO_SERR Sideband message sending is enabled or SERR# Wire is not suppressed). This register field is not reset by FLR.

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**SATA Mode Select (SMS):** Software (SW) programs these bits to control the mode in which the SATA HBA should operate: 0b = AHCI mode; **Note:** SW shall not manipulate SATAGC.SMS during runtime operation; i.e. the OS will not do this.
15	0h RW	**Data Phase Parity Error Enable (DPPEE):** When 1, IOSF data phase parity error handling is enabled. When 0, the data phase parity error handling is disabled. This register field is not reset by FLR.
14:12	0h RW	**Write Request_Size Select/Max_Payload_Size (WRRSELMPS):** These two bits select the max write request size that SATA host controller will initiate for DMA write to memory. SATA host controller will internally break up larger write request based on these bits. The request is address-aligned to the selected size. Defined encodings for this field are: 000b = 128 address aligned bytes max payload size; 111b = 64 address aligned bytes max payload size. All other values are reserved for SATA host controller. This field is not reset by FLR.
11	0h RW	**Command Parity Error Enable (CPEE):** When 1, command parity error handing is enabled. When 0, the command parity error handling is disabled. This field is not reset by FLR.
10	0h RW	**SATA Controller Function Disable (SCFD):** BIOS program this bit to 1 to disable the SATA Controller function. When 0, SATA Controller function is enabled. When disable, SATA Host Controller will not claimed the register access targeting its Configuration Space. In IOSF primary Fabric Decode scheme, it's expected BIOS also program the corresponding bit used by the Fabric Decoder accordingly hence both SATA SIP and Fabric Decoder are in sync, and BIOS need to program this bit before programming the one in Fabric Decoder. Once this bit is set, BIOS is not able to revert it back to Function Enable until next round of platform reset. This register field is not reset by FLR.
9	0h RW	**Unsupported Request Reporting Enable (URRE):** If set to 1 by software, it allows reporting of an Unsupported Request as a system error. If both URRE and PCI configuration SERR# Enable registers are set to a 1, then the agent must set the Signaled System Error bit in the PCI Status register and send a DO_SERR message in IOSF-SB interface.
8	0h RW/1C/V	**Unsupported Request Detected (URD):** Set to 1 by hardware upon detecting an Unsupported Request on IOSF Primary interface that is not considered Advisory Non-Fatal. Cleared to 0 by SW. URD bit is only set based on IOSF primary bus interface activity. It is not set based on IOSF sideband bus interface activity.
7	0h RW/O	**Alternate ID Enable (AIE):** When programmed to 0, HW will report the following DID value to load the Window_InBox_Driver. When programmed to a 1, SATA Host Controller will not report the DID value to load the Windows_InBox_Driver. Programming this bit to a 1 will prevent the Windows in-box version of the Intel AHCI driver from loading on the platform - will require that the user perform an 'F6' installation of the Intel driver that is appropriate for the reported DID. This field is applicable when the AHCI is configured for RAID mode of operation. It has no impact for AHCI and IDE modes of operation. ***Note:*** BIOS is recommended to program this bit prior to programming the SATAGC.SMS field to reflect RAID. This field is reset by PLTRST# and BIOS is required to reprogram the value (either 0 or 1) after resuming from S3, S4 or S5. This insures that the value is properly and cannot be changed during runtime. This field is not reset by FLR.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW/O/V	**AIE0 DevID Selection (DEVIDSEL):** This register allows BIOS to select Device ID when AIE=0 and Server Feature (SATA AIE DEVIDSEL) Disable Fuse =0. This bit only has effect in Desktop SKU. In Mobile SKU this bit has no effect at all. Check with config register offset 09h PI for usage. Server BIOS is required to program this field to 1 together with the write to the AIE bit in a single configuration write cycle. Client BIOS is required to program this bit to 0 together with the write to the AIE bit in a single configuration write cycle. When Server Feature (SATA AIE DEVIDSEL) Disable Fuse is programmed to 1, this disables the write-ability of this DEVIDSEL register bit, and becomes RO with a value of 0. This field is not reset by FLR.
5	0h RW/O	**FLR Capability Selection (FLRCSSEL):** This allows the FLR Capability to be bypassed. Check with config offset B0h. BIOS is required to program this bit to 1 and config offset A8h SATACR0.NEXT to 00h. This field is not reset by FLR.
4:3	0h RW/O	**MXTBA Size Select (MSS):** These 2 bits select the size of the Memory space for the MSI-X Table defined in BAR 0 (Configuration space offset 10h). MSI-X Table Memory space size is 32k when MSS[1:0]=00, 16k when MSS[1:0]=01, 8k when MSS[1:0]=10. This field is not reset by FLR.
2:0	0h RW/O	**ABAR Size Select (ASSEL):** These 3 bits select the size of the Memory space for the ABAR in BAR 5 (Configuration space offset 24h). ABAR Memory space size is 2k when ASSEL[2:0]=000, 16k when ASSEL[2:0]=001, 32k when ASSEL[2:0]=010, 64k when ASSEL[2:0]=011, 128k when ASSEL[2:0]=100, 256k when ASSEL[2:0]=101, 512k when ASSEL[2:0]=110. This field is not reset by FLR.

15.1.27 SATA Initialization Register Index (SIRI) - Offset A0h

SATA Initialization Register Index.

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:23, F:0] + A0h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:2	00h RW	**IDX:** 6-bit index pointer into the 256-byte space. Data is written into the SIRD (DFTD) register and read from the SIRD register. This point to a DWord register. The byte enables on the SIRD register affect what will be written.
1:0	0h RO	**Reserved**

15.1.28 SATA Initialization Register Data (SIRD) - Offset A4h

SATA Initialization Register Data.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:23, F:0] + A4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**DTA:** 32-bit data value that is written to the register pointed to by SIRI, or read from the register pointed to by SIRI.

15.1.29 Serial ATA Capability Register 0 (SATACR0) - Offset A8h

The SATACR0.NEXT is not changed from RO to become RWO because there is an existing method (SATAGC.FLRCSSEL bit) to bypass the FLR Capability structure, and since the FLR Capability ID.NEXT is already indicating end of capability structure, it does not need change to be RWO.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:23, F:0] + A8h	00100012h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:20	1h RO	**Major Revision (MAJREV):** Major revision number of the SATA Capability Pointer implemented.
19:16	0h RO	**Minor Revision (MINREV):** Minor revision number of the SATA Capability Pointer implemented.
15:8	00h RW/L	**Next Capability Pointer (NEXT):** 00h indicating the final item in the Capability List. Note: Refer to SATAGC.REGLOCK description in order to lock the register to become RO. This register is not reset by FLR. **Locked by:** SATAGC.REGLOCK
7:0	12h RO	**Capability ID (CAP):** The value of 12h has been assigned by the PCI SIG to designate the SATA Capability pointer.

15.1.30 Serial ATA Capability Register 1 (SATACR1) - Offset ACh

Serial ATA Capability Register 1.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:23, F:0] + ACh	00000048h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:4	004h RO	**BAR Offset (BAROFST):** Indicates the offset into the BAR where the AHCI Index/Data pair is located (in Dword granularity). The Index and Data I/O registers are located at offset 10h within the I/O space defined by AIDPBA(BAR4). A value of 004h indicates offset 10h. 000h = 0h offset; 001h = 4h offset; 002h = 8h offset; 003h = Ch offset; 004h = 10h offset; ...; FFFh = 3FFFh offset (max 16 KB)
3:0	8h RO	**BAR Location (BARLOC):** Indicates the absolute PCI Configuration Register address of the BAR containing the Index/Data pair (in Dword granularity). The Index and Data I/O registers reside within the space defined by AIDPBA(BAR4) in the SATA controller. A value of 8h indicates offset 20h, which is AIDPBA (BAR4). 0000 - 0011b = reserved; 0100b = 10h => BAR0; 0101b = 14h => BAR1; 0110b = 18h => BAR2; 0111b = 1Ch => BAR3; 1000b = 20h => AIDPBA; 1001b = 24h => BAR5; 1010 - 1110b = reserved; 1111b = Index/Data pair in PCI Configuration space which is not supported in SATA Host Controller.

15.1.31 Scratch Pad (SP) - Offset C0h

Scratch Pad.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:23, F:0] + C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DT:** This is a read/write register that is available for software to use. No hardware action is taken on this register.

15.1.32 MSI-X Identifiers (MXID) - Offset D0h

MSI-X Identifiers.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:23, F:0] + D0h	0011h

Bit Range	Default & Access	Field Name (ID): Description
15:8	00h RW/L	**Next Pointer (NEXT):** Indicates the next item in the list. This may be other capability pointers or it may be the last item in the list. Note: Refer to SATAGC.REGLOCK description in order to lock the register to become RO. This register is not reset by FLR. **Locked by:** SATAGC.REGLOCK
7:0	11h RO	**Capability ID (CID):** Capabilities ID indicates this is an MSI-X capability.

15.1.33 MSI-X Message Control (MXC) - Offset D2h

MSI-X Message Control.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:23, F:0] + D2h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**MSI-X Enable (MXE):** If set to '1' and the MSI Enable bit in the MSI Message Control register is cleared to '0', the function is permitted to use MSI-X to request service and is prohibited from using its INTx# pin (if implemented). If cleared to '0', the function is prohibited from using MSI-X to request service.
14	0h RW	**Function Mask (FM):** If set to '1', all of the vectors associated with the function are masked, regardless of their per vector Mask bit states. If cleared to '0', each vector's Mask bit determines whether the vector is masked or not. Setting or clearing the MSI-X Function Mask bit has no effect on the state of the per vector Mask bits.
13:11	0h RO	**Reserved**
10:0	000h RO	**Table Size (TS):** This value indicates the size of the MSI-X Table as the value n, which is encoded as n - 1. For example, a returned value of 3h corresponds to a table size of 4.

15.1.34 MSI-X Table Offset And Table BIR (MXT) - Offset D4h

MSI-X Table Offset And Table BIR.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:23, F:0] + D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW/O	**Table Offset (TO):** Used as an offset from the address contained by one of the function's Base Addresses registers to point to the base of the MSI-X Table. The lower three Table BIR bits are masked off (cleared to 000b) by system software to form a 32-bit Qword-aligned offset.
2:0	0h RO	**Table BIR (TBIR):** This field indicates which one of a function's Base Address registers, located beginning at 10h in Configuration Space, is used to map the function's MSI-X Table into system memory. A read-only value of '0' means 10h.

15.1.35 MSI-X PBA Offset And PBA BIR (MXP) - Offset D8h

MSI-X PBA Offset And PBA BIR.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:23, F:0] + D8h	00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW/O	**PBA Offset (PBAO):** Used as an offset from the address contained by one of the function's Base Addresses registers to point to the base of the MSI-X PBA. The lower three PBA BIR bits are masked off (cleared to 000b) by software to form a 32-bit Qword-aligned offset.
2:0	1h RO	**PBA BIR (PBIR):** This field indicates which one of a function's Base Address registers, located beginning at 10h in Configuration Space, is used to map the function's MSI-X PBA into system memory. A read-only value of '1' means 14h.

15.1.36 BIST FIS Control/Status (BFCS) - Offset E0h

BIST FIS Control/Status.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:23, F:0] + E0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17	0h RW	**Port 7 BIST FIS Initiate (P7BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 7, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable the PCS.P7E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s) that has port 7 physically.
16	0h RW	**Port 6 BIST FIS Initiate (P6BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 6, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable the PCS.P6E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s) that has port 6 physically.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**Port 5 BIST FIS Initiate (P5BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 5, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable the PCS.P5E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s) that has port 5 physically.
14	0h RW	**Port 4 BIST FIS Initiate (P4BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 4, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable PCS.P4E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s) that has port 4 physically.
13	0h RW	**Port 3 BIST FIS Initiate (P3BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 3, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable the PCS.P3E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s) that has port 3 physically.
12	0h RW	**Port 2 BIST FIS Initiate (P2BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 2, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable PCS.P2E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s) that has port 2 physically.
11	0h RW/1C/V	**BIST FIS Successful (BFS):** This bit is set anytime a BIST FIS transmitted by the SATA controller receives an R_OK completion status from the device.
10	0h RW/1C/V	**BIST FIS Failed (BFF):** This bit is set anytime that a BIST FIS transmitted by the SATA controller receives an R_ERR completion status from the device.
9	0h RW	**Port 1 BIST FIS Initiate (P1BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 1, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable PCS.P1E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s) that has port 1 physically.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**Port 0 BIST FIS Initiate (P0BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 0, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable PCS.P0E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s) that has port 0 physically.
7:2	00h RW	**BIST FIS Parameters (BFP):** These bits form the contents of the upper 6 bits of the BIST FIS Pattern Definition in the BIST FIS transmitted by the SATA controller. This field is not port specific - its contents will be used for any BIST FIS initiated on the SATA controller. The specific bit definitions are: Bit 7 (T) Far End Transmit mode; bit 6 (A) Align Bypass mode; bit 5 (S) Bypass Scrambling; bit 4 (L) Far End Retimed Loopback; bit 3 (F) Far End Analog Loopback; bit 2 (P) Primitive bit for use with Transmit mode.
1:0	0h RO	**Reserved**

15.1.37 BIST FIS Transmit Data 1 (BFTD1) - Offset E4h

BIST FIS Transmit Data 1.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:23, F:0] + E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DATA:** The data programmed into this register will form the contents of the second DW of any BIST FIS initiated by the SATA controller. This register is not port specific - its contents will be used for BIST FIS initiated on any port. Although the 2nd and 3rd DWs of the BIST FIS are only meaningful when the T bit of the BIST FIS is set to indicate Far-End Transmit mode, this register's contents will be transmitted as the BIST FIS 2nd DW regardless of whether or not the T bit is indicated in the BFCS register.

15.1.38 BIST FIS Transmit Data 2 (BFTD2) - Offset E8h

BIST FIS Transmit Data 2.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:23, F:0] + E8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DATA:** The data programmed into this register will form the contents of the third DW of any BIST FIS initiated by the SATA controller. This register is not port specific - its contents will be used for BIST FIS initiated on any port. Although the 2nd and 3rd DWs of the BIST FIS are only meaningful when the T bit of the BIST FIS is set to indicate Far-End Transmit mode, this register's contents will be transmitted as the BIST FIS 3rd DW regardless of whether or not the T bit is set in the BFCS register.

15.2 SATA ABAR Register Summary

This chapter records SATA ABAR Register.

Base address for this register is defined in SATA PCI register in Bus:0, Device:23 Function:0.

The offset value for this register: 24h

Table 15-2. Summary of SATA ABAR Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	HBA Capabilities (GHC_CAP)	FF36FF07h
4h	4	Global HBA Control (GHC)	80000000h
8h	4	Interrupt Status Register (IS)	00000000h
Ch	4	Ports Implemented (GHC_PI)	00000000h
10h	4	AHCI Version (VS)	00010301h
1Ch	4	Enclosure Management Location (EM_LOC)	01600002h
20h	4	Enclosure Management Control (EM_CTL)	07010000h
24h	4	HBA Capabilities Extended (GHC_CAP2)	0000003Ch
A0h	4	Vendor Specific (VSP)	00000048h
A4h	4	Vendor-Specific Capabilities Register (VS_CAP)	001002DEh
C0h	4	RAID Platform ID (RPID)	00311C02h
C4h	2	Premium Feature Block (PFB)	0000h
C8h	2	SW Feature Mask (SFM)	003Fh

15.2.1 HBA Capabilities (GHC_CAP) - Offset 0h

This register indicates basic capabilities of the HBA to driver software. The RWO bits in this register are only cleared upon PLTRST#. This register is not reset by FLR.

Type	Size	Offset	Default
MMIO	32 bit	ABAR + 0h	FF36FF07h

Bit Range	Default & Access	Field Name (ID): Description
31	1h RW/O	**Supports 64-bit Addressing (S64A):** Indicates the S-ATA controller can access 64-bit data structures. The 32-bit upper bits of the port DMA Descriptor, the PRD Base, and each PRD entry are read/ write.
30	1h RW/O	**Supports Native Command Queuing Acceleration (SCQA):** Indicates the SATA controller supports Serial-ATA Native Command Queueing. The HBA will handle DMA Setup FISes in hardware, including support for auto-activiate optimization through the FIS.
29	1h RW/O	**Supports SNotification Register (SSNTF):** When set to 1, indicates that the HBA supports the PxSNTF (SNotification) register and its associated functionality. When cleared to 0, the HBA does not support the PxSNTF (SNotification) register and its associated functionality.

Bit Range	Default & Access	Field Name (ID): Description
28	1h RW/O	**Supports Mechanical Presence Switch (SMPS):** When set to 1, the HBA supports mechanical presence switches on its ports for use in hot plug operations. When cleared to 0, this function is not supported. This value is loaded by the BIOS prior to OS initialization.
27	1h RW/O	**Supports Staggered Spin-up (SSS):** Indicates whether the SATA controller supports staggered spin-up on its ports, for use in balancing power spikes. This value is loaded by platform BIOS prior to OS initialization.
26	1h RW/O	**Supports Aggressive Link Power Management (SALP):** Indicates the SATA controller supports auto-generating link requests to the partial or slumber states when there are no commands to process. When cleared to 0, software shall treat the PxCMD.ALPE and PxCMD.ASP bits as reserved.
25	1h RW/O	**Supports Activity LED (SAL):** Indicates the SATA controller supports a single output pin (SATALED#) which indicates activity.
24	1h RW/O	**Supports Command List Override (SCLO):** When set to 1, indicates that the HBA supports the PxCMD.CLO bit and it's associated function. When cleared to 0, The HBA is not capable of clearing the BSY and DRQ bits in the Status register in order to issue a software reset if these bits are still set from a previous operation.
23:20	3h RW/O	**Interface Speed Support (ISS):** Indicates the maximum speed the SATA controller can support on its ports. These encodings match the system software programmable PxSCTL.DET.SPD field. 0000 = Reserved; 0001 = Gen 1 (1.5 Gbps); 0010 = Gen 2 (3 Gbps); 0011 = Gen 3 (6 Gbps); 0100 - 1111 = Reserved. If (FFSATA0p0, FFSATA0p1, FFSATA0p2, FFSATA0p3, FFSATA0p4, FFSATA0p5, FFSATA0p6 and FFSATA0p7) are all 1, this field is RWO defaulting to 0010 and ignores software write value of 0011. If either FFSATA0p0, FFSATA0p1, FFSATA0p2, FFSATA0p3, FFSATA0p4, FFSATA0p5, FFSATA0p6 or FFSATA0p7 is 0, this field is RWO defaulting to 0011.
19	0h RO	**Reserved**
18	1h RO	**Supports AHCI mode only (SAM):** The SATA controller may optionally support AHCI access mechanism only. A value of 0 indicates that in addition to the native AHCI mechanism (via ABAR), the SATA controller implements a legacy, task-file based register interface such as SFF-8038i. A value of 1 indicates that the SATA controller does not implement a legacy, task-file based register interface.
17	1h RW/O	**Supports Port Multiplier (SPM):** The SATA controller may optionally support command-based switching Port Multipliers. BIOS must clear this bit if Port Multipliers are not supported.
16	0h RO	**FIS-based Switching Supported (FBSS):** Not supported.
15	1h RO	**PIO Multiple DRQ Block (PMD):** If set to 1, the HBA supports multiple DRQ block data transfers for the PIO command protocol.
14	1h RW/O	**Slumber State Capable (SSC):** The SATA controller supports the slumber state.
13	1h RW/O	**Partial State Capable (PSC):** The SATA controller supports the partial state.
12:8	1Fh RO	**Number of Command Slots (NCS):** 1Fh indicating support for 32 slots.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Command Completion Coalescing Supported (CCCS):** When set to 1, indicates that the HBA supports command completion coalescing. When command completion coalescing is supported, the HBA has implemented the CCC_CTL and the CCC_PORTS global HBA registers. When cleared to 0, indicates that the HBA does not support command completion coalescing and the CCC_CTL and CCC_PORTS global HBA registers are not implemented.
6	0h RW/O/V	**Enclosure Management Supported (EMS):** When set to 1, indicates that the HBA supports enclosure management. When enclosure management is supported, the HBA has implemented the EM_LOC and EM_CTL global HBA registers. When cleared to 0, indicates that the HBA does not support enclosure management and the EM_LOC and EM_CTL global HBA registers are not implemented. Implementation note: the default value is governed by the parameter SATA_EM_EN. When SATA_EM_EN=1, the attribute-reset is RWO-one. When SATA_EM_EN=0, the attribute-reset is RO-zero.
5	0h RW/O	**Supports External SATA (SXS):** When set to 1, indicates that the HBA has one or more Serial ATA ports that have a signal only connector that is externally accessible. If this bit is set, software may check with the PxCMD.ESP bit to determine whether a specific port has its signal connector externally accessible as a signal only connector (i.e. power is not part of that connector). When the bit is cleared to 0, indicates that the HBA has no Serial ATA ports that have a signal only connector externally accessible.
4:0	07h RO/V	**Number of Ports (NP):** 0's based value indicating the maximum number of ports supported. Note that the number of ports indicated in this field may be more than the number of ports indicated in the PI register. Number of ports shall be dependent on fuses (FFSATA7, FFSATA8) and SATA PORT MUXing configuration where if ANY of these parameter disables a particular port then that port is disabled and not counted.

15.2.2 Global HBA Control (GHC) - Offset 4h

This register controls various global actions of the HBA.

Type	Size	Offset	Default
MMIO	32 bit	ABAR + 4h	80000000h

Bit Range	Default & Access	Field Name (ID): Description
31	1h RO	**AHCI Enable (AE):** When set, indicates that an AHCI driver is loaded and communication to the HBA shall be via AHCI mechanisms. This can be used by an HBA that supports both legacy mechanisms (such as SFF-8038i) and AHCI to know when the HBA is running under an AHCI driver. When set, software shall only talk to the HBA using AHCI. The HBA will not have to allow command processing via both AHCI and legacy mechanisms. When cleared, software will only communicate with the HBA using legacy mechanisms. Software shall set this bit to 1 before accessing other AHCI registers. The implementation of this bit is dependent upon the value of the CAP.SAM bit. If CAP.SAM is 0, then GHC.AE should be RW and shall have a reset value of 0. If CAP.SAM is 1, then AE shall be read only and shall have a reset value of 1.
30:3	0h RO	**Reserved**
2	0h RO	**MSI Revert to Single Message (MRSM):** When set to 1 by hardware, indicates that the HBA requested more than one MSI vector but has reverted to using the first vector only. When this bit is cleared to 0, the HBA has not reverted to single MSI mode (i.e. hardware is already in single MSI mode, software has allocated the number of messages requested, or hardware is sharing interrupt vectors if MC.MME < MC.MMC). The HBA may revert to single MSI mode when the number of vectors allocated by the host is less than the number requested. This bit shall only be set to 1 when the following conditions hold: MC.MSIE = 1 (MSI is enabled); MC.MMC > 0 (multiple messages requested); MC.MME > 0 (more than one message allocated); MC.MME != MC.MMC (messages allocated not equal to number requested). When this bit is set to 1, single MSI mode operation is in use and software is responsible for clearing bits in the IS register to clear interrupts. This bit shall be cleared to 0 by hardware when any of the four conditions stated are false. This bit is also cleared to 0 when MC.MSIE = 1 and MC.MME = 0h. In this case, the hardware has been programmed to use single MSI mode, and is not reverting to that mode. The HBA shall always revert to single MSI mode when the number of vectors allocated by the host is less than the number requested.
1	0h RW	**Interrupt Enable (IE):** This global bit enables interrupts from the HBA. When cleared (reset default), all interrupt sources from all ports are disabled. When set, interrupts are enabled.
0	0h RW/1S/V	**HBA Reset (HR):** When set by SW, this bit causes an internal reset of the HBA. All state machines that relate to data transfers and native command queuing will return to an idle condition, and all ports will be re-initialized via COMRESET. When the HBA has performed the reset action, it will reset this bit to 0. A software writes of 0 will have no effect.

15.2.3 Interrupt Status Register (IS) - Offset 8h

This register indicates which of the ports within the controller have an interrupt pending and require service.

Type	Size	Offset	Default
MMIO	32 bit	ABAR + 8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7	0h RW/1C/V	**Interrupt Pending Status Port 7 (IPS7):** If set, indicates that port 7 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s) that has port 7 physically.
6	0h RW/1C/V	**Interrupt Pending Status Port 6 (IPS6):** If set, indicates that port 6 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s) that has port 6 physically.
5	0h RW/1C/V	**Interrupt Pending Status Port 5 (IPS5):** If set, indicates that port 5 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s) that has port 5 physically.
4	0h RW/1C/V	**Interrupt Pending Status Port 4 (IPS4):** If set, indicates that port 4 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s) that has port 4 physically.
3	0h RW/1C/V	**Interrupt Pending Status Port 3 (IPS3):** If set, indicates that port 3 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s) that has port 3 physically.
2	0h RW/1C/V	**Interrupt Pending Status Port 2 (IPS2):** If set, indicates that port 2 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s) that has port 2 physically.
1	0h RW/1C/V	**Interrupt Pending Status Port 1 (IPS1):** If set, indicates that port 1 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s) that has port 1 physically.
0	0h RW/1C/V	**Interrupt Pending Status Port 0 (IPS0):** If set, indicates that port 0 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s) that has port 0 physically.

15.2.4 Ports Implemented (GHC_PI) - Offset Ch

This register indicates which ports are exposed to the HBA. It is loaded by platform BIOS. It indicates which ports that the device supports are available for software to use. Any available port may not be implemented.

Note: If a Fabric Decoding scheme is used, this register bit is shadowed by the Fabric Decoder.

Type	Size	Offset	Default
MMIO	32 bit	ABAR + Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7	0h RW/O/V	**Port 7 Implemented (PI7):** If set, then port 7 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Check with CAP.NP where port 7 is not available.
6	0h RW/O/V	**Port 6 Implemented (PI6):** If set, then port 6 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Check with CAP.NP where port 6 is not available.
5	0h RW/O/V	**Port 5 Implemented (PI5):** If set, then port 5 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Check with CAP.NP where port 5 is not available.
4	0h RW/O/V	**Port 4 Implemented (PI4):** If set, then port 4 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Check with CAP.NP where port 4 is not available.
3	0h RW/O/V	**Port 3 Implemented (PI3):** If set, then port 3 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Check with CAP.NP where port 3 is not available.
2	0h RW/O/V	**Port 2 Implemented (PI2):** If set, then port 2 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Check with CAP.NP where port 2 is not available.
1	0h RW/O/V	**Port 1 Implemented (PI1):** If set, then port 1 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Check with CAP.NP where port 1 is not available.
0	0h RW/O/V	**Port 0 Implemented (PI0):** If set, then port 0 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: CHeck with CAP.NP where port 0 is not available.

15.2.5 AHCI Version (VS) - Offset 10h

This register indicates the major and minor version of the AHCI specification. It is BCD encoded. The upper two bytes represent the major version number, and the lower two bytes represent the minor version number. Example: Version 3.12 would be represented as 00030102h.

