Intel Atom® x6000E Series, and Intel® Pentium® and Celeron® N and J Series Processors for IoT Applications

Datasheet, Volume 2 (Book 2 of 3)

Platform Controller Hub (PCH)

February 2023

Revision 003

Document Number: 636722

You may not use or facilitate the use of this document in connection with any infringement or other legal analysis concerning Intel products described herein. You agree to grant Intel a non-exclusive, royalty-free license to any patent claim thereafter drafted which includes subject matter disclosed herein.

No license (express or implied, by estoppel or otherwise) to any intellectual property rights is granted by this document.

Intel technologies' features and benefits depend on system configuration and may require enabled hardware, software or service activation. Learn more at Intel.com, or from the OEM or retailer.

No computer system can be absolutely secure. Intel does not assume any liability for lost or stolen data or systems or any damages resulting from such losses.

The products described may contain design defects or errors known as errata which may cause the product to deviate from published specifications. Current characterized errata are available on request.

Intel disclaims all express and implied warranties, including without limitation, the implied warranties of merchantability, fitness for a particular purpose, and non-infringement, as well as any warranty arising from course of performance, course of dealing, or usage in trade.

All information provided here is subject to change without notice. Contact your Intel representative to obtain the latest Intel product specifications and roadmaps.

Copies of documents which have an order number and are referenced in this document may be obtained by calling 1-800-548-4725 or visit www.intel.com/design/literature.htm.

No computer system can provide absolute security under all conditions. Intel® Trusted Execution Technology (Intel® TXT) requires a computer system with Intel® Virtualization Technology, an Intel TXT-enabled processor, chipset, BIOS, Authenticated Code Modules and an Intel TXT-compatible measured launched environment (MLE). The MLE could consist of a virtual machine monitor, an OS or an application. In addition, Intel TXT requires the system to contain a TPM v1.2, as defined by the Trusted Computing Group and specific software for some uses. For more information, see http://www.intel.com/technology/security/

Intel® Virtualization Technology requires a computer system with an enabled Intel® processor, BIOS, virtual machine monitor (VMM) and, for some uses, certain computer system software enabled for it. Functionality, performance or other benefits will vary depending on hardware and software configurations and may require a BIOS update. Software applications may not be compatible with all operating systems. Please check with your application vendor.

Intel® High Definition Audio (Intel® HD Audio): Requires an Intel® HD Audio enabled system. Consult your PC manufacturer for more information. Sound quality will depend on equipment and actual implementation. For more information about Intel® HD Audio, refer to http://www.intel.com/design/chipsets/hdaudio.htm

Hyper-Threading Technology requires a computer system with a processor supporting HT Technology and an HT Technology-enabled chipset, BIOS and operating system. Performance will vary depending on the specific hardware and software you use. For more information including details on which processors support HT Technology, see http://www.intel.com/info/hyperthreading.

Enhanced Intel SpeedStep® Technology See the Processor Spec Finder or contact your Intel representative for more information.

64-bit computing on Intel architecture requires a computer system with a processor, chipset, BIOS, operating system, device drivers and applications enabled for Intel® 64 architecture. Performance will vary depending on your hardware and software configurations. Consult with your system vendor for more information.

Intel processor numbers are not a measure of performance. Processor numbers differentiate features within each processor family, not across different processor families. See www.intel.com/products/processor_number for details.

Revision History

Revision Date	Revision Number	Description
February 2023	003	• Chapter 2, "Enhanced Serial Peripheral Interface (eSPI) Controller" — Section 2.1.29 - Updated bit range, default & access and field description, Manufacturer's ID (ESPI_MANID) - Offset F8h. • Chapter 5, "Converged Audio, Voice, Speech (cAVS) Controller" — Section 5.1.41 - Updated bit range, default & access and field description, Manufacturing Process (MANID) - Offset F8h • Chapter 6, "System Management Bus (SMBus) Controller" — Section 6.1.25 - Updated bit range, default & access and field description, Manufacturer's ID (MANID) - Offset F8h • Chapter 7, "Serial Peripheral Interface (SPI) Controller" — Section 7.1.10 - Updated bit range, default & access and field description, Manufacturer's ID (BIOS_SPI_MANID) - Offset F8h • Chapter 10, "TSN GbE Controller" — Section 10.2.52 - Updated field description on Bit16, MAC_GPIO_STATUS — Offset 20Ch • Chapter 13, "Secure Digital I/O (SDIO) Controller" — Section 13.3.7 - Added new table — Section 13.3.8 - Added new table — Section 13.3.9 - Added new table — Section 13.3.11 - Added new table • Chapter 16, "Host Embedded Controller Interface (HECI)" — Section 16.1.40 - Updated field description on Bit16, MAC_GPIO_STATUS — Offset 20Ch • Chapter 31, "ModPHY Configuration" — New chapter
August 2021	002	• Chapter 4, "Power Management Controller (PMC)" — Section 4.3.14 - Updated field description on Bit7, General Purpose Event 0 Status [127:96] (GPE0_STS_127_96) — Offset 6Ch. — Section 4.3.14 - Updated field description on Bit19, General Purpose Event 0 Status [127:96] (GPE0_STS_127_96) — Offset 6Ch. — Section 4.3.18 - Updated field description on Bit19, General Purpose Event 0 Enable [127:96] (GPE0_EN_127_96) — Offset 7Ch.
July 2021	001	Initial release.

§ §

1 Introduction

The Intel Atom® x6000E series, Pentium® N and J series, and Celeron® N and J series processor is targeted towards various IoT segments, such as industrial, retail, and embedded. It features real time compute with technologies such as TSN, TCC, which are expected to drive the future of IoT.

Intel Atom® x6000E series, Pentium® N and J series, and Celeron® N and J series processor is an Intel Architecture (IA) Multi-Chip Processor (MCP) 2-Chip Package, built on a 10-nanometer Compute Die and a 14-nanometer Platform Controller Hub (PCH) into a single package. Both dies are connected via the On Package Interface (OPI).

1.1 About this Manual

This document is intended for Original Equipment Manufacturers (OEMs), Original Design Manufacturers (ODM) and BIOS vendors creating products based on the Elkhart Lake family Multi Chip Package (MCP).

Throughout this document, the name "Processor" is used as a general term and refers to all Elkhart Lake family SKUs, unless specifically noted otherwise. The compute die may be referred to simply as "Compute Die" and the Platform Controller Hub may be referred to simply as "PCH".

This manual assumes a working knowledge of the vocabulary and principles of interfaces and architectures such as PCI express* (PCIe*), Universal Serial Bus (USB), Advanced Host Controller Interface (AHCI), eXtensible Host Controller Interface (xHCI), and so forth.

This manual abbreviates PCI buses as Bn, devices as Dn and functions as Fn. For example, Device 31 Function 0 is abbreviated as D31:F0, and Bus 1 Device 8 Function 0 is abbreviated as B1:D8:F0. Generally, the bus number will not be used, and can be considered to be Bus 0. These numbers are shown as decimal unless otherwise indicated.

This is the core reference document for external design specifications. Information provided here takes precedence, if there are any discrepancies found in related documents.

2 Enhanced Serial Peripheral Interface (eSPI) Controller

2.1 eSPI Configuration Registers Summary

This chapter documents the registers in Bus: 0, Device 31, Function 0.

Summary of Bus: 0, Device: 31, Function: 0 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	Device and Vendor Identifiers (ESPI_DID_VID)	4B008086h
4h	4	Device Status and Command (ESPI_STS_CMD)	00000403h
6h	2	Primary Status (STS)	0200h
8h	4	Class Code and Revision ID (ESPI_CC_RID)	06010000h
Ch	4	Peripheral Channel Header Type and Primary Latency (ESPI_PCHT_PCPLT)	00800000h
Dh	1	Primary Latency Timer (PLT)	00h
Eh	1	Header Type (HTYPE)	80h
2Ch	4	Sub System Identifiers (ESPI_SS)	00000000h
34h	4	Capability List Pointer (ESPI_CAPP)	00000000h
64h	4	Peripheral Channel Serial IRQ Control (ESPI_PCSERIRQC)	00000000h
80h	4	I/O Decode Ranges and I/O Enables (ESPI_IOD_IOE)	00000000h
82h	2	I/O Enables (IOE)	0000h
84h	4	LPC Generic IO Range 1 (ESPI_LGIR1)	00000000h
88h	4	LPC Generic IO Range 2 (ESPI_LGIR2)	00000000h
8Ch	4	LPC Generic IO Range 3 (ESPI_LGIR3)	00000000h
90h	4	LPC Generic IO Range 4 (ESPI_LGIR4)	00000000h
94h	4	USB Legacy Keyboard/Mouse Control (ESPI_ULKMC)	00000000h
98h	4	LPC Generic Memory Range (ESPI_LGMR)	00000000h
A0h	4	eSPI CS1 IO Routing Enables (ESPI_CS1IORE)	00000000h
A4h	4	eSPI CS1 Generic IO Range 1 (ESPI_CS1GIR1)	00000000h
A8h	4	eSPI CS1 Generic Memory Range 1 (ESPI_CS1GMR1)	00000000h
D0h	4	FWH ID Select 1 (ESPI_PCFS1)	00000000h
D4h	4	FWH ID Select 2 (ESPI_PCFS2)	00000000h
D8h	4	BIOS Decode Enable (ESPI_BDE)	0000FFCFh
DCh	4	BIOS Control (ESPI_BC)	00000020h
E0h	4	PCI Clock Control (PCCTL)	00000000h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
F0h	4	Unsupported Request Error Status (URES)	00000000h
F4h	4	Unsupported Request Error Control (UREC)	00000000h
F8h	4	Manufacturer's ID (ESPI_MANID)	00000F00h

2.1.1 Device and Vendor Identifiers (ESPI_DID_VID) - Offset 0h

Various Identifiers.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:0] + 0h	4B008086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	4B00h RO/V	**Device Identification (DID):** The default value of this is hardwired. The upper 9-bits of this field can be overridden by the SetID IOSF-SB Message.
15:0	8086h RO	**Vendor Identification (VID):** Indicates Intel

2.1.2 Device Status and Command (ESPI_STS_CMD) - Offset 4h

Device Status and Command.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:0] + 4h	00000403h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**Detected Parity Error (DPE):** Set when the bridge detects a parity error on the internal backbone. This bit gets set even if CMD.PERE is not set.
30	0h RW/1C/V	**Signaled System Error (SSE):** Set when the LPC bridge signals a system error to the internal SERR# logic.
29	0h RW/1C/V	**Received Master Abort (RMA):** Set when the bridge receives a completion with unsupported request status from the backbone.
28	0h RW/1C/V	**Received Target Abort (RTA):** Set when the bridge receives a completion with completer abort status from the backbone.
27	0h RW/1C/V	**Signaled Target Abort (STA):** Set when the bridge generates a completion packet with target abort status on the backbone.
26:25	0h RO	**DEVSEL# Timing Status (DTS):** Indicates medium timing, although this has no meaning on the backbone.

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW/1C/V	**Data Parity Error Detected (DPD):** Set when the bridge receives a completion packet from the backbone from a previous request, and detects a parity error, and CMD.PERE is set.
23	0h RO	**Fast Back to Back Capable (FBC):** Reserved
22	0h RO	**Reserved**
21	0h RO	**66 MHz Capable (C66):** Reserved
20	0h RO	**Capabilities List (CLIST):** There is a capabilities list in the LPC bridge.
19	0h RO	**Interrupt Status (INTS):** The LPC bridge does not generate interrupts.
18:11	0h RO	**Reserved**
10	1h RO	**Interrupt Disable (INTD):** The LPC bridge has no interrupts to disable
9	0h RO	**Fast Back to Back Enable (FBE):** Reserved
8	0h RW	**SERR# Enable (SEE):** The LPC bridge generates SERR# if this bit is set.
7	0h RO	**Wait Cycle Control (WCC):** Reserved
6	0h RW	**Parity Error Response Enable (PERE):** When this bit is set to 1, it enables the LPC bridge to response to parity errors detected on backbone interface.
5	0h RO	**VGA Palette Snoop (VGA_PSE):** Reserved
4	0h RO	**Memory Write and Invalidate Enable (MWIE):** Reserved
3	0h RO	**Special Cycle Enable (SCE):** Reserved
2	0h RW	**Bus Master Enable (BME):** Controls a device's ability to act as a master on the bus. A value of 0 disables the device from generating traffic. A value of 1 allows the device to behave as a bus master. State after RST# is 0.
1	1h RO	**Memory Space Enable (MSE):** Memory space cannot be disabled on LPC.
0	1h RO	**I/O Space Enable (IOSE):** I/O space cannot be disabled on LPC.

2.1.3 Primary Status (STS) - Offset 6h

Status.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:31, F:0] + 6h	0200h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C	**Detected Parity Error (DPE):** Set when the bridge detects a parity error on the internal backbone. This bit gets set even if CMD.PERE is not set.
14	0h RW/1C	**Signaled System Error (SSE):** Set when the LPC bridge signals a system error to the internal SERR# logic.
13	0h RO	**Received Master Abort (RMA):** Set when the bridge receives a completion with unsupported request status from the backbone. LPC is a target only controller.
12	0h RO	**Received Target Abort (RTA):** Set when the bridge receives a completion with completer abort status from the backbone. LPC is a target only controller.
11	0h RW/1C	**Signalled Target Abort (STA):** Set when the bridge generates a completion packet with target abort status on the backbone.
10:9	1h RO	**DEVSEL# Timing Status (DTS):** Indicates medium timing, although this has no meaning on the backbone.
8	0h RW/1C	**Data Parity Error Detected (DPD):** Set when the bridge receives a completion packet from the backbone from a previous request, and detects a parity error, and CMD.PERE is set.
7	0h RO	**Fast Back to Back Capable (FBC):** Reserved
6	0h RO	**Reserved**
5	0h RO	**66 MHz Capable (C66):** Reserved
4	0h RO	**Capabilities List (CLIST):** There is a capabilities list in the LPC bridge.
3	0h RO	**Interrupt Status (INTRSTS):** The LPC bridge does not generate interrupts.
2:0	0h RO	**Reserved**

2.1.4 Class Code and Revision ID (ESPI_CC_RID) - Offset 8h

Writing to this register controls what is reported in all of the RID registers in the component. The value written does not get directly loaded in this register. However, the value is checked to determine which value to report.

Once written, additional writes to this register must not have any effect until a core-well reset occurs. BIOS must always write to this register in order to guarantee that the functionality is locked.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:0] + 8h	06010000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	06h RO	**Base Class Code (BCC):** Indicates the device is a bridge device.
23:16	01h RO	**Sub-Class Code (SCC):** Indicates the device a PCI to ISA bridge.
15:8	00h RO	**Programming Interface (PI):** The LPC bridge has no programming interface.
7:0	00h RO/V	**Revision ID (RID):** Indicates the part revision This will reset to 0 but is expected to be overridden by the SetID IOSF-SB message.

2.1.5 Peripheral Channel Header Type and Primary Latency (ESPI_PCHT_PCPLT) - Offset Ch

Peripheral Channel Header Type and Primary Latency.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:0] + Ch	00800000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	1h RO	**Multi-function Device (MFD):** This bit is 1 to indicate that this PCI function is part of a multi-function device.
22:16	00h RO	**Header Type (HTYPE):** Identifies the header layout of the configuration space, which is a generic device.
15:11	00h RO	**Master Latency Count (MLC):** Reserved
10:0	0h RO	**Reserved**

2.1.6 Primary Latency Timer (PLT) - Offset Dh

Primary Latency Timer.

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:31, F:0] + Dh	00h

Bit Range	Default & Access	Field Name (ID): Description
7:3	00h RO	**Master Latency Count (MLC):** Reserved
2:0	0h RO	**Reserved**

2.1.7 Header Type (HTYPE) - Offset Eh

Header Type.

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:31, F:0] + Eh	80h

Bit Range	Default & Access	Field Name (ID): Description
7	1h RO	**Multi-function Device (MFD):** This bit is 1 to indicate a multifunction device.
6:0	00h RO	**Header Type (HTYPE):** Identifies the header layout of the configuration space, which is a generic device.

2.1.8 Sub System Identifiers (ESPI_SS) - Offset 2Ch

This register is initialized to logic 0 by the assertion of PLTRST#. This register can be written only once after PLTRST# de-assertion.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:0] + 2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O	**Subsystem ID (SSID):** This is written by BIOS. No hardware action taken on this value.
15:0	0000h RW/O	**Subsystem Vendor ID (SSVID):** This is written by BIOS. No hardware action taken on this value.

2.1.9 Capability List Pointer (ESPI_CAPP) - Offset 34h

Capability List Pointer.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:0] + 34h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO	**Capability Pointer (CP):** Indicates the offset of the first Capability Item.

2.1.10 Peripheral Channel Serial IRQ Control (ESPI_PCSERIRQC) - Offset 64h

Peripheral Channel Serial IRQ Control.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:0] + 64h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**Reserved**

2.1.11 I/O Decode Ranges and I/O Enables (ESPI_IOD_IOE) - Offset 80h

I/O Decode Ranges and I/O Enables.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:0] + 80h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29	0h RW	**Microcontroller Enable #2 (ME2):** Enables decoding of I/O locations 4Eh and 4Fh to LPC.
28	0h RW	**SuperI/O Enable (SE):** Enables decoding of I/O locations 2Eh and 2Fh to LPC.
27	0h RW	**Microcontroller Enable #1 (ME1):** Enables decoding of I/O locations 62h and 66h to LPC.
26	0h RW	**Keyboard Enable (KE):** Enables decoding of the keyboard I/O locations 60h and 64h to LPC.
25	0h RW	**High Gameport Enable (HGE):** Enables decoding of the I/O locations 208h to 20Fh to LPC.
24	0h RW	**Low Gameport Enable (LGE):** Enables decoding of the I/O locations 200h to 207h to LPC.

Bit Range	Default & Access	Field Name (ID): Description
23:20	0h RO	**Reserved**
19	0h RW	**Floppy Drive Enable (FDE):** Enables decoding of the FDD range to LPC. Range is selected by LIOD.FDE
18	0h RW	**Parallel Port Enable (PPE):** Enables decoding of the LPT range to LPC. Range is selected by LIOD.LPT.
17	0h RW	**Com Port B Enable (CBE):** Enables decoding of the COMB range to LPC. Range is selected LIOD.CB.
16	0h RW	**Com Port A Enable (CAE):** Enables decoding of the COMA range to LPC. Range is selected LIOD.CA.
15:13	0h RO	**Reserved**
12	0h RW	**FDD Range (FDD):** The following table describes which range to decode for the FDD Port Bits Decode Range 0 3F0h - 3F5h, 3F7h (Primary) 1 370h - 375h, 377h (Secondary)
11:10	0h RO	**Reserved**
9:8	0h RW	**LPT Range (LPT):** The following table describes which range to decode for the LPT Port: Bits Decode Range 00 378h - 37Fh and 778h - 77Fh 01 278h - 27Fh (port 279h is read only) and 678h - 67Fh 10 3BCh - 3BEh and 7BCh - 7BEh 11 Reserved
7	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
6:4	0h RW	**ComB Range (CB):** The following table describes which range to decode for the COMB Port Bits Decode Range 000 3F8h - 3FFh (COM 1) 001 2F8h - 2FFh (COM 2) 010 220h - 227h 011 228h - 22Fh 100 238h - 23Fh 101 2E8h - 2EFh (COM 4) 110 338h - 33Fh 111 3E8h - 3EFh (COM 3)
3	0h RO	**Reserved**
2:0	0h RW	**ComA Range (CA):** The following table describes which range to decode for the COMA Port Bits Decode Range 000 3F8h - 3FFh (COM 1) 001 2F8h - 2FFh (COM 2) 010 220h - 227h 011 228h - 22Fh 100 238h - 23Fh 101 2E8h - 2EFh (COM 4) 110 338h - 33Fh 111 3E8h - 3EFh (COM 3)

2.1.12 I/O Enables (IOE) - Offset 82h

I/O Enables.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:31, F:0] + 82h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	**Reserved**
13	0h RW	**Microcontroller Enable #2 (ME2):** Enables decoding of I/O locations 4Eh and 4Fh to LPC.
12	0h RW	**SuperI/O Enable (SE):** Enables decoding of I/O locations 2Eh and 2Fh to LPC.
11	0h RW	**Microcontroller Enable #1 (ME1):** Enables decoding of I/O locations 62h and 66h to LPC.
10	0h RW	**Keyboard Enable (KE):** Enables decoding of the keyboard I/O locations 60h and 64h to LPC.
9	0h RW	**High Gameport Enable (HGE):** Enables decoding of the I/O locations 208h to 20Fh to LPC.
8	0h RW	**Low Gameport Enable (LGE):** Enables decoding of the I/O locations 200h to 207h to LPC.

Bit Range	Default & Access	Field Name (ID): Description
7:4	0h RO	**Reserved**
3	0h RW	**Floppy Drive Enable (FDE):** Enables decoding of the FDD range to LPC. Range is selected by LIOD.FDE
2	0h RW	**Parallel Port Enable (PPE):** Enables decoding of the LPT range to LPC. Range is selected by LIOD.LPT.
1	0h RW	**Com Port B Enable (CBE):** Enables decoding of the COMB range to LPC. Range is selected LIOD.CB.
0	0h RW	**Com Port A Enable (CAE):** Enables decoding of the COMA range to LPC. Range is selected LIOD.CA.

2.1.13 LPC Generic IO Range 1 (ESPI_LGIR1) - Offset 84h

LPC Generic IO Range 1.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:0] + 84h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:18	00h RW	**Address[7:2] Mask (ADDR_MASK):** A 1 in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size.
17:16	0h RO	**Reserved**
15:2	0000h RW	**ADDR:** DWord-aligned address. Note that PCH does not provide decode down to the word or byte level.
1	0h RO	**Reserved**
0	0h RW	**LPC Decode Enable (LDE):** When this bit is set to 1, then the range specified in this register is enabled for decoding to LPC.

2.1.14 LPC Generic IO Range 2 (ESPI_LGIR2) - Offset 88h

LPC Generic IO Range 2.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:0] + 88h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:18	00h RW	**Address[7:2] Mask (ADDR_MASK):** A 1 in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size.
17:16	0h RO	**Reserved**
15:2	0000h RW	**ADDR:** DWord-aligned address. Note that PCH does not provide decode down to the word or byte level.
1	0h RO	**Reserved**
0	0h RW	**LPC Decode Enable (LDE):** When this bit is set to 1, then the range specified in this register is enabled for decoding to LPC.

2.1.15 LPC Generic IO Range 3 (ESPI_LGIR3) - Offset 8Ch

LPC Generic IO Range 3.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:0] + 8Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:18	00h RW	**Address[7:2] Mask (ADDR_MASK):** A 1 in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size.
17:16	0h RO	**Reserved**
15:2	0000h RW	**ADDR:** DWord-aligned address. Note that PCH does not provide decode down to the word or byte level.
1	0h RO	**Reserved**
0	0h RW	**LPC Decode Enable (LDE):** When this bit is set to 1, then the range specified in this register is enabled for decoding to LPC.

2.1.16 LPC Generic IO Range 4 (ESPI_LGIR4) - Offset 90h

LPC Generic IO Range 4.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:0] + 90h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:18	00h RW	**Address[7:2] Mask (ADDR_MASK):** A 1 in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size.
17:16	0h RO	**Reserved**
15:2	0000h RW	**ADDR:** DWord-aligned address. Note that PCH does not provide decode down to the word or byte level.
1	0h RO	**Reserved**
0	0h RW	**LPC Decode Enable (LDE):** When this bit is set to 1, then the range specified in this register is enabled for decoding to LPC.

2.1.17 USB Legacy Keyboard/Mouse Control (ESPI_ULKMC) - Offset 94h

USB Legacy Keyboard/Mouse Control.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:0] + 94h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW/1C/V	**SMI Caused by End of Pass-through (SMIBYENDPS):** Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the Bit 7, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch.
14:12	0h RO	**Reserved**
11	0h RW/1C/V	**SMI Caused by Port 64 Write (TRAPBY64W):** Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the Bit 3, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch. Note that the A20Gate Pass-Through Logic allows specific port 64h Writes to complete without setting this bit.

Bit Range	Default & Access	Field Name (ID): Description
10	0h RW/1C/V	**SMI Caused by Port 64 Read (TRAPBY64R):** Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the Bit 2, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch.
9	0h RW/1C/V	**SMI Caused by Port 60 Write (TRAPBY60W):** Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the Bit 1, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch. Note that the A20Gate Pass-Through Logic allows specific port 60h Writes to complete without setting this bit.
8	0h RW/1C/V	**SMI Caused by Port 60 Read (TRAPBY60R):** Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the Bit 0, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch.
7	0h RW	**SMI at End of Pass-through Enable (SMIATENDPS):** May need to cause SMI at the end of a pass-through. Can occur if an SMI is generated in the middle of a pass through, and needs to be serviced later.
6	0h RO/V	**Pass Through State (PSTATE):** This read-only bit indicates that the state machine is in the middle of an A20GATE pass-through sequence. If software needs to reset this bit, it should set Bit 5 0.
5	0h RW	**A20Gate Pass-Through Enable (A20PASSEN):** When enabled, allows A20GATE sequence Pass-Through function. When enabled, a specific cycle sequence involving writes to port 60h and port 64h do not result in the setting of the SMI status bits.SMI# will not be generated, even if the various enable bits are set.
4	0h RO	**Reserved**
3	0h RW	**SMI on Port 64 Writes Enable (S64WEN):** When set, a 1 in bit 11 will cause an SMI event.
2	0h RW	**SMI on Port 64 Reads Enable (S64REN):** When set, a 1 in bit 10 will cause an SMI event.
1	0h RW	**SMI on Port 60 Writes Enable (S60WEN):** When set, a 1 in bit 9 will cause an SMI event.
0	0h RW	**SMI on Port 60 Reads Enable (S60REN):** When set, a 1 in bit 8 will cause an SMI event.

2.1.18 LPC Generic Memory Range (ESPI_LGMR) - Offset 98h

LPC Generic Memory Range.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:0] + 98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**Memory Address[31:16] (MADDR):** This field specifies a 64KB memory block anywhere in the 4GB memory space that will be decoded to LPC as standard LPC Memory Cycle if enabled.
15:1	0h RO	**Reserved**
0	0h RW	**LPC Memory Range Decode Enable (LGMRD_EN):** When this bit is set to 1, then the range specified in this register is enabled for decoding to LPC.

2.1.19 eSPI CS1 IO Routing Enables (ESPI_CS1IORE) - Offset A0h

Note: This register is used to route fixed I/O transactions from the Host to the second Slave device (CS1#) over the Peripheral Channel on the eSPI bus.

Register Lock: This register is locked in a single Slave configuration (soft-strap espi_cs1_en = 0b). All writes to this register must be dropped and reads to this register must return the default (reset) values.

Implementation / Usage Note: PCIODE enables a given range if that is zero, all accesses to that range are U/R'd, irrespective of the settings for that range in this register. So PCIODE should be set/checked first. If a given range is enabled in PCIODE, then this register (PCCS1IORE) is used to select which eSPI Slave device to route the transactions to. When a second eSPI Slave device is not present, then PCCS1IORE is ignored and all IO transactions targeted to any range enabled in PCIODE are routed to CS0#.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:0] + A0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	**Reserved**
14	0h RW/V	**Debug Port CS1# Routing Enable (DPRE):** Enables routing of I/O locations 80h, 84h-86h, 88h, 8Ch-8Eh, 90h, 94h-96h, 98h, 9Ch-9Eh to eSPI CS1#. This field is only writeable if the eSPI CS1 is enabled and is RO when eSPI CS1 is disabled.
13	0h RW/V	**Microcontroller #2 CS1# Routing Enable (MRE2):** Enables routing of I/O locations 4Eh and 4Fh to eSPI CS1#. This field is only writeable if the eSPI CS1 is enabled and is RO when eSPI CS1 is disabled.
12	0h RW/V	**SuperI/O CS1# Routing Enable (SRE):** Enables routing of I/O locations 2Eh and 2Fh to eSPI CS1#. This field is only writeable if the eSPI CS1 is enabled and is RO when eSPI CS1 is disabled.

Bit Range	Default & Access	Field Name (ID): Description
11	0h RW/V	**Microcontroller #1 CS1# Routing Enable (MRE1):** Enables routing of I/O locations 62h and 66h to eSPI CS1#. This field is only writeable if the eSPI CS1 is enabled and is RO when eSPI CS1 is disabled.
10	0h RW/V	**Keyboard CS1# Routing Enable (KRE):** Enables routing of the keyboard I/O locations 60h and 64h to eSPI CS1#. This field is only writeable if the eSPI CS1 is enabled and is RO when eSPI CS1 is disabled.
9	0h RW/V	**High Gameport CS1# Routing Enable (HGRE):** Enables routing of the I/O locations 208h to 20Fh to eSPI CS1#. This field is only writeable if the eSPI CS1 is enabled and is RO when eSPI CS1 is disabled.
8	0h RW/V	**Low Gameport CS1# Routing Enable (LGRE):** Enables routing of the I/O locations 200h to 207h to eSPI CS1#. This field is only writeable if the eSPI CS1 is enabled and is RO when eSPI CS1 is disabled.
7:4	0h RO	**Reserved**
3	0h RW/V	**Floppy Drive CS1# Routing Enable (FDRE):** Enables routing of the FDD range to eSPI CS1#. Range is selected by LIOD.FDE. This field is only writeable if the eSPI CS1 is enabled and is RO when eSPI CS1 is disabled.
2	0h RW/V	**Parallel Port CS1# Routing Enable (PPRE):** Enables routing of the LPT range to eSPI CS1#. Range is selected by LIOD.LPT. This field is only writeable if the eSPI CS1 is enabled and is RO when eSPI CS1 is disabled.
1	0h RW/V	**Com Port B CS1# Routing Enable (CBRE):** Enables routing of the COMB range to eSPI CS1#. Range is selected by LIOD.CB. This field is only writeable if the eSPI CS1 is enabled and is RO when eSPI CS1 is disabled.
0	0h RW/V	**Com Port A CS1# Routing Enable (CARE):** Enables routing of the COMA range to eSPI CS1#. Range is selected by LIOD.CA. This field is only writeable if the eSPI CS1 is enabled and is RO when eSPI CS1 is disabled.

2.1.20 eSPI CS1 Generic IO Range 1 (ESPI_CS1GIR1) - Offset A4h

This register has the same bit definitions as PCLGIR1.

Note: This register is used to route variable IO transactions from the Host to the second Slave device (CS1#) over the Peripheral Channel on the eSPI bus.

Implementation Note: If this range is enabled (LPC Decode Enable = 1b) in a single Slave configuration (espi_cs1_en soft-strap = 0b), any IO accesses to the range must by U/Rd by eSPI-MC.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:0] + A4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:18	00h RW	**Address[7:2] Mask (ADDR_MASK):** A 1 in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size.
17:16	0h RO	**Reserved**
15:2	0000h RW	**ADDR:** DWord-aligned address. Note that PCH does not provide decode down to the word or byte level.
1	0h RO	**Reserved**
0	0h RW	**LPC Decode Enable (LDE):** When this bit is set to 1, then the range specified in this register is enabled for decoding to LPC.

2.1.21 eSPI CS1 Generic Memory Range 1 (ESPI_CS1GMR1) - Offset A8h

This register has the same bit definitions as PCLGMR.

Note: This register is used to route memory transactions from the Host to the second Slave device (CS1#) over the Peripheral Channel on the eSPI bus.

Implementation Note: If this range is enabled (LPC Decode Enable = 1b) in a single Slave configuration (espi_cs1_en soft-strap = 0b), any IO accesses to the range must by U/Rd by eSPI-MC.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:0] + A8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**Memory Address[31:16] (MADDR):** This field specifies a 64KB memory block anywhere in the 4GB memory space that will be decoded to LPC as standard LPC Memory Cycle if enabled.
15:1	0h RO	**Reserved**
0	0h RW	**LPC Memory Range Decode Enable (LGMRD_EN):** When this bit is set to 1, then the range specified in this register is enabled for decoding to LPC.

2.1.22 FWH ID Select 1 (ESPI_PCFS1) - Offset D0h

FWH ID Select 1.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:0] + D0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**Reserved**

2.1.23 FWH ID Select 2 (ESPI_PCFS2) - Offset D4h

FWH ID Select 2.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:0] + D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**Reserved**

2.1.24 BIOS Decode Enable (ESPI_BDE) - Offset D8h

Note that this register affects the BIOS decode regardless of whether the BIOS is resident on SPI. The concept of Feature Space does not apply to SPI-based flash. PCH simply decodes these ranges as memory accesses when enabled for the SPI flash interface.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:0] + D8h	0000FFCFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**BDE Lock Enable (BLE):** When this bit is set, the RW bits of this BDE register are locked down. Once set, this bit can only be cleared by PLTRST#. **Locked by:** ESPI_BDE.BLE
30:16	0h RO	**Reserved**
15	1h RO	**F8-FF Enable (EF8):** Enables decoding of 512K of the following BIOS range: Data space: FFF80000h - FFFFFFFFh Feature space: FFB80000h - FFBFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
14	1h RW/L	**F0-F8 Enable (EF0):** Enables decoding of 512K of the following BIOS range: Data space: FFF00000h - FFF7FFFFh Feature space: FFB00000h - FFB7FFFFh **Locked by:** ESPI_BDE.BLE
13	1h RW/L	**E8-EF Enable (EE8):** Enables decoding of 512K of the following BIOS range: Data space: FFE80000h - FFEFFFFFh Feature space: FFA80000h - FFAFFFFFh **Locked by:** ESPI_BDE.BLE
12	1h RW/L	**E0-E8 Enable (EE0):** Enables decoding of 512K of the following BIOS range: Data space: FFE00000h - FFE7FFFFh Feature Space: FFA00000h - FFA7FFFFh **Locked by:** ESPI_BDE.BLE
11	1h RW/L	**D8-DF Enable (ED8):** Enables decoding of 512K of the following BIOS range: Data space: FFD80000h - FFDFFFFFh Feature space: FF980000h - FF9FFFFFh **Locked by:** ESPI_BDE.BLE
10	1h RW/L	**D0-D7 Enable (ED0):** Enables decoding of 512K of the following BIOS range: Data space: FFD00000h - FFD7FFFFh Feature space: FF900000h - FF97FFFFh **Locked by:** ESPI_BDE.BLE
9	1h RW/L	**C8-CF Enable (EC8):** Enables decoding of 512K of the following BIOS range: Data space: FFC80000h - FFCFFFFFh Feature space: FF880000h - FF8FFFFFh **Locked by:** ESPI_BDE.BLE
8	1h RW/L	**C0-C7 Enable (EC0):** Enables decoding of 512K of the following BIOS range: Data space: FFC00000h - FFC7FFFFh Feature space: FF800000h - FF87FFFFh **Locked by:** ESPI_BDE.BLE
7	1h RW/L	**Legacy F Segment Enable (LFE):** This enables the decoding of the legacy 64KB range at F0000h - FFFFFh Note that decode for the BIOS legacy F segment is enabled by the LFE bit only, it is not affected by the GEN_PMCON_1.iA64_EN bit. **Locked by:** ESPI_BDE.BLE

Bit Range	Default & Access	Field Name (ID): Description
6	1h RW/L	**Legacy E Segment Enable (LEE):** This enables the decoding of the legacy 64KB range at E0000h - EFFFFh Note that decode for the BIOS legacy E segment is enabled by the LEE bit only, it is not affected by the GEN_PMCON_1.iA64_EN bit. **Locked by:** ESPI_BDE.BLE
5:4	0h RO	**Reserved**
3	1h RW/L	**70-7F Enable (E70):** Enables decoding of 1MB of the following BIOS range: Data space: FF700000h - FF7FFFFFh Feature space: FF300000h - FF3FFFFFh **Locked by:** ESPI_BDE.BLE
2	1h RW/L	**60-6F Enable (E60):** Enables decoding of 1MB of the following BIOS range: Data space: FF600000h - FF6FFFFFh Feature Space: FF200000h - FF2FFFFFh **Locked by:** ESPI_BDE.BLE
1	1h RW/L	**50-5F Enable (E50):** Enables decoding of 1MB of the following BIOS range: Data space: FF500000h - FF5FFFFFh Feature space: FF100000h - FF1FFFFFh **Locked by:** ESPI_BDE.BLE
0	1h RW/L	**40-4F Enable (E40):** Enables decoding of 1MB of the following BIOS range: Data space: FF400000h - FF4FFFFFh Feature space: FF000000h - FF0FFFFFh **Locked by:** ESPI_BDE.BLE

2.1.25 BIOS Control (ESPI_BC) - Offset DCh

BIOS Control.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:0] + DCh	00000020h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RW/L	**BIOS Write Reporting (Async-SMI) Enable (BWRE):** 1'b0: Disable reporting of BIOS Write event. 1'b1: Enable reporting of BIOS Write event (PCBC.BWRS = 1) using Async-SMI. **Locked by:** ESPI_BC.BILD
10	0h RW/1C/V	**BIOS Write Status (BWRS):** HW sets this bit if a memory write access is detected to a protected BIOS range. 1'b0: Memory writes to BIOS region not attempted or attempted with PCBC.WPD = 1. 1'b1: A memory writes transaction to BIOS region has been received with PCBC.WPD = 0. ***Note:*** An Async-SMI message is generated to report this event if PCBC.BWRE is set. ***Note:*** SW must write a 1 to this bit to clear it, which will also deassert the Async-SMI, if PCBC.BWRE is set.
9	0h RO	**Reserved**
8	0h RW/1C/V	**BIOS Write Protect Disable Status (BWPDS):** HW sets this bit if configuration write access is detected to protected PCBC.WPD bit. 1'b0: No attempt has been made to set PCBC.WPD with PCBC.LE = 1. 1'b1: A configuration write request has been received to set PCBC.WPD (0 1) with PCBC.LE = 1. ***Note:*** An IOSF-SB Sync-SMI (Assert_SSMI) message is generated to report this event if HW sets this bit. The unsuccessful completion for the configuration write is returned upon receiving the SMI_Ack message response. ***Note:*** SW must write a 1 to this bit to clear it, which will also deassert the Sync-SMI (IOSF-SB Deassert_SSMI message is generated). ***Note:*** The Sync-SMI sets the PMC SMI_STS.TCO_STS register.
7	0h RW/L	**BIOS Interface Lock-Down (BILD):** When set, prevents BC.TS and BC.BBS from being changed. This bit can only be written from 0 to 1 once. ***BIOS Note:*** This bit is not backed up in the RTC well. This bit should also be set in the BUC register in the RTC device to record the last state of this value following a cold reset. **Locked by:** ESPI_BC.BILD
6	0h RW/V/L	**Boot BIOS Strap (BBS):** This field determines the destination of accesses to the BIOS memory range. Bits Description; 0 SPI 1 Reserved When SPI is selected, the range that is decoded is further qualified by other configuration bits described in the respective sections. The value in this field can be overwritten by software as long as the BIOS Interface Lock-Down is not set. **Locked by:** ESPI_BC.BILD
5	1h RW/L	**Enable InSMM.STS (EISS):** When this bit is set, the BIOS region is not writable until SMM sets the InSMM.STS bit. Today BIOS Flash is writable if WPD is a 1. If this bit (5) is set, then WPD must be a 1 and InSMM.STS (0xFED3_0880(0)) must be 1 also. If this bit (5) is clear, then BIOS is write-able based only on WPD = 1 and the InSMM.STS is a don't care. **Locked by:** ESPI_BC.LE

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO/V	**Top Swap (TS):** When set, PCH will invert either A16, A17, or A18 for cycles going to the BIOS space (but not the Feature space) in the FWH. When cleared, PCH will not invert A16. If booting from LPC (FWH) or eSPI, then the Boot Block Size is fixed at 64KB and A16 is inverted if Top Swap is enabled. If booting from SPI, then the BOOT_BLOCK_SIZE soft strap determines if A16, A17, or A18 should be inverted if Top Swap is enabled. ***Note:*** If the Top-Swap strap is asserted, then this bit cannot be cleared by software. The strap jumper should be removed and the system rebooted. ***BIOS Note:*** This bit provides a read-only path to view the state of the Top Swap strap. It is backed up and driven from the RTC well. BIOS will need to program the corresponding register in the RTC well, which will be reflected in this register.
3	0h RO	**Reserved**
2	0h RO/V	**eSPI Enable Pin Strap (ESPI):** eSPI Enable Pin Strap (ESPI): This field determines the destination of accesses to the D31:F0 and related Fixed and Variable IO and Memory decode ranges, including BIOS memory range. 1'b0: LPC is the D31:F0 target. 1'b1: eSPI is the D31:F0 target. ***Note:*** This field, along with the PCBC.BBS strap setting, determines PCH configuration. ***Note:*** This field cannot be overwritten by software (unlike the PCBC.BBS field). ***Note:*** This bit is also reflected in the LPC (D31:F0) and SPI Flash (D31:F5) PCI Configuration register Offset DCh.
1	0h RW/L	**Lock Enable (LE):** When set, setting the WP bit will cause SMI. When cleared, setting the WP bit will not cause SMI. Once set, this bit can only be cleared by a PLTRST#. When this bit is set, EISS - bit (5) of this register is locked down. **Locked by:** ESPI_BC.LE
0	0h RW	**Write Protect Disable (WPD):** When set, access to the BIOS space is enabled for both read and write cycles to BIOS. When cleared, only read cycles are permitted to the FWH or SPI flash. When this bit is written from a 0 to a 1 and the LE bit is also set, an SMI# is generated. This ensures that only SMM code can update BIOS.

2.1.26 PCI Clock Control (PCCTL) - Offset E0h

PCI Clock Control.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:0] + E0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**Clock Run Enable (CLKRUN_EN):** Enables the CLKRUN# logic to stop the PCI clocks. If the SLP_EN bit is set, then the Intel PCH will drive CLKRUN# low. This will keep the PCI and LPC clocks running on the way to the sleeping state. This is required to meet an LPC specification. This does not necessarily mean that the CLKRUN_EN bit is forced low when SLP_EN is set. Even though the CLKRUN# signal will be low when SLP_EN is set, the state of the CLKRUN_EN bit is ignored when SLP_EN bit is set. This gives flexibility in the implementation.

2.1.27 Unsupported Request Error Status (URES) - Offset F0h

This register denotes the status for the unsupported request on IOSF Primary I/F.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:0] + F0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW/C	**Unsupported Request Detected (URD):** Set to 1 by hardware upon detecting an Unsupported Request on IOSF Primary interface that is not considered Advisory Non-Fatal. Cleared to 0 by SW. URD bit is only set based on IOSF primary bus interface activity. It is not set based on IOSF sideband bus interface activity.

2.1.28 Unsupported Request Error Control (UREC) - Offset F4h

This register denotes the status for the unsupported request on IOSF Primary I/F.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:0] + F4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**Unsupported Request Reporting Enable (URRE):** If set to 1 by software, it allows reporting of an Unsupported Request as a system error.

2.1.29 Manufacturer's ID (ESPI_MANID) - Offset F8h

This register is assigned during the boot flow using the SetID message based on values found in the fuse block. All fields except MID will be reset by hardware to zero and set only by the SetID message.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:0] + F8h	00000F00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000F00h RO/P	**Manufacturers ID Field (MANID):** Manufacturer ID: Default value comes from straps

2.2 eSPI PCR Registers Summary

Table 2-1. Summary of eSPI PCR Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
4000h	4	eSPI PCR Register And Link Control (SLV_CFG_REG_CTL)	00000000h
4004h	4	eSPI PCR Register Data (SLV_CFG_REG_DATA)	00000000h
4020h	4	Peripheral Channel Error for Slave 0 (PCERR_SLV0)	00000080h
4024h	4	Peripheral Channel Error for Slave 1 (PCERR_SLV1)	00000000h
4030h	4	Virtual Wire Channel Error for Slave 0 (VWERR_SLV0)	00000000h
4034h	4	Virtual Wire Channel Error for Slave 1 (VWERR_SLV1)	00000000h
4040h	4	Flash Access Channel Error for Slave 0 (FCERR_SLV0)	00040080h
4050h	4	Link Error for Slave 0 (LNKERR_SLV0)	0000FF00h
4054h	4	Link Error for Slave 1 (LNKERR_SLV1)	0000FF00h

2.2.1 eSPI PCR Register And Link Control (SLV_CFG_REG_CTL) - Offset 4000h

Along with SLV_CFG_REG_DATA, this register controls Rd/Wr access to Slave Configuration registers using eSPI Get/Set_Configuration, Get_Status and In-Band Reset cycles. It allows Tunneled Access to Slave Configuration (TASC) registers from Host/CSME software/firmware.

Type	Size	Offset	Default
MMIO	32 bit	FD720000h + 4000h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S/V	**Slave Configuration Register Access Enable (SCRE):** Writing a 1 to this field triggers an access (SCRT) to a Slave Config Register ('Go'). **Note:** Hardware clears this bit to 0 (& sets the SCRS field) when the transaction has completed on the eSPI bus. In the case of a configuration/status register read, the data is valid only after this bit has been cleared by HW. **Note:** The SCRE is effective only if SCRS is clear.
30:28	0h RW/1C/V	**Slave Configuration Register Access Status (SCRS):** This field is set by upon the completion of a configuration register access (SCRE). Software must clear this field by writing all 1s before initiating another Slave configuration register access (SCRE). 3'h0: Status not valid 3'h1: Slave No_Response 3'h2: Slave Response CRC Error 3'h3: Slave Response Fatal Error 3'h4: Slave Response Non-Fatal Error 3'h5 3'h6: Reserved 3'h7: No errors (transaction completed successfully)
27	0h RW/1S	**IOSF-SB eSPI Link Configuration Lock (SBLCL):** When set, eSPI-MC prevents writes (i.e., SET_CONFIGURATION) from this IOSF-SB TASC mechanism to any eSPI Specification defined Slave Capabilities and Configuration registers in the reserved register address range (0h 7FFh). Access to Slave implementation specific configuration registers outside this range are not impacted by this lock bit and are always available access protections to such registers are Slave implementation dependent. **Note:** This bit cannot be written to 0 once it has been set to 1. It can only be cleared by PLTRST# assertion. The lock is automatically disabled if and while the LNKERR_SLV0.SLCRR register bit is asserted (upon an eSPI link Fatal Error condition) to allow BIOS (or another SW agent) to attempt to recover the link. **Note:** This bit has no effect (i.e., IOSF-SB TASC is always enabled) when PLTRST# is asserted. **BIOS Note:** BIOS must ensure that this bit is set to 1 after initial eSPI link configuration is over to prevent any further (unintentional or malicious) changes to the eSPI link configuration via IOSF-SB (per AR from eSPI SAFE S1 review).
26:21	0h RO	**Reserved**
20:19	0h RW	**Slave ID (SID):** eSPI Slave ID (CS#) to which the Slave Configuration Register Access (SCRT) is directed. 2'b00: eSPI Slave 0 (EC/BMC) 2'b01: eSPI Slave 1 (Note: *Only* supported when a when a second eSPI Slave device is present) 2'b10: eSPI Slave 2 (Note: *Only* supported when a when a third eSPI Slave device is present) 2'b11: eSPI Slave 3 (Note: *Only* supported when a when a fourth eSPI Slave device is present)
18	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
17:16	0h RW	**Slave Configuration Register Access Type (SCRT):** Rd/Wr/Status 2'b00: Slave Configuration register read from address SCRA[11:0] (GET_CONFIG) 2'b01: Slave Configuration register write to address SCRA[11:0] (SET_CONFIG) 2'b10: Slave Status register read (GET_STATUS) 2'b11: In-Band Reset **Note:** Writes to Slave Configuration registers in the reserved address range (0h 7FFh) are gated by the SBLCL bit. **Note:** Setting this field to 2'b10 triggers a Get_Status command to the Slave. In this case, the SCRA field is ignored and only the lower 16-bits of the returned data (SLV_CFG_REG_DATA[15:0]) are valid. **Note:** Setting this field to 2'b11 triggers an In-Band Reset command to the Slave. In this case, the SCRA field is ignored and no data is returned. This command resets the link for the targeted Slave to a default configuration. Software is responsible for reinitializing the link to optimized (higher performance) settings using these registers.
15:12	0h RO	**Reserved**
11:0	000h RW	**Slave Configuration Register Address (SCRA):** Per eSPI Spec. / eSPI Compatibility Spec.

2.2.2 eSPI PCR Register Data (SLV_CFG_REG_DATA) - Offset 4004h

Along with SLV_CFG_REG_CTL, this register controls Rd/Wr access to Slave Configuration registers using eSPI Get/Set_Configuration cycles. It allows access to Slave configuration registers from Host/CSME software/firmware.

For writes (SCRT = 2'b01) to Slave Configuration registers, this register should be written to first with the required data before writing to the CTL register. The eSPI-MC processes the write to the Slave using an eSPI Set_Configuration command.

If a write is to a supported register in the reserved register address range (0h 7FFh), the eSPI-MC updates its local copy of the Slave configuration registers after the write has been successfully sent to the Slave.

Note: eSPI-MC does no checking of the register values (even for supported Slave Capabilities / Configuration Registers) the SW assumes full responsibility for programming legal values supported by both the eSPI-MC and the Slave.

For reads (SCRT = 2'b00 or 2b10) to Slave Configuration registers, the hardware writes the data read back from the Slave into this register. The read data is valid after hardware has cleared the SCRE bit in the CTL register and the SCRS field indicates a successful transaction.

Type	Size	Offset	Default
MMIO	32 bit	FD720000h + 4004h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Slave Configuration Register for Read and Write data (SCRD):** Configuration register Write data from software or read data from the Slave. For writes, this register must be programmed before the CTL register. For reads, data in this register is valid after the CTL.SCRE bit has been cleared by HW and the CTL.SCRS field indicates a successful transaction.

