20.2.59 PWM Control (PWMC) - Offset 204h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 204h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
	0h RW	**EN:** 0 = Disable PWM Output 1 = Enable PWM Output
30	0h RW/1S/V	**Software Update (SWUP):** Indication that there is an update to PWM settings pending. SW sets this bit to 1 when updating the PWM_base_unit or PWM_on_time_divisor fields. The PWM module will apply the new settings at the end of the current cycle and reset this bit. 0 = No updates pending 1 = Update pending
29:8	000000h RW	**Base Unit (BASEUNIT):** Base unit register. Unsigned 8 integer bits, 14 fraction bits. Used to determine PWM output frequency. The PWM base frequency for SPT is 32.768 KHz. Refer to PWM section for programming details.
7:0	00h RW	**On Time Divisor (ONTIMEDIV):** PWM duty cycle = PWM_on-time_divisor/256.

20.2.60 GPIO Serial Blink Enable (GP_SER_BLINK) - Offset 20Ch

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 20Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4:0	00h RW	**GP SER BLINK (GP_SER_BLINK):** The setting of this bit has no effect if the corresponding GPIO is programmed as an input, if the corresponding GPIO has the PWM enabled, or if Serial Blink capability does not exist . This bit should be set to a 1 before output buffer is enabled. When set to a '0', the corresponding GPIO will function normally. This bit should be set to a 1 while the corresponding PMode bit is set to 0h (GPIO Mode). Setting the PMode bit to other value (non-GPIO Mode) after the GP_SER_BLINK bit ensures PCH will not drive a 1 on the pin as an output. When this corresponding bit is set to a 1 and the pin is configured to output mode, the serial blink capability is enabled and the programmed message is serialized out through an open-drain buffer configuration. The value of the corresponding GPIOTxState bit remains unchanged and does not impact the serial blink capability in any way. Writes to this register have no effect when the corresponding pin is configured in native mode and the read value returned is undefined. Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= Pad N-1 Note: N is the number of Pads in the Community. Optionally N may be the number of pads for a group of pads in the Community. In which case there is a register for each group.

20.2.61 GPIO Serial Blink Command/Status (GP_SER_CMDSTS) - Offset 210h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 210h	00080000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:22	0h RW	**Data Length Select (DLS):** This read/write field determines the number of bytes to serialize on GPIO 00: Serialize bits 7:0 of GP_GB_DATA (1 byte) 01: Serialize bits 15:0 of GP_GB_DATA (2 bytes) 10: Undefined - Software must not write this value 11: Serialize bits :0 of GP_GB_DATA (4 bytes) Software should not modify the value in this register unless the Busy bit is clear
21:16	08h RW	**Data Rate Select (DRS):** This read/write field selects the number of 166.64ns (4 clock periods GPIO clock - if GPIO clock is 24MHz) time intervals to count between Manchester data transitions. The default of 8h results in a 1333.33 ns minimum time between transitions. A value of 0h in this register produces undefined behavior. Software should not modify the value in this register unless the Busy bit is clear.
15:9	0h RO	**Reserved**
8	0h RO/V	**BUSY:** This read-only status bit is the hardware indication that a serialization is in progress. Hardware sets this bit to 1 based on the Go bit being set. Hardware clears this bit when the Go bit is cleared by the hardware.
7:1	0h RO	**Reserved**
0	0h RW	**GO:** This bit is set to 1 by software to start the serialization process. Hardware clears the bit after the serialized data is sent. Writes of 0 to this register have no effect. Software should not write this bit to 1 unless the Busy status bit is cleared.

20.2.62 GPIO Serial Blink Data (GP_SER_DATA) - Offset 214h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 214h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GP Serial Blink Data (GP_GB_DATA):** This read-write register contains the data serialized out. The number of bits shifted out is selected through the DLS field in the GP_GB_CMDSTS register. This register should not be modified by software when the Busy bit is set.

20.2.63 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_V_0) - Offset 700h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 700h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally

Bit Range	Default & Access	Field Name (ID): Description
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.