Type	Size	Offset	Default
MMIO	32 bit	ABAR + 10h	00010301h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0001h RO	**Major Version Number (MJR):** Indicates the major version is 1.
15:0	0301h RO	**Minor Version Number (MNR):** Indicates the minor version is 31.

15.2.6 Enclosure Management Location (EM_LOC) - Offset 1Ch

The enclosure management location register identifies the location and size of the enclosure management message buffer. This register is not implemented if enclosure management is not supported (i.e. CAP.EMS = 0).

Type	Size	Offset	Default
MMIO	32 bit	ABAR + 1Ch	01600002h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0160h RO	**OFST:** The offset of the message buffer in Dwords from the beginning of the ABAR.
15:0	0002h RO	**Buffer Size (SZ):** Specifies the size of the transmit message buffer area in Dwords. If both transmit and receive buffers are supported, then the transmit buffer begins at ABAR[EM_LOC.OFST*4] and the receive buffer directly follows it. If both transmit and receive buffers are supported, both buffers are of the size indicated in the Buffer Size field. A value of 0 is invalid. The SATA controller only supports transmit buffer.

15.2.7 Enclosure Management Control (EM_CTL) - Offset 20h

This register is used to control and obtain status for the enclosure management interface. The register includes information on the attributes of the implementation, enclosure management messages supported, the status of the interface, whether any messages are pending, and is used to initiate sending messages. This register is not implemented if enclosure management is not supported (i.e. CAP.EMS = 0).

Type	Size	Offset	Default
MMIO	32 bit	ABAR + 20h	07010000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27	0h RO	**Port Multiplier Support (ATTR_PM):** The HBA does not support enclosure management messages for devices attached via a Port Multiplier. Software should use the Serial ATA enclosure management bridge that is built into many Port Multipliers for enclosure services with these devices. For more information on Serial ATA enclosure management bridges, check with the Serial ATA II: Extensions to Serial ATA 1.0a revision 1.2 specification.
26	1h RW/O	**Activity LED Hardware Driven (ATTR_ALHD):** If set to 1, the HBA drives the activity LED for the LED message type in hardware and does not utilize software settings for this LED. The HBA does not begin transmitting the hardware based activity signal until after software has written CTL.TM=1 after a reset condition.
25	1h RO	**Transmit Only (ATTR_XMT):** If set to 1, the HBA only supports transmitting messages and does not support receiving messages. If cleared to 0, the HBA supports transmitting and receiving messages.
24	1h RO	**Single Message Buffer (ATTR_SMB):** If set to 1, the HBA has one message buffer that is shared for messages to transmit and messages received. In this case, unsolicited receive messages are not supported and it is software's responsibility to manage access to this buffer. If cleared to 0, there are separate receive and transmit buffers such that unsolicited messages could be supported.
23:20	0h RO	**Reserved**
19	0h RO	**SGPIO Enclosure Management Messages (SUPP_SGPIO):** If set to 1, the HBA supports the SGPIO register interface message type.
18	0h RO	**SES-2 Enclosure Management Messages (SUPP_SES2):** If set to 1, the HBA supports the SES-2 message type.
17	0h RO	**SAF-TE Enclosure Management Messages (SUPP_SAFTE):** If set to 1, the HBA supports the SAF-TE message type.
16	1h RO	**LED Message Types (SUPP_LED):** If set to 1, the HBA supports the LED message type defined in LED Message Type.
15:10	0h RO	**Reserved**
9	0h RW/1S/V	**RST:** When set to 1 by software, the HBA shall reset all enclosure management message logic and take all appropriate reset actions to ensure messages can be transmitted/received after the reset. After the HBA completes the reset operation, the HBA shall set the value to 0. A write of 0 by software to this field shall have no effect.
8	0h RW/1S/V	**Transmit Message (CTL_TM):** When set to 1 by software, the HBA shall transmit the message contained in the message buffer. When the message is completely sent, the HBA shall clear this bit to 0. A write of 0 to this bit by software shall have no effect. Software shall not change the contents of the message buffer while CTL.TM is set to 1.
7:1	0h RO	**Reserved**
0	0h RO	**Message Received (STS_MR):** Message received is not supported.

15.2.8 HBA Capabilities Extended (GHC_CAP2) - Offset 24h

This register indicates basic capabilities of the HBA to driver software. The RWO bits in this register are only cleared upon PLTRST#.

Type	Size	Offset	Default
MMIO	32 bit	ABAR + 24h	0000003Ch

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5	1h RW/O	**DEVSLP Entrance from Slumber Only (DESO):** This field specifies that the HBA shall only assert DEVSLP if the interface is in Slumber. When this bit is set to 1, the HBA shall ignore software directed entrance to DEVSLP via PxCMD.ICC unless PxSSTS.IPM = 6h. When this bit is cleared to 0, the HBA may enter DEVSLP from any link state (active, Partial, or Slumber). BIOS is required to program this field to 1.
4	1h RW/O/V	**Supports Aggressive DEVSLP Management (SADM):** When set to 1, the HBA supports hardware assertion of the DEVSLP signal after the idle timeout expires. When cleared to 0, this function is not supported and software shall treat the PxDEVSLP.ADSE field as reserved. If SATA PHY PM Disable Fuse is 1, this register will read 0. Else this register will read 1 with RWO attribute.
3	1h RW/O/V	**Supports DEVSLP (SDS):** When set to 1, the HBA supports the DEVSLP feature. When cleared to 0, DEVSLP is not supported. ***Note:*** If SATA PHY PM Disable Fuse is 1, this register will read 0. Else this register will read 1 with RWO attribute.
2	1h RW/O/V	**Automatic Partial to Slumber Transitions (APST):** When set to 1, the HBA supports Automatic Partial to Slumber Transitions. When cleared to 0, Automatic Partial to Slumber Transition is not supported. ***Note:*** If SATA PHY PM Disable Fuse is 1, this register will read only 0. Else this register will read 1 with RWO attribute.
1	0h RO	**Reserved**
0	0h RO	**BIOS/OS Handoff (BOH):** Not supported.

15.2.9 Vendor Specific (VSP) - Offset A0h

Vendor Specific.

Type	Size	Offset	Default
MMIO	32 bit	ABAR + A0h	00000048h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6	1h RO	**Software Feature Mask Supported (SFMS):** Set to 1 if the platform is enabled for premium storage features mask (SFM) as in VS MMIO space at offset ABAR[RPID.(OFST*4)+4].
5	0h RO/V	**Premium Features Supported (PFS):** Set to 1 if the platform is enabled for premium storage features (PFB) as in VS MMIO space at offset ABAR[RPID.OFST*4]. Set to 0 if the platform is not enabled for premium storage features. The state of this bit reflects the opposite state of fuse FFSATA5 & FFSATA 3 (PFS =1 if fuse values=10 or 11, else PFS=0) or the resulting state of Premium soft sku override (check with ME29 FLEXSKU.FLEXSKU_OVR or PMC MR_SSKUCONC.SHAD_SATA_PREMIUM_FEAT).
4	0h RO/V	**Platform Type (PT):** Set to 1 if mobile platform. Clear (0) if desktop.
3	1h RO	**Supports RAID Platform ID Reporting (SRPIR):** If set to 1, then indicates that the RAID Platform ID is reported via ABAR + C0h. Set to 0 if this ID is not reported via MMIO space.
2:0	0h RO	**Reserved**

15.2.10 Vendor-Specific Capabilities Register (VS_CAP) - Offset A4h

Vendor-Specific Capabilities Register.

Type	Size	Offset	Default
MMIO	32 bit	ABAR + A4h	001002DEh

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27:16	010h RW/O	**NVM Remapped Register Offset (NRMO):** Specifies the offset (in 128B unit) within ABAR as to where the NVM Remap memory BAR register space is remapped. For example, NRMO=1 means ABAR + 128B. This allows the remapped offset to shift between ABAR + 0B, and ABAR + 512KK - 128B, with 128B step. The remapped offset into the AHCI memory space must not overlap with the memory space used for SATA. The remapped offset into the AHCI memory space and the remapped size must not exceed the allocated AHCI memory space of the integrated AHCI controller. Only valid when NRMBE = '1'. The reset default of this field is 10h, this places the start of the PCIe NAND memory BAR register space at ABAR + 2K. This field is not reset by FLR.

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	**Reserved**
12:1	16Fh RW/O	**Memory Space Limit. (MSL):** This field specifies the size (in 128B unit) of the remapped memory space for the PCIe NAND device. It is a 0-based field. For example, MSL=1 means 256B. This allows the remapped size to shift between 128B and 512K with the step of 128B.Memory BAR offset from 0 to MSL of the PCIe NAND device are remapped under the integrated AHCI controller memory space. The remapped offset into the AHCI memory space and the value programmed in this field must not exceed the allocated AHCI memory space of the integrated AHCI controller. Only valid when NRMBE = 1. The reset default of this field is 16Fh which specifies the size of the remapped memory space as 34k.This field is not reset by FLR.
0	0h RW/O	**NVM Remap Memory BAR Enable (NRMBE):** Set to 1 if NVM Remap device is present and remapping of its memory BAR register space is enabled. Cleared to 0 if there is no PCIe NAND device present or the remapping of its memory BAR register space is disabled. This bit is not reset by FLR.

15.2.11 RAID Platform ID (RPID) - Offset C0h

This register is used by the Intel Matrix Storage Manager OROM to match the features supported by the OROM with the platform on which the OROM is executing. This prevents the use of an OROM designed for newer chipsets from being use on older chipsets as this could reduce up-sell potential.

Type	Size	Offset	Default
MMIO	32 bit	ABAR + C0h	00311C02h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0031h RO	**OFST:** The offset of the Premium Feature Block (PFB) in DWords from the beginning of the ABAR. SFM follows directly after PFB.
15:0	1C02h RO/V	**RAID Platform ID (RPID):** Specifies the DID value that has been assigned to the platform. This is the same DID that is reported by the SATA controller when SATAGC.AIE is set to 1 except that the DID is always reported through this register, regardless if the programming of SATAGC.AIE.

15.2.12 Premium Feature Block (PFB) - Offset C4h

Note: Bits 4-0 are not bit-mapped to individual fuses and/or soft SKU settings; rather FFSATA5& FFSATA 3 /soft sku is used to indicate support for all of these features (check with VSP.PFS). These registers indicate to the Intel Rapid Storage Technology AHCI driver that those premium RAID features that can be supported on the platform.

Type	Size	Offset	Default
MMIO	16 bit	ABAR + C4h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:2	0h RO	**Reserved**
1	0h RO	**Supports Email Alert (SEA):** Read value is the same as VSP.PFS. If set to 1, then this feature is supported as part of the premium feature set.
0	0h RO/V	**Supports OEM IOCTL (SOI):** Read value is the same as VSP.PFS. If set to 1, then this feature is supported as part of the premium feature set.

15.2.13 SW Feature Mask (SFM) - Offset C8h

The following will be programmed by the BIOS when VS_CAP.SFMS == 1. The feature mask is used by SW to determine which non-premium features shall be supported by SW. These register bits are not reset by FLR since they are programmed by BIOS.

Type	Size	Offset	Default
MMIO	16 bit	ABAR + C8h	003Fh

Bit Range	Default & Access	Field Name (ID): Description
15:12	0h RO	**Reserved**
11:10	0h RW/O	**OROM UI Normal Delay. (OROM_UI_NORMAL_DELAY):** Values of these bits specify the delay of the OROM UI Splash Screen in a normal status. 00 = 2 secs (default and previous value); 01 = 4 secs; 10 = 6 secs; 11 = 8 secs. If bit 5 == 0, then these values are disregarded.
9	0h RW/O	**Smart Response Technology. (SMART_RESPONSE_TECHNOLOGY):** If set to '1', then Smart Response Technology is enabled. If cleared to '0', the feature is disabled.
8	0h RW/O	**RRT Only on ESATA (IRRT_ONLY_ON_ESATA):** If set to 1, then only RRT volumes can span internal and external SATA ports (e.g. eSATA). If cleared to 0, then any RAID volume can span internal and external SATA ports (e.g. eSATA).
7	0h RW/O	**LED Locate (LED_LOCATE):** If set to 1, then LED/SGPIO hardware is attached and the ping to locate feature is enabled in the OS.
6	0h RW/O	**HDDUNLOCK:** If set to 1, then HDD password unlock is enabled in the OS.
5	1h RW/O	**OROM UI and BANNER (OROM_UI_AND_BANNER):** If set to 1, then the OROM UI is displayed. When cleared to 0, the OROM UI and BANNER are not displayed if all disks and volumes have a normal status.
4	1h RW/O	**IRRT:** If set to 1, then Rapid Recovery Technology is enabled.
3	1h RW/O	**R5:** If set to 1, then RAID5 is enabled

Bit Range	Default & Access	Field Name (ID): Description
2	1h RW/O	**R10:** If set to 1, then RAID10 is enabled
1	1h RW/O	**R1:** If set to 1, then RAID1 is enabled
0	1h RW/O	**R0:** If set to 1, then RAID0 is enabled

15.3 SATA AIDP Registers Summary

This chapter records SATA AIDP Register.

Base address for this register is defined in SATA PCI register in Bus:0, Device:23 Function:0.

The offset value for this register: 20h

Table 15-3. Summary of SATA AIDP Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
10h	4	AHCI Index Register (INDEX)	00000000h
14h	4	AHCI Data Register (DATA)	00000000h

15.3.1 AHCI Index Register (INDEX) - Offset 10h

This register is only available if CC.SCC is not 01h to index into all memory registers defined in Memory Registers and the message buffer used for enclosure management. If CC.SCC is 01h, these AHCI Index Data Pair registers are not accessible and SINDEX/SDATA register pair shall be used to index into a subset of the memory registers defined in (See Memory Registers for more information on which registers could be indexed).

Type	Size	Offset	Default
MMIO	32 bit	AIDP + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	**Reserved**
18:2	00000h RW	**INDEX:** This Index register is used to select the Dword offset of the Memory Mapped AHCI register to be accessed. A Dword, Word or Byte access is specified by the active byte enables of the I/O access to the Data register.
1:0	0h RO	**Reserved**

15.3.2 AHCI Data Register (DATA) - Offset 14h

This register is index into all memory registers defined in Memory Registers and the message buffer used for enclosure management.

Type	Size	Offset	Default
MMIO	32 bit	AIDP + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DATA:** This Data register is a window through which data is read or written to the memory mapped register pointed to by the Index register. Note that a physical register is not actually implemented as the data is actually stored in the memory mapped registers. Since this is not a physical register, the default value is the same as the default value of the register pointed to by Index.

15.4 SATA MXPBA Registers Summary

Table 15-4. Summary of SATA MXPBA Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	MSI-X Pending Bit Array QW 0 (MXPQW0_DW0)	00000000h

15.4.1 MSI-X Pending Bit Array QW 0 (MXPQW0_DW0) - Offset 0h

MSI-X Pending Bit Array QW 0.

Type	Size	Offset	Default
MMIO	32 bit	MXPBA + 0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO/V	**MSI-X vector Pending (MXVP):** For each Pending Bit that is set, the function has a pending message for the associated MSI-X Table entry. Pending bits that have no associated MSI-X Table entry are reserved. After reset, the state of reserved Pending bits must be 0. Software should never write, and should only read Pending Bits. If software writes to Pending Bits, the result is undefined. Each Pending Bit's state after reset is 0 (no message pending).

16 Host Embedded Controller Interface (HECI)

16.1 HECI Configuration Registers Summary

This chapter records the registers in Bus: 0, Device 22, Function 0, 1, 4 and 5.

DID Values:

- HECI #1:- D22: F0 - 4B70h
- HECI #2:- D22: F1 - 4B71h
- HECI #3:- D22: F4 - 4B74h
- HECI #4:- D22: F5 - 4B75h

Table 16-1. Summary of Bus: 0, Device: 22, Function: 5 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	HECI ID (HECI4_ID)	4B758086h
4h	2	HECI Command (HECI4_CMD)	0000h
6h	2	HECI Status (HECI4_STS)	0010h
8h	4	Revision ID And Class Code (HECI4_RID_CC)	07800000h
Ch	1	Cache Line Size (HECI4_CLS)	00h
Dh	1	Master Latency Timer (HECI4_MLT)	00h
Eh	1	Header Type (HECI4_HTYPE)	80h
Fh	1	Built In Self-Test (HECI4_BIST)	00h
10h	4	HECI MMIO Base Address Low (HECI4_MMIO_MBAR_LO)	00000004h
14h	4	HECI MMIO Base Address High (HECI4_MMIO_MBAR_HI)	00000000h
2Ch	4	Sub System Identifiers (HECI4_SS)	00000000h
34h	4	Capabilities Pointer (HECI4_CAP)	00000050h
3Ch	2	Interrupt Information (HECI4_INTR)	0100h
3Eh	1	Minimum Grant (HECI4_MGNT)	00h
3Fh	1	Maximum Latency (HECI4_MLAT)	00h
40h	4	Host Firmware Status (HECI4_HFS)	00000000h
48h	4	General Status Shadow 1 (HECI4_GS_SHDW1)	00000000h
4Ch	4	Host General Status (HECI4_H_GS1)	00000000h
50h	2	PCI Power Management Capability ID (HECI4_PID)	8C01h
52h	2	PCI Power Management Capabilities (HECI4_PC)	4003h
54h	2	PCI Power Management Control And Status (HECI4_PMCS)	0008h
60h	4	General Status Shadow 2 (HECI4_GS_SHDW2)	00000000h
64h	4	General Status Shadow 3 (HECI4_GS_SHDW3)	00000000h
68h	4	General Status Shadow 4 (HECI4_GS_SHDW4)	00000000h
6Ch	4	General Status Shadow 5 (HECI4_GS_SHDW5)	00000000h
70h	4	Host General Status 2 (HECI4_H_GS2)	00000000h
74h	4	Host General Status 3 (HECI4_H_GS3)	00000000h
8Ch	2	Message Signaled Interrupt Identifiers (HECI4_MID)	A405h
8Eh	2	Message Signaled Interrupt Message Control (HECI4_MC)	0080h
90h	4	Message Signaled Interrupt Message Address (HECI4_MA)	00000000h
94h	4	Message Signaled Interrupt Upper Address (HECI4_MUA)	00000000h
98h	2	Message Signaled Interrupt Message Data (HECI4_MD)	0000h
A0h	1	HECI Interrupt Delivery Mode (HECI4_HIDM)	00h
A4h	4	Vendor Specific Capability Register (HECI4_VSCR)	F0140009h
A8h	4	Vendor Specific Extended Capability Register (HECI4_VSEC)	01400010h
ACh	4	SW LTR Pointer Register (HECI4_SWLTRPTR)	00000000h
B0h	4	Device Idle Pointer Register (HECI4_DEVIDLEPTR)	00008001h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
B4h	2	Device Idle Power On Latency (HECI4_DEVIDLEPOL)	0D38h
B6h	2	DevIdle Power Control Enabled Register (HECI4_PWRCTRLEN)	000Eh
F8h	4	Manufacturer's ID (HECI4_MANID)	00000000h

16.1.1 HECI ID (HECI4_ID) - Offset 0h

Identification

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:22, F:5] + 0h	4B758086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	4B75h RO/V	**Device ID (DID):** Indicates device number assigned by Intel. The upper 9 bits of this field are set by a special sideband message (SetIDValue). The lower 7 bits are set by soft straps. Note that the default value of this field is not 0, but depends on the value of soft straps.
15:0	8086h RO	**Vendor ID (VID):** 16-bit field which indicates Intel is the vendor, assigned by the PCI SIG.

16.1.2 HECI Command (HECI4_CMD) - Offset 4h

Command

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:22, F:5] + 4h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	**Reserved**
10	0h RW	**Interrupt Disable (ID):** Disables this device from generating PCI line based interrupts. This bit does not have any effect on MSI operation.
9	0h RO	**Fast Back-to-Back Enable (FBE):** Not implemented, hardwired to 0.
8	0h RO	**SERR# Enable (SEE):** Not implemented, hardwired to 0.
7	0h RO	**Wait Cycle Enable (WCC):** Not implemented, hardwired to 0.
6	0h RO	**Parity Error Response Enable (PEE):** Not implemented, hardwired to 0.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RO	**VGA Palette Snooping Enable (VAG):** Not implemented, hardwired to 0
4	0h RO	**Memory Write And Invalidate Enable (MWIE):** Not implemented, hardwired to 0.
3	0h RO	**Special Cycle Enable (SCE):** Not implemented, hardwired to 0.
2	0h RW	**Bus Master Enable (BME):** Controls the HECI host controller's ability to act as a system memory master for data transfers. When this bit is cleared, HECI bus master activity stops and any active DMA engines return to an idle condition. This bit is made visible to firmware through the H_PCI_CSR register, and changes to this bit may be configured by the H_PCI_CSR register to generate an MSI to mIA. When this bit is '0', HECI is blocked from generating MSI to the host CPU. Note that this bit does not block HECI accesses to CSE-UMA.
1	0h RW	**Memory Space Enable (MSE):** Controls access to the HECI host controller's memory mapped register space.
0	0h RO	**I/O Space Enable (IOSE):** Not implemented, hardwired to 0.

16.1.3 HECI Status (HECI4_STS) - Offset 6h

Status

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:22, F:5] + 6h	0010h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Detected Parity Error (DPE):** Not implemented, hardwired to 0.
14	0h RO	**Signaled System Error (SSE):** Not implemented, hardwired to 0.
13	0h RO	**Received Master-Abort (RMA):** Not implemented, hardwired to 0.
12	0h RO	**Received Target Abort (RTA):** Not implemented, hardwired to 0.
11	0h RO	**Signaled Target-Abort (STA):** Not implemented, hardwired to 0.
10:9	0h RO	**DEVSEL# Timing (DEVT):** These bits are hardwired to 00.
8	0h RO	**Master Data Parity Error Detected (DPD):** Not implemented, hardwired to 0.
7	0h RO	**Fast Back-to-Back Capable (FBC):** Not implemented, hardwired to 0.
6	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
5	0h RO	**66 MHz Capable (C66):** Not implemented, hardwired to 0.
4	1h RO	**Capabilities List (CL):** Indicates the presence of a capabilities list, hardwired to 1.
3	0h RO/V	**Interrupt Status (IS):** Reflects the state of the INTx# signal at the input of the enable/disable circuit. This bit is a 1 when the INTx# is asserted. This bit is a 0 after the interrupt is cleared (independent of the state of the Interrupt Disable bit in the command register). Note that this bit is not set by an MSI.
2:0	0h RO	**Reserved**

16.1.4 Revision ID And Class Code (HECI4_RID_CC) - Offset 8h

Revision ID And Class Code

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:22, F:5] + 8h	07800000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	07h RO	**Base Class Code (BCC):** Indicates the base class code of the HECI host controller device.
23:16	80h RO	**Sub Class Code (SCC):** Indicates the sub class code of the HECI host controller device.
15:8	00h RO	**Programming Interface (PI):** Indicates the programming interface of the HECI host controller device.
7:0	00h RO/V	**Revision ID (RID):** Indicates stepping of the HECI host controller. This field is set by a special IOSF SB message (SetIDValue).

16.1.5 Cache Line Size (HECI4_CLS) - Offset Ch

Cache Line Size

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:22, F:5] + Ch	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RO	**Cache Line Size (CLS):** Not implemented, hardwired to 0.

16.1.6 Master Latency Timer (HECI4_MLT) - Offset Dh

Master Latency Timer

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:22, F:5] + Dh	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RO	**Master Latency Timer (MLT):** Not implemented, hardwired to 0.

16.1.7 Header Type (HECI4_HTYPE) - Offset Eh

Header Type

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:22, F:5] + Eh	80h

Bit Range	Default & Access	Field Name (ID): Description
7	1h RO	**Multi-Function Device (MFD):** Indicates the HECI host controller is part of a multi-function device.
6:0	00h RO	**Header Layout (HL):** Indicates that the HECI host controller uses a target device layout.

16.1.8 Built In Self-Test (HECI4_BIST) - Offset Fh

Built In Self-Test

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:22, F:5] + Fh	00h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**BIST Capable (BC):** Not implemented, hardwired to 0.
6:0	0h RO	**Reserved**

16.1.9 HECI MMIO Base Address Low (HECI4_MMIO_MBAR_LO) - Offset 10h

HECI MMIO Base Address Low

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:22, F:5] + 10h	00000004h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Low (BA_LO):** Lower 32 bits of base address of register memory space.
11:4	00h RO	**Memory Size (MS):** This field is hardwired to 0 to indicate that HECI device requests 4KB of memory space.
3	0h RO	**PF:** Indicates that this range is not pre-fetchable.
2:1	2h RO	**TP:** Indicates that this range can be mapped anywhere in 64-bit address space.
0	0h RO	**Resource Type Indicator (RTE):** Indicates a request for register memory space.

16.1.10 HECI MMIO Base Address High (HECI4_MMIO_MBAR_HI) - Offset 14h

HECI MMIO Base Address High

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:22, F:5] + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High (BA_HI):** Upper 32 bits of base address of register memory space.

16.1.11 Sub System Identifiers (HECI4_SS) - Offset 2Ch

Sub System Identifiers

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:22, F:5] + 2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O	**Subsystem ID (SSID):** Indicates the subsystem identifier. This field should be programmed by BIOS during boot-up. Once written, this register becomes Read Only.
15:0	0000h RW/O	**Subsystem Vendor ID (SSVID):** Indicates the subsystem vendor identifier. This field should be programmed by BIOS during boot-up. Once written, this register becomes Read Only.

16.1.12 Capabilities Pointer (HECI4_CAP) - Offset 34h

Capabilities Pointer

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:22, F:5] + 34h	00000050h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	50h RO	**Capability Pointer (CP):** Indicates the first capability pointer offset. It points to the PCI power management capability offset.

16.1.13 Interrupt Information (HECI4_INTR) - Offset 3Ch

Interrupt Information

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:22, F:5] + 3Ch	0100h

Bit Range	Default & Access	Field Name (ID): Description
15:8	01h RO/V	**Interrupt Pin (IPIN):** This field indicates the virtual interrupt pin the HECI host controller uses. A value of 0x1/0x2/0x3/0x4 indicates that this function implements legacy interrupt on INTA/INTB/INTC/INTD, respectively. When legacy interrupt is not used this register should be set to 0x0. Programmed by BIOS over IOSF SB through corresponding Private CR register.
7:0	00h RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this field.

16.1.14 Minimum Grant (HECI4_MGNT) - Offset 3Eh

Minimum Grant

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:22, F:5] + 3Eh	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RO	**GNT:** Not implemented, hardwired to 0.

16.1.15 Maximum Latency (HECI4_MLAT) - Offset 3Fh

Maximum Latency

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:22, F:5] + 3Fh	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RO	**LAT:** Not implemented, hardwired to 0.