2.2.3 Peripheral Channel Error for Slave 0 (PCERR_SLV0) - Offset 4020h

Peripheral Channel Error for Slave 0

Type	Size	Offset	Default
MMIO	32 bit	FD720000h + 4020h	00000080h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**Slave Host Reset Ack Override (SLV_HOST_RST_ACK_OVRD):** A 1 in this bit will cause the eSPI-MC to not wait for the Slave HOST_RESET_ACK Virtual Wire before (immediately) asserting the ResetPrepAck (Host space, GenPrep). The Host_Reset_Warn VW will be transmitted to the Slave independent of the setting for this bit.
27:26	0h RW	**Peripheral Channel Received Master or Target Abort Reporting Enable (PCRMTARE):** 2'b00: Disable RMA or RTA Reporting 2'b01: Reserved 2'b10: Enable RMA or RTA Reporting as SERR (IOSF-SB Do_SErr message) 2'b11: Enable RMA or RTA Reporting as SMI (IOSF-SB Assert_SMI message) **Note:** SERR enable is also qualified by PCCMD.SEE (Offset 04h) when PLTRST# is deasserted. **Note:** SERR also sets PCSTS.SSE (Offset 06h) when PLTRST# is deasserted.
25	0h RW	**Peripheral Channel Unsupported Request Reporting Enable (PCURRE):** If set to 1 by software, it allows reporting of an Unsupported Request (UR) as a System Error (SERR). If eSPI-MC decodes a Posted transaction on IOSF-P Host Root Space that is not supported, it sets the PCURD bit. If PCCMD.SEE (SERR enable) is also set to 1, then eSPI-MC sets the PCSTS.SSE (Signaled System Error) bit and sends a Do_SErr message on its IOSF-SB interface. Note: If the transaction was a Non-Posted request, then the agent handles the transaction as an Advisory Non-Fatal error, and no error logging or signaling is done. The Completion with UR Completion Status serves the purpose of error reporting.
24	0h RW/1C/V	**Peripheral Channel Unsupported Request Detected (PCURD):** Set to 1 by hardware upon detecting an Unspported Request (UR) that is not considered an Advisory Non-Fatal error and PCERR.PCURRE is set. Cleared to 0 when software writes a 1 to this register.
23:15	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
14:13	0h RW	**Peripheral Channel Non-Fatal Error Reporting Enable (PCNFEE):** 2'b00: Disable Non-Fatal Error Reporting 2'b01: Reserved 2'b10: Enable Non-Fatal Error Reporting as SERR (IOSF-SB Do_SErr message) 2'b11: Enable Non-Fatal Error Reporting as SMI (IOSF-SB Assert_SMI message) **Note:** SERR enable is also qualified by PCCMD.SEE (Offset 04h) when PLTRST# is deasserted. **Note:** SERR also sets PCSTS.SSE (Offset 06h) when PLTRST# is deasserted. **Note:** SMI/SERR messages are not generated if the Host is in reset (PLTRST# asserted).
12	0h RW/1C/V	**Peripheral Channel Non-Fatal Status (PCNFES):** This field is set by hardware if a Non-Fatal Error condition is detected on the Peripheral Channel. Software must clear this bit. 1'b0: No Non-Fatal Error detected 1'b1: Non-Fatal Error detected (PCNFEC has a non-zero value) **Note:** Clearing this unlocks the PCNFEC field and triggers an IOSF-SB Deassert_SMI message if PCNFEE is set to SMI. **Note:** Setting of this bit is independent of the enable to generate a SMI/SERR (PCNFEE).
11:8	0h RO/V	**Peripheral Channel Non-Fatal Cause (PCNFEC):** 4'h0: No error 4'h1: Slave Response Code: NONFATAL_ERROR 4'h2: Slave Response Code: Unsuccessful Completion 4'h3: Unexpected completion received from Slave (i.e. completion without non-posted request or completion with invalid tag or completion with invalid length) 4'h4: Unsupported Cycle Type (w.r.t. Command) 4'h5: Unsupported Message Code 4'h6: Unsupported Address/Length alignment (upstream only): Memory: Address + Length > 64 B (aligned) [for both Posted and Non-Posted transactions] 4'h7: Unsupported Address/Length alignment (upstream only): Memory: 64-bit Address with Addr[63:32] = 0h [for both Posted and Non-Posted transactions] 4'h8 - 4'hF: Reserved **Note:** This field is updated after a Peripheral channel transaction is completed if the PCNFES bit is not set.
7	1h RW	**PLCC Misaligned Memory Access (PMMA):** Applies to only posted and non-posted memory transactions directed towards D31:f0 to be sent over the eSPI Peripheral Channel to an eSPI Slave. 1'b0: Requests with a length of 3 bytes or requests with a length of 1/2/4 bytes whose Address+Length is not DWord aligned will be rejected. 1'b1: Requests with a length of 3 bytes or requests with a lenght of 1/2/4 butes whose Address+Length is not DWord aligned will be sent to the slave using the memory write/read format.

Bit Range	Default & Access	Field Name (ID): Description
6:5	0h RW	**Peripheral Channel Fatal Error Reporting (PCFEE):** 2'b00: Disable Fatal Error Reporting 2'b01: Reserved 2'b10: Enable Fatal Error Reporting as SERR (IOSF-SB Do_SErr message) 2'b11: Enable Fatal Error Reporting as SMI (IOSF-SB Assert_SMI message) **Note:** SERR enable is also qualified by PCCMD.SEE (Offset 04h) when PLTRST# is deasserted. **Note:** SERR also sets PCSTS.SSE (Offset 06h) when PLTRST# is deasserted. **Note:** SMI/SERR messages are not generated if the Host is in reset (PLTRST# asserted).
4	0h RW/1C/V	**Peripheral Channel Fatal Error Reporting (PCFES):** This field is set by hardware if a Fatal Error condition is detected on the Peripheral Channel. Software must clear this bit by writing a 1 to it. 1'b0: No Fatal Error detected 1'b1: Fatal Error Type 2 detected (PCFEC has a non-zero value) **Note:** Clearing this unlocks the PCFEC field and triggers an IOSF-SB Deassert_SMI message if PCFEE is set to SMI. **Note:** Setting of this bit is independent of the enable to generate a SMI/SERR (PCFEE).
3:0	0h RO/V	**Peripheral Channel Fatal Error Cause (PCFEC):** 4'h0: No error 4'h1 4'h7: Reserved 4'h8: Malformed Slave Response Payload: Payload length > Max Payload Size (aligned) [Type 2] 4'h9: Malformed Slave Response Payload: Read request size > Max Read Request Size (aligned) [Type 2] 4'hA: Malformed Slave Response Payload: Address + Length > 4KB (aligned) [Type 2] 4'hB 4'hF: Reserved **Note:** This field is updated after a Peripheral channel transaction is completed if the PCFES bit is not set.

2.2.4 Peripheral Channel Error for Slave 1 (PCERR_SLV1) - Offset 4024h

This register is used to control error reporting for the eSPI Peripheral Channel for the second eSPI Slave device.

Note: Accesses to this register must respond with a U/R when a second eSPI Slave device is not present (i.e., in a single Slave configuration).

The register definition is identical to that of PCERR_SLV0, with the following exception:

SLV_HOST_RST_ACK_OVRD (bit [28]): This bit has no impact since the Host_Reset_Ack VW from CS1# is not supported by eSPI-MC (Host partition reset flow is gated only for CS0#).

Type	Size	Offset	Default
MMIO	32 bit	FD720000h + 4024h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**Slave Host Reset Ack Override (SLV_HOST_RST_ACK_OVRD):** This bit has no impact since the Host_Reset_Ack VW from CS1# is not supported by eSPI-MC (Host partition reset flow is gated only for CS0#).
27:26	0h RW	**Peripheral Channel Received Master or Target Abort Reporting Enable (PCRMTARE):** Not used by the design. The field in the Slave 0 register is used.
25	0h RW	**Peripheral Channel Unsupported Request Reporting Enable (PCURRE):** See PCERR_SLV0.PCURRE.
24	0h RW/1C/V	**Peripheral Channel Unsupported Request Detected (PCURD):** See PCERR_SLV0.PCURD
23:15	0h RO	**Reserved**
14:13	0h RW	**Peripheral Channel Non-Fatal Error Reporting Enable (PCNFEE):** See PCERR_SLV0.PCNFEE.
12	0h RW/1C/V	**Peripheral Channel Non-Fatal Status (PCNFES):** See PCERR_SLV0.PCNFES.
11:8	0h RO/V	**Peripheral Channel Non-Fatal Cause (PCNFEC):** See PCERR_SLV0.PCNFEC.
7	0h RO	**Reserved**

4	0h RW/1C/V	**Peripheral Channel Fatal Error Reporting (PCFES):** See PCERR_SLV0.PCFES.
3:0	0h RO/V	**Peripheral Channel Fatal Error Cause (PCFEC):** See PCERR_SLV0.PCFEC.

2.2.5 Virtual Wire Channel Error for Slave 0 (VWERR_SLV0) - Offset 4030h

This register is used to control error reporting for the eSPI Virtual Wire Channel

Type	Size	Offset	Default
MMIO	32 bit	FD720000h + 4030h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW/L	**Master HOST_C10, NMIOUT# and SMIOUT# (Virtual Wires) to Slave Enable Lock (VWNSMIEL):** 1'b0: VWHC10OE(if present), VMNMIOE, VWSMIOEi, and VWNSMIEL fields are not locked (writeable by SW) 1'b1: VWHC10OE(if present), VMNMIOE, VWSMIOE, and VWNSMIEL fields are locked **Note:** This bit can be cleared only upon assertion of eSPI_Reset#. **Note:** This field is supported for server platforms only. **Locked by:** VWERR_SLV0.VWNSMIEL
27	0h RW/L	**Master NMIOUT (Virtual Wire) to Slave Enable (VWNMIOE):** 1'b0: Disable NMIOUT# reporting (NMI#_Sent indication from ITSS is ignored) 1'b1: Enable NMIOUT# reporting to Slave via eSPI Virtual Wire (upon receiving a NMI#_Sent indication from ITSS) **Note:** This field is supported for server platforms only. **Note:** This bit is locked when VWNSMIEL = 1. **Locked by:** VWERR_SLV0.VWNSMIEL
26	0h RW/L	**Master SMIOUT (Virtual Wire) to Slave Enable (VWSMIOE):** 1'b0: Disable SMIOUT# reporting (SMI#_Sent indication from PMC is ignored) 1'b1: Enable SMIOUT# reporting to Slave via eSPI Virtual Wire (upon receiving a SMI#_Sent indication from PMC) **Note:** This field is supported for server platforms only. **Note:** This bit is locked when VWNSMIEL = 1. **Locked by:** VWERR_SLV0.VWNSMIEL
25	0h RW/L	**Master HOST_C10 (Virtual Wire) to Slave Enable (VWHC10OE):** 1'b0: Disable HOST_C10 reporting (HOST_C10 indication from PMC is ignored) 1'b1: Enable HOST_C10 reporting to Slave via eSPI Virtual Wire (upon receiving a HOST_C10 indication from PMC) **Note:** This field is supported for server platforms only. **Note:** This bit is locked when VWNSMIEL = 1. **Locked by:** VWERR_SLV0.VWNSMIEL
24:15	0h RO	**Reserved**
14:13	0h RW	**Virtual Wire Channel Non-Fatal Error Reporting Enable (VWNFEE):** 2'b00: Disable Non-Fatal Error Reporting 2'b01: Reserved 2'b10: Enable Non-Fatal Error Reporting as SERR (IOSF-SB Do_SErr message) 2'b11: Enable Non-Fatal Error Reporting as SMI (IOSF-SB Assert_SMI message) **Note:** SERR enable is also qualified by PCCMD.SEE (Offset 04h) when PLTRST# is deasserted. **Note:** SERR also sets PCSTS.SSE (Offset 06h) when PLTRST# is deasserted. **Note:** SMI/SERR messages are not generated if the Host is in reset (PLTRST# asserted).
12	0h RW/1C/V	**Virtual Wire Channel Non-Fatal Error Status (VWNFES):** This field is set by hardware if a Non-Fatal Error condition is detected on the Virtual Wire Channel. Software must clear this bit. 1'b0: No Non-Fatal Error detected 1'b1: Non-Fatal Error detected (VWNFEC has a non-zero value) **Note:** Clearing this unlocks the VWNFEC field and triggers an IOSF-SB Deassert_SMI message if VWNFEE is set to SMI. **Note:** Setting of this bit is independent of the enable to generate a SMI/SERR (VWNFEE).

Bit Range	Default & Access	Field Name (ID): Description
11:8	0h RO/V	**Virtual Wire Channel Non-Fatal Error Cause (VWNFEC):** 4'h0: No error 4'h1: Slave Response Code: NONFATAL_ERROR 4'h2 4'h5: Reserved 4'h6 4'hD: Reserved 4'hE: Slave Virtual Wire: NON_FATAL_ERROR: 0->1 transition (1->0 transition on this VW is ignored) 4'hF: Reserved **Note:** This field is updated after a Virtual Wire Channel transaction is completed if the VWNFES bit is not set.
7	0h RO	**Reserved**
6:5	0h RW	**Virtual Wire Channel Fatal Error Reporting Enable (VWFEE):** 2'b00: Disable Fatal Error Reporting 2'b01: Reserved 2'b10: Enable Fatal Error Reporting as SERR (IOSF-SB Do_SErr message) 2'b11: Enable Fatal Error Reporting as SMI (IOSF-SB Assert_SMI message) **Note:** SERR enable is also qualified by PCCMD.SEE (Offset 04h) when PLTRST# is deasserted. **Note:** SERR also sets PCSTS.SSE (Offset 06h) when PLTRST# is deasserted. **Note:** SMI/SERR messages are not generated if the Host is in reset (PLTRST# asserted).
4	0h RW/1C/V	**Virtual Wire Channel Fatal Error Status (VWFES):** This field is set by hardware if a Fatal Error condition is detected on the Virtual Wire Channel. Software must clear this bit by writing all 1s to it. 1'b0: No Fatal Error detected 1'b1: Fatal Error Type 2 detected (VWFEC has a non-zero value) **Note:** Clearing this unlocks the VWFEC field and triggers an IOSF-SB Deassert_SMI message if VWFEE is set to SMI. **Note:** Setting of this bit is independent of the enable to generate a SMI/SERR (VWFEE).
3:0	0h RO/V	**Virtual Wire Channel Fatal Error Cause (VWFEC):** 4'h0: No error 4'h1 4'h7: Reserved 4'h8: Malformed Slave Response Payload: VW Count > Max. VW Count [Type 2] 4'h9 4'hD: Reserved 4'hE: Slave Virtual Wire: FATAL_ERROR 0->1 transition (1->0 transition on this VW is ignored) [Type 2] 4'hF: Reserved **Note:** This field is updated after a Virtual Wire Channel transaction is completed if the VWFES bit is not set.

2.2.6 Virtual Wire Channel Error for Slave 1 (VWERR_SLV1) - Offset 4034h

This register is used to control error reporting for the eSPI Virtual Wire Channel for the second eSPI Slave device.

Note: Accesses to this register must respond with a U/R when a second eSPI Slave device is not present (i.e., in a single Slave configuration).

The register definition is identical to that of VWERR_SLV0, with the following exception:

VWNSMIEL, VWNMIOE, VWSMIOE (bits [28:26]): These bits are not supported. The correspomding bits for Slave0 in VWERR_SLV0 register cover NMI# and SMI# transmission to both Slaves.

Type	Size	Offset	Default
MMIO	32 bit	FD720000h + 4034h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RO	**Master NMIOUT# and SMIOUT# (Virtual Wires) to Slave Enable Lock (VWNSMIEL):** These bits are not supported. The corresponding bits for Slave0 in VWERR_SLV0 register cover NMI# and SMI# transmission to both Slaves.
27	0h RO	**Master NMIOUT (Virtual Wire) to Slave Enable (VWNMIOE):** These bits are not supported. The corresponding bits for Slave0 in VWERR_SLV0 register cover NMI# and SMI# transmission to both Slaves.
26	0h RO	**Master SMIOUT (Virtual Wire) to Slave Enable (VWSMIOE):** These bits are not supported. The corresponding bits for Slave0 in VWERR_SLV0 register cover NMI# and SMI# transmission to both Slaves.
25:15	0h RO	**Reserved**
14:13	0h RW	**Virtual Wire Channel Non-Fatal Error Reporting Enable (VWNFEE):** See VWERR_SLV0.VWNFEE.
12	0h RW/1C/V	**Virtual Wire Channel Non-Fatal Error Status (VWNFES):** See VWERR_SLV0.VWNFES.
11:8	0h RO/V	**Virtual Wire Channel Non-Fatal Error Cause (VWNFEC):** See VWERR_SLV0.VWNFEC.
7	0h RO	**Reserved**
6:5	0h RW	**Virtual Wire Channel Fatal Error Reporting Enable (VWFEE):** See VWERR_SLV0.VWFEE.
4	0h RW/1C/V	**Virtual Wire Channel Fatal Error Status (VWFES):** See VWERR_SLV0.VWFES.
3:0	0h RO/V	**Virtual Wire Channel Fatal Error Cause (VWFEC):** See VWERR_SLV0.VWFEC.

2.2.7 Flash Access Channel Error for Slave 0 (FCERR_SLV0) - Offset 4040h

This register is used to determine how to log and report errors on the Flash Access channel, for both Master and Slave Attached Flash configurations.

Type	Size	Offset	Default
MMIO	32 bit	FD720000h + 4040h	00040080h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	**Reserved**
18	1h RO/V	**SAF CAM Empty (SAFCAMEMPTY):** Only valid in slave-attached flash mode. Will always read 1 otherwise. 0: SAF CAM is not empty - there are outstanding NP flash transactions to the eSPI slave. 1: SAF CAM is empty - there are no outstanding NP flash transactions to the eSPI slave.
17	0h RW/1C/V	**SAF Blocked (SAFBLK):** Only valid in slave-attached flash mode. Will never be set to 1 by hardware otherwise. Set to 1 by hardware, when SAF NF Error Blocking Enable is set, when a NON_FATAL_ERROR response is received in response to a GET_FLASH_C. When this bit is set, the eSPI master will not issue any additional transactions on the flash channel. Software must write a 1 to clear this bit.
16	0h RW	**SAF NF Error Blocking Enable (SAFNFEBLKEN):** Only valid in slave-attached flash mode. Has no impact otherwise. 1: the flash channel will be blocked when a NON_FATAL_ERROR response is received in response to a GET_FLASH_C. 0: the flash channel will NOT be blocked when a NON_FATAL_ERROR response is received in response to a GET_FLASH_C.
15	0h RO	**Reserved**
14:13	0h RW	**Flash Access Channel Non-Fatal Error Reporting Enable (FCNFEE):** 2'b00: Disable Non-Fatal Error Reporting 2'b01: Reserved 2'b10: Enable Non-Fatal Error Reporting as SERR (IOSF-SB Do_SErr message) 2'b11: Enable Non-Fatal Error Reporting as SMI (IOSF-SB Assert_SMI message) **Note:** SERR enable is also qualified by PCCMD.SEE (Offset 04h) when PLTRST# is deasserted. **Note:** SERR also sets PCSTS.SSE (Offset 06h) when PLTRST# is deasserted. **Note:** SMI/SERR messages are not generated if the Host is in reset (PLTRST# asserted).
12	0h RW/1C/V	**Flash Access Channel Non-Fatal Error Status (FCNFES):** This field is set by hardware if a Non-Fatal Error condition is detected on the Flash Access Channel. Software must clear this bit. 1'b0: No Non-Fatal Error detected 1'b1: Non-Fatal Error detected (FCNFEC has a non-zero value) **Note:** Clearing this unlocks the FCNFEC field and triggers an IOSF-SB Deassert_SMI message if FCNFEE is set to SMI. **Note:** Setting of this bit is independent of the enable to generate a SMI/SERR (FCNFEE).

Bit Range	Default & Access	Field Name (ID): Description
11:8	0h RO/V	**Flash Access Channel Non-Fatal Error Cause (FCNFEC):** 4'h0: No error 4'h1: Slave Response Code: NONFATAL_ERROR received in response to GET_FLASH_NP, PUT_FLASH_C [for Master-Attached Flash accesses only] or GET_FLASH_C [for Slave-Attached Flash accesses only]. 4'h2: Slave Response Code: Unsuccessful Completion [for Slave-Attached Flash accesses only] 4'h3: Unexpected completion received from Slave (i.e. completion without non-posted request or completion with invalid tag or completion with invalid length) [for Slave-Attached Flash accesses only] 4'h4: Unsupported Cycle Type (w.r.t. Command) [for SPT-LP Master Attached Flash this should only be unsupported Erase Block Size] 4'h5: Slave Response Code: NONFATAL_ERROR received in response to PUT_FLASH_NP [for Slave-Attached Flash accesses only]. 4'h6: Unsupported Address (i.e., address > Flash linear address range) [for Master-Attached Flash accesses only] set to Flash Access Error 4'h7: Reserved 4'h8-4'hF: Reserved **Note:** This field is updated after a Flash Access Channel transaction is completed if the FCNFES bit is not set
7	1h RW	**Master Attached Flash Request Priority (MAFRP):** 1'b0: MAF Completion Requests are highest priority 1'b1: MAF Non-posted Requests are highest priority
6:5	0h RW	**Flash Access Channel Fatal Error Reporting Enable (FCFEE):** 2'b00: Disable Fatal Error Reporting 2'b01: Reserved 2'b10: Enable Fatal Error Reporting as SERR (IOSF-SB Do_SErr message) 2'b11: Enable Fatal Error Reporting as SMI (IOSF-SB Assert_SMI message) **Note:** SERR enable is also qualified by PCCMD.SEE (Offset 04h) when PLTRST# is deasserted. **Note:** SERR also sets PCSTS.SSE (Offset 06h) when PLTRST# is deasserted. **Note:** SMI/SERR messages are not generated if the Host is in reset (PLTRST# asserted).
4	0h RW/1C/V	**Flash Access Channel Fatal Error Status (FCFES):** This field is set by hardware if a Fatal Error condition is detected on the Flash Access Channel. Software must clear this bit by writing a 1 to it. 1'b0: No Fatal Error detected 1'b1: Fatal Error Type 2 detected (FCFEC has a non-zero value) **Note:** Clearing this unlocks the FCFEC field and triggers an IOSF-SB Deassert_SMI message if FCFEE is set to SMI. **Note:** Setting of this bit is independent of the enable to generate a SMI/SERR (FCFEE).
3:0	0h RO/V	**Flash Access Channel Fatal Error Cause (FCFEC):** 4'h0: No error 4'h1-4'h7: Reserved 4'h8: Malformed Slave Response Payload: Payload length > Max Payload Size [Type 2] 4'h9: Malformed Slave Response Payload: Read request size > Max Read Request Size [for Master-Attached Flash accesses only] [Type 2] 4'hA-4'hF: Reserved **Note:** This field is updated after a Flash Access Channel transaction is completed if the FCFES bit is not set.

2.2.8 Link Error for Slave 0 (LNKERR_SLV0) - Offset 4050h

This register is used to control link error reporting for the eSPI Slave 0.

Type	Size	Offset	Default
MMIO	32 bit	FD720000h + 4050h	0000FF00h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**eSPI Link and Slave Channel Recovery Required (SLCRR):** HW sets this bit when it has detected a Type 1 Fatal Error condition, for any channel (LFET1C is non-zero). Setting of this bit will trigger an error handling sequence by the eSPI-MC. SW must clear this bit (by writing a 1 to it) after it has taken all necessary actions to recover the link. This indicates the eSPI-MC to resume HW initiated transactions with the Slave.
30:23	0h RO	**Reserved**
22:21	0h RW	**Fatal Error Type 1 Reporting Enable (LFET1E):** 2'b00: Disable Fatal Error Type 1 Reporting 2'b01: Reserved 2'b10: Enable Fatal Error Type 1 Reporting as SERR (IOSF-SB Do_SErr message) 2'b11: Enable Fatal Error Type 1 Reporting as SMI (IOSF-SB Assert_SMI message) **Note:** SERR enable is also qualified by PCCMD.SEE (Offset 04h) when PLTRST# is deasserted. **Note:** SERR also sets PCSTS.SSE (Offset 06h) when PLTRST# is deasserted. **Note:** SMI/SERR messages are not generated if the Host is in reset (PLTRST# asserted). **Note:** When this error is reported, SW must also inspect and handle the SLCRR field.
20	0h RW/1C/V	**Fatal Error Type 1 Reporting Status (LFET1S):** This field is set by hardware if a Link Fatal Error Type 1 condition is detected on the eSPI link (any transaction). Software must clear this bit by writing a 1 to it. 1'b0: No Link Fatal Error Type 1 detected 1'b1: Fatal Error Type 1 detected (LFET1C has a non-zero value) **Note:** Clearing this unlocks the LFET1C field and triggers an IOSF-SB Deassert_SMI message if LFET1E is set to SMI. **Note:** Setting of this bit is independent of the enable to generate a SMI/SERR (LFET1E).
19:16	0h RO/V	**Link Fatal Type 1 cause (LFET1C):** 4'h0: No error 4'h1: Slave Response Code: NO_RESPONSE [Type 1] 4'h2: Slave Response Code: FATAL_ERROR [Type 1] or length in header >= 512 Bytes 4'h3: Slave Response Code: CRC_ERROR [Type 1] 4'h4: Invalid Slave Response Code (w.r.t. to Command) [Type 1] 4'h5: Invalid Slave Cycle Type (w.r.t. to Command) [Type 1] 4'h6 4'hF: Reserved **Note:** This field is updated after a transaction (any channel) is completed if the LFET1S bit is clear. **Note:** A non-zero value in this field also causes the SLCRR bit to be set.
15:8	FFh RO/V	**Link Fatal Error Type 1 Cycle Type (LFET1CTYP):** When LFET1C is set, this field reflects the Cycle Type for the transaction that encountered the Fatal Error Type 1. If no valid Cycle Type exists w.r.t. the Command (LFET1CMD), this field is set to 8hFF to indicate that it should be ignored. **Note:** This field is updated after a transaction (any channel) is completed if the LFET1S bit is clear.
7:0	00h RO/V	**Link Fatal Error Type 1 Command (LFET1CMD):** When LFET1C is set, this field reflects the Command for the transaction that encountered the Fatal Error Type 1. **Note:** This field is updated after a transaction (any channel) is completed if the LFET1S bit is clear.

2.2.9 Link Error for Slave 1 (LNKERR_SLV1) - Offset 4054h

This register is used to log and control link error reporting for the second eSPI Slave device.

Note: Accesses to this register must respond with a U/R when a second eSPI Slave device is not present (i.e., in a single Slave configuration).

The register definition is identical to that of LNKERR_SLV0.

Type	Size	Offset	Default
MMIO	32 bit	FD720000h + 4054h	0000FF00h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**eSPI Link and Slave Channel Recovery Required (SLCRR):** See LNKERR_SLV0.SLCRR.
30:23	0h RO	**Reserved**
22:21	0h RW	**Fatal Error Type 1 Reporting Enable (LFET1E):** See LNKERR_SLV0.LFET1E.
20	0h RW/1C/V	**Fatal Error Type 1 Reporting Status (LFET1S):** See LNKERR_SLV0.LFET1S.
19:16	0h RO/V	**Link Fatal Type 1 cause (LFET1C):** See LNKERR_SLV0.LFET1C.
15:8	FFh RO/V	**Link Fatal Error Type 1 Cycle Type (LFET1CTYP):** See LNKERR_SLV0.LFET1CTYP.
7:0	00h RO/V	**Link Fatal Error Type 1 Command (LFET1CMD):** See LNKERR_SLV0.LFET1CMD.

3 Primary to Sideband Bridge (P2SB)

3.1 P2SB Configuration Registers Summary

This chapter documents the registers in Bus: 0, Device 31, Function 1.

Table 3-1. Summary of Bus: 0, Device: 31, Function: 1 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	PCI Identifier (PCIID)	4B208086h
4h	2	PCI Command (PCICMD)	0004h
Eh	1	PCI Header Type (PCIHTYPE)	00h
10h	4	Sideband Register Access BAR (SBREG_BAR)	00000004h
14h	4	Sideband Register BAR High DWORD (SBREG_BARH)	00000000h
2Ch	4	PCI Subsystem Identifiers (PCIHSS)	00000000h
50h	2	VLW Bus:Device:Function (VBDF)	00F8h
52h	2	ERROR Bus:Device:Function (EBDF)	00F8h
54h	4	Routing Configuration (RCFG)	0000C700h
60h	1	High Performance Event Timer Configuration (HPTC)	00h
64h	2	IOxAPIC Configuration (IOAC)	0000h
6Ch	2	IOxAPIC Bus:Device:Function (IBDF)	00F8h
70h	2	HPET Bus:Device:Function (HBDF)	00F8h
C0h	4	Display Bus:Device:Function (DISPBDF)	00060010h
C4h	2	ICC Register Offsets (ICCOS)	0000h
D0h	4	SBI Address (SBIADDR)	00000000h
D4h	4	SBI Data (SBIDATA)	00000000h
D8h	2	SBI Status (SBISTAT)	0000h
DAh	2	SBI Routing Identification (SBIRID)	0000h
DCh	4	SBI Extended Address (SBIEXTADDR)	00000000h
E0h	4	P2SB Control (P2SBC)	00000007h
E4h	1	Power Control Enable (PCE)	09h
200h	4	Sideband Register Posted 0 (SBREGPOSTED0)	00000000h
204h	4	Sideband Register Posted 1 (SBREGPOSTED1)	00000000h
208h	4	Sideband Register Posted 2 (SBREGPOSTED2)	00000000h
20Ch	4	Sideband Register Posted 3 (SBREGPOSTED3)	00000000h
210h	4	Sideband Register Posted 4 (SBREGPOSTED4)	00000000h
214h	4	Sideband Register Posted 5 (SBREGPOSTED5)	00000000h
218h	4	Sideband Register Posted 6 (SBREGPOSTED6)	00000000h
21Ch	4	Sideband Register Posted 7 (SBREGPOSTED7)	00000000h
220h	4	Endpoint Mask 0 (EPMASK0)	00000000h
224h	4	Endpoint Mask 1 (EPMASK1)	00000000h
228h	4	Endpoint Mask 2 (EPMASK2)	00000000h
22Ch	4	Endpoint Mask 3 (EPMASK3)	00000000h
230h	4	Endpoint Mask 4 (EPMASK4)	00000000h
234h	4	Endpoint Mask 5 (EPMASK5)	00000000h
238h	4	Endpoint Mask 6 (EPMASK6)	00000000h
23Ch	4	Endpoint Mask 7 (EPMASK7)	00000000h

3.1.1 PCI Identifier (PCIID) - Offset 0h

PCI header registers.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:1] + 0h	4B208086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	4B20h RO/V	**Device Identification (DID):** The upper 8-bits of this field can be overridden by the SetID IOSF-SB Message.
15:0	8086h RO	**Vendor Identification (VID):** Indicates Intel

3.1.2 PCI Command (PCICMD) - Offset 4h

PCI header registers.

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:31, F:1] + 4h	0004h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	**Reserved**
10	0h RO	**Interrupt Disable (INTD):** P2SB does not issue any interrupts on its own behalf.
9	0h RO	**Fast Back to Back Enable (FB2BE):** Not applicable.
8	0h RW	**SERR# Enable (SEE):** This will enable parity error reporting to IEH.
7	0h RO	**Reserved**
6	0h RW	**Parity Error Response Enable (PEE):** This bit controls the device's response to parity error.
5	0h RO	**VGA Palette Snoop (VGA):** Not applicable.
4	0h RO	**Memory Write & Invalidate Enable (MWIE):** Not applicable.
3	0h RO	**Special Cycle Enable (SCE):** Not applicable.

Bit Range	Default & Access	Field Name (ID): Description
2	1h RO	**Bus Master Enable (BME):** Bus mastering cannot be disabled as this device acts as a proxy for non-PCI devices.
1	0h RW	**Memory Space Enable (MSE):** Will control the P2SB acceptance of PCI MMIO BARs only. Other legacy regions are unaffected by this bit.
0	0h RW	**I/O Space Enable (IOSE):** Legacy regions are unaffected by this bit.

3.1.3 PCI Header Type (PCIHTYPE) - Offset Eh

PCI header registers.

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:31, F:1] + Eh	00h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Multi-Function Device (MFD):** Indicates that this is part of a multi-function device.
6:0	0h RO	**Header Type (HTYPE):** Indicates a generic device header.

3.1.4 Sideband Register Access BAR (SBREG_BAR) - Offset 10h

PCI header registers.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:1] + 10h	00000004h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**Register Base Address (RBA):** Lower DWORD of the base address for the sideband register access BAR.
23:4	0h RO	**Hardwired to 0 to request a BAR of 16MB (HW202RB16MB):** Hardwired to 0 to request a BAR of 16MB
3	0h RO	**PREF:** Indicates this is not pre-fetch-able.
2:1	2h RO	**Address Type (ATYPE):** Indicates that this can be placed anywhere in 64b space.
0	0h RO	**Space Type (STYPE):** Indicates memory space

3.1.5 Sideband Register BAR High DWORD (SBREG_BARH) - Offset 14h

PCI header registers.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:1] + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Register Base Address (RBAH):** Upper DWORD of the base address for the sideband register access BAR.

3.1.6 PCI Subsystem Identifiers (PCIHSS) - Offset 2Ch

PCI header registers.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:1] + 2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem ID (SSID):** Written by BIOS. Not used by hardware.
15:0	0h RW/O	**Subsystem Vendor ID (SSVID):** Written by BIOS. Not used by hardware.

3.1.7 VLW Bus:Device:Function (VBDF) - Offset 50h

This register specifies the Bus:Device:Function ID that the VLW VDM will use for its Requester ID.

This field is default to Bus 0: Device 31: Function 0 after reset. BIOS shall program this field accordingly if unique bus:device:function number is required for the VLW message.

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:31, F:1] + 50h	00F8h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RW	**Bus Number (BUS):** VLW Bus Number
7:3	1Fh RW	**Device Number (DEV):** VLW Device Number
2:0	0h RW	**Function Number (FUNC):** VLW Function Number

3.1.8 ERROR Bus:Device:Function (EBDF) - Offset 52h

This register specifies the Bus:Device:Function ID that the Error Signaling messages VDM will use for its Requester ID.

This field is default to Bus 0: Device 31: Function 0 after reset. BIOS shall program this field accordingly if unique bus:device:function number is required for the VLW message.

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:31, F:1] + 52h	00F8h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RW	**Bus Number (BUS):** ERROR Bus Number
7:3	1Fh RW	**Device Number (DEV):** ERROR Device Number
2:0	0h RW	**Function Number (FUNC):** ERROR Function Number

3.1.9 Routing Configuration (RCFG) - Offset 54h

This register contains information used for routing transactions between primary and sideband interfaces.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:1] + 54h	0000C700h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:8	C7h RW	**Reserved Page Register Destination ID (RPRID):** Specifies the IOSF-SB destination ID for sending Reserved Page Register cycles (e.g. Port 80h). By default this will load to the ID of the eSPI device depending on which has been strapped active in the system.
7:1	0h RO	**Reserved**
0	0h RW	**RTC Shadow Enable (RSE):** When set, all IO writes to the RTC will be also sent to the PMC. This allows cases where the battery backed storage is in an external PMIC.

3.1.10 High Performance Event Timer Configuration (HPTC) - Offset 60h

HPET configuration register.

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:31, F:1] + 60h	00h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Address Enable (AE):** When set, the P2SB will decode the High Performance Timer memory address range selected by bits 1:0 below.
6:2	0h RO	**Reserved**
1:0	0h RW	**Address Select (AS):** This 2-bit field selects 1 of 4 possible memory address ranges for the High Performance Timer functionality. The encodings are: 00: FED0_0000h - FED0_03FFFh 01: FED0_1000h - FED0_13FFFh 10: FED0_2000h - FED0_23FFFh 11: FED0_3000h - FED0_33FFFh

3.1.11 IOxAPIC Configuration (IOAC) - Offset 64h

IOAPIC configuration register.

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:31, F:1] + 64h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:9	0h RO	**Reserved**
8	0h RW	**Address Enable (AE):** When set, the P2SB will decode the IOxAPIC memory address range selected by bits 7:0 below.
7:0	0h RW	**APIC Range Select (ASEL):** These bits define address bits 19:12 for the IOxAPIC range. The default value of 00h enables compatibility with prior products as an initial value. This value must not be changed unless the IOxAPIC Enable bit is cleared.

3.1.12 IOxAPIC Bus:Device:Function (IBDF) - Offset 6Ch

This register specifies the Bus:Device:Function ID that the IOxAPIC will use in the following:

As the Requester ID when initiating Interrupt Messages to the CPU.

As the Completer ID when responding to the reads targeting the IOxAPICs Memory-Mapped I/O registers.

This field is default to Bus 0: Device 31: Function 0 after reset. BIOS shall program this field accordingly if unique Bus:Device:Function number is required for the internal IOxAPIC.

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:31, F:1] + 6Ch	00F8h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RW	**Bus Number (BUS):** IOxAPIC Bus Number
7:3	1Fh RW	**Device Number (DEV):** IOxAPIC Device Number
2:0	0h RW	**Function Number (FUNC):** IOxAPIC Function Number

3.1.13 HPET Bus:Device:Function (HBDF) - Offset 70h

This register specifies the Bus:Device:Function ID that the HPET device will use in the following:

As the Requester ID when initiating Interrupt Messages to the CPU.

As the Completer ID when responding to the reads targeting the corresponding HPETs Memory-Mapped I/O registers.

This field is default to Bus 0: Device 31: Function 0 after reset. BIOS shall program this field accordingly if unique Bus:Device:Function number is required for the corresponding HPET.

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:31, F:1] + 70h	00F8h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RW	**Bus Number (BUS):** HPET Bus Number
7:3	1Fh RW	**Device Number (DEV):** HPET Device Number
2:0	0h RW	**Function Number (FUNC):** HPET Function Number

3.1.14 Display Bus:Device:Function (DISPBDF) - Offset C0h

This register specifies the Bus:Device:Function ID that the Display initiated upstream RAVDMs will use for its Requester ID. This will also be used for the claiming these Route-by-ID RAVDMs downstreams.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:1] + C0h	00060010h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	**Reserved**
18:16	6h RW	**Display Target Block (DTBLK):** This register contains the Target BLK field that will be used when sending RAVDM messages to the CPU Complex North Display.
15:8	0h RW	**Bus Number (BUS):** The bus number of the Display in the CPU Complex.
7:3	2h RW	**Device Number (DEV):** The bus number of the Display in the CPU Complex.
2:0	0h RW	**Function Number (FUNC):** The function number of the Display in the CPU Complex

3.1.15 ICC Register Offsets (ICCOS) - Offset C4h

This register contains the offsets to be used when sending RAVDMs to the Integrated Clock Controller. Each of the two spaces decoded for the ICC has a separate base address that will be used when sending those transactions on IOSF-SB to the ICC.

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:31, F:1] + C4h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RW	**Modulator Control Address Offset (MODBASE):** This specifies the upper 8b for the 16b address that will be used for sending RAVDM access that target the Modulator Control range of the ICC (FFF00h - FFFFFh).
7:0	0h RW	**Buffer Address Offset (BUFBASE):** This specifies the upper 8b for the 16b address that will be used for sending RAVDM access that target the Buffer range of the ICC (FFE00h - FFEFFh).

3.1.16 SBI Address (SBIADDR) - Offset D0h

Provides mechanism to send message on IOSFSB; the SAI check is only required on RS field but due to tool limitation, the SAI check is applied in RDL on whole register.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:1] + D0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**Destination Port ID (DESTID):** The content of this register field is sent in the IOSF Sideband Message Register Access dest field.
23:20	0h RO	**Reserved**
19:16	0h RW	**Root Space (RS):** Destination IOSF-SB Root Space. ***Note:*** This register may only be written during manufacturing test. P2SB will only accept writes to this register from transactions with a SAI equal to the SBI_RS_ACCESS_SAI parameter. This should be assigned to the SAI used by the functional test module (typically TAM) that will perform this register write on IOSF-P.
15:0	0h RW	**Address Offset (OFFSET):** Register address offsets. The content of this register field is sent in the IOSF Sideband Message Register Access address(15:0) field.

3.1.17 SBI Data (SBIDATA) - Offset D4h

Provides mechanism to send message on IOSFSB.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:1] + D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**DATA:** The content of this register field is sent on the IOSF sideband Message Register Access data(31:0) field.

3.1.18 SBI Status (SBISTAT) - Offset D8h

Provides mechanism to send message on IOSFSB.

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:31, F:1] + D8h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RW	**OPCODE:** This is the Opcode sent in the IOSF sideband message.
7	0h RW	**POSTED:** When set to 1, the message will be sent as a posted message instead of non-posted. This should only be used if the receiver is known to support posted operations for the specified operation.
6:3	0h RO	**Reserved**
2:1	0h RW/V	**Response Status (RESPONSE):** 00 - Successful 01 - Unsuccessful / Not Supported 10 - Powered Down 11 - Multi-cast Mixed This register reflects the response status for the previously completed transaction. The value of this register is only meaningful if SBISTAT.INITRDY is zero.
0	0h RW/1S	**Initiate/ Ready# (INITRDY):** 0: The IOSF sideband interface is ready for a new transaction 1: The IOSF sideband interface is busy with the previous transaction. A write to set this register bit to 1 will trigger an IOSF sideband message on the private IOSF sideband interface. The message will be formed based on the values programmed in the Sideband Message Interface Register Access registers. Software needs to ensure that the interface is not busy (SBISTAT.INITRDY is clear) before writing to this register.

3.1.19 SBI Routing Identification (SBIRID) - Offset DAh

Provides mechanism to send message on IOSFSB.

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:31, F:1] + DAh	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:12	0h RW	**First Byte Enable (FBE):** The content of this field is sent in the IOSF Sideband Register Access FBE field.
11	0h RO	**Reserved**
10:8	0h RW	**Base Address Register (BAR):** The contents of this field are sent in the IOSF Sideband Register Access BAR field. This should be zero performing a Memory Mapped operation to a PCI compliant device.
7:0	0h RW	**Function ID (FID):** The contents of this field are sent in the IOSF Sideband Register access FID field. This field should generally remain at zero unless specifically required by a particular application.

3.1.20 SBI Extended Address (SBIEXTADDR) - Offset DCh

Provides mechanism to send message on IOSFSB.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:1] + DCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Extended Address (ADDR):** The content of this register field is sent on the IOSF sideband Message Register Access address(48:32) field. This must be set to all 0 if 16b addressing is desired.

3.1.21 P2SB Control (P2SBC) - Offset E0h

P2SB general configuration register.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:1] + E0h	00000007h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/O	**SBI register Lock (SBILOCK):** Once written, it will not be writeable until module reset. Write once (1 or 0) to lock the Lock Bit. SBISTAT.INITRDY Register bit only lock if SBILOCK Bit = 1
30:28	0h RO	**Reserved**
27	0h RW	**VLW Wire Mode Enable (VWME):** When 1, VLW Wire Mode is enabled, where the VLW events from ITSS are received via the sideband wire handshake and this handshake is handled in P2SB as if a Posted Message is received from ITSS to the VLW VDM logic in Legacy Service agent. When 0, VLW Wire Mode is disabled, where the VLW events from ITSS are received via the IOSF Sideband using Non-Posted message. This policy is default to '0' which is the old behavior since Sunrise point. ***BIOS Note***: BIOS is expected to set this to '1' for Server Platform to mitigate in-out dependency risk.
26	0h RW	**Data Parity Error Enable (DPEE):** IOSFP data parity error handling (EP bit) enabling bit
25	0h RW	**Command Parity Error Enable (CPEE):** IOSFP command parity error handling enabling bit
24	0h RW	**Data Phase Parity Error Enable (DPPEE):** IOSFP data phase parity error handling enabling bit
23:18	0h RO	**Reserved**
17	0h RW/O	**Endpoint Mask Lock (MASKLOCK):** Locks the value of the EPMASK[0-7] registers. Once this value is written to a one it may only be cleared by a reset.
16	0h RW	**PGCB Clock Gating Enable (PGCBCGE):** When asserted the P2SB can de-assert the clock request to disable the PGCB clock dynamically when it reaches the power down idle state.
15:9	0h RO	**Reserved**
8	0h RW	**Hide Device (HIDE):** When this bit is set, the P2SB will return 1s on any PCI Configuration Read on IOSF-P. All other transactions including PCI Configuration Writes are unaffected by this. This does not affect reads performed on the IOSF-SB interface.
7:5	0h RO	**Reserved**
4	0h RW	**RAVDM Completion Status Policy Enable (RCSPE):** When this bit is SET, P2SB performs the following. 1) Return '000' (Successful Completion) for upstream Reg_rsp RAVDM on IOSF-P. 2) Return '001' (Unsupported Request) for upstream Reg_rsp. When clear P2SB always return '000' (Successful Completion) for Upstream Reg_rsp RAVDM
3	0h RO	**Reserved**
2:0	7h RW	**Max Writes Pending (MAXW):** This controls the max number of outstanding writes on IOSF-SB initiated by MMIO writes to the SBREG_BAR. Once the number of SBREG_BAR writes issued but not completed on IOSF-SB is equal to this value no new requests will be forwarded until completions are received. A value of zero will have the same behavior as the value of one (single write outstanding).

3.1.22 Power Control Enable (PCE) - Offset E4h

Power Control Enable register.

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:31, F:1] + E4h	09h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RW	**Hardware Autonomous Enable (HAE):** When set, the P2SB will automatically engage power gating when it has reached its idle condition.
4	0h RO	**Reserved**
3	1h RO	**Sleep Enable (SE):** tied to 1
2	0h RO	**D3-Hot Enable (D3HE):** No support for D3 Hot power gating.
1	0h RO	**I3 Enable (I3E):** No support for S0i3 power gating.
0	1h RW	**PMC Power Gating Enable (PMCPG_EN):** When set to 1, the P2SB will engage power gating if it is idle and the pmc_p2sb_sw_pg_req_b signal is asserted.

3.1.23 Sideband Register Posted 0 (SBREGPOSTED0) - Offset 200h

Provides a mechanism to send MMIO writes as posted writes on the IOSFSB space.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:1] + 200h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Sideband Register Posted 0 (SBREGPOSTED0):** One hot masks for setting SBREG to posted for IOSF-SB endpoint IDs 31-0.

3.1.24 Sideband Register Posted 1 (SBREGPOSTED1) - Offset 204h

Provides a mechanism to send MMIO writes as posted writes on the IOSFSB space.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:1] + 204h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Sideband Register Posted 1 (SBREGPOSTED1):** One hot masks for setting SBREG to posted for IOSF-SB endpoint IDs 63-32.

3.1.25 Sideband Register Posted 2 (SBREGPOSTED2) - Offset 208h

Provides a mechanism to send MMIO writes as posted writes on the IOSFSB space.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:1] + 208h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Sideband Register Posted 0 (SBREGPOSTED2):** One hot masks for setting SBREG to posted for IOSF-SB endpoint IDs 95-64.

3.1.26 Sideband Register Posted 3 (SBREGPOSTED3) - Offset 20Ch

Provides a mechanism to send MMIO writes as posted writes on the IOSFSB space.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:1] + 20Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Sideband Register Posted 3 (SBREGPOSTED3):** One hot masks for setting SBREG to posted for IOSF-SB endpoint IDs 127-96.

3.1.27 Sideband Register Posted 4 (SBREGPOSTED4) - Offset 210h

Provides a mechanism to send MMIO writes as posted writes on the IOSFSB space.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:1] + 210h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Sideband Register Posted 4 (SBREGPOSTED4):** One hot masks for setting SBREG to posted for IOSF-SB endpoint IDs 159-128.

3.1.28 Sideband Register Posted 5 (SBREGPOSTED5) - Offset 214h

Provides a mechanism to send MMIO writes as posted writes on the IOSFSB space.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:1] + 214h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Sideband Register Posted 5 (SBREGPOSTED5):** One hot masks for setting SBREG to posted for IOSF-SB endpoint IDs 191-160.

3.1.29 Sideband Register Posted 6 (SBREGPOSTED6) - Offset 218h

Provides a mechanism to send MMIO writes as posted writes on the IOSFSB space.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:1] + 218h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Sideband Register Posted 6 (SBREGPOSTED6):** One hot masks for setting SBREG to posted for IOSF-SB endpoint IDs 223-192.

3.1.30 Sideband Register Posted 7 (SBREGPOSTED7) - Offset 21Ch

Provides a mechanism to send MMIO writes as posted writes on the IOSFSB space.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:1] + 21Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Sideband Register Posted 7 (SBREGPOSTED7):** One hot masks for setting SBREG to posted for IOSF-SB endpoint IDs 255-224.