Bit Range	Default & Access	Field Name (ID): Description
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.64 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_V_0) - Offset 704h

Refer to Register Field for detail

Type	Size	Offset	Default

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	2Ch RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.65 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_V_1) - Offset 710h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 710h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	2Dh RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	2Eh RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.69 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_V_3) - Offset 730h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 730h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	30h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.73 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_V_5) - Offset 750h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 750h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.74 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_V_5) - Offset 754h

Refer to Register Field for detail

Type	Size	Offset	Default

18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	32h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.77 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_V_7) - Offset 770h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 770h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.80 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_V_8) - Offset 784h

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	34h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.81 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_V_9) - Offset 790h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 790h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.84 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_V_10) - Offset 7A4h

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	36h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.85 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_V_11) - Offset 7B0h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 7B0h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)

Bit Range	Default & Access	Field Name (ID): Description
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.88 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_V_12) - Offset 7C4h

Bit Range	Default & Access	Field Name (ID): Description
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	38h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.89 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_V_13) - Offset 7D0h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 7D0h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	39h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.91 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_V_14) - Offset 7E0h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 7E0h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)

Bit Range	Default & Access	Field Name (ID): Description
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.92 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_V_14) - Offset 7E4h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 7F0h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	3Bh RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.95 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_0) - Offset 800h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 800h	44000200h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved**
12:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.96 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_H_0) - Offset 804h

Refer to Register Field for detail

29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	3Dh RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.99 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_2) - Offset 820h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 820h	44000200h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved**
12:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.100 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_H_2) - Offset 824h

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	3Fh RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.103 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_4) - Offset 840h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 840h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)

Bit Range	Default & Access	Field Name (ID): Description
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	41h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.107 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_6) - Offset 860h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 860h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved**
12:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved**
12:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.110 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_H_7) - Offset 874h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 874h	00000043h

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	43h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.111 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_8) - Offset 880h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 880h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved**
12:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.112 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_H_8) - Offset 884h

Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	44h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.113 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_9) - Offset 890h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 890h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)

Bit Range	Default & Access	Field Name (ID): Description
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved**
12:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.114 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_H_9) - Offset 894h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 894h	00000045h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	45h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.115 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_10) - Offset 8A0h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 8A0h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved**
12:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	46h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.117 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_11) - Offset 8B0h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 8B0h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved**
12:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	48h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.121 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_13) - Offset 8D0h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 8D0h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW/V	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.122 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_H_13) - Offset 8D4h

Refer to Register Field for detail

Type	Size	Offset	Default

17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	4Ah RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.125 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_15) - Offset 8F0h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 8F0h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW/V	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved**
11:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.128 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_H_16) - Offset 904h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 904h	0000004Ch

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	4Ch RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.129 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_17) - Offset 910h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 910h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.130 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_H_17) - Offset 914h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	4Eh RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.133 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_19) - Offset 930h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 930h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.136 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_H_20) - Offset 944h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 944h	00000050h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	50h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.137 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_21) - Offset 950h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 950h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	51h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.139 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_22) - Offset 960h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 960h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)

Bit Range	Default & Access	Field Name (ID): Description
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.140 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_H_22) - Offset 964h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 964h	00000052h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	52h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 970h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	53h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.143 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_D_0) - Offset 980h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 980h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.144 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_D_0) - Offset 984h

Refer to Register Field for detail

The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	6Eh RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.147 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_D_2) - Offset 9A0h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 9A0h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.148 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_D_2) - Offset 9A4h

Refer to Register Field for detail

Type	Size	Offset	Default

The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	70h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.151 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_D_4) - Offset 9C0h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 9C0h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.154 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_D_5) - Offset 9D4h

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	72h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.155 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_D_6) - Offset 9E0h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 9E0h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	74h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.159 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_D_8) - Offset A00h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + A00h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.161 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_D_9) - Offset A10h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + A10h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)

Bit Range	Default & Access	Field Name (ID): Description
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.162 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_D_9) - Offset A14h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + A14h	00000076h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	76h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.163 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_D_10) - Offset A20h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + A20h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.164 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_D_10) - Offset A24h

The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	77h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.165 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_D_11) - Offset A30h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + A30h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.166 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_D_11) - Offset A34h

21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	19h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.169 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_D_13) - Offset A50h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + A50h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.170 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_D_13) - Offset A54h

Refer to Register Field for detail

31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	1Bh RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.173 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_D_15) - Offset A70h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + A70h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.174 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_D_15) - Offset A74h

Refer to Register Field for detail

This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.176 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_D_16) - Offset A84h

18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	1Dh RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.177 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_D_17) - Offset A90h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + A90h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	1Fh RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.181 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_D_19) - Offset AB0h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + AB0h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved**
11:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.184 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_U_0) - Offset AD4h

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	22h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.185 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_U_1) - Offset AE0h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + AE0h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved**
11:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	23h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.187 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_U_2) - Offset AF0h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + AF0h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved**
11:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.188 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_U_2) - Offset AF4h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + AF4h	00000024h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	24h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	25h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.191 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_U_4) - Offset B10h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + B10h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved**
12:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	57h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.195 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_U_6) - Offset B30h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + B30h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved**
12:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.196 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_U_6) - Offset B34h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + B34h	00000058h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.