16.1.16 Host Firmware Status (HECI4_HFS) - Offset 40h

Host Firmware Status

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:22, F:5] + 40h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Firmware Status Host Access (FS_HA):** Indicates current status of the firmware for the HECI controller. This field is the host's read only access to the FS field in the CSE Firmware Status register.

16.1.17 General Status Shadow 1 (HECI4_GS_SHDW1) - Offset 48h

General Status Shadow 1

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:22, F:5] + 48h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**General Status Shadow 1 (GSS1):** This field is host side shadow of CSE General Status 1 (CSE_GS1).

16.1.18 Host General Status (HECI4_H_GS1) - Offset 4Ch

Host General Status

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:22, F:5] + 4Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Host General Status (H_GS1):** General status of Host. This field is not used by hardware.

16.1.19 PCI Power Management Capability ID (HECI4_PID) - Offset 50h

PCI Power Management Capability ID

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:22, F:5] + 50h	8C01h

Bit Range	Default & Access	Field Name (ID): Description
15:8	8Ch RO	**Next Capability (NEXT):** Indicates the location of the next capability item in the list. This is the Message Signaled Interrupts capability.
7:0	01h RO	**Cap ID (CID):** Indicates that this pointer is a PCI power management.

16.1.20 PCI Power Management Capabilities (HECI4_PC) - Offset 52h

PCI Power Management Capabilities

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:22, F:5] + 52h	4003h

Bit Range	Default & Access	Field Name (ID): Description
15:11	08h RO	**PME Support (PSUP):** Indicates the states that can generate PME#. HECI can assert PME# from D3hot only.
10	0h RO	**D2 Support (D2S):** The D2 state is not supported for the HECI host controller.
9	0h RO	**D1 Support (D1S):** The D1 state is not supported for the HECI host controller.
8:6	0h RO	**Aux Current (AUXC):** Reports the maximum Suspend well current required when in the D3COLD state. Value of 0 is reported.
5	0h RO	**Device Specific Initialization (DSI):** Indicates whether device-specific initialization is required.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO	**Reserved**
3	0h RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
2:0	3h RO	**VS:** Indicates support for Revision 1.2 of the PCI Power Management Specification.

16.1.21 PCI Power Management Control And Status (HECI4_PMCS) - Offset 54h

PCI Power Management Control And Status

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:22, F:5] + 54h	0008h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C/V	**PME Status (PMES):** The PME Status bit in HECI space can be set to '1' by CSE FW performing a write into CSE side register to set PMES. This bit is cleared by host CPU writing a '1' to it. CSE cannot clear this bit. Host CPU writes with value '0' have no effect on this bit.
14:9	0h RO	**Reserved**
8	0h RW	**PME Enable (PMEE):** When set, PME_assert and PME_deassert messages are sent over Sideband to PMC based on the PMES bit. When reset these messages may not be sent.
7:4	0h RO	**Reserved**
3	1h RO	**No Soft Reset (NSR):** This bit indicates that when the HECI host controller is transitioning from D3hot to D0 due to power state command, it does not perform an internal reset.
2	0h RO	**Reserved**
1:0	0h RW	**Power State (PS):** This field is used both to determine the current power state of the HECI host controller and to set a new power state. The values are: 00 - D0 state 11 - D3HOT state The D1 and D2 states are not supported for this HECI host controller. If software attempts to write an unsupported, optional state to this field, the write operation must complete normally on the bus; however, the data is discarded and no state change occurs. When in the D3HOT state, the HBA's configuration space is available, but the registers memory space is not. Additionally, interrupts are blocked. This field is visible to firmware through the H_PCI_CSR register, and changes to this field may be configured by the H_PCI_CSR register to generate an MSI to mIA.

16.1.22 General Status Shadow 2 (HECI4_GS_SHDW2) - Offset 60h

General Status Shadow 2

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:22, F:5] + 60h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**General Status Shadow 2 (GSS2):** This field is host side shadow of CSE General Status 2 (CSE_GS2).

16.1.23 General Status Shadow 3 (HECI4_GS_SHDW3) - Offset 64h

General Status Shadow 3

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:22, F:5] + 64h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**General Status Shadow 3 (GSS3):** This field is host side shadow of CSE General Status 3 (CSE_GS3).

16.1.24 General Status Shadow 4 (HECI4_GS_SHDW4) - Offset 68h

General Status Shadow 4

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:22, F:5] + 68h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**General Status Shadow 4 (GSS4):** This field is host side shadow of CSE General Status 4 (CSE_GS4).

16.1.25 General Status Shadow 5 (HECI4_GS_SHDW5) - Offset 6Ch

General Status Shadow 5

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:22, F:5] + 6Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**General Status Shadow 5 (GSS5):** This field is host side shadow of CSE General Status 5 (CSE_GS5).

16.1.26 Host General Status 2 (HECI4_H_GS2) - Offset 70h

Host General Status 2

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:22, F:5] + 70h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Host General Status 2 (H_GS2):** General status of Host. This field is not used by hardware.

16.1.27 Host General Status 3 (HECI4_H_GS3) - Offset 74h

Host General Status 3

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:22, F:5] + 74h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Host General Status 3 (H_GS3):** General status of Host. This field is not used by hardware.

16.1.28 Message Signaled Interrupt Identifiers (HECI4_MID) - Offset 8Ch

Message Signaled Interrupt Identifiers

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:22, F:5] + 8Ch	A405h

Bit Range	Default & Access	Field Name (ID): Description
15:8	A4h RO	**Next Pointer (NEXT):** Indicates the location of the next capability item in the list. This is the DevIdle conventional PCI vendor specific capability.
7:0	05h RO	**Capability ID (CID):** Indicates MSI.

16.1.29 Message Signaled Interrupt Message Control (HECI4_MC) - Offset 8Eh

Message Signaled Interrupt Message Control

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:22, F:5] + 8Eh	0080h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved**
7	1h RO	**64 Bit Address Capable (C64):** Specifies whether capable of generating 64-bit messages.
6:4	0h RO	**Multiple Message Enable (MME):** Not implemented, hardwired to 0.
3:1	0h RO	**Multiple Message Capable (MMC):** Not implemented, hardwired to 0.
0	0h RW	**MSI Enable (MSIE):** If set, MSI is enabled and INTx virtual wires are not used to generate interrupts.

16.1.30 Message Signaled Interrupt Message Address (HECI4_MA) - Offset 90h

Message Signaled Interrupt Message Address

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:22, F:5] + 90h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RW	**ADDR:** Lower 32 bits of the system specified message address, always DW aligned.
1:0	0h RO	**Reserved**

16.1.31 Message Signaled Interrupt Upper Address (HECI4_MUA) - Offset 94h

Message Signaled Interrupt Upper Address

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:22, F:5] + 94h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Upper Address (UADDR):** Upper 32 bits of the system specified message address. This register is optional and only implemented if MC.C64=1.

16.1.32 Message Signaled Interrupt Message Data (HECI4_MD) - Offset 98h

Message Signaled Interrupt Message Data

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:22, F:5] + 98h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW	**DATA:** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the FSB during the data phase of the MSI memory write transaction.

16.1.33 HECI Interrupt Delivery Mode (HECI4_HIDM) - Offset A0h

HECI Interrupt Delivery Mode

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:22, F:5] + A0h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	**Reserved**
2	0h RW/1S/V	**HIDM Lock (HIDM_L):** Writing 1 to this bit locks the HIDM field.
1:0	0h RW/L	**HECI Interrupt Delivery Mode (HIDM):** These bits control what type of interrupt the HECI will send when CSE FW writes to set the CSE_IG bit. They are interpreted as follows: 00 - Generate Legacy or MSI interrupt; 01 - Generate SCI; 10 - Generate SMI; This field may be locked by writing 1 to HIDM_L bit. **Locked by:** HECI4_HIDM.HIDM_L

16.1.34 Vendor Specific Capability Register (HECI4_VSCR) - Offset A4h

Vendor Specific Capability Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:22, F:5] + A4h	F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**Vendor-Specific Capability ID (VSID):** A value of 4'hF in this 4-bit field identifies this Vendor Specific Capability as an Extended Capability, which uses a VSEC 16-bit Extended Capability ID in the subsequent four bytes. This field allows software to differentiate this capability from other Vendor Specific capabilities.
27:24	0h RO	**Vendor Specific Capability Revision (VSREV):** For a VSID of 4'hF, this field is reserved 4'h0.
23:16	14h RO	**Vendor Specific Capability Length (VSLEN):** This field indicates the number of bytes of this Vendor Specific capability as required by the PCI spec inclusive of the CapID and Next Pointer. It has the value of 8'h14 for the DevIdle Capability.
15:8	00h RO	**Next Capability Pointer (NEXT):** Pointer to the configuration offset of the next Capability item. It is 8'h00 since it is the final item in the Capability list.
7:0	09h RO	**Capability ID (CAPID):** The value of 8h09 in this field indicates a Vendor Specific capability.

16.1.35 Vendor Specific Extended Capability Register (HECI4_VSEC) - Offset A8h

Vendor Specific Extended Capability Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:22, F:5] + A8h	01400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	014h RO	**Vendor Specific Extended Capability Length (VSECLEN):** This field indicates the number of bytes of this Vendor Specific capability inclusive of the 1st DW which includes the capability ID and Next pointer. For DevIdle, this is 12'h14.
19:16	0h RO	**Vendor Specific Extended Capability Revision (VSECREV):** For this revision of DevIdle, this field is 4h0.
15:0	0010h RO	**Vendor Specific Extended Capability ID (NEXT):** DevIdle has been assigned the Intel VSEC ID of 16h10.

16.1.36 SW LTR Pointer Register (HECI4_SWLTRPTR) - Offset ACh

Software Latency Tolerance Reporting (LTR) Pointer Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:22, F:5] + ACh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RO	**SW LTR Update MMIO Offset Location (SWLTRLOC):** This register contains the location pointer to the SW LTR register in MMIO space, as an offset from the specified BAR. The value of this register is not valid, if the Valid bit is not set.
3:1	0h RO	**Base Address Register Number (BARNUM):** Contains the 0's based AR Number of the BAR which contains the location of the SW LTR MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number. Bar 0 is the 1st BAR. The value of this register is not valid, if the Valid bit is not set.
0	0h RO	**VALID:** Set to 1'b1 to indicate that the function has implemented a SW LTR register as specified in the DevIdle that can be located using the SWLTRLOC register and BARNUM. Set to 1'b0 to indicate that the function has not implemented a SW LTR register that is compliant to the DevIdle definition. This could be because the function has not implemented SW LTR at all, or has a device specific version of SW LTR.

16.1.37 Device Idle Pointer Register (HECI4_DEVIDLEPTR) - Offset B0h

Device Idle Pointer Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:22, F:5] + B0h	00008001h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000800h RO	**Device Idle MMIO Offset Location (DEVIDLELOC):** This register contains the location pointer to the DevIdle register in MMIO space, as an offset from the specified BAR. The value of this register is not valid, if the Valid bit is not set.
3:1	0h RO	**Base Address Register Number (BARNUM):** Contains the 0's based AR Number of the BAR which contains the location of the SW LTR MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number. Bar 0 is the 1st BAR. The value of this register is not valid, if the Valid bit is not set.
0	1h RO	**VALID:** Set to 1'b1 to indicate that the function has implemented a SW LTR register as specified DevIdle that can be located using the DEVIDLELOC register and BARNUM. Set to 1'b0 to indicate that the function has not implemented a DevIdle register that is compliant to the DevIdle definition. This could be because the function has not implemented SW LTR at all, or has a device specific version of device idle.

16.1.38 Device Idle Power On Latency (HECI4_DEVIDLEPOL) - Offset B4h

Device Idle Power On Latency

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:22, F:5] + B4h	0D38h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	**Reserved**
12:10	3h RW/O	**Power On Latency Scale (POLS):** Latency Scale multiplier: 010: 1us 011: 32us All other settings are reserved (not enforced by HW). The value of this register is multiplied with the Power On Latency Value (POLV) to provide the DevIdle power on exit latency multiplier scale from 1us to 32ms. This register is defined to be RWO (read-write-once) to allow BIOS to set the initial value. This register is undefined if the device idle valid bit is 1'b0.
9:0	138h RW/O	**Power On Latency Value (POLV):** 10-bit value that is multiplied by the Power On Latency Scale. A value of 0 indicates a power on latency of less than 1us. This register is defined to be RWO (read-write-once) to allow BIOS to set the initial value. This register is undefined if the device idle valid bit is 1'b0.

16.1.39 DevIdle Power Control Enabled Register (HECI4_PWRCTRLEN) - Offset B6h

DevIdle Power Control Enabled Register

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:22, F:5] + B6h	000Eh

Bit Range	Default & Access	Field Name (ID): Description
15:6	0h RO	**Reserved**
5	0h RO	**Hardware Autonomous Enable (HAE):** CSE does not support autonomous power gating on idle.
4	0h RO	**Reserved**
3	1h RO	**Sleep Enable (SE):** CSE always asserts the sleep signal during power gating.
2	1h RO	**D3-Hot Enable (D3HEN):** CSE could power gate when idle and the PMCSR[1:0] register in the function =2'b11 (D3).
1	1h RO	**DEVIDLE Enable (DEVIDLEN):** CSE could power gate when idle and the DevIdle register (DevIdleC[2] = 1'b1) is set.
0	0h RO	**PMC Request Enable (PMCRE):** CSE will not power gate due to pmc_ip_sw_pg_req_b = LOW.

16.1.40 Manufacturer's ID (HECI4_MANID) - Offset F8h

Manufacturer's ID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:22, F:5] + F8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/P	**Manufacturers ID Field (MANID)**: Manufacturer ID: Default value comes from straps

16.2 HECI Memory Mapped Registers Summary

Table 16-2. Summary of HECI Memory Mapped Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	Host CB Write Window (HECI4_H_CB_WW)	00000000h
4h	4	Host Control And Status Register (HECI4_H_CSR)	80000000h
8h	4	CSE Circular Buffer Read Window (HECI4_CSE_CB_RW)	FFFFFFFFh
Ch	4	CSE Control And Status Register Host Access (HECI4_CSE_CSR_HA)	80000000h
800h	4	DEVIDLE Control (HECI4_DEVIDLEC)	00000010h

16.2.1 Host CB Write Window (HECI4_H_CB_WW) - Offset 0h

This register is for host to write into its Circular Buffer

Type	Size	Offset	Default
MMIO	32 bit	HECI_MMIO_MBAR + 0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h WO	**Host Circular Buffer Write Window Field (H_CB_WWF):** This field is for host to write into its circular buffer. This field is write only, reads will return arbitrary data. Writes to this register will increment the H_CBWP as long as CSE_RDY is 1. When CSE_RDY is 0, writes to this register have no effect and are not delivered to the H_CB, nor is H_CBWP incremented.

16.2.2 Host Control And Status Register (HECI4_H_CSR) - Offset 4h

This register reports status information about the host circular buffer (H_CB) and allows host software to control interrupt generation.

Note to software: Reserved bits in this register must be set to 0 whenever this register is written.

Type	Size	Offset	Default
MMIO	32 bit	HECI_MMIO_MBAR + 4h	80000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	80h RO	**Host Circular Buffer Depth (H_CBD):** This field indicates the maximum number of 32 bit entries available in the host circular buffer (H_CB). Host software uses this field along with the H_CBRP and H_CBWP fields to calculate the number of valid entries in the H_CB to read or number of entries available for write. Programmer's note: This field is implemented with a '1-hot' scheme. Only one bit will be set to a '1' at a time. Each bit position represents the value n of a buffer depth of (2^n). For example, when bit# 1 is 1, the buffer depth is 2; when bit#2 is 1, the buffer depth is 4, etc. **This field is hardwired to represent** a depth of 128 entries.
23:16	00h RO/V	**Host CB Write Pointer (H_CBWP):** Points to next location in the H_CB for host to write the data. Software uses this field along with H_CBRP and H_CBD fields to calculate the number of valid entries in the H_CB to read or number of entries available for write.
15:8	00h RO/V	**Host CB Read Pointer (H_CBRP):** Points to next location in the H_CB where a valid data is available for embedded controller to read. Software uses this field along with H_CBWR and H_CBD fields to calculate the number of valid entries in the host CB to read or number of entries available for write.
7	0h RO	**Reserved**
6	0h RW/1C/V	**Host DEVIDLEC Interrupt Status (H_DEVIDLEC_IS):** HW sets this bit to 1 when DEVIDLEC.IR is set and DEVIDLEC.CIP transitions from 1 to 0. Host clears this bit to 0 by writing a 1 to this bit position. H_DEVIDLEC_IE has no effect on this bit.
5	0h RW	**Host DEVIDLEC Interrupt Enable (H_DEVIDLEC_IE):** Host sets this bit to 1 to enable the host interrupt (MSI, INTx, SMI or SCI) to be asserted when H_DEVIDLEC_IS is set to 1.
4	0h RW	**Host Reset (H_RST):** Setting this bit to 1 will initiate the HECI reset sequence to get the circular buffers into a known good state for host and CSE communication. When this bit transitions from 0 to 1, hardware will clear the H_RDY and CSE_RDY bits.
3	0h RW/V	**Host Ready (H_RDY):** This bit indicates that the host is ready to process messages.
2	0h RW/V	**Host Interrupt Generate (H_IG):** Once message(s) are written into its CB, the host sets this bit to one for the HW to set the CSE_IS bit in the CSE_CSR and to generate an interrupt message to mIA. HW then clears this bit to 0.
1	0h RW/1C/V	**Host Interrupt Status (H_IS):** HW sets this bit to 1 when CSE_IG bit is set to 1. Host clears this bit to 0 by writing a 1 to this bit position. H_IE has no effect on this bit.
0	0h RW	**Host Interrupt Enable (H_IE):** Host sets this bit to 1 to enable the host interrupt (MSI, INTx, SMI or SCI) to be asserted when H_IS is set to 1.

16.2.3 CSE Circular Buffer Read Window (HECI4_CSE_CB_RW) - Offset 8h

This register is for host to read from the CSE Circular Buffer (CSE_CB)

Type	Size	Offset	Default
MMIO	32 bit	HECI_MMIO_MBAR + 8h	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RO	**CSE Circular Buffer Read Window Field (CSE_CB_RWF):** This bit field is for host to read from the CSE Circular Buffer. This field is read only, writes have no effect. Reads to this register will increment the CSE_CBRP as long as CSE_RDY is 1. When CSE_RDY is 0, reads to this register have no effect, all 1s are returned, and CSE_CBRP is not incremented.

16.2.4 CSE Control And Status Register Host Access (HECI4_CSE_CSR_HA) - Offset Ch

This register allows host software to read the CSE Control Status register (CSE_CSR)

Type	Size	Offset	Default
MMIO	32 bit	HECI_MMIO_MBAR + Ch	80000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	80h RO	**CSE Circular Buffer Depth Host Read Access (CSE_CBD_HRA):** Host read access to CSE_CBD. **This field is hardwired to represent** A depth of 128 entries.
23:16	00h RO/V	**CSE CB Write Pointer Host Read Access (CSE_CBWP_HRA):** Host read only access to CSE_CBWP.
15:8	00h RO/V	**CSE CB Read Pointer Host Read Access (CSE_CBRP_HRA):** Host read only access to CSE_CBRP.
7	0h RO/V	**NMI Status Host Read Access (NMI_STS_HRA):** Host read access to NMI_STS.
6	0h RO	**Reserved**
5	0h RO/V	**Pointer Reset Host Read Access (PTR_RST_HRA):** Host read access to PTR_RST.
4	0h RO/V	**CSE Reset Host Read Access (CSE_RST_HRA):** Host read access to CSE_RST.
3	0h RO/V	**CSE Ready Host Read Access (CSE_RDY_HRA):** Host read access to CSE_RDY.
2	0h RO/V	**CSE Interrupt Generate Host Read Access (CSE_IG_HRA):** Host read only access to CSE_IG.
1	0h RO/V	**CSE Interrupt Status Host Read Access (CSE_IS_HRA):** Host read only access to CSE_IS.
0	0h RO/V	**CSE Interrupt Enable Host Read Access (CSE_IE_HRA):** Host read only access to CSE_IE.

16.2.5 DEVIDLE Control (HECI4_DEVIDLEC) - Offset 800h

This register allows host to configure the power mode using D0i0/D0i3 support

Type	Size	Offset	Default
MMIO	32 bit	HECI_MMIO_MBAR + 800h	00000010h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4	1h RO	**Interrupt Request Capable (IRC):** Set to be always 1'b1 since CSE is capable of generating an interrupt on command completion.
3	0h RO	**Restore Required (RR):** When this bit is set (by HW), SW must restore the state of the IP. This bit is cleared by SW writing a 1. **In CSE this bit is never set so it does not need to be** cleared by SW.
2	0h RW	**DEVIDLE:** SW sets this bit to 1'b1 to move the function into the DevIdle state. Writing this bit to 1'b0 will return the function to the fully active D0 state (D0i0). When this bit changes state, mIA may be interrupted (see H_PCI_CSR.DEVIDLEC_IS register's description).
1	0h RW	**Interrupt Request (IR):** SW sets this bit to 1'b1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this on each write to this register. When this bit is set to 1'b1, Command-in-Progress deassertion is captured in H_CSR. H_DEVIDLEC_IS. If H_CSR.H_DEVIDLEC_IE is 1b1 as well, host interrupt will be initiated.
0	0h RO/V	**CIP:** HW sets this bit on a 1'b1->1'b0 or 1'b0->1'b1 transition of DEVIDLE. While set, the other bits in this register are not valid and it is illegal for SW to write to any bit in this register. HW clears this bit when CSE FW clears its own DevIdle interrupt status bit indicating completion of the DevIdle transition command. When clear, all the other bits in the register are valid and SW may write to any bit. If Interrupt Request (IR) was set for the current command, HW may clear this bit before the interrupt has been made visible to SW, since when SW actually handles a particular interrupt is not visible to the HW. SW writes to this bit have no effect.

17 USB eXtensible Host Controller Interface (xHCI)

17.1 xHCI Configuration Registers Summary

This chapter records the registers in Bus: 0, Device 20, Function 0.

Table 17-1. Summary of Bus: 0, Device: 20, Function: 0 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	2	Vendor ID (VID)	8086h
2h	2	Device ID (DID)	4B7Dh
4h	2	Command Reg (CMD)	0000h
6h	2	Device Status (STS)	0290h
8h	1	Revision ID (RID)	00h
9h	1	Programming Interface (PI)	30h
Ah	1	Sub Class Code (SCC)	03h
Bh	1	Base Class Code (BCC)	0Ch
Dh	1	Master Latency Timer (MLT)	00h
Eh	1	Header Type (HT)	80h
10h	8	Memory Base Address (MBAR)	0000000000000004h
2Ch	2	USB Subsystem Vendor ID (SSVID)	0000h
2Eh	2	USB Subsystem ID (SSID)	0000h
34h	1	Capabilities Pointer (CAP_PTR)	70h
3Ch	1	Interrupt Line (ILINE)	00h
3Dh	1	Interrupt Pin (IPIN)	00h
58h	4	Audio Time Synchronization (AUDSYNC)	00000000h
60h	1	Serial Bus Release Number (SBRN)	31h
61h	1	Frame Length Adjustment (FLADJ)	60h
62h	1	Best Effort Service Latency (BESL)	00h
70h	1	PCI Power Management Capability ID (PM_CID)	01h
71h	1	Next Item Pointer 1 (PM_NEXT)	80h
72h	2	Power Management Capabilities (PM_CAP)	C1C2h
74h	2	Power Management Control/Status (PM_CS)	0008h
80h	1	Message Signaled Interrupt CID (MSI_CID)	05h
81h	1	Next Item Pointer (MSI_NEXT)	90h
82h	2	Message Signaled Interrupt Message Control (MSI_MCTL)	0086h
84h	4	Message Signaled Interrupt Message Address (MSI_MAD)	00000000h
88h	4	Message Signaled Interrupt Upper Address (MSI_MUAD)	00000000h
8Ch	2	Message Signaled Interrupt Message Data (MSI_MD)	0000h
A4h	4	High Speed Configuration 2 (HSCFG2)	00003800h

17.1.1 Vendor ID (VID) - Offset 0h

Vendor ID.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:20, F:0] + 0h	8086h

Bit Range	Default & Access	Field Name (ID): Description
15:0	8086h RO	**Vendor ID (VID):** Vendor ID

17.1.2 Device ID (DID) - Offset 2h

Device ID.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:20, F:0] + 2h	4B7Dh

Bit Range	Default & Access	Field Name (ID): Description
15:0	4B7Dh RO/V	**Device ID (DID):** See Global Device ID table for value

17.1.3 Command Reg (CMD) - Offset 4h

Command Reg.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:20, F:0] + 4h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	**Reserved**
10	0h RW	**Interrupt Disable (INTR_DIS):** When cleared to 0, the function is capable of generating interrupts. When 1, the function cannot generate its interrupt to the interrupt controller. Note that the corresponding Interrupt Status bit is not affected by the interrupt enable.
9	0h RO	**Fast Back to Back Enable (FBE):** Fast Back to Back Enable
8	0h RW	**SERR# Enable (SERR):** When set to 1, the XHC is capable of generating (internally) SERR#.
7	0h RO	**Wait Cycle Control (WCC):** Wait Cycle Control
6	0h RW	**Parity Error Response (PER):** When set to 1, the XHCI Host Controller will check for correct parity (on its internal interface) and halt operation when bad parity is detected during the data phase as recommended by the XHCI specification. Note that this applies to both requests and completions from the system interface. This bit must be set in order for the parity errors to generate SERR#.
5	0h RO	**VGA Palette Snoop (VPS):** VGA Palette Snoop

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO	**Memory Write Invalidate (MWI):** Memory Write Invalidate
3	0h RO	**Special Cycle Enable (SCE):** Special Cycle Enable
2	0h RW	**Bus Master Enable (BME):** When set, it allows XHC to act as a bus master. When cleared, it disables XHC from initiating transactions on the system bus.
1	0h RW	**Memory Space Enable (MSE):** This bit controls access to the XHC Memory Space registers. If this bit is set, accesses to the XHC registers are enabled. The Base Address register for the XHC should be programmed before this bit is set.
0	0h RO	**I/O Space Enable (IOSE):** Reserved

17.1.4 Device Status (STS) - Offset 6h

Device Status.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:20, F:0] + 6h	0290h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C	**Detected Parity Error (DPE):** This bit is set by the Intel PCH whenever a parity error is seen on the internal interface to the XHC host controller, regardless of the setting of bit 6 or bit 8 in the Command register or any other conditions. Software clears this bit by writing a 1 to this bit location.
14	0h RW/1C	**Signaled System Error (SSE):** This bit is set by the Intel PCH whenever it signals SERR# (internally). The SERR_EN bit (bit 8 in the Command Register) must be 1 for this bit to be set. Software clears this bit by writing a 1 to this bit location.
13	0h RW/1C	**Received Master-Abort Status (RMA):** This bit is set when XHC, as a master, receives a master-abort status on a memory access. This is treated as a Host Error and halts the DMA engines. Software clears this bit by writing a 1 to this bit location.
12	0h RW/1C	**Received Target Abort Status (RTA):** This bit is set when XHC, as a master, receives a target abort status on a memory access. This is treated as a Host Error and halts the DMA engines. Software clears this bit by writing a 1 to this bit location.
11	0h RW/1C	**Signaled Target-Abort Status (STA):** This bit is used to indicate when the XHC function responds to a cycle with a target abort.
10:9	1h RO	**DEVSEL# Timing Status (DEVT):** This 2-bit field defines the timing for DEVSEL# assertion. Read-Only.
8	0h RW/1C	**Master Data Parity Error Detected (MDPED):** This bit is set by the Intel PCH whenever a data parity error is detected on an XHC read completion packet on the internal interface to the XHC host controller and bit 6 of the Command register is set to 1. Software clears this bit by writing a 1 to this bit location.