3.1.31 Endpoint Mask 0 (EPMASK0) - Offset 220h

Provide a mechanism for disabling particular IOSF-SB endpoints from being allowed to targeted by transactions from the P2SB.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:1] + 220h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/L	**Endpoint Mask 0 (EPMASK0):** One hot masks for disabling IOSF-SB endpoint IDs 31-0 **Locked by:** P2SBC.MASKLOCK

3.1.32 Endpoint Mask 1 (EPMASK1) - Offset 224h

Provide a mechanism for disabling particular IOSF-SB endpoints from being allowed to targeted by transactions from the P2SB.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:1] + 224h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/L	**Endpoint Mask 1 (EPMASK1):** One hot masks for disabling IOSF-SB endpoint IDs 63-32 **Locked by:** P2SBC.MASKLOCK

3.1.33 Endpoint Mask 2 (EPMASK2) - Offset 228h

Provide a mechanism for disabling particular IOSF-SB endpoints from being allowed to targeted by transactions from the P2SB.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:1] + 228h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/L	**Endpoint Mask 2 (EPMASK2):** One hot masks for disabling IOSF-SB endpoint IDs 95-64 **Locked by:** P2SBC.MASKLOCK

3.1.34 Endpoint Mask 3 (EPMASK3) - Offset 22Ch

Provide a mechanism for disabling particular IOSF-SB endpoints from being allowed to targeted by transactions from the P2SB.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:1] + 22Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/L	**Endpoint Mask 3 (EPMASK3):** One hot masks for disabling IOSF-SB endpoint IDs 127-96 **Locked by:** P2SBC.MASKLOCK

3.1.35 Endpoint Mask 4 (EPMASK4) - Offset 230h

Provide a mechanism for disabling particular IOSF-SB endpoints from being allowed to targeted by transactions from the P2SB.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:1] + 230h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/L	**Endpoint Mask 4 (EPMASK4):** One hot masks for disabling IOSF-SB endpoint IDs 128-159 **Locked by:** P2SBC.MASKLOCK

3.1.36 Endpoint Mask 5 (EPMASK5) - Offset 234h

Provide a mechanism for disabling particular IOSF-SB endpoints from being allowed to targeted by transactions from the P2SB.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:1] + 234h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/L	**Endpoint Mask 5 (EPMASK5):** One hot masks for disabling IOSF-SB endpoint IDs 191-160 **Locked by:** P2SBC.MASKLOCK

3.1.37 Endpoint Mask 6 (EPMASK6) - Offset 238h

Provide a mechanism for disabling particular IOSF-SB endpoints from being allowed to targeted by transactions from the P2SB.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:1] + 238h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/L	**Endpoint Mask 6 (EPMASK6):** One hot masks for disabling IOSF-SB endpoint IDs 223-192 **Locked by:** P2SBC.MASKLOCK

3.1.38 Endpoint Mask 7 (EPMASK7) - Offset 23Ch

Provide a mechanism for disabling particular IOSF-SB endpoints from being allowed to targeted by transactions from the P2SB.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:1] + 23Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/L	**Endpoint Mask 7 (EPMASK7):** One hot masks for disabling IOSF-SB endpoint IDs 255-224 **Locked by:** P2SBC.MASKLOCK

4 Power Management Controller (PMC)

4.1 PMC Configuration Registers Summary

This chapter documents the registers in Bus: 0, Device 31, Function 2.

Table 4-1. Summary of Bus: 0, Device: 31, Function: 2 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	Device Vendor ID (DEVVENDID)	4B218086h
4h	4	STATUSCOMMAND Status and Command (STATUSCOMMAND)	00100000h
8h	4	Revision Class Codes (REVCLASSCODE)	00000000h
Ch	4	CLLATHEADERBIST Cache Line Latency Header And BIST (CLLATHEADERBIST)	00000000h
10h	4	32-bit Base Address Register (BAR)	00000004h
14h	4	BAR HIGH (BAR_HIGH)	00000000h
18h	4	32-bit Base Address Register1 (BAR1)	00000004h
1Ch	4	BAR1 HIGH (BAR1_HIGH)	00000000h
20h	4	Bar 2 (BAR2)	00000001h
2Ch	4	Subsystem Identifiers (SUBSYSTEMID)	00000000h
30h	4	EXPANSION ROM BASEADDR (EXPANSION_ROM_BASEADDR)	00000000h
34h	4	CAPABILITY PTR (CAPABILITYPTR)	00000080h
3Ch	4	INTERRUPT REG Interrupt Register (INTERRUPTREG)	00000000h
80h	4	POWER CAP ID PowerManagement Capability ID (POWERCAPID)	48030001h
84h	4	PME CTRL STATUS (PMECTRLSTATUS)	00000008h
90h	4	PCIDEVIDLE CAP RECORD (PCIDEVIDLE_CAP_RECORD)	F0140009h
94h	4	DEVID VEND SPECIFIC REG (DEVID_VEND_SPECIFIC_REG)	01400010h
98h	4	D0I3 CONTROL SW LTR MMIO REG (D0I3_CONTROL_SW_LTR_MMIO_REG)	00000000h
9Ch	4	DEVICE IDLE POINTER REG (DEVICE_IDLE_POINTER_REG)	00000000h
A0h	4	D0I3 MAX POW LAT PG CONFIG (D0I3_MAX_POW_LAT_PG_CONFIG)	00000800h
B0h	4	GEN REGRW1 (GEN_REGRW1)	00000000h
B4h	4	GEN REGRW2 (GEN_REGRW2)	00000000h
B8h	4	GEN REGRW3 (GEN_REGRW3)	00000000h
BCh	4	GEN REGRW4 (GEN_REGRW4)	00000000h
C0h	4	GEN INPUT REG (GEN_INPUT_REG)	00000000h
F8h	4	Manufacturer's ID (MANID)	00000000h

4.1.1 Device Vendor ID (DEVVENDID) - Offset 0h

Device Vendor ID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:2] + 0h	00008086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	4B21h RO	**Device Identification (DEVICEID):** These bits are controlled as follows: Bits [15:7]: SETID msg Bits [6:0]: strap_deviceid[6:0] (00 to 1F - variable).
15:0	8086h RO	**Vendor Identification (VENDORID):** Indicates Intel

4.1.2 STATUSCOMMAND Status and Command (STATUSCOMMAND) - Offset 4h

Status and Command

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:2] + 4h	00100000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29	0h RW/1C	**RMA:** Received Master Abort
28	0h RW/1C	**RTA:** Received Target Abort
27:21	0h RO	**Reserved**
20	1h RO	**CAPLIST:** Capabilities List
19	0h RO	**INTR_STATUS:** Interrupt Status
18:11	0h RO	**Reserved**
10	0h RW	**INTR_DISABLE:** Interrupt Disable
9	0h RO	**Reserved**
8	0h RW	**SERR_ENABLE:** System Error Enable
7:3	0h RO	**Reserved**
2	0h RW	**BME:** Bus Master Enable
1	0h RW	**MSE:** Memory Space Enable
0	0h RO	**Reserved**

4.1.3 Revision Class Codes (REVCLASSCODE) - Offset 8h

Revision Class Codes

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:2] + 8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	**CLASS_CODES:** Class Codes
7:0	00h RO	**RID:** Revision ID

4.1.4 CLLATHEADERBIST Cache Line Latency Header And BIST (CLLATHEADERBIST) - Offset Ch

Cache Line Latency Header And BIST

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:2] + Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	0h RO	**MULFNDEV:** Multi Function Device
22:16	00h RO	**HEADERTYPE:** Header Type
15:8	00h RO	**LATTIMER:** Latency Timer
7:0	00h RW	**CACHELINE_SIZE:** Cacheline Size

4.1.5 32-bit Base Address Register (BAR) - Offset 10h

Base Address Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:2] + 10h	00000004h

Bit Range	Default & Access	Field Name (ID): Description
31:13	00000h RW	**BASEADDR:** Software programs this register with the base address of the device's memory region
12:4	000h RO	**Size Indicator (SIZEINDICATOR):** Hardwired to 0 to indicate 8KB of memory space
3	0h RO	**PREFETCHABLE:** A device can mark a range as pre-fetch-able if there are no side effects on reads, the device returns all bytes on reads regardless of the byte enables. Hardwired to 0 to indicate the device's memory space as not pre-fetch-able.
2:1	2h RO	**TYPE:** Hardwired to 10 to indicate that Base register is 64 bits wide and mapping can be done anywhere in the 64-bit Memory Space.
0	0h RO	**Memory Space Indicator (MESSAGE_SPACE):** Hardwired to 0 to identify a Memory BAR.

4.1.6 BAR HIGH (BAR_HIGH) - Offset 14h

BAR -Base Address Register High

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:2] + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address HIGH (BASEADDR_HIGH):** Base Address

4.1.7 32-bit Base Address Register1 (BAR1) - Offset 18h

Base Address Register1

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:2] + 18h	00000004h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**BASEADDR1:** Software programs this register with the base address of the device's memory region
11:4	00h RO	**Size Indicator (SIZEINDICATOR1):** Hardwired to 0 to indicate 4KB of memory space

Bit Range	Default & Access	Field Name (ID): Description
3	0h RO	**PREFETCHABLE1:** A device can mark a range as pre-fetch-able if there are no side effects on reads, the device returns all bytes on reads regardless of the byte enables. Hardwired to 0 to indicate the device's memory space as not pre-fetch-able.
2:1	2h RO	**TYPE1:** Hardwired to 10 to indicate that Base register is 64 bits wide and mapping can be done anywhere in the 64-bit Memory Space.
0	0h RO	**Memory Space Indicator (MESSAGE_SPACE1):** Hardwired to 0 to identify a Memory BAR.

4.1.8 BAR1 HIGH (BAR1_HIGH) - Offset 1Ch

BAR1 - Base Address Register High

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:2] + 1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address HIGH (BASEADDR1_HIGH):** Base Address HIGH

4.1.9 Bar 2 (BAR2) - Offset 20h

BAR - Base Address Register2

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:2] + 20h	00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0000000h RW	**Base Address (BASEADDR):** Base Address
6:1	0h RO	**Reserved**
0	1h RO	**Message Space (MESSAGE_SPACE):** Hardwired to 1 to identify an IO BAR.

4.1.10 Subsystem Identifiers (SUBSYSTEMID) - Offset 2Ch

Subsystem Identifiers

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:2] + 2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O	**Subsystem ID (SUBSYSTEMID):** Written by BIOS. Not used by hardware.
15:0	0000h RW/O	**Subsystem Vendor ID (SUBSYSTEMVENDORID):** Written by BIOS.Not used by hardware.

4.1.11 EXPANSION ROM BASEADDR (EXPANSION_ROM_BASEADDR) - Offset 30h

EXPANSION ROM base address

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:2] + 30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**EXPANSION_ROM_BASE:** Expansion ROM Base

4.1.12 CAPABILITY PTR (CAPABILITYPTR) - Offset 34h

CAPABILITYPTR - Capabilities Pointer

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:2] + 34h	00000080h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	80h RO	**CAPPTR_POWER:** Capabilities Pointer

4.1.13 INTERRUPT REG Interrupt Register (INTERRUPTREG) - Offset 3Ch

Interrupt Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:2] + 3Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**MAX_LAT:** Maximum Latency
23:16	00h RO	**MIN_GNT:** Minimum GNT
15:12	0h RO	**Reserved**
11:8	0h RO	**INTPIN:** Interrupt Pin
7:0	00h RW	**INTLINE:** Interrupt Line

4.1.14 POWER CAP ID Power Management Capability ID (POWERCAPID) - Offset 80h

Power Management Capability ID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:2] + 80h	48030001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	09h RO	**PMESUPPORT:** PME Support
26:19	0h RO	**Reserved**
18:16	3h RO	**VERSION:** Version
15:8	00h RO	**NXTCAP:** Next Capability
7:0	01h RO	**POWER_CAP:** Power Management Capability

4.1.15 PME CTRL STATUS (PMECTRLSTATUS) - Offset 84h

Power Management Control and Status Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:2] + 84h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW/1C	**PMESTATUS:** PME Status
14:9	0h RO	**Reserved**
8	0h RW	**PMEENABLE:** PME Enable
7:4	0h RO	**Reserved**
3	1h RO	**NO_SOFT_RESET:** NO SOFT RESET
2	0h RO	**Reserved**
1:0	0h RW	**POWERSTATE:** Power State

4.1.16 PCIDEVIDLE CAP RECORD (PCIDEVIDLE_CAP_RECORD) - Offset 90h

PCI DEVICE IDLE CAPABILITY RECORD

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:2] + 90h	F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**VEND_CAP:** Vendor Specific Capability ID
27:24	0h RO	**REVID:** Vendor Specific Capability Revision
23:16	14h RO	**CAP_LENGTH:** Vendor Specific Capability Length
15:8	00h RO	**NEXT_CAP:** NEXT Capability
7:0	09h RO	**CAPID:** Capability ID

4.1.17 DEVID VEND SPECIFIC REG (DEVID_VEND_SPECIFIC_REG) - Offset 94h

DEVID VENDOR SPECIFIC REG

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:2] + 94h	01400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	014h RO	**VSEC_LENGTH:** Vendor Specific Extended Capability Length
19:16	0h RO	**VSEC_REV:** Vendor Specific Extended Capability Revision
15:0	0010h RO	**VSECID:** Vendor Specific Extended Capability ID

4.1.18 D0I3 CONTROL SW LTR MMIO REG (D0I3_CONTROL_SW_LTR_MMIO_REG) - Offset 98h

SW LTR Update MMIO Location Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:2] + 98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RO	**SW_LAT_DWORD_OFFSET:** SW LTR Update MMIO Offset Location
3:1	0h RO	**SW_LAT_BAR_NUM:** SW LTR Bar Num
0	0h RO	**SW_LAT_VALID:** SW LTR Valid Strap

4.1.19 DEVICE IDLE POINTER REG (DEVICE_IDLE_POINTER_REG) - Offset 9Ch

Device IDLE Pointer Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:2] + 9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RO	**DWORD_OFFSET:** Device MMIO Offset Location
3:1	0h RO	**BAR_NUM:** D0i3 MMIO Location
0	0h RO	**VALID:** D0i3 Valid Strap

4.1.20 D0I3 MAX POW LAT PG CONFIG (D0I3_MAX_POW_LAT_PG_CONFIG) - Offset A0h

DEVICE PG CONFIG

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:2] + A0h	00000800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21	0h RW	**HAE:** Hardware Autonomous Enable
20	0h RO	**Reserved**
19	0h RW	**SLEEP_EN:** Sleep Enable
18	0h RW	**PGE:** Power Gate Enable
17	0h RW	**I3_ENABLE:** I3 Enable

4.2.1 General PM Configuration A (GEN_PMCON_A) — Offset 1020h

Usage ACPI, Legacy. Available Desktop, Mobile.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1020h	20014000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30	0h RW	**DC PHY Power Disable (DC_PP_DIS):** This bit determines the Host software contribution to whether the LAN PHY remains powered in Sx/MOFF or DeepSx while on battery. See the SLP_LAN# sub-section later in the chapter for more information.
29	1h RW	**Deep-Sx PHY Power Disable (DSX_PP_DIS):** This bit determines the Host software contribution to whether the LAN PHY remains powered in DeepSx. See the SLP_LAN# sub-section later in the chapter for more information. If this bit is cleared, for the PHY to be powered in deep-Sx state, SX_PP_EN must be set to 1.
28	0h RW	**After G3 PHY Power Enable (AG3_PP_EN):** This bit determines the Host software contribution to whether the LAN PHY is powered up after exiting G3 (to either Sx/MOFF or DeepSx). See the SLP_LAN# sub-section later in the chapter for more information.
27	0h RW	**Sx PHY Power Enable (SX_PP_EN):** This bit determines the Host software contribution to whether the LAN PHY remains powered in an Sx/MOFF state that was entered from S0 (rather than from G3). See the SLP_LAN# sub-section later in the chapter for more information.
26:25	0h RO	**Reserved**
24	0h RW/1C/V	**Global Reset Status (GBL_RST_STS):** This bit is set after a global reset (not G3 or DeepSx) occurs. See the GEN_PMCON_B.HOST_RST_STS bit for potential usage models.
23	0h RW	**DRAM Initialization Scratchpad Bit (DISB):** This bit does not effect hardware functionality in any way. It is provided as a scratchpad bit that is maintained through main power well resets and CF9h-initiated resets. BIOS is expected to set this bit prior to starting the DRAM initialization sequence and to clear this bit after completing the DRAM initialization sequence. BIOS can detect that a DRAM initialization sequence was interrupted by a reset by reading this bit during the boot sequence. If the bit is 1, then the DRAM initialization was interrupted. This bit is reset by the assertion of the RSMRST# pin.
22	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
21	0h RO/V	**Memory Placed in Self-Refresh (MEM_SR):** This bit will be set to 1 if DRAM should have remained powered and held in Self-Refresh through the last power state transition (i.e. the last time the system left S0). The scenarios where this should be the case are: - successful S3 entry & exit - successful Host partition reset without power cycle These scenarios both involve a handshake between the PCH and the CPU/MCH. The acknowledge from the CPU/MCH back to the PCH is assumed to imply that memory was successfully placed into Self-Refresh (the PCH has no way to verify whether that actually occurred). This bit will be cleared whenever the PCH begins a transition out of S0. Note: This bit should not be consulted upon wake from S1, as that state does not involve the same type of handshake or placing memory into Self-Refresh. It is assumed that software is already aware that memory context is not impacted by S1 and therefore does not need to check this bit.
20:19	0h RO	**Reserved**
18	0h RW/1C/V	**Minimum SLP_S4# Assertion Width Violation Status (MS4V):** Hardware sets this bit when the SLP_S4# assertion width is less than the time programmed in the SLP_S4# Minimum Assertion Width field (D31.F0.A4h.5:4). The PCH begins the timer when SLP_S4# pin (including ME override logic) is asserted during S4/S5 entry, or when the pri_pwrgood_rst_b input is deasserted during SUS well power-up. The status bit is cleared by software writing a 1 to the bit. Note that this bit is functional regardless of the value in the SLP_S4# Assertion Stretch Enable and the Disable SLP_X Stretching After SUS Power Failurebits. This bit is reset by the assertion of the pri_pwrgood_rst_b pin, but can be set in some cases before the default value is readable.
17	0h RO	**Reserved**
16	1h RW/1C	**SUS Well Power Failure (SUS_PWR_FLR):** This bit is set to '1' whenever SUS well power is lost, as indicated by RSMRST# assertion. Software writes a 1 to this bit to clear it.
15	0h RW	**PME B0 S5 Disable (PME_B0_S5_DIS):** When set to '1', this bit blocks wake events from PME_B0_STS in S5, regardless of the state of PME_B0_EN. When cleared (default), wake events from PME_B0_STS are allowed in S5 if PME_B0_EN = '1'. Wakes from power states other than S5 are not affected by this policy bit. The net effect of setting PME_B0_S5_DIS = '1' is described by the truth table below: Y = Wake N = Don't wake B0 = PME_B0_EN OV = WOL Enable Override B0/OV | S1/S3/S4 | S5 00 | N | N 01 | N | Y (LAN only) 11 | Y (all PME B0 sources) | Y (LAN only) 10 | Y (all PME B0 sources) | N This bit is cleared by the rtc_pwrgood_rst_b pin.
14	1h RW/1C	**PF:** 1 = Indicates that the trickle current (from the main battery or trickle supply) was removed or failed. 0 = Indicates that the trickle current has not failed since the last time the bit was cleared. Software writes a 1 to this bit to clear it. This bit is in the DSW well, and defaults to '1' based on dsw_pwrgood_rst_b deassertion (not cleared by any type of reset). Implementation Note: dsw_pwrgood_rst_b is an asynchronous set term to this bit.

Bit Range	Default & Access	Field Name (ID): Description
13	0h RO	**Reserved**
12	0h RW/L	**Disable SLP_X Stretching After SUS Well Power Up (DIS_SLP_X_STRCH_SUS_UP):** When this bit is set to 1, all SLP_* pin stretching is disabled when powering up after a SUS well power loss. When this bit is left at 0, SLP_* stretching will be performed after SUS power failure as enabled in various other fields. Note that if this bit is a 0, SLP_* stretch timers start on SUS well power up (the PCH has no ability to count stretch time while the SUS well is powered down). Setting this bit can therefore prevent long delays after SUS power loss which may be common in mobile platforms and in manufacturing flow testing, while still allowing for the full power cycling during S3, S4 and S5 states. If the platform guarantees minimum SUS power down residence in other ways, an additional PCH-induced delay is not needed or wanted. Note: This policy bit has a different effect on SLP_SUS# stretching than on the other SLP_* pins, since SLP_SUS# is the control signal for one of the scenarios where SUS well power is lost (DeepSx). The effect of setting this bit to '1' on: - SLP_S3#, SLP_S4#, SLP_A# and SLP_LAN# stretching: disabled after any SUS power loss - SLP_SUS# stretching: disabled after G3, but no impact on DeepSx This field is not writable when the SLP_Sx# Stretching Policy Lock-Down bit is set. This bit is cleared by the rtc_pwrgood_rst_b pin. **Locked by:** GEN_PMCON_B.SLPSX_STR_POL_LOCK
11:10	0h RW/L	**SLP_S3# Minimum Assertion Width (SLP_S3_MIN_ASST_WDTH):** This 2-bit value indicates the minimum assertion width of the SLP_S3# signal to guarantee that the Main power supplies have been fully power-cycled. This value may be modified per platform depending on power supply capacitance, board capacitance, power failure detection circuits, etc. Settings are: 00: 60 usec 01: 1 ms 10: 50 ms 11: 2 sec This field is not writable when the SLP_Sx# Stretching Policy Lock- Down bit is set. This bit is cleared by the pri_pwrgood_rst_b pin. **Locked by:** GEN_PMCON_B.SLPSX_STR_POL_LOCK
9	0h RW/1C/V	**Host Reset Status (HOST_RST_STS):** This bit is set by hardware when a host partition reset (not a global reset, DeepSx, or G3) occurs. This bit is an optional tool to help BIOS determine when a host partition reset might have collided with a wake from a valid sleep state. A possible usage model would be to consult and then write a '1' to clear this bit during the boot flow before determining what action to take based on reading PM1_STS.WAK_STS = '1'. If HOST_RST_STS = '1' and/or GEN_PMCON_A.GBL_RST_STS = '1', the cold reset boot path could be followed rather than the resume path, regardless of the setting of WAK_STS. This bit does not affect PCH operation in any way, and can therefore be left set if BIOS chooses not to use it.
8	0h RW/L	**ESPI SMI Lock (ESPI_SMI_LOCK):** When this bit is set, writes to the ESPI_SMI_EN bit will have no effect. Once the ESPI_SMI_LOCK bit is set, writes of 0 to ESPI_SMI_LOCK bit will have no effect (i.e. once set, this bit can only be cleared by host_prim_rst_b). **Locked by:** GEN_PMCON_A.ESPI_SMI_LOCK

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RW	**SWSMI Rate Select (SWSMI_RATESEL):** This 2-bit value indicates when the SWSMI timer will time out. Valid values are: 00 1.5ms +/- 0.6ms 01 16ms +/- 4ms 10 32ms +/- 4ms 11 64ms +/- 4ms These bits are not cleared by any type of reset except rtc_pwrgood_rst_b.
5:4	0h RW/L	**SLP_S4# Minimum Assertion Width (S4MAW):** This 2-bit value indicates the minimum assertion width of the SLP_S4# signal to guarantee that the DRAMs have been safely power-cycled. This value may be modified per platform depending on DRAM types, power supply capacitance, etc. Valid values are: 11: 1 second 10: 2 seconds 01: 3 seconds 00: 4 seconds This value is used in two ways: 1. If the SLP_S4# assertion width is ever shorter than this time, a status bit (D31.F0.A2h.2) is set for BIOS to read when S0 is entered 2. If enabled by bit 3 in this register, the hardware will prevent the SLP_S4# signal from deasserting within this minimum time period after asserting. Note that the logic that measures this time is in the suspend power well. Therefore, when leaving a G3 or DeepSx state, the minimum time is measured from the deassertion of the internal suspend well reset (unless the Disable SLP_X Stretching After SUS Power Failurebit is set). This field is not writable when the SLP_Sx# Stretching Policy Lock-Down bit is set. rtc_pwrgood_rst_b forces this field to the conservative default state (00b). **Locked by:** GEN_PMCON_B.SLPSX_STR_POL_LOCK
3	0h RW/L	**SLP_S4# Assertion Stretch Enable (S4ASE):** When set to 1, the SLP_S4# pin (which includes the ME override logic) will minimally assert for the time specified in bits 5:4 of this register. When 0, the minimum assertion time for SLP_S4# is the same as the timing defined in the timing tables in Default 16.6.3. This bit is provided so that all DIMMs in the system can deterministically detect a power-cycle event for proper initialization. Note that there are behavioral changes that may be noticeable to the end-user when this bit is set. Resume times from S4 and S5 and power-up times from G3 or DeepSx may be delayed by several seconds. Cases in which this feature may not be desirable and therefore keeping the bit cleared are: A customer decides the user confusion due to the hardware delay is a bigger issue than the potential DRAM issue A customer decides the software status bit solution is adequate A different DRAM type is used or the platform provides an external solution to solve the power-cycling issue Validation regressions are impacted by the delay (especially after pri_pwrgood_rst_b deassertion) Avoid potential resume time WHQL violations This bit is not writable when the SLP_Sx# Stretching Policy Lock-Down bit is set. This bit is cleared by rtc_pwrgood_rst_b. **Locked by:** GEN_PMCON_B.SLPSX_STR_POL_LOCK
2:1	0h RW	**Period SMI Select (PER_SMI_SEL):** Software sets these bits to control the rate at which the periodic SMI# is generated: 00 = 64 seconds (default), 01 = 32 seconds, 10 = 16 seconds, 11 = 8 seconds Tolerance for the timer is +/- 1 second.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	**AG3E:** Determines what state to go to when power is reapplied after a power failure (G3 state). 0 = System will return to an S0 state (boot) after power is re-applied. 1 = System will return to the S5 state (except if it was in S4, in which case it will return to S4-like state). In the S5 state, the only enabled wake-up event is the Power Button or any enabled wake event that was preserved through the power failure. This bit is in the RTC well and is only cleared by rtc_pwrgood_rst_b assertion.

4.2.2 General PM Configuration B (GEN_PMCON_B) — Offset 1024h

General PM configuration B

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	**Reserved**
18	0h RW/L	**SLP_Sx# Stretching Policy Lock-Down (SLPSX_STR_POL_LOCK):** When set to 1, this bit locks down the following fields: - GEN_PMCON_3.DIS_SLP_X_STRCH_SUSPF - GEN_PMCON_3.SLP_S3_MIN_ASST_WDTH - GEN_PMCON_3.S4MAW - GEN_PMCON_3.S4ASE - PM_CFG.SLP_A_MIN_ASST_WDTH - PM_CFG.SLP_LAN_MIN_ASST_WDTH - PM_CFG.PWR_CYC_DUR Those bits become read-only. This bit becomes locked when a value of 1b is written to it. Writes of 0 to this bit are always ignored. Once locked by writing 1, the only way to clear this bit is to perform a platform reset. This lockdown bit is available in both desktop and mobile. **Locked by:** GEN_PMCON_B.SLPSX_STR_POL_LOCK
17:14	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
13	0h RW	**WOL Enable Override (WOL_EN_OVRD):** When this bit is set to 1, the integrated LAN is enabled to wake the system from S5 regardless of the value in the PME_B0_EN bit in the GPE0_EN register. This allows the system BIOS to enable Wake-On-LAN regardless of the policies selected through the operating system. This bit is maintained in the RTC power well, therefore permitting WOL following a surprise power failure even in cases in which the system may have been running in S0 without the PME Enables set. (Note that the LAN NVRAM configuration must support WOL after SUS power loss.) When this bit is cleared to 0, the wake-on-LAN policies are determined by OS-visible bits. This bit has no effect on wakes from S1, S3, or S4. This bit is cleared by the rtc_pwrgood_rst_b pin
12:11	0h RO	**Reserved**
10	0h RW	**BIOS PCI Express Enable (BIOS_PCI_EXP_EN):** This bit acts as a global enable for the SCI associated with the PCI express ports. If this bit is not set, then the various PCI Express ports and MCH cannot cause the PCI_EXP_STS bit to go active.
9	0h RO/V	**Power Button Level (PWRBTN_LVL):** This read-only bit indicates the current state of the PWRBTN# signal. 1= High, 0 = Low. The value reflected in this bit is dependent upon PM_CFG1.PB_DB_MODE. The PB_DB_MODE bit's value causes the following behavior: - '0': PWRBTN_LVL is taken from the debounced PWRBTN# pin value that is seen at the output of a 16ms debouncer. - '1': PWRBTN_LVL is taken from the raw PWRBTN# pin (before the debouncer).
8	0h RW	**T32a Bypass Enable (T32A_BYPASS_EN):** When set to '1', the full t32a timing will only be counted on the first boot after an RTC power-loss. When '0', t32a will be will be counted on every boot after a G3. Note: If the t32a_bypass pin-strap is set, t32a is never counted and this bit has no effect.
7:5	0h RO	**Reserved**
4	0h RW/L	**SMI Lock (SMI_LOCK):** When this bit is set, writes to the GLB_SMI_EN bit will have no effect. Once the SMI_LOCK bit is set, writes of 0 to SMI_LOCK bit will have no effect (i.e. once set, this bit can only be cleared by host_prim_rst_b). **Locked by:** GEN_PMCON_B.SMI_LOCK
3	0h RO	**Reserved**
2	1h RW	**RPS:** Intel PCH will set this bit to 1 when rtc_pwrgood_rst_b indicates a weak or missing battery. The bit will remain set until the software clears it by writing a 0 back to this bit position. This bit is not cleared by any type of reset.
1:0	0h RO	**Reserved**

4.2.3 Configured Revision ID (CRID) — Offset 1030h

Configured revision ID Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1030h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**CRID Lock (CRID_LK):** BIOS writes to this bit to lock this register (a specific lock bit is preferable over a write-based self-lock for the RID_SEL field). When this bit is written to 1, the entire register becomes RO (writes have no effect, reads return actual value) until the next assertion of host_prim_rst_b. **Locked by:** CRID.CRID_LK
30:2	0h RO	**Reserved**
1:0	0h RW/L	**RID Select(RID_SEL) (RID_SEL):** Software writes this field to select the fuse sets reflected in PCI config space Revision ID. The decoding is: 00 - Revision ID 01 - CRID 0 10 - CRID 1 11 - CRID 2 Once written, this field can only be cleared by a reset. reset_type = host_prim_rst_bDeepRst-BIOS wr all boots, (HOST_RST/platform reset when arch available.) (setid multicast sends this out) . **Locked by:** CRID.CRID_LK

4.2.4 Extended Test Mode Register 3 (ETR3) — Offset 1048h

This register resides in the primary well. All bits except bit[23:16] are reset by host_deep_rst_b. Bit[23:16] are reset by pri_pwrgood_rst_b only.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1048h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V/L	**CF9h Lockdown (CF9LOCK):** When set, this will lock the CF9h Global Resetbit. When set, this register locks itself. This register is reset by a CF9h reset. **Locked by:** ETR3.CF9LOCK
30	0h RW/V	**Reserved**
29	0h RW	**Reserved**
28	0h WO	**Reserved**
27:21	0h RO	**Reserved**
20	0h RW/L	**CF9h Global Reset (CF9GR):** When this bit is set, a CF9h write of 6h or Eh will cause a Global Reset of both the Host and the ME partitions. If this bit is cleared, a CF9h write of 6h or Eh will only reset the Host partition. It is recommended that BIOS should set this bit early on in the boot sequence, and then clear it and set the CF9LOCK bit prior to loading the OS in both an ME Enabled and a ME Disabled system. When this bit is set, the hardware assumes that bit 18 (CF9h Without Resume Well Reset Enable) is cleared. This register is locked by the CF9 Lockdown (CF9LOCK) bit. This register is not reset by a CF9h reset. **Locked by:** ETR3.CF9LOCK
19:0	0h RO	**Reserved**

4.2.5 SET STRAP MSG LOCK (SSML) — Offset 104Ch

4.2.6 SET STRAP MSG CONTROL (SSMC) — Offset 1050h

SET STRAP Message Control

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1050h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW/L	**Set_Strap Mux Select (SSMS):** When set to 1, the Set strap message bits [47:32] come from the Set_Strap Msg Data register. This bit is reset by the RSMRST# pin only. When 0, the Set-Strap data continues to come from the soft straps themselves.This register field is locked by the Set Strap Lock (SSML.SSL) bit. **Locked by:** SSML.SSL

4.2.7 SET STRAP MSG DATA (SSMD) — Offset 1054h

This register is used to provide a BIOS programmable sticky register which contains data that will be used in the Set-Strap type 1 msg on subsequent resets. The bits in the message control certain CPU features, for which see the CPU spec. These bits are in the resume well, so only reset on G3. The usage model is that on each reset BIOS will check the state of the CPU. If the state is correct, then BIOS continues. If not, then BIOS writes the SSMD and SSMC registers and does a CF9 reset. On the reset the value of what was written to SSMD takes effect. Note that some mobile platforms force G3 on

S5 requests. For those platforms, if the user/BIOS wants to have these bits set, there will be 2 resets on every power-on. If the platform accepts the default of 0 for these controls, then there is only one reset. The bits are in DSW and not RTC well because this allows a user upgrade, assuming the user unplugged the system before doing the upgrade, to revert to a setting of 0. This should reduce any interoperability concerns regarding user upgrades. The DSW bits are all cleared dsw_pok, and must not be cleared by CF9h resets.

Type	Size	Offset	Default

6	0h RO/V	**PCIe Low Power Status (PCIE_LP_STS):** This bit when 1 indicates that all PCIe root port controllers are in their low power state.
5	0h RO/V	**Thermal Sensor Disabled Status (TS_DIS_STS):** This bit when 1 indicates that the thermal sensor is disabled
4	0h RO/V	**GBE No Link Status (GBE_NO_LINK_STS):** This bit when 1 indicates that the GBE interface is disconnected.
3	0h RO/V	**Dynamic Flex IO Status (DYNAMIC_FLEX_IO_STS):** This bit when 1 indicates that Dynamic FLEX IO change is not in progress.
2	0h RO/V	**USB2 SUS Power Gated Status (USB2_SUS_PG_STS):** This bit when 1 indicates that USB2 PHY SUS power domain is off.
1	0h RO/V	**CSME Power Gated Status (CSME_PG_STS):** This bit when 1 indicates that all power gated domains in CSME are turned off.
0	0h RO/V	**MHPY CORE Power Gated Status (MPHY_CORE_PG_STS):** This bit when 1 indicates that mphy core and data lanes are off.

4.2.12 ModPHY Power Management Configuration Reg 1 (MODPHY_PM_CFG1) — Offset 10C0h

This register contains misc. fields used to configure the PCH's power management behavior with respect to the modPHY

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10C0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
11:0	000h RW	**ModPHY Lane S0 SUS Well Power Gating Policy [11:0] (MLS0SWPGP):** This is a bit per lane that controls SUS Well Power Gating for a ModPHY lane to be used for S0 and S0ix use models. Bit 0: Corresponds to ModPHY Lane 0 Bit 1: Corresponds to ModPHY Lane 1 Bit 2: Corresponds to ModPHY Lane 2 : : Bit 11: Corresponds to ModPHY Lane 11 For each lane: 0: Lane power gating not permitted in S0. 1: Lane power gating is permitted in S0. Note that strap information/PCIe Lane reversal information will be factored by BIOS when programming these bits in the configuration registers. Note that it is illegal SW programming to have a bit location to be 1 in this field and the corresponding bit position to be 0 in MLSXSWPGP

4.2.13 ModPHY Power Management Configuration Reg 2 (MODPHY_PM_CFG2) — Offset 10C4h

This register contains misc. fields used to configure the PCH's power management behavior with respect to the modPHY

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10C4h	00000FFFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
11:0	FFFh RW	**ModPHY Lane Sx SUS Well Power Gating Policy [11:0] (MLSXSWPGP):** This is a bit per lane that controls SUS Well Power Gating for a ModPHY lane when system is in Sx. Bit 0: Corresponds to ModPHY Lane 0 Bit 1: Corresponds to ModPHY Lane 1 Bit 2: Corresponds to ModPHY Lane 2 : : Bit 11: Corresponds to ModPHY Lane 11 For each lane: 0: Lane power gating not permitted in Sx. 1: Lane power gating is permitted in Sx. Note that strap information/PCIe Lane reversal information will be factored by BIOS when programming these bits in the configuration registers. For ease of PMC implementation, this field will be used to manage Sx policies even in S0. In other words, the earlier restriction that BIOS does not have to program this field if MLSPDDGE is 1 does not apply any more. BIOS shall set this field appropriately for all cases.

4.2.14 ModPHY Power Management Configuration Reg 3 (MODPHY_PM_CFG3) — Offset 10C8h

This register contains misc. fields used to configure the PCH's power management behavior with respect to the modPHY.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10C8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30	0h RW	**ModPHY Lane SUS Power Domain Dynamic Gating Enable (MLSPDDGE):** When this bit is set to 1, ModPHY Lane SUS Well Dynamic Gating is enabled. When this bit is 0, ModPHY Lane SUS Well Gating can still be done at a more coarse level using MLSXSWPGP and MLS0SWPGP fields.
29:2	0h RO	**Reserved**
1	0h RW	**ModPHY Per-Lane SUS Power Domain Dynamic Gating Enable (MPLSPDDGE):** When this bit is set to 1, ModPHY Per-Lane SUS Well Dynamic Gating is enabled. When this bit is 0, if modPHY lane SUS power domain dynamic gating is enabled, all lanes are gated/ungated together. This bit has no impact if modPHY lane SUS power domain dynamic gating is disabled.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	**C10 Qualifier for MPHY Power Gating (C10_QUAL_MPHYPG):** C10 qualification for MPHY power gating, 1: C10 is not required for mPHY Sus power gating 0: C10 is required for mPHY Sus power gating

4.2.15 ModPHY Power Management Configuration Reg 4 (MODPHY_PM_CFG4) — Offset 10CCh

This register contains misc. fields used to configure the PCH's power management behavior with respect to the modPHY

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10CCh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**ASL Over-rides [26:0] (ASLOR):** This field provides ASL code to take over SPD power gating control. If ASL code sets a bit corresponding to a controller, it implies that PMC shall ignore any other inputs from that controller and assume that the controller is ready for SPD power gating. 0 in a bit position: Use HW interfaces for the controller to manage SPD gating/wake-up. 1 in a bit position: Ignore HW interfaces for the controller, rely only on MSPDRTReq field thats managed by ASL code. Bit 0: Corresponds to PCIe Controller A, Function 0 Bit 1: Corresponds to PCIe Controller A, Function 1 Bit 2: Corresponds to PCIe Controller A, Function 2 Bit 3: Corresponds to PCIe Controller A, Function 3 Bit 4: Corresponds to PCIe Controller B, Function 0 Bit 5: Corresponds to PCIe Controller B, Function 1 Bit 6: Corresponds to PCIe Controller B, Function 2 Bit 7: Corresponds to PCIe Controller B, Function 3 Bit 8: Corresponds to PCIe Controller C, Function 0 Bit 9: Corresponds to PCIe Controller C, Function 1 Bit 10: Corresponds to PCIe Controller C, Function 2 Bit 11: Corresponds to PCIe Controller C, Function 3 Bit 12: Corresponds to SATA Controller Bit 13: Corresponds to Gbe Controller Bit 14: Corresponds to xHCI Controller Bit 15: Corresponds to xDCI Controller Bit 16: Reserved Bit 17: Corresponds to PCIe Controller D, Function 0 Bit 18: Corresponds to PCIe Controller D, Function 1 Bit 19: Corresponds to PCIe Controller D, Function 2 Bit 20: Corresponds to PCIe Controller D, Function 3 Bit 21: Corresponds to PCIe Controller E, Function 0 Bit 22: Corresponds to PCIe Controller E, Function 1 Bit 23: Corresponds to PCIe Controller E, Function 2 Bit 24: Corresponds to PCIe Controller E, Function 3 Bit 25: Corresponds to DMI Controller Bit 26: Reserved Bit 27: Corresponds to PCIe Controller F, Function 0 Bit 28: Corresponds to PCIe Controller F, Function 1 Bit 29: Corresponds to PCIe Controller F, Function 2 Bit 30: Corresponds to PCIe Controller F, Function 3 Bit 31: Corresponds to GBETSN Controller This field is going to be used in conjunction with MSPDRTReq and MSPDRTRAck fields above. If ASL code intends to over-ride HW decisions, it will set the corresponding bit for a controller/function to 1 in ASLOR and use MSPDRTReq bits to power-up/power-down SPD.

4.2.16 ModPHY Power Management Configuration Reg 5 (MODPHY_PM_CFG5) — Offset 10D0h

This register contains misc fields used to configure the PCH's power management behavior with respect to the modPHY.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10D0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Controller SPD RTD3 Request [26:0] (MSPDRTREQ):** This field represents ASL code trigger request for ModPHY SPD gating. If this bit is set (to 1) for a controller, it implies that ASL code provides consent for SPD to be gated for the corresponding controllers lanes. Note that this bit could also be more statically used by BIOS to set this to 1 for a controller where SPD will only be managed through other interfaces implying ASL code does not exist for a controller. The controllers that are not enabled (Function Disabled), this field will be statically set by BIOS to activate ASL component in SPD gating equations. Bit 0: Corresponds to PCIe Controller A, Function 0 Bit 1: Corresponds to PCIe Controller A, Function 1 Bit 2: Corresponds to PCIe Controller A, Function 2 Bit 3: Corresponds to PCIe Controller A, Function 3 Bit 4: Corresponds to PCIe Controller B, Function 0 Bit 5: Corresponds to PCIe Controller B, Function 1 Bit 6: Corresponds to PCIe Controller B, Function 2 Bit 7: Corresponds to PCIe Controller B, Function 3 Bit 8: Corresponds to PCIe Controller C, Function 0 Bit 9: Corresponds to PCIe Controller C, Function 1 Bit 10: Corresponds to PCIe Controller C, Function 2 Bit 11: Corresponds to PCIe Controller C, Function 3 Bit 12: Corresponds to SATA Controller Bit 13: Corresponds to Gbe Controller Bit 14: Corresponds to xHCI Controller Bit 15: Corresponds to xDCI Controller Bit 16: Reserved Bit 17: Corresponds to PCIe Controller D, Function 0 Bit 18: Corresponds to PCIe Controller D, Function 1 Bit 19: Corresponds to PCIe Controller D, Function 2 Bit 20: Corresponds to PCIe Controller D, Function 3 Bit 21: Corresponds to PCIe Controller E, Function 0 Bit 22: Corresponds to PCIe Controller E, Function 1 Bit 23: Corresponds to PCIe Controller E, Function 2 Bit 24: Corresponds to PCIe Controller E, Function 3 Bit 25: Corresponds to DMI Controller Bit 26: Reserved Bit 27: Corresponds to PCIe Controller F, Function 0 Bit 28: Corresponds to PCIe Controller F, Function 1 Bit 29: Corresponds to PCIe Controller F, Function 2 Bit 30: Corresponds to PCIe Controller F, Function 3 Bit 31: Corresponds to GBETSN Controller

4.2.17 ModPHY Power Management Configuration Reg 6 (MODPHY_PM_CFG6) — Offset 10D4h

This register contains misc. fields used to configure the PCH's power management behavior with respect to the modPHY.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10D4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Controller SPD RTD3 Request Acknowledge [19:0] (MSPDRTRACK):** This field represents the acknowledge for ASL code trigger request for ModPHY SPD gating. PMC sets a bit in this field to 1 to acknowledge that it has registered the corresponding MSPDRTREQ. Note that the action of setting this bit to 1 is immediate no other gating conditions are involved in this. Actual SPD shutdown may happen later once other power gating conditions have been satisfied as well. PMC clears a bit to 0 in this field once the corresponding MSPTDRTREQ is cleared by the ASL code and SPD state has been fully restored. Bit 0: Corresponds to PCIe Controller A, Function 0 Bit 1: Corresponds to PCIe Controller A, Function 1 Bit 2: Corresponds to PCIe Controller A, Function 2 Bit 3: Corresponds to PCIe Controller A, Function 3 Bit 4: Corresponds to PCIe Controller B, Function 0 Bit 5: Corresponds to PCIe Controller B, Function 1 Bit 6: Corresponds to PCIe Controller B, Function 2 Bit 7: Corresponds to PCIe Controller B, Function 3 Bit 8: Corresponds to PCIe Controller C, Function 0 Bit 9: Corresponds to PCIe Controller C, Function 1 Bit 10: Corresponds to PCIe Controller C, Function 2 Bit 11: Corresponds to PCIe Controller C, Function 3 Bit 12: Corresponds to SATA Controller Bit 13: Corresponds to Gbe Controller Bit 14: Corresponds to xHCI Controller Bit 15: Corresponds to xDCI Controller Bit 16: Reserved Bit 17: Corresponds to PCIe Controller D, Function 0 Bit 18: Corresponds to PCIe Controller D, Function 1 Bit 19: Corresponds to PCIe Controller D, Function 2 Bit 20: Corresponds to PCIe Controller D, Function 3 Bit 21: Corresponds to PCIe Controller E, Function 0 Bit 22: Corresponds to PCIe Controller E, Function 1 Bit 23: Corresponds to PCIe Controller E, Function 2 Bit 24: Corresponds to PCIe Controller E, Function 3 Bit 25: Corresponds to DMI Controller Bit 26: Reserved Bit 27: Corresponds to PCIe Controller F, Function 0 Bit 28: Corresponds to PCIe Controller F, Function 1 Bit 29: Corresponds to PCIe Controller F, Function 2 Bit 30: Corresponds to PCIe Controller F, Function 3 Bit 31: Corresponds to GBETSN Controller

4.2.18 External Rail Config (EXT_RAIL_CONFIG) — Offset 11B8h

External Rail Configuration

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11B8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**VNN_MIN_RET_VOLT_SUPPORTED:** This bit indicates whether minimum retention voltage (0.7V) is supported for VNN rail **Locked by:** GEN_PMCON_B.VR_CONFIG_LOCK
30	0h RW/L	**VNN_MIN_ACTIVE_VOLT_SUPPORTED:** This bit indicates whether minimum active voltage (0.75V) is supported for VNN rail **Locked by:** GEN_PMCON_B.VR_CONFIG_LOCK

4.2.25 Always Running Timer Value 31:0 (ARTV_31_0) — Offset 1200h

Always Running Timer Value

Note: This register is intended for debug purposes only. to obtain the most accurate timer reading, customers are recommended to read the PCH ART through the CPU TSC (Time Stamp Counter) register and apply CPUID conversion.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1200h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**ART Value (ARTV):** Reads return current value of the ART timer [31:0]. Writes to this register has no effect Note: Given that 64 bit values are in two registers, SW needs to account for roll over possibility

4.2.26 Always Running Timer Value 31:0 (ARTV_63_32) — Offset 1204h

Always Running Timer Value

Note: This register is intended for debug purposes only. to obtain the most accurate timer reading, customers are recommended to read the PCH ART through the CPU TSC (Time Stamp Counter) register and apply CPUID conversion.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1204h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**ART Value (ARTV):** Reads return current value of the ART timer [63:32]. Writes to this register has no effect Note: Given that 64 bit values are in two registers, SW needs to account for roll over possibility

4.2.27 Timed GPIO Control 0 (TGPIOCTL0) — Offset 1210h

Timed GPIO Control 0

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1210h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4	0h RW	**Periodic Mode (PM):** 0:Periodic mode is disabled 1:periodic mode is enabled This bit is only applicable when Timed GPIO is configured as an output
3:2	0h RW	**Event Polarity (EP):** 00:Rising Edge 01:Falling Edge 10:Toggle Edge 11:Reserved
1	0h RW	**DIR:** 0: Output 1: Input

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	**EN:** 0: Timed GPIO is disabled 1: Timed GPIO is enabled Note: a. When Enabled, xtal clock turnoff is disabled. This may also disable SLP_S0 assertion b. All other Timed GPIO configuration bits must be programmed before enable bit is set and must not change while the enable is 1

4.2.28 Timed GPIO 0 Comparator Value 31:0 (TGPIOCOMPV0_31_0) — Offset 1220h

Timed GPIO 0 comparator Value 31:0

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1220h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Comparator Value (COMPV):** This register is only applicable when Timed GPIO is configured as an output. If periodic mode is not enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. The value in this register does not change. If periodic mode is enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. When this occurs, the value in this register is increased by the value in the Periodic Interval register. For example, in periodic mode if the value written to this register is 00000100h, and Periodic Interval register has the value of 200h. 1. A Timed GPIO event will be generated when ART reaches 00000100h. 2. The value in this register will then be adjusted by the hardware to 00000300h. 3. Another Timed GPIO event will be generated when the ART reaches 00000300h. 4. The value in this register will then be adjusted by the hardware to 00000500h As such when periodic Timed GPIO event occurs, the value in this register will increment. Note: Given that 64 bit values are in two registers, SW needs to account for roll over possibility

4.2.29 Timed GPIO Comparator Value 63:32 (TGPIOCOMPV0_63_32) — Offset 1224h

Timed GPIO Comparator Value

Note: **NOTE:** Bit definitions are the same as TGPIOCOMPV0_31_0, offset 1220h.

4.2.30 Timed GPIO0 Periodic Interval Value 31_0 (TGPIOPIV0_31_0) — Offset 1228h

Timed GPIO0 Periodic Interval Value 31_0

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1228h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Periodic Interval Value [31:0] (PIV):** This register is only applicable when Timed GPIO is configured as an output, and Periodic Mode is enabled. The value in this register is written by SW to set the interval for the periodic Timed GPIO event

4.2.31 Timed GPIO 0 Periodic Interval Value 63_32 (TGPIOPIV0_63_32) — Offset 122Ch

Timed GPIO 0 Periodic Interval Value 63_32

Note: **NOTE:** Bit definitions are the same as TGPIOPIV0_31_0, offset 1228h.

4.2.32 Timed GPIO Time Capture Register 31_0 (TGPIOTCV0_31_0) — Offset 1230h

Timed GPIO Time Cpature Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1230h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Time Capture Value [31:0] (TCV):** When Timed GPIO event triggers, HW captures the current ART time into this register. This register is applicable to both when Timed GPIO is configured as an input or an output. When Timed GPIO is configured as an output, the Time Capture Value in this register is the Comparator Value (COMPV) when a match with ART time happens and a Timed GPIO output event generated. Note: Given that 64 bit values are in two registers, SW needs to account for roll over possibility

4.2.33 Timed GPIO0 Time Capture Register 63_32 (TGPIOTCV0_63_32) — Offset 1234h

Timed GPIO Time Capture Register 63_32

Note: **NOTE:** Bit definitions are the same as TGPIOTCV0_31_0, offset 1230h.