31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.198 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_U_7) - Offset B44h

18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	59h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.199 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_U_8) - Offset B50h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + B50h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.202 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_U_9) - Offset B64h

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	5Bh RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.203 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_U_10) - Offset B70h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + B70h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.206 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_U_11) - Offset B84h

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	5Dh RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.207 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_U_12) - Offset B90h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + B90h	44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved**
11:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved**
11:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.210 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_U_13) - Offset BA4h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + BA4h	0000105Fh

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	4h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	5Fh RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.211 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_U_14) - Offset BB0h

Refer to Register Field for detail

MMIO	32 bit	FD6D0000h + BB0h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved**
11:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	60h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.213 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_U_15) - Offset BC0h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + BC0h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)

Bit Range	Default & Access	Field Name (ID): Description
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.214 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_U_15) - Offset BC4h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + BC4h	00000061h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	61h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + BD0h	44600700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	3h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved**
11:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	62h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.217 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_U_17) - Offset BE0h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + BE0h	44600700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	3h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved**
11:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.218 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_U_17) - Offset BE4h

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	64h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.2.221 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_U_19) - Offset C00h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + C00h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.2.222 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_U_19) - Offset C04h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + C04h	00000065h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.

20.3 GPIO Community 2 Registers Summary

This chapter documents GPIO 2 Registers.

Table 20-3. Summary of GPIO 2 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
8h	4	Family Base Address (FAMBAR)	00000300h
Ch	4	Pad Base Address (PADBAR)	00000700h
10h	4	Miscellaneous Configuration (MISCCFG)	34043200h
20h	4	Pad Ownership (PAD_OWN_DSW_0)	00000000h
24h	4	Pad Ownership (PAD_OWN_DSW_1)	00000000h
80h	4	Pad Configuration Lock (PADCFGLOCK_DSW_0)	00000000h
84h	4	Pad Configuration Lock GPIO TxState Register (PADCFGLOCKTX_DSW_0)	00000000h
B0h	4	Host Software Pad Ownership (HOSTSW_OWN_DSW_0)	00000000h
100h	4	GPI Interrupt Status (GPI_IS_DSW_0)	00000000h
120h	4	GPI Interrupt Enable (GPI_IE_DSW_0)	00000000h
140h	4	GPI General Purpose Events Status (GPI_GPE_STS_DSW_0)	00000000h
160h	4	GPI General Purpose Events Enable (GPI_GPE_EN_DSW_0)	00000000h
180h	4	SMI Status (GPI_SMI_STS_DSW_0)	00000000h
1A0h	4	SMI Enable (GPI_SMI_EN_DSW_0)	00000000h
1C0h	4	NMI Status (GPI_NMI_STS_DSW_0)	00000000h
1E0h	4	NMI Enable (GPI_NMI_EN_DSW_0)	00000000h
250h	4	Event Trigger Output Enable (EVOUTEN_0)	00000000h
260h	8	Event Trigger Mapping (EVMAP_0)	0000000000000000h
700h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPD_0)	04000700h
704h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPD_0)	00003021h
710h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPD_1)	04000700h
714h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPD_1)	00003C22h
720h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPD_2)	04000700h
724h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPD_2)	00003C23h
730h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPD_3)	04000700h
734h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPD_3)	00003024h
740h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPD_4)	04000600h
744h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPD_4)	00000025h
750h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPD_5)	04000600h
754h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPD_5)	00000026h
770h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPD_7)	04000200h
774h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPD_7)	00000028h
780h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPD_8)	04000700h
784h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPD_8)	00000029h
790h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPD_9)	04000600h
794h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPD_9)	0000002Ah
7A0h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPD_10)	04000600h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
7A4h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPD_10)	0000002Bh
7B0h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPD_11)	04000600h
7B4h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPD_11)	0000006Bh

20.3.1 Family Base Address (FAMBAR) - Offset 8h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6C0000h + 8h	00000300h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0300h RO	**Family Base Address (FAMBAR):** This field provides the starting byte-align address of Family0 register sets within a Community. It is meant for software to discover from where the very first Family register (i.e. Family0 register) starts to compute the next Families address offsets.