Bit Range	Default & Access	Field Name (ID): Description
7	1h RO	**Fast Back-to-Back Capable (FBBC):** Reserved
6	0h RO	**User Definable Features (UDF):** Reserved
5	0h RO	**66 MHz Capable (MC):** Reserved
4	1h RO	**Capabilities List (CL):** Hardwired to 1 indicating that offset 34h contains a valid capabilities pointer.
3	0h RO/V	**Interrupt Status (INTR_STS):** This read-only bit reflects the state of this function's interrupt at the input of the enable/disable logic. This bit is a 1 when the interrupt is asserted. This bit will be 0 when the interrupt is deasserted. The value reported in this bit is independent of the value in the Interrupt Enable bit.
2:0	0h RO	**Reserved**

17.1.5 Revision ID (RID) - Offset 8h

Revision ID.

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:20, F:0] + 8h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RO/V	**Revision ID (RID)**

17.1.6 Programming Interface (PI) - Offset 9h

Programming Interface.

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:20, F:0] + 9h	30h

Bit Range	Default & Access	Field Name (ID): Description
7:0	30h RO	**Programming Interface (PI):** A value of 30h indicates that this USB Host Controller conforms to the XHCI specification.

17.1.7 Sub Class Code (SCC) - Offset Ah

Sub Class Code.

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:20, F:0] + Ah	03h

Bit Range	Default & Access	Field Name (ID): Description
7:0	03h RO	**Sub Class Code (SCC):** A value of 03h indicates that this is a Universal Serial Bus Host Controller.

17.1.8 Base Class Code (BCC) - Offset Bh

Base Class Code.

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:20, F:0] + Bh	0Ch

Bit Range	Default & Access	Field Name (ID): Description
7:0	0Ch RO	**Base Class Code (BCC):** A value of 0Ch indicates that this is a Serial Bus controller.

17.1.9 Master Latency Timer (MLT) - Offset Dh

Master Latency Timer.

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:20, F:0] + Dh	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RO	**Master Latency Timer (MLT):** Because the XHC controller is internally implemented with arbitration on an internal interface, it does not need a master latency timer. The bits will be fixed at 0.

17.1.10 Header Type (HT) - Offset Eh

Header Type.

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:20, F:0] + Eh	80h

Bit Range	Default & Access	Field Name (ID): Description
7	1h RO	**Multi-Function Bit (MFB):** Read only indicating single function device.
6:0	00h RO	**Configuration layout (CL):** Hardwired to 0 to indicate a standard PCI configuration layout.

17.1.11 Memory Base Address (MBAR) - Offset 10h

Value in this register will be different after the enumeration process.

Type	Size	Offset	Default
PCI	64 bit	[B:0, D:20, F:0] + 10h	0000000000000004h

Bit Range	Default & Access	Field Name (ID): Description
63:16	0000000000000h RW	**Base Address (BA):** Bits (63:16) correspond to memory address signals (63:16), respectively. This gives 64 KB of relocatable memory space aligned to 64 KB boundaries.
15:4	0h RO	**Reserved**
3	0h RO	**PREFETCHABLE:** This bit is hardwired to 0 indicating that this range should not be prefetched.
2:1	2h RO	**MBAR_TYPE:** If this field is hardwired to 00 it indicates that this range can be mapped anywhere within 32-bit address space. If this field is hardwired to 10 it indicates that this range can be mapped anywhere within 64-bit address space.
0	0h RO	**Resource Type Indicator (RTE):** This bit is hardwired to 0 indicating that the base address field in this register maps to memory space

17.1.12 USB Subsystem Vendor ID (SSVID) - Offset 2Ch

This register is modified and maintained by BIOS.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:20, F:0] + 2Ch	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW/L	**USB Subsystem Vendor ID (SSVID):** This register, in combination with the USB Subsystem ID register, enables the operating system to distinguish each subsystem from the others. Writes to this register are controlled by the Access Control bit (ACCTRL). **Locked by:** XHCC1.ACCTRL

17.1.13 USB Subsystem ID (SSID) - Offset 2Eh

This register is modified and maintained by BIOS.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:20, F:0] + 2Eh	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW/L	**USB Subsystem ID (SSID):** BIOS sets the value in this register to identify the Subsystem ID. This register, in combination with the Subsystem Vendor ID register, enables the operating system to distinguish each subsystem from other(s). Writes to this register are controlled by the Access Control bit (ACCTRL). **Locked by:** XHCC1.ACCTRL

17.1.14 Capabilities Pointer (CAP_PTR) - Offset 34h

Capabilities Pointer.

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:20, F:0] + 34h	70h

Bit Range	Default & Access	Field Name (ID): Description
7:0	70h RO	**Capabilities Pointer (CAP_PTR):** This register points to the starting offset of the capabilities ranges.

17.1.15 Interrupt Line (ILINE) - Offset 3Ch

Interrupt Line.

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:20, F:0] + 3Ch	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW	**Interrupt Line (ILINE):** This data is not used by the Intel PCH. It is used as a scratchpad register to communicate to software the interrupt line that the interrupt pin is connected to.

17.1.16 Interrupt Pin (IPIN) - Offset 3Dh

This register is modified and maintained by BIOS.

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:20, F:0] + 3Dh	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW/L	**Interrupt pin (IPIN):** Bits 7:0 reflect the Interrupt Pin assigned to the host controller by the platform (and are hardwired). **Locked by:** XHCC1.ACCTRL

17.1.17 Audio Time Synchronization (AUDSYNC) - Offset 58h

This 32 bit register is used for audio stream synchronization across different devices. Global signal sample_now captures a value in AUDSYNC register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:0] + 58h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:16	0000h RO/V	**Captured Frame List Current Index/Frame Number (CMFI):** The value in this register is updated in response to sample_now signal. Bits (29:16) reflect state of bits (13:0) of FRINDEX
15:13	0h RO	**Reserved**
12:0	0000h RO/V	**Captured Micro-frame BLIF (CMFB):** The value is updated in response to sample_now signal and provides information about offset within micro-frame. Captured value represents number of 8 high-speed bit time units from start of micro-frame. At the beginning of micro-frame captured value will be 0 and increase to maximum value at the end. Default maximum value is 7499 but it may be changed as result of adjustment done in FLA.

17.1.18 Serial Bus Release Number (SBRN) - Offset 60h

Serial Bus Release Number.

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:20, F:0] + 60h	31h

Bit Range	Default & Access	Field Name (ID): Description
7:0	31h RO	**Serial Bus Release Number (SBRN):** A value of 30h indicates that this controller follows USB release 3.0.

17.1.19 Frame Length Adjustment (FLADJ) - Offset 61h

This feature is used to adjust any offset from the clock source that generates the clock that drives the SOF counter. When a new value is written into these six bits, the length of the frame is adjusted. Its initial programmed value is system dependent based on the accuracy of hardware USB clock and is initialized by system BIOS. This register should only be modified when the HChalted bit in the USBSTS register is a one. Changing value of this register while the host controller is operating yields undefined results.

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:20, F:0] + 61h	60h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Reserved**
6	1h RO	**No Frame Length Timing Capability (NO_FRAME_LENGTH_TIMING_CAP):** This flag is set to 1 to indicate that the host controller does not support a programmable Frame Length Timing Value field.
5:0	20h RO	**Frame Length Timing Value (FLTV):** SOF micro-frame length) is equal to 59488 + value in this field. The default value is decimal 32 (20h), which gives a SOF cycle time of 60000. Frame Length (number of High Speed bit times) FLADJ Value (decimal) (decimal) 59488 0 (00h) 59504 1 (01h) 59520 2 (02h) ... 59984 31 (1Fh) 60000 32 (20h) ... 60480 62 (3Eh) 60496 63 (3Fh) Each decimal value change to this register corresponds to 16 high-speed bit times. The SOF cycle time (number of SOF counter clock periods to generate a SOF micro-frame length) is equal to 59488 + value in this field. The default value is decimal 32 (20h), which gives a SOF cycle time of 60000. Frame Length (# High Speed bit times) FLADJ Value

17.1.20 Best Effort Service Latency (BESL) - Offset 62h

Best Effort Service Latency.

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:20, F:0] + 62h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0h RW/L	**Default Best Effort Service Latency Deep (DBESLD):** Default Best Effort Service Latency (DBESLD) If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESLD field. This is programmed by BIOS based on platform parameters. **Locked by:** XHCC1.ACCTRL
3:0	0h RW/L	**Default Best Effort Service Latency (DBESL):** If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESL field. This is programmed by BIOS based on platform parameters. **Locked by:** XHCC1.ACCTRL

17.1.21 PCI Power Management Capability ID (PM_CID) - Offset 70h

PCI Power Management Capability ID.

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:20, F:0] + 70h	01h

Bit Range	Default & Access	Field Name (ID): Description
7:0	01h RO	**PCI Power Management Capability ID (PM_CID):** A value of 01h indicates that this is a PCI Power Management capabilities field.

17.1.22 Next Item Pointer 1 (PM_NEXT) - Offset 71h

This register is modified and maintained by BIOS.

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:20, F:0] + 71h	80h

Bit Range	Default & Access	Field Name (ID): Description
7:0	80h RW/L	**Next Item Pointer 1 (PM_NEXT):** This register defaults to 80h, which indicates that the next capability registers begin at configuration offset 80h. This register is writable when the Access Control bit is set to '0'. This allows BIOS to effectively hide the next capability registers, if necessary. This register should only be written during system initialization before the plug-and-play software has enabled any master-initiated traffic. Values of: 80h implies next capability is MSI 00h implies that MSI capability is hidden. Note: This value is never expected to be programmed. **Locked by:** XHCC1.ACCTRL

17.1.23 Power Management Capabilities (PM_CAP) - Offset 72h

Normally, this register is read-only to report capabilities to the power management software. In order to report different power management capabilities depending on the system in which the Intel PCH is used, the write access to this register is controlled by the Access Control bit (ACCTRL). The value written to this register does not affect the hardware other than changing the value returned during a read.

This register is modified and maintained by BIOS.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:20, F:0] + 72h	C1C2h

Bit Range	Default & Access	Field Name (ID): Description
15:11	18h RW/L	**PME_SUPPORT:** This 5-bit field indicates the power states in which the function may assert PME#. The Intel PCH XHC does not support the D1 or D2 states. For all other states, the Intel PCH XHC is capable of generating PME#. Software should never need to modify this field. However, the ability to change this field may prove useful for some systems. **Locked by:** XHCC1.ACCTRL
10	0h RW/L	**D2_SUPPORT:** The D2 state is not supported. **Locked by:** XHCC1.ACCTRL
9	0h RW/L	**D1_SUPPORT:** The D1 state is not supported. **Locked by:** XHCC1.ACCTRL
8:6	7h RW/L	**AUX_CURRENT:** The Intel PCH XHC reports 375mA maximum Suspend well current required when in the D3cold state. This value can be written by BIOS when a more accurate value is known. **Locked by:** XHCC1.ACCTRL
5	0h RW/L	**DSI:** The Intel PCH reports 0, indicating that no device-specific initialization is required. **Locked by:** XHCC1.ACCTRL
4	0h RO	**Reserved**
3	0h RW/L	**PME Clock (PMECLOCK):** The Intel PCH reports 0, indicating that no PCI clock is required to generate PME#. **Locked by:** XHCC1.ACCTRL
2:0	2h RW/L	**VERSION:** The Intel PCH reports 010, indicating that it complies with Revision 1.1 of the PCI Power Management Specification. **Locked by:** XHCC1.ACCTRL

17.1.24 Power Management Control/Status (PM_CS) - Offset 74h

Power Management Control/Status.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:20, F:0] + 74h	0008h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C	**PME_STATUS:** This bit is set when the Intel PCH XHC would normally assert the PME# signal independent of the state of the PME_En bit. Writing a 1 to this bit will clear it and cause the internal PME to deassert (if enabled). Writing a 0 has no effect. This bit must be explicitly cleared by the operating system each time the operating system is loaded.
14:13	0h RO	**DATA_SCALE:** The Intel PCH hardwires these bits to 00 because it does not support the associated Data register.
12:9	0h RO	**DATA_SELECT:** The Intel PCH hardwires these bits to 0000 because it does not support the associated Data register.
8	0h RW	**PME_EN:** A 1 enables the Intel PCH XHC to generate an internal PME signal when PME_Status is 1. This bit must be explicitly cleared by the operating system each time it is initially loaded.
7:4	0h RO	**Reserved**
3	1h RO	**No Soft Reset (NSR):** No_Soft_Reset - When set ("1"), this bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits. Transition from D3hot to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled.
2	0h RO	**Reserved**
1:0	0h RW	**POWERSTATE:** This 2-bit field is used both to determine the current power state of XHC function and to set a new power state. The definitions of the field values are: 00b - D0 state 11b - D3hot state If software attempts to write a value of 10b or 01b in to this field, the write operation must complete normally, however, the data is discarded and no state change occurs. When in the D3hot state, the Intel PCH must not accept accesses to the XHC memory range, but the configuration space must still be accessible. Software should wait for 100ms before requesting the xHCI controller to re-enter D3 after a D3 exit.

17.1.25 Message Signaled Interrupt CID (MSI_CID) - Offset 80h

Message Signaled Interrupt CID.

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:20, F:0] + 80h	05h

Bit Range	Default & Access	Field Name (ID): Description
7:0	05h RO	**Capability ID (CID):** Indicates that this is an MSI capability

17.1.26 Next Item Pointer (MSI_NEXT) - Offset 81h

Next Item Pointer.

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:20, F:0] + 81h	90h

Bit Range	Default & Access	Field Name (ID): Description
7:0	90h RW/L	**Next Pointer (NEXT_POINTER):** Indicates that this is the last item on the capability list **Locked by:** XHCC1.ACCTRL

17.1.27 Message Signaled Interrupt Message Control (MSI_MCTL) - Offset 82h

Message Signaled Interrupt Message Control.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:20, F:0] + 82h	0086h

Bit Range	Default & Access	Field Name (ID): Description
15:9	0h RO	**Reserved**
8	0h RO	**Per-Vector Masking Capable (PVM):** Specifies whether controller supports MSI per vector masking. Not supported
7	1h RO	**64 Bit Address Capable (C64):** Specifies whether capable of generating 64-bit messages. This device is 64-bit capable.

Bit Range	Default & Access	Field Name (ID): Description
6:4	0h RW	**Multiple Message Enable (MME):** Indicates the number of messages the controller should assert. This device supports multiple message MSI.
3:1	3h RO	**Multiple Message Capable (MMC):** Indicates the number of messages the controller wishes to assert. This field must be set by HW to reflect the number of Interrupters supported. Encoding number of Vectors requested (number of Interrupters) 000 1 001 2 010 4 011 8 100 16 101 32 110-111 Reserved
0	0h RW	**MSI Enable (MSIE):** If set to 1, MSI is enabled and the traditional interrupt pins are not used to generate interrupts. If cleared to 0, MSI operation is disabled and the traditional interrupt pins are used.

17.1.28 Message Signaled Interrupt Message Address (MSI_MAD) - Offset 84h

Message Signaled Interrupt Message Address.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:0] + 84h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RW	**ADDR:** Lower DW of system specified message address, always DWORD aligned
1:0	0h RO	**Reserved**

17.1.29 Message Signaled Interrupt Upper Address (MSI_MUAD) - Offset 88h

Message Signaled Interrupt Upper Address.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:0] + 88h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Upper Addr (UPPERADDR):** Upper DW of system specified message address.

17.1.30 Message Signaled Interrupt Message Data (MSI_MD) - Offset 8Ch

Message Signaled Interrupt Message Data.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:20, F:0] + 8Ch	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW	**DATA:** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word (PCI AD(15:0)) during the data phase of the MSI memory write transaction. The Multiple Message Enable field (bits 6-4 of the Message Control register) defines the number of low order message data bits the function is permitted to modify to generate its system software allocated vectors. For example, a Multiple Message Enable encoding of 010 indicates the function has been allocated four vectors and is permitted to modify message data bits 1 and 0 (a function modifies the lower message data bits to generate the allocated number of vectors). If the Multiple Message Enable field is 000, the function is not permitted to modify the message data.

17.1.31 High Speed Configuration 2 (HSCFG2) - Offset A4h

High Speed Configuration 2.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:0] + A4h	00003800h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	**Reserved**
18	0h RW	**PORT1_HOST_MODE_OVERRIDE:** When set, this bit causes the Host_Device mux on port 1 to be forced into the Host mode.
17:16	0h RW	**EUSB2SEL:** The two bits are associate with USB2 ports 1 - bit 16 and 2 - bit 2 0: Port is mapped to USB2 1: Port is mapped to eUSB2

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**HS ASYNC Active IN Mask (HSAAIM):** Determines if the Async Active will mask/ignore IN EP s. 0 HS ASYNC Active will include IN EP s. 1 HS ASYNC Active will mask/ignore IN EP s.
14	0h RW	**HS OUT ASYNC Active Polling EP Mask (HSOAAPEPM):** Determines if the Async Active for OUT HS/FS/LS masks/ignores EP s that are polling/PINGing (HS) due to NAK. 0 HS OUT ASYNC Active will include EP s that are polling. 1 HS OUT ASYNC Active will mask/ignore EP s that are polling.
13	1h RW	**HS IN ASYNC Active Polling EP Mask (HSIAAPEPM):** Determines if the Async Active for IN HS/FS/LS masks/ignores EP s that are polling due to NAK. 0 HS IN ASYNC Active will include EP s that are polling. 1 HS IN ASYNC Active will mask/ignore EP s that are polling.
12:11	3h RW	**HS INTR IN Periodic Active Policy Control (HSIIPAPC):** Controls how the HS INTR IN periodic active is used to generate the global periodic active. This will determine how the smallest service interval among active EP s and number of active EP s are used. 0 HS INTR IN periodic active will be used to generate periodic active if Service Interval Threshold OR Numb of EP Threshold values meet the requirement. 1 HS INTR IN periodic active will be used to generate periodic active if Service Interval Threshold AND Numb of EP Threshold values meet the requirement. 2 Always allow HS INTR EP s to be used in the generation of the global Periodic Active indication. 3 Never allow HS INTR EP s to be used in the generation of the global Periodic Active indication.
10:4	00h RW	**HS INTR IN Periodic Active Num of EP Threshold (HSIIPANEPT):** Defines the threshold used to determine if Periodic Active may include HS/FS/LS INTR IN EP active indication. If there are more than NumEPThreshold active HS/FS/LS INTR EP s then they may be included as part of the periodic active generation.
3:0	0h RW	**HS INTR IN Periodic Active Service Interval Threshold (HSIIPASIT):** Defines the Service Interval threshold used to determine if Periodic Active will include HS/FS/LS INTR IN EP active indication. If there are any active HS/FS/LS INTR EP s with a service interval less than or equal to this threshold then they may be included as part of the periodic active generation.

17.2 xHCI Memory Mapped Registers Summary

Table 17-2. Summary of xHCI Memory Mapped Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	1	Capability Registers Length (CAPLENGTH)	80h
2h	2	Host Controller Interface Version Number (HCIVERSION)	0110h
4h	4	Structural Parameters 1 (HCSPARAMS1)	10000840h
8h	4	Structural Parameters 2 (HCSPARAMS2)	14200054h
Ch	4	Structural Parameters 3 (HCSPARAMS3)	00A0000Ah
10h	4	Capability Parameters (HCCPARAMS)	20007FC1h
14h	4	Doorbell Offset (DBOFF)	00003000h
18h	4	Runtime Register Space Offset (RTSOFF)	00002000h
80h	4	USB Command (USBCMD)	00000000h
84h	4	USB Status (USBSTS)	00000001h
88h	4	Page Size (PAGESIZE)	00000001h
94h	4	Device Notification Control (DNCTRL)	00000000h
98h	4	Command Ring Low (CRCR_LO)	00000000h
9Ch	4	Command Ring High (CRCR_HI)	00000000h
B0h	4	Device Context Base Address Array Pointer Low (DCBAAP_LO)	00000000h
B4h	4	Device Context Base Address Array Pointer High (DCBAAP_HI)	00000000h
B8h	4	Configure Reg (CONFIG)	00000000h
480h	4	Port Status AndControl USB2 (PORTSC1)	000002A0h
484h	4	Port Power Management Status Aand Control USB2 (PORTPMSC1)	00000000h
48Ch	4	Port X Hardware LPM Control Register (PORTHLPMC1)	00000000h
2000h	4	Microframe Index (RTMFINDEX)	00000000h
2020h	4	Interrupter Management (IMAN0)	00000000h
2024h	4	Interrupter Moderation (IMOD0)	00000FA0h
2028h	4	Event Ring Segment Table Size (ERSTSZ0)	00000000h
2030h	4	Event Ring Segment Table Base Address Low (ERSTBA_LO0)	00000000h

17.2.1 Capability Registers Length (CAPLENGTH) - Offset 0h

This register is modified and maintained by BIOS.

Type	Size	Offset	Default
MMIO	8 bit	MBAR + 0h	80h

Bit Range	Default & Access	Field Name (ID): Description
7:0	80h RW/L	**Capability Registers Length (CAPLENGTH):** Capability Registers Length (CAPLENGTH) **Locked by:** XHCC1.ACCTRL

17.2.2 Host Controller Interface Version Number (HCIVERSION) - Offset 2h

This register is modified and maintained by BIOS.

Type	Size	Offset	Default
MMIO	16 bit	MBAR + 2h	0110h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0110h RW/L	**Host Controller Interface Version Number (HCIVERSION):** Host Controller Interface Version Number (HCIVERSION) **Locked by:** XHCC1.ACCTRL

17.2.3 Structural Parameters 1 (HCSPARAMS1) - Offset 4h

This register is modified and maintained by BIOS.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 4h	10000840h

Bit Range	Default & Access	Field Name (ID): Description
31:24	10h RW/L	**Number of Ports (MAXPORTS):** Number of Ports (MaxPorts): The value in this field reflects the highest numbered port in the controller, not the actual count of the number of ports. This allows for gaps in the port numbering, between USB2 and USB3 protocol capabilities. **Locked by:** XHCC1.ACCTRL
23:19	0h RO	**Reserved**
18:8	008h RW/L	**Number of Interrupters (MAXINTRS):** Number of Interrupters (MaxInt) **Locked by:** XHCC1.ACCTRL
7:0	40h RW/L	**Number of Device Slots (MAXSLOTS):** Number of Device Slots (MaxSlots) **Locked by:** XHCC1.ACCTRL

17.2.4 Structural Parameters 2 (HCSPARAMS2) - Offset 8h

This register is modified and maintained by BIOS.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 8h	14200054h

Bit Range	Default & Access	Field Name (ID): Description
31:27	02h RW/L	**Max Scratchpad Buffers LO (MAXSCRATCHPADBUFS):** Max Scratchpad Buffers Lo (MaxScratchpadBufs) **Locked by:** XHCC1.ACCTRL
26	1h RW/L	**Scratchpad Restore (SPR):** Scratchpad Restore (SPR) **Locked by:** XHCC1.ACCTRL
25:21	01h RW/L	**Max Scratchpad Buffers HI (MAXSCRATCHPADBUFS_HI):** Max Scratchpad Buffers Hi (MaxScratchpadBufs) **Locked by:** XHCC1.ACCTRL
20:8	0h RO	**Reserved**
7:4	5h RW/L	**Event Ring Segment Table Max (ERSTMAX):** Event Ring Segment Table Max (ERSTMax) **Locked by:** XHCC1.ACCTRL
3:0	4h RW/L	**Isochronous Scheduling Threshold (IST):** Isochronous Scheduling Threshold (IST) **Locked by:** XHCC1.ACCTRL

17.2.5 Structural Parameters 3 (HCSPARAMS3) - Offset Ch

This register is modified and maintained by BIOS.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + Ch	00A0000Ah

Bit Range	Default & Access	Field Name (ID): Description
31:16	00A0h RW/L	**U2 Device Exit Latency (U2DEL):** U2 Device Exit Latency (U2DEL) **Locked by:** XHCC1.ACCTRL
15:8	0h RO	**Reserved**
7:0	0Ah RW/L	**U1 Device Exit Latency (U1DEL):** U1 Device Exit Latency (U1DEL) **Locked by:** XHCC1.ACCTRL

17.2.6 Capability Parameters (HCCPARAMS) - Offset 10h

This register is modified and maintained by BIOS.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 10h	20007FC1h

Bit Range	Default & Access	Field Name (ID): Description
31:16	2000h RW/L	**xHCI Extended Capabilities Pointer (XECP):** xHCI Extended Capabilities Pointer (xECP): The Default value should be 2008h if NumUSB2 = 0 **Locked by:** XHCC1.ACCTRL
15:12	7h RW/L	**Maximum Primary Stream Array Size (MAXPSASIZE):** Maximum Primary Stream Array Size (MaxPSASize) **Locked by:** XHCC1.ACCTRL
11	1h RW/L	**Contiguous Frame ID Capability (CFC):** Contiguous Frame ID Capability (CFC) **Locked by:** XHCC1.ACCTRL
10	1h RW/L	**Stopped EDLTA Capability (SEC):** Stopped EDLTA Capability (SEC) **Locked by:** XHCC1.ACCTRL
9	1h RW/L	**Stopped - Short Packet Capability (SPC):** Stopped - Short Packet Capability (SPC) **Locked by:** XHCC1.ACCTRL
8	1h RW/L	**Parse All Event Data (PAE):** Parse All Event Data (PAE) **Locked by:** XHCC1.ACCTRL
7	1h RW/L	**No Secondary SID Support (NSS):** No Secondary SID Support (NSS) **Locked by:** XHCC1.ACCTRL
6	1h RW/L	**Latency Tolerance Messaging Capability (LTC):** Latency Tolerance Messaging Capability (LTC) **Locked by:** XHCC1.ACCTRL
5	0h RW/L	**Light HC Reset Capability (LHRC):** Light HC Reset Capability (LHRC) **Locked by:** XHCC1.ACCTRL
4	0h RW/L	**Port Indicators (PIND):** Port Indicators (PIND) **Locked by:** XHCC1.ACCTRL
3	0h RW/L	**Port Power Control (PPC):** Port Power Control (PPC) **Locked by:** XHCC1.ACCTRL
2	0h RW/L	**Context Size (CSZ):** Context Size (CSZ) **Locked by:** XHCC1.ACCTRL
1	0h RW/L	**BW Negotiation Capability (BNC):** BW Negotiation Capability (BNC) **Locked by:** XHCC1.ACCTRL
0	1h RW/L	**64-bit Addressing Capability (AC64):** 64-bit Addressing Capability (AC64) **Locked by:** XHCC1.ACCTRL

17.2.7 Doorbell Offset (DBOFF) - Offset 14h

Doorbell Offset.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 14h	00003000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000C00h RO	**Doorbell Array Offset (DBAO):** Doorbell Array Offset (DBAO)
1:0	0h RO	**Reserved**

17.2.8 Runtime Register Space Offset (RTSOFF) - Offset 18h

Runtime Register Space Offset.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 18h	00002000h

2:0	0h RW	**L1 Status (L1S):** Note: This register is sticky.