4.2.34 Timed GPIO0 Event Counter Capture Register 31_0 (TGPIOECCV0_31_0) — Offset 1238h

Timed GPIO0 Event Counter Capture Register 31_0

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1238h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Event Counter Capture Value [31:0] (ECCV):** The value in this register must be the Timed GPIO event count associated with the time captured in the Time Capture Value register. A read to the Time Capture Value (TGPIOTCV0_31_0) register triggers HW to load the Event Counter value into this register. Note: The 'load' signal is the same register read signal that returns the Time Capture Value to the SW. SW must first perform a read to the Time Capture Value (TGPIOTCV0_31_0) register, followed by a read to this Event Counter Capture Value (ECCV) register such that these two values are associated with each others, despite they are obtained thru 2 separate register read operations one after another. Note: Given that 64 bit values are in two registers, SW needs to account for roll over possibility

4.2.35 Timed GPIO0 Event Counter Capture Register 63_32 (TGPIOECCV0_63_32) — Offset 123Ch

Timed GPIO0 Event Counter Capture Register 63_32

Type	Size	Offset	Default
MMIO	32 bit	BAR + 123Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Event Counter Capture Value [63:32] (ECCV):** The value in this register must be the Timed GPIO event count associated with the time captured in the Time Capture Value (TGPIOTCV0_31_0) register. A read to the Time Capture Value (TGPIOTCV0_31_0) register triggers HW to load the Event Counter value into this register. Note: The 'load' signal is the same register read signal that returns the Time Capture Value to the SW. SW must first perform a read to the Time Capture Value (TCV_31_0) register, followed by a read to this Event Counter Capture Value (ECCV) register such that these two values are associated with each others, despite they are obtained thru 2 separate register read operations one after another. Note: Given that 64 bit values are in two registers, SW needs to account for roll over possibility

4.2.36 Timed GPIO0 Event Counter Register 31_0 (TGPIOEC0_31_0) — Offset 1240h

Timed GPIO0 Event Counter Register 31_0

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1240h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Event Counter Register [31:0] (EC):** Event Counter (EC): After Timed GPIO is enabled, event counter operates as follow: ' When Timed GPIO is configured as input, event counter will increment by 1 for every input event triggered. ' When Timed GPIO is configured as output, event counter will increment by 1 for every output event generated. Note: The signal to increment the count is the same signal that captures the ART time into the TCV register. For Timed GPIO configured as output with Periodic Mode enabled, it is also the same signal that updates the Comparator Value for the subsequent match. When Timed GPIO is disabled, event counter is reset to 0x0. Note: Given that 64 bit values are in two registers, SW needs to account for roll over possibility

4.2.37 Timed GPIO0 Event Counter Register 63_32 (TGPIOEC0_63_32) — Offset 1244h

Timed GPIO0 Event Counter Register 63_32

Note: **NOTE:** Bit definitions are the same as TGPIOEC0_31_0, offset 1240h.

4.2.38 Timed GPIO Control 1 (TGPIOCTL1) — Offset 1310h

Timed GPIO Control 1

Note: **NOTE:** Bit definitions are the same as TGPIOCTL0, offset 1210h.

4.2.39 Timed GPIO 1 Comparator Value 31:0 (TGPIOCOMPV1_31_0) — Offset 1320h

Timed GPIO 1 comparator Value 31:0

Note: **NOTE:** Bit definitions are the same as TGPIOCOMPV0_31_0, offset 1220h.

4.2.40 Timed GPIO Comparator Value 63:32 (TGPIOCOMPV1_63_32) — Offset 1324h

Timed GPIO Comparator Value 63:32

Note: **NOTE:** Bit definitions are the same as TGPIOCOMPV0_31_0, offset 1220h.

4.2.41 Timed GPIO1 Periodic Interval Value 31_0 (TGPIOPIV1_31_0) — Offset 1328h

Timed gPIO Periodic Interval Value 31_0

Note: **NOTE:** Bit definitions are the same as TGPIOPIV0_31_0, offset 1228h.

4.2.42 Timed GPIO 1 Periodic Interval Value 63_32 (TGPIOPIV1_63_32) — Offset 132Ch

Timed GPIO 1 Periodic Interval Value 63_32

Note: **NOTE:** Bit definitions are the same as TGPIOPIV0_31_0, offset 1228h.

4.2.43 Timed GPIO Time Capture Register 31_0 (TGPIOTCV1_31_0) — Offset 1330h

Timed GPIO Time Capture Register 31_0

Note: **NOTE:** Bit definitions are the same as TGPIOTCV0_31_0, offset 1230h.

4.2.44 Timed GPIO Time Capture Register 63_32 (TGPIOTCV1_63_32) — Offset 1334h

Timed GPIO Time Capture Register 63_32

Note: **NOTE:** Bit definitions are the same as TGPIOTCV0_31_0, offset 1230h.

4.2.45 Timed GPIO0 Event Counter Capture Register 31_0 (TGPIOECCV1_31_0) — Offset 1338h

Timed GPIO0 Event Counter Capture Register 31_0

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1338h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Event Counter Capture Value [31:0] (ECCV):** The value in this register must be the Timed GPIO event count associated with the time captured in the Time Capture Value register. A read to the Time Capture Value (TCV1_31_0) register triggers HW to load the Event Counter value into this register. Note: The 'load' signal is the same register read signal that returns the Time Capture Value to the SW. SW must first perform a read to the Time Capture Value (TCV1_31_0) register, followed by a read to this Event Counter Capture Value (ECCV) register such that these two values are associated with each others, despite they are obtained thru 2 separate register read operations one after another. Note: Given that 64 bit values are in two registers, SW needs to account for roll over possibility

4.2.46 Timed GPIO0 Event Counter Capture Register 63_32 (TGPIOECCV1_63_32) — Offset 133Ch

Timed GPIO0 Event Counter Capture Register 63_32

Type	Size	Offset	Default
MMIO	32 bit	BAR + 133Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Event Counter Capture Value [63:32] (ECCV):** The value in this register must be the Timed GPIO event count associated with the time captured in the Time Capture Value (TGPIOTCV0_31_0) register. A read to the Time Capture Value (TCV) register triggers HW to load the Event Counter value into this register. Note: The 'load' signal is the same register read signal that returns the Time Capture Value to the SW. SW must first perform a read to the Time Capture Value (TCV1_31_0) register, followed by a read to this Event Counter Capture Value (ECCV) register such that these two values are associated with each others, despite they are obtained thru 2 separate register read operations one after another. Note: Given that 64 bit values are in two registers, SW needs to account for roll over possibility

4.2.47 Timed GPIO1 Event Counter Register 31_0 (TGPIOEC1_31_0) — Offset 1340h

Timed GPIO1 Event Counter Register 31_0

Note: **NOTE:** Bit definitions are the same as TGPIOEC0_31_0, offset 1240h.

4.2.48 Timed GPIO Event Counter Register 63_32 (TGPIOEC1_63_32) — Offset 1344h

Timed GPIO Event Counter Register 63_32

Note: **NOTE:** Bit definitions are the same as TGPIOEC0_31_0, offset 1240h.

4.2.49 Catastrophic Trip Point Enable (CTEN) — Offset 150Ch

This register is used to enable Catastrophic Trip point assertion into S5 state on a Cattrip event. This bit should always be set in all functional cases.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 150Ch	00000001h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**Policy Lock-Down Bit (CTENLOCK):** When written to 1, this bit prevents any more writes to this register. **Locked by:** CTEN.CTENLOCK
30:1	0h RO	**Reserved**
0	1h RW/L	**Catastrophic Power-Down Enable (CPDEN):** 0x1 (Default): When set, the power management logic (PMC) transitions to the S5 state when a catastrophic temperature is detected by any of the sensor. The transition to the S5 state must be unconditional (like the Power Button Override Function).0x0: Disable going into S5 state on a CatTrip detection. This bit should only be set to 0 for debug purposes. Note: Thermal sensor and response logic are in the core/main power well; therefore, detection of a catastrophic temperature is limited to times when this well is powered and out of reset. **Locked by:** CTEN.CTENLOCK

4.2.50 EC Thermal Sensor Reporting Enable (ECRPTEN) — Offset 1510h

This is a BIOS programmable register used to enable reporting of temperature by PMC to EC over eSPI. Setting bit 0 will cause a GCR interrupt to PMC FW through generic GCR mechanism. FW needs to enable the periodic reporting task accordingly. Bit 31 is uses as a lock bit to prevent any further writes to bit 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1510h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**Lock-Down Bit (ECRPTENLOCK):** When written to 1, this bit prevents any more writes to this register. **Locked by:** ECRPTEN.ECRPTENLOCK
30:1	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW/L	**Enable PMC to EC Temperature Reporting (EN_PMC_TO_EC_TEMP_RPT):** 0x1: Enables the reporting of the PCH temperature to the EC (via SMBUS or eSPI). Note that this must also be set if ME needs access to the PCH temperature. Once enabled this bit should not be cleared by SW. If it is cleared then the EC may get an undefined value. SW has no need to dynamically disable and then re-enable this bit.0x0 (Default): Disables temperature reporting (default) **Locked by:** ECRPTEN.ECRPTENLOCK

4.2.51 Throttle Level (TL) — Offset 1520h

Throttle Level.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1520h	0FF3FCFFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**TLLOCK:** When set to 1, this entire register (TL) is locked and remains locked until the next platform reset **Locked by:** TL.TLLOCK
30	0h RW/L	**TT State 13 Enable (TT13EN):** When set to 1 and the programmed GPIO pin is a 1, then PMSync state 13 (now called GPIO_A) will force at least T2 state **Locked by:** TL.TLLOCK
29	0h RW/L	**TT Enable (TTEN):** This is the enable bit associated with the FW control of the throttle state. This bit needs to be set in order for the FW to be able to update the throttle state based on the comparison of the T2L/T1L/T0L with the temperature. At reset, BIOS must set bits 28:0 and then do a separate write to set bit 29 to enable throttling. SW may set bit 31 at the same time it sets bit 29 if it wishes to lock the register. If SW wishes to change the values of 28:0, it must first clear the TTEN bit, then change the values in 28:0; and then re-enable TTEN. It is legal to set bits 31, 30 and 29 with the same write This bit must not be set by SW until SW has already enabled atleast one of the thermal sensor(setting TSENx.ETS bits to 1) If TTEN is written to 0, after having been enabled, then the PCH may stay in the throttling state it was in at the moment TTEN is disabled. There is no intent that the sensor be enabled for a while and then disabled and left off. It may be disabled temporarily while changing the register values, but it should not be left in the disabled state **Locked by:** TL.TLLOCK
28:20	0FFh RW/L	**T2 Level (T2L):** Determines the temp level for T2 state. If TTEN = 1 AND TSEN = 1 AND T2L >= TEMP.MAXTEMP[8:0] > T1L, then the system is in T2 state. If TTEN = 1 AND TSE = 1 AND TEMP.MAXTEMP [8:0] > T2L, then the system is in T3 state.SW Note: When TTEN =1 condition to satisfy is T2L > T1L > T0L NOTE: the T3 condition overrides PMSync[13] and forces the system to T3 if both cases are true **Locked by:** TL.TLLOCK

Bit Range	Default & Access	Field Name (ID): Description
19	0h RO	**Reserved**
18:10	0FFh RW/L	**T1 Level (T1L):** Determines the temp level for T1 state. If TTEN = 1 AND (|TSEN) = 1 AND T1L >= TEMP.MAXTEMP[8:0] > T0L, then the system is in T1 state. SW Note: When TTEN =1 condition to satisfy is T2L > T1L > T0L **Locked by:** TL.TLLOCK
9	0h RO	**Reserved**
8:0	0FFh RW/L	**T0 Level (T0L):** Determines the temp level for T0 state. If TEMP.MAXTEMP[8:0] <= T0L or TTEN = 0 OR (|TSEN) = 0, then the system is in T0 state SW Note: When TTEN =1 condition to satisfy is T2L> T1L > T0L **Locked by:** TL.TLLOCK

4.2.52 Throttle Levels Enable (TLEN) — Offset 1528h

Throttle Levels Enable

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1528h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**TLENLOCK:** When set to 1, this entire register (TLEN) is locked and remains locked until the next platform reset **Locked by:** TLEN.TLENLOCK
30:0	0h RO	**Reserved**

4.2.53 Thermal Sensor Alert High Value (TSAHV) — Offset 1530h

This register is used to set the Thermal Alert High Value for all Thermal Sensors on the chip. PMC HW should compare the aggregated MAXTEMP against these values to cause an SMI or SCI Interrupt

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1530h	000000FFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved**
8:0	0FFh RW	**Alert High Value (AHV):** Sets the high value for the alert indication. See the later section for usage. Temperature programmed in S9.8.0 2s complement format This register is not lockable, so that SW can change the values during runtime. NOTE: it is illegal for SW to program TSAHV.AHV to a value lower than TSAL.ALV

4.2.54 Thermal Sensor Alert Low Value (TSALV) — Offset 1534h

This register is used to set the Thermal Alert Low Value for all Thermal Sensors on the chip. PMC HW should compare the aggregated MINTEMP against these values to cause an SMI or SCI Interrupt

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1534h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved**
8:0	000h RW	**Alert Low Value (ALV):** Sets the low value for the alert indication. See the later section for usage. Temperature programmed in S9.8.0 2s complement format This register is not lockable, so that SW can change the values during runtime. NOTE: it is illegal for SW to program TSALV.ALV to a value higher than TSAH.AHV

4.2.55 Thermal Alert Trip Status (TAS) — Offset 1538h

SW uses this register to determine the Thermal Alert Trip event (Low-to-High or High-to-Low) along with the Thermal Sensor ID that caused this event.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1538h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW/1C/V	**TS Alert High-to-Low Event (AHLE):** 0x1: Indicates that an Thermal Sensor trip event occurred based on a higher to lower temperature transition thru the trip point 0x0: No trip for this event Software must write a 1 to clear this status bit Note: AHLE will not be set until there has been one occurrence of a Low to High event (ALHE must have been set once). This prevents the case where the system power up at a reasonably high temperature and starts to cool off while booting and causing an interrupt before there is SW loaded to handle it
14:12	0h RO	**Reserved**
11:8	0h RO/V	**High-to-Low trip TS (HLTTS):** 0xF 0x3: Reserved 0x2: TS2 0x1: TS1 0x0: TS0

This prevents the case where the system power up at a reasonably high temperature and starts to cool off while booting and causing an interrupt before there is SW loaded to handle it
6:4	0h RO	**Reserved**
3:0	0h RO/V	**Low-to-High trip TS (LHTTS):** 0xF 0x3: Reserved 0x2: TS2 0x1: TS1 0x0: TS0

4.2.56 PCH Hot Level Control (PHLC) — Offset 1540h

PCH Hot Level Control

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1540h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**PHL Lock (PHLCLOCK):** When written to a 1, this entire register is locked and remains locked until next platform reset **Locked by:** PHLC.PHLCLOCK
30:16	0h RO	**Reserved**
15	0h RW/L	**PHL Enable (PHLE):** When set and the current temperature reading, MaxTSR is greater than PHLL, then the PCHHOT# pin will be asserted (active low) **Locked by:** PHLC.PHLCLOCK
14:9	0h RO	**Reserved**
8:0	000h RW/L	**PHL Level (PHLL):** Temperature value used for PCHHOT# pin assertion based on 2s complement format 0x001 positive 1oC 0x000 0oC 0x1FF negative 1oC 0x1D8 negative 40oC and so on **Locked by:** PHLC.PHLCLOCK

4.2.57 Temperature Sensor Control and Status (TSS0) — Offset 1560h

Register address 0x1560-0x157C are used to capture the raw 2s complement temperature received from the multiple Digital Thermal Sensor (DTS) on a die.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1560h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**Policy Lock-Down Bit (TSS0LOCK):** When set to 1, this bit locks down the following fields: - TSS0.TSMASKEN The other bits in TSSx are anyway RO and hence do not need a lock bit set for them.Those bits become read-only . This bit becomes locked when a value of 1b is written to it. Writes of 0 to this bit are always ignored. Once locked by writing 1, the only way to clear this bit is to perform a global reset. **Locked by:** TSS0.TSS0LOCK
30:17	0h RO	**Reserved**
16	0h RW/L	**TS MASK for MAXTEMP calculation (TSMASKEN):** 0x0 (Default): Temperature reported from TS is used for temperature comparison with PMC. 0x1: Temperature reported from the TS is masked for TEMP comparison within PMC. This in turn will also enable/disable SMI/SCI assertions for alert thermal events from this TS. **Locked by:** TSS0.TSS0LOCK
15:10	0h RO	**Reserved**
9	0h RO/V	**TS Reading Valid (TSRV):** This bit indicates if the TS die temperature reported in valid or not.
8:0	000h RO/V	**TS Reading (TSR):** The TS die temperature with resolution of 1oC in S9.8.0 2s complement format 0x001 positive 1oC 0x000 0oC 0x1FF negative 1oC 0x1D8 negative 40oC and so on

4.2.58 Wake Alarm Device Timer: AC (WADT_AC) — Offset 1800h

Bits in this register only need to be valid for reading when the Main power well is up. However, since some of the events may initially be detected while the Main power well and SUS well are down, they are marked as DSW bits.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1800h	FFFFFFFFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW/V	**Wake Alarm Device Timer Value for AC Mode (WADT_AC_VAL):** This field contains the 32-bit wake alarm device timer value (granularity 1s) for AC power. The timer begins decrementing when written to a value other than FFFFFFFFh (regardless of the power source when the write occurs). Upon counting down to 0: If on AC power, GPE0b_STS.WADT_STS will be set. This status bit being set will generate a host wake if GPE0b_EN.WADT_EN is 1. If the power source is DC at this time, the status bit is not set. However, if AC power subsequently returns to the platform, the AC Expired Timer begins running. See the WADT_EXP_AC register for details. The timer returns to its default value of FFFFFFFFh.

4.2.59 Wake Alarm Device Timer: DC (WADT_DC) — Offset 1804h

Bits in this register only need to be valid for reading when the Main power well is up. However, since some of the events may initially be detected while the Main power well and SUS well are down, they are marked as DSW bits.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1804h	FFFFFFFFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW/V	**Wake Alarm Device Timer Value for DC Mode (WADT_DC_VAL):** This field contains the 32-bit wake alarm device timer value (granularity 1s) for DC power. The timer begins decrementing when written to a value other than FFFFFFFFh (regardless of the power source when the write occurs). Upon counting down to 0: If on DC power, GPE0b_STS.WADT_STS will be set. This status bit being set will generate a host wake if GPE0b_EN.WADT_EN is 1. If the power source is AC at this time, the status bit is not set. However, if DC power subsequently returns to the platform, the DC Expired Timer begins running. See the WADT_EXP_DC register for details. The timer returns to its default value of FFFFFFFFh.

4.2.60 Wake Alarm Device Expired Timer: AC (WADT_EXP_AC) — Offset 1808h

Bits in this register only need to be valid for reading when the Main power well is up. However, since some of the events may initially be detected while the Main power well and SUS well are down, they are marked as DSW bits.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1808h	FFFFFFFFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW/V	**Wake Alarm Device Expired Timer Value for AC Mode (WADT_EXP_AC_VAL):** This field contains the 32-bit wake alarm device Expired Timervalue (granularity 1s) for AC power. The timer begins decrementing after switching from DC to AC power, in the case where the WADT_AC timer has already expired while the platform was on DC power. This timer only decrements while operating on AC power. So if the power source switches back to DC power, the timer will stop (but not reset). When AC power returns, the timer will again begin decrementing. Note: This timer will only begin decrementing under the conditions described above if this field has been configured for something other than its default value of FFFFFFFFh (i.e. FFFFFFFFh = disabled). Upon expiration of this timer: If on AC power, GPE0b_STS.WADT_STS will be set. This status bit being set will generate a host wake if GPE0b_EN.WADT_EN is 1. BOTH the AC and DC Expired Timers return to their defaults value of FFFFFFFFh.

4.2.61 Wake Alarm Device Expired Timer: DC (WADT_EXP_DC) — Offset 180Ch

Bits in this register only need to be valid for reading when the Main power well is up. However, since some of the events may initially be detected while the Main power well and SUS well are down, they are marked as DSW bits.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 180Ch	FFFFFFFFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW/V	**Wake Alarm Device Expired Timer Value for DC Mode (WADT_EXP_DC_VAL):** This field contains the 32-bit wake alarm device Expired Timervalue (granularity 1s) for DC power. The timer begins decrementing after switching from AC to DC power, in the case where the WADT_DC timer has already expired while the platform was on AC power. This timer only decrements while operating on DC power. So if the power source switches back to AC power, the timer will stop (but not reset). When DC power returns, the timer will again begin decrementing. Note: This timer will only begin decrementing under the conditions described above if this field has been configured for something other than its default value of FFFFFFFFh (i.e. FFFFFFFFh = disabled). Upon expiration of this timer: If on DC power, GPE0b_STS.WADT_STS will be set. This status bit being set will generate a host wake if GPE0b_EN.WADT_EN is 1. BOTH the AC and DC Expired Timers return to their defaults value of FFFFFFFFh.

4.2.62 Power and Reset Status (PRSTS) — Offset 1810h

Bits in this register only need to be valid for reading when the Main power well is up. However, since some of the events may initially be detected while the Main power well is down, they are marked as suspend well bits. All suspend well bits in this register are reset by global_rst_b.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1810h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5	0h RW/1C/V	**Wake On LAN Override Wake Status (WOL_OVR_WK_STS):** This bit gets set when integrated LAN Signals a Power Management Event AND the system is in S5. BIOS can read this status bit to determine this wake source. Software clears this bit by writing a 1 to it.
4	0h RW/1C/V	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
3:1	0h RO	**Reserved**
0	0h RW/1C/V	**ME_HOST_WAKE_STS:** This bit is set when the ME generates a non-maskable wake event and is not affected by any other enable bit. When this bit is set, the host power management logic wakes to S0.

4.2.63 Power Management Configuration Reg 1 (PM_CFG) — Offset 1818h

This register contains misc. fields used to configure the PCH's power management behavior.

This register is in multiple power wells and reset domains (see below).

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1818h	00000020h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**SATA Interface Disable Indication (SATA_DIS_IND):** When set to 1, this bit indicates that the SATA interface on the PCH is completely disabled. Therefore, the mPhy lanes normally assigned to SATA will operate through the PCIe controller (or not be used at all). When cleared, it indicates that at least some of the SATA interface lanes may be used actively in the PCH by the SATA controller, so none of the four lanes assigned to SATA interface can operate through the PCIe controller.
30	0h RW	**Timing t591 (TIMING_T591):** This field configures t591 timing involved in the over-clocking flow (Wait times between writes from PMC to ICC registers when executing BCLK slow ramp flow) Note: Encodings are all min timings.
29	0h RW	**Allow 24MHz Crystal Oscillator Shutdown (ALLOW_24_OSC_SD):** When this bit is '0', the 24MHz crystal oscillator will always be running while in S0. When this bit is '1', the 24MHz crystal oscillator may be shut down in S0 (Cx only) if all other conditions allow.
28	0h RW	**Time Sync Maximum Attempts (TS_MAXTRY):** The value of this bit determines how many times the PMC will retry time synchronization before stopping and reporting failure to the initiator. Encoding: 0 Maximum of 5 attempts 1 Maximum of 10 attempts
27	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
26	0h RW	**Boot Media RTD3 Power Management Enable (BMRTD3PME):** 0: RTD3 is not enabled. Drive '1' to BOOTMPC pin 1: RTD3 is enabled. Drive the value of BMRTD3PP to BOOTMPC pin
25	0h RW	**Allow USB2 PHY Core Power Gating (ALLOW_USB2_CORE_PG):** When this bit is '0' (default), USB2 PHY power gating is disabled. When this bit is '1', USB2 PHY power gating can occur if all other required conditions are met.
24	0h RW/L	**Energy Reporting Lock (ER_LOCK):** When this bit is written to 1, it will remain 1 until the next host_prim_rst_b assertion. While this bit is 1, GEN_PMCON_A.ER_EN value cannot be changed. BIOS should write 1b1 to this bit only AFTER writing to GEN_PMCON_A.ER_EN. **Locked by:** PM_CFG.ER_LOCK
23:22	0h RO	**Reserved**
21	0h RW	**RTC Wake from DeepSx Disable (RTC_DSX_WAKE_DIS):** When set, this bit disables RTC wakes from waking the system from DeepSx.
20	0h RW	**Boot Media RTD3 Reset Management Enable (BMRTD3RME):** 0: Boot Media device not in D3. Drive '1' to reset pin 1: Boot Media device in D3. Drive the value of BMRTD3RP to reset pin
19:18	0h RW/L	**SLP_SUS# Minimum Assertion Width (SLP_SUS_MIN_ASST_WDTH):** This 2-bit value indicates the minimum assertion width of the SLP_SUS# signal to guarantee that the SUS well power supplies have been fully power-cycled. This value may be modified per platform depending on power supply capacitance, board capacitance, power failure detection circuits, etc. Settings are: 00 = 0 ms (i.e. stretching disabled - default) 01 = 500ms 10 = 1s 11 = 4s This field is not writable when the SLP_Sx# Stretching Policy Lock- Down bit is set. This field is ignored when exiting a G3 state if the Disable SLP_X Stretching After SUS Power Failurebit is set. Note that unlike with all other SLP_* pin stretching, this disable bit only impacts SLP_SUS# stretching during G3 exit rather than both G3 and DeepSx exit. SLP_SUS# stretching always applies to DeepSx regardless of the disable bit. Programming Note: For platforms that enable DeepSx, BIOS must program SLP_SUS# stretching to be greater than or equal to the largest stretching value on any other SLP_* pin (SLP_S3#, SLP_S4#, SLP_LAN#, or SLP_A#). This bit is cleared by the rtc_pwrgood_rst_b pin. **Locked by:** PCI_MMR.GEN_PMCON_B.SLPSX_STR_POL_LOCK
17:16	0h RW/L	**SLP_A# Minimum Assertion Width (SLP_A_MIN_ASST_WDTH):** This 2-bit value indicates the minimum assertion width of the SLP_A# signal to guarantee that the ASW power supplies have been fully power-cycled. This value may be modified per platform depending on power supply capacitance, board capacitance, power failure detection circuits, etc. Settings are: 00 = 0 ms (i.e. stretching disabled - default) 01 = 4 s 10 = 98 ms 11 = 2 s This field is not writable when the SLP_Sx# Stretching Policy Lock- Down bit is set. This field is ignored when exiting a G3 or DeepSx state if the Disable SLP_X Stretching After SUS Power Failurebit is set. This bit is cleared by the rtc_pwrgood_rst_b pin. **Locked by:** PCI_MMR.GEN_PMCON_B.SLPSX_STR_POL_LOCK

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RW/L	**SLP_LAN# Minimum Assertion Width (SLP_LAN_MIN_ASST_WDTH):** This 2-bit value indicates the minimum assertion width of the SLP_LAN# signal to guarantee that the power to the PHY has been fully power-cycled. This value may be modified per platform depending on power supply, capacitance, board capacitance, power failure detection circuits, etc. This field is not writable when the SLP_Sx# Stretching Policy Lock Down bit is set to 1.Encoding o0: 0ms, 01: 1ms, 10: 50ms, 11: 2s **Locked by:** PCI_MMR.GEN_PMCON_B.SLPSX_STR_POL_LOCK
13	0h RW	**After G3 Last State Enable (AG3_LS_EN):** When PM_CFG.AG3E is '0', AG3_LS_EN determines whether the PCH will consider the platform's previous state when determining whether to power-up after G3. Encodings: 0 (default): PCH power-up policies after G3 do not depend on the platform's state when the G3 occurred. 1: PCH power-up policies after G3 depend on the platform's state when the G3 occurred. - If the power failure occurred while the platform was in S0 or while in the process of going to S0, the platform will power-up to S0 upon exiting G3. - If the power failure occurred while the platform was in Sx or while in the process of going to Sx, the platform will stay in S4/S5 upon exiting G3. Note: This bit applies only when GEN_PMCON_3.AG3E is '0'. If AG3E is '1', the platform will always stay in S4/S5 after G3 regardless of the value of AG3_LS_EN.
12	0h RW	**After Type 8 Global Reset Last State Enable (A8GR_LS_EN):** AGR_LS_EN determines whether the PCH will consider the platform's previous state when determining whether to power-up after non-thermal and non-explicitly requested type 8 global resets. Encodings: 0 (default): PCH power-up policies after a global reset do not depend on the platform's state when the reset occurred. 1: PCH power-up policies after a global reset depend on the platform's state when the reset occurred. If the global reset occurred while the platform was in S0 or while in the process of going to S0, the platform will power-up to S0 after the reset. If the global reset occurred while the platform was in Sx or while in the process of going to Sx, the platform will stay in S5 upon exiting G3.
11	0h RW	**Global Reset Three Strike Counter Enable (GR_TSC_EN):** When set, GR_TSC_EN will cause the PMC to keep the platform in S5 after the third consecutive type 7 global reset occurs during the boot flow. The three strike counter is reset in the following situations: - The system reaches S0 - A type 8 global reset occurs, including after the three strike counter causes the system to stay in S5. - RSMRST# asserts (due to DeepSx entry or a G3 event occurring)
10	0h RW	**Power Button Debounce Mode (PB_DB_MODE):** This bit controls when interrupts (SMI#, SCI) are generated in response to assertion of the PWRBTN# pin. This bit's values cause the following behavior: - '0': The 16ms debounce period applies to all usages of the PWRBTN# pin (legacy behavior). - '1': When a falling edge occurs on the PWRBTN# pin, an interrupt is generated and the 16ms debounce timer starts. Subsequent interrupts are masked while the debounce timer is running. Note: Power button override logic always samples the post-debounce version of the pin.

Bit Range	Default & Access	Field Name (ID): Description
9:8	0h RW/L	**Reset Power Cycle Duration (PWR_CYC_DUR):** The value in this register determines the minimum time a platform will stay in reset (SLP_S3#, SLP_S4#, SLP_S5# asserted and also SLP_A# and SLP_LAN# asserted if applicable) during a host partition reset with power cycle or a global reset. The duration programmed in this register takes precedence over the applicable SLP_# stretch timers in these reset scenarios. This field is not writable when the SLP_Sx# Stretching Policy Lock-Down bit is set.Encoding 00: 4-5sec, 01: 3-4sec, 10: 2-3 sec, 11: 1-2 sec Note that the duration programmed in this register should never be smaller than the stretch duration programmed in the following registers - - GEN_PMCON_3.SLP_S3_MIN_ASST_WDTH - GEN_PMCON_3.S4MAW - PM_CFG.SLP_A_MIN_ASST_WDTH - PM_CFG.SLP_LAN_MIN_ASST_WDTH **Locked by:** PCI_MMR.GEN_PMCON_B.SLPSX_STR_POL_LOCK
7:6	0h RW	**T37 Value (T37_VAL):** This field determines the delay from ungating the CPU RTC clock until the PMC considers the clock to be valid, allowing the boot flow to proceed. Encodings: 00 - 10ms 01 - 5ms 10 - 1ms 11 - 200us
5	1h RW/V	**CPU OC Strap (COCS):** SW programs this pin with the value that should be reflected to the GPIO8_OCS pin, when the pin is in native mode. Hardware also sets this bit when the over-clocking watchdog timer expires.
4:3	0h RO	**Reserved**
2	0h RW/L	**Energy Reporting Enable (ER_EN):** When this bit is 1, the PCH will periodically calculate and report its energy consumption to the CPU via PM_SYNC. When this bit is 0, the PCH will neither calculate nor report its energy consumption. **Locked by:** PM_CFG.ER_LOCK
1:0	0h RW/V	**Timing t581 (TIMING_T581):** This field configures the t581 timing involved in the power down flow (CPUPWRGD inactive to ICC_ICLK_INIT inactive). Encodings (all min timings): 00: 10 us (default) 01: 100 us 10: 1 ms 11: 10 ms reset_type=host_deep_rst_b

4.2.64 S3 Power Gating Policies (S3_PWRGATE_POL) — Offset 1828h

This register contains policy bits to configure various power gating options while the system is in S3. Note that setting any of these policies to enabledmay not directly result in power gating - in some cases other HW qualifications may be dynamically applied.

This register is in the RTC power well and is reset by rtc_pwrgood_rst_b.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1828h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1	0h RW	**S3 Power Gate Enable in DC Mode: SUS Well (S3DC_GATE_SUS):** A '1' in this bit enables power gating of the SUS well in S3 while operating on DC power (based on the AC_PRESENT pin value).
0	0h RW	**S3 Power Gate Enable in AC Mode: SUS Well (S3AC_GATE_SUS):** A '1' in this bit enables power gating of the SUS well in S3 while operating on AC power (based on the AC_PRESENT pin value).

4.2.65 S4 Power Gating Policies (S4_PWRGATE_POL) — Offset 182Ch

This register contains policy bits to configure various power gating options while the system is in S4. Note that setting any of these policies to enabledmay not directly result in power gating - in some cases other HW qualifications may be dynamically applied.

This register is in the RTC power well and is reset by rtc_pwrgood_rst_b.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 182Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1	0h RW	**S4 Power Gate Enable in DC Mode: SUS Well (S4DC_GATE_SUS):** A '1' in this bit enables power gating of the SUS well in S4 while operating on DC power (based on the AC_PRESENT pin value).
0	0h RW	**S4 Power Gate Enable in AC Mode: SUS Well (S4AC_GATE_SUS):** A '1' in this bit enables power gating of the SUS well in S4 while operating on AC power (based on the AC_PRESENT pin value).

4.2.66 S5 Power Gating Policies (S5_PWRGATE_POL) — Offset 1830h

This register contains policy bits to configure various power gating options while the system is in S5. Note that setting any of these policies to enabledmay not directly result in power gating - in some cases other HW qualifications may be dynamically applied.

This register is in the RTC power well and is reset by rtc_pwrgood_rst_b.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1830h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW	**S5 Power Gate Enable in DC Mode: SUS Well (S5DC_GATE_SUS):** A '1' in this bit enables power gating of the SUS well in S5 while operating on DC power (based on the AC_PRESENT pin value).
14	0h RW	**S5 Power Gate Enable in AC Mode: SUS Well (S5AC_GATE_SUS):** A '1' in this bit enables power gating of the SUS well in S5 while operating on AC power (based on the AC_PRESENT pin value).
13:0	0h RO	**Reserved**

4.2.67 DeepSx Configuration (DSX_CFG) — Offset 1834h

This register contains misc. fields used to configure the PCH's power management behavior.

This register is in the RTC power well.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1834h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4	0h RW	**Require CNV Wake Disabled for DeepSx Entry/SUSPWRDNACK (REQ_CNV_NOWAKE_DSX):** If this bit is 0, the state of connectivity wake enable is not considered when making DeepSx entry decisions. If this bit is 1, connectivity wake must be disabled to allow DeepSx entry or SUSPWRDNACK assertion, and even then all other conditions must be satisfied.
3	0h RW	**Require BATLOW# Assertion for DeepSx Entry/SUSPWRDNACK (REQ_BATLOW_DSX):** If this bit is 0, the state of the BATLOW# pin is not considered when making DeepSx entry and SUSPWRDNACK decisions. If this bit is 1, BATLOW# must be asserted to allow DeepSx entry or SUSPWRDNACK assertion, and even then all other entry conditions must be satisfied.
2	0h RW	**WAKE# Pin DeepSx Enable (WAKE_PIN_DSX_EN):** When this bit is 1, the PCI Express WAKE# pin is monitored while in DeepSx, supporting waking from DeepSx due to assertion of this pin. In this case, the platform must externally pull up the pin to the DSW (instead of pulling up to the SUS as has historically been the case). DeepSx disabled configurations must leave this bit at 0. When this bit is 0: DeepSx enabled configurations: The PCH internal pull-down on the WAKE# pin is enabled in deep-Sx and during G3 exit and the pin is not monitored during this time. DeepSx disabled configurations: The PCH internal pull-down on the WAKE# pin is never enabled
1	0h RW	**AC_PRESENT Pin Pulldown in DeepSx Disable (ACPRES_PD_DSX_DIS):** When this bit is 1, the internal pull-down on the AC_PRESENT pin is disabled. However, the pulldown is not necessarily enabled if the bit '0. This bit must be left at 0 for DeepSx disabled configurations, and the pulldown is disabled for those configurations even though the bit is 0. To support ME wakes from DeepSx using MGPIO2, the pin is always monitored regardless of the value of this host policy bit. When this bit is 0: DeepSx enabled configurations: The PCH internal pull-down on AC_PRESENT is enabled in deep-Sx and during G3 exit. DeepSx disabled configurations: The PCH internal pull-down on AC_PRESENT is always disabled. Note: This bit has no impact on GPIO31 functionality (muxed with AC_PRESENT). GPIO31 is still only driven/monitored while the SUS well is up.
0	0h RW	**LANWAKE Pin DeepSx Enable (LANWAKE_PIN_DSX_EN):** When this bit is 1, the LANWAKE pin is monitored while in DeepSx, supporting waking from DeepSx due to assertion of this pin. In this case, the platform must drive the pin to the correct value while in DeepSx. DeepSx disabled configurations must leave this bit at 0. When this bit is 0: DeepSx enabled configurations: The PCH internal pull-down on LANWAKE pin is enabled in deep-Sx and during G3 exit and the pin is not monitored during this time. DeepSx disabled configurations: The PCH internal pull-down is never enabled

4.2.68 Power Management Configuration Reg 2 (PM_CFG2) — Offset 183Ch

This register contains misc. fields used to configure the PCH's power management behavior.

This register is in multiple power wells and reset domains (see below).

Type	Size	Offset	Default
MMIO	32 bit	BAR + 183Ch	08000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RW	**Power Button Override Period (PBOP):** This field determines, while the power button remains asserted, how long the PMC will wait before initiating a global reset. <Enter text here> Encoding: 000b - 4 seconds 001b - 6 seconds 010b - 8 seconds 011b - 10 seconds 100b - 12 seconds 101b - 14 seconds Others - Reserved
28	0h RW/L	**Power Button Native Mode Disable (PB_DIS):** When this bit is '0' (default), the PMC's power button logic will act upon the input value from the GPIO unit, as normal. When this bit is set to '1', the PMC must force its internal version of the power button pin to '1'. This will result in the PMC logic constantly seeing the pin as de-asserted. This bit is not writable when ETR3.PB_DIS_LOCK bit is set. **Locked by:** PCI_MMR.ETR3.PB_DIS_LOCK
27	1h RW	**Reserved**
26	0h RW/V	**DRAM_RESET# Control (DRAM_RESET_CTL):** BIOS uses this bit to control the DRAM_RESET# pin from the PCH, which is routed to the reset pin on the DRAM. Encoding: 0 - DRAM_RESET# = '0' 1 - DRAM_RESET# output is tri-stated. Note: This bit is cleared to '0' by HW when SLP_S4# goes low.
25:0	0h RO	**Reserved**

4.2.69 PM_SYNC Miscellaneous Configuration (PM_SYNC_MISC_CFG) — Offset 18C8h

This register is used to configure miscellaneous aspects of the PM_SYNC pin.

This register is in the CORE power well and is reset by host_prim_rst_b.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 18C8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RW/L	**GPIO_D Pin Selection (GPIO_D_SEL):** There are two possible GPIOs that can be routed to the GPIO_D PM_SYNC state. This bit selects between them: 0: CPU_GP_3 (default) 1: CPU_GP_2 This field is not writeable when PM_SYNC_LOCK=1. **Locked by:** PM_SYNC_MISC_CFG.PM_SYNC_LOCK
10	0h RW/L	**GPIO_C Pin Selection (GPIO_C_SEL):** There are two possible GPIOs that can be routed to the GPIO_C PM_SYNC state. This bit selects between them: 0: CPU_GP_0 (default) 1: CPU_GP_1 This field is not writeable when PM_SYNC_LOCK=1. **Locked by:** PM_SYNC_MISC_CFG.PM_SYNC_LOCK
9	0h RW/L	**GPIO_B Pin Selection (GPIO_B_SEL):** There are two possible GPIOs that can be routed to the GPIO_B PM_SYNC state. This bit selects between them: 0: CPU_GP_2 (default) 1: CPU_GP_0 This field is not writeable when PM_SYNC_LOCK=1. **Locked by:** PM_SYNC_MISC_CFG.PM_SYNC_LOCK
8	0h RW/L	**GPIO_A Pin Selection (GPIO_A_SEL):** There are two possible GPIOs that can be routed to the GPIO_A PM_SYNC state. This bit selects between them: 0: CPU_GP_1 (default) 1: CPU_GP_3 This field is not writeable when PM_SYNC_LOCK=1. **Locked by:** PM_SYNC_MISC_CFG.PM_SYNC_LOCK
7:0	0h RO	**Reserved**

4.2.70 Power Management Configuration Reg 3 (PM_CFG3) — Offset 18E0h

This register contains misc. fields used to configure the PCH's power management behavior.

This register is in multiple power wells and reset domains (see below).

Type	Size	Offset	Default
MMIO	32 bit	BAR + 18E0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**BIOS FIVR Dynamic Management Enable (BIOS_FIVR_DYN_EN):** This bit must be '1' to allow dynamic management of the FIVRs. This bit, the SMIP bit, and PMC internal policies must be also be enabled or FIVRs will not be dynamically managed
27:22	0h RO	**Reserved**
21:18	0h RW	**Reserved**
17	0h RW	**Host Wireless LAN Phy Power Enable (HOST_WLAN_PP_EN):** This policy bit is set by Host software when it desires the wireless LAN PHY to be powered in Sx power states for wakes over wireless LAN (WoWLAN). See the SLP_WLAN# sub-section later in this chapter for additional information.
16	0h RW	**Deep-Sx WLAN Phy Power Enable (DSX_WLAN_PP_EN):** When set to 1, PMC will keep SLP_WLAN# high in deep-Sx to enable WoWLAN. Note: (1) This policy bit will be applied for deep-Sx entry from S3, S4 and S5. (2) This bit does not affect SLP_WLAN# behaviour in Sx after G3 or after a global reset (3) HOST_WLAN_PP_EN must be set when this bit is set.
15:5	0h RO	**Reserved**
4	0h RW	**Halt Energy Reporting HW Counters with SLP_S0 Assertion (ER_HALT_SLPS0):** 0: When this register bit is cleared (or left in its default state), then all Energy Reporting HW counters are not halted from incrementing (free running).1: When this bit is set, then all Energy Reporting HW counters will stop incrementing when slp_s0# asserts regardless of the input signal state.
3:0	0h RW	**Reserved**

4.2.71 Power Management Configuration Reg 4 (PM_CFG4) — Offset 18E8h

This register contains misc. fields used to configure the PCH's power management behavior.

This register is in multiple power wells and reset domains (see below).

Type	Size	Offset	Default
MMIO	32 bit	BAR + 18E8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30	0h RW	**USB2 PHY SUS Well Power Gating Enable (U2_PHY_PG_EN):** If this bit is 1, dynamic power gating of the USB2 PHY SUS well is enabled. Note: This bit prevents HW from initiating power gating entry. However, the USB2 PHY SUS well is power gated by default while in Sx after global_rst_b assertion. So HW will not spontaneously exit power gating while in Sx just because this bit is 0.
29	0h RW	**CPU BCLK Config Override Enable (CPU_BCLK_CFG_OVR_EN):** When set to '1', the value of CPU_BCLK_CFG_OVR_VAL is sent to the CPU as part of EPOC2 instead of the value of the DEF_CPU_BCLK_CFG soft-strap.
28:27	0h RW	**CPU BCLK Config Override Value (CPU_BCLK_CFG_OVR_VAL):** See the definition of CPU_BCLK_CFG_OVR_EN
26:0	0h RO	**Reserved**

4.2.72 CPU Early Power-on Configuration (CPU_EPOC) — Offset 18ECh

CPU Early Power on Configuration

Type	Size	Offset	Default
MMIO	32 bit	BAR + 18ECh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21:20	0h RO/V	**Crystal Frequency[2:1] (XTAL_FREQ_MSB):** Along with XTAL_FREQ_LSB the 3 bit field reflects the frequency of the crystal (aka NSSC) clock used by the CPU and PCH Encoding: 000b -24MHz 001b -19.Mhz 010b -38.4 Mhz Others - Reserved
19	0h RO/V	**EPOC Data[19] (EPOC_DATA_19):** DAM (Delayed Authentication Mode
18	0h RO/V	**EPOC Data[18] (EPOC_DATA_18):** Debug Consent
17	0h RO/V	**Crystal Frequency [0] (XTAL_FREQ_LSB):** See XTAL_FREQ_MSB
16	0h RO	**Reserved**
15:8	00h RO/V	**EPOC Data[15:8] (EPOC_DATA_15_8):** These bits come from PMC soft straps reserved for straps that must be available to the CPU prior to PLTRST# de-assertion. Note: Any straps that only need to be available after OPI is up should be sent as part of the strap set message from SPI instead of being reserved in the PMC straps, defined in EPOC, and sent by the PMC.
7:3	00h RW/L	**EPOC Data [7:3] (EPOC_DATA_7_3):** EPOC Data [7:3] **Locked by:** GEN_PMCON_B.CPU_EPOC_LOCK
2	0h RO	**Reserved**
1:0	0h RW/L	**EPOC Data [1:0] (EPOC_DATA_1_0):** EPOC Data [1:0] **Locked by:** GEN_PMCON_B.CPU_EPOC_LOCK

4.2.73 ACPI Timer Control (ACPI_TMR_CTL) — Offset 18FCh

This register allows software to disable the ACPI Timer, which could result in power savings for the PCH.

This register is in the CORE power well and is reset by host_prim_rst_b

Type	Size	Offset	Default
MMIO	32 bit	BAR + 18FCh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1	0h RW	**ACPI Timer Disable (ACPI_TIM_DIS):** This bit determines whether the ACPI Timer is enabled to run. Note that even when enabled, the timer only runs during S0. - 0: ACPI Timer is enabled (default) - 1: ACPI Timer is disabled (halted at the current value)
0	0h RW/1S/V	**ACPI Timer Clear (ACPI_TIM_CLR):** Writing a 1 to this bit will clear the ACPI Timer to all 0s. Hardware will automatically clear the bit back to '0' once the timer clear operation has completed. Writing a 0 to this bit has no effect. Implementation Note: The PCH must be capable of honoring this bit even while ACPI_TIM_DIS=1.

4.2.74 Last TSC Alarm Value[31:0] (TSC_ALARM_LO) — Offset 1910h

This register is in the CORE power well and is reset by host_prim_rst_b.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1910h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Last TSC Alarm Value [31:0] (TSC_ALARM_VAL_LO):** This field contains bits 31:0 of the last TSC alarm value received from the CPU.

4.2.75 Last TSC Alarm Value[63:32] (TSC_ALARM_HI) — Offset 1914h

This register is in the CORE power well and is reset by host_prim_rst_b.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1914h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Last TSC Alarm Value [63:32] (TSC_ALARM_VAL_HI):** This field contains bits 63:32 of the last TSC alarm value received from the CPU.

4.2.76 GPIO Configuration (GPIO_CFG) — Offset 1920h

This register is in the PRIMARY power well and is reset by global_rst_b.

reset_type=global_rst_b

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1920h	00000432h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description

0	0h RW/1S/V	**ISH VNNREQ (ISH_VNNREQ):** ISH VNN REQ indication.

4.2.83 DBG SLP S0 WAKE2 (DBG_SLP_S0_WAKE2) — Offset 1A7Ch

This register captures the value of SLP_S0 wake events whenever the SLP_S0 s/m moves out of the SLP_S0 state. This register is in the core power well and it is reset by pmc_pltrst_b.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1A7Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7	0h RW/1S/V	**IOTG PLL SHUTDOWN (IOTG_PLL_OFF):** IOTG PLL shutdown indication.
6	0h RW/1S/V	**CSME POWER GATING (CSME_POWER_GATING):** CSME Power gating indication.
5	0h RW/1S/V	**TSC ALARM EXPIRATION (TSC_ALARM_EXPIRATION):** TSC ALARM indication.
4	0h RW/1S/V	**ISH VNNAONREQ (ISH_VNNAONREQ):** ISH VNNAON request indication.
3	0h RW/1S/V	**CNV_VNNREQ:** CNV VNNREQ indication
2	0h RW/1S/V	**LPC_AGG_CLKREQ:** LPC Aggregated Clockreq Indication.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW/1S/V	Reserved
0	0h RW/1S/V	Reserved

4.2.84 CWB MDID Status Register (CWBMDIDSTATUS) — Offset 1BD4h

CWB MDID Status Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1BD4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**CWB Status (CWB_STS):** When set, DMI Central Write Buffer is enabled. Reflects DMI's np_pmc_cwb_en_ack status. 1: CWB on 0: CWB off
30:27	0h RO	**Reserved**
26:18	000h RW/V	**WIGIG MDID Value (WIGIG_MDID):** WIGIG sent MDID value.
17:9	000h RW/V	**DMI MDID Value (DMI_MDID):** DMI sent MDID value.
8:0	000h RW/V	Reserved

4.2.85 ACPI Control (ACTL) — Offset 1BD8h

ACPI Control

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1BD8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7	0h RW	**ACPI Enable (EN):** When set, decode of the I/O range pointed to by the ACPI base register is enabled and the ACPI power management function is enabled.
6:3	0h RO	**Reserved**
2:0	0h RW	**SCI IRQ Select (SCIS):** Specifies on which IRQ the SCI will internally appear. If not using the APIC, the SCI must be routed to IRQ[9-11], and that interrupt is not sharable with the SERIRQ stream, but is shareable with other PCI interrupts. If using the APIC, the SCI can also be mapped to IRQ20-23, and can be shared with other interrupts. Bits - SCI Map ---- - ------- 000 - IRQ9 001 - IRQ10 010 - IRQ11 011 - Reserved 100 - IRQ20 (only if APIC is enabled) 101 - IRQ21 (only if APIC is enabled) 110 - IRQ22 (only if APIC is enabled) 111 - IRQ23 (only if APIC is enabled) When the interrupt is mapped to APIC interrupts 9, 10 or 11, the APIC should be programmed for active-high reception. When the interrupt is mapped to APIC interrupts 20 through 23, the APIC should be programmed for active-low reception.