20.3.2 Pad Base Address (PADBAR) - Offset Ch

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6C0000h + Ch	00000700h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0700h RO	**Pad Base Address (PADBAR):** This field provides the starting byte-align address of Pad0 register sets within a Community. It is meant for software to discover from where the very first Pad register (i.e. Pad0 register) starts to compute the next Pad address offsets.

20.3.3 Miscellaneous Configuration (MISCCFG) - Offset 10h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6C0000h + 10h	34043200h

Bit Range	Default & Access	Field Name (ID): Description
31:24	34h RW	**GPIO Driver Mode Interrupt Select (GPDMINTSEL):** IRQ globally for all pads (GPI_IS with corresponding GPI_IE enable). 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.3.6 Pad Configuration Lock (PADCFGLOCK_DSW_0) - Offset 80h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6C0000h + 80h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	**Reserved**
16	0h RO	**Reserved**
15	0h RO	**Reserved**
14	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
13	0h RO	**Reserved**
12	0h RO	**Reserved**
11	0h RW	**Pad Config Lock (PADCFGLOCK_GPD_11):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally.
10	0h RW	**Pad Config Lock (PADCFGLOCK_GPD_10):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally.

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	1h RO/V	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.3.20 Pad Configuration DW1 (PAD_CFG_DW1_GPD_0) - Offset 704h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6C0000h + 704h	00003021h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RO	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	Ch RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RO	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	21h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.3.21 Pad Configuration DW0 (PAD_CFG_DW0_GPD_1) - Offset 710h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6C0000h + 710h	04000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RO	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	Fh RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RO	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	22h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.3.23 Pad Configuration DW0 (PAD_CFG_DW0_GPD_2) - Offset 720h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6C0000h + 720h	04000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.3.24 Pad Configuration DW1 (PAD_CFG_DW1_GPD_2) - Offset 724h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6C0000h + 724h	00003C23h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RO	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	Fh RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RO	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	23h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)

Bit Range	Default & Access	Field Name (ID): Description
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
17:14	0h RO	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	Ch RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RO	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	24h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.3.27 Pad Configuration DW0 (PAD_CFG_DW0_GPD_4) - Offset 740h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6C0000h + 740h	04000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	1h RO/V	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RO	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RO	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	26h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.3.31 Pad Configuration DW0 (PAD_CFG_DW0_GPD_7) - Offset 770h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6C0000h + 770h	04000200h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	0h RO	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.3.32 Pad Configuration DW1 (PAD_CFG_DW1_GPD_7) - Offset 774h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6C0000h + 774h	00000028h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RO	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. 31:30	0h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RO	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RO	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	29h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.3.35 Pad Configuration DW0 (PAD_CFG_DW0_GPD_9) - Offset 790h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6C0000h + 790h	04000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	1h RO/V	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	1h RO/V	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.3.38 Pad Configuration DW1 (PAD_CFG_DW1_GPD_10) - Offset 7A4h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6C0000h + 7A4h	0000002Bh

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RO	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RO	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	2Bh RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.3.39 Pad Configuration DW0 (PAD_CFG_DW0_GPD_11) - Offset 7B0h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6C0000h + 7B0h	04000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	1h RO/V	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.3.40 Pad Configuration DW1 (PAD_CFG_DW1_GPD_11) - Offset 7B4h

Refer to Register Field for detail

20.4.1 Family Base Address (FAMBAR) - Offset 8h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6B0000h + 8h	00000300h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0300h RO	**Family Base Address (FAMBAR):** This field provides the starting byte-align address of Family0 register sets within a Community. It is meant for software to discover from where the very first Family register (i.e. Family0 register) starts to compute the next Families address offsets.

20.4.2 Pad Base Address (PADBAR) - Offset Ch

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6B0000h + Ch	00000700h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0700h RO	**Pad Base Address (PADBAR):** This field provides the starting byte-align address of Pad0 register sets within a Community. It is meant for software to discover from where the very first Pad register (i.e. Pad0 register) starts to compute the next Pad address offsets.