17.2.20 Port X Hardware LPM Control Register (PORTHLPMC1) - Offset 48Ch

This register is reset only by platform hardware during cold reset or in response to a Host Controller Reset (HCRST).

The definition for the fields depend on the protocol supported. For USB3 this register is reserved and shall be treated by software as RsvdP. For USB2 the definition is given below. Fields contain parameters necessary for xHC to automatically generate an LPM Token to the downstream device.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 48Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13:10	0h RW	**Host Initiated Resume Duration-Deep (HIRDD):** System software sets this field to indicate to the recipient device how long the xHC will drive resume if an exit from L1. The HIRDD value is encoded as follows: 0h: 50 us (default) 1h: 125 us 2h: 200 us ... Fh: 1.175ms The value of 0h is interpreted as 50 us. Each incrementing value adds 75 us to the previous value.
9:2	00h RW/P	**L1 Timeout (L1_TO):** Timeout value for L1 inactivity timer. This field shall be set to 00h by assertion of PR to '1'. Following are permissible values: 00h: 128 us (default) 01h: 256 us. ... FFh: 65,280us Note: This register is sticky.
1:0	0h RW/P	**Host Initiated Resume Duration Mode (HIRDM):** Indicates which HIRD value should be used. Following are permissible values: 0: Initiate L1 using HIRD only time out (default) 1: Initiate HIRDDon timeout. If rejected by device, initiate L1 using HIRD 2,3: Reserved Note: This register is sticky.

17.2.21 Microframe Index (RTMFINDEX) - Offset 2000h

Microframe Index.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 2000h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13:0	0000h RO	**Microframe Index (IMAN0):** Microframe Index

17.2.22 Interrupter Management (IMAN0) - Offset 2020h

There are 8 IMAN registers.

x = 1, 2, ..., 8

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 2020h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**

17.2.101 Door Bell (DB23) - Offset 305Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 305Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**DB Stream ID (DSI):** DB Stream ID
15:8	0h RO	**Reserved**
7:0	00h RW	**DB Target (DT):** DB Target

17.2.102 Door Bell (DB24) - Offset 3060h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 3060h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**DB Stream ID (DSI):** DB Stream ID
15:8	0h RO	**Reserved**
7:0	00h RW	**DB Target (DT):** DB Target

17.2.103 Door Bell (DB25) - Offset 3064h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 3064h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**DB Stream ID (DSI):** DB Stream ID
15:8	0h RO	**Reserved**
7:0	00h RW	**DB Target (DT):** DB Target

17.2.104 Door Bell (DB26) - Offset 3068h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 3068h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**DB Stream ID (DSI):** DB Stream ID
15:8	0h RO	**Reserved**
7:0	00h RW	**DB Target (DT):** DB Target

17.2.105 Door Bell (DB27) - Offset 306Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 306Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**DB Stream ID (DSI):** DB Stream ID
15:8	0h RO	**Reserved**
7:0	00h RW	**DB Target (DT):** DB Target

17.2.106 Door Bell (DB28) - Offset 3070h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 3070h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**DB Stream ID (DSI):** DB Stream ID

7:0	00h RW	**DB Target (DT):** DB Target

17.2.117 Door Bell (DB39) - Offset 309Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 309Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**DB Stream ID (DSI):** DB Stream ID
15:8	0h RO	**Reserved**
7:0	00h RW	**DB Target (DT):** DB Target

17.2.118 Door Bell (DB40) - Offset 30A0h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 30A0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**DB Stream ID (DSI):** DB Stream ID
15:8	0h RO	**Reserved**
7:0	00h RW	**DB Target (DT):** DB Target

17.2.119 Door Bell (DB41) - Offset 30A4h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 30A4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**DB Stream ID (DSI):** DB Stream ID
15:8	0h RO	**Reserved**
7:0	00h RW	**DB Target (DT):** DB Target

17.2.120 Door Bell (DB42) - Offset 30A8h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 30A8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**DB Stream ID (DSI):** DB Stream ID
15:8	0h RO	**Reserved**
7:0	00h RW	**DB Target (DT):** DB Target

17.2.121 Door Bell (DB43) - Offset 30ACh

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 30ACh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**DB Stream ID (DSI):** DB Stream ID
15:8	0h RO	**Reserved**
7:0	00h RW	**DB Target (DT):** DB Target

17.2.122 Door Bell (DB44) - Offset 30B0h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 30B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**DB Stream ID (DSI):** DB Stream ID
15:8	0h RO	**Reserved**
7:0	00h RW	**DB Target (DT):** DB Target

17.2.123 Door Bell (DB45) - Offset 30B4h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 30B4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**DB Stream ID (DSI):** DB Stream ID
15:8	0h RO	**Reserved**
7:0	00h RW	**DB Target (DT):** DB Target

17.2.124 Door Bell (DB46) - Offset 30B8h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 30B8h	00000000h

8	1h RW	**Turn on scratch_pad_en (TO_SCRATCH_PAD_EN):** Cmd Mgr: Enables scratch pad function
7	0h RW	**Scheduler Host Control Reg (STOP_SCH_UNCON):** Enable check to stop scheduling on port that is not connected
6	1h RW	**Disable 1 pack scheduling limit when ISO pending in present microframe (DIS_SCH_LIMIT):** Disable 1 pack scheduling limit when ISO pending in present microframe
5:4	0h RW	**scheduler sort pattern (SCH_SORT_PATTERN):** 00 (default) search ISO ahead of interrupt within each service interval 01 - search USB2-ISO, USB3-ISO, USB2-Interrupt, USB3-Interrupt within each service interval 10 - search strictly by interval 11 - search all ISO intervals ahead interrupt intervals and within each interval, USB2 ahead of USB3
3	0h RW	**Enable TTE overlap prevention on interrupt OUT EPs (at cost of possible service interval slip (EN_TTE_OVERLAP_PREV_OUT):** Enable TTE overlap prevention on interrupt OUT EPs (at cost of possible service interval slip

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Enable TTE overlap prevention on interrupt IN EPs (at cost of possible service interval slip (EN_TTE_OVERLAP_PREV_IN):** Enable TTE overlap prevention on interrupt IN EPs (at cost of possible service interval slip
1	0h RW	**Disable TRM active IN EP valid check function (DIS_TRM_ACT_IN_VALID):** Disable TRM active IN EP valid check function
0	0h RW	**Disable poll delay function (DIS_POLL_DELAY):** Scheduler: Disable poll delay function

17.2.161 Power Management Control (PMCTRL_REG) - Offset 80A4h

Power Management Control.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 80A4h	492D5094h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Async PME Source Enable (ASYNC_PME_SRC_EN):** This field allows the async PME source to be allowed to generate PME. This is specifically required for SOCs that do not allow for any clock other than RTC to be available during RTD3.
30	1h RW	**Legacy PME Source Enable (LEGACY_PME_SRC_EN):** This field allows the legacy PME source to be used in PME generation. The legacy source in reference to the source prior to the RTD3 changes.
29	0h RW	**Reset Warn Power Gate Trigger Disable (RESET_WARN_PWR_GATE_TRIGGER_DISABLE):** This field controls the actions taken for due to reset warn. 0 - Reset Warn will trigger a HW autonomous Power Gate 1 - Reset Warn will not trigger a HW autonomous Power Gate
28	0h RW	**CLR_PME_FLAG_PULSE_AUX_CCLK:** Internal PME flag Clear This Write-Only bit can be used to clear the internal PME flag. SW writes to 1 will clear the PME flag. SW writes to 0 will have no effect and be ignored by the controller. Read always return 0
27	1h RW	**Disable RTD3 power gating when in D3 (DIS_D3_PG):** Disable RTD3 power gating when in D3 and context save operation is not performed
26	0h RW	**XLFPSCOUNTSRC:** XLFPSCOUNTSRC (Source for LFPS OFF Counter) 0: Central RTC Counter for LFPS detection 1: Local Counter for LFPS detection
25	0h RW	**XELFPSRTC:** XELFPSRTC (Enable LFPS Filtering on RTC) 0: Use Oscillator clock for LFPS Filtering during P3 1: Use RTC Clock for LFPS Filtering during P3

Bit Range	Default & Access	Field Name (ID): Description
24	1h RW	**XMPHYSPGDD0I2:** XMPHYSPGDD0I2 (ModPhy Sus Well Power Gate Disable for D0I2) 0: Modphy sus well power gating enabled 1: Modphy sus well power gating disabled
23	0h RW	**XMPHYSPGDD0I3:** XMPHYSPGDD0I3 (ModPhy Sus Well Power Gate Disable for D0I3) 0: Modphy sus well power gating enabled 1: Modphy sus well power gating disabled
22	0h RW	**XMPHYSPGDRTD3:** XMPHYSPGDRTD3 (ModPhy Sus Well Power Gate Disable for RTD3) 0: Modphy sus well power gating enabled 1: Modphy sus well power gating disabled
21:18	Bh RW	**XD3RTCPTTM:** XD3RTCPTTM (D3 RTC Port Timer Tick Multiplier) This register will be the multiplication factor for determining Wake Detection Frequency and RXDET based on the XD3RTCPTTC value. If XD3RTCPTTC is 9h and this register is Bh, frequency for RXDET and H8EXIT detection while MODPHY SUS Power gating is enabled would be 99ms.
17	0h RW	**U3 LFPS Periodic Sampling ON Time Control (U3_LFPS_PRDC_SAMPLING_ON_TIME_CTRL):** This field controls the ON time for the LFPS periodic sampling for USB3 ports. 0 ON time is 2 rtc clocks 1 ON time is 3 rtc clocks Note: This field is ignored if USB3 PHY SUS Well Power Gating is enabled.
16	1h RW	**AON LFPS Detector Enable Mode (AON_LFPS_DETECTOR_EN_MODE):** 1 - Allow the LFSP Detector in AON to own LFPS detection when the port is in PS3 for U2/U3 - not RxD regardless of port ownership. 0 - Allow the LFPS Detector in AON to own the LFPS detection only when the AON owns the port and in U2/U3 - not RxD
15:8	50h RW	**SS U3 LFPS Detection Threshold (SS_U3_LFPS_DETECTION_THRESHOLD):** This field controls the threshold used to determine when a valid U3 Wake is detected through when using the unfiltered LFPS source. The value on this field will reflect the binary count required to have been detected on the counter being clocked by the unfiltered lfps source to result in a valid U3 wake detection.
7:4	9h RW	**SS_U3_LFPS_PRDC_SAMPLING_OFFTIME_CTRL:** This field controls the OFF time for the LFPS periodic sampling for USB3 Ports 0x0 periodic sampling is disabled. 0x1 OFF time is 1ms 0x2 OFF time is 2ms 0xF OFF time is 15ms The ON Time is determined by the amount of time required to reliably determine if there is a valid LFPS and is HW implementation specific. A speed up mode shall be implemented where this field is in units of us. i.e. 0x1 = 1 us OFF time, 0x2 = 2 us OFF time, etc.
3	0h RW	**PS3 LFPS Source Select (PS3_LFPS_SRC_SEL):** 0 LFPS Source is unfiltered 1 LFPS Source is filtered (Rx-Elec-Idle) LFPS Source is Rx-Elec-Idle for any non PS3 state.

Bit Range	Default & Access	Field Name (ID): Description
2	1h RW	**XHCI Engine Autonomous Power Gate Exit Reset Policy (XHC_AUTO_PWRGATE_EXITRST_POLICY):** Controls when the xHCI engine is brought out of reset due to a power ungate. 0 Engine is brought out of reset when D3 to D0 is triggered. This allows for a quick power up sequence while leaving the virtual PCIe LTSSM in L23 is power ungate is not due to D3 to D0. 1 Engine is brought out of reset along with the rest of the IP. This is required for PMC save/restore flow.
1	0h RW	**USB2 Port Wake Unit Coupling Policy (USB2_PORT_WAKE_COUPLING_POLICY):** Controls the trigger for USB2 Port Wake Units to initiate Port Level Power Off Preparation. 0 RTD3 triggered 1 - Port Triggered when in L1, L2 or Disabled, Disconnected
0	0h RW	**USB3 Port Wake Unit Coupling Policy (USB3_PORT_WAKE_COUPLING_POLICY):** Controls the trigger for USB3 Port Wake Units to initiate Port Level Power Off Preparation. 0 - RTD3 Triggered 1 - Port Triggered when in PS3 due to RxDetect, U3, U2 or Disabled

17.2.162 Host Controller Misc Reg (HOST_CTRL_MISC_REG) - Offset 80B0h

Host Controller Misc Reg.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 80B0h	0080037Fh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**USB2_LTRUPDT_DIS:** This controls the inclusion of the USB2 LTR based on link state. Setting this bit will disable USB2 LTR and will expose a NO Requirement from USB2 thus not impacting the aggregated LTR value for the controller.
30	0h RW	**USB2 Line State Debounce During Port Reset Policy (USB2_LINE_STATE_DEBOUNCE_DURING_PORT_RESET_POLICY):** This register controls how the debounce is enforced during the Port Reset phase. 0 do not enable the line state debounce during port reset. 1 enable the line state debounce during port reset.
29	0h RW	**TTE PEXE Credit Fix Disable (TTE_PEXE_CREDIT_FIX_DISABLE):** When set, it disables a fix implemented to re-deem PEXE credits when a port is disconnected
28	0h RW	**TTE Scheduling policy (TTE_SCHEDULING_POLICY):** This register controls a fix made to prevent over-scheduling by not account for 188B in each uFrame. Setting this bit will disable the fix and allow for over-scheduling.

Bit Range	Default & Access	Field Name (ID): Description
27	0h RW	**USB3 ITP Delta Timer Source Select (USB3_ITP_DELTA_TIMER_SOURCE_SELECT):** This register selects the source for the delta timer tracking used for ITP generation. 0 the source is a 16.666 ns tick generated from a crystal reference clock 1 - the source is a 16.666 ns tick generated from the aux_cclk. This field needs to remain in sync with Frame Timer Source Select to ensure the are both set or both cleared. There is no support for any other combination.
26	0h RW	**Frame Timer Source Select (FRAME_TIMER_SOURCE_SELECT):** This register controls the source for the frame timer. 0 the source for the frame timer is a crystal reference clock 1 the source for the frame timer is the aux_cclk.
25	0h RW	**uFrame Masking Enable (UFRAME_MASKING_ENABLE):** If set, enables the uFrame tick to be masked due to ports being in U3/NC. This controls a fix made to disable the auto masking of uFrame tick due to port state w/o any pipeline idle condition. When cleared, it rely on gating of frame timer due to proper port state and idleness tracking from the pipeline.
24	0h RW	**Late FID Check Disable (LATE_FID_CHECK_DISABLE):** This register disables the Late FID Check performed when starting an ISOCH stream.
23	1h RW	**Late FID TTE count adjust Disable (DIS_LATE_FID_TTE_CNT_ADJ):** 0 the value of frame late skip count starts at 1 for TTE eps and 0 for non tte eps. this represents an adjustment for the number of SI missed 1 the value of frame late skip count starts at 0 for both TTE eps and non tte eps
22	0h RW	**Late FID difference calculation legacy (DIS_DIF_CAL_LEGACY):** 0 late uframeid uses the new difference calculation to compute how may SI the TD is late 1 late uframeid uses the legacy difference calculation to compute how may SI the TD is late
21	0h RW	Reserved
20	0h RW	Reserved
19	0h RW	**USB2 Resume Cx Inhibit Disable (USB2_RESUME_CX_INHIBIT_DISABLE):** Controls if USB2 L1 Resume is allowed to contribute to DMA Active which will inhibit Cx state. 0 USB2 L1 Resume is allowed to inhibit Cx via DMA Active 1 USB2 L1 Resume is NOT allowed to inhibit Cx via DMA Active When cleared, Cx will only be inhibited when the DMA traffic for the port begins.
18	0h RW	**LATE_FID_TTE_DIS:** Late FID TTE Disable 0: Late Frame ID Check is enabled for TTE Endpoints 1: Late Frame ID Check is disabled for TTE Endpoints

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**Late FID uframe Check Disable (LATE_FID_UFRAME_CHK_DIS):** 0 Frame ID Match only asserts in uframe 7 for non-TTE Endpoints Frame before match 1 Frame ID Match can assert in any uframe
16	0h RW	**Late FID Extra Interval (LATE_FID_EXTRA_INTER):** This register controls the extra number of intervals added onto the advancing of late FID check essentially a bias used to correct for possible errors in implementation
15:0	037Fh RW	**Valid Isoch Scheduling Range (VALID_ISOCH_SCHEDULING_RANGE):** This register defines the window in milliseconds from the current Frame that will be considered for scheduling in an upcoming Frame. Anything scheduled outside of this window will be considered as late and will trigger the Missed Service Error.

17.2.163 Host Controller Misc Reg2 (HOST_CTRL_MISC_REG2) - Offset 80B4h

Host Controller Misc Reg2.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 80B4h	10000184h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RW	**MAX_SHORT_PKT_ADV_CNT:** Short Packet Advance Throttling 0 - Limit SPA to 4 TRB's 1 - Limit SPA to 16 TRB's 2 - limit SPA to 64 TRB's 3 - limit SPA to 128 TRB's 4 - limit SPA to 512 TRB's 5 - limit SPA to 1024 TRB's 6 - limit SPA to 2048 TRB's 7 - Disabled
28	1h RW	Reserved

26	0h RW	Reserved
25	0h RW	**LTM_BELT_VALID_CLR:** ltm_belt_valid_clr
24	0h RW	**CFG_TRM_DROP_SCH_REQ_DIS:** cfg_trm_drop_sch_req_dis
23	0h RW	**CFG_TRM_DROP_TTE_REQ_DIS:** cfg_trm_drop_tte_req_dis

Bit Range	Default & Access	Field Name (ID): Description
22	0h RW	**CFG_TRM_EDTLA_CLR_DIS:** cfg_trm_edtla_clr_dis
21	0h RW	**CFG_XFER_IS_SERVE_CHK_EN:** Enable checking is_serve condition in XFER, mainly for undoing fix if needed
20	0h RW	**CFG_CPL_NPKT0_FC_DIS:** Set low to allow receiving ACK with NUMP>0 to bring the TRM out of Remote Flow Control
19:18	0h RO	**Reserved**
17	0h RW	**Disable IDT credit leak fix (CFG_DIS_ODMA_IDT_CRD_LEAK_FIX):** Disable the IDT credit leak fix in odma. 0 Fix is enabled 1 Fix is disabled
16	0h RW	**CFG_IDMA_TTYPE_CHK_DIS:** Set to disable packet Transfer Type checking in IDMA
15	0h RW	**HC Reset Controller Isolation Disable (HCRST_CTRL_ISOL_DISABLE):** Setting this bit to 1 will disable the HC Reset based quiescing/isolation flow
14	0h RW	**DISABLE_IDMA_PERF_FIX:** Fix is enabled by default 0 - fix is enabled 1 - fix is disabled
13	0h RW	**EN_HH_FRINDEX_NOT_RUN:** enable_hh_frindex_not_run
12	0h RW	Reserved
11	0h RW	Reserved
10	0h RW	Reserved
9	0h RW	**EN_100MS_WATCH_DOG_TIMER:** 100ms Watch Dog Timer When set, it will enable 100ms Watch Dog Timer for Aux PM FSM for phystatus assertion else watch dog timer is 300ms.
8	1h RW	**EN_WATCH_DOG_TIMER:** Enable Watch Dog Timer: When set, it will enable 100/300ms watch dog timer for AUX PM FSM for phystatus assertion
7	1h RW	**EN_SSP_ISOC_PIPELINING:** enable isoc pipelining feature for ssp devices 1:enable the feature 0:disable the feature
6	0h RW	**DISABLE_TCG_UNGATE_ON_FLUSH:** When set, it will ungate the trunk clock gating for PIPE clock when there is flush when DBC/EXI HHH is not idle.
5	0h RW	**DISABLE_VNN_FRAME_TIMER:** Frame Timer Select This register defines the frame timer used for all frame timer derived ticks. 0 - Frame timer in the VNN is the source for all frame timer related tracking. 1 - Frame timer in the Gated VNN is the source for all frame timer related tracking.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	**DISABLE_CLR_CCS_ON_CAS_SET:** Clear CCS on CAS When set, XHCI port will not clear the CAS when CCS is set. (BUGDE 5076358)
3	0h RW	**DISABLE_RHUB_PARK_AT_DBCDISC:** On Default Enables Root Hub s/m to arc to DBC_DISCONNECTED from ERROR and RESET states if the reason to enter into those state was a prior connection failure to exchange Link Capabilities Set 1 Keep the Root hub s/m in ERROR or RESET as the case may be , on a successful connection as a DBC if the first attempt was failed due to PortConfigTimeout
2	1h RW	**DISABLE_BLOCK_WPR_ON_DISPORTS:** Warm Port Reset on Disconnected Port Disable When set, disables the generation of a WPR on a disconnected port.
1:0	0h RW	**HOST_CTRL_MISC_REG2_1_0:** Reserved

17.2.164 Super Speed Port Enable (SSPE_REG) - Offset 80B8h

Super Speed Port Enable.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 80B8h	C0000000h

Bit Range	Default & Access	Field Name (ID): Description
31	1h RW	**SS_CFG_BLOCK_PWRDWN_4_ACT_LFPS:** Delay power down entry if Rx LFPS is active. Setting this bit will block the controllers power down entry seq (for Sx/D3/D0i2 etc) if Rx LFPS is active. The power down entry will happen once a device stops sending LFPS.
30	1h RW	**DIS_CLR_CCS_4_HCRESET:** Enable Clearing of CCS for HCReset - Setting this bit clears the USB3 ports PORTSC.CCS bit upon HCReset.
29	0h RW	**DISABLE_RAWLFPS_BASED_WAKE_FIX:** Disable Raw Lfps Detection Based Wake from P3 This bit is used to disable RTL fix provided to separate RawLFPS and RxElecIDle detection 0: Transition port to RESUME based on raw LFPS detection 1: Transition port to RESUME based Filtered RxElecIdle detection

Bit Range	Default & Access	Field Name (ID): Description
28	0h RW	**EXI OVERRIDE DISABLE (EXI_OVERRIDE_DIS):** EXI Override Disable
27:4	0h RO	**Reserved**
3:0	0h RW	**SSPE_REG:** USB3 Port Enable This field controls whether SuperSpeed capability is enabled for a given USB3 port. When set to 1, Enables SS termination Enables PORTSC to see the connects on the ports. When set to 0, Disables SS termination Blocks PORTSC from reporting attach/connect. Places port in the lowest power state.

17.2.165 AUX Power Management Control (AUX_CTRL_REG1) - Offset 80E0h

AUX Power Management Control.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 80E0h	8080BCE0h

Bit Range	Default & Access	Field Name (ID): Description
31	1h RW	**D3 Hot function enable register (D3_HOT_FXN_EN):** This bit is from pin input which is set 1. But it allows software to alter it if it is needed. 1: D3 hot enabled 0: D3 hot not able.
30	0h RW	**Allow L1 Core Clock Gating (ALL_L1_CORE_CG):** When set to 1 allows core clock being gated during L1 state.
29	0h RW	**Allow Engine PHY Status Extension (AL_EP_SEXT):** When set to 1 allows the engine to extend PHY status of PCIe PIPE for one more cycle. This is due to the fact that our rate change function has a potential of not being able to sample the phystatus signal.
28	0h RW	**Allow Engine PCIe Rate Change Passing (ALL_EP_RCP):** When set to 1 allows the engine to pass PCIe rate change signal as it is from PCIe core to PCIe PHY.
27	0h RW	**Allow Engine PERST Fundamental Reset (AL_PERST_FRST):** When set to 1 allow engine to treat PERST# as a fundamental reset
26	0h RW	**Overwrite PCIe P2 to P1 (OVR_PCIE_P2_P1):** When set to 1 will overwrite a PCIe powerdown state of P2 to P1.
25	0h RW	**Set Internal SSV 1 (SET_ISSV_1):** When set to 1 set the internal SSV to 1.
24	0h RW	**Clear Internal SSV 0 (CLR_ISSV_0):** When set to 1 clear the internal SSV to 0.

Bit Range	Default & Access	Field Name (ID): Description
23	1h RW	**Enable save_restore_enable SW Loading (EN_SRE_SW_LD):** This is a bit that enables the save_restore_enable signal being loaded when a software command has set Save bit. This is a debug function.
22	0h RO	**Reserved**
21	0h RW	**Force save_restore 1 (FORCE_SR1):** When set to 1, it will force the save_restore flag to 1. This flag is an bit to ensure that have masked the update during low power state. If software write this bit to 1, it must write it to 0 in order to resume the normal save and restore function.
20	0h RW	**CFG DISABLE_WARM_RST_DET_specUpPorts (CFG_DIS_WRSTDET_SPECU):** 0: Speculative upstream for Debug and SS/SSP port will detect WPR 1: No speculative upstream till port configuration is completed
19	0h RW	**cfg iob drivestrength[1] (CIDS1):** Controls the drive strength of the IO buffer
18	0h RW	**cfg iob drivestrength[0] (CIDS0):** Controls the drive strength of the IO buffer
17	0h RW	**CFG_DIS_ARC_RXDP3:** When set to '1' DIsables arc to RXDET_p3 on disc from U2P3/U3
16	0h RW	**cfg clk gate dis (CCGD):** 1: Disable USB3 port clock gating 0: Enable USB3 port clock gating
15	1h RW	**Enable CFG RXDET P3 (EN_CFG_RDP3):** When set to '1' enable cfg rxdet p3
14	0h RW	**Enable CFG PIPE Reset (EN_CFG_PIPE_RST):** When set to '1' enable cfg pipe rst
13	1h RW	**Enable Filter TX Idle (EN_FILT_TX_IDLE):** When set to 1 enables a filter function to TX electrical idle signal at PCie PIPE. There have a filter that will set TXelecidle signal of PCIe PIPE to 1 whenever in isolation state or power down transition states.
12	1h RW	**Enable Host Engine Generate PME (EN_HE_GEN_PME):** This is a global switch to whether or not able this host engine to generate PME message.
11	1h RW	**Enable Isolation (EN_ISOL):** When set to '1' enable isolation
10	1h RW	**Enable L1 Caused P2 Overwrite (EN_L1_P2_OVR):** Set 1 to enable a new feature. This new feature is designed to use L1 as a state to identify whether it should do P2 Overwrite or not. It used to use P1 state to identify whether or not to invoke P2 overwrite function.
9	0h RW	**Enable Core Clock Gating (EN_CORE_CG):** When set to '1' disable core clock gating based on low power state entered
8	0h RW	**Enable PHY Status Timeout (EN_PHY_STS_TO):** When set to '1' enable PHY status timeout function which is designed to cover the PCIePHY issue that may have not able to detect the PHY status toggle.
7	1h RW	**Ignore aux_pm_en PCIe Core (IGN_APE_PC):** When set to '1' ignore the aux_pm_en reg from PCIe core to continue the remote wake/clock switching support
6	1h RW	**Enable P2 Overwrite P1 (EN_P2_OVR_P1):** When set to '1' enable P2 overwrite P1 when PCIe core has indicated the transition from P0 to P1. This is to enable entering the even lower power state.