4.2.86 Clock Source Shutdown Control Reg 2 (CS_SD_CTL2) — Offset 1BECh

This register configures if and how CPPM interacts with PCH clock gating and PLL shutdown.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1BECh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29	0h RW	**Clock Source 6 Override Value (CS6_OVR_VAL):** See CS1_OVR_VAL; when CS6_OVR_EN = 1, CS6_OVR_VAL will be driven on the FORCE_ON signal for clock source 6.
28	0h RW	**Clock Source 5 Override Value (CS5_OVR_VAL):** See CS1_OVR_VAL; when CS5_OVR_EN = 1, CS5_OVR_VAL will be driven on the FORCE_ON signal for clock source 5.
27	0h RW	**Clock Source 4 Override Value (CS4_OVR_VAL):** See CS1_OVR_VAL; when CS4_OVR_EN = 1, CS5_OVR_VAL will be driven on the FORCE_ON signal for clock source 4.
26	0h RW	**Clock Source 3 Override Value (CS3_OVR_VAL):** See CS1_OVR_VAL; when CS3_OVR_EN = 1, CS5_OVR_VAL will be driven on the FORCE_ON signal for clock source 3.
25	0h RW	**Clock Source 5 Override Value (CS2_OVR_VAL):** See CS1_OVR_VAL; when CS2_OVR_EN = 1, CS5_OVR_VAL will be driven on the FORCE_ON signal for clock source 2.
24	0h RW	**Clock Source 1 Override Value (CS1_OVR_VAL):** See CS1_OVR_VAL; when CS1_OVR_EN = 1, CS5_OVR_VAL will be driven on the FORCE_ON signal for clock source 1.
23:22	0h RO	**Reserved**
21	0h RW	**Clock Source 6 Override Enable (CS6_OVR_EN):** See CS1_OVR_EN; when CS6_OVR_EN = 1, CS6_OVR_VAL will be driven on the FORCE_ON signal for clock source 6.
20	0h RW	**Clock Source 5 Override Enable (CS5_OVR_EN):** See CS1_OVR_EN; when CS5_OVR_EN = 1, CS5_OVR_VAL will be driven on the FORCE_ON signal for clock source 5.
19	0h RW	**Clock Source 4 Override Enable (CS4_OVR_EN):** See CS1_OVR_EN; when CS4_OVR_EN = 1, CS4_OVR_VAL will be driven on the FORCE_ON signal for clock source 4.
18	0h RW	**Clock Source 3 Override Enable (CS3_OVR_EN):** See CS1_OVR_EN; when CS3_OVR_EN = 1, CS3_OVR_VAL will be driven on the FORCE_ON signal for clock source 3.
17	0h RW	**Clock Source 2 Override Enable (CS2_OVR_EN):** See CS1_OVR_EN; when CS2_OVR_EN = 1, CS2_OVR_VAL will be driven on the FORCE_ON signal for clock source 2.
16	0h RW	**Clock Source 1 Override Enable (CS1_OVR_EN):** See CS1_OVR_EN; when CS1_OVR_EN = 1, CS1_OVR_VAL will be driven on the FORCE_ON signal for clock source 1.

Bit Range	Default & Access	Field Name (ID): Description
15:6	0h RO	**Reserved**
5	0h RW	**Clock Source 6 EA Enable (CS6_EA_EN):** See CS1_EA_EN; controls application of EA value to shutting down clock source 5.
4	0h RW	**Clock Source 5 EA Enable (CS5_EA_EN):** See CS1_EA_EN; controls application of EA value to shutting down clock source 5.
3	0h RW	**Clock Source 4 EA Enable (CS4_EA_EN):** See CS1_EA_EN; controls application of EA value to shutting down clock source 4.
2	0h RW	**Clock Source 3 EA Enable (CS3_EA_EN):** See CS1_EA_EN; controls application of EA value to shutting down clock source 3.
1	0h RW	**Clock Source 2 EA Enable (CS2_EA_EN):** See CS1_EA_EN; controls application of EA value to shutting down clock source 2.
0	0h RW	**Clock Source 1 EA Enable (CS1_EA_EN):** When this bit is set to 1, the FORCE_ON signal for clock source 1 will always be 1 while EA is 1. This bit takes precedence over the CPPM dynamic qualifiers. So if this bit is 1 and EA is 1, FORCE_ON will be 1 even if the dynamic qualifiers are satisfied. Note: The static BIOS and PMC overrides, if enabled, will force FORCE_ON to 0 or 1 regardless of how this bit is programmed.

4.2.87 PGD PG_ACK Status Register 0 (PPASR0) — Offset 1D80h

PGD PG ACK Status Register 0

Type	Size	Offset	Default

Bit Range	Default & Access	Field Name (ID): Description
0	0h RO/V	**XHCI Fuse Disable (XHCI_FUSE_DIS):** XHCI fuse disable placeholder if this information is used by PMC due to specific XHCI requirements.

4.2.95 Static PG Fuse and Soft Strap Disable Read Register 2 (STPG_FUSE_SS_DIS_RD_2) — Offset 1E44h

This register contains fuse and soft strap disable based information - all of which is used for static power-gating (for example, if a bit is set in this register for a particular IP, PMC keeps that IP in a power-gated state - except as noted below.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1E44h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30	0h RO/V	**ISI Fuse or Soft Strap Disable (ISI_FUSE_SS_DIS):** RO bit indicating if ISI function is disabled through fuse/soft strap. Note: Each port within this function has individual disable fuse - listed in N_STPG_FUSE_SS_DIS_RD_1 register that does not contribute to static power gating.
29	0h RO/V	**TBTLSX Fuse or Soft Strap Disable (TBTLSX_FUSE_SS_DIS):** RO bit indicating if TBTLSX function is disabled through fuse/soft strap. Note: Each port within this function has individual disable fuse - listed in N_STPG_FUSE_SS_DIS_RD_1 register that does not contribute to static power gating.
28	0h RO/V	**WIGIG Fuse or Soft Strap Disable (WIGIG_FUSE_SS_DIS):** RO bit indicating if WIGIG function is disabled through fuse or soft strap.
27	0h RO	**Reserved**
26	0h RO/V	**SPD Soft Strap Disable (SPD_SS_DIS):** RO bit indicating if SPD function is disabled through soft strap. Note: Each port within this function has individual disable fuse - listed in N_STPG_FUSE_SS_DIS_RD_1 register that does not contribute to static power gating.
25	0h RO/V	**SPC Soft Strap Disable (SPC_SS_DIS):** RO bit indicating if SPC function is disabled through soft strap. Note: Each port within this function has individual disable fuse - listed in N_STPG_FUSE_SS_DIS_RD_1 register that does not contribute to static power gating.

Bit Range	Default & Access	Field Name (ID): Description
24	0h RO/V	**SPB Soft Strap Disable (SPB_SS_DIS):** RO bit indicating if SPB function is disabled through fuse/soft strap. Note: Each port within this function has individual disable fuse - listed in N_STPG_FUSE_SS_DIS_RD_1 register that does not contribute to static power gating.
23	0h RO/V	**SPA Soft Strap Disable (SPA_SS_DIS):** RO bit indicating if SPA function is disabled through soft strap. Note: Each port within this function has individual disable fuse - listed in N_STPG_FUSE_SS_DIS_RD_1 register that does not contribute to static power gating.
22	0h RO/V	**PPBR Fuse or Soft Strap Disable (PPBR_SS_DIS):** RO bit indicating if PPBR function is disabled through soft strap.
21	0h RO/V	**PSTH Fuse or Soft Strap Disable (PSTH_FUSE_SS_DIS):** RO bit indicating if PSTH function is disabled through fuse/soft strap.
20	0h RO/V	**DMI Fuse or Soft Strap Disable (DMI_FUSE_SS_DIS):** RO bit indicating if DMI function is disabled through fuse/soft strap.
19	0h RO/V	**XDCI Fuse or Soft Strap Disable (XDCI_FUSE_SS_DIS):** RO bit indicating if XDCI function is disabled through fuse/soft strap.
18	0h RO/V	**XHCI Soft Strap Disable (XHCI_SS_DIS):** RO bit indicating if XHCI function is disabled through soft strap. Note: This is intended for use only as a debug tool (to work around any issues related to XHCI in reset/boot/Sx entry flows), since disabling XHCI prevents ModPhy power-gating on the lanes driven by the XHCI controller. The corresponding XHCI disable fuse bit is located in N_STPG_FUSE_SS_DIS_RD_1 register.
17	0h RO/V	**FIA Fuse or Soft Strap Disable (FIA_FUSE_SS_DIS):** RO bit indicating if FIA function is disabled through fuse/soft strap.
16	0h RO/V	**DSP Fuse or Soft Strap Disable (DSP_FUSE_SS_DIS):** RO bit indicating if DSP function is disabled through fuse/soft strap.
15	0h RO/V	**SATA Fuse or Soft Strap Disable (SATA_FUSE_SS_DIS):** RO bit indicating if SATA function is disabled through fuse/soft strap.
14	0h RO/V	**ICC Fuse or Soft Strap Disable (ICC_FUSE_SS_DIS):** RO bit indicating if ICC function is disabled through fuse/soft strap.
13	0h RO/V	**LPC Fuse or Soft Strap Disable (LPC_FUSE_SS_DIS):** RO bit indicating if LPC function is disabled through fuse/soft strap.
12	0h RO/V	**RTC Fuse or Soft Strap Disable (RTC_FUSE_SS_DIS):** RO bit indicating if RTC function is disabled through fuse/soft strap.
11	0h RO/V	**P2S Fuse or Soft Strap Disable (P2S_FUSE_SS_DIS):** RO bit indicating if P2S function is disabled through fuse/soft strap.
10	0h RO/V	**TRSB Fuse or Soft Strap Disable (TRSB_FUSE_SS_DIS):** RO bit indicating if TRSB function is disabled through fuse/soft strap.
9	0h RO/V	**SMB Fuse or Soft Strap Disable (SMB_FUSE_SS_DIS):** RO bit indicating if SMB function is disabled through fuse/soft strap.
8	0h RO/V	**ITSS Fuse or Soft Strap Disable (ITSS_FUSE_SS_DIS):** RO bit indicating if ITSS function is disabled through fuse/soft strap.
7	0h RO/V	Reserved
6	0h RO/V	**LPSS Fuse or Soft Strap Disable (LPSS_FUSE_SS_DIS):** RO bit indicating if LPSS function is disabled through fuse/soft strap.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RO/V	**EMMC Fuse or Soft Strap Disable (EMMC_FUSE_SS_DIS):** RO bit indicating if EMMC function is disabled through fuse/soft strap.
4	0h RO/V	Reserved
3	0h RO/V	**P2D Fuse or Soft Strap Disable (P2D_FUSE_SS_DIS):** RO bit indicating if 2D function is disabled through fuse/soft strap.
2	0h RO/V	**SD Controller Fuse or Soft Strap Disable (SDX_FUSE_SS_DIS):** RO bit indicating if SD Controller function is disabled through fuse/soft strap.
1	0h RO/V	**ISH Fuse or Soft Strap Disable (ISH_FUSE_SS_DIS):** RO bit indicating if OSE function is disabled through fuse or soft strap.
0	0h RO/V	**GBE Fuse or Soft Strap Disable (GBE_FUSE_SS_DIS):** RO bit indicating if GBE function is disabled through fuse or Soft strap.

4.2.96 CPPMVRIC3 CPPM VR Idle Control 3 (CPPMVRIC3) — Offset 1E4Ch

This register contains misc. configuration related to SLP_S0# control / VR Idle.

4.3 PMC ACPI IO Registers Summary

Table 4-3. Summary of PMC ACPI IO Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	Power Management 1 Enables and Status (PM1_EN_STS)	00000000h
4h	4	Power Management 1 Control (PM1_CNT)	00000000h
8h	4	Power Management 1 Timer (PM1_TMR)	00000000h
20h	4	Therm Timer Delay Register (THERM_TIMER_DELAY)	00000000h
30h	4	SMI Control and Enable (SMI_EN)	00000002h
34h	4	SMI Status Register (SMI_STS)	00000000h
40h	4	General Purpose Event Control (GPE_CTRL)	00000000h
44h	4	Device Trap Status Register (DEVTRAP_STS)	00000000h
50h	4	PM2a Control Block (PM2A_CNT_BLK)	00000000h
54h	4	Over-Clocking WDT Control (OC_WDT_CTL)	00002000h
60h	4	General Purpose Event 0 Status [31:0] (GPE0_STS_31_0)	00000000h
64h	4	General Purpose Event 0 Status [63:32] (GPE0_STS_63_32)	00000000h
68h	4	General Purpose Event 0 Status [95:64] (GPE0_STS_95_64)	00000000h
6Ch	4	General Purpose Event 0 Status [127:96] (GPE0_STS_127_96)	00000000h
70h	4	General Purpose Event 0 Enable [31:0] (GPE0_EN_31_0)	00000000h
74h	4	General Purpose Event 0 Enable [63:32] (GPE0_EN_63_32)	00000000h
78h	4	General Purpose Event 0 Enable [95:64] (GPE0_EN_95_64)	00000000h
7Ch	4	General Purpose Event 0 Enable [127:96] (GPE0_EN_127_96)	00000000h

4.3.1 Power Management 1 Enables and Status (PM1_EN_STS) — Offset 0h

Power Management 1 Enables and Status

Type	Size	Offset	Default
MMIO	32 bit	BAR + 0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30	0h RW	**PCI Express Wake Disable (PCIEXP_WAKE_DIS):** This bit disables the inputs to the PCIEXP_WAKE_STS bit in the PM1 Status register from waking the system. Modification of this bit has no impact on the value of the PCIEXP_WAKE_STS bit.

Bit Range	Default & Access	Field Name (ID): Description
29:27	0h RO	**Reserved**
26	0h RW/V	**RTC Alarm Enable (RTC_EN):** This is the RTC alarm enable bit. It works in conjunction with the SCI_EN bit: RTC_EN SCI_EN Effect when RTC_STS is set 0 x No SMI# or SCI. If system was in S1-S5, no wake even occurs. 1 0 SMI#. If system was in S1-S5, then a wake event occurs before the SMI#. 1 1 SCI. If system was in S1-S5, then a wake event occurs before the SCI. Note: This bit needs to be backedby the RTC well to allow an RTC event to wake after a power failure.
25	0h RO	**Reserved**
24	0h RW/V	**Power Button Enable (PWRBTN_EN):** This bit is the power button enable. It works in conjunction with the SCI_EN bit: PWRBTN_EN SCI_EN Effect when PWRBTN_STS is set 0 x No SMI# or SCI. 1 0 SMI#. 1 1 SCI. NOTE: PWRBTN_EN has no effect on the PWRBTN_STS bit being set by the assertion of the power button. The Power Button is always enabled as a Wake event.
23:22	0h RO	**Reserved**
21	0h RW	**Global Enable (GBL_EN):** The global enable bit. When both the GBL_EN and the GBL_STS are set, PCH generates an SCI.
20:17	0h RO	**Reserved**
16	0h RW	**Timer Overflow Interrupt Enable (TMROF_EN):** This is the timer overflow interrupt enable bit. It works in conjunction with the SCI_EN bit: TMROF_EN SCI_EN Effect when TMROF_STS is set 0 x No SMI# or SCI. 1 0 SMI#. 1 1 SCI.
15	0h RW/1C/V	**Wake Status (WAK_STS):** This bit is set when the system is in one of the Sleep states (via the SLP_EN bit) and an enabled Intel PCH Wake event occurs. Upon setting this bit, the Intel PCH will transition the system to the ON state. This bit can only be set by hardware and can only be cleared by writing a one to this bit position. This bit is not affected by hard resets caused by a CF9 write, but is reset by RSMRST#. If a power failure occurs (such as removed batteries) without the SLP_EN bit set, the WAK_STS bit will not be set when the power returns if the AFTER_G3 bit is 0. If the AFTER_G3 bit is 1, then the WAK_STS bit will be set after waking from a power failure. If necessary, the BIOS can clear the WAK_STS bit in this case.

Bit Range	Default & Access	Field Name (ID): Description
14	0h RW/1C/V	**PCI Express Wake Status (PCIEXP_WAKE_STS):** This bit is set by hardware to indicate that the system woke due to a PCI Express wakeup event. This event can be caused by the PCI Express WAKE# pin being active, or one or more of the PCI Express ports being in beacon state, or receipt of a PCI Express PME message at root port. This bit should only be set when one of these events causes the system to transition from a non-S0 system power state to the S0 system power state. This bit is set independent of the PCIEXP_WAKE_DIS bit. Software writes a 1 to clear this bit. If WAKE# pin is still active during the write or one or more PCI Express ports is in the beacon state or PME message received indication is not cleared in the root port, then the bit will remain active (i.e. all inputs to this bit are level sensitive) Note: This bit does not itself cause a wake event or prevent entry to a sleeping state. Thus if the bit is 1 and the system is put into a sleeping state, the system will not automatically wake.
13:12	0h RO	**Reserved**
11	0h RW/1C/V	**Power Button Override (PWRBTNOR_STS):** This bit is set any time a Power Button Override Event occurs (i.e. the power button is pressed for at least 4 consecutive seconds), the corresponding bit is received in the SMBus slave message, the ME-Initiated Power Button Override bit is set, the ME-Initiated Host Reset with Power Down is set, or due to an internal thermal sensor catastrophic condition. These events cause an unconditional transition to the S5 state. The BIOS or SCI handler clears this bit by writing a 1 to it. This bit is not affected by hard resets via CF9h writes, and is not reset by pri_pwrgood_rst_b. Thus, this bit is preserved through power failures. Note that this bit is still asserted when the global SCI_EN is set to '1' then an SCI will be generated.
10	0h RW/1C/V	**RTC Status (RTC_STS):** This bit is set when the RTC generates an alarm (assertion of the IRQ8# signal), and is not affected by any other enable bit. See RTC_EN for the effect when RTC_STS goes active. This bit is only set by hardware and can only be reset by writing a one to this bit position. This bit is not affected by hard resets caused by a CF9 write, but is reset by dsw_pwrgood_rst_b.
9	0h RO	**Reserved**
8	0h RW/1C/V	**Power Button Status (PWRBTN_STS):** This bit is set when the PWRBTN# signal is asserted (low), independent of any other enable bit. See PWRBTN_EN for the effect when PWRBTN_STS goes active. PWRBTN_STS is always a wake event. This bit is only set by hardware and can be cleared by software writing a one to this bit position. This bit is not affected by hard resets caused by a CF9 write, but is reset by dsw_pwrgood_rst_b. If the PWRBTN# signal is held low for more than 4 seconds, the Intel PCH clears the PWRBTN_STS bit, sets the PWRBTNOR_STS bit, the system transitions to the S5 state, and only PWRBTN# is enabled as a wake event. If PWRBTN_STS bit is cleared by software while the PWRBTN# pin is still held low, this will not cause the PWRBTN_STS bit to be set. The PWRBTN# signal must go inactive and active again to set the PWRBTN_STS bit. Note that the SMBus Unconditional Powerdown message, the CPU Thermal Trip and the Internal Thermal Sensors' Catastrophic Condition result in behavior matching the Powerbutton Override, which includes clearing this bit.
7:6	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW/1C/V	**GBL Status (GBL_STS):** This bit is set when an SCI is generated due to the BIOS wanting the attention of the SCI handler. BIOS has a corresponding bit, BIOS_RLS, which will cause an SCI and set this bit. The SCI handler should then clear this bit by writing a 1 to it. This bit will not cause wake events or SMI#. This bit is not effected by SCI_EN. Note: GBL_STS being set will cause an SCI, even if the SCI_EN bit is not set. Software must take great care not to set the BIOS_RLS bit (which causes GBL_STS to be set) if the SCI handler is not in place.
4	0h RW/1C/V	**Bus Master Status (BM_STS):** This bit is set to 1 by the Intel PCH when a PCH-visible bus master requests access to memory or the BM_BUSY# signal is active. This bit is cleared by the CPU writing a 1 to this bit position. This bit will not cause a wake event, SCI, or SMI. Implementation Details There are several conditions that can result in this bit being set based on various qualifications: o Qualified by BM_STS_ZERO_EN = 0 - any live snoopable backbone request - any pegged activeevent (see EN_PA_* registers) >> includes the BM_BUSY# pin o Qualified by PHOLD_BM_STS_BLOCK = 0 - PHOLD (LPC DMA or LPC bus master activity) o Qualified by individual BM_BREAK_EN bits being set to '1' - See BM_BREAK_EN register for list of devices
3:1	0h RO	**Reserved**
0	0h RW/1C/V	**Timer Overflow Status (TMROF_STS):** This is the timer overflow status bit. This bit gets set anytime bit 22 of the 24 bit timer goes low (bits are counted from 0 to 23). This will occur every 2.3435 seconds. See TMROF_EN for the effect when TMROF_STS goes active. Software clears this bit by writing a 1 to it.

4.3.2 Power Management 1 Control (PM1_CNT) — Offset 4h

Lockable: No Usage: ACPI or Legacy Power Well: Bits 0-9, 13-31: Primary, Bits 10-12: RTC Available: Desktop, Mobile

Type	Size	Offset	Default

4.3.5 SMI Control and Enable (SMI_EN) — Offset 30h

I/O Address: PMBASE + 30h Attribute: Read/Write

Default Value: 00000000h Size: 32-bit

Lockable: No Usage: ACPI or Legacy

Power Well: Primary Available: Desktop, Mobile

Note: This register is symmetrical to the SMI Status Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 30h	00000002h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**XHCI SMI Enable (XHCI_SMI_EN):** Software sets this bit to enable XHCI SMI events.
30	0h RW	**ME SMI Enable (ME_SMI_EN):** Software sets this bit to enable ME SMI# events.
29	0h RW	**LPSS SMI Enable (LPSS_SMI_EN):** Software sets this bit to enable LPSS SMII events

Bit Range	Default & Access	Field Name (ID): Description
28	0h RW/L	**eSPI SMI Enable (ESPI_SMI_EN):** Software sets this bit to enable eSPI SMI events. NOTE: When the ESPI_SMI_LOCK bit is set, this bit cannot be changed. **Locked by:** PCI_MMR.GEN_PMCON_A.ESPI_SMI_LOCK
27	0h RW/1S	**GPIO Unlock SMI Enable (GPIO_UNLOCK_SMI_EN):** Setting this bit will cause the Intel PCH to generate an SMI# when the GPIO_UNLOCK_SMI_STS bit is set in the SMI_STS register. Once written to '1', this bit can only be cleared by host_prim_rst_b.
26	0h RO	**Reserved**
25	0h RW	**SDX SMI Enable (SDX_SMI_EN):** Software sets this bit to enable SCC SMI events
24:19	0h RO	**Reserved**
18	0h RW	**THERM SMI Enable (THERM_SMI_EN):** Software sets this bit to enable Thermal SMI# events.
17	0h RW	**Legacy USB 2 Enable (LEGACY_USB2_EN):** Enables legacy USB2 logic to cause SMI#.
16:15	0h RO	**Reserved**
14	0h RW	**Periodic Enable (PERIODIC_EN):** Setting this bit will cause the Intel PCH to generate an SMI# when the PERIODIC_STS bit is set in the SMI_STS register..
13	0h RW/L	**TCO Enable (TCO_EN):** 1 = Enables the TCO logic to generate SMI#. 0 = Disables TCO logic generating an SMI#. If the NMI2SMI_EN bit is set, then SMI's that are caused by NMI's (i.e. rerouted) will not be gated by the TCO_EN bit. Even if the TCO_EN bit is 0, the NMI's will still be routed to cause the SMI#. NOTE: This bit can not be written once the TCO_LOCK bit (at offset 08h of TCO I/O Space) is set. This prevents unauthorized software from disabling the generation of TCO-based SMI's **Locked by:** `PMCIUNIT_WRAPPER.I_PMCIACPI.I_PMCIACPIR.MSUS_PMCI_TCO_LOCK_SYNCPMC
12	0h RO	**Reserved**
11	0h RW	**MCSMI Enable (MCSMI_EN):** Software sets this bit to 1 to enables Intel PCH to trap access to the microcontroller range (62h or 66h). A 'trapped' cycles will be claimed by Intel PCH, but not forwarded to LPC. An SMI# will also be generated.
10:8	0h RO	**Reserved**
7	0h WO	**BIOS_RLS:** Enables the generation of an SCI interrupt for ACPI software when a one is written to this bit position by BIOS software. This bit always reads a zero. NOTE: GBL_STS being set will cause an SCI, even if the SCI_EN bit is not set. Software must take great care not to set the BIOS_RLS bit (which causes GBL_STS to be set) if the SCI handler is not in place.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**Software SMI Timer Enable (SWSMI_TMR_EN):** Software sets this bit to a 1 to start the Software SMI# Timer. When the timer expires (depending on the SWSMI_RATE_SEL bits), it will generate an SMI# and set the SWSMI_TMR_STS bit. The SWSMI_TMR_EN bit will remain at 1 until software sets it back to 0. Clearing the SWSMI_TMR_EN bit before the timer expires will reset the timer and the SMI# will not be generated. The default for this bit is 0.
5	0h RW	**APMC Enable (APMC_EN):** If set, this enables writes to the APM_CNT register to cause an SMI#
4	0h RW	**SMI On Sleep Enable (SMI_ON_SLP_EN):** If this bit is set, the Intel PCH will generate an SMI# when a write access attempts to set the SLP_EN bit (in the PM1_CNT register). Furthermore, the Intel PCH will not put the system to a sleep state. This allows the SMI# handler work around chip-level bugs. It is expected that the SMI# handler will turn off the SMI_ON_SLP_EN bit before actually setting the SLP_EN bit.
3	0h RW	**Legacy USB Enable (LEGACY_USB_EN):** Enables legacy USB circuit to cause SMI#.
2	0h RW	**BIOS Enable (BIOS_EN):** Enables the generation of SMI# when ACPI software writes a 1 to the GBL_RLS bit. Note that if the BIOS_STS bit, which gets set when software writes a 1 to GBL_RLS bit, is already a 1 at the time that BIOS_EN becomes 1, an SMI# will be generated when BIOS_EN gets set.
1	1h RW/1S/V	**End of SMI (EOS):** This bit controls the arbitration of the SMI signal to the processor. This bit must be set in order for Intel PCH to assert SMI# low to the processor after SMI# has been asserted previously. Once Intel ICH asserts SMI# low, the EOS bit is automatically cleared. In the SMI handler, the CPU should clear all pending SMIs (by servicing them and then clearing their respective status bits), set the EOS bit, and exit SMM. This will allow the SMI arbiter to reassert SMI upon detection of an SMI event and the setting of a SMI status bit. The SMI# signal will go inactive for 4 PCI clocks.
0	0h RW/L	**Global SMI Enable (GBL_SMI_EN):** When set, this bit enables the generation of SMIs in the system upon any enabled SMI event. This bit is reset by a PCI reset event. If this bit is not set, no SMI# will be generated. NOTE: When the SMI_LOCK bit is set, this bit cannot be changed. **Locked by:** PCI_MMR.GEN_PMCON_B.SMI_LOCK

4.3.6 SMI Status Register (SMI_STS) — Offset 34h

Lockable: No Usage: ACPI or Legacy Power Well: Primary Available: Desktop, Mobile

Note: If the corresponding _EN bit is set when the _STS bit is set, the Intel PCH will cause an SMI# (except bits 8-10, which don't cause SMI#)

Type	Size	Offset	Default
MMIO	32 bit	BAR + 34h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**XHCI SMI Status (XHCI_SMI_STS):** This bit will be set when any USB3 (XHCI) Host Controller is requesting an SMI.
30	0h RO/V	**ME SMI Status (ME_SMI_STS):** This bit will be set when ME is requesting an SMI#.
29	0h RW/1C/V	**LPSS SMI Status (LPSS_SMI_STS):** This bit gets set when LPSS agent is requesting SMI #. This bit is set by hardware and cleared by software writing a 1 to this bit position
28	0h RO/V	**eSPI SMI Status (ESPI_SMI_STS):** This bit is set if an eSPI agent is requesting an SMI#. This bit is set by hardware and cleared by software writing a 1 to its bit position.
27	0h RW/1C/V	**GPIO Unlock SMI Status (GPIO_UNLOCK_SMI_STS):** This bit will be set of the GPIO registers lockdown logic is requesting an SMI#. Writing a '1' to this bit position clears this bit to '0'.
26	0h RO/V	**SPI_SMI Status (SPI_SMI_STS):** This bit will be set when the SPI logic is requesting an SMI#. This bit is read only because the sticky status and enable bits associated with this function are located in the SPI registers.
25	0h RW/1C/V	**SCC SMI Status (SDX_SMI_STS):** This bit gets set when SCC agent is requesting SMI#.This bit is set by hardware and cleared by software writing a 1 to this bit position
24	0h RO/V	**Reserved**
23	0h RO	**Reserved**
22	0h RO/V	**INTERNAL_TT Status (INTERNAL_TT_STS):** This bit will be set if the internal thermal throttle mechanism has changed state. This bit is read only because the sticky status and enable bit associated with this function is in the other unit.
21	0h RO/V	**Monitor Status (MONITOR_STS):** This bit will be set if the Trap/SMI logic has caused the SMI. This will occur when the CPU or a bus master accesses an assigned register (or a sequence of accesses).
20	0h RO/V	**PCI_EXP_SMI Status (PCI_EXP_SMI_STS):** 1- PCI Express SMI event occurred. This could be due to a PCI Express PME event or Hot Plug Event.
19	0h RO/V	**RTC Update-In-Progress SMI Status (RTC_UIP_SMI_STS):** This bit will be set when the RTC Update-In-Progress signal transitions either from low-to-high or high-to-low, depending on the enables in the I/O Trap register space. This bit is Read Only. The sticky Read/Write Clear status bits are implemented in the I/O Trap register space. There is no need for a corresponding enable because individual enables are provided in the the I/O Trap register space.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RW/1C/V	**Thermal SMI Status (THERM_SMI_STS):** This bit will be set when the FW sets DRV_THERM_SMI_SCI_STS.DRV_SMI_STS bit. It is cleared by the Host Software
17	0h RO/V	**Legacy USB 2 Status (LEGACY_USB2_STS):** This non-sticky read-only bit is a logical OR of each of the SMI status bits in the USB2 Legacy Support Register ANDed with the corresponding enable bits. This bit will not be active if the enable bits are not set. Writes to this bit will have no effect. All integrated USB2 Host Controllers are represented with this bit.
16	0h RW/1C/V	**SMBUS_SMI Status (SMBUS_SMI_STS):** Intel PCH sets this bit to 1 to indicate that the SMI# was caused by: 1. The SMBus Slave receiving a message that an SMI# should be caused, or 2. The SMBALERT# signal goes active and the SMB_SMI_EN bit is set and the SMBALERT_DIS bit is cleared. 3. The SMBus Slave receiving a HOST_NOTIFY message and the HOST_NOTIFY_INTREN and the SMB_SMI_EN bits are set. 4. The SMBus Slave receiving a SMI in S0message. This bit is sticky. It is cleared by writing a 1 to this bit position. Note that this bit is set from the 64 KHz clock domain used by the SMBus. Software must wait at least 15.63 microseconds
15	0h RO/V	**SERIRQ_SMI Status (SERIRQ_SMI_STS):** 1 = Indicates the SMI# was caused by the SERIRQ decoder. 0 = SMI# not caused by SERIRQ decoder. Note, this bit is not sticky. Writes to this bit will have no effect.
14	0h RW/1C/V	**Periodic Status (PERIODIC_STS):** This bit will be set at the rate determined by the PER_SMI_SEL bits. If the PERIODIC_EN bit is also set, the Intel PCH will generate an SMI#. This bit is cleared by writing a 1 to this bit position.
13	0h RW/1C/V	**TCO Status (TCO_STS):** 1 = Indicates SMI was caused by the TCO logic. 0 = SMI not caused by TCO logic. NOTE: Will not cause wake event. This bit is cleared by writing a 1 to this bit position.
12	0h RO/V	**DEVMON Status (DEVMON_STS):** This read-only bit is set when bit 0 in the DEVTRAP_STS register is set. It is not sticky, so writes to this bit will have no effect.
11	0h RW/1C/V	**MCSMI Status (MCSMI_STS):** This bit is set if there is an access to the power management microcontroller range (62h or 66h). If this bit is set, and the MCSMI_EN bit is also set, the Intel PCH will generate an SMI#. This bit is set by hardware and cleared by software writing a 1 to its bit position.
10	0h RO/V	**GPIO SMI Status (GPIO_SMI_STS):** This bit will be a 1 if any GPIO that is enabled to trigger SMI is asserted. GPIOs that are not routed to cause an SMI will have no effect on this bit. This bit is NOT sticky. Writes to this bit will have no effect.
9	0h RO/V	**GPE0 Status (GPE0_STS):** There are several status/enable bit pairs in GPE0_STS/EN_127_96 that are capable of triggering SMIs. This bit is a logical OR of all of those pairs (i.e. this bit is asserted whenever at least one of those pairs has both the status and enable bit asserted). This bit is NOT sticky. Writes to this bit will have no effect. Note: The setting of this bit does not cause the SMI#. The following bit pairs are included in this logical OR: - GPE0_STS/EN_127_96 [18, 17, 16, 13, 11, 10, 8, 2]
8	0h RO/V	**PM1 Status Register (PM1_STS_REG):** This is an OR of the bits (except for bits 5 and 4) in the ACPI PM1 Status Reg. (offset PMBASE+00h). Not sticky. Writes to this bit have no effect. Note: The setting of this bit does not cause the SMI#.
7	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW/1C/V	**Software SMI Timer Status (SWSMI_TMR_STS):** This bit will be set to 1 by the hardware when the Software SMI# Timer expires. This bit will remain 1 until the software writes a 1 to this bit.
5	0h RW/1C/V	**APM Status (APM_STS):** SMI# was generated by a write access to the APM control register and if the APMC_EN bit is set. This bit is cleared by writing a one to its bit position.
4	0h RW/1C/V	**SMI_ON_SLP_EN Status (SMI_ON_SLP_EN_STS):** This bit will be set by the Intel PCH when a write access attempts to set the SLP_EN bit. This bit is cleared by writing a 1 to this bit position
3	0h RO/V	**Legacy USB Status (LEGACY_USB_STS):** This non-sticky read-only bit is a logical OR of each of the SMI status bits in the USB Legacy Keybd Register ANDed with the corresponding enable bits. This bit will not be active if the enable bits are not set. Writes to this bit will have no effect.
2	0h RW/1C/V	**BIOS Status (BIOS_STS):** This bit gets set by hardware when a 1 is written by software to the GBL_RLS bit. When both BIOS_EN and the BIOS_STS bit are set, an SMI# will be generated. The BIOS_STS bit is cleared when software writes a 1 to this bit position.
1:0	0h RO	**Reserved**

4.3.7 General Purpose Event Control (GPE_CTRL) — Offset 40h

Lockable: No Usage: ACPI or Legacy Power Well: Primary Available: Desktop, Mobile

Type	Size	Offset	Default
MMIO	32 bit	BAR + 40h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17	0h RW/V	**Software GPE Control (SWGPE_CTRL):** This bit allows software to control the assertion of SWGPE_STS bit. This bit is used by hardware as the level input signal for the SWGPE_STS bit in the GPE0_STS register. When SWGPE_CTRL is 1, SWGPE_STS will be set to 1, and writes to SWGPE_STS with a value of 1 to clear SWGPE_STS will result in SWGPE_STS being set back to 1 by hardware. When SWGPE_CTRL is 0, writes to SWGPE_STS with a value of 1 will clear SWGPE_STS to 0.
16:0	0h RO	**Reserved**

4.3.8 Device Trap Status Register (DEVTRAP_STS) — Offset 44h

Lockable: No Usage: Legacy Only Power Well: Primary Available: Desktop, Mobile

Each bit indicates if an access has occurred to the corresponding device's trap range, or for bits 6:9 if the corresponding PCI interrupt is active. Write 1 to the same bit position to clear it. This register is used by APM power management software to see if there has been system activity. The periodic SMI# timer indicates if it is the right time to read the DEVTRAP_STS register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 44h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description

7	0h RW/1C/V	**D7 Trap Status (D7_TRP_STS):** PIRQ
6	0h RW/1C/V	**D6 Trap Status (D6_TRP_STS):** PIRQ[A or E] This bit will be set if PCI IRQ A or PCI IRQ E goes active (by the pin or internal signal).
5	0h RW/1C/V	**D5 Trap Status (D5_TRP_STS):** This will be set if any of the following are accessed (as determined by the I/O ranges in the LPC decoder (even if the LPC forwarding is not enabled): SP1, SP2, PP, FDC.
4:1	0h RO	**Reserved**
0	0h RW/1C/V	**D0 Trap Status (D0_TRP_STS):** The access/SMI was due to the SATA logic. There is no corresponding bit in the DEVTRAP_EN register because the enables are in the new SATA registers.

4.3.9 PM2a Control Block (PM2A_CNT_BLK) — Offset 50h

Lockable: No Usage: ACPI or Legacy Power Well: Primary Available: Desktop, Mobile

Note: BIOS must describe this register as 1 byte wide to the OS

Type	Size	Offset	Default
MMIO	32 bit	BAR + 50h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**ARB_DIS:** This bit is essentially just a scratchpad bit for legacy software compatibility.

4.3.10 Over-Clocking WDT Control (OC_WDT_CTL) — Offset 54h

This register controls the operation of the PCHs Over-Clocking Watchdog Timer.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 54h	00002000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h WO	**Over-Clocking WDT Reload (OC_WDT_RLD):** Software can write a '1' to this bit to reload (ping) the PCH over-clocking watchdog timer while it is running. A write of '0' to this bit has no effect. A write of '1' to this bit while OC_WDT_EN=0, or with the clearing of OC_WDT_EN, does not start or reload the WDT (i.e. OC_WDT_EN takes precedence). The value in OC_WDT_TOV may be changed by software along with its setting of this bit. On a WDT reload, the current (potentially new) value in OC_WDT_TOV is loaded into the WDT as the new timeout value.
30:26	0h RO	**Reserved**
25	0h RW/1C/V	**Over-Clocking WDT ICC Survivability Mode Timeout Status (OC_WDT_ICCSURV_STS):** This bit is set to '1' if the over-clocking WDT has timed out and triggered a global reset while running in a mode that has ICC survivability impact (OC_WDT_ICCSURV=1). It is cleared by a software write of '1' or by the RSMRST# pin.
24	0h RW/1C/V	**Over-Clocking WDT Non-ICC Survivability Mode Timeout Status (OC_WDT_NO_ICCSURV_STS):** This bit is set to '1' if the over-clocking WDT has timed out and triggered a global reset while running in a mode that does not have ICC survivability impact (OC_WDT_ICCSURV=0). It is cleared by a software write of '1' or by the RSMRST# pin.

Bit Range	Default & Access	Field Name (ID): Description
23:16	00h RW	**Over-Clocking WDT Scratchpad (OC_WDT_SCRATCH):** This field is available as scratchpad space for software and has no effect on PCH HW operation.
15	0h RW/L	**Over-Clocking WDT Force All (OC_WDT_FORCE_ALL):** GATE_BIT:OC_WDT_CTL.OC_WDT_CTL_LCK.HIGH When this bit is set to 1 and the OC_WDT is running, any included global reset source will behave as though the OC_WDT expired. **Locked by:** OC_WDT_CTL.OC_WDT_CTL_LCK
14	0h RW/V/L	**Over-Clocking WDT Enable (OC_WDT_EN):** Software sets this bit to '1' to enable the PCH over-clocking watchdog timer. While the counter is running, if it expires before being reloaded by software via the OC_WDT_RLD bit or halted by software clearing this bit, then one of the status bits will be set (which one depends on the WDT operating mode at the time - see the OC_WDT_ICCSURV bit description), and a global reset will be triggered. This bit is also set by the hardware when conditions allow the OC_WDT to self-start at power cycle reboot (effectively changes the default of this bit as seen by software). **Locked by:** OC_WDT_CTL.OC_WDT_CTL_LCK
13	1h RW/L	**Over-Clocking WDT ICC Survivability Impact (OC_WDT_ICCSURV):** This bit determines whether OC_WDT expiration will have an impact on ICC (Integrated Clock Controller) bootstrap survivability. OC_WDT_ICCSURV=1 (default) An OC_WDT timeout while operating in this mode causes certain ICC hardware auto-recovery actions to take place. A timeout in this mode will set OC_WDT_ICCSURV_STS. OC_WDT_ICCSURV=0 Software should configure the OC_WDT to this mode if no ICC hardware auto-recovery actions are desired in the event of a timeout. A timeout in this mode will set OC_WDT_NO_ICCSURV_STS. **Locked by:** OC_WDT_CTL.OC_WDT_CTL_LCK
12	0h RW/L	**OC_WDT_CTL Register Lock (OC_WDT_CTL_LCK):** This bit controls write-ability to this register. Encodings: 0: All fields of register OC_WDT_CTL operate as normal and can be updated by software. Reads to the register operate as normal. 1: All RW/L fields of register OC_WDT_CTL, including this lock control bit, are locked. Writes to these register fields have no effect and the register fields retain their current states. Reads to the register operate as normal. Once this bit is set, it can only be cleared by CORE well power loss. **Locked by:** OC_WDT_CTL.OC_WDT_CTL_LCK
11:10	0h RO	**Reserved**
9:0	000h RW/V/L	**Over-Clocking WDT Timeout Value (OC_WDT_TOV):** Software programs the desired over-clocking WDT timeout value into this register. This timer is zero-based and has a granularity of 1 second. Example timeout values: 000h: 1 second 001h: 2 seconds ... 3FFh: ~17 minutes (1024 seconds) The value of OC_WDT_TOV may be changed by software along with its setting of the OC_WDT_RLD bit. On a WDT reload, the current (potentially new) value in OC_WDT_TOV is loaded into the WDT as the new timeout value. This field is also updated by the hardware when conditions allow the OC_WDT to self-start at power cycle reboot (effectively changes the default of this field as seen by software). **Locked by:** OC_WDT_CTL.OC_WDT_CTL_LCK

4.3.11 General Purpose Event 0 Status [31:0] (GPE0_STS_31_0) — Offset 60h

GPE0_STS bits 31:0 are claimed by the PMC on IOSF primary and forwarded to the GPIO unit via IOSF sideband.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 60h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/1C/V	**General Purpose Event 0 Status [31:0] (GPE0_STS_31_0)**

4.3.12 General Purpose Event 0 Status [63:32] (GPE0_STS_63_32) — Offset 64h

GPE0_STS bits 63:32 are claimed by the PMC on IOSF primary and forwarded to the GPIO unit via IOSF sideband.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 64h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/1C/V	**General Purpose Event 0 Status [63:32] (GPE0_STS_63_32)**

4.3.13 General Purpose Event 0 Status [95:64] (GPE0_STS_95_64) — Offset 68h

GPE0_STS bits 95:64 are claimed by the PMC on IOSF primary and forwarded to the GPIO unit via IOSF sideband.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 68h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/1C/V	**General Purpose Event 0 Status [95:64] (GPE0_STS_95_64)**

4.3.14 General Purpose Event 0 Status [127:96] (GPE0_STS_127_96) — Offset 6Ch

Note: This register is symmetrical to the General Purpose Event 0 Enable [127:96] Register. Unless indicated otherwise below, if the corresponding _EN bit is set, then when the STS bit get set, the Intel PCH will generate a Wake Event. Once back in an S0 state (or if already in an S0 state when the event occurs), the Intel PCH will also generate an SCI if the SCIEN bit is set, or an SMI# if the SCIEN bit is not set and GBL_SMI_EN is set.

Note that GPE0_STS bits 95:0 are claimed by the GPIO register block.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19	0h RO	**Reserved**
18	0h RW/1C/V	**Wake Alarm Device Timer Status (WADT_STS):** This bit is set whenever the any of the wake alarm device timers signal a timer expiration.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW/1C/V	**USB Connection in/after DeepSx Status (USB_CON_DSX_STS):** This bit is set when a connection event occurs on any unmasked USB port while in DeepSx or while in Sx immediately after DeepSx. Note: This bit will be set regardless of the value of the DSX_CFG.USB_CON_DSX_MODE bit. Note: Because this status bit is only set during DeepSx exit or while in Sx after DeepSx, SMI/SCI generation will only occur immediately as the platform enters S0. The event cannot occur and the bit cannot be set after the platform reaches S0. Hence, the event cannot generate an SMI/SCI after the platform reach S0.
16	0h RW/1C/V	**GPIO[27] Status (LANWAKE_STS):** This bit is set whenever GPIO[27] is seen asserted low. Note that unlike the GPI[n]_STS bits, GPIO[27] is always monitored as an input for the purpose of setting this bit, regardless of the actual GPIO configuration.
15	0h RW/1C/V	**GPIO Tier2 SCI Status (GPIO_TIER2_SCI_STS):** This bit is a logical OR of sci_wake from tier 2 GPIO's. reset_type=host_deep_rst_b
14	0h RW/1C/V	**eSPI SCI Status (ESPI_SCI_STS):** This bit will be set when an agent attached to eSPI is requesting an SCI. Note: This source is not able to cause a wake event.
13	0h RW/1C/V	**Power Management Event Bus 0 Status (PME_B0_STS):** This bit will be set to 1 by the Intel PCH when any internal device with PCI Power Management capabilities on bus 0 asserts the equivalent of the PME# signal. Additionally, if the PME_B0_EN and SCI_EN bits are set, and the system is in an S0 state, then the setting of the PME_B0_STS bit will generate an SCI (or SMI# if SCI_EN is not set). If the PME_B0_EN bit is set, and the system is in an S1-S4 state (or S5 state due to SLP_TYP and SLP_EN), then the setting of the PME_B0_STS bit will generate a wake event. If the system is in an S5 state due to power button override, then the PME_B0_STS bit will not cause a wake event or SCI. This bit is cleared by a software write of '1'. Internal devices which can set this bit: - Integrated LAN - HD Audio/Audio DSP - SATA - EHCI ('USB2') - XHCI ('USB3') - ME Maskable Host Wake
12	0h RW/1C/V	**ME SCI Status (ME_SCI_STS):** This bit will be set when ME is requesting an SCI. Software must clear the ME source of the SCI before clearing this bit. Note: This source is not able to cause a wake event.
11	0h RW/1C/V	**Power Management Event Status (PME_STS):** This bit will be set to 1 by hardware when the PME# signal goes active. Additionally, if the PME_EN and SCI_EN bits are set, and system is in an S0 state, then the setting of the PME_STS bit will generate an SCI (or SMI# if SCI_EN is not set). If the PME_EN bit is set, and the system is in an S1-S4 state (or S5 state due to SLP_TYP and SLP_EN), then the setting of the PME_STS bit will generate a wake event. If the system is in an S5 state due to power button override, then PME_STS will not cause a wake event or SCI. This bit is cleared by writing a 1 to this bit position.
10	0h RW/1C/V	**Battery Low Status (BATLOW_STS):** In Mobile Mode this bit will be set to 1 by hardware when the BATLOW# signal goes low. Software clears the bit by writing a 1 to the bit position. In Desktop Mode, this bit will be treated as Reserved.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW/1C/V	**PCI Express Status (PCI_EXP_STS):** This bit will be set to 1 by hardware to indicate that: The PME event message was received on one or more of the PCI-Express Ports An Assert PMEGPE message received from the MCH via DMI Note: The PCI WAKE# pin and the PCI-Express Beacons have no impact on this bit. Software attempts to clear this bit by writing a 1 to this bit position. If the PCI_EXP_STS bit went active due to an Assert PMEGPE message, then a Deassert PMEGPE message must be received prior to the software write in order for the bit to be cleared. If the bit is not cleared and the corresponding PCI_EXP_EN bit is set, the leveltriggered SCI will remain active. Note that a race condition exists where the PCI Express device sends another PME message because the PCI Express device was not serviced within the time when it must resend the message. This may result in a spurious interrupt, and this is comprehended and approved by the PCI Express specification. The window for this race condition is approximately 95-105 milliseconds.
8	0h RW/1C/V	**OSE Status (OSE_STS):** This bit will be set to1 by hardware when the OSE# input signal goes active. This bit can be reset by writing a 1 to this bit position.
7	0h RW/1C/V	**SMBus Wake Status (SMB_WAK_STS):** This bit is set to 1 by the hardware to indicate that the wake event was caused by the PCH's SMBus logic. This could be due to either the SM Bus slave unit receiving a message or the SMBALERT# signal going active. NOTES: 1. The SMBus controller will independently cause an SMI# so this bit does not need to do so (unlike the other bits in this register). 2. This bit is set by the SMBus slave command 01h (Wake/SMI#) even when the system is in the S0 state. Therefore, to avoid an instant wake on subsequent transitions to sleep states, software must clear this bit after each reception of the Wake/SMI# command or just prior to entering the sleep state. 3. The SMBALERT_STS bit (SMBus I/O Offset 00h:bit 5) should be cleared by software before clearing this bit.
6	0h RW/1C/V	**TCOSCI Status (TCOSCI_STS):** This bit will be set to 1 by hardware when the TCO logic or Thermal Sensor logic causes an SCI. This bit can be reset by writing a one to this bit position.
5	0h RO	**Reserved**
4	0h RW/1C/V	**Thermal SCI Status (THERM_SCI_STS):** This bit will be set to 1 by hardware when the firmware sets the DRV_THERM_SMI_SCI_STS.DRV_SCI_STS. This bit can be cleared by writing a one to this bit position.
3	0h RW/1C/V	**eSPI Unconditional Wake Status (ESPIUWAK_STS):** This bit is set to 1 by hardware upon reception of an unconditional wake message from eSPI
2	0h RW/1C/V	**Software GPE Status (SWGPE_STS):** The SWGPE_CTRL bit (bit 1 of GPE_CTRL reg) acts as a level input to this bit.
1	0h RW/1C/V	**Hot Plug Status (HOT_PLUG_STS):** This bit is set to 1 by hardware when a PCI-Express hotplug event occurs. This will cause an SCI if the HOT_PLUG_EN and SCI_EN bits are set. This bit is cleared by writing a 1 to this bit position. The following events cause this bit to set Assert_GPE message received from any of the PCI_E ports in PCH Assert_HPGPE message received from any of the PCI_E ports in PCH Assert_GPE message received downstream from MCH Assert_HPGPE message received downstream from MCH
0	0h RW/1C/V	**FIA dFlex SCI Status (FIA_DFLEX_STS):** This bit will be set when requests an SCI as part of the dFlex flow.