20.4.3 Miscellaneous Configuration (MISCCFG) - Offset 10h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6B0000h + 10h	35043200h

Bit Range	Default & Access	Field Name (ID): Description
31:24	35h RW	**GPIO Driver Mode Interrupt Select (GPDMINTSEL):** IRQ globally for all pads (GPI_IS with corresponding GPI_IE enable). 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255
23:20	0h RO	**Reserved**
19:16	4h RW	**Reserved**
15:12	3h RW	**GPIO Group to GPE_DW1 assignment encoding (GPE0_DW1):** This register assigns a specific GPIO Group to the ACPI GPE0[63:32]. The setting is processor specific.
11:8	2h RW	**GPIO Group to GPE_DW0 assignment encoding (GPE0_DW0):** This register assigns a specific GPIO Group to the ACPI GPE0[:0]. The setting is processor specific.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**GPIO IOSF Sideband VNNREQ Enable (GPVNNREQEN):** Specify whether the GPIO Community should take part in IOSFSB VNNREQ/ACK handshake 0 = Disable participation in IOSF SB VNNREQ and VNNACK handshake 1 = Enable participation in IOSF SB VNNREQ and VNNACK handshake When this bit set to 1, GPIO controller will de-assert the VNNREQ when there is no outstanding IOSF SB upstream cycle from GPIO controller. When this bit set to 1 and MISCSECCFG.SBTRIGDIS is 0, GPIO controller will assert the VNNREQ to request for the following list of IOSF-SB Message initiation. Event list: IRQ NMI SMI SSMI Fuse/Soft strap pull VNNREQ shall de-assert when MISCSECCFG.SBTRIGDIS is set to 1. As VNNAON IP, GPIO controller will assert the VNNREQ when in reset. The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pwrgate_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For processor that does not have the soft strap defined for this power gating, this register always default to 1.
6	0h RW	**GPIO PGCB Clock Dynamic Partition Clock Gating Enable (GPPGCBDPCGEN):** Specify whether the GPIO Community PGCB clock should take part in partition clock gating 0 = Disable participation in PGCB clock dynamic partition clock gating 1 = Enable participation in PGCB clock dynamic partition clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For processor that does not have the soft strap defined for this clock gating, this register always default to 0

This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally.

Bit Range	Default & Access	Field Name (ID): Description
19	0h RW	**Pad Config Lock (PADCFGLOCK_GPPC_A_19):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally.
18	0h RW	**Pad Config Lock (PADCFGLOCK_GPPC_A_18):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... 20.4.12 Pad Configuration Lock GPIO TxState Register (PADCFGLOCKTX_GPP_A_0) - Offset 94h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6B0000h + 94h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_A_23):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value.
22	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_A_22):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value.

Bit Range	Default & Access	Field Name (ID): Description
21	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_A_21):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value.
20	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_A_20):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value.

Bit Range	Default & Access	Field Name (ID): Description
19	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_A_19):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value.
18	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_A_18):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value.

This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value.

20.4.15 Host Software Pad Ownership (HOSTSW_OWN_GPP_S_0) - Offset B4h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6B0000h + B4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1	0h RSV	**HOSTSW_OWN_GPP_S_1:** This register determines the appropriate host status bit update when a pad is under host ownership (refer to PAD_OWN). 0 = ACPI Mode. GPIO input event updates are limited to GPI_GPE_STS, GPI_NMI_STS and/or GPI_SMI_STS. GPI_STS update is masked. 1 = GPIO Driver Mode. GPIO input event updates are limited to GPI_STS. GPI_GPE_STS, GPI_NMI_STS and/or GPI_SMI_STS updates are masked. Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 Note: N is the number of Pads in the Community. Optionally N may be the number of pads for a group of pads in the Community. In which case there is a register for each group.
0	0h RSV	**HOSTSW_OWN_GPP_S_0:** This register determines the appropriate host status bit update when a pad is under host ownership (refer to PAD_OWN). 0 = ACPI Mode. GPIO input event updates are limited to GPI_GPE_STS, GPI_NMI_STS and/or GPI_SMI_STS. GPI_STS update is masked. 1 = GPIO Driver Mode. GPIO input event updates are limited to GPI_STS. GPI_GPE_STS, GPI_NMI_STS and/or GPI_SMI_STS updates are masked. Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 Note: N is the number of Pads in the Community.