Bit Range	Default & Access	Field Name (ID): Description
5	1h RW	**Enable P2 Remote Wake (EN_P2_REM_WAKE):** When set 1 '1' enable the remote wake function by allowing P2 clock/switching and P2 entering
4:1	0h RW	**Forced PM State (FORCED_PM_STATE):** Forced PM state
0	0h RW	**Initiate Force PM State (INIT_FPMS):** When set to '1' force PM state to go to the state indicated in bit 4:1

17.2.166 SuperSpeed Port Link Control (HOST_CTRL_PORT_LINK_REG) - Offset 80ECh

SuperSpeed Port Link Control.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 80ECh	18020C00h

Bit Range	Default & Access	Field Name (ID): Description
31:27	03h RW	**Force LTSSM State (FORCE_LTSSM_ST):** LTSSM state to be forced This value is for test purpose only.
26	0h RW	**Direct Link LTSSM State (DL_LTSSM_ST):** 0: Normal operation mode 1: Direct link to a specific state specified by bit 31:27 This bit is for test purpose only. It shall be written 0 in normal operation mode.
25	0h RW	**Direct Link To U0 (DL_U0):** 0: Normal operation mode 1: Direct link to U0 This bit is for test purpose only. It shall be written 0 in normal operation mode.
24:21	0h RW	**Forced Compliance Pattern (FORCED_CMP_PAT):** Compliance pattern to be forced to enter compliance mode This value is for test purpose only.
20	0h RW	**Enable Link Error Slave Count (EN_LES_CNT):** 0: Disable link error slave count 1: Enable link error slave count
19	0h RW	**TS rcv to complete U1/U2/U3 exit LFPS handshake (TS_RCV_UX_EXIT_LFPS_HS):** 1: enable TS receive to complete U1/U2/U3 exit LFPS handshake 0: disable TS receive to complete U1/U2/U3 exit LFPS handshake
18	0h RW	**EN_LOGIC_TO_EXIT_POLLCONF_AND_RECCONF:** 1: enable logic idle receive to exit Polling.Configuration and Recovery.Configuration 0: disable logic idle receive to exit Polling.Configuration and Recovery.Configuration
17	1h RW	**PORT_INTIL_TIMEOUT_VAL:** This bit specifies the port initialization timeout value. 1: 20us - 21us 0: 19us - 20us

Bit Range	Default & Access	Field Name (ID): Description
16:15	0h RW	**PHY Low Power Latency (PHY_LP_LAT):** This field defines the latency to drive the PHY to enter low power mode 0: 4 cycles 1: 8 cycles 2: 16 cycles 3: 32 cycles
14:12	0h RW	**Link Recovery Minimum Time (LR_MIN_TM):** This value defines the minimum time for the link to stay in Recovery.Active other than from U3. The granuity is 128us.
11:9	6h RW	**Link Polling Minimum Time (LP_MIN_TM):** This value defines the minimum time for the link to stay in Polling.Active and Recovery.Active from U3. The granuity is 128us.
8	0h RW	**Force Link Accept PM Command (FORCE_LA_PMC):** 0: Normal operation mode 1: Force link to accept power management command
7	0h RW	**Direct Link Recovery U0 (DL_REC_U0):** 0: Normal operation mode 1: Direct link to Recovery from U0
6	0h RW	**Link Fast Training Mode (LINK_FTM):** 0: Normal operation mode 1: Link fast training mode This bit should be written 0 in normal operation.
5	0h RW	**Disable Link Scrambler (DIS_LINK_SCRAM):** 0: Enable link scrambler 1: Disable link scrambler
4	0h RW	**Direct Link U3 From U0 (DL_U3_U0):** 0: Normal operation mode 1: Direct link to U3 from U0 This bit is for test purpose only. It shall be written 0 in normal operation mode.
3	0h RW	**Direct Link U3 From U0 (DL_U2_U0):** 0: Normal operation mode 1: Direct link to U2 from U0 This bit is for test purpose only. It shall be written 0 in normal operation mode.
2	0h RW	**Direct Link U3 From U0 (DL_U1_U0):** 0: Normal operation mode 1: Direct link to U1 from U0 This bit is for test purpose only. It shall be written 0 in normal operation mode.
1	0h RW	**Enable Link Loopback Master Mode (EN_LINK_LB_MAST):** 0: Disable link loopback master mode 1: Enable link loopback master mode
0	0h RW	**Disable Link Compliance Mode (DIS_LINK_CM):** 0: Enable link compliance mode 1: Disable link compliance mode

17.2.167 USB2 Port Link Control 1 (USB2_LINK_MGR_CTRL_REG1) - Offset 80F0h

These set of registers is used to control key USB set of timers. They are spread over 4 registers each 32 bits wide.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 80F0h	314803A0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	31h RW	**FS/LS Mode SE0 Disconnect Delay[7:0] (FSLS_SE0_DIS_DEL_7_0):** # of microseconds of SE0 in FS/LS mode to register disconnect had occurred.
23	0h RW	**EN_SNPS_PHY_FIX:** Enable SNPS PHY Fix: 1: When set, term select will assert at the start of EOR. Fslsserialmode will also deassert at the same clock as txenb. 0: Legacy behavior for Intel PHY.
22	1h RW	**EN_L1_DISC_IN_L0:** Enable Pseudo L0 state when transition from L1 to L2 due to disconnect: 1: When set, {L1 suspendm, L2 suspendm} will go from 01->11->10 to allow the USB2 PHY to exit L1 and enter L2 for deeper PM 0: Legacy behavior (01->10)
21	0h RW	**DIS_PURGE_ON_SETUP_FIX:** To disable the fix for SETUP purge that match for both device address and endpoint number: 0: Only allow purge for SETUP when both device address and endpoint number are matched. 1: Revert back to old behavior that purge is allowed when either device address or endpoint number is matched.
20	0h RW	**L1_EXIT_RECOVERY_MODE:** Mode for extended L1 Exit recovery delay: 0: 12us 1: 50us
19	1h RW	**L1_TO_INCR_MODE:** Mode select for L1 Timeout increments: 0: time out increments is in 125us 1: L1 Timeout increments are in 256us. For additional details , USB2 PORTHLPMC.L1 Timeout in XHCI Spec.
18	0h RO	**Reserved**
17	0h RW	**EN_DETECT_NOMINAL_PKT_EOP:** 0: Detect minimal packet EOP. 1: Detect nominal packet EOP.
16	0h RW	**Disable Chirp Response (DIS_CHIRP_RESPONSE):** 0: Normal 1: Force full speed on host ports (disable chirp response)
15	0h RW	**Disable 192 Byte Limit Check (DIS_192B_LIM):** 0: Enforce 192 byte limit on complete-split INs. Treat any packet) 192 as babble case. 1: Disable 192 byte limit check.
14	0h RW	**External Provided FS/LS Disconnect (EXT_FSLS_DIS):** 0: Internal FS/LS Disconnect from linestate(1:0) 1: External provided FS/LS Disconnect from hostdisconnect input

Bit Range	Default & Access	Field Name (ID): Description
13:12	0h RW	**UTMI Reset Source Select (UTMI_RST_SEL):** Select UTMI Reset Source (FRD UTMI Reset Only) 00: HCReset or Force PHY Reset or internal reset after disconnect/suspend for restart (default) 01,11: UTMI reset = ~UTMI suspendm 10: UTMI reset = ~UTMI suspendm and synchronization to port clk.
11	0h RW	**Disable HS Disconnect Window (DIS_HS_DIS_WIN):** 0: Enable HS Disconnect Window Function 1: Disable HS Disconnect Window Function
10	0h RW	**Disable Port Error Detection (DIS_PERR_DET):** 0: Enable Port Error Detection (default) 1: Disable Port Error Detection
9	1h RW	**Disable Peek Function for ISO-OUT (DIS_PF_IOUT):** 0: Enable Peek function for ISO-OUT (default) 1: Disable Peek function for ISO-OUT
8	1h RW	**Drive Resume-K FS/LS Serial Interface (DRV_RESK_FSLS_SER):** 0: Drive Resume-K on parallel Interface 1: Drive Resume-K directly on FS/LS Serial Interface (default)
7	1h RW	**Enable USB2 Drop-Ping (EN_U2_DROP_PING):** 0: Disable Drop-Ping Function in USB2 Protocol (default) 1: Enable Drop-Ping Function in USB2 Protocol
6	0h RW	**Enable USB2 Force-Ping (EN_U2_FORCE_PING):** 0: Disable Force-Ping Function in USB2 Protocol (default) 1: Enable Force-Ping Function in USB2 Protocol

30	0h RW	**CFG_FAST_TRAINING:** 0: Normal operation mode 1: Link fast training mode This bit should be written 0 in normal operation
29	0h RW	**SNPS_PHYSTATUS_DONE_L1_DIS:** snps_phystatus_done_l1_dis
28	0h RW	**SHADOW_DECODE_DIS:** shadow_decode_dis_reg
27	0h RW	**BATT_CHARGE_D3_EN:** batt_charge_d3_en
26	0h RW	**CFG_DEBOUNCE_EN:** cfg_debounce_en
25	0h RW	**PCIE_P0_EXIT_L1_EN:** pcie_p0_exit_l1_en_reg

Bit Range	Default & Access	Field Name (ID): Description
24	1h RW	**Enable L1 exit notification to SNPS PCIe core (EN_L1_EXIT_NOTIF_PCIE):** This bit enables a L1 exit notification to SNPS PCIe core. There is a case where USB ports have waked up and AUX PM module has started the wakeup process. The AUX PM control state got into a wait for P0 state because it needs to wait until PCIe core to signal powerdown state change. Due to the fact that the core is in D3Hot, there is no run_stop bit set such that no internal interrupt will be fired. This causes the LTSSM of PCIe stayed in L1 even though AUX PM has known that it needs an L1 exit. This bit works together with bit21 of this register. 1: enables this feature 0: disables this feature.
23	0h RW	**DISABLE PLC ON DISCONNECT (DIS_PLC_ON_DISCONNECT):** 1: do not assert PLC for disconnection 0: assert PLC for disconnection
22	0h RW	**TREAT_IDLE_AS_TS2_IN_LTSSM_WAIT_4_TS2:** This bit enables a feature in PCIe core LTSSM to treat IDLE received as TS2 when LTSSM is in wait for TS2 receive state. This is a function requested from PHY where it is possible to not able to receive TS2 without error. 1: treat Logic IDLE as TS2 received when in some PCIe LTSSM state. 0: disable this feature.
21	0h RW	**Disable p2 overwrite due to the D3HOT where PCIe core enters the L1 (DIS_P2_OVERWRITE_DUE2_D3HOT):** Added a feature where if PCIe core LTSSM enters L1 due to the D3hot, the aux PM control will not start a P2 overwrite function in anticipating for the next L23 enter. 1: disables p2 overwrite due to the D3HOT where PCIe core enters the L1. 0: enables P2 overwrite even if it is in D3Hot.
20	1h RW	**Enable the port to enter U3 automatically when in U1/U2 (ENABLE_AUTO_U3_ENTRY_FROM_U2_U3):** 1: enables the port to enter U3 automatically when in U1/U2 0: disables the port to enter U3 automatically when in U1/U2
19	1h RW	**No linkdown reset is issue during low power state (DIS_LINKDOWN_RST_DURING_LOW_POWER):** No linkdown reset is issue during low power state
18	0h RW	**EN_EXIT_DEEP_SLEEP_IF_PCIE_IN_P0:** This bit enables a feature in AUX PM module where if PCIe core LTSSM is in P0 for a duration of time, it will exit the deep sleep state. This is for failure control in case. 1: enables this feature 0: disable this feature
17	0h RW	**U2_EXIT_LFPS_TIMER_VALUE:** This bit selects U2 exit LFPS timer value 0: 320ns 400ns in 25MHz domain 1: 240ns 320ns in 25MHz domain
16	1h RW	**EN_EXIT_DEEP_SLEEP_ON_USB_PORT_WAKEUP:** This bit enables a function that AUX PM module exits from the deep sleep state due to the USB ports wakeup level signal. There have added this feature where USB ports will generates a wakeup level signal to wakeup the AUX PM module if it is in deep sleep state and this level signal will be cleared if the change bits are updated by software. 1: enables this function 0: disables this function which means that a wakeup pulse generated from each USB PortSC event will wake up the AUX PM module from deep sleep if the D3 state is programmed.

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RW	**P3_ENTRY_TIMEOUT:** This field defines the timeout value to enter P3 mode in U2. 00: 7us 8us 01: 511us 512us 10: disables the timer (0us) 11: disables the timer (0us)
13	1h RW	**Enable U2 P3 Mode (EN_U2_P3):** 0: Disable U2 P3 mode 1: Enable U2 P3 mode
12:11	0h RW	**Fine Debug Mode Select (FINE_DM_SEL):** Fine Debug Mode Select
10	0h RW	**Enable Low Power State Based Core Clock Gating (EN_LP_CORE_CG):** When set to '1' enable core clock gating based on low power state entered
9	1h RW	**Disable USB3 Port Status Changed Event (DIS_U3_PORT_SCE):** 0: Enable USB3 port status change event generation if any change bit is not cleared 1: Disable USB3 port status change event generation if any change bit is not cleared Bit 12 default 0
8:4	00h RW	**Debug Mode Select Register (DEB_MODE_SEL):** Debug Mode Select Register
3	0h RW	**Enable Auto Wakeup Non-IDLE (EN_AWAK_NIDLE):** When set to 1 enables the auto wakeup function when engine has identified non IDLE condition.
2	1h RW	**Enable PM Control P1 Exit P2 (EN_PMC_P1_EXIT_P2):** When set 1 enables the PM control module to transition to P1 instead of P0 when exit P2.
1	1h RW	**Enable PCIe PIPE CLK Isolation (EN_PP_CLK_ISOL):** When set to 1 enables the PCIe PIPE CLK to be isolated when main power is removed.
0	0h RW	**Enable P2 Overwrite P1 Allowed Detect (EN_P2OVRP1_ADET):** When set to 1 enables a function that can detect whether or not enable P2 overwrite P1 function. The condition to get to P2 overwrite is when engine is in idle conditions. This means that there is no ISO EP pending.

17.2.174 USB2 PHY Power Management Control (USB2_PHY_PMC) - Offset 8164h

USB2 PHY Power Management Control.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 8164h	000000FCh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	Reserved
30:8	0h RO	**Reserved**
7	1h RW	**EN_CMDM_TXRXB:** Enable Command Manager Active indication for Tx/Rx Bias circuit HS Phy PM Policy
6	1h RW	**EN_TTE_TXRXB:** Enable TTE Active indication for Tx/Rx Bias circuit HS Phy PM Policy
5	1h RW	**EN_IDMA_TXRXB:** Enable IDMA Active indication for Tx/Rx Bias circuit HS Phy PM Policy

2	1h RW	**EN_SCH_TXRXB:** Enable Scheduler Active indication for Tx/Rx Bias circuit HS Phy PM Policy
1	0h RW	**Enable Rx Bias ckt disable (EN_RXB_CD):** When set enables the Rx bias ckt to be disabled when conditions met (as in the HS phy PM policy bits)
0	0h RW	**Enable Tx Bias ckt disable (EN_TXB_CD):** When set enables the Tx bias ckt to be disabled when conditions met (as in the HS phy PM policy bits)

17.2.175 XHCI Aux Clock Control Register (XHCI_AUX_CCR) - Offset 816Ch

XHCI Aux Clock Control Register.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 816Ch	000F403Ch

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19	1h RW	**USB3 Partition Engine/Link trunk gating Enable (PARUSB3_ENG_GEN):** When set to 1 enables gating of the SOSC trunk to the XHCI engine and link in the PARUSB3 partition.
18	1h RW	**USB3 Partition Frame Timer trunk gating Enable (PARUSB3_LINK_GEN):** When set to 1 enables gating of the SOSC trunk to the Frame timer in the PARUSB3 partition.
17	1h RW	**USB2 link partition clock gating enable (PARUSB2_CLK_GEN):** When set to 1 enables gating of the SOSC trunk to the USB2 link and Phy logic in the PARUSB2 partition.

Bit Range	Default & Access	Field Name (ID): Description
16	1h RW	**USB2/USHIP 12.5 MHz partition clock gating enable (USHIP_PCGEN):** When set to 1 enables gating of the 12.5 MHz SOSC trunk to the USB2 and USHIP logic in the PARUSB2 partition.
15	0h RO	**Reserved**
14	1h RW	**USB3 Port Aux/Core clock gating enable (USB3_AC_CGE):** When set, allows the aux_cclk clock into the USB3 port to be gated when conditions are met. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.
13:12	0h RW	**Rx Detect Timer when port Aux Clock is Gated (RX_DT_ACG):** This field defines the value of the timer used to perform Rx Detect when port Aux Clock has been gated. 0x0: 100ms 0x1: 12ms Others: Reserved Note: This timer shall use the Fast Training Timer Tick (about 1us tick) for simulation purposes. For Fast Training mode, the above timeouts will become about 11us and about 100us, +/- implementation uncertainty, respectively.
11:10	0h RO	**Reserved**
9	0h RW	**Aux Clock Gating Counter PipeStage Enable (AUXCLKGT_CNTEN_PIPE_STGEN):** Policy to enable pipe stage on cnten of aux_clk and frame_clk gating logic
8	0h RO	**Reserved**
7	0h RW	**Frame Timer Clock Gating Ports in U2 Enable (FTCGPU2E):** This bit, when set, allows Host Controller to gate the clock to the Frame Timer when ports are in U2.
6	0h RW	**USB2 port clock throttle enable (USB2_PC_TE):** When set, allows the Aux clock into the USB2 ports to be throttled when conditions allow.
5	1h RW	**XHCI Engine Aux clock gating enable (XHCI_AC_GE):** When set, allows the aux clock into the XHCI engine to be gated when idle. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.
4	1h RW	**XHCI Aux PM block clock gating enable (XHCI_APMB_CGE):** When set, allows the aux clock into the Aux PM block to be gated when idle. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.

Bit Range	Default & Access	Field Name (ID): Description
3	1h RW	**USB3 Aux Clock Trunk Gating Enable (USB3_AC_TGE):** When set, allows Aux Clock Trunk feeding to USB3.0 ports to be gated when port Aux clock is gated at all USB3.0 ports and all USB3.0 modPHY instances. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.
2	1h RW	**USB3 Port Aux/Port clock gating enable (USB3_AP_CGE):** When set, allows the aux_pclk clock into the USB3 port to be gated when conditions are met. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.
1	0h RW	**ModPHY port Aux clock gating enable in U2 (MPP_AC_GEU2):** When set, allows the aux clock into the ModPhy to be gated when Link is in U2 and pipe has been in PS3 for at least the time defined by U2 Residency Before ModPHY Clock Gating field. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.
0	0h RW	**ModPHY port Aux clock gating enable in Disconnected, U3 or Disabled (MPP_AC_GE_DDU3):** When set, allows the aux clock into the ModPHY to be gated when Link is in Disconnected, U3 or Disabled state. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.

17.2.176 XHC Latency Tolerance Parameters LTV Control (XLTP_LTV1) - Offset 8174h

XHC Latency Tolerance Parameters LTV Control.

Type	Size	Offset	Default
MMIOMMIO	32 bit	MBAR + 8174h	01400C01h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Disable scheduler direct transition from IDLE to NO requirement (DIS_SDT_IDL_NR):** 0: (default) allow scheduler direct transition from IDLE to NO requirement 1: Disable scheduler direct transition from IDLE to NO requirement
30	0h RW	**XHCI LTR Transition Policy (XLTRTP) (LTR_TRANS_POL):** When 0, the LTR messaging state machine transitions through High Med Low Active states assuming enough latency is available for each transition. When 1, LTR messaging state machine transitions from High, Medium, or Low LTR states to Active state upon the Alarm Timer timeout and stays in Active until the next service boundary.
29	0h RW	Reserved
28	0h RW	**XHCI LTR Active Enable (XLTRAE) (XLTRAE):** 0: The Power Scheduler will not request an LTR message on a transition to ACTIVE. 1: The Power Scheduler will request an LTR message on a transition to ACTIVE.
27	0h RW	**Power Scheduler Local Clock Gating Enable (PWRLCGE) (PWRLCGE):** 0: Power Scheduler does not use local clock gating 1: Power Scheduler's local clock gating enabled. Note: This functionality is no longer required. This LCG existed previous to the inclusion of Aux clock gating.
26	0h RW	**LTR EVM Hysteresis Max Count (LTR_HYS_MAX):** Power Scheduler's Periodic IDLE residency before it asserts Periodic Complete 0: Hysteresis set to 127 clock ticks. (.64us) 1: Hysteresis set to 31 clock ticks (.16us)
25	0h RW	**USB2 async active policy (EN_USB2_LTV_U0_PORT_ASYNC_ACTIVE):** Active USB2 slots in U0 will get LTV from slot lookup table
24	1h RW	**XHCI LTR Enable (XLTRE):** This bit must be set to enable LTV messaging from XHCI to the PMC.
23:12	400h RW	**Periodic Active LTV (PA_LTV):** 23:22 Latency Scale 00b: Reserved 01b: Latency Value to be multiplied by 1024 10b: Latency Value to be multiplied by 32,768 11b: Latency Value to be multiplied by 1,048,576 21:12 Latency Value (ns) Defaults to 0 micro seconds
11:0	C01h RW	**USB2 Port L0 LTV (USB2_PL0_LTV):** 11:10 Latency Scale 00b: Reserved 01b: Latency Value to be multiplied by 1024 10b: Latency Value to be multiplied by 32,768 11b: Latency Value to be multiplied by 1,048,576 9:0 Latency Value (ns) Defaults to 128 Micro Seconds

17.2.177 XHC Latency Tolerance Parameters LTV Control 2 (XLTP_LTV2) - Offset 8178h

XHC Latency Tolerance Parameters LTV Control 2.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 8178h	000017FFh

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	**Reserved**
16	0h RW	**Non Offload Active Periodic TTE Counter Clearing Disable (NONOFLD_ACTV_PRDC_TTE_CNT_CLR_DIS):** Setting this bit will disable clearing Non-offload active periodic TTE counter based on TTE Idle indicator
15	0h RW	**Enable USB2 Port L0 LTV based on active async (EN_USB2_L0_LTV_ASYN):** 0 - USB2 Port L0 LTV is used regardless of whether there is active async EPs being present or not (Legacy mode) 1 - USB2 LTR L0 LTV is used only when there is active async EPs being present on that port. In the absence of active async EPs on given port, the L0 LTR value is NoRequirement for that port.

Bit Range	Default & Access	Field Name (ID): Description
14	0h RW	**Audio Offload USB2 Resume to DMA Active Mapping Enable (ADO_USB2RES_DMAACTV_MAP_EN):** Enables USB2 Port Resume Influence on 'XHCI DMA Active' indication (i.e. Run 125) for Ports Handling Audio Offload. 0 - A USB2 port involved with Audio Offload will NOT influence the XHCI DMA Active indication through USB2 Resume (i.e. USB2 resume for the associated port is not consumed when generating XHCI DMA Active). 1 - A USB2 port involved with Audio Offload will influence (legacy mode) the XHCI DMA Active indication through USB2 Resume (i.e. USB2 resume for the associated port is not consumed when generating XHCI DMA Active). Note: When this field is '0' will allow for a different field to determine what constitutes Audio Offload involvement. The different field is located at 0x8174[13]
13	0h RW	**Audio Offload USB2 Resume to DMA Active Mask Policy (ADO_USB2RES_DMAACTV_MASK_POLICY):** Defines the conditions required for what constitutes Audio Offload involvement for appropriate masking of USB2 Resume on 'XHCI DMA Active' indication (i.e. Run 125) for Ports Handling Audio Offload. 0 - Mask USB2 Resume from asserting the XHCI DMA Active if the particular port going through resume is engaged in Audio Offload while an Audio Offload DB is active (i.e. Audio Offload is connected and active). 1 - Mask USB2 Resume from asserting the XHCI DMA Active if the particular port going through resume is engaged in Audio Offload (i.e. Audio Offload is connected) irrespective of a DB being active/idle.
12:0	17FFh RW	**LTV Limit (LTV_LMT):** This register defines a maximum LTR value that is allowed to be advertised to the PMC. This is meant to be used as a workaround or mitigation if issues are discovered with the LTR values generated by the XHC using the defined algorithms. If the LTR value of the XHC is larger than the value in this register field, the value in this field is sent to the PMC instead. Default value is the highest possible - 101b 12:10: Latency Multiplier Field 000b - Value times 1 ns 001b - Value times 32 ns 010b - Value times 1,024 ns 011b - Value times 32,768 ns 100b - Value times 1,048,576 ns 101b - Value times 33,554,432 ns 110b-111b - Not Permitted 9:0: Latency Value Default = 3FFh

17.2.178 XHC Latency Tolerance Parameters High Idle Time Control (XLTP_HITC) - Offset 817Ch

XHC Latency Tolerance Parameters High Idle Time Control.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 817Ch	00050002h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:16	0005h RW	**Minimum High Idle Time (MHIT):** This is the minimum schedule idle time that must be available before a "High" LTR value can be indicated. This value must be larger than HIWL 12:7 - Time value in # of 125 Micro Seconds Bus Intervals (0 - 8ms) 6:0 - Fractional BI Time value in Micro Seconds (0 - 124 Micro Seconds)
15:13	0h RO	**Reserved**
12:0	0002h RW	**High Idle Wake Latency (HIWL):** This is the latency to access memory from the High Idle Latency state. This value must be larger than MIWL and LIWL 12:7 - Time value in # of 125 Micro Seconds Bus Intervals (0 - 8ms) 6:0 - Fractional BI Time value in Micro Seconds (0 - 124 Micro Seconds)

17.2.179 XHC Latency Tolerance Parameters Medium Idle Time Control (XLTP_MITC) - Offset 8180h

XHC Latency Tolerance Parameters Medium Idle Time Control.