4.3.15 General Purpose Event 0 Enable [31:0] (GPE0_EN_31_0) — Offset 70h

GPE0_EN bits 31:0 are claimed by the PMC on IOSF primary and forwarded to the GPIO unit via IOSF sideband.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 70h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Event 0 Enable [31:0] (GPE0_EN_31_0)**

4.3.16 General Purpose Event 0 Enable [63:32] (GPE0_EN_63_32) — Offset 74h

GPE0_EN bits 63:32 are claimed by the PMC on IOSF primary and forwarded to the GPIO unit via IOSF sideband.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 74h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Event 0 Enable [63:32] (GPE0_EN_63_32)**

4.3.17 General Purpose Event 0 Enable [95:64] (GPE0_EN_95_64) — Offset 78h

GPE0_EN bits 95:64 are claimed by the PMC on IOSF primary and forwarded to the GPIO unit via IOSF sideband.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 78h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Event 0 Enable [95:64] (GPE0_EN_95_64)**

4.3.18 General Purpose Event 0 Enable [127:96] (GPE0_EN_127_96) — Offset 7Ch

Note: This register is symmetrical to the General Purpose Event 0 Status [127:96] Register.

Note that GPE0_STS bits 95:0 are claimed by the GPIO register block.reset_type=host_deep_rst_b

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19	0h RO	**Reserved**
18	0h RW	**Wake Alarm Device Timer Enable (WADT_EN):** Used to enable the setting of the WADT_STS bit to generate wake/SMI#/SCI.
17	0h RW	**USB Connection in/after DeepSx Enable (USB_CON_DSX_EN):** Used to enable the setting of the USB_CON_DSX_STS bit to generate wake/SMI#/SCI.
16	0h RW	**GPIO[27] Enable (LANWAKE_EN):** Used to enable the setting of the LANWAKE_STS bit to generate wake/SMI#/SCI. Host wake events from the PHY through LANWAKE cannot be disabled by clearing this bit. Note that GPIO[27] is a valid host wake event from Deep-Sx. But the wake enable configuration must persist even after a G3. So this bit is in the RTC well.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/V	**GPIO Tier2 SCI EN (GPIO_TIER2_SCI_EN):** Used to enable the setting of GPIO_TIER2_SCI_STS to generate wake/SCI# reset_type=host_deep_rst_b
14	0h RW/V	**eSPI SCI Enable (ESPI_SCI_EN):** Used to enable the setting of the ESPI_SCI_STS bit to generate a SCI.
13	0h RW/V	**PME_B0 Enable (PME_B0_EN):** Enables the setting of the PME_B0_STS bit to generate a wake event and/or an SCI or SMI#.
12	0h RW/V	**ME SCI Enable (ME_SCI_EN):** Used to enable the setting of the ME_SCI_STS bit to generate a SCI.
11	0h RW/V	**Power Management Event Enable (PME_EN):** Enables the setting of the PME_STS to generate a wake event and/or an SCI.
10	0h RW/V	**Low Battery Enable (BATLOW_EN):** In Mobile Mode, this bit enables the BATLOW# signal to cause an SMI# or SCI (depending on the SCI_EN bit) when it goes low.This bit does not prevent the BATLOW# signal from inhibiting the wake event. In Desktop Mode this bit will be treated as Reserved.
9	0h RW/V	**PCI Express Enable (PCI_EXP_EN):** Enables PCH to cause an SCI when PCI_EXP_STS bit is set. This is used to allow the PCI Express ports, including the link to the MCH, to cause an SCI due to wake/PME events.
8	0h RW/V	**OSE Enable (OSE_EN):** When OSE_EN and OSE_STS are both set, a Wake event will occur. If OSE_EN is not set, then when OSE_STS is set, no Wake event will occur.
7	0h RO	**Reserved**
6	0h RW/V	**TCOSCI Enable (TCOSCI_EN):** When TCOSCI_EN and TCOSCI_STS are both set, an SCI will be generated.
5	0h RO	**Reserved**
4	0h RW	**Thermal SCI Enable (THERM_EN):** When THERM_EN and THERM_SCI_STS are both set, an SCI will be generated.
3	0h RO	**Reserved**
2	0h RW/V	**Software GPE Enable (SWGPE_EN):** This bit, when set to 1, enables the SW GPE function. If SWGPE_CTRL is written to a 1, hardware will set SWGPE_STS (acts as a level input) If SWGPE_STS, SWGPE_EN, and SCI_EN are all 1's, an SCI will be generated If SWGPE_STS = 1, SWGPE_EN = 1, SCI_EN = 0, and GBL_SMI_EN = 1 then an SMI# will be generated
1	0h RW/V	**Hot Plug Enable (HOT_PLUG_EN):** Enables PCH to cause an SCI when the HOT_PLUG_STS bit is set. This is used to allow the PCI Express ports to cause an SCI due to hot-plug events. (The following events cause HOT_PLUG_STS bit to set Assert_GPE message received from any of the PCI_E ports in PCH Assert_HPGPE message received from any of the PCI_E ports in PCH Assert_GPE message received downstream from MCH Assert_HPGPE message received downstream from MCH)
0	0h RW	**FIA dFlex SCI Enable (FIA_DFLEX_EN):** Used to enable the setting of the FIA_DFLEX_STS bit to generate an SCI.

5 Converged Audio, Voice, Speech (cAVS) Controller

5.1 cAVS Configuration Registers Summary

This chapter documents the registers in Bus: 0, Device 31, Function 3.

DID Values:

cAVS Controller - D27: F0 - 4B5xh

4B55h, 4B56h, 4B57h, 4B58h, 4B59h, 4B5Ah, 4B5Bh, 4B5Ch.

Table 5-1. Summary of Bus: 0, Device: 31, Function: 3 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	2	Vendor Identification (VID)	8086h
2h	2	Device ID (DID)	4B5xh

14Ch	4	Link 1 Upper Address (L1UADD)	00000000h

5.1.1 Vendor Identification (VID) - Offset 0h

This register identifies the manufacturer of the device. Valid vendor identifiers are allocated by the PCI SIG to ensure uniqueness. FFFFh is an invalid value for Vendor ID.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:31, F:3] + 0h	8086h

Bit Range	Default & Access	Field Name (ID): Description
15:0	8086h RO	**Vendor ID (VID):** Indicates that Intel is the vendor.

5.1.2 Device ID (DID) - Offset 2h

This register is not affected by D3HOT to D0 reset or FLR.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:31, F:3] + 2h	8C20h

Bit Range	Default & Access	Field Name (ID): Description
15:0	4B5xh RO/V	**Device ID (DID):** Indicates the device number assigned by the SIG. Bits(2:0) of the DID is controlled by fuse. IOSF Sideband Set ID Value message initializes bits 15:7 of this register value, while bits 6:0 of this register value are hard-coded. See the Global Device ID table in Intel Atom® x6000E Series, and Intel® Pentium® and Celeron® N and J Series Processors for Internet of Things (IoT) Applications Volume 1.

5.1.3 CMD - Offset 4h

This Register Provides Coarse Control Over A Device's Ability To Generate And Respond To PCI Cycles.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:31, F:3] + 4h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	**Reserved**
10	0h RW	**Interrupt Disable (ID):** Enables the device to assert an INTx#. When set, the Intel® HD Audio controller's INTx# signal will be de-asserted. When cleared, the INTx# signal may be asserted. Note that this bit does not affect the generation of MSI's.
9	0h RO	**Fast Back to Back Enable (FBE):** Not implemented. Hardwired to 0.
8	0h RW	**SERR Enable (SEN):** Functionality not implemented. This bit is R/W to pass PCIe compliance testing.
7	0h RO	**Wait Cycle Control (WCC):** Not implemented. Hardwired to 0.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**Parity Error Response (PER):** Functionality not implemented. This bit is R/W to pass PCIe compliance testing.
5	0h RO	**VGA Palette Snoop (VPS):** Not implemented. Hardwired to 0.
4	0h RO	**Memory Write and Invalidate Enable (MWI):** Not implemented. Hardwired to 0.
3	0h RO	**Special Cycle Enable (SCE):** Not implemented. Hardwired to 0.
2	0h RW	**Bus Master Enable (BME):** 1 = Enable, 0 = Disable. Controls standard PCI Express bus mastering capabilities for Memory and IO, reads and writes. Note that this also controls MSI generation since MSI is essentially Memory writes.
1	0h RW	**Memory Space Enable (MSE):** When set, enables memory space accesses to the Intel HD Audio controller.
0	0h RO	**I/O Space (IOS):** The Intel HD Audio controller does not implement IO Space, therefore this bit is hardwired to 0.

5.1.4 STS - Offset 6h

This register is used to record status information for PCI bus related events.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:31, F:3] + 6h	0010h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Detected Parity Error (DPE):** Not implemented. Hardwired to 0.
14	0h RO	**SERR# Status (SERRS):** Not implemented. Hardwired to 0.
13	0h RW/1C/V	**Received Master Abort (RMA):** If the completion status received from IOSF is UR, this bit is set. SW writes a 1 to this bit to clear it.
12	0h RW/1C/V	**Received Target Abort (RTA):** If the completion status received from IOSF is CA, this bit is set. SW writes a 1 to this bit to clear it.
11	0h RO	**Signaled Target-Abort (STA):** Not implemented. Hardwired to 0.
10:9	0h RO	**DEVSEL# Timing Status (DEVT):** Does not apply. Hardwired to 0.
8	0h RO	**Master Data Parity Error (MDPE):** Not implemented. Hardwired to 0.
7	0h RO	**Fast Back to Back Capable (FBC):** Does not apply. Hardwired to 0.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RO	**Reserved**
5	0h RO	**66 MHz Capable (C66):** Does not apply. Hardwired to 0.
4	1h RO	**Capabilities List Exists (CLIST):** Indicates that the controller contains a capabilities pointer list. The first item is pointed to by looking at configuration offset 34h.
3	0h RO/V	**Interrupt Status (IS):** Reflects the state of the INTx# signal at the input of the enable/disable circuit. This bit is a 1 when the INTx# is asserted. This bit is a 0 after the interrupt is cleared (independent of the state of the Interrupt Disable bit in the command register). Note that this bit is not set by an MSI.
2:0	0h RO	**Reserved**

5.1.5 Revision Identification (RID) - Offset 8h

This register is not affected by D3HOT to D0 reset or FLR

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:31, F:3] + 8h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RO/V	**Revision ID (RID):** Indicates the device specific revision identifier. IOSF Sideband Set ID Value message initializes this register value

5.1.6 Programming Interface (PI) - Offset 9h

This register is not affected by D3HOT to D0 reset or FLR

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:31, F:3] + 9h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW/L	**Programming Interface (PI):** Value assigned to the Intel HD Audio subsystem. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD

5.1.7 Sub Class Code (SCC) - Offset Ah

This register is not affected by D3HOT to D0 reset or FLR

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:31, F:3] + Ah	03h

Bit Range	Default & Access	Field Name (ID): Description
7:0	03h RW/L	**Sub Class Code (SCC):** This indicates the device is an Intel HD Audio audio device, in the context of a multimedia device. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD

5.1.8 Base Class Code (BCC) - Offset Bh

This register is not affected by D3HOT to D0 reset or FLR

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:31, F:3] + Bh	04h

Bit Range	Default & Access	Field Name (ID): Description
7:0	04h RW/L	**Base Class Code (BCC):** This register indicates that the function implements a multimedia device. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD

5.1.9 Cache Line Size (CLS) - Offset Ch

This register specifies the system cache line size in units of DWORDs.

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:31, F:3] + Ch	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW	**Cache Line Size (CLS):** Doesn't apply to PCI Express. PCI Express spec requires this to be implemented as a R/W register but has no functional impact on the PCH.

5.1.10 Latency Timer (LT) - Offset Dh

This register specifies, in units of PCI bus clocks, the value of the Latency Timer for this PCI bus master.

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:31, F:3] + Dh	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW/L	**Latency Timer (LT):** Doesn't apply to PCI Express. RO as 00h if PCI Express. If configured to appear as PCI device, maintain RW for Legacy PCI SW compliance. Locked when FNCFG.HDASPCID = 0 **Locked by:** SBPR.FNCFG.HDASPCID

5.1.11 Header Type (HTYPE) - Offset Eh

This register identifies the layout of the second part of the predefined header and also whether or not the device contains multiple functions.

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:31, F:3] + Eh	00h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW/L	**Multi Function Device (MFD):** Value of 0 indicates a single function device. Value of 1 indicates a multi-function device. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
6:0	00h RO	**Header Type (HTYPE):** Implements Type 0 Configuration header.

5.1.12 Built-in Self Test (BIST) - Offset Fh

This optional register is used for control and status of BIST.

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:31, F:3] + Fh	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RO	**Built-in Self Test (BIST):** Not implemented in the Intel HD Audio subsystem. Hardwired to 00h.

5.1.13 Intel HD Audio Base Lower Address (HDALBA) - Offset 10h

This BAR creates a selected size of memory space to signify the base address of the Intel HD Audio memory mapped configuration registers depending on implementation.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:3] + 10h	00000004h

Bit Range	Default & Access	Field Name (ID): Description
31:14	00000h RW	**Lower Base Address (LBA):** Base address for the Intel HD Audio subsystem s memory mapped configuration registers. 16 Kbytes are requested by hardwiring bits 13:4 to 0 s.
13:4	0h RO	**Reserved**
3	0h RO	**PREF:** Indicates that this BAR is NOT pre-fetchable.
2:1	2h RO	**Address Range (ADDRNG):** Indicates that this BAR can be located anywhere in 64-bit address space.
0	0h RO	**Space Type (SPTYP):** Indicates that this BAR is located in memory space.

5.1.14 Intel HD Audio Base Upper Address (HDAUBA) - Offset 14h

This BAR creates a selected size of memory space to signify the base address (upper 32 bits) of the Intel HD Audio memory mapped configuration registers, depending on implementation.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:3] + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Intel HD Audio Upper Base Address (UBA):** Upper 32 bits of the Base address for the Intel(r) HD Audio controller's memory mapped configuration registers.

5.1.15 Shadowed PCI Configuration Lower Base Address (SPCLBA) - Offset 18h

This BAR creates 4 Kbytes of memory space to signify the base address (lower 32 bits) of the shadowed PCI configuration when used as an ACPI device.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:3] + 18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW/L	**Lower Base Address (LBA):** Base address for the PCI Configuration registers shadowed to memory mapped. 4 KB is requested by hardwiring bits 11:4 to 0 s. Locked when PCICFGCTL0.SPCBAD = 1. **Locked by:** SBPR.PCICFGCTL.SPCBAD
11:4	0h RO	**Reserved**
3	0h RO	**PREF:** Indicates that this BAR is NOT pre-fetchable.
2:1	0h RO/V	**Address Range (ADDRNG):** Indicates that this BAR can be located anywhere in 64-bit address space.
0	0h RO	**Space Type (SPTYP):** Indicates that this BAR is located in memory space.

5.1.16 Shadowed PCI Configuration Upper Base Address (SPCUBA) - Offset 1Ch

This BAR creates 4 Kbytes of memory space to signify the base address (upper 32 bits) of the shadowed PCI configuration when used as an ACPI device.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:3] + 1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/L	**Upper Base Address (UBA):** Upper 32 bits of the Base address for the PCI Configuration register shadowed to memory mapped. Locked when PCICFGCTL0.SPCBAD = 1. **Locked by:** SBPR.PCICFGCTL.SPCBAD

5.1.17 Audio DSP Lower Base Address (ADSPLBA) - Offset 20h

This BAR creates a selected size of memory space to signify the base address of the Audio DSP memory mapped configuration registers depending on implementation.

The number of LBA bits in this register is depending on the size of the memory window implemented, represented as x in the register table. The x value is determined by the parameter HDMBABC.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:3] + 20h	00000004h

Bit Range	Default & Access	Field Name (ID): Description
31:20	000h RW	**Lower Base Address (LBA):** Base address for the Audio DSP memory mapped configuration registers.
19:4	0h RO	**Reserved**
3	0h RO	**PREF:** Indicates that this BAR is NOT pre-fetchable.
2:1	2h RO	**Address Range (ADDRNG):** Indicates that this BAR can be located anywhere in 64-bit address space.
0	0h RO	**Space Type (SPTYP):** Indicates that this BAR is located in memory space.

5.1.18 Audio DSP Upper Base Address (ADSPUBA) - Offset 24h

This BAR creates a selected size of memory space to signify the base address (upper 32 bits) of the Audio DSP memory-mapped configuration registers, depending on implementation.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:3] + 24h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Upper Base Address (UBA):** Upper 32 bits of the Base address for the Audio DSP memory mapped configuration registers.

5.1.19 Subsystem Vendor ID (SVID) - Offset 2Ch

This register should be implemented for any function that could be instantiated more than once in a given system, for example, a system with 2 audio subsystems, one down on the motherboard and the other plugged into a PCI expansion slot, should have the SVID register implemented. The SVID register, in combination with the Subsystem ID register, enables the operating environment to distinguish one audio subsystem from the other(s).

Software (BIOS) will write the value to this register. After that, the value can be read, but writes to the register will have no effect. The write to this register should be combined with the write to the SID to create one 32-bit write. This register is not affected by D3HOT to D0 reset or FLR

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:31, F:3] + 2Ch	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW/L	**SVID:** These RW bits have no functionality. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD

5.1.20 Subsystem ID (SID) - Offset 2Eh

This register should be implemented for any function that could be instantiated more than once in a given system, for example, a system with 2 audio subsystems, one down on the motherboard and the other plugged into a PCI expansion slot. The SID register, in combination with the Subsystem Vendor ID register make it possible for the operating environment to distinguish one audio subsystem from the other(s).

Software (BIOS) will write the value to this register. After that, the value can be read, but writes to the register will have no effect. The write to this register should be combined with the write to the SVID to create one 32-bit write. This register is not affected by D3HOT to D0 reset or FLR.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:31, F:3] + 2Eh	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW/L	**SID:** These RW bits have no functionality. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD

5.1.21 Capability Pointer (CAPPTR) - Offset 34h

This optional register is used to point to a linked list of new capabilities implemented by this device.

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:31, F:3] + 34h	50h

Bit Range	Default & Access	Field Name (ID): Description
7:0	50h RO	**Capability Pointer (CAPPTR):** Indicates that the first capability pointer offset is offset 50h (Power Management Capability).

5.1.22 Interrupt Line (INTLN) - Offset 3Ch

This register is not affected by FLR. ***Implementation Notes:*** Due to legacy implementation of the INTLN field being implemented as reset by D3HOT to D0 Reset but not FLR and already work well with existing SW (despite FLR section in PCIe

Specification does not have this register in the preservation list), this legacy implementation remains no change and documented here as reset by D3ONLY, which is a deviation from D3RST definition by excluding FLR.

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:31, F:3] + 3Ch	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW	**Interrupt Line (INTLN):** Hardware does not use this field directly. It is used to communicate to software the interrupt line that the interrupt pin is connected to.

5.1.23 Interrupt Pin (INTPN) - Offset 3Dh

This register is not affected by D3HOT to D0 reset or FLR.

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:31, F:3] + 3Dh	01h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0h RO	**Reserved**
3:0	1h RW/L	**Interrupt Pin (INTPN):** Identifies the interrupt pin the function uses. 0h: No interrupt pin 1h: INTA 2h: INTB 3h: INTC 4h: INTD 5h Fh: reserved Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD

5.1.24 PCI Power Management Capability ID (PID) - Offset 50h

This register declares the power management capability structure.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:31, F:3] + 50h	6001h

Bit Range	Default & Access	Field Name (ID): Description
15:8	60h RW/L	**Next Capability (NEXT):** Points to the next capability structure (MSI). Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
7:0	01h RO	**Cap ID (CAP):** Indicates that this pointer is a PCI power management capability

5.1.25 Power Management Capabilities (PC) - Offset 52h

This register provides information on the capabilities of the function related to power management.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:31, F:3] + 52h	C043h

Bit Range	Default & Access	Field Name (ID): Description
15:11	18h RW/L	**PMES:** Indicates PME# can be generated from D3 and D0 states. Programmable by BIOS for the option to declare SUS well wake is supported or not: 19h (SUS well wake supported) or 09h (SUS well wake not supported). Locked when FNCFG.BCLD = 1 **Locked by:** SBPR.FNCFG.BCLD
10	0h RO	**D2S:** The D2 state is not supported.
9	0h RO	**D1S:** The D1 state is not supported.
8:6	1h RW/L	**AC:** Reports 55 mA maximum Suspend well current required when in the D3cold state. Programmable by BIOS for the option to declare SUS well wake is supported or not: 001b (SUS well wake supported) or 000b (SUS well wake not supported). Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
5	0h RO	**Device Specific Initialization (DSI):** Indicates that no device-specific initialization is required.
4	0h RO	**Reserved**
3	0h RO	**PME Clock (PMEC):** Does not apply. Hardwired to 0.
2:0	3h RW/L	**VS:** Indicates support for Revision 1.2 of the PCI Power Management Specification. Programmable by BIOS to older revision if compatibility issue is found. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD

5.1.26 Power Management Control And Status (PCS) - Offset 54h

PMES and PMEE bits reside in Resume well, and reset by resume reset.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:3] + 54h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**DT:** Does not apply. Hardwired to 0's.
23	0h RO	**Bus Power/Clock Control Enable (BPCCE):** Does not apply. Hardwired to0.
22	0h RO	**B2/B3 Support (B23):** Does not apply. Hardwired to 0.
21:16	0h RO	**Reserved**
15	0h RW/1C/V	**PME Status (PMES):** This bit is set when the Intel HD Audio controller would normally assert the PME# signal independent of the state of the PME bit. This bit is cleared on a power-on reset. Software must not make assumptions about the reset state of this bit and must set it appropriately.
14:9	0h RO	**Reserved**
8	0h RW	**PME Enable (PMEE):** When set, and if corresponding PMES is also set, the Intel HD Audio subsystem send PME to PMC. This bit is cleared on a power-on reset. Software must not make assumptions about the reset state of this bit and must set it appropriately.
7:4	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
3	1h RW/L	**No Soft Reset (NSR):** When set (1), this bit indicates that devices transitioning from D3hot to D0 because of Power State commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the Power State bits. When clear (0), devices do perform an internal reset upon transitioning from D3hot to D0 via software control of the Power State bits. Configuration Context is lost when performing the soft reset. Upon transition from the D3hot to the D0 state, full reinitialization sequence is needed to return the device to D0 Initialized. Regardless of this bit, devices that transition from D3hot to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
2	0h RO	**Reserved**
1:0	0h RW	**Power State (PS):** This field is used both to determine the current power state of the Intel HD Audio subsystem and to set a new power state. The values are: 00 D0 state 11 D3HOT state If software attempts to write a value of 10b or 01b in to this field, the write operation must complete normally, however, the data is discarded and no state change occurs. When in the D3HOT states, the Intel HD Audio subsystem s configuration space is available, but the I/O and memory spaces are not. Additionally, interrupts are blocked. When software changes this value from the D3HOT state to the D0 state, an internal warm (soft) reset is generated, and software must re-initialize the function. **Locked by:** SBPR.FNCFG.BCLD

5.1.27 MSI Capability ID (MID) - Offset 60h

NEXT field is not affected by D3HOT to D0 reset or FLR

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:31, F:3] + 60h	7005h

Bit Range	Default & Access	Field Name (ID): Description
15:8	70h RO/V	**Next Capability (NEXT):** Points to the PCI Express* capability structure. The value of this field depends on the FNCFG.HDASPCID bit. When FNCFG.HDASPCID is 0 , this field has a value of 70h where it points to the PCI Express capability structure. When FNCFG.HDASPCID bit is 1, this field has a value of 00h to indicate that this is the last capability structure in the list.
7:0	05h RO	**Cap ID (CAP):** Indicates that this pointer is a MSI capability

5.1.28 MSI Message Control (MMC) - Offset 62h

This register provides system software control over MSI.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:31, F:3] + 62h	0080h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved**
7	1h RO	**64b Address Capability (ADD64):** Indicates the ability to generate a 64-bit message address
6:4	0h RO	**Multiple Message Enable (MME):** Normally this is a R/W register. However since only 1 message is supported, these bits are hardwired to 000 = 1 message.
3:1	0h RO	**Multiple Message Capable (MMC):** Hardwired to 0 indicating request for 1 message
0	0h RW	**MSI Enable (ME):** If set to 1 an MSI will be generated instead of an INTx# signal. If set to 0, an MSI may not be generated.

5.1.29 MSI Message Lower Address (MMLA) - Offset 64h

This register specifies the MSI message address (lower 32 bits).

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:3] + 64h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RW	**MSI Message Lower Address (MMLA):** Lower Address used for MSI Message.
1:0	0h RO	**Reserved**

5.1.30 MSI Message Upper Address (MMUA) - Offset 68h

This register specifies the MSI message address (upper 32 bits).

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:3] + 68h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSI Message Upper Address (MMUA):** Upper 32 bits of address used for MSI Message.

5.1.31 MSI Message Data (MMD) - Offset 6Ch

This register specifies the MSI message data.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:31, F:3] + 6Ch	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW	**MSI Message Data (MMD):** Data used for MSI Message.

5.1.32 PCI Express Capability ID (PXID) - Offset 70h

This register declares the PCI Express capability structure.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:31, F:3] + 70h	0010h

Bit Range	Default & Access	Field Name (ID): Description
15:8	00h RO	**Next Capability (NEXT):** Indicates that this is the last capability structure in the list.
7:0	10h RO	**Cap ID (CAP):** Indicates that this pointer is a PCI Express capability structure.

5.1.33 PCI Express Capabilities (PXC) - Offset 72h

This register identifies PCI Express device Function type and associated capabilities.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:31, F:3] + 72h	0091h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	**Reserved**
13:9	00h RO	**Interrupt Message Number (IMN):** Hardwired to 0.
8	0h RO	**Slot Implemented (SI):** Hardwired to 0.
7:4	9h RO	**Device/Port Type (DPT):** Indicates that this is a Root Complex Integrated Endpoint Device.
3:0	1h RO	**Capability Version (CV):** Indicates version #1 PCI Express capability

5.1.34 Device Capabilities (DEVCAP) - Offset 74h

This register is not affected by D3HOT to D0 reset or FLR.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:3] + 74h	10000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	1h RW/L	**Functional Level Reset (FLR):** A 1 indicates that the Intel HD Audio subsystem supports the Function Level Reset capability. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
27:26	0h RO	**Captured Slot Power Limit Scale (SPLS):** Hardwired to 0.
25:18	00h RO	**Captured Slot Power Limit Value (SPLV):** Hardwired to 0.
17:15	0h RO	**Reserved**
14	0h RO	**Power Indicator Present (PIP):** Hardwired to 0.
13	0h RO	**Attention Indicator Present (AIP):** Hardwired to 0.
12	0h RO	**Attention Button Present (ABP):** Hardwired to 0.

Bit Range	Default & Access	Field Name (ID): Description
11:9	0h RW/L	**Endpoint L1 Acceptable Latency (L1CAP):** This bit field is defined in the PCI Express spec as RO. At this time it is risky to assign a hardwired value to this bit field. Making it RW would cause a WHQL failure. By making it RW/L it will appear as RO to WHQL testing while allowing BIOS to write a value at boot that is determined by post silicon system testing. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
8:6	0h RW/L	**Endpoint L0s Acceptable Latency (L0SCAP):** This bit field is defined in the PCI Express spec as RO. At this time it is risky to assign a hardwired value to this bit field. Making it RW would cause a WHQL failure. By making it RW/L it will appear as RO to WHQL testing while allowing BIOS to write a value at boot that is determined by post silicon system testing. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
5	0h RO	**Extended Tag Field Support (ETCAP):** Indicates 5 bit tag supported.
4:3	0h RO	**Phantom Functions Supported (PFCAP):** Indicates phantom functions not supported.
2:0	0h RO	**Max Payload Size Supported (MPCAP):** Indicates 128B maximum payload size capability.

5.1.35 Device Control (DEVC) - Offset 78h

NSNPEN bit is not affected by D3HOT to D0 reset or FLR.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:31, F:3] + 78h	2800h

Bit Range	Default & Access	Field Name (ID): Description
15	0h WO	**Initiate FLR (IF):** Used to initiate FLR transition. A write of 1 initiates FLR transition. Since hardware must not respond to any cycles until FLR completion, the read value by software from this bit is 0.
14:12	2h RW	**Max Read Request Size (MRRS):** This field sets the maximum Read Request size for the Function as a Requester. The Function must not generate Read Requests with size exceeding the set value. Defined encodings for this field are: 000: 128 B 001: 256 B 010: 512 B 011: 1024 B 100: 2048 B 101: 4096 B 110 111: Reserved
11	1h RW	**Enable No Snoop (NSNPEN):** When set to 1 (or EM2.FNSNPEN = 1) the Intel HD Audio controller is permitted to set the No Snoop bit in the Requester Attributes of a bus master transaction. In this case VC0, VCp, or VC1 may be used for isochronous transfers. When set to 0 (and EM2.FNSNPEN = 0) the Intel HD Audio controller will not set the No Snoop bit. In the case isochronous transfers will not use VC1(VCi) even if it is enabled since VC1 is never snooped. Isochronous transfers will use either VCp or VC0. This bit is not affected by D3HOT to D0 reset or FLR.
10	0h RO	**Auxiliary (AUX) Power PM Enable (AUXPEN):** Hardwired to 0 indicating Intel HD Audio device does not draw AUX power.
9	0h RO	**Phantom Functions Enable (PFEN):** Hardwired to 0 disabling phantom functions.
8	0h RO	**Extended Tag Field Enable (ETEN):** Hardwired to 0 enabling 5-bit tag.
7:5	0h RO	**Max Payload Size (MAXPAY):** Hardwired to 000 indicating 128 B.
4	0h RO	**Enable Relaxed Ordering (ROEN):** Hardwired to 0 disabling relaxed ordering.
3	0h RW	**Unsupported Request Reporting Enable (URREN):** Functionality not implemented. This bit is R/W to pass PCIe compliance testing.
2	0h RW	**Fatal Error Reporting Enable (FEREN):** Functionality not implemented. This bit is R/W to pass PCIe compliance testing.
1	0h RW	**Non-Fatal Error Reporting Enable (NFEREN):** Functionality not implemented. This bit is R/W to pass PCIe compliance testing.
0	0h RW	**Correctable Error Reporting Enable (CEREN):** Functionality not implemented. This bit is R/W to pass PCIe compliance testing.

5.1.36 Device Status (DEVS) - Offset 7Ah

This register provides information about PCI Express device (Function) specific parameters.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:31, F:3] + 7Ah	0010h

Bit Range	Default & Access	Field Name (ID): Description
15:6	0h RO	**Reserved**
5	0h RO/V	**Transactions Pending (TXP):** A 1 indicates that the Intel HD Audio controller has issued Non-Posted requests which have not been completed. A 0 indicates that Completions for all Non-Posted Requests have been received.
4	1h RW/L	**AUX Power Detected (AUXDET):** Hardwired to 1 indicating the device is connected to Suspend power. Programmable by BIOS for the option to declare SUS well wake is supported or not: 1b (SUS well wake supported) or 0b (SUS well wake not supported). Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
3	0h RO	**Unsupported Request Detected (URDET):** Not implemented. Hardwired to 0.
2	0h RO	**Fatal Error Detected (FEDET):** Not implemented. Hardwired to 0.
1	0h RO	**Non-Fatal Error Detected (NFEDET):** Not implemented. Hardwired to 0.
0	0h RO	**Correctable Error Detected (CEDET):** Not implemented. Hardwired to 0.

5.1.37 Vendor Specific Capability Identifiers (VSCID) - Offset 80h

This register declares the vendor specific capability structure.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:3] + 80h	F0146009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**Vendor-Specific Capability ID (VSID):** A value of Fh in this 4-bit field identifies this Vendor Specific Capability as an Extended Capability, which uses a VSEC 16-bit Extended Capability ID in the subsequent four bytes. This field allows software to differentiate this capability from other Vendor Specific capabilities.
27:24	0h RO	**Vendor Specific Capability Revision (VSREV):** For a VSID of Fh, this field is reserved 0h.

Bit Range	Default & Access	Field Name (ID): Description
23:16	14h RO	**Vendor Specific Capability Length (VSLEN):** This field indicates the # of bytes of this Vendor Specific capability as required by the PCI spec inclusive of the CapID and Next Pointer.
15:8	60h RW/L	**Next Capability (NEXT):** Points to the next capability structure (MSI). Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
7:0	09h RO	**Cap ID (CAP):** Indicates that this pointer is a vendor specific capability.

5.1.38 Vendor Specific Extended Capability (VSECID) - Offset 84h

This register declares the vendor specific extended capability structure.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:3] + 84h	01400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	014h RO	**Vendor Specific Extended Capability Length (VSECLEN):** This field indicates the # of bytes of this Vendor Specific capability inclusive of the 1st DW which includes the capability ID and Next pointer. For DevIdle, this is 14h.
19:16	0h RO	**Vendor Specific Extended Capability Revision (VSEREV):** For this revision of DevIdle, this field is 0h.
15:0	0010h RO	**Vendor Specific Extended Capability ID (VSECID):** DevIdle has been assigned the Intel VSEC ID of 10h.

5.1.39 Device Idle Pointer (DEVIDLEPTR) - Offset 8Ch

This register specifies the location pointer to the DevIdle register in MMIO space.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:3] + 8Ch	000104A1h

Bit Range	Default & Access	Field Name (ID): Description
31:4	000104Ah RO	**DevIdle MMIO Offset Location (DEVIDLELOC):** This register contains the location pointer to the DevIdle register in MMIO space, as an offset from the specified BAR.
3:1	0h RO	**Base Address Register Number (BARNUM):** Contains the 0s based BAR Number of the BAR which contains the location of the DevIdle MMIO register.
0	1h RO	**VALID:** Set to 1 to indicate that the function has implemented a DevIdle register as specified in the DevIdle that can be located using the DEVIDLELOC register and BARNUM.

5.1.40 Device Idle Power On Latency (DEVIDLEPOL) - Offset 90h

This register specifies the device idle power on latency.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:31, F:3] + 90h	0800h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	**Reserved**
12:10	2h RW/L	**Power On Latency Scale (POLS):** Latency Scale multiplier: 010: 1 us 011: 32 us All other settings are reserved. The value of this register is multiplied with the Power On Latency Value (POLV) to provide the DevIdle power on exit latency multiplier scale from 1us to 32us. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
9:0	000h RW/L	**Power On Latency Value (POLV):** Contains the 0#s based BAR Number of the BAR which contains the location of the DevIdle MMIO register. **Locked by:** SBPR.FNCFG.BCLD

5.1.41 Manufacturing Process (MANID) - Offset F8h

This register reports the manufacturing and process details.

Implementation Notes: The actual implementation of the register needs on be on IOSF Sideband reset which de-asserts earlier than platform reset, so that it may receive the Set ID message over IOSF Sideband during initialization (before platform reset de-asserts).

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:3] + F8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/P	**Manufacturers ID Field (MANID)**: Manufacturer ID: Default value comes from straps.

5.1.42 Virtual Channel Enhanced Capability Header (VCCAP) - Offset 100h

This register is not affected by D3HOT to D0 reset or FLR.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:3] + 100h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	000h RW/L	**Next Capability Offset (NXTCAP):** Points to the next capability header, which is the Root Complex Link Declaration Enhanced Capability Header. This register is RW/L to support removing the Root Complex Topology Capability from the PCI Express Extended Capability List. For systems which support the Root Complex Topology Capability Structure, boot BIOS should write a 130h to this register, otherwise boot BIOS should write a 000h to this register. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
19:16	0h RW/L	**Capability Version (CV):** This register is RW/L to support removing the PCI Express Extended Capabilities from the Intel HD Audio subsystem. For systems which support the PCI Express Virtual Channel capability and the Root Complex Topology Capability Structure, boot BIOS should write a 1h to this register, otherwise boot BIOS should write a 0h to this register. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
15:0	0000h RW/L	**PCI Express Extended Capability ID (PCIEECID):** This register is RW/L to support removing the PCI Express Extended Capabilities from the Intel HD Audio subsystem. For systems which support the PCI Express Virtual Channel capability and the Root Complex Topology Capability Structure, boot BIOS should write a 0002h to this register, otherwise boot BIOS should write a 0000h to this register. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD

5.1.43 Port VC Capability Register 1 (PVCCAP1) - Offset 104h

This register describes the configuration of the Virtual Channels associated with a PCI Express Port.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:3] + 104h	00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11:10	0h RO	**Port Arbitration Table Entry Size (PARBTBLES):** This is an endpoint device therefore this field is hardwired to 0 s.
9:8	0h RO	**Reference Clock (RC):** This is an endpoint device therefore this field is hardwired to 0 s.
7	0h RO	**Reserved**
6:4	0h RO	**Low Priority Extended VC Count (LPVCCNT):** Indicates that only VC0 belongs to the low-priority VC group.
3	0h RO	**Reserved**
2:0	1h RO	**Extended VC Count (VCCNT):** Indicates that one extended VC (in addition to VC0) is supported by the Intel(r) HD Audio controller.

5.1.44 Port VC Capability Register 2 (PVCCAP2) - Offset 108h

This register provides further information about the configuration of the Virtual Channels associated with a PCI Express Port.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:3] + 108h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**VC Arbitration Table Offset (VCARBTBL):** Hardwired to 0 indicating that a VC Arbitration Table is not present.
23:8	0h RO	**Reserved**
7:0	00h RO	**VC Arbitration Capability (VCARBCAP):** Hardwired to 0 s. These bits are not applicable since the Intel HD Audio controller reports a 0 in the Low Priority Extended VC Count field.

5.1.45 Port VC Control Register (PVCCTL) - Offset 10Ch

This register provides control of the configuration of Virtual Channels associated with a Port.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:31, F:3] + 10Ch	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:4	0h RO	**Reserved**
3:1	0h RO	**VC Arbitration Select (VCARBSEL):** Hardwired to 0 s. Normally these bits are RW. But these bits are not applicable since the Intel HD Audio controller reports a 0 in the Low Priority Extended VC Count field.
0	0h RO	**Load VC Arbitration Table (LVCARBTBL):** Hardwired to 0 since an arbitration table is not present.

5.1.46 Port VC Status Register (PVCSTS) - Offset 10Eh

This register provides status of the configuration of Virtual Channels associated with a Port.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:31, F:3] + 10Eh	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:1	0h RO	**Reserved**
0	0h RO	**VC Arbitration Table Status (VCARBTBLSTS):** Hardwired to 0 since the VC Arbitration Table is not present.

5.1.47 VC0 Resource Capability Register (VC0CAP) - Offset 110h

This register describes the capabilities and configuration of VC0 Virtual Channel resource.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:3] + 110h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Port Arbitration Table Offset (PARBTBL):** Hardwired to 0 since this field is not valid for endpoint devices.
23	0h RO	**Reserved**
22:16	00h RO	**Maximum Time Slots (MTS):** Hardwired to 0 since this field is not valid for endpoint devices.
15	0h RO	**Reject Snoop Transactions (RST):** Hardwired to 0 since this field is not valid for endpoint devices.
14	0h RO	**Advanced Packet Switching (APS):** Hardwired to 0 since this field is not valid for endpoint devices.
13:8	0h RO	**Reserved**
7:0	00h RO	**Port Arbitration Capability (PARBCAP):** Hardwired to 0 since this field is not valid for endpoint devices.

5.1.48 VC0 Resource Control Register (VC0CTL) - Offset 114h

VC0MAP(7:1) field is not affected by FLR.

Implementation Notes: Due to legacy implementation of the VC0MAP field being implemented as reset by D3HOT to D0 Reset but not FLR and already work well with existing SW (and there is no clear definition in the PCI and PCIe Specification whether it should be reset by D3HOT to D0 Reset or not), this legacy implementation remains no change and documented here as reset by D3ONLY, which is a deviation from D3RST definition by excluding FLR.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:3] + 114h	800000FFh

Bit Range	Default & Access	Field Name (ID): Description
31	1h RO	**VC0 Enable (VC0EN):** Hardwired to 1 for VC0.
30:27	0h RO	**Reserved**
26:24	0h RO	**VC0 ID (VC0ID):** Hardwired to 0 since the first VC is always assigned as VC0.
23:20	0h RO	**Reserved**
19:17	0h RO	**Port Arbitration Select (PARBSEL):** Hardwired to 0 since this field is not valid for endpoint devices.
16	0h RO	**Load Port Arbitration Table (LPARBTBL):** Hardwired to 0 since this field is not valid for endpoint devices.

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved**
7:1	7Fh RW	**TC/VC0 Map (VC0MAP):** Bits (7:1) are implemented as R/W bits. This field is not used by the hardware, but it is RW to avoid confusing software.
0	1h RO	**TC/VC0 Map (VC0MAP_0):** Bit 0 is hardwired to 1 since TC0 is always mapped to VC0

5.1.49 VC0 Resource Status Register (VC0STS) - Offset 11Ah

This register provides status of the configuration of VC0 Virtual Channels.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:31, F:3] + 11Ah	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:2	0h RO	**Reserved**
1	0h RO	**VC0 Negotiation Pending (VCNP):** This bit does not apply to the integrated Intel HD Audio device and is therefore hardwired to 0.
0	0h RO	**Port Arbitration Table Status (PARBTBLSTS):** Hardwired to 0 since this field is not valid for endpoint devices.

5.1.50 VCI Resource Capability Register (VCICAP) - Offset 11Ch

This register describes the capabilities and configuration of VC1 Virtual Channel resource.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:3] + 11Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Port Arbitration Table Offset (PARBTBL):** Hardwired to 0 since this field is not valid for endpoint devices.
23	0h RO	**Reserved**
22:16	00h RO	**Maximum Time Slots (MTS):** Hardwired to 0 since this field is not valid for endpoint devices.
15	0h RO	**Reject Snoop Transactions (RST):** Hardwired to 0 since this field is not valid for endpoint devices.

Bit Range	Default & Access	Field Name (ID): Description
14	0h RO	**Advanced Packet Switching (APS):** Hardwired to 0 since this field is not valid for endpoint devices.
13:8	0h RO	**Reserved**
7:0	00h RO	**Port Arbitration Capability (PARBCAP):** Hardwired to 0 since this field is not valid for endpoint devices.

5.1.51 VCI Resource Control Register (VCICTL) - Offset 120h

VCIEN bit and VCIID field are not affected by D3HOT to D0 Reset or FLR. VCiM(7:1) field is not affected by FLR.

Implementation Notes: Due to legacy implementation of the VCiM field being implemented as reset by D3HOT to D0 Reset but not FLR and already work well with existing SW (and there is no clear definition in the PCI and PCIe. Specification whether it should be reset by D3HOT to D0 Reset or not), this legacy implementation remains no change and documented here as reset by D3ONLY, which is a deviation from D3RST definition by excluding FLR.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:3] + 120h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**VCi Enable (VCIEN):** When set to 1, VCi is enabled. This bit is not affected by D3HOT to D0 reset.
30:27	0h RO	**Reserved**
26:24	0h RW	**VCI ID (VCIID):** This field assigns a VC ID to the VCI resource. This field is not used by the PCH hardware, but it is RW to avoid confusing software. These bits are not affected by D3HOT to D0 reset.
23:20	0h RO	**Reserved**
19:17	0h RO	**Port Arbitration Select (PARBSEL):** Hardwired to 0 since this field is not valid for endpoint devices.
16	0h RO	**Load Port Arbitration Table (LPARBTBL):** Hardwired to 0 since this field is not valid for endpoint devices.

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved**
7:1	00h RW	**TC/VCI Map (VCIM):** This field indicates the TCs that are mapped to the VCi resource. Bits (7:1) are implemented as RW bits. This field is not used by the hardware, but it is RW to avoid confusing software.
0	0h RO	**TC/VCI Map (VCIM_0):** This field indicates the TCs that are mapped to the VCI resource. Bit 0 is hardwired to 0 indicating it can not be mapped to VCI. This field is not used by the hardware.

5.1.52 VCI Resource Status Register (VCISTS) - Offset 126h

This register provides status of the configuration of VC1 Virtual Channels.

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:31, F:3] + 126h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:2	0h RO	**Reserved**
1	0h RO	**VCI Negotiation Pending (VCNP):** This bit does not apply to the integrated Intel HD Audio subsystem and is therefore hardwired to 0.
0	0h RO	**Port Arbitration Table Status (PARBTBLSTS):** Hardwired to 0 since this field is not valid for endpoint devices.

5.1.53 Root Complex Link Declaration Enhanced (RCCAP) - Offset 130h

This register declares the root complex link enhanced capability structure.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:3] + 130h	00010005h

Bit Range	Default & Access	Field Name (ID): Description
31:20	000h RO	**Next Capability Offset (NXTCAP):** Indicates this is the last capability.
19:16	1h RO	**Capability Version (CV):** Indicates the version of the capability structure present.
15:0	0005h RO	**PCI Express Extended Capability ID (PCIEECID):** Indicates that this pointer is a Root Complex Link Declaration Enhanced capability.

5.1.54 Element Self Description (ESD) - Offset 134h

This register provides information about the Root Complex element containing the Link Declaration Capability.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:3] + 134h	0F000100h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0Fh RO	**Port Number (PORT):** Intel HD Audio assigned as Port #15.
23:16	00h RW/L	**Component ID (COMPID):** Indicates the component ID assigned to this element by software. This is written once by platform BIOS and is locked until a platform reset. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
15:8	01h RO	**Number of Link Entries (LNKENT):** The Intel HD Audio controller only connects to one device, the SOC egress port. Therefore this field reports a value of 1.
7:4	0h RO	**Reserved**
3:0	0h RO	**Element Type (ELTYP):** The Intel HD Audio controller is an Integrated Root Complex Device. Therefore this field reports a value of 0h.

5.1.55 Link 1 Description (L1DESC) - Offset 140h

This register describes the link entry attributes.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:3] + 140h	00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Target Port Number (TPORT):** The Intel HD Audio controller targets the SOC RCRB egress port, which is port #0.
23:16	00h RW/L	**Target Component ID (TCOMPID):** This field is programmed by platform BIOS to match the component ID of the SOC RCRB that is attached to this RCRB Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD

Bit Range	Default & Access	Field Name (ID): Description
15:2	0h RO	**Reserved**
1	0h RO	**Link Type (LNKTYP):** Indicates Type 0.
0	1h RO	**Link Valid (LNKVLD):** Hardwired to 1.

5.1.56 Link 1 Lower Address (L1LADD) - Offset 148h

This register specifies the pointer (lower 32 bits) to a memory-mapped RCRB.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:3] + 148h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	00000h RO/V	**Link 1 Lower Address (L1LADD):** Hardwired to match the RCBA register value in the PCI-LPC bridge.
13:0	0h RO	**Reserved**

5.1.57 Link 1 Upper Address (L1UADD) - Offset 14Ch

This register specifies the pointer (upper 32 bits) to a memory-mapped RCRB.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:3] + 14Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Link 1 Upper Address (L1UADD):** Hardwired to match the RCBA register value in the PCI-LPC bridge.

5.2 cAVS Memory Mapped Register Summary

Table 5-2. Summary of cAVS Memory Mapped Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	2	Global Capabilities (GCAP)	9701h
2h	1	Minor Version (VMIN)	00h
3h	1	Major Version (VMAJ)	01h
4h	2	Output Payload Capability (OUTPAY)	003Ch
6h	2	Input Payload Capability (INPAY)	001Dh
8h	4	Global Control (GCTL)	00000000h
Ch	2	Wake Enable (WAKEEN)	0000h
Eh	2	Wake Status (WAKESTS)	0000h
10h	2	Global Status (GSTS)	0000h
12h	2	Global Capabilities 2 (GCAP2)	0001h
14h	2	Linked List Capabilities Header (LLCH)	0C00h
18h	2	Output Stream Payload Capability (OUTSTRMPAY)	0030h
1Ah	2	Input Stream Payload Capability (INSTRMPAY)	0018h
20h	4	Interrupt Control (INTCTL)	00000000h
24h	4	Interrupt Status (INTSTS)	00000000h
30h	4	Wall Clock Counter (WALCLK)	00000000h
38h	4	Stream Synchronization (SSYNC)	00000000h
40h	4	CORB Lower Base Address (CORBLBASE)	00000000h
44h	4	CORB Upper Base Address (CORBUBASE)	00000000h
48h	2	CORB Write Pointer (CORBWP)	0000h
4Ah	2	CORB Read Pointer (CORBRP)	0000h
4Ch	1	CORB Control (CORBCTL)	00h
4Dh	1	CORB Status (CORBSTS)	00h
4Eh	1	CORB Size (CORBSIZE)	42h
50h	4	RIRB Lower Base Address (RIRBLBASE)	00000000h
54h	4	RIRB Upper Base Address (RIRBUBASE)	00000000h
58h	2	RIRB Write Pointer (RIRBWP)	0000h
5Ah	2	Response Interrupt Count (RINTCNT)	0000h
5Ch	1	RIRB Control (RIRBCTL)	00h
5Dh	1	RIRB Status (RIRBSTS)	00h
5Eh	1	RIRB Size (RIRBSIZE)	42h
60h	4	Immediate Command (IC)	00000000h
64h	4	Immediate Response (IR)	00000000h

5.2.1 Global Capabilities (GCAP) - Offset 0h

This register indicates the capabilities of the controller.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 0h	9701h

Bit Range	Default & Access	Field Name (ID): Description
15:12	9h RW/L	**Number of Output Streams Supported (OSS):** 0100b indicates that the Intel HD Audio controller supports four output streams. Reset value is hardcoded to parameter HSTOSC. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
11:8	7h RW/L	**Number of Input Streams Supported (ISS):** 0100b indicates that the Intel HD Audio controller supports four input streams. Reset value is hardcoded to parameter HSTISC. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
7:3	00h RO	**Number of Bidirectional Streams Supported (BSS):** 00000b indicates that the Intel HD Audio controller supports 0 bidirectional streams.
2:1	0h RW/L	**Number of Serial Data Out Signals (NSDO):** 00b indicates that the Intel HD Audio controller supports one Serial Data Output signal. For the case of multiple link segments is supported, this field indicates the number of SDO for link 0. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
0	1h RW/L	**64 Bit Address Supported (ADD64OK):** A 1 indicates that the Intel HD Audio controller supports 64 bit addressing for BDL addresses, data buffer addresses, and command buffer addresses. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD

5.2.2 Minor Version (VMIN) - Offset 2h

This register indicates minor revision number of the High Definition Audio specification.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 2h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW/L	**Minor Version (VMIN):** Indicates the Intel HD Audio controller supports minor revision number 00h of the Intel HD Audio specification. **Locked by:** SBPR.FNCFG.BCLD

5.2.3 Major Version (VMAJ) - Offset 3h

This register indicates major revision number of the High Definition Audio specification.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 3h	01h

Bit Range	Default & Access	Field Name (ID): Description
7:0	01h RW/L	**Major Version (VMAJ):** Indicates the Intel HD Audio controller supports major revision number 1 of the Intel HD Audio specification. **Locked by:** SBPR.FNCFG.BCLD

5.2.4 Output Payload Capability (OUTPAY) - Offset 4h

This register indicates the total output payload available on the link.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 4h	003Ch

Bit Range	Default & Access	Field Name (ID): Description
15:0	003Ch RW/L	**Output Payload Capability (OUTPAY):** Indicates the total output payload available on the link. This does not include bandwidth used for command and control. This measurement is in 16-bit word quantities per 48 kHz frame. The default link clock speed of 24.000 MHz (the data is double pumped) provides 1000 bits per frame, or 62.5 words in total. 40 bits are used for command and control, leaving 60 words available for data payload. Note that this value does not reflect any bandwidth increase due to support for multiple SDO lines. 00h: 0 words 01h: 1 word payload ... FFh: 255h word payload ***Note***: In the event that multiple links is supported (GCAP2.LCOUNT) 0), the payload advertised will be the lowest common denominator offered by the default clock frequency on each link. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD

5.2.5 Input Payload Capability (INPAY) - Offset 6h

This register indicates the total input payload available on the link.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 6h	001Dh

Bit Range	Default & Access	Field Name (ID): Description
15:0	001Dh RW/L	**Input Payload Capability (INPAY):** Indicates the total input payload available on the link. This does not include bandwidth used for response. This measurement is in 16-bit word quantities per 48 kHz frame. The default link clock speed of 24.000 MHz provides 500 bits per frame, or 31.25 words in total. 36 bits are used for response, leaving 29 words for data payload. Note that this value does not reflect any bandwidth increase due to support for multiple SDI lines. 00h: 0 words 01h: 1 word payload ... FFh: 255h word payload ***Note***: In the event that multiple links are supported (GCAP2.LCOUNT) 0), the payload advertised will be the lowest common denominator offered by the default clock frequency on each link. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD

5.2.6 Global Control (GCTL) - Offset 8h

CRSTB bit is not affected by controller reset.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved**
8	0h RW	**Accept Unsolicited Response Enable (UNSOL):** If UNSOL is a 1, Unsolicited Responses from the codecs are accepted by the controller and placed into the Response Input Ring Buffer. If UNSOL is a 0, unsolicited response are not accepted, and dropped on the floor.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	**Reserved**
1	0h RW/1S/V	**Flush Control (FCNTRL):** Writing a 1 to this bit initiates a flush. When the flush completion is received by the controller, hardware sets the Flush Status bit and clears this Flush Control bit. Before a flush cycle is initiated, the DMA Position Buffer must be programmed with a valid memory address by software, but the DMA Position Buffer bit 0 need not be set to enable the position reporting mechanism. Also, all streams must be stopped (the associated RUN bit must be 0). When the flush is initiated, the controller will flush pipelines to memory to guarantee that the hardware is ready to transition to a D3 state. Setting this bit is not a critical step in the power state transition if the content of the FIFOs is not critical.
0	0h RW/V	**Controller Reset# (CRSTB):** Writing a 0 to this bit causes the Intel HD Audio controller to be reset. All state machines, FIFO's and non-suspend well memory mapped configuration registers (except ECAP, and not PCI Configuration Registers) in the controller will be reset. The Intel HD Audio link RESET# signal will be asserted and all other link signals will be driven to their "reset" values. After the hardware has completed sequencing into the reset state, it will report a 0 in this bit. Software must read a 0 from this bit to verify that the controller is in reset. Writing a 1 to this bit causes the controller to exit its reset state and deassert the Intel HD Audio link RESET# signal. Software is responsible for setting/clearing this bit such that the minimum Intel HD Audio link RESET# signal assertion pulse width specification is met. When the controller hardware is ready to begin operation, it will report a 1 in this bit. Software must read a 1 from this bit before accessing any controller registers. The CRST# bit defaults to a 0 after hardware reset, therefore software needs to write a 1 to this bit to begin operation. Note that the CORB/RIRB RUN bits and all Stream RUN bits must be verified cleared to zero before CRST# is written to 0 (asserted) in order to assure a clean re-start. When setting or clearing CRST#, software must ensure that minimum link timing requirements (minimum RESET# assertion time, etc.) are met. When CRST# is 0 indicating that the controller is in reset, writes to all Intel HD Audio memory mapped registers are ignored as if the device is not present. The only exception is the Global Control register containing the CRST# bit itself. The Global Control register is write-able as a DWord, Word, or Byte even when CRST# is 0 if the byte enable for the byte containing the CRST# bit (Byte Enable 0) is active. If Byte Enable 0 is not active, writes to the Global Control register will be ignored when CRST# is 0. When CRST# is 0, reads to Intel HD Audio memory mapped registers will return their default value except for registers that are not reset with PLTRST# or on a D3hot to D0 transition.

5.2.7 Wake Enable (WAKEEN) - Offset Ch

This register indicates which bits in the WAKESTS register may cause either a wake event or an interrupt.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + Ch	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0h RO	**Reserved**
2:0	0h RW	**SDIN Wake Enable Flags (WAKEEN):** Bits which control which SDI signal(s) may generate a wake event. A 1 bit in the bit mask indicates that the associated SDIN signal is enabled to generate a wake. These bits are cleared on a power-on reset. Software must not make assumptions about the reset state of these bits and must set them appropriately.

5.2.8 Wake Status (WAKESTS) - Offset Eh

This register indicates that a Status Change event has occurred on the link, which usually indicates that either the codec has just come out of reset and is requesting an address, or that a codec is signaling a wake event.

Implementation Notes: Because of the legacy implementations of the WAKESTS bits are physically located in the Resume clock domain and it takes time to clock cross the clearing event resulted from SW writing a 1, it is possible that the SW may still read back 1 after clearing the WAKESTS bits, especially if the Resume clock is tied to a slow clock in the SoC, e.g. RTC clock.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + Eh	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0h RO	**Reserved**
2:0	0h RW/1C/V	**SDIN State Change Status Flags (WAKESTS):** Flag bits that indicate which SDI signal(s) received a State Change event. The bits are cleared by writing 1's to them. These bits are cleared on a power-on reset. Software must not make assumptions about the reset state of these bits and must set them appropriately.

5.2.9 Global Status (GSTS) - Offset 10h

This register provides global level status of the controller.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 10h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:2	0h RO	**Reserved**
1	0h RW/1C/V	**Flush Status (FSTS):** This bit is set to a 1 by the hardware to indicate that the flush cycle initiated when the FCNTRL bit was set has completed. Software must write a 1 to clear this bit before the next time FCNTRL is set.
0	0h RO	**Reserved**

5.2.10 Global Capabilities 2 (GCAP2) - Offset 12h

This register indicates the additional capabilities of the controller.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 12h	0001h

Bit Range	Default & Access	Field Name (ID): Description
15:2	0h RO	**Reserved**
1	0h RW/L	**Dynamic FIFO Limit Change Capability (DFIFOLCC):** Indicates whether the energy efficient audio FIFOLC operation is static or dynamic. 0 = Static. FIFOLC bit only has effect before RUN bit is set for the first time. 1 = Dynamic. FIFOLC bit has effect before RUN bit is set for the first time, as well as after that. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
0	1h RW/V/L	**Energy Efficient Audio Capability (EEAC):** Indicates whether the energy efficient audio with deeper buffering is supported or not. 0 = Not supported. FIFOL register and FIFOLC bit behave as RO. 1 = Supported. FIFOL register and FIFOLC bit behave as RW. Locked when FNCFG.BCLD = 1 or FUSVAL.CPPMD = 1. **Locked by:** SBPR.FNCFG.BCLD

5.2.11 Linked List Capabilities Header (LLCH) - Offset 14h

This register provides the pointer to the first capability structure, if exists.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 14h	0C00h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0C00h RW/L	**First Capability Pointer (PTR):** This field contains the offset to the first capability structure of the linked list capabilities, or 0000h if no linked list capabilities exist. Point to Multiple Links Capability. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD

5.2.12 Output Stream Payload Capability (OUTSTRMPAY) - Offset 18h

This register indicates the maximum number of Words per frame for any single output stream.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 18h	0030h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0030h RO	**Output Stream Payload Capability (OUTSTRMPAY):** Indicates maximum number of words per frame for any single output stream. This measurement is in 16 bit word quantities per 48 kHz frame. 48 Words (96B) are the maximum supported, therefore a value of 30h is reported in this register. Software must ensure that a format which would cause more words per frame than indicated is not programmed into the Output Stream Descriptor register. 00h: 0 words 01h: 1 word payload ... FFh: 255h word payload

5.2.13 Input Stream Payload Capability (INSTRMPAY) - Offset 1Ah

This register indicates the maximum number of Words per frame for any single input stream.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 1Ah	0018h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0018h RO	**Input Stream Payload Capability (INSTRMPAY):** Indicates maximum number of words per frame for any single input stream. This measurement is in 16 bit word quantities per 48 kHz frame. 24 Words (48B) are the maximum supported, therefore a value of 18h is reported in this register. Software must ensure that a format which would cause more words per frame than indicated is not programmed into the Input Stream Descriptor register. 00h: 0 words 01h: 1 word payload ... FFh: 255h word payload

5.2.14 Interrupt Control (INTCTL) - Offset 20h

The Interrupt Status and Control register provides a central point for controlling and monitoring interrupt generation. The SIE (Stream Interrupt Enable) register controls the interrupt mask for each individual Input or Output Stream. Setting a 1 in the appropriate bit allows the particular interrupt source to generate a processor interrupt. The SIS (Stream Interrupt Status) register indicates the current interrupt status of each interrupt source. A 1 indicates that an interrupt is being requested. Note that the state of these bits is independent of the SIE bits; even if the corresponding bit is set to a 0 in the Stream Interrupt Enable register to disable processor interrupt generation, the Status bit may still be set to indicate that stream is requesting service. This can be used by polling software to determine which Streams need attention without incurring system interrupts. The CIE (Controller Interrupt Enable) and CIS (Controller Interrupt Status) control and indicate the status of the general controller interrupt. General controller interrupt sources are to a Response Interrupt, a Response Buffer Overrun, and State Change events. Note that the CIS is independent of the CIE bit; even if the CIE bit is set to a 0 to disable processor interrupt generation, the CIS bit may still be set to indicate that stream is requesting service.

The GIE (Global Interrupt Enable) and GIS (Global Interrupt Status) control and indicate the status of all hardware interrupt sources in the Intel HD Audio controller. If GIS bit is a 1, a processor interrupt is currently being requested. If GIE is a 1, a processor interrupt may be requested; if GIE is a 0, then no processor interrupt may be requested. Note that the GIS is independent of the GIE bit; even if the GIE bit is set to a 0 to disable processor interrupt generation, the GIS bit may still be set to indicate that stream is requesting service.

GIE and CIE bits are not affected by controller reset. The number of SIE bits in this register is depending on the total number of streams DMA implemented, represented as x in the register table. The x value is determined by the sum of parameter HSTISC and HSTOSC.

For SPT implementation, x = 16.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 20h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Global Interrupt Enable (GIE):** Global bit to enable device interrupt generation. When set to 1 the Intel HD Audio function is enabled to generate an interrupt. This control is in addition to any bits in the bus specific address space, such as the Interrupt Enable bit in the PCI Configuration Space.
30	0h RW	**Controller Interrupt Enable (CIE):** Enables the general interrupt for controller functions. When set to 1 (and GIE is enabled), the controller generates an interrupt when the CIS bit gets set.
29:16	0h RO	**Reserved**
15:0	0000h RW	**Stream Interrupt Enable (SIE):** When set to 1 the individual Streams are enabled to generate an interrupt when the corresponding stream status bits get set. A stream interrupt will be caused as a result of a buffer with IOC=1 in the BDL entry being completed, or as a result of a FIFO error (under run or overrun) occurring. Control over the generation of each of these sources is in the associated Stream Descriptor. The streams are numbered and the SIE bits assigned sequentially, based on their order in the register set.

5.2.15 Interrupt Status (INTSTS) - Offset 24h

GIS and CIS bits are not affected by controller reset.

The number of SIS bits in this register is depending on the total number of streams

DMA implemented, represented as x in the register table.

The x value is determined by the sum of parameter HSTISC and HSTOSC.

For SPT implementation, x = 16.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 24h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Global Interrupt Status (GIS):** This bit is an OR of all of the interrupt status bits in this register and PPSTS register
30	0h RW/V	**Controller Interrupt Status (CIS):** Status of general controller interrupt. A 1 indicates that an interrupt condition occurred due to a Response Interrupt, a Response Buffer Overrun Interrupt, CORB Memory Error Interrupt, Error Present Interrupt, or a SDIN State Change event. The exact cause can be determined by interrogating other registers. Note that a HW interrupt will not be generated unless the corresponding enable bit is set. This bit is an OR of all of the stated interrupt status bits for this register.
29:16	0h RO	**Reserved**
15:0	0000h RW/V	**Stream Interrupt Status (SIS):** A 1 indicates that an interrupt condition occurred on the corresponding Stream. Note that a HW interrupt will not be generated unless the corresponding enable bit is set. This bit is an OR of all of an individual stream s interrupt status bits. The streams are numbered and the SIS bits assigned sequentially, based on their order in the register set.

5.2.16 Wall Clock Counter (WALCLK) - Offset 30h

The 32 bit monotonic counter provides a 'wall clock' that can be used by system software to synchronize independent audio controllers. The counter must be implemented.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Wall Clock Counter (WALCLK):** 32 bit counter that is incremented on each link BCLK period and rolls over from FFFF_FFFFh to 0000_0000h. This counter will roll over to zero with a period of approximately 179 seconds. This counter is enabled while the BCLK bit is set to 1. Software uses this counter to synchronize between multiple controllers. Will be reset on controller reset. With the introduction of multiple link segments for the Intel HD Audio controller, and the capability of running each link segment at different clock speed, the BCLK definition for this counter is fixed at 24 MHz equivalent rate always, independent of the physical link clock speed, and reports the link 0 wall clock value.

5.2.17 Stream Synchronization (SSYNC) - Offset 38h

To synchronize two or more streams the corresponding SSYNC bits for the streams to be synchronized should be set to 1 before the 'RUN' bit for each stream is set.

The RUN bit for the corresponding stream must be set to 1 (and FIFORDY=1) prior to that stream's SSYNC bit being written to 0. To start multiple streams synchronously, the stream sync bits for those streams should be written to 0 at the same time. For all SSYNC bits on output engines that transition from 1 to 0 on the same write, the formatter will deliver a sample over the link in the same 48kHz frame. For all SSYNC bits on input engines that transition from 1 to 0 on the same write, the formatter will take stream data off the link and place it in the FIFO.

If synchronization is not desired, the stream synchronization bits may be left 0, and the stream will simply begin running normally when the stream's 'RUN' bit is set. In addition to platform reset, FLR, and controller reset, the register is also reset by stream reset. The number of SSYNC bits in this register is depending on the total number of streams DMA implemented, represented as x in the register table. The x value is determined by the sum of parameter HSTISC and HSTOSC. For SPT implementation, x = 16.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 38h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0000h RW	**Stream Synchronization Bits (SSYNC):** The Stream Synchronization bits, when set to 1, block data from being sent on or received from the link. Each bit controls the associated Stream Descriptor, bit 0 corresponds to the first Stream Descriptor, etc. To synchronously start a set of DMA engines, the bits in the SSYNC register are first set to a 1. The RUN bits for the associated Stream Descriptors are then set to a 1 to start the DMA engines. When all streams are ready (FIFORDY=1), the associated SSYNC bits can all be set to 0 at the same time, and transmission or reception of bits to or from the link will begin together at the start of the next full link frame. To synchronously stop streams, first the bits are set in the SSYNC register, and then the individual RUN bits in the Stream Descriptors are cleared by software. The streams are numbered and the SSYNC bits assigned sequentially, based on their order in the register set.

5.2.18 CORB Lower Base Address (CORBLBASE) - Offset 40h

This register specifies the address (lower 32 bits) of the Command Output Ring Buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 40h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0000000h RW	**CORB Lower Base Address (CORBLBASE):** Lower address of the Command Output Ring Buffer, allowing the CORB Base Address to be assigned on any 128-B boundary. This register field must not be written when the DMA engine is running or the DMA transfer may be corrupted.
6:0	0h RO	**Reserved**

5.2.19 CORB Upper Base Address (CORBUBASE) - Offset 44h

This register specifies the address (upper 32 bits) of the Command Output Ring Buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 44h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/L	**CORB Upper Base Address (CORBUBASE):** Upper 32 bits of address of the Command Output Ring Buffer. This register field must not be written when the DMA engine is running or the DMA transfer may be corrupted. Locked when GCAP.ADD64OK = 0. **Locked by:** GCAP.ADD64OK

5.2.20 CORB Write Pointer (CORBWP) - Offset 48h

This register specifies the write pointer of the Command Output Ring Buffer.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 48h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved**
7:0	00h RW	**CORB Write Pointer (CORBWP):** Software writes the last valid CORB entry offset into this field in Dword granularity. The DMA engine fetches commands from the CORB until the Read Pointer matches the Write Pointer. Supports 256 CORB entries (256 x 4B=1KB). This field may be written while the DMA engine is running.

5.2.21 CORB Read Pointer (CORBRP) - Offset 4Ah

This register reports the read pointer of the Command Output Ring Buffer.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 4Ah	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/V	**CORB Read Pointer Reset (CORBRPRST):** Software writes a 1 to this bit to reset the CORB Read Pointer to 0 and clear any residual pre-fetched commands in the CORB hardware buffer within the Intel Audio controller. The hardware will physically update this bit to 1 when the CORB Pointer reset is complete. Software must read a 1 to verify that the reset completed correctly. Software must clear this bit back to 0 and read back the 0 to verify that the clear completed correctly. The CORB DMA engine must be stopped prior to resetting the Read Pointer or else DMA transfer may be corrupted.
14:8	0h RO	**Reserved**
7:0	00h RO/V	**CORB Read Pointer (CORBRP):** Software reads this field to determine how many commands it can write to the CORB without over-running. The value read indicates the CORB Read Pointer offset in Dword granularity. The offset entry read from this field has been successfully fetched by the DMA controller and may be over-written by software. Supports 256 CORB entries (256 x 4B=1KB). This field may be read while the DMA engine is running.

5.2.22 CORB Control (CORBCTL) - Offset 4Ch

This register provides the control of the Command Output Ring Buffer.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 4Ch	00h

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	**Reserved**
1	0h RW/V	**Enable CORB DMA Engine (CORBRUN):** 0 = DMA Stop 1 = DMA Run After SW writes a 0 to this bit, the HW may not stop immediately. The hardware will physically update the bit to a 0 when the DMA engine is truly stopped. SW must read a 0 from this bit to verify that the DMA is truly stopped.
0	0h RW	**CORB Memory Error Interrupt Enable (CMEIE):** If this bit is set (and GIE and CIE are enabled), the controller will generate an interrupt if the MEI status bit is set.

5.2.23 CORB Status (CORBSTS) - Offset 4Dh

This register provides the status of the Command Output Ring Buffer.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 4Dh	00h

Bit Range	Default & Access	Field Name (ID): Description
7:1	0h RO	**Reserved**
0	0h RW/1C/V	**CORB Memory Error Indication (CMEI):** If this status bit is set, the controller has detected an error in the pathway between the controller and memory. This may be an ECC bit error or any other type of detectable data error which renders the command data fetched invalid. Software can clear this bit by writing a 1 to it. However, this type of error leaves the audio subsystem in an unviable state and typically requires CRST#.

5.2.24 CORB Size (CORBSIZE) - Offset 4Eh

This register declares the size of the Command Output Ring Buffer.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 4Eh	42h

Bit Range	Default & Access	Field Name (ID): Description
7:4	4h RO	**CORB Size Capability (CORBSZCAP):** 0100b indicates that the ICH9 only supports a CORB size of 256 CORB entries (1024B).
3:2	0h RO	**Reserved**
1:0	2h RO	**CORB Size (CORBSIZE):** Hardwired to 10b which sets the CORB size to 256 entries (1024B).

5.2.25 RIRB Lower Base Address (RIRBLBASE) - Offset 50h

This register specifies the address (lower 32 bits) of the Response Input Ring Buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 50h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0000000h RW	**RIRB Lower Base Address (RIRBLBASE):** Lower address of the Response Input Ring Buffer, allowing the RIRB Base Address to be assigned on any 128-B boundary. This register field must not be written when the DMA engine is running or the DMA transfer may be corrupted.
6:0	0h RO	**Reserved**

5.2.26 RIRB Upper Base Address (RIRBUBASE) - Offset 54h

This register specifies the address (upper 32 bits) of the Response Input Ring Buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 54h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/L	**RIRB Upper Base Address (RIRBUBASE):** Upper 32 bits of address of the Command Output Ring Buffer. This register field must not be written when the DMA engine is running or the DMA transfer may be corrupted. Locked when GCAP.64OK = 0. **Locked by:** GCAP.ADD64OK

5.2.27 RIRB Write Pointer (RIRBWP) - Offset 58h

This register reports the write pointer of the Response Input Ring Buffer.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 58h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h WO	**RIRB Write Pointer Reset (RIRBWPRST):** Software writes a 1 to this bit to reset the RIRB Write Pointer to 0's. The RIRB DMA engine must be stopped prior to resetting the Write Pointer or else DMA transfer may be corrupted. This bit will always be read as 0.
14:8	0h RO	**Reserved**
7:0	00h RO/V	**RIRB Write Pointer (RIRBWP):** Indicates the last valid RIRB entry written by the DMA controller. Software reads this field to determine how many responses it can read from the RIRB. The value read indicates the RIRB Write Pointer offset in 2 Dword RIRB entry units (since each RIRB entry is 2 Dwords long). Supports up to 256 RIRB entries (256 x 8B=2KB). This field may be read while the DMA engine is running.

5.2.28 Response Interrupt Count (RINTCNT) - Offset 5Ah

This register specifies the threshold of Response Input Ring Buffer that triggers an interrupt.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 5Ah	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved**
7:0	00h RW	**N Response Interrupt Count (RINTCNT):** 0000_0001b = 1 Response sent to RIRB ... 1111_1111b = 255 Responses sent to RIRB 0000_0000b = 256 Responses sent to RIRB The DMA engine should be stopped when changing this field or else an interrupt maybe lost. Note that each Response occupies 2 Dwords in the RIRB. This is compared to the total number of responses that have been returned, as opposed to the number of frames in which there were responses. If more than one codec responds in one frame, then the count is increased by the number of responses received in the frame.

5.2.29 RIRB Control (RIRBCTL) - Offset 5Ch

This register provides the control of the Response Input Ring Buffer.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 5Ch	00h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	**Reserved**
2	0h RW	**Response Overrun Interrupt Control (RIRBOIC):** If this bit is set (and GIE and CIE are enabled), the hardware will generate an interrupt when the Response Overrun Interrupt Status bit is set.
1	0h RW/V	**RIRB DMA Enable (RIRBRUN):** 0 = DMA Stop 1 = DMA Run After SW writes a 0 to this bit, the HW may not stop immediately. The hardware will physically update the bit to a 0 when the DMA engine is truly stopped. SW must read a 0 from this bit to verify that the DMA is truly stopped.
0	0h RW	**Response Interrupt Control (RINTCTL):** 0 = Disable Interrupt 1 = Generate an interrupt (if GIE and CIE are enabled) after N number of Responses are sent to the RIRB buffer OR when an empty Response slot is encountered on all SDI_x inputs (whichever occurs first). The N counter is reset when the interrupt is generated.

5.2.30 RIRB Status (RIRBSTS) - Offset 5Dh

This register provides the status of the Response Input Ring Buffer.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 5Dh	00h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	**Reserved**
2	0h RW/1C/V	**Response Overrun Interrupt Status (RIRBOIS):** Hardware sets this bit to a 1 when the RIRB DMA engine is not able to write the incoming responses to memory before additional incoming responses overrun the internal FIFO. When the overrun occurs, the hardware will drop the responses which overrun the buffer. An interrupt may be generated if the Response Overrun Interrupt Control bit is set. Note that this status bit is set even if an interrupt is not enabled for this event. Software clears this flag by writing a 1 to this bit.
1	0h RO	**Reserved**
0	0h RW/1C/V	**Response Interrupt (RINTFL):** Hardware sets this bit to a 1 when an interrupt has been generated after N number of Responses are sent to the RIRB buffer OR when an empty Response slot is encountered on all SDI(x) inputs (whichever occurs first). Note that this status bit is set even if an interrupt is not enabled for this event. Software clears this flag by writing a 1 to this bit.

5.2.31 RIRB Size (RIRBSIZE) - Offset 5Eh

This register declares the size of the Response Input Ring Buffer.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 5Eh	42h

Bit Range	Default & Access	Field Name (ID): Description
7:4	4h RO	**RIRB Size Capability (RIRBSZCAP):** 0100b indicates that the PCH only supports a RIRB size of 256 RIRB entries (2048B).
3:2	0h RO	**Reserved**
1:0	2h RO	**RIRB Size (RIRBSIZE):** Hardwired to 10b which sets the RIRB size to 256 entries (2048B).

5.2.32 Immediate Command (IC) - Offset 60h

This register provides the control of the immediate command.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 60h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Immediate Command (IC):** The command to be sent to the codec via the Immediate Command mechanism is written to this register. The command stored in this register is sent out over the link during the next available frame after a 1 is written to the ICB bit.

5.2.33 Immediate Response (IR) - Offset 64h

This register reports the response received for the immediate command.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 64h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Immediate Response (IR):** This register contains the response received from a codec resulting from a command sent via the Immediate Command mechanism. If multiple codecs responded in the same frame, there is no guarantee as to which response will be latched. Therefore broadcast-type commands must not be issued via the Immediate Command mechanism.

5.2.34 Immediate Command Status (ICS) - Offset 68h

This register provides the status of the immediate command.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 68h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:2	0h RO	**Reserved**
1	0h RW/1C/V	**Immediate Result Valid (IRV):** This bit is set to a 1 by hardware when a new response is latched into the IR register. This is a status flag indicating that software may read the response from the Immediate Response register. Software must clear this bit (by writing a one to it) before issuing a new command so that the software may determine when a new response has arrived.
0	0h RW/V	**Immediate Command Busy (ICB):** When this bit as read as a 0 it indicates that a new command may be issued using the Immediate Command mechanism. When this bit transitions from a 0 to a 1 (via software writing a 1), the controller issues the command currently stored in the Immediate Command register to the codec over the link. When the corresponding response is latched into the Immediate Response register, the controller hardware sets the IRV flag and clears the ICB bit back to 0. SW may write this bit to a 0 if the bit fails to return to 0 after a reasonable timeout period. Note that an Immediate Command must not be issued while the CORB/RIRB mechanism is operating, otherwise the responses conflict. This must be enforced by software.

5.2.35 DMA Position Lower Base Address (DPLBASE) - Offset 70h

This register specifies the base address (lower 32 bits) of DMA Position Buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 70h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0000000h RW	**DMA Position Lower Base Address (DPLBASE):** Lower 32 bits of the DMA Position Buffer Base Address. This register field must not be written when any DMA engine is running or the DMA transfer may be corrupted. This same address is used by the Flush Control, and must be programmed with a valid value before the FLCNRTL bit is set.
6:1	0h RO	**Reserved**
0	0h RW	**DMA Position Buffer Enable (DPBE):** When this bit is set to a '1', the controller will write the DMA positions of each of the DMA engines to the buffer in main memory periodically (typically once/ frame). Software can use this value to know what data in memory is valid data. The controller must guarantee that the values in the DMA Position Buffer that the software can read represent positions in the stream for which valid data exists in the Stream's DMA buffer. This has particular relevance in systems which support isochronous transfer, the stream positions in the software-visible memory buffer must represent stream data which has reached the Global Observation point.

5.2.36 DMA Position Upper Base Address (DPUBASE) - Offset 74h

This register specifies the base address (upper 32 bits) of DMA Position Buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 74h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/L	**DMA Position Upper Base Address (DPUBASE):** Upper 32 bits of address of the DMA Position Buffer Base Address. This register field must not be written when the DMA engine is running or the DMA transfer may be corrupted. Locked when GCAP.ADD64OK = 0. **Locked by:** GCAP.ADD64OK

5.2.37 Input/Output Stream Descriptor x Control (ISD0CTLB0) - Offset 80h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 80h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RW/V/L	**FIFO Limit Change (FIFOLC):** Writing a 1 to this bit indicates a new update to the FIFOL register has been made. After the HW has completed sequencing into the new effective FIFO size, it will clear this bit. This bit is RO if GCAP2.EEAC = 0. If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 0 (static), this bit will only have effect when the stream is idle (before the first time RUN bit is set). If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 1 (dynamic), on top of supporting the static behavior describe above, this bit also has effect when the stream is active (after the first time RUN bit is set). **Locked by:** SBPR.FNCFG.BCLD
4	0h RW	**Descriptor Error Interrupt Enable (DEIE):** Controls whether an interrupt is generated when the Descriptor Error Status (DESE) bit is set.
3	0h RW	**FIFO Error Interrupt Enable (FEIE):** This bit controls whether the occurrence of a FIFO error (overrun for input or underrun for output) will cause an interrupt or not. If this bit is not set, bit 3 in the Status register will be set, but the interrupt will not occur. Either way, the samples will be dropped.
2	0h RW	**Interrupt On Completion Enable (IOCE):** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set, bit 2 in the Status register will be set, but the interrupt will not occur
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

5.2.38 Input/Output Stream Descriptor x Status (ISD0STS) - Offset 83h

This register provides the status of the stream DMA.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 83h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RO/V	**FIFO Ready (FIFORDY):** This bit defaults to 0 on reset because the FIFO is cleared on a reset. Input Stream: For input streams, the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. Output Stream: For output streams, the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on then link.
4	0h RW/1C/V	**Descriptor Error (DESE):** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort, a Parity or ECC error on the bus, or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error, as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.
3	0h RW/1C/V	**FIFO Error (FIFOE):** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. Input Stream: For an input stream, this indicates a FIFO overrun occurring while the RUN bit is set. When this happens, the FIFO pointers don't increment and the incoming data is not written into the FIFO, thereby being lost. Output Stream: For an output stream, this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send.
2	0h RW/1C/V	**Buffer Completion Interrupt Status (BCIS):** This bit is set to 1 by the hardware after the last sample of a buffer has been processed, AND if the Interrupt on Completion (IOC) bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
1:0	0h RO	**Reserved**

5.2.39 Input/Output Stream Descriptor x Link Position in Buffer (ISD0LPIB) - Offset 84h

This register reports the link position in buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 84h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Link Position in Buffer (LPIB):** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.40 Input/Output Stream Descriptor x Cyclic Buffer Length (ISD0CBL) - Offset 88h

This register specifies the cyclic buffer size.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 88h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Cyclic Buffer Length (CBL):** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer (LPIB) will be reset when it reaches this value. Software may only write to this register after Global Reset, Controller Reset, or Stream Reset has occurred. This value should only be modified when the RUN bit is '0'. Once the RUN bit has been set to enable the engine, software must not write to this register until after the next reset is asserted, or transfers may be corrupted.

5.2.41 Input/Output Stream Descriptor x Last Valid Index (ISD0LVI) - Offset 8Ch

This register specifies the last valid buffer descriptor index.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 8Ch	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved**
7:0	00h RW	**Last Valid Index (LVI):** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor, it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1, i.e., there must be at least two valid entries in the buffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is '0'

5.2.42 Input/Output Stream Descriptor x FIFO Eviction Watermark (ISD0FIFOW) - Offset 8Eh

This register reports the threshold of the FIFO that triggers an access to cyclic buffer.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 8Eh	0004h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0h RO	**Reserved**
2:0	4h RO/V	**FIFOW:** Indicates the minimum number of bytes accumulated (for input) or free (for output) in the FIFO before the controller will start an eviction (for input) or fetch (for output) of data. The PCH HD Audio controller hardwires the FIFO Watermark, either 32B or 64B based on the following. Bit(2:0) Description 000-011 Reserved 100 32 B Supported. The 32 B request is aligned to 32 B boundaries. 101 64 B Supported. The 64 B request is aligned to 64 B boundaries. 110-111 Reserved Input Stream: For input streams, the FIFOW value is determined by the EM3.ISRWS (SEM3.ISRWS) field. Output Stream: For output streams, the FIFOW value is determined by the EM4.OSRWS (SEM4.OSRWS) field.

5.2.43 Input/Output Stream Descriptor x FIFO Size (ISD0FIFOS) - Offset 90h

This register reports the FIFO size of the stream DMA.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 90h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW/V	**FIFO Size (FIFOS):** When GCAP2.EEAC = 0, indicates the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time. This is the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on the stream format programmed in (I/O) SDxFMT register, the min frame of buffering setting in EM(3/4)(SEM(3/4)).(I/O)SBSMFA[1:0] field, and the minimum buffer size threshold setting in EM2.BSMT[1:0] field. As the default value is zero, SW must write to the (I/O) SDxFMT register to kick off the FIFO size calculation, and read back to find out the HW allocated FIFO size. When GCAP2.EEAC = 1, this FIFOS value represent the minimum FIFO size HW required to operate efficiently. SW can program FIFOL register to extend the effective FIFO size in HW beyond this minimum value advertised. In this case, the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time, the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and also the maximum possible value that the PICB count will increase by one time, all these maximum values could be larger than FIFOS value, depending on the FIFOL register setting. When EM2.HWFIFOL = 1, this FIFOS value will reflect the larger FIFO size of up to 10 ms, if extra buffer space is available.

5.2.44 Input/Output Stream Descriptor x Format (ISD0FMT) - Offset 92h

This register specifies the audio format of the stream DMA.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 92h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW	**Sample Base Rate (BASE):** 0=48 kHz 1=44.1 kHz
13:11	0h RW	**Sample Base Rate Multiple (MULT):** 000=48 kHz/44.1 kHz or less 001=x2 (96 kHz, 88.2 kHz, 32 kHz) 010=x3 (144 kHz) 011=x4 (192 kHz, 176.4 kHz) 100-111=Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** 000=Divide by 1 (48 kHz, 44.1 kHz) 001=Divide by 2 (24 kHz, 22.05 kHz) 010=Divide by 3 (16 kHz, 32 kHz) 011=Divide by 4 (11.025 kHz) 100=Divide by 5 (9.6 kHz) 101=Divide by 6 (8 kHz) 110=Divide by 7 111=Divide by 8 (6 kHz)

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Reserved**
6:4	0h RW	**Bits per Sample (BITS):** 000=8 bits. The data will be packed in memory in 8bit containers on 16bit boundaries 001=16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries 010=20 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 011=24 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 100=32 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 101-111=Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: 0000=1 0001=2 ... 1111=16

5.2.45 Input/Output Stream Descriptor x FIFO Limit (ISD0FIFOL) - Offset 94h

This register controls the effective FIFO size for energy efficient audio operation.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 94h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW/L	**GNL:** Granularity associated with LMT field definition. The LMT value needs to be multiplied with 125 us or 1 ms to get the access limit in time domain. 0 = 125 us 1 = 1 ms This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO). **Locked by:** GCAP2.EEAC
13:0	0000h RW/L	**FIFO Limit (FIFOL):** Indicate how far the media player / application intend to process ahead, in units of time. HW can extend the effective FIFO size to fetch (for output stream) or evict (for input stream) more data in the cyclic buffer beyond the minimum FIFO size advertised in FIFOS register, up to this access limit. Need to multiply with the granularity (125 us vs. 1 ms) as defined in GNL bit, to get the actual processing ahead time.0 = Disabled (FIFOS is the limit)0001h 3FFFh = 1 16383 units. When value) 0 (enabled), setting FIFOLC bit will trigger HW to evaluate the access limit change and update effective FIFO size (depending on the capability supported). SW shall make sure the FIFOL field is not changed in the progress of access limit change sequence. This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO). **Locked by:** GCAP2.EEAC

5.2.46 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (ISD0BDLPLBA) - Offset 98h

This register specifies the base address (lower 32 bits) of Buffer Descriptor List.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0000000h RW	**Buffer Descriptor List Lower Base Address (BDLPLBA):** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted.
6:0	0h RO	**Reserved**

5.2.47 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (ISD0BDLPUBA) - Offset 9Ch

This register specifies the base address (upper 32 bits) of Buffer Descriptor List.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/L	**Buffer Descriptor List Upper Base Address (BDLPUBA):** Upper 32bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. Locked when GCAP.64OK = 0. **Locked by:** GCAP.ADD64OK

5.2.48 Input/Output Stream Descriptor x Control (ISD1CTLB0) - Offset A0h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + A0h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RW/V/L	**FIFO Limit Change (FIFOLC):** Writing a 1 to this bit indicates a new update to the FIFOL register has been made. After the HW has completed sequencing into the new effective FIFO size, it will clear this bit. This bit is RO if GCAP2.EEAC = 0.If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 0 (static), this bit will only have effect when the stream is idle (before the first time RUN bit is set).If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 1 (dynamic), on top of supporting the static behavior describe above, this bit also has effect when the stream is active (after he first time RUN bit is set). **Locked by:** SBPR.FNCFG.BCLD
4	0h RW	**Descriptor Error Interrupt Enable (DEIE):** Controls whether an interrupt is generated when the Descriptor Error Status (DESE) bit is set.
3	0h RW	**FIFO Error Interrupt Enable (FEIE):** This bit controls whether the occurrence of a FIFO error (overrun for input or under run for output) will cause an interrupt or not. If this bit is not set, bit 3 in the Status register will be set, but the interrupt will not occur. Either way, the samples will be dropped.
2	0h RW	**Interrupt On Completion Enable (IOCE):** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set, bit 2 in the Status register will beset, but the interrupt will not occur
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the streams registers. The RUN bit must be cleared before SRST is asserted.

5.2.49 Input/Output Stream Descriptor x Status (ISD1STS) - Offset A3h

This register provides the status of the stream DMA.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + A3h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RO/V	**FIFO Ready (FIFORDY):** This bit defaults to 0 on reset because the FIFO is cleared on a reset. Input Stream: For input streams, the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. Output Stream: For output streams, the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on then link.
4	0h RW/1C/V	**Descriptor Error (DESE):** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort, a Parity or ECC error on the bus, or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error, as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.
3	0h RW/1C/V	**FIFO Error (FIFOE):** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. Input Stream: For an input stream, this indicates a FIFO overrun occurring while the RUN bit is set. When this happens, the FIFO pointers don't increment and the incoming data is not written into the FIFO, thereby being lost. Output Stream: For an output stream, this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send.
2	0h RW/1C/V	**Buffer Completion Interrupt Status (BCIS):** This bit is set to 1 by the hardware after the last sample of a buffer has been processed, AND if the Interrupt on Completion (IOC) bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
1:0	0h RO	**Reserved**

5.2.50 Input/Output Stream Descriptor x Link Position in Buffer (ISD1LPIB) - Offset A4h

This register reports the link position in buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + A4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Link Position in Buffer (LPIB):** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1).Once RUN bit is set, the register will become read only until SRST occurs.

5.2.51 Input/Output Stream Descriptor x Cyclic Buffer Length (ISD1CBL) - Offset A8h

This register specifies the cyclic buffer size.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + A8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Cyclic Buffer Length (CBL):** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer (LPIB) will be reset when it reaches this value. Software may only write to this register after Global Reset, Controller Reset, or Stream Reset has occurred. This value should only be modified when the RUN bit is'0'. Once the RUN bit has been set to enable the engine, software must not write to this register until after the next reset is asserted, or transfers may be corrupted.

5.2.52 Input/Output Stream Descriptor x Last Valid Index (ISD1LVI) - Offset ACh

This register specifies the last valid buffer descriptor index.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + ACh	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved**
7:0	00h RW	**Last Valid Index (LVI):** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor, it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1, i.e., there must be at least two valid entries in the buffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is '0'

5.2.53 Input/Output Stream Descriptor x FIFO Eviction Watermark (ISD1FIFOW) - Offset AEh

This register reports the threshold of the FIFO that triggers an access to cyclic buffer.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + AEh	0004h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0h RO	**Reserved**
2:0	4h RO/V	**FIFOW:** Indicates the minimum number of bytes accumulated (for input) or free (for output) in the FIFO before the controller will start an eviction (for input) or fetch (for output) of data. The PCH HD Audio controller hardwires the FIFO Watermark, either 32B or 64Bbased on the following. Bit(2:0) Description 000-011 Reserved 100 32 B Supported. The 32 B request is aligned to 32 B boundaries. 101 64 B Supported. The 64 B request is aligned to 64 B boundaries. 110-111 Reserved Input Stream: For input streams, the FIFOW value is determined by the EM3.ISRWS (SEM3.ISRWS) field. Output Stream: For output streams, the FIFOW value is determined by the EM4.OSRWS (SEM4.OSRWS) field.

5.2.54 Input/Output Stream Descriptor x FIFO Size (ISD1FIFOS) - Offset B0h

This register reports the FIFO size of the stream DMA.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + B0h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW/V	**FIFO Size (FIFOS):** When GCAP2.EEAC = 0, indicates the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time. This is the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on the stream format programmed in (I/O) SDxFMT register, the min frame of buffering setting inEM(3/4)(SEM(3/4)).(I/O)SBSMFA[1:0] field, and the minimum buffer size threshold setting in EM2.BSMT[1:0] field. As the default value is zero, SW must write to the (I/O) SDxFMT register to kick off the FIFO size calculation, and read back to find out the HW allocated FIFO size. When GCAP2.EEAC = 1, this FIFOS value represent the minimum FIFO size HW required to operate efficiently. SW can program FIFOL register to extend the effective FIFO size in HW beyond this minimum value advertised. In this case, the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time, the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and also the maximum possible value that the PICB count will increase by one time, all these maximum values could be larger than FIFOS value, depending on the FIFOL register setting. When EM2.HWFIFOL = 1, this FIFOS value will reflect the larger FIFO size of up to 10 ms, if extra buffer space is available.

5.2.55 Input/Output Stream Descriptor x Format (ISD1FMT) - Offset B2h

This register specifies the audio format of the stream DMA.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + B2h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**

5.2.56 Input/Output Stream Descriptor x FIFO Limit (ISD1FIFOL) - Offset B4h

This register controls the effective FIFO size for energy efficient audio operation.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + B4h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW/L	**GNL:** Granularity associated with LMT field definition. The LMT value needs to be multiplied with 125 us or 1 ms to get the access limit in time domain. 0 = 125 us 1 = 1 ms This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO). **Locked by:** GCAP2.EEAC
13:0	0000h RW/L	**FIFO Limit (FIFOL):** Indicate how far the media player / application intend to process ahead, in units of time. HW can extend the effective FIFO size to fetch (for output stream) or evict (for input stream) more data in the cyclic buffer beyond the minimum FIFO size advertised in FIFOS register, up to this access limit. Need to multiply with the granularity (125 us vs. 1 ms) as defined in GNL bit, to get the actual processing ahead time.0 = Disabled (FIFOS is the limit)0001h 3FFFh = 1 16383 units When value) 0 (enabled), setting FIFOLC bit will trigger HW to evaluate the access limit change and update effective FIFO size (depending on the capability supported). SW shall make sure the FIFOL field is not changed in the progress of access limit change sequence. This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO). **Locked by:** GCAP2.EEAC

5.2.57 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (ISD1BDLPLBA) - Offset B8h

This register specifies the base address (lower 32 bits) of Buffer Descriptor List.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + B8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0000000h RW	**Buffer Descriptor List Lower Base Address (BDLPLBA):** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted.
6:0	0h RO	**Reserved**

5.2.58 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (ISD1BDLPUBA) - Offset BCh

This register specifies the base address (upper 32 bits) of Buffer Descriptor List.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + BCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/L	**Buffer Descriptor List Upper Base Address (BDLPUBA):** Upper 32bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. Locked when GCAP.64OK = 0. **Locked by:** GCAP.ADD64OK

5.2.59 Input/Output Stream Descriptor x Control (ISD2CTLB0) - Offset C0h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + C0h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RW/V/L	**FIFO Limit Change (FIFOLC):** Writing a 1 to this bit indicates a new update to the FIFOL register has been made. After the HW has completed sequencing into the new effective FIFO size, it will clear this bit. This bit is RO if GCAP2.EEAC = 0.If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 0 (static), this bit will only have effect when the stream is idle (before the first time RUN bit is set).If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 1 (dynamic), on top of supporting the static behavior describe above, this bit also has effect when the stream is active (after the first time RUN bit is set). **Locked by:** SBPR.FNCFG.BCLD
4	0h RW	**Descriptor Error Interrupt Enable (DEIE):** Controls whether an interrupt is generated when the Descriptor Error Status (DESE) bit is set.
3	0h RW	**FIFO Error Interrupt Enable (FEIE):** This bit controls whether the occurrence of a FIFO error (overrun for input or under run for output) will cause an interrupt or not. If this bit is not set, bit 3 in the Status register will be set, but the interrupt will not occur. Either way, the samples will be dropped.
2	0h RW	**Interrupt On Completion Enable (IOCE):** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set, bit 2 in the Status register will beset, but the interrupt will not occur
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the streams registers. The RUN bit must be cleared before SRST is asserted.

5.2.60 Input/Output Stream Descriptor x Status (ISD2STS) - Offset C3h

This register provides the status of the stream DMA.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + C3h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RO/V	**FIFO Ready (FIFORDY):** This bit defaults to 0 on reset because the FIFO is cleared on a reset. Input Stream: For input streams, the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. Output Stream: For output streams, the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on the link.
4	0h RW/1C/V	**Descriptor Error (DESE):** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort, a Parity or ECC error on the bus, or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error, as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.
3	0h RW/1C/V	**FIFO Error (FIFOE):** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. Input Stream: For an input stream, this indicates a FIFO overrun occurring while the RUN bit is set. When this happens, the FIFO pointers don't increment and the incoming data is not written into the FIFO, thereby being lost. Output Stream: For an output stream, this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send.
2	0h RW/1C/V	**Buffer Completion Interrupt Status (BCIS):** This bit is set to 1 by the hardware after the last sample of a buffer has been processed, AND if the Interrupt on Completion (IOC) bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
1:0	0h RO	**Reserved**

5.2.61 Input/Output Stream Descriptor x Link Position in Buffer (ISD2LPIB) - Offset C4h

This register reports the link position in buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + C4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Link Position in Buffer (LPIB):** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1).Once RUN bit is set, the register will become read only until SRST occurs.

5.2.62 Input/Output Stream Descriptor x Cyclic Buffer Length (ISD2CBL) - Offset C8h

This register specifies the cyclic buffer size.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + C8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Cyclic Buffer Length (CBL):** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer (LPIB) will be reset when it reaches this value. Software may only write to this register after Global Reset, Controller Reset, or Stream Reset has occurred. This value should only be modified when the RUN bit is'0'. Once the RUN bit has been set to enable the engine, software must not write to this register until after the next reset is asserted, or transfers may be corrupted.

5.2.63 Input/Output Stream Descriptor x Last Valid Index (ISD2LVI) - Offset CCh

This register specifies the last valid buffer descriptor index.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + CCh	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved**
7:0	00h RW	**Last Valid Index (LVI):** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor, it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1, i.e., there must be at least two valid entries in the buffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is '0'

5.2.64 Input/Output Stream Descriptor x FIFO Eviction Watermark (ISD2FIFOW) - Offset CEh

This register reports the threshold of the FIFO that triggers an access to cyclic buffer.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + CEh	0004h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0h RO	**Reserved**
2:0	4h RO/V	**FIFOW:** Indicates the minimum number of bytes accumulated (for input) or free (for output) in the FIFO before the controller will start an eviction (for input) or fetch (for output) of data. The PCH HD Audio controller hardwires the FIFO Watermark, either 32B or 64Bbased on the following. Bit(2:0) Description 000-011 Reserved 100 32 B Supported. The 32 B request is aligned to 32 B boundaries. 101 64 B Supported. The 64 B request is aligned to 64 B boundaries. 110-111 Reserved Input Stream: For input streams, the FIFOW value is determined by the EM3.ISRWS (SEM3.ISRWS) field. Output Stream: For output streams, the FIFOW value is determined by the EM4.OSRWS (SEM4.OSRWS) field.