Type	Size	Offset	Default

17.2.192 Debug Capability Status Register (DCST) - Offset 8724h

Debug Capability Status Register.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 8724h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Debug Port Number (DPNUM):** This field provides the ID of the Root Hub port that the Debug Capability has been automatically attached to. The value is '0' when the Debug Capability is not attached to a Root Hub port.
23:1	0h RO	**Reserved**
0	0h RO	**Event Ring Not Empty (ERNE):** When '1', this field indicates that the Debug Capability Event Ring has a Transfer Event on it. It is automatically cleared to '0' by the xHC when the Debug Capability Event Ring is empty, i.e. the Debug Capability Enqueue Pointer is equal to the Debug Capability Event Ring Dequeue Pointer register.

17.2.193 Debug Capability Port Status And Control Register (DCPORTSC) - Offset 8728h

Debug Capability Port Status And Control Register.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 8728h	00000080h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	0h RW/1C	**USB3-Port Config Error Change. USB2-Reserved for USB2 Debug Capability (CEC):** USB3-This flag indicates that the port failed to configure its link partner. 0 = No change. 1 = Port Config Error detected. Software shall clear this bit by writing a '1' to it. USB2-This bit shall never be set when operating in USB2 Kernel Debug mode.
22	0h RW/1C	**Port Link Status Change (PLC):** This flag is set to '1' due to the following PLS transitions: U0 -) U3 Suspend signaling detected from Debug Host U3 -) U0 Resume complete Polling -) Disabled Training Error Ux or Recovery -) Inactive Error Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'
21	0h RW/1C	**Port Reset Change (PRC):** This bit is set when reset processing on this port is complete (i.e. a '1' to '0' transition of PR). '0' = No change. '1' = Reset complete. Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'.
20:18	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW/1C	**Connect Status Change (CSC):** '1' = Change in Current Connect Status. '0' = No change. Indicates a change has occurred in the port's Current Connect Status. The xHC sets this bit to '1' for all changes to the Debug Device connect status, even if system software has not cleared an existing DbC Connect Status Change. For example, the insertion status changes twice before system software has cleared the changed condition, hardware will be "setting" an already-set bit (i.e., the bit will remain '1'). Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'.
16:14	0h RO	**Reserved**
13:10	0h RO	**Port Speed (PSPD):** This field identifies the speed of the port. This field is only relevant when a Debug Host is attached (CCS = '1') in all other cases this field shall indicate Undefined Speed. 0 Undefined Speed 1-15 Protocol Speed ID (PSI) Note: The Debug Capability only does not supports LS, FS, or HS operation.
9	0h RO	**Reserved**
8:5	4h RO	**Port Link State (PLS):** This field reflects its current link state. This field is only relevant when a Debug Host is attached (Debug Port Number) '0'). Value Meaning 0 Link is in the U0 State 1 Link is in the U1 State 2 Link is in the U2 State 3 Link is in the U3 State (Device Suspended) 4 Link is in the Disabled State 5 Link is in the RxDetect State 6 Link is in the Inactive State 7 Link is in the Polling State 8 Link is in the Recovery State 9 Link is in the Hot Reset State 15:10 Reserved Note: Transitions between different states are not reflected until the transition is complete.
4	0h RO	**Port Reset (PR):** '1' = Port is in Reset. '0' = Port is not in Reset. This bit is set to '1' when the bus reset sequence as defined in the USB Specification is detected on the Root Hub port assigned to the Debug capability. It is cleared when the bus reset sequence is completed by the Debug Host, and the DbC shall transition to the USB Default state. A '0' to '1' transition of this bit shall clear DCPORTSC PED ('0'). This field is '0' if DCE or CCS are '0'.

Bit Range	Default & Access	Field Name (ID): Description
3:2	0h RO	**Reserved**
1	0h RW	**Port Enabled/Disabled (PED):** Default = '0'. '1' = Enabled. '0' = Disabled. This flag shall be set to '1' by a '0' to '1' transition of CCS or a '1' to '0' transition of the PR. When PED transitions from '1' to '0' due to the assertion of PR, the port's link shall transition to the Rx.Detect state. This flag may be used by software to enable or disable the operation of the Root Hub port assigned to the Debug Capability. The Debug Capability Root Hub port operation may be disabled by a fault condition (disconnect event or other fault condition, e.g. a LTSSM Polling substate timeout, tPortConfiguration timeout error, etc.), the assertion of DCPORTSC PR, or by software. 0 = Debug Capability Root Hub port is disabled. 1 = Debug Capability Root Hub port is enabled. When the port is disabled (PED = '0') the port's link shall enter the SS.Disabled state and remain there until PED is reasserted ('1') or DCE is negated ('0'). Note that the Root Hub port is remains mapped to Debug Capability while PED = '0'. While PED = '0' the Debug Capability will appear to be disconnected to the Debug Host. Note, this bit is not affected by PORTSC PR bit transitions. This field is '0' if DCE or CCS are '0'.
0	0h RO	**Current Connect Status (CCS):** '1' = A Root Hub port is connected to a Debug Host and assigned to the Debug Capability. '0' = No Debug Host is present. This value reflects the current state of the port, and may not correspond to the value reported by the Connect Status Change (CSC) field in the Port Status Change Event. Port Status Change Event is generated when both PED and CSC are set to 1. This is a change compared to USB3 because for USB2, the Port Speed field is only valid after PED is set to 1, which only happens some time after CSC is set to 1. This flag is '0' if Debug Capability Enable (DCE) is '0'.

17.2.194 Debug Capability Context Pointer Register (DCCP) - Offset 8730h

Debug Capability Context Pointer Register.

Type	Size	Offset	Default
MMIO	64 bit	MBAR + 8730h	0000000000000000h

The RW/L property of this register is controlled by OCCFDONE bit.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 9138h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3:0	0h RW/L	**OC Mapping (OCM):** USB3 Port assignment When Set to 1, Bit 0 maps the OC pin N to USB3 std. port 1 Bit 1 maps the OC pin N to USB3 std. port 2 ... Bit (NumUSB3std-1) maps the OC pin N to USB3 Std port NumUSB3std **Locked by:** XHCC2.OCCFGDONE

17.2.214 XHCI USB3 Overcurrent Pin Mapping (U3OCM7) - Offset 913Ch

The RW/L property of this register is controlled by OCCFDONE bit.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 913Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3:0	0h RW/L	**OC Mapping (OCM):** USB3 Port assignment When Set to 1, Bit 0 maps the OC pin N to USB3 std. port 1 Bit 1 maps the OC pin N to USB3 std. port 2 ... Bit (NumUSB3std-1) maps the OC pin N to USB3 Std port NumUSB3std **Locked by:** XHCC2.OCCFGDONE

17.2.215 XHCI USB3 Overcurrent Pin Mapping (U3OCM8) - Offset 9140h

The RW/L property of this register is controlled by OCCFDONE bit.

Type	Size	Offset	Default
MMIO	32 bit	MBAR + 9140h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3:0	0h RW/L	**OC Mapping (OCM):** USB3 Port assignment When Set to 1, Bit 0 maps the OC pin N to USB3 std. port 1 Bit 1 maps the OC pin N to USB3 std. port 2 ... Bit (NumUSB3std-1) maps the OC pin N to USB3 Std port NumUSB3std **Locked by:** XHCC2.OCCFGDONE

17.3 USB Configuration Registers Summary

The USB Configuration Registers are distributed within the PCH Private Configuration Space which is accessible through the PCH Sideband Interface using the following Target Port (Destination Port) Identification:

Target Port (Destination Port) Identification = 0xCA

For complete details on how to use the PCH Sideband Interface to access these PCH Private Configuration Registers reference the latest Platform Controller Hub BIOS Specification.

Table 17-3. Summary of USB Configuration Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
402Bh	4	GLB ADP VBUS COMP REG (GLB_ADP_VBUS_COMP_REG)	006A4005h
4100h	4	c73usb2ad_USB2 PER PORT (USB2_PER_PORT_PP0)	00003D00h
4126h	4	c73usb2ad_USB2 PER PORT 2 (USB2_PER_PORT_2_PP0)	01800000h

17.3.1 GLB ADP VBUS COMP REG (GLB_ADP_VBUS_COMP_REG) - Offset 402Bh

GLB ADP VBUS COMP REG

Type	Size	Offset	Default
MMIO	32 bit	FDCA0000h + 402Bh	006A4005h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22	1h RW	**Reserved**

18 USB eXtensible Device Controller Interface (xDCI)

18.1 USB xDCI Configuration Registers Summary

This chapter records the registers in Bus: 0, Device 20, Function 1.

Table 18-1. Summary of Bus: 0, Device: 20, Function: 1 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	Device ID And Vendor ID Register (DEVVENDID)	4B7E8086h
4h	4	Status And Command (STATUSCOMMAND)	00100000h
10h	4	Base Address Register (BAR)	00000004h
14h	4	Base Address Register High (BAR_HIGH)	00000000h
18h	4	Base Address Register1 (BAR1)	00000004h
1Ch	4	Base Address Register1 High (BAR1_HIGH)	00000000h
2Ch	4	Subsystem Vendor And Subsystem ID (SUBSYSTEMID)	00000000h
34h	4	Capabilities Pointer Register (CAPABILITYPTR)	00000080h
3Ch	4	Interrupt Register (INTERRUPTREG)	00000100h
80h	4	Power Management Capability Id (POWERCAPID)	48039001h
84h	4	Power Management Control And Status Register (PMECTRLSTATUS)	00000008h
90h	4	Pci Device Idle Vendor Capability Register (PCIDEVIDLE_CAP_RECORD)	F0140009h
94h	4	Vendor Specific Extended Capability Register (DEVID_VEND_SPECIFIC_REG)	01400010h
98h	4	Software LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG)	00000000h
9Ch	4	Device Idle Pointer Register (DEVICE_IDLE_POINTER_REG)	010F8301h
A0h	4	D0i3 And Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG)	00080800h

18.1.1 Device ID And Vendor ID Register (DEVVENDID) - Offset 0h

Device ID and Vendor ID.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:1] + 0h	4B7E8086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	4B7Eh RO/P	**Device ID Field (DEVICEID):** Device ID identifies the particular PCI device
15:0	8086h RO	**Vendor Id Field (VENDORID):** Vendor ID is a unique ID provided by the PCI SIG which identifies the manufacturer of the device

18.1.2 Status And Command (STATUSCOMMAND) - Offset 4h

Command and Status Registers.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:1] + 4h	00100000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29	0h RW/1C	**RMA Field (RMA):** Received Master Abort
28	0h RW/1C	**RTA Field (RTA):** Received Target Abort
27:21	0h RO	**Reserved**
20	1h RO	**Cap List Field (CAPLIST):** Capabilities List: Indicates that the controller contains a capabilities pointer list
19	0h RO	**Interrupt Status Field (INTR_STATUS):** Interrupt Status: This bit reflects state of interrupt in the device
18:11	0h RO	**Reserved**
10	0h RW	**Interrupt Disable Field (INTR_DISABLE):** This field is Interrupt Disable
9	0h RO	**Reserved**
8	0h RW	**SERR Enable Field (SERR_ENABLE):** SERR Enable Not implemented
7:3	0h RO	**Reserved**
2	0h RW	**BME Field (BME):** Bus Master Enable
1	0h RW	**MSE Field (MSE):** Memory Space Enable
0	0h RO	**Reserved**

18.1.3 Base Address Register (BAR) - Offset 10h

Base Address Register Low [31:2] type[2:1] in 32bit or 64bit address range and memory space indicator [0].

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:1] + 10h	00000004h

Bit Range	Default & Access	Field Name (ID): Description
31:21	000h RW	**Base Address Field (BASEADDR):** Base Address Register Low Base address of the OCP fabric memory space. Taken from Strap values as ones
20:12	0h RO	**Reserved**
11:4	00h RO	**Size Field (SIZEINDICATOR):** Size Indicator RO Always returns 0 The size of this register depends on the size of the memory space
3	0h RO	**Prefetchable Field (PREFETCHABLE):** Prefetchable: Indicates that this BAR is not prefetchable
2:1	2h RO	**Type Field (TYPE0):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE):** Memory Space Indicator: 0 indicates this BAR is present in the memory space.

18.1.4 Base Address Register High (BAR_HIGH) - Offset 14h

Base Address Register High enabled if [2:1] of BAR is 10.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:1] + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR_HIGH):** Base Address high - MSB

18.1.5 Base Address Register1 (BAR1) - Offset 18h

Base Address Register1 accesses to PCI configuration space and is always 4K type in [2:1] and memory space indicator in [0].

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:1] + 18h	00000004h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR1):** Base Address1 This field is present if BAR1 is enabled through private configuration space.
11:4	00h RO	**Size Field (SIZEINDICATOR1):** Always is 0 as minimum size is 4K
3	0h RO	**Prefetchable Field (PREFETCHABLE1):** Prefetchable: Indicates that this BAR is not prefetchable.
2:1	2h RO	**Type Field (TYPE1):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE1):** Memory Space Indicator: 0 Indicates this BAR is present in the memory space

18.1.6 Base Address Register1 High (BAR1_HIGH) - Offset 1Ch

Base Address Register1 High enabled only if [2:1] of BAR1 register is 10.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:1] + 1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR1_HIGH):** Base Address: Base address of the OCP fabric memory space. Taken from Strap values as ones

18.1.7 Subsystem Vendor And Subsystem ID (SUBSYSTEMID) - Offset 2Ch

SVID register along with SID register is to distinguish subsystem from another.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:1] + 2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O/P	**Subsystem ID Field (SUBSYSTEMID):** Subsystem ID: This register is implemented for any function that can be instantiated more than once in a given system.
15:0	0000h RW/O/P	**Subsystem Vendor Field (SUBSYSTEMVENDORID):** Subsystem Vendor ID: This register must be implemented for any function that can be instantiated more than once in a given system

18.1.8 Capabilities Pointer Register (CAPABILITYPTR) - Offset 34h

Capabilities Pointer register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:1] + 34h	00000080h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	80h RO	**Capabilities Pointer Field (CAPPTR_POWER):** Capabilities Pointer: Indicates what the next capability is.

18.1.9 Interrupt Register (INTERRUPTREG) - Offset 3Ch

Interrupt line Register isn't used in Bridge directly Interrupt Pin register reflects the IPIN value in private configuration space. Min_gnt register indicating the req of latency timers and max_lat register max latency.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:1] + 3Ch	00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Max Latency Field (MAX_LAT):** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	00h RO	**Min GNT Field (MIN_GNT):** Value of 0 indicates device has no major requirements for the settings of latency timers // Re-Check Desc Padma
15:12	0h RO	**Reserved**
11:8	1h RO	**Interrupt Pin Field (INTPIN):** Interrupt Pin: Value in this register is reflected from the IPIN value in the private configuration space.
7:0	00h RW/P	**Interrupt Line Field (INTLINE):** Interrupt Line: It is used to communicate to software the interrupt line to which the interrupt pin is connected

18.1.10 Power Management Capability ID (POWERCAPID) - Offset 80h

Power Management Capability ID register points to Next Capability Structure and Power Management Capability with Power Management capabilities register for PME support and version.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:1] + 80h	48039001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	09h RO	**PME Support Field (PMESUPPORT):** This 5-bit field indicates the power states in which the function can assert the PME#
26:19	0h RO	**Reserved**
18:16	3h RO	**Version Field (VERSION):** Indicates support for Revision 1.2 of the PCI Power Management Specification
15:8	90h RO	**Next Cap Field (NXTCAP):** Next Capability: Points to the next capability structure.
7:0	01h RO	**Power Capability ID Field (POWER_CAP):** Power Management Capability: Indicates this is Power Management Capability

18.1.11 Power Management Control And Status Register (PMECTRLSTATUS) - Offset 84h

Power Management Control And Status Register to set and read PME Status, PME Enable, No Soft Reset and Power State.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:1] + 84h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW/1C/P	**PME Status Field (PMESTATUS):** This field is PME Status
14:9	0h RO	**Reserved**
8	0h RW/P	**PME Enable Field (PMEENABLE):** This field is PME Enable
7:4	0h RO	**Reserved**
3	1h RO	**No Soft Reset Field (NO_SOFT_RESET):** This bit indicates that devices transitioning from D3hot to D0 because of Powerstate commands do not perform an internal reset
2	0h RO	**Reserved**
1:0	0h RW	**Power State Field (POWERSTATE):** Power State: This field is used both to determine the current power state and to set a new power state

18.1.12 PCI Device Idle Vendor Capability Register (PCIDEVIDLE_CAP_RECORD) - Offset 90h

PCI Device Vendor Specific Capability register defines Vendor Specific Capability ID, Revision Length, Next Capability and CAPID.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:1] + 90h	F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**Vendor Cap Field (VEND_CAP):** Vendor Specific Capability ID
27:24	0h RO	**Revision ID Field (REVID):** Revision ID of Capability Structure
23:16	14h RO	**Cap Length Field (CAP_LENGTH):** Vendor Specific Capability Length
15:8	00h RO	**Next Capability Field (NEXT_CAP):** This field is Next Capability
7:0	09h RO	**Capability Id Field (CAPID):** This field is Capability ID

18.1.13 Vendor Specific Extended Capability Register (DEVID_VEND_SPECIFIC_REG) - Offset 94h

Extended Vendor Capability Register for VSEC Length, Revision and ID.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:1] + 94h	01400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	014h RO	**Vendor Specific Id Field (VSEC_LENGTH):** Vendor Specific Extended Capability Length
19:16	0h RO	**Vendor Specific Revision Field (VSEC_REV):** Vendor specific Extended Capability Revision
15:0	0010h RO	**Vendor Specific Length Field (VSECID):** Vendor Specific Extended Capability ID

18.1.14 Software LTR Update MMIO LSW LTR location Register (D0I3_CONTROL_SW_LTR_MMIO_REG) - Offset 98h

Software Location Pointer in MMIO space as an offset specified by BAR.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:1] + 98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RO	**SW LTR Dword Offset Field (SW_LAT_DWORD_OFFSET):** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**SW LTR BAR Number Field (SW_LAT_BAR_NUM):** Indicates that the SW LTR update MMIO location is always at BAR0
0	0h RO	**SW LTR Valid Field (SW_LAT_VALID):** This value is reflected from the SW LTR valid strap at the top level

18.1.15 Device Idle Pointer Register (DEVICE_IDLE_POINTER_REG) - Offset 9Ch

Device IDLE pointer register giving details on Device MMIO offset location BAR NUM and D0i3 Valid Strap.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:1] + 9Ch	010F8301h

Bit Range	Default & Access	Field Name (ID): Description
31:4	010F830h RO	**D0i3 Dword Offset Field (DWORD_OFFSET):** Contains the location pointer to the SW LTR register in MMIO space as an offset from the specified BAR
3:1	0h RO	**BAR Num Field (BAR_NUM):** BAR Num: Indicates that the D0i3 MMIO location is always at BAR0
0	1h RO	**D0i3 Valid Field (VALID):** Valid: This value is reflected from the D0i3 valid strap at the top level.

18.1.16 D0i3 And Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG) - Offset A0h

D0idle_Max_Power_On_Latency register set at boot and Power control enable register to enable communication with the PGCB block below the Bridge.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:1] + A0h	00080800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21	0h RW/P	**HAE Field (HAE):** Hardware Autonomous Enable
20	0h RO	**Reserved**
19	1h RW/P	**Sleep Enable Field (SLEEP_EN):** This field is Sleep Enable
18	0h RW/P	**D3 Hen Field (D3HEN):** D3-Hot Enable (D3HEN): If 1 then function will power gate when idle and the PMCSR[1:0] register in the function =11 (D3).
17	0h RW/P	**Device Idle En Field (DEVIDLEN):** DEVIDLE Enable (DEVIDLEN): If 1 then the function will power gate when idle and the DevIdle register (DevIdleC[2] = 1) is set.
16	0h RW/P	**PMC Request Enable Field (PMCRE):** PMCRE: PMC Request Enable
15:13	0h RO	**Reserved**
12:10	2h RW/O/P	**Power Latency Scale Field (POW_LAT_SCALE):** Power On Latency Scale
9:0	000h RW/O/P	**Power Latency Value Field (POW_LAT_VALUE):** Power On Latency Value

19 Intel® Safety Island (Intel® SI)

19.1 Intel®SI Configuration Registers Summary

This chapter records the registers in Bus: 0, Device 26, Function 3.

Table 19-1. Summary of Bus: 0, Device: 26, Function: 3 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	Device ID And Vendor ID Register (DEVVENDID)	4B4A8086h
4h	4	Status And Command (STATUSCOMMAND)	00100000h
8h	4	Revision ID And Class Code (REVCLASSCODE)	00000000h
Ch	4	Cache Line Latency Header And BIST (CLLATHEADERBIST)	00000000h
10h	4	Base Address Register (BAR)	00000004h
14h	4	Base Address Register High (BAR_HIGH)	00000000h
18h	4	Base Address Register1 (BAR1)	00000000h
1Ch	4	Base Address Register1 High (BAR1_HIGH)	00000000h
2Ch	4	Subsystem Vendor and Subsystem ID (SUBSYSTEMID)	00000000h
30h	4	Expansion Rom Base Address (EXPANSION_ROM_BASEADDR)	00000000h
34h	4	Capabilities Pointer (CAPABILITYPTR)	00000080h
3Ch	4	Interrupt Register (INTERRUPTREG)	00000000h
80h	4	Power Management Capability ID (POWERCAPID)	00039001h
84h	4	Power Management Control And Status Register (PMECTRLSTATUS)	00000008h
90h	4	PCI Device Idle Vendor Capability Register (PCIDEVIDLE_CAP_RECORD)	F014D009h
94h	4	Vendor Specific Extended Capability Register (DEVID_VEND_SPECIFIC_REG)	01400010h
98h	4	Software LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG)	00000000h
9Ch	4	Device Idle Pointer Register (DEVICE_IDLE_POINTER_REG)	00000000h
A0h	4	D0i3 and Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG)	00250000h
C0h	4	General Purpose Input Register (GEN_INPUT_REG)	00000000h
D0h	4	MSI Capability Register (MSI_CAP_REG)	01800005h
D4h	4	MSI Message Low Address (MSI_ADDR_LOW)	00000000h
D8h	4	MSI Message High Address (MSI_ADDR_HIGH)	00000000h
DCh	4	MSI Message Data (MSI_MSG_DATA)	00000000h
E0h	4	MSI Mask Register (MSI_MASK)	00000000h
E4h	4	MSI Pending Register (MSI_PENDING)	00000000h
F8h	4	Manufacturers ID (MANID)	00000000h

19.1.1 Device ID And Vendor ID Register (DEVVENDID) - Offset 0h

Device ID and Vendor ID.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:3] + 0h	4B4A8086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	4B4Ah RO/P	**Device Id Field (DEVICEID):** Device ID identifies the particular PCI device
15:0	8086h RO	**Vendor Id Field (VENDORID):** Vendor ID is a unique ID provided by the PCI SIG which identifies the manufacturer of the device

19.1.2 Status And Command (STATUSCOMMAND) - Offset 4h

Command and Status.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:3] + 4h	00100000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C	**Detected Parity Error (DPE):** Detected Parity Error
30	0h RW/1C	**Signaled System Error (SSE):** Signaled System Error
29	0h RW/1C	**RMA Field (RMA):** Received Master Abort
28	0h RW/1C	**RTA Field (RTA):** Received Target Abort
27:25	0h RO	**Reserved**
24	0h RW/1C	**Master Data Parity Error (MDPE):** Master Data Parity Error
23:21	0h RO	**Reserved**
20	1h RO	**Capability List Field (CAPLIST):** Capabilities List: Indicates that the controller contains a capabilities pointer list
19	0h RO	**Interrupt Status Field (INTR_STATUS):** Interrupt Status: This bit reflects state of interrupt in the device
18:11	0h RO	**Reserved**
10	0h RW	**Interrupt Disable Field (INTR_DISABLE):** Interrupt Disable
9	0h RO	**Reserved**
8	0h RW	**SERR Enable Field (SERR_ENABLE):** SERR Enable Not implemented
7	0h RO	**Reserved**
6	0h RW	**Parity Error Response Enable (PERE):** Parity Error Response Enable

Bit Range	Default & Access	Field Name (ID): Description
5:3	0h RO	**Reserved**
2	0h RW	**BME Field (BME):** Bus Master Enable
1	0h RW	**MSE Field (MSE):** Memory Space Enable
0	0h RO	**Reserved**

19.1.3 Revision ID And Class Code (REVCLASSCODE) - Offset 8h

Revision ID and Class Code Registers.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:3] + 8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	**Revision ID Field (CLASS_CODES):** Class Code register is read-only and is used to identify the generic function of the device and in some cases a specific register-level programming interface
7:0	00h RO/P	**Class Code Field (RID):** Revision ID identifies the revision of particular PCI device.

19.1.4 Cache Line Latency Header And BIST (CLLATHEADERBIST) - Offset Ch

Cache Line size as RW with def 0 Latency timer RW with def 0 Header type with Type 0 configuration header and Reserved BIST register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:3] + Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	0h RO	**Multifunction Device Field (MULFNDEV):** Multi-Function Device

Bit Range	Default & Access	Field Name (ID): Description
22:16	00h RO	**Header Type Field (HEADERTYPE):** Header Type: Implements Type 0 Configuration header
15:8	00h RO	**Latency Timer Field (LATTIMER):** Latency Timer:This register is implemented as R/W with default as 0
7:0	00h RW/P	**Cache Line Size Field (CACHELINE_SIZE):** Cache line Size

19.1.5 Base Address Register (BAR) - Offset 10h

Base Address Register Low [31:2] type[2:1] in 32bit or 64bit address range and memory space indicator [0]

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:3] + 10h	00000004h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR):** Base Address Register Low Base address of the AXI fabric memory space. Taken from Strap values as ones
11:4	00h RO	**Size Field (SIZEINDICATOR):** Size Indicator Ro Always returns 0 The size of this register depends on the size of the memory space
3	0h RO	**Prefetchable Field (PREFETCHABLE):** Prefetchable: Indicates that this BAR is not prefetchable
2:1	2h RO	**Type Field (TYPE0):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE):** Memory Space Indicator: 0 indicates this BAR is present in the memory space.

19.1.6 Base Address Register High (BAR_HIGH) - Offset 14h

Base Address Register High enabled if [2:1] of BAR_HIGH is 10.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:3] + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR_HIGH):** Base Address high - MSB

19.1.7 Base Address Register1 (BAR1) - Offset 18h

Base Address Register1 accesses to PCI configuration space and is always 4K type in [2:1] and memory space indicator in [0].

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:3] + 18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR1):** Base Address1 This field is present if BAR1 is enabled through private configuration space.
11:4	00h RO	**Size Field (SIZEINDICATOR1):** Always is 0 as minimum size is 4K
3	0h RO	**Prefetchable Field (PREFETCHABLE1):** Prefetchable: Indicates that this BAR is not prefetchable.
2:1	0h RO	**Type Field (TYPE1):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE1):** Memory Space Indicator: 0 Indicates this BAR is present in the memory space

19.1.8 Base Address Register1 High (BAR1_HIGH) - Offset 1Ch

Base Address Register1 High enabled only if [2:1] of BAR1 register is 10.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:3] + 1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR1_HIGH):** Base Address: Base address of the AXI fabric memory space. Taken from Strap values as ones

19.1.9 Subsystem Vendor and Subsystem ID (SUBSYSTEMID) - Offset 2Ch

SVID register along with SID register is to distinguish subsystem from another.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:3] + 2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O/P	**Subsystem Id Field (SUBSYSTEMID):** Subsystem ID: This register is implemented for any function that can be instantiated more than once in a given system.
15:0	0000h RW/O/P	**Subsystem Vendor Field (SUBSYSTEMVENDORID):** Subsystem Vendor ID: This register must be implemented for any function that can be instantiated more than once in a given system

19.1.10 Expansion Rom Base Address (EXPANSION_ROM_BASEADDR) - Offset 30h

Expansion Rom Base Address Register is a Ro indicates support for expansion ROMs.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:3] + 30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Expansion Rom base address field (EXPANSION_ROM_BASE):** Expansion ROM Base Address: Value of all zeros indicates no support for Expansion ROM

19.1.11 Capabilities Pointer (CAPABILITYPTR) - Offset 34h

Capabilities Pointer Register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:3] + 34h	00000080h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	80h RO	**Capabilities Pointer Field (CAPPTR_POWER):** Capabilities Pointer: Indicates what the next capability is.

19.1.12 Interrupt Register (INTERRUPTREG) - Offset 3Ch

Interrupt line Register isn't used in Bridge directly Interrupt Pin register reflects the IPIN value in private config space. Min_GNT register indicating the req of latency timers and Max_LAT register max latency.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:3] + 3Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Max Latency Field (MAX_LAT):** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	00h RO	**Min GNT Field (MIN_GNT):** Value of 0 indicates device has no major requirements for the settings of latency timers
15:12	0h RO	**Reserved**
11:8	0h RO	**Interrupt Pin Field (INTPIN):** Interrupt Pin: Value in this register is reflected from the IPIN value in the private configuration space.
7:0	00h RW/P	**Interrupt Line Field (INTLINE):** Interrupt Line: It is used to communicate to software the interrupt line to which the interrupt pin is connected

19.1.13 Power Management Capability ID (POWERCAPID) - Offset 80h

Power Management Capability ID register points to Next Capability Structure And Power Management Capability with Power Management capabilities register for PME support and version.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:3] + 80h	00039001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**PME Support Field (PMESUPPORT):** This 5-bit field indicates the power states in which the function can assert the PME#
26:19	0h RO	**Reserved**
18:16	3h RO	**Version Field (VERSION):** Indicates support for Revision 1.2 of the PCI Power Management Specification
15:8	90h RO	**Next Cap Field (NXTCAP):** Next Capability: Points to the next capability structure.
7:0	01h RO	**Power Capability Id Field (POWER_CAP):** Power Management Capability: Indicates this is power management capability

19.1.14 Power Management Control And Status Register (PMECTRLSTATUS) - Offset 84h

Power Management Control And Status Register to set and read PME Status, PME Enable, No Soft Reset and Power State.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:3] + 84h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW/1C/P	**PME Status Field (PMESTATUS):** PME Status
14:9	0h RO	**Reserved**
8	0h RW/P	**PME Enable Field (PMEENABLE):** PME Enable
7:4	0h RO	**Reserved**
3	1h RO	**No Soft Reset Field (NO_SOFT_RESET):** This bit indicates that devices transitioning from D3hot to D0 because of Powerstate commands do not perform an internal reset
2	0h RO	**Reserved**
1:0	0h RW	**Power State Field (POWERSTATE):** Power State: This field is used both to determine the current power state and to set a new power state

19.1.15 PCI Device Idle Vendor Capability Register (PCIDEVIDLE_CAP_RECORD) - Offset 90h

PCI Device Vendor Specific Capability register defines Vendor Specific Capability ID, Revision Length, Next Capability and CAPID.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:3] + 90h	F014D009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**Vendor Cap Field (VEND_CAP):** Vendor Specific Capability ID
27:24	0h RO	**Revision ID Field (REVID):** Revision ID of Capability Structure
23:16	14h RO	**Cap Length Field (CAP_LENGTH):** Vendor Specific Capability Length
15:8	D0h RO	**Next Capability Field (NEXT_CAP):** Next Capability
7:0	09h RO	**Capability Id Field (CAPID):** Capability ID

19.1.16 Vendor Specific Extended Capability Register (DEVID_VEND_SPECIFIC_REG) - Offset 94h

Extended Vendor capability register for VSEC Length Revision and ID.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:3] + 94h	01400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	014h RO	**Vendor Specific Id Field (VSEC_LENGTH):** Vendor Specific Extended Capability Length
19:16	0h RO	**Vendor Specific Revision Field (VSEC_REV):** Vendor specific Extended Capability Revision
15:0	0010h RO	**Vendor Specific Length Field (VSECID):** Vendor Specific Extended Capability ID

19.1.17 Software LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG) - Offset 98h

Software Location Pointer in MMIO space as an offset specified by BAR.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:3] + 98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RO	**SW LTR Dword Offset Field (SW_LAT_DWORD_OFFSET):** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**SW LTR BAR Number Field (SW_LAT_BAR_NUM):** Indicates that the SW LTR update MMIO location is always at BAR0
0	0h RO	**SW LTR Valid Field (SW_LAT_VALID):** This value is reflected from the SW LTR valid strap at the top level

19.1.18 Device Idle Pointer Register (DEVICE_IDLE_POINTER_REG) - Offset 9Ch

Device IDLE pointer register giving details on Device MMIO offset location BAR NUM and D0i3 Valid Strap.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:3] + 9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RO	**D0i3 Dword Offset Field (DWORD_OFFSET):** Contains the location pointer to the SW LTR register in MMIO space as an offset from the specified BAR
3:1	0h RO	**BAR NUM Field (BAR_NUM):** BAR Num: Indicates that the D0i3 MMIO location is always at BAR0
0	0h RO	**D0i3 Valid Field (VALID):** Valid: This value is reflected from the D0i3 valid strap at the top level

19.1.19 D0i3 and Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG) - Offset A0h

D0idle_Max_Power_On_Latency Register set at boot and Power Control Enable Register to enable communication with the PGCB block below the Bridge.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:3] + A0h	00250000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21	1h RW/P	**HAE:** Hardware Autonomous Enable
20	0h RO	**Reserved**
19	0h RW/P	**Sleep Enable Field (SLEEP_EN):** Sleep Enable
18	1h RW/P	**D3 Hen Field (D3HEN):** DEVIDLE Enable (DEVIDLEN): If '1', then the function will power gate when idle and the DevIdle register (DevIdleC[2] = '1') is set.
17	0h RW/P	**Device Idle En Field (DEVIDLEN):** PMCRE: PMC Request Enable
16	1h RW/P	**PMC Request Enable Field (PMCRE):** D3-Hot Enable (D3HEN): If '1', then function will power gate when idle and the PMCSR[1:0] register in the function = '11' (D3).
15:13	0h RO	**Reserved**
12:10	2h RW/O/P	**Power Latency Scale Field (POW_LAT_SCALE):** Power On Latency Scale
9:0	000h RW/O/P	**Power Latency Value Field (POW_LAT_VALUE):** Power On Latency Value

19.1.20 General Purpose Input Register (GEN_INPUT_REG) - Offset C0h

General Purpose Input Register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:3] + C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**General Purpose Input Field (GEN_REG_INPUT_RW):** General Purpose Input Register: This register value reflects the value of GEN_REG_INPUT_RW

19.1.21 MSI Capability Register (MSI_CAP_REG) - Offset D0h

MSI Capability Register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:3] + D0h	01800005h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	1h RO	**Per Vector Masking Capability Field (PER_VECTOR_MSK_CAP):** Per Vector Masking Capability
23	1h RO	**MSI Capability Field (MSI_CAP_64B):** 64 bit message address capability
22:20	0h RW	**Multi Message En Field (MUL_MSG_EN):** Multiple Message Enable
19:17	0h RO	**Multi Message Cap Field (MUL_MSG_CAP):** Multiple Message Capable
16	0h RW	**MSI Enable Field (MSG_MSI_ENABLE):** MSI Enable
15:8	00h RO	**Next Pointer Field (MSG_NXT_PTR):** Next Capability Pointer
7:0	05h RO	**MSI Capability Field (MSG_CAP_ID):** MSI Capability ID

19.1.22 MSI Message Low Address (MSI_ADDR_LOW) - Offset D4h

MSI Message Low Address.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:3] + D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RW	**MSI Message Low Address Field (MSI_ADDR_LOW):** MSI Message Low Address
1:0	0h RO	**Reserved**

19.1.23 MSI Message High Address (MSI_ADDR_HIGH) - Offset D8h

MSI Message High Address.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:3] + D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSI Message High Address Field (MSI_ADDR_HIGH):** MSI Message High Address

19.1.24 MSI Message Data (MSI_MSG_DATA) - Offset DCh

MSI Message Data.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:3] + DCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0000h RW	**MSI Message Data Field (MSI_MSG_DATA):** MSI Message Data

19.1.25 MSI Mask Register (MSI_MASK) - Offset E0h

MSI Mask bits.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:3] + E0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSI Mask Field (MSI_MASK):** MSI Mask bits

19.1.26 MSI Pending Register (MSI_PENDING) - Offset E4h

MSI Pending bits.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:3] + E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**MSI Pending Field (MSI_PENDING):** MSI Pending bits

19.1.27 Manufacturers ID (MANID) - Offset F8h

Manufacturers ID register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:3] + F8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/P	**Manufacturers Id Field (MANID):** Manufacturer ID: Default value comes from straps.

20 General Purpose I/O

20.1 GPIO Community 0 Registers Summary

This chapter documents GPIO 0 Registers.

Table 20-1. Summary of GPIO 0 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
8h	4	Family Base Address (FAMBAR)	00000300h
Ch	4	Pad Base Address (PADBAR)	00000700h
10h	4	Miscellaneous Configuration (MISCCFG)	32043200h
20h	4	Pad Ownership (PAD_OWN_GPP_B_0)	00000000h
24h	4	Pad Ownership (PAD_OWN_GPP_B_1)	00000000h
28h	4	Pad Ownership (PAD_OWN_GPP_B_2)	00000000h
30h	4	Pad Ownership (PAD_OWN_GPP_T_0)	00000000h
34h	4	Pad Ownership (PAD_OWN_GPP_T_1)	00000000h
38h	4	Pad Ownership (PAD_OWN_GPP_G_0)	00000000h
3Ch	4	Pad Ownership (PAD_OWN_GPP_G_1)	00000000h
40h	4	Pad Ownership (PAD_OWN_GPP_G_2)	00000000h
80h	4	Pad Configuration Lock (PADCFGLOCK_GPP_B_0)	00000000h
84h	4	Pad Configuration Lock GPIO TxState Register (PAD CFGLOCKTX_GPP_B_0)	00000000h
88h	4	Pad Configuration Lock (PAD CFGLOC_GPP_T_0)	00000000h
8Ch	4	Pad Configuration Lock GPIO TxState Register (PADCFGLOCKTX_GPP_T_0)	00000000h
90h	4	Pad Configuration Lock (PADCFGLOCK_GPP_G_0)	00000000h
94h	4	Pad Configuration Lock GPIO TxState Register (PADCFGLOCKTX_GPP_G_0)	00000000h
B0h	4	Host Software Pad Ownership (HOSTSW_OWN_GPP_B_0)	00000000h
B4h	4	Host Software Pad Ownership (HOSTSW_OWN_GPP_T_0)	00000000h
B8h	4	Host Software Pad Ownership (HOSTSW_OWN_GPP_G_0)	00000000h
100h	4	GPI Interrupt Status (GPI_IS_GPP_B_0)	00000000h
104h	4	GPI Interrupt Status (GPI_IS_GPP_T_0)	00000000h
108h	4	GPI Interrupt Status (GPI_IS_GPP_G_0)	00000000h
120h	4	GPI Interrupt Enable (GPI_IE_GPP_B_0)	00000000h
124h	4	GPI Interrupt Enable (GPI_IE_GPP_T_0)	00000000h
128h	4	GPI Interrupt Enable (GPI_IE_GPP_G_0)	00000000h
140h	4	GPI General Purpose Events Status (GPI_GPE_STS_GPP_B_0)	00000000h
144h	4	GPI General Purpose Events Status (GPI_GPE_STS_GPP_T_0)	00000000h
148h	4	GPI General Purpose Events Status (GPI_GPE_STS_GPP_G_0)	00000000h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
160h	4	GPI General Purpose Events Enable (GPI_GPE_EN_GPP_B_0)	00000000h
164h	4	GPI General Purpose Events Enable (GPI_GPE_EN_GPP_T_0)	00000000h
168h	4	GPI General Purpose Events Enable (GPI_GPE_EN_GPP_G_0)	00000000h
180h	4	SMI Status (GPI_SMI_STS_GPP_B_0)	00000000h
184h	4	SMI Status (GPI_SMI_STS_GPP_T_0)	00000000h
188h	4	SMI Status (GPI_SMI_STS_GPP_G_0)	00000000h
1A0h	4	SMI Enable (GPI_SMI_EN_GPP_B_0)	00000000h
1A4h	4	SMI Enable (GPI_SMI_EN_GPP_T_0)	00000000h
1A8h	4	SMI Enable (GPI_SMI_EN_GPP_G_0)	00000000h
1C0h	4	NMI Status (GPI_NMI_STS_GPP_B_0)	00000000h
1C4h	4	NMI Status (GPI_NMI_STS_GPP_T_0)	00000000h
1C8h	4	NMI Status (GPI_NMI_STS_GPP_G_0)	00000000h
1E0h	4	NMI Enable (GPI_NMI_EN_GPP_B_0)	00000000h
1E4h	4	NMI Enable (GPI_NMI_EN_GPP_T_0)	00000000h
1E8h	4	NMI Enable (GPI_NMI_EN_GPP_G_0)	00000000h
700h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPPC_B_0)	44000700h
704h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPPC_B_0)	00000018h
710h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPPC_B_1)	44000700h
714h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPPC_B_1)	00000019h
720h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPPC_B_2)	44001300h
724h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPPC_B_2)	0000301Ah
730h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPPC_B_3)	44001300h
734h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPPC_B_3)	0000301Bh
740h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPPC_B_4)	44001300h
744h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPPC_B_4)	0000301Ch
750h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPPC_B_5)	44000300h
754h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPPC_B_5)	0000001Dh
760h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPPC_B_6)	44000300h
764h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPPC_B_6)	0000001Eh
770h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPPC_B_7)	44000300h
774h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPPC_B_7)	0000001Fh

20.1.1 Family Base Address (FAMBAR) - Offset 8h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6E0000h + 8h	00000300h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0300h RO	**Family Base Address (FAMBAR):** This field provides the starting byte-align address of Family0 register sets within a Community. It is meant for software to discover from where the very first Family register (i.e. Family0 register) starts to compute the next Families address offsets.

20.1.2 Pad Base Address (PADBAR) - Offset Ch

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6E0000h + Ch	00000700h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0700h RO	**Pad Base Address (PADBAR):** This field provides the starting byte-align address of Pad0 register sets within a Community. It is meant for software to discover from where the very first Pad register (i.e. Pad0 register) starts to compute the next Pad address offsets.

20.1.3 Miscellaneous Configuration (MISCCFG) - Offset 10h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6E0000h + 10h	32043200h

Bit Range	Default & Access	Field Name (ID): Description
31:24	32h RW	**GPIO Driver Mode Interrupt Select (GPDMINTSEL):** IRQ globally for all pads (GPI_IS with corresponding GPI_IE enable). 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255
23:20	0h RO	**Reserved**
19:16	4h RO	**Reserved**
15:12	3h RW	**GPIO Group to GPE_DW1 assignment encoding (GPE0_DW1):** This register assigns a specific GPIO Group to the ACPI GPE0[63:32]. The setting is processor specific.
11:8	2h RW	**GPIO Group to GPE_DW0 assignment encoding (GPE0_DW0):** This register assigns a specific GPIO Group to the ACPI GPE0[:0]. The setting is processor specific.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**GPIO IOSF Sideband VNNREQ Enable (GPVNNREQEN):** Specify whether the GPIO Community should take part in IOSFSB VNNREQ/ACK handshake 0 = Disable participation in IOSF SB VNNREQ and VNNACK handshake 1 = Enable participation in IOSF SB VNNREQ and VNNACK handshake When this bit set to 1, GPIO controller will de-assert the VNNREQ when there is no outstanding IOSF SB upstream cycle from GPIO controller. When this bit set to 1 and MISCSECCFG.SBTRIGDIS is 0, GPIO controller will assert the VNNREQ to request for the following list of IOSF-SB Message initiation. Event list: IRQ NMI SMI SSMI Fuse/Soft strap pull VNNREQ shall de-assert when MISCSECCFG.SBTRIGDIS is set to 1. As VNNAON IP, GPIO controller will assert the VNNREQ when in reset. The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pwrgate_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For processor that does not have the soft strap defined for this power gating, this register always default to 1.
6	0h RW	**GPIO PGCB Clock Dynamic Partition Clock Gating Enable (GPPGCBDPCGEN):** Specify whether the GPIO Community PGCB clock should take part in partition clock gating 0 = Disable participation in PGCB clock dynamic partition clock gating 1 = Enable participation in PGCB clock dynamic partition clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For processor that does not have the soft strap defined for this clock gating, this register always default to 0
5	0h RW	**GPIO IOSF Sideband Dynamic Partition Clock Gating Enable (GPSIDEDPCGEN):** Specify whether the GPIO Community IOSF sideband clock should take part in partition clock gating 0 = Disable participation in IOSF sideband clock dynamic partition clock gating 1 = Enable participation in IOSF sideband clock dynamic partition clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For processor that does not have the soft strap defined for this clock gating, this register always default to 0
4	0h RW	**GPIO RCOMP clock Dynamic Local Clock Gating (GPRCOMPCDLCGEN):** Specify whether the GPIO Community should perform local clock gating on RCOMP clock 0 = Disable dynamic RCOMP clock local clock gating 1 = Enable dynamic RCOMP clock local clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For processor that does not have the soft strap defined for this clock gating, this register always default to 0

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**GPIO RTC clock Dynamic Local Clock Gating (GPRTCDLCGEN):** Specify whether the GPIO Community should perform local clock gating on RTC clock 0 = Disable dynamic RTC clock local clock gating 1 = Enable dynamic RTC clock local clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For processor that does not have the soft strap defined for this clock gating, this register always default to 0
2	0h RO	**Reserved**
1	0h RW	**GPIO Dynamic Partition Clock Gating Enable (GPDPCGEN):** Specify whether the GPIO Community should take part in partition clock gating 0 = Disable participation in dynamic partition clock gating 1 = Enable participation in dynamic partition clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For processor that does not have the soft strap defined for this clock gating, this register always default to 0
0	0h RW	**GPIO Dynamic Local Clock Gating Enable (GPDLCGEN):** Specify whether the GPIO Community should perform local clock gating 0 = Disable dynamic local clock gating 1 = Enable dynamic local clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For processor that does not have the soft strap defined for this clock gating, this register always default to 0

20.1.4 Pad Ownership (PAD_OWN_GPP_B_0) - Offset 20h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6E0000h + 20h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:28	0h RW	**Pad Ownership (PAD_OWN_GPPC_B_7):** This register can be written by CSME GPIO Function** only. Write access without CSME GPIO Function SAI shall be dropped. There is no SAI restriction on register read. Status update: GPIO input event notification (if enabled) to embedded system owner via IOSF-SB Virtual Wire message, or Host SMI (if implemented), NMI (if implemented), SCI/GPE or GPI_INT status update All subsequent read/write accesses to the corresponding pad's Pad Configuration Register are verified with the owner's GPIO Function SAI. PAD_OWN[1:0] encoding: '00' = Host GPIO ACPI Mode or GPIO Driver Mode. Host software (ACPI or GPIO Driver) has ownership of the pad. In Host GPIO Driver Mode (refer to HOSTSW_OWN), GPIO input event update is limited to GPI_STS update only. Otherwise in Host ACPI Mode, updates are limited to GPI_GPE_STS, GPI_NMI_STS and/or GPI_SMI_STS. No read/write restriction to the Pad Configuration register set during host ownership. During host ownership, CSME and PSE do not own this pad and are not notified of the GPIO input event. '01' = CSME GPIO Mode. CSME has ownership of the pad. All accesses to Pad Configuration register set must be verified with CSME GPIO Function SAI **. Non-posted cycle access without CSME SAI shall result into unsuccessful completion status. Posted cycle access without CSME SAI shall be dropped. In CSME GPIO Mode, the host related status registers related to the pad (refer to host ownership above) are masked from being updated by GPIO input event. If IOSF-SB Virtual Wire message generation is enabled for this pad, GPIO hardware sends the Virtual Wire message to CSME GPIO Function. Only CSME GPIO Function is notified of the GPIO input event. '10' = Reserved '11' = Reserved All other values are reserved. Implementation shall treat reserved values the same as 0h.
27:26	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
25:24	0h RW	**Pad Ownership (PAD_OWN_GPPC_B_6):** This register can be written by CSME GPIO Function** only. Write access without CSME GPIO Function SAI shall be dropped. During host ownership, CSME, and PSE do not own this pad and are not notified of the GPIO input event. '01' = CSME GPIO Mode. CSME has ownership of the pad. All accesses to Pad Configuration register set must be verified with CSME GPIO Function SAI **. Non-posted cycle access without CSME SAI shall result into unsuccessful completion status. Posted cycle access without CSME SAI shall be dropped. In CSME GPIO Mode, the host related status registers related to the pad (refer to host ownership above) are masked from being updated by GPIO input event. If IOSF-SB Virtual Wire message generation is enabled for this pad, GPIO hardware sends the Virtual Wire message to CSME GPIO Function. Only CSME GPIO Function is notified of the GPIO input event. '10' = PSE GPIO Mode. Same description as CSME GPIO Mode above except verifying PSE GPIO Function SAI for pad related register accesses and the Virtual Wire message is delivered to the PSE GPIO Function. '11' = Reserved. All other values are reserved. Implementation shall treat reserved values the same as 0h.
3:2	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
1:0	0h RW	**Pad Ownership (PAD_OWN_GPPC_G_16):** This register can be written by CSME GPIO Function** only. Write access without CSME GPIO Function SAI shall be dropped. There is no SAI restriction on register read. Status update: GPIO input event notification (if enabled) to embedded system owner via IOSF-SB Virtual Wire message, or Host SMI (if implemented), NMI (if implemented), SCI/GPE or GPI_INT status update All subsequent read/write accesses to the corresponding pad's Pad Configuration Register are verified with the owner's GPIO Function SAI. PAD_OWN[1:0] encoding: '00' = Host GPIO ACPI Mode or GPIO Driver Mode. Host software (ACPI or GPIO Driver) has ownership of the pad. In Host GPIO Driver Mode (refer to HOSTSW_OWN), GPIO input event update is limited to GPI_STS update only. Otherwise in Host ACPI Mode, updates are limited to GPI_GPE_STS, GPI_NMI_STS and/or GPI_SMI_STS. No read/write restriction to the Pad Configuration register set during host ownership. During host ownership, CSME, and PSE do not own this pad and are not notified of the GPIO input event. '01' = CSME GPIO Mode. CSME has ownership of the pad. All accesses to Pad Configuration register set must be verified with CSME GPIO Function SAI **. Non-posted cycle access without CSME SAI shall result into unsuccessful completion status. Posted cycle access without CSME SAI shall be dropped. In CSME GPIO Mode, the host related status registers related to the pad (refer to host ownership above) are masked from being updated by GPIO input event. If IOSF-SB Virtual Wire message generation is enabled for this pad, GPIO hardware sends the Virtual Wire message to CSME GPIO Function. Only CSME GPIO Function is notified of the GPIO input event. '10' = PSE GPIO Mode. Same description as CSME GPIO Mode above except verifying PSE GPIO Function SAI for pad related register accesses and the Virtual Wire message is delivered to the PSE GPIO Function. '11' = Reserved. All other values are reserved. Implementation shall treat reserved values the same as 0h.

20.1.12 Pad Configuration Lock (PADCFGLOCK_GPP_B_0) - Offset 80h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6E0000h + 80h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved**
25	0h RO	**Reserved**
24	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**Pad Config Lock (PADCFGLOCK_GPPC_B_23):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally.
22	0h RW	**Pad Config Lock (PADCFGLOCK_GPPC_B_22):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally.

Bit Range	Default & Access	Field Name (ID): Description
21	0h RW	**Pad Config Lock (PADCFGLOCK_GPPC_B_21):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	**Pad Config Lock (PADCFGLOCK_GPPC_B_0):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally.

20.1.13 Pad Configuration Lock GPIO TxState Register (PADCFGLOCKTX_GPP_B_0) - Offset 84h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6E0000h + 84h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved**
25	0h RO	**Reserved**
24	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_B_23):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value.
22	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_B_22):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value.

Bit Range	Default & Access	Field Name (ID): Description
21	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_B_21):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value.
20	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_B_20):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value.

Bit Range	Default & Access	Field Name (ID): Description
19	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_B_19):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally.
14	0h RW	**Pad Config Lock (PADCFGLOCK_GPPC_T_14):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally.

20.1.15 Pad Configuration Lock GPIO TxState Register (PADCFGLOCKTX_GPP_T_0) - Offset 8Ch

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6E0000h + 8Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_T_15):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value.
14	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_T_14):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value.

Bit Range	Default & Access	Field Name (ID): Description
13	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_T_13):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value.
12	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_T_12):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value.

Bit Range	Default & Access	Field Name (ID): Description
11	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_T_11):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value.
10	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_T_10):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_T_9):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value.
8	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_T_8):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value.
4	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_T_4):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_T_3):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_T_2):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value.
1	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_T_1):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_T_0):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value.

20.1.16 Pad Configuration Lock (PADCFGLOCK_GPP_G_0) - Offset 90h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6E0000h + 90h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RO	**Reserved**
23	0h RW	**Pad Config Lock (PADCFGLOCK_GPPC_G_23):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally.
22	0h RW	**Pad Config Lock (PADCFGLOCK_GPPC_G_22):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally.

Bit Range	Default & Access	Field Name (ID): Description
21	0h RW	**Pad Config Lock (PADCFGLOCK_GPPC_G_21):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... 3	0h RW	**Pad Config Lock (PADCFGLOCK_GPPC_G_3):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Pad Config Lock (PADCFGLOCK_GPPC_G_2):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_G_0):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value.

20.1.18 Host Software Pad Ownership (HOSTSW_OWN_GPP_B_0) - Offset B0h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6E0000h + B0h	00000000h