5.2.65 Input/Output Stream Descriptor x FIFO Size (ISD2FIFOS) - Offset D0h

This register reports the FIFO size of the stream DMA.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + D0h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW/V	**FIFO Size (FIFOS):** When GCAP2.EEAC = 0, indicates the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time. This is the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on the stream format programmed in (I/O) SDxFMT register, the min frame of buffering setting inEM(3/4)(SEM(3/4)).(I/O)SBSMFA[1:0] field, and the minimum buffer size threshold setting in EM2.BSMT[1:0] field. As the default value is zero, SW must write to the (I/O) SDxFMT register to kick off the FIFO size calculation, and read back to find out the HW allocated FIFO size. When GCAP2.EEAC = 1, this FIFOS value represent the minimum FIFO size HW required to operate efficiently. SW can program FIFOL register to extend the effective FIFO size in HW beyond this minimum value advertised. In this case, the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time, the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and also the maximum possible value that the PICB count will increase by one time, all these maximum values could be larger than FIFOS value, depending on the FIFOL register setting. When EM2.HWFIFOL = 1, this FIFOS value will reflect the larger FIFO size of up to 10 ms, if extra buffer space is available.

5.2.66 Input/Output Stream Descriptor x Format (ISD2FMT) - Offset D2h

This register specifies the audio format of the stream DMA.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + D2h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW	**Sample Base Rate (BASE):** 0=48 kHz 1=44.1 kHz
13:11	0h RW	**Sample Base Rate Multiple (MULT):** 000=48 kHz/44.1 kHz or less 001=x2 (96 kHz, 88.2 kHz, 32 kHz) 010=x3 (144 kHz) 011=x4 (192 kHz, 176.4 kHz) 100-111=Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** 000=Divide by 1 (48 kHz, 44.1 kHz) 001=Divide by 2 (24 kHz, 22.05 kHz) 010=Divide by 3 (16 kHz, 32 kHz) 011=Divide by 4 (11.025 kHz) 100=Divide by 5 (9.6 kHz) 101=Divide by 6 (8 kHz) 110=Divide by 7 111=Divide by 8 (6 kHz)

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Reserved**
6:4	0h RW	**Bits per Sample (BITS):** 000=8 bits. The data will be packed in memory in 8bit containers on 16bit boundaries 001=16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries 010=20 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 011=24 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 100=32 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 101-111=Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: 0000=1 0001=2 ... 1111=16

5.2.67 Input/Output Stream Descriptor x FIFO Limit (ISD2FIFOL) - Offset D4h

This register controls the effective FIFO size for energy efficient audio operation.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + D4h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW/L	**GNL:** Granularity associated with LMT field definition. The LMT value needs to be multiplied with 125 us or 1 ms to get the access limit in time domain. 0 = 125 us 1 = 1 ms This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO). **Locked by:** GCAP2.EEAC
13:0	0000h RW/L	**FIFO Limit (FIFOL):** Indicate how far the media player / application intend to process ahead, in units of time. HW can extend the effective FIFO size to fetch (for output stream) or evict (for input stream) more data in the cyclic buffer beyond the minimum FIFO size advertised in FIFOS register, up to this access limit. Need to multiply with the granularity (125 us vs. 1 ms) as defined in GNL bit, to get the actual processing ahead time.0 = Disabled (FIFOS is the limit)0001h 3FFFh = 1 16383 units When value) 0 (enabled), setting FIFOLC bit will trigger HW to evaluate the access limit change and update effective FIFO size (depending on the capability supported). SW shall make sure the FIFOL field is not changed in the progress of access limit change sequence. This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO). **Locked by:** GCAP2.EEAC

5.2.68 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (ISD2BDLPLBA) - Offset D8h

This register specifies the base address (lower 32 bits) of Buffer Descriptor List.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0000000h RW	**Buffer Descriptor List Lower Base Address (BDLPLBA):** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted.
6:0	0h RO	**Reserved**

5.2.69 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (ISD2BDLPUBA) - Offset DCh

This register specifies the base address (upper 32 bits) of Buffer Descriptor List.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + DCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/L	**Buffer Descriptor List Upper Base Address (BDLPUBA):** Upper 32bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. Locked when GCAP.64OK = 0. **Locked by:** GCAP.ADD64OK

5.2.70 Input/Output Stream Descriptor x Control (ISD3CTLB0) - Offset E0h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + E0h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RW/V/L	**FIFO Limit Change (FIFOLC):** Writing a 1 to this bit indicates a new update to the FIFOL register has been made. After the HW has completed sequencing into the new effective FIFO size, it will clear this bit. This bit is RO if GCAP2.EEAC = 0.If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 0 (static), this bit will only have effect when the stream is idle (before the first time RUN bit is set).If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 1 (dynamic), on top of supporting the static behavior describe above, this bit also has effect when the stream is active (after the first time RUN bit is set). **Locked by:** SBPR.FNCFG.BCLD
4	0h RW	**Descriptor Error Interrupt Enable (DEIE):** Controls whether an interrupt is generated when the Descriptor Error Status (DESE) bit is set.
3	0h RW	**FIFO Error Interrupt Enable (FEIE):** This bit controls whether the occurrence of a FIFO error (overrun for input or under run for output) will cause an interrupt or not. If this bit is not set, bit 3 in the Status register will be set, but the interrupt will not occur. Either way, the samples will be dropped.
2	0h RW	**Interrupt On Completion Enable (IOCE):** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set, bit 2 in the Status register will beset, but the interrupt will not occur
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit.Software must read a 0 from this bit before accessing any of the streams registers. The RUN bit must be cleared before SRST is asserted.

5.2.71 Input/Output Stream Descriptor x Status (ISD3STS) - Offset E3h

This register provides the status of the stream DMA.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + E3h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RO/V	**FIFO Ready (FIFORDY):** This bit defaults to 0 on reset because the FIFO is cleared on a reset. Input Stream: For input streams, the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. Output Stream: For output streams, the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on then link.
4	0h RW/1C/V	**Descriptor Error (DESE):** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort, a Parity or ECC error on the bus, or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error, as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.
3	0h RW/1C/V	**FIFO Error (FIFOE):** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. Input Stream: For an input stream, this indicates a FIFO overrun occurring while the RUN bit is set. When this happens, the FIFO pointers don't increment and the incoming data is not written into the FIFO, thereby being lost. Output Stream: For an output stream, this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send.
2	0h RW/1C/V	**Buffer Completion Interrupt Status (BCIS):** This bit is set to 1 by the hardware after the last sample of a buffer has been processed, AND if the Interrupt on Completion (IOC) bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
1:0	0h RO	**Reserved**

5.2.72 Input/Output Stream Descriptor x Link Position in Buffer (ISD3LPIB) - Offset E4h

This register reports the link position in buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Link Position in Buffer (LPIB):** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1).Once RUN bit is set, the register will become read only until SRST occurs.

5.2.73 Input/Output Stream Descriptor x Cyclic Buffer Length (ISD3CBL) - Offset E8h

This register specifies the cyclic buffer size.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + E8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Cyclic Buffer Length (CBL):** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer (LPIB) will be reset when it reaches this value. Software may only write to this register after Global Reset, Controller Reset, or Stream Reset has occurred. This value should only be modified when the RUN bit is'0'. Once the RUN bit has been set to enable the engine, software must not write to this register until after the next reset is asserted, or transfers may be corrupted.

5.2.74 Input/Output Stream Descriptor x Last Valid Index (ISD3LVI) - Offset ECh

This register specifies the last valid buffer descriptor index.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + ECh	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved**
7:0	00h RW	**Last Valid Index (LVI):** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor, it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1, i.e., there must be at least two valid entries in the buffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is '0”.

5.2.75 Input/Output Stream Descriptor x FIFO Eviction Watermark (ISD3FIFOW) - Offset EEh

This register reports the threshold of the FIFO that triggers an access to cyclic buffer.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + EEh	0004h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0h RO	**Reserved**
2:0	4h RO/V	**FIFOW:** Indicates the minimum number of bytes accumulated (for input) or free (for output) in the FIFO before the controller will start an eviction (for input) or fetch (for output) of data. The PCH HD Audio controller hardwires the FIFO Watermark, either 32B or 64Bbased on the following. Bit(2:0) Description 000-011 Reserved 100 32 B Supported. The 32 B request is aligned to 32 B boundaries. 101 64 B Supported. The 64 B request is aligned to 64 B boundaries. 110-111 Reserved Input Stream: For input streams, the FIFOW value is determined by the EM3.ISRWS (SEM3.ISRWS) field. Output Stream: For output streams, the FIFOW value is determined by the EM4.OSRWS (SEM4.OSRWS) field.

5.2.76 Input/Output Stream Descriptor x FIFO Size (ISD3FIFOS) - Offset F0h

This register reports the FIFO size of the stream DMA.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + F0h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW/V	**FIFO Size (FIFOS):** When GCAP2.EEAC = 0, indicates the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time. This is the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on the stream format programmed in (I/O) SDxFMT register, the min frame of buffering setting inEM(3/4)(SEM(3/4)).(I/O)SBSMFA[1:0] field, and the minimum buffer size threshold setting in EM2.BSMT[1:0] field. As the default value is zero, SW must write to the (I/O) SDxFMT register to kick off the FIFO size calculation, and read back to find out the HW allocated FIFO size. When GCAP2.EEAC = 1, this FIFOS value represent the minimum FIFO size HW required to operate efficiently. SW can program FIFOL register to extend the effective FIFO size in HW beyond this minimum value advertised. In his case, the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time, the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and also the maximum possible value that the PICB count will increase by one time, all these maximum values could be larger than FIFOS value, depending on the FIFOL register setting. When EM2.HWFIFOL = 1, this FIFOS value will reflect the larger FIFO size of up to 10 ms, if extra buffer space is available.

5.2.77 Input/Output Stream Descriptor x Format (ISD3FMT) - Offset F2h

This register specifies the audio format of the stream DMA.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + F2h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW	**Sample Base Rate (BASE):** 0=48 kHz 1=44.1 kHz
13:11	0h RW	**Sample Base Rate Multiple (MULT):** 000=48 kHz/44.1 kHz or less 001=x2 (96 kHz, 88.2 kHz, 32 kHz) 010=x3 (144 kHz) 011=x4 (192 kHz, 176.4 kHz) 100-111=Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** 000=Divide by 1 (48 kHz, 44.1 kHz) 001=Divide by 2 (24 kHz, 22.05 kHz) 010=Divide by 3 (16 kHz, 32 kHz) 011=Divide by 4 (11.025 kHz) 100=Divide by 5 (9.6 kHz) 101=Divide by 6 (8 kHz) 110=Divide by 7 111=Divide by 8 (6 kHz)

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Reserved**
6:4	0h RW	**Bits per Sample (BITS):** 000=8 bits. The data will be packed in memory in 8bit containers on 16bit boundaries 001=16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries 010=20 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 011=24 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 100=32 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 101-111=Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: 0000=1 0001=2 ... 1111=16

5.2.78 Input/Output Stream Descriptor x FIFO Limit (ISD3FIFOL) - Offset F4h

This register controls the effective FIFO size for energy efficient audio operation.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + F4h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW/L	**GNL:** Granularity associated with LMT field definition. The LMT value needs to be multiplied with 125 us or 1 ms to get the access limit in time domain. 0 = 125 us 1 = 1 ms This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO). **Locked by:** GCAP2.EEAC
13:0	0000h RW/L	**FIFO Limit (FIFOL):** Indicate how far the media player / application intend to process ahead, in units of time. HW can extend the effective FIFO size to fetch (for output stream) or evict (for input stream) more data in the cyclic buffer beyond the minimum FIFO size advertised in FIFOS register, up to this access limit. Need to multiply with the granularity (125 us vs. 1 ms) as defined in GNL bit, to get the actual processing ahead time.0 = Disabled (FIFOS is the limit)0001h 3FFFh = 1 16383 units. When value) 0 (enabled), setting FIFOLC bit will trigger HW to evaluate the access limit change and update effective FIFO size (depending on the capability supported). SW shall make sure the FIFOL field is not changed in the progress of access limit change sequence. This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO). **Locked by:** GCAP2.EEAC

5.2.79 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (ISD3BDLPLBA) - Offset F8h

This register specifies the base address (lower 32 bits) of Buffer Descriptor List.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + F8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0000000h RW	**Buffer Descriptor List Lower Base Address (BDLPLBA):** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted.
6:0	0h RO	**Reserved**

5.2.80 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (ISD3BDLPUBA) - Offset FCh

This register specifies the base address (upper 32 bits) of Buffer Descriptor List.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + FCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/L	**Buffer Descriptor List Upper Base Address (BDLPUBA):** Upper 32bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. Locked when GCAP.64OK = 0. **Locked by:** GCAP.ADD64OK

5.2.81 Input/Output Stream Descriptor x Control (ISD4CTLB0) - Offset 100h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 100h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RW/V/L	**FIFO Limit Change (FIFOLC):** Writing a 1 to this bit indicates a new update to the FIFOL register has been made. After the HW has completed sequencing into the new effective FIFO size, it will clear this bit. This bit is RO if GCAP2.EEAC = 0.If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 0 (static), this bit will only have effect when the stream is idle (before the first time RUN bit is set).If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 1 (dynamic), on top of supporting the static behavior describe above, this bit also has effect when the stream is active (after the first time RUN bit is set). **Locked by:** SBPR.FNCFG.BCLD
4	0h RW	**Descriptor Error Interrupt Enable (DEIE):** Controls whether an interrupt is generated when the Descriptor Error Status (DESE) bit is set.
3	0h RW	**FIFO Error Interrupt Enable (FEIE):** This bit controls whether the occurrence of a FIFO error (overrun for input or underrun for output) will cause an interrupt or not. If this bit is not set, bit 3 in the Status register will be set, but the interrupt will not occur. Either way, the samples will be dropped.
2	0h RW	**Interrupt On Completion Enable (IOCE):** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set, bit 2 in the Status register will beset, but the interrupt will not occur
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the streams registers. The RUN bit must be cleared before SRST is asserted.

5.2.82 Input/Output Stream Descriptor x Status (ISD4STS) - Offset 103h

This register provides the status of the stream DMA.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 103h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RO/V	**FIFO Ready (FIFORDY):** This bit defaults to 0 on reset because the FIFO is cleared on a reset.Input Stream: For input streams, the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. Output Stream: For output streams, the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on the link.
4	0h RW/1C/V	**Descriptor Error (DESE):** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort, a Parity or ECC error on the bus, or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error, as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.
3	0h RW/1C/V	**FIFO Error (FIFOE):** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. Input Stream: For an input stream, this indicates a FIFO overrun occurring while the RUN bit is set. When this happens, the FIFO pointers don't increment and the incoming data is not written into the FIFO, thereby being lost. Output Stream: For an output stream, this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send.
2	0h RW/1C/V	**Buffer Completion Interrupt Status (BCIS):** This bit is set to 1 by the hardware after the last sample of a buffer has been processed, AND if the Interrupt on Completion (IOC) bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
1:0	0h RO	**Reserved**

5.2.83 Input/Output Stream Descriptor x Link Position in Buffer (ISD4LPIB) - Offset 104h

This register reports the link position in buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 104h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Link Position in Buffer (LPIB):** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1).Once RUN bit is set, the register will become read only until SRST occurs.

5.2.84 Input/Output Stream Descriptor x Cyclic Buffer Length (ISD4CBL) - Offset 108h

This register specifies the cyclic buffer size.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 108h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Cyclic Buffer Length (CBL):** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer (LPIB) will be reset when it reaches this value. Software may only write to this register after Global Reset, Controller Reset, or Stream Reset has occurred. This value should only be modified when the RUN bit is'0'. Once the RUN bit has been set to enable the engine, software must not write to this register until after the next reset is asserted, or transfers may be corrupted.

5.2.85 Input/Output Stream Descriptor x Last Valid Index (ISD4LVI) - Offset 10Ch

This register specifies the last valid buffer descriptor index.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 10Ch	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved**
7:0	00h RW	**Last Valid Index (LVI):** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor, it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1, i.e., there must be at least two valid entries in the buffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is '0'

5.2.86 Input/Output Stream Descriptor x FIFO Eviction Watermark (ISD4FIFOW) - Offset 10Eh

This register reports the threshold of the FIFO that triggers an access to cyclic buffer.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 10Eh	0004h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0h RO	**Reserved**
2:0	4h RO/V	**FIFOW:** Indicates the minimum number of bytes accumulated (for input) or free (for output) in the FIFO before the controller will start an eviction (for input) or fetch (for output) of data. The PCH HD Audio controller hardwires the FIFO Watermark, either 32B or 64Bbased on the following. Bit(2:0) Description 000-011 Reserved 100 32 B Supported. The 32 B request is aligned to 32 B boundaries. 101 64 B Supported. The 64 B request is aligned to 64 B boundaries. 110-111 Reserved Input Stream: For input streams, the FIFOW value is determined by the EM3.ISRWS (SEM3.ISRWS) field. Output Stream: For output streams, the FIFOW value is determined by the EM4.OSRWS (SEM4.OSRWS) field.

5.2.87 Input/Output Stream Descriptor x FIFO Size (ISD4FIFOS) - Offset 110h

This register reports the FIFO size of the stream DMA.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 110h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW/V	**FIFO Size (FIFOS):** When GCAP2.EEAC = 0, indicates the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time. This is the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on the stream format programmed in (I/O) SDxFMT register, the min frame of buffering setting inEM(3/4)(SEM(3/4)).(I/O)SBSMFA[1:0] field, and the minimum buffer size threshold setting in EM2.BSMT[1:0] field. As the default value is zero, SW must write to the (I/O) SDxFMT register to kick off the FIFO size calculation, and read back to find out the HW allocated FIFO size. When GCAP2.EEAC = 1, this FIFOS value represent the minimum FIFO size HW required to operate efficiently. SW can program FIFOL register to extend the effective FIFO size in HW beyond this minimum value advertised. In this case, the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time, the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and also the maximum possible value that the PICB count will increase by one time, all these maximum values could be larger than FIFOS value, depending on the FIFOL register setting. When EM2.HWFIFOL = 1, this FIFOS value will reflect the larger FIFO size of up to 10 ms, if extra buffer space is available.

5.2.88 Input/Output Stream Descriptor x Format (ISD4FMT) - Offset 112h

This register specifies the audio format of the stream DMA.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 112h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW	**Sample Base Rate (BASE):** 0=48 kHz 1=44.1 kHz
13:11	0h RW	**Sample Base Rate Multiple (MULT):** 000=48 kHz/44.1 kHz or less 001=x2 (96 kHz, 88.2 kHz, 32 kHz) 010=x3 (144 kHz) 011=x4 (192 kHz, 176.4 kHz) 100-111=Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** 000=Divide by 1 (48 kHz, 44.1 kHz) 001=Divide by 2 (24 kHz, 22.05 kHz) 010=Divide by 3 (16 kHz, 32 kHz) 011=Divide by 4 (11.025 kHz) 100=Divide by 5 (9.6 kHz) 101=Divide by 6 (8 kHz) 110=Divide by 7 111=Divide by 8 (6 kHz)
7	0h RO	**Reserved**
6:4	0h RW	**Bits per Sample (BITS):** 000=8 bits. The data will be packed in memory in 8bit containers on 16bit boundaries 001=16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries 010=20 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 011=24 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 100=32 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 101-111=Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: 0000=1 0001=2 ... 1111=16

5.2.89 Input/Output Stream Descriptor x FIFO Limit (ISD4FIFOL) - Offset 114h

This register controls the effective FIFO size for energy efficient audio operation.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 114h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW/L	**GNL:** Granularity associated with LMT field definition. The LMT value needs to be multiplied with 125 us or 1 ms to get the access limit in time domain. 0 = 125 us 1 = 1 ms This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO). **Locked by:** GCAP2.EEAC
13:0	0000h RW/L	**FIFO Limit (FIFOL):** Indicate how far the media player / application intend to process ahead, in units of time. HW can extend the effective FIFO size to fetch (for output stream) or evict (for input stream) more data in the cyclic buffer beyond the minimum FIFO size advertised in FIFOS register, up to this access limit. Need to multiply with the granularity (125 us vs. 1 ms) as defined in GNL bit, to get the actual processing ahead time.0 = Disabled (FIFOS is the limit)0001h 3FFFh = 1 16383 units. When value) 0 (enabled), setting FIFOLC bit will trigger HW to evaluate the access limit change and update effective FIFO size (depending on the capability supported). SW shall make sure the FIFOL field is not changed in the progress of access limit change sequence. This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO). **Locked by:** GCAP2.EEAC

5.2.90 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (ISD4BDLPLBA) - Offset 118h

This register specifies the base address (lower 32 bits) of Buffer Descriptor List.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 118h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0000000h RW	**Buffer Descriptor List Lower Base Address (BDLPLBA):** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted.
6:0	0h RO	**Reserved**

5.2.91 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (ISD4BDLPUBA) - Offset 11Ch

This register specifies the base address (upper 32 bits) of Buffer Descriptor List.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 11Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/L	**Buffer Descriptor List Upper Base Address (BDLPUBA):** Upper 32bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. Locked when GCAP.64OK = 0. **Locked by:** GCAP.ADD64OK

5.2.92 Input/Output Stream Descriptor x Control (ISD5CTLB0) - Offset 120h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 120h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RW/V/L	**FIFO Limit Change (FIFOLC):** Writing a 1 to this bit indicates a new update to the FIFOL register has been made. After the HW has completed sequencing into the new effective FIFO size, it will clear this bit. This bit is RO if GCAP2.EEAC = 0.If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 0 (static), this bit will only have effect when the stream is idle (before the first time RUN bit is set).If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 1 (dynamic), on top of supporting the static behavior describe above, this bit also has effect when the stream is active (after the first time RUN bit is set). **Locked by:** SBPR.FNCFG.BCLD
4	0h RW	**Descriptor Error Interrupt Enable (DEIE):** Controls whether an interrupt is generated when the Descriptor Error Status (DESE) bit is set.
3	0h RW	**FIFO Error Interrupt Enable (FEIE):** This bit controls whether the occurrence of a FIFO error (overrun for input or under-run for output) will cause an interrupt or not. If this bit is not set, bit 3 in the Status register will be set, but the interrupt will not occur. Either way, the samples will be dropped.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Interrupt On Completion Enable (IOCE):** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set, bit 2 in the Status register will beset, but the interrupt will not occur
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the streams registers. The RUN bit must be cleared before SRST is asserted.

5.2.93 Input/Output Stream Descriptor x Status (ISD5STS) - Offset 123h

This register provides the status of the stream DMA.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 123h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RO/V	**FIFO Ready (FIFORDY):** This bit defaults to 0 on reset because the FIFO is cleared on a reset. Input Stream: For input streams, the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. Output Stream: For output streams, the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on the link.
4	0h RW/1C/V	**Descriptor Error (DESE):** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort, a Parity or ECC error on the bus, or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error, as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/1C/V	**FIFO Error (FIFOE):** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. Input Stream: For an input stream, this indicates a FIFO overrun occurring while the RUN bit is set. When this happens, the FIFO pointers don't increment and the incoming data is not written into the FIFO, thereby being lost. Output Stream: For an output stream, this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send.
2	0h RW/1C/V	**Buffer Completion Interrupt Status (BCIS):** This bit is set to 1 by the hardware after the last sample of a buffer has been processed, AND if the Interrupt on Completion (IOC) bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
1:0	0h RO	**Reserved**

5.2.94 Input/Output Stream Descriptor x Link Position in Buffer (ISD5LPIB) - Offset 124h

This register reports the link position in buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 124h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Link Position in Buffer (LPIB):** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1).Once RUN bit is set, the register will become read only until SRST occurs.

5.2.95 Input/Output Stream Descriptor x Cyclic Buffer Length (ISD5CBL) - Offset 128h

This register specifies the cyclic buffer size.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 128h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Cyclic Buffer Length (CBL):** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer (LPIB) will be reset when it reaches this value. Software may only write to this register after Global Reset, Controller Reset, or Stream Reset has occurred. This value should only be modified when the RUN bit is'0'. Once the RUN bit has been set to enable the engine, software must not write to this register until after the next reset is asserted, or transfers may be corrupted.

5.2.96 Input/Output Stream Descriptor x Last Valid Index (ISD5LVI) - Offset 12Ch

This register specifies the last valid buffer descriptor index.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 12Ch	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved**
7:0	00h RW	**Last Valid Index (LVI):** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor, it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1, i.e., there must be at least two valid entries in the buffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is '0'

5.2.97 Input/Output Stream Descriptor x FIFO Eviction Watermark (ISD5FIFOW) - Offset 12Eh

This register reports the threshold of the FIFO that triggers an access to cyclic buffer.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 12Eh	0004h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0h RO	**Reserved**
2:0	4h RO/V	**FIFOW:** Indicates the minimum number of bytes accumulated (for input) or free (for output) in the FIFO before the controller will start an eviction (for input) or fetch (for output) of data. The PCH HD Audio controller hardwires the FIFO Watermark, either 32B or 64Bbased on the following. Bit(2:0)Description000-011 Reserved 100 32 B Supported. The 32 B request is aligned to 32 B boundaries. 101 64 B Supported. The 64 B request is aligned to 64 B boundaries. 110-111 Reserved Input Stream: For input streams, the FIFOW value is determined by the EM3.ISRWS (SEM3.ISRWS) field. Output Stream: For output streams, the FIFOW value is determined by the EM4.OSRWS (SEM4.OSRWS) field.

5.2.98 Input/Output Stream Descriptor x FIFO Size (ISD5FIFOS) - Offset 130h

This register reports the FIFO size of the stream DMA.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 130h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW/V	**FIFO Size (FIFOS):** When GCAP2.EEAC = 0, indicates the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time. This is the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on the stream format programmed in (I/O) SDxFMT register, the min frame of buffering setting inEM(3/4)(SEM(3/4)).(I/O)SBSMFA[1:0] field, and the minimum buffer size threshold setting in EM2.BSMT[1:0] field. As the default value is zero, SW must write to the (I/O) SDxFMT register to kick off the FIFO size calculation, and read back to find out the HW allocated FIFO size. When GCAP2.EEAC = 1, this FIFOS value represent the minimum FIFO size HW required to operate efficiently. SW can program FIFOL register to extend the effective FIFO size in HW beyond this minimum value advertised. In this case, the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time, the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and also the maximum possible value that the PICB count will increase by one time, all these maximum values could be larger than FIFOS value, depending on the FIFOL register setting. When EM2.HWFIFOL = 1, this FIFOS value will reflect the larger FIFO size of up to 10 ms, if extra buffer space is available.

5.2.99 Input/Output Stream Descriptor x Format (ISD5FMT) - Offset 132h

This register specifies the audio format of the stream DMA.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 132h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW	**Sample Base Rate (BASE):** 0=48 kHz 1=44.1 kHz

3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: 0000=1 0001=2 ... 1111=16

5.2.100 Input/Output Stream Descriptor x FIFO Limit (ISD5FIFOL) - Offset 134h

This register controls the effective FIFO size for energy efficient audio operation.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 134h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW/L	**GNL:** Granularity associated with LMT field definition. The LMT value needs to be multiplied with 125 us or 1 ms to get the access limit in time domain. 0 = 125 us 1 = 1 ms This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO). **Locked by:** GCAP2.EEAC
13:0	0000h RW/L	**FIFO Limit (FIFOL):** Indicate how far the media player / application intend to process ahead, in units of time. HW can extend the effective FIFO size to fetch (for output stream) or evict (for input stream) more data in the cyclic buffer beyond the minimum FIFO size advertised in FIFOS register, up to this access limit. Need to multiply with the granularity (125 us vs. 1 ms) as defined in GNL bit, to get the actual processing ahead time.0 = Disabled (FIFOS is the limit)0001h 3FFFh = 1 16383 units. When value) 0 (enabled), setting FIFOLC bit will trigger HW to evaluate the access limit change and update effective FIFO size (depending on the capability supported). SW shall make sure the FIFOL field is not changed in the progress of access limit change sequence. This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO). **Locked by:** GCAP2.EEAC

5.2.101 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (ISD5BDLPLBA) - Offset 138h

This register specifies the base address (lower 32 bits) of Buffer Descriptor List.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 138h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0000000h RW	**Buffer Descriptor List Lower Base Address (BDLPLBA):** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted.
6:0	0h RO	**Reserved**

5.2.102 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (ISD5BDLPUBA) - Offset 13Ch

This register specifies the base address (upper 32 bits) of Buffer Descriptor List.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 13Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/L	**Buffer Descriptor List Upper Base Address (BDLPUBA):** Upper 32bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. Locked when GCAP.64OK = 0. **Locked by:** GCAP.ADD64OK

5.2.103 Input/Output Stream Descriptor x Control (ISD6CTLB0) - Offset 140h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 140h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RW/V/L	**FIFO Limit Change (FIFOLC):** Writing a 1 to this bit indicates a new update to the FIFOL register has been made. After the HW has completed sequencing into the new effective FIFO size, it will clear this bit. This bit is RO if GCAP2.EEAC = 0.If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 0 (static), this bit will only have effect when the stream is idle (before the first time RUN bit is set).If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 1 (dynamic), on top of supporting the static behavior describe above, this bit also has effect when the stream is active (after the first time RUN bit is set). **Locked by:** SBPR.FNCFG.BCLD
4	0h RW	**Descriptor Error Interrupt Enable (DEIE):** Controls whether an interrupt is generated when the Descriptor Error Status (DESE) bit is set.
3	0h RW	**FIFO Error Interrupt Enable (FEIE):** This bit controls whether the occurrence of a FIFO error (overrun for input or underrun for output) will cause an interrupt or not. If this bit is not set, bit 3 in the Status register will be set, but the interrupt will not occur. Either way, the samples will be dropped.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Interrupt On Completion Enable (IOCE):** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set, bit 2 in the Status register will beset, but the interrupt will not occur
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the streams registers. The RUN bit must be cleared before SRST is asserted.

5.2.104 Input/Output Stream Descriptor x Status (ISD6STS) - Offset 143h

This register provides the status of the stream DMA.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 143h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RO/V	**FIFO Ready (FIFORDY):** This bit defaults to 0 on reset because the FIFO is cleared on a reset. Input Stream: For input streams, the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. Output Stream: For output streams, the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on the link.
4	0h RW/1C/V	**Descriptor Error (DESE):** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort, a Parity or ECC error on the bus, or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error, as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/1C/V	**FIFO Error (FIFOE):** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. Input Stream: For an input stream, this indicates a FIFO overrun occurring while the RUN bit is set. When this happens, the FIFO pointers don't increment and the incoming data is not written into the FIFO, thereby being lost. Output Stream: For an output stream, this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send.
2	0h RW/1C/V	**Buffer Completion Interrupt Status (BCIS):** This bit is set to 1 by the hardware after the last sample of a buffer has been processed, AND if the Interrupt on Completion (IOC) bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
1:0	0h RO	**Reserved**

5.2.105 Input/Output Stream Descriptor x Link Position in Buffer (ISD6LPIB) - Offset 144h

This register reports the link position in buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 144h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Link Position in Buffer (LPIB):** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1).Once RUN bit is set, the register will become read only until SRST occurs.

5.2.106 Input/Output Stream Descriptor x Cyclic Buffer Length (ISD6CBL) - Offset 148h

This register specifies the cyclic buffer size.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 148h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Cyclic Buffer Length (CBL):** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer (LPIB) will be reset when it reaches this value. Software may only write to this register after Global Reset, Controller Reset, or Stream Reset has occurred. This value should only be modified when the RUN bit is'0'. Once the RUN bit has been set to enable the engine, software must not write to this register until after the next reset is asserted, or transfers may be corrupted.

5.2.107 Input/Output Stream Descriptor x Last Valid Index (ISD6LVI) - Offset 14Ch

This register specifies the last valid buffer descriptor index.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 14Ch	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved**
7:0	00h RW	**Last Valid Index (LVI):** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor, it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1, i.e., there must be at least two valid entries in the buffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is '0'

5.2.108 Input/Output Stream Descriptor x FIFO Eviction Watermark (ISD6FIFOW) - Offset 14Eh

This register reports the threshold of the FIFO that triggers an access to cyclic buffer.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 14Eh	0004h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0h RO	**Reserved**
2:0	4h RO/V	**FIFOW:** Indicates the minimum number of bytes accumulated (for input) or free (for output) in the FIFO before the controller will start an eviction (for input) or fetch (for output) of data. The PCH HD Audio controller hardwires the FIFO Watermark, either 32B or 64B based on the following. Bit(2:0)Description000-011 Reserved 100 32 B Supported. The 32 B request is aligned to 32 B boundaries. 101 64 B Supported. The 64 B request is aligned to 64 B boundaries. 110-111 Reserved Input Stream: For input streams, the FIFOW value is determined by the EM3.ISRWS (SEM3.ISRWS) field. Output Stream: For output streams, the FIFOW value is determined by the EM4.OSRWS (SEM4.OSRWS) field.

5.2.109 Input/Output Stream Descriptor x FIFO Size (ISD6FIFOS) - Offset 150h

This register reports the FIFO size of the stream DMA.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 150h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW/V	**FIFO Size (FIFOS):** When GCAP2.EEAC = 0, indicates the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time. This is the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on the stream format programmed in (I/O) SDxFMT register, the min frame of buffering setting inEM(3/4)(SEM(3/4)).(I/O)SBSMFA[1:0] field, and the minimum buffer size threshold setting in EM2.BSMT[1:0] field. As the default value is zero, SW must write to the (I/O) SDxFMT register to kick off the FIFO size calculation, and read back to find out the HW allocated FIFO size. When GCAP2.EEAC = 1, this FIFOS value represent the minimum FIFO size HW required to operate efficiently. SW can program FIFOL register to extend the effective FIFO size in HW beyond this minimum value advertised. In this case, the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time, the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and also the maximum possible value that the PICB count will increase by one time, all these maximum values could be larger than FIFOS value, depending on the FIFOL register setting. When EM2.HWFIFOL = 1, this FIFOS value will reflect the larger FIFO size of up to 10 ms, if extra buffer space is available.

5.2.110 Input/Output Stream Descriptor x Format (ISD6FMT) - Offset 152h

This register specifies the audio format of the stream DMA.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 152h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW	**Sample Base Rate (BASE):** 0=48 kHz 1=44.1 kHz
13:11	0h RW	**Sample Base Rate Multiple (MULT):** 000=48 kHz/44.1 kHz or less 001=x2 (96 kHz, 88.2 kHz, 32 kHz) 010=x3 (144 kHz) 011=x4 (192 kHz, 176.4 kHz) 100-111=Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** 000=Divide by 1 (48 kHz, 44.1 kHz) 001=Divide by 2 (24 kHz, 22.05 kHz) 010=Divide by 3 (16 kHz, 32 kHz) 011=Divide by 4 (11.025 kHz) 100=Divide by 5 (9.6 kHz) 101=Divide by 6 (8 kHz) 110=Divide by 7 111=Divide by 8 (6 kHz)
7	0h RO	**Reserved**
6:4	0h RW	**Bits per Sample (BITS):** 000=8 bits. The data will be packed in memory in 8bit containers on 16bit boundaries 001=16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries 010=20 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 011=24 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 100=32 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 101-111=Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: 0000=1 0001=2 ... 1111=16

5.2.111 Input/Output Stream Descriptor x FIFO Limit (ISD6FIFOL) - Offset 154h

This register controls the effective FIFO size for energy efficient audio operation.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 154h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW/L	**GNL:** Granularity associated with LMT field definition. The LMT value needs to be multiplied with 125 us or 1 ms to get the access limit in time domain. 0 = 125 us 1 = 1 ms This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO). **Locked by:** GCAP2.EEAC
13:0	0000h RW/L	**FIFO Limit (FIFOL):** Indicate how far the media player / application intend to process ahead, in units of time. HW can extend the effective FIFO size to fetch (for output stream) or evict (for input stream) more data in the cyclic buffer beyond the minimum FIFO size advertised in FIFOS register, up to this access limit. Need to multiply with the granularity (125 us vs. 1 ms) as defined in GNL bit, to get the actual processing ahead time.0 = Disabled (FIFOS is the limit)0001h 3FFFh = 1 16383 units. When value) 0 (enabled), setting FIFOLC bit will trigger HW to evaluate the access limit change and update effective FIFO size (depending on the capability supported). SW shall make sure the FIFOL field is not changed in the progress of access limit change sequence. This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO). **Locked by:** GCAP2.EEAC

5.2.112 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (ISD6BDLPLBA) - Offset 158h

This register specifies the base address (lower 32 bits) of Buffer Descriptor List.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 158h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0000000h RW	**Buffer Descriptor List Lower Base Address (BDLPLBA):** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted.
6:0	0h RO	**Reserved**

5.2.113 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (ISD6BDLPUBA) - Offset 15Ch

This register specifies the base address (upper 32 bits) of Buffer Descriptor List.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 15Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/L	**Buffer Descriptor List Upper Base Address (BDLPUBA):** Upper 32bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. Locked when GCAP.64OK = 0. **Locked by:** GCAP.ADD64OK

5.2.114 Input/Output Stream Descriptor x Control (OSD0CTLB0) - Offset 160h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 160h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RW/V/L	**FIFO Limit Change (FIFOLC):** Writing a 1 to this bit indicates a new update to the FIFOL register has been made. After the HW has completed sequencing into the new effective FIFO size, it will clear this bit. This bit is RO if GCAP2.EEAC = 0.If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 0 (static), this bit will only have effect when the stream is idle (before the first time RUN bit is set).If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 1 (dynamic), on top of supporting the static behavior describe above, this bit also has effect when the stream is active (after the first time RUN bit is set). **Locked by:** SBPR.FNCFG.BCLD
4	0h RW	**Descriptor Error Interrupt Enable (DEIE):** Controls whether an interrupt is generated when the Descriptor Error Status (DESE) bit is set.
3	0h RW	**FIFO Error Interrupt Enable (FEIE):** This bit controls whether the occurrence of a FIFO error (overrun for input or underrun for output) will cause an interrupt or not. If this bit is not set, bit 3 in the Status register will be set, but the interrupt will not occur. Either way, the samples will be dropped.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Interrupt On Completion Enable (IOCE):** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set, bit 2 in the Status register will beset, but the interrupt will not occur
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the streams registers. The RUN bit must be cleared before SRST is asserted.

5.2.115 Input/Output Stream Descriptor x Status (OSD0STS) - Offset 163h

This register provides the status of the stream DMA.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 163h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RO/V	**FIFO Ready (FIFORDY):** This bit defaults to 0 on reset because the FIFO is cleared on a reset. Input Stream: For input streams, the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. Output Stream: For output streams, the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on the link.
4	0h RW/1C/V	**Descriptor Error (DESE):** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort, a Parity or ECC error on the bus, or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error, as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/1C/V	**FIFO Error (FIFOE):** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. Input Stream: For an input stream, this indicates a FIFO overrun occurring while the RUN bit is set. When this happens, the FIFO pointers don't increment and the incoming data is not written into the FIFO, thereby being lost. Output Stream: For an output stream, this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send.
2	0h RW/1C/V	**Buffer Completion Interrupt Status (BCIS):** This bit is set to 1 by the hardware after the last sample of a buffer has been processed, AND if the Interrupt on Completion (IOC) bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
1:0	0h RO	**Reserved**

5.2.116 Input/Output Stream Descriptor x Link Position in Buffer (OSD0LPIB) - Offset 164h

This register reports the link position in buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 164h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Link Position in Buffer (LPIB):** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1).Once RUN bit is set, the register will become read only until SRST occurs.

5.2.117 Input/Output Stream Descriptor x Cyclic Buffer Length (OSD0CBL) - Offset 168h

This register specifies the cyclic buffer size.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 168h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Cyclic Buffer Length (CBL):** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer (LPIB) will be reset when it reaches this value. Software may only write to this register after Global Reset, Controller Reset, or Stream Reset has occurred. This value should only be modified when the RUN bit is'0'. Once the RUN bit has been set to enable the engine, software must not write to this register until after the next reset is asserted, or transfers may be corrupted.

5.2.118 Input/Output Stream Descriptor x Last Valid Index (OSD0LVI) - Offset 16Ch

This register specifies the last valid buffer descriptor index.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 16Ch	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved**
7:0	00h RW	**Last Valid Index (LVI):** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor, it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1, i.e., there must be at least two valid entries in the buffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is '0'

5.2.119 Input/Output Stream Descriptor x FIFO Eviction Watermark (OSD0FIFOW) - Offset 16Eh

This register reports the threshold of the FIFO that triggers an access to cyclic buffer.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 16Eh	0004h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0h RO	**Reserved**
2:0	4h RO/V	**FIFOW:** Indicates the minimum number of bytes accumulated (for input) or free (for output) in the FIFO before the controller will start an eviction (for input) or fetch (for output) of data. The PCH HD Audio controller hardwires the FIFO Watermark, either 32B or 64Bbased on the following. Bit(2:0) Description 000-011 Reserved 100 32 B Supported. The 32 B request is aligned to 32 B boundaries. 101 64 B Supported. The 64 B request is aligned to 64 B boundaries. 110-111 Reserved Input Stream: For input streams, the FIFOW value is determined by the EM3.ISRWS (SEM3.ISRWS) field. Output Stream: For output streams, the FIFOW value is determined by the EM4.OSRWS (SEM4.OSRWS) field.

5.2.120 Input/Output Stream Descriptor x FIFO Size (OSD0FIFOS) - Offset 170h

This register reports the FIFO size of the stream DMA.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 170h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW/V	**FIFO Size (FIFOS):** When GCAP2.EEAC = 0, indicates the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time. This is the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on the stream format programmed in (I/O) SDxFMT register, the min frame of buffering setting inEM(3/4)(SEM(3/4)).(I/O)SBSMFA[1:0] field, and the minimum buffer size threshold setting in EM2.BSMT[1:0] field. As the default value is zero, SW must write to the (I/O) SDxFMT register to kick off the FIFO size calculation, and read back to find out the HW allocated FIFO size. When GCAP2.EEAC = 1, this FIFOS value represent the minimum FIFO size HW required to operate efficiently. SW can program FIFOL register to extend the effective FIFO size in HW beyond this minimum value advertised. In this case, the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time, the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and also the maximum possible value that the PICB count will increase by one time, all these maximum values could be larger than FIFOS value, depending on the FIFOL register setting. When EM2.HWFIFOL = 1, this FIFOS value will reflect the larger FIFO size of up to 10 ms, if extra buffer space is available.

5.2.121 Input/Output Stream Descriptor x Format (OSD0FMT) - Offset 172h

This register specifies the audio format of the stream DMA.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 172h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW	**Sample Base Rate (BASE):** 0=48 kHz 1=44.1 kHz

5.2.122 Input/Output Stream Descriptor x FIFO Limit (OSD0FIFOL) - Offset 174h

This register controls the effective FIFO size for energy efficient audio operation.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 174h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW/L	**GNL:** Granularity associated with LMT field definition. The LMT value needs to be multiplied with 125 us or 1 ms to get the access limit in time domain. 0 = 125 us 1 = 1 ms This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO). **Locked by:** GCAP2.EEAC
13:0	0000h RW/L	**FIFO Limit (FIFOL):** Indicate how far the media player / application intend to process ahead, in units of time. HW can extend the effective FIFO size to fetch (for output stream) or evict (for input stream) more data in the cyclic buffer beyond the minimum FIFO size advertised in FIFOS register, up to this access limit. Need to multiply with the granularity (125 us vs. 1 ms) as defined in GNL bit, to get the actual processing ahead time.0 = Disabled (FIFOS is the limit)0001h 3FFFh = 1 16383 units When value) 0 (enabled), setting FIFOLC bit will trigger HW to evaluate the access limit change and update effective FIFO size (depending on the capability supported). SW shall make sure the FIFOL field is not changed in the progress of access limit change sequence. This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO). **Locked by:** GCAP2.EEAC

5.2.123 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (OSD0BDLPLBA) - Offset 178h

This register specifies the base address (lower 32 bits) of Buffer Descriptor List.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 178h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0000000h RW	**Buffer Descriptor List Lower Base Address (BDLPLBA):** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted.
6:0	0h RO	**Reserved**

5.2.124 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (OSD0BDLPUBA) - Offset 17Ch

This register specifies the base address (upper 32 bits) of Buffer Descriptor List.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 17Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/L	**Buffer Descriptor List Upper Base Address (BDLPUBA):** Upper 32bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. Locked when GCAP.64OK = 0. **Locked by:** GCAP.ADD64OK

5.2.125 Input/Output Stream Descriptor x Control (OSD1CTLB0) - Offset 180h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 180h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RW/V/L	**FIFO Limit Change (FIFOLC):** Writing a 1 to this bit indicates a new update to the FIFOL register has been made. After the HW has completed sequencing into the new effective FIFO size, it will clear this bit. This bit is RO if GCAP2.EEAC = 0.If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 0 (static), this bit will only have effect when the stream is idle (before the first time RUN bit is set).If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 1 (dynamic), on top of supporting the static behavior describe above, this bit also has effect when the stream is active (after the first time RUN bit is set). **Locked by:** SBPR.FNCFG.BCLD
4	0h RW	**Descriptor Error Interrupt Enable (DEIE):** Controls whether an interrupt is generated when the Descriptor Error Status (DESE) bit is set.
3	0h RW	**FIFO Error Interrupt Enable (FEIE):** This bit controls whether the occurrence of a FIFO error (overrun for input or underrun for output) will cause an interrupt or not. If this bit is not set, bit 3 in the Status register will be set, but the interrupt will not occur. Either way, the samples will be dropped.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Interrupt On Completion Enable (IOCE):** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set, bit 2 in the Status register will beset, but the interrupt will not occur
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the streams registers. The RUN bit must be cleared before SRST is asserted.

5.2.126 Input/Output Stream Descriptor x Status (OSD1STS) - Offset 183h

This register provides the status of the stream DMA.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 183h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RO/V	**FIFO Ready (FIFORDY):** This bit defaults to 0 on reset because the FIFO is cleared on a reset. Input Stream: For input streams, the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. Output Stream: For output streams, the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on the link.
4	0h RW/1C/V	**Descriptor Error (DESE):** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort, a Parity or ECC error on the bus, or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error, as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/1C/V	**FIFO Error (FIFOE):** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. Input Stream: For an input stream, this indicates a FIFO overrun occurring while the RUN bit is set. When this happens, the FIFO pointers don't increment and the incoming data is not written into the FIFO, thereby being lost. Output Stream: For an output stream, this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send.
2	0h RW/1C/V	**Buffer Completion Interrupt Status (BCIS):** This bit is set to 1 by the hardware after the last sample of a buffer has been processed, AND if the Interrupt on Completion (IOC) bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
1:0	0h RO	**Reserved**

5.2.127 Input/Output Stream Descriptor x Link Position in Buffer (OSD1LPIB) - Offset 184h

This register reports the link position in buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 184h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Link Position in Buffer (LPIB):** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.128 Input/Output Stream Descriptor x Cyclic Buffer Length (OSD1CBL) - Offset 188h

This register specifies the cyclic buffer size.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 188h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Cyclic Buffer Length (CBL):** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer (LPIB) will be reset when it reaches this value. Software may only write to this register after Global Reset, Controller Reset, or Stream Reset has occurred. This value should only be modified when the RUN bit is'0'. Once the RUN bit has been set to enable the engine, software must not write to this register until after the next reset is asserted, or transfers may be corrupted.

5.2.129 Input/Output Stream Descriptor x Last Valid Index (OSD1LVI) - Offset 18Ch

This register specifies the last valid buffer descriptor index.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 18Ch	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved**
7:0	00h RW	**Last Valid Index (LVI):** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor, it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1, i.e., there must be at least two valid entries in the buffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is '0”.

5.2.130 Input/Output Stream Descriptor x FIFO Eviction Watermark (OSD1FIFOW) - Offset 18Eh

This register reports the threshold of the FIFO that triggers an access to cyclic buffer.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 18Eh	0004h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0h RO	**Reserved**
2:0	4h RO/V	**FIFOW:** Indicates the minimum number of bytes accumulated (for input) or free (for output) in the FIFO before the controller will start an eviction (for input) or fetch (for output) of data .The PCH HD Audio controller hardwires the FIFO Watermark, either 32B or 64Bbased on the following. Bit(2:0) Description 000-011 Reserved 100 32 B Supported. The 32 B request is aligned to 32 B boundaries. 101 64 B Supported. The 64 B request is aligned to 64 B boundaries. 110-111 Reserved Input Stream: For input streams, the FIFOW value is determined by the EM3.ISRWS (SEM3.ISRWS) field. Output Stream: For output streams, the FIFOW value is determined by the EM4.OSRWS (SEM4.OSRWS) field.

5.2.131 Input/Output Stream Descriptor x FIFO Size (OSD1FIFOS) - Offset 190h

This register reports the FIFO size of the stream DMA.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 190h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW/V	**FIFO Size (FIFOS):** W hen GCAP2.EEAC = 0, indicates the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time. This is the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on the stream format programmed in (I/O) SDxFMT register, the min frame of buffering setting inEM(3/4)(SEM(3/4)).(I/O)SBSMFA[1:0] field, and the minimum buffer size threshold setting in EM2.BSMT[1:0] field. As the default value is zero, SW must write to the (I/O) SDxFMT register to kick off the FIFO size calculation, and read back to find out the HW allocated FIFO size. When GCAP2.EEAC = 1, this FIFOS value represent the minimum FIFO size HW required to operate efficiently. SW can program FIFOL register to extend the effective FIFO size in HW beyond this minimum value advertised. In this case, the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time, the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and also the maximum possible value that the PICB count will increase by one time, all these maximum values could be larger than FIFOS value, depending on the FIFOL register setting. When EM2.HWFIFOL = 1, this FIFOS value will reflect the larger FIFO size of up to 10 ms, if extra buffer space is available.

5.2.132 Input/Output Stream Descriptor x Format (OSD1FMT) - Offset 192h

This register specifies the audio format of the stream DMA.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 192h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW	**Sample Base Rate (BASE):** 0=48 kHz 1=44.1 kHz
13:11	0h RW	**Sample Base Rate Multiple (MULT):** 000=48 kHz/44.1 kHz or less 001=x2 (96 kHz, 88.2 kHz, 32 kHz) 010=x3 (144 kHz) 011=x4 (192 kHz, 176.4 kHz) 100-111=Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** 000=Divide by 1 (48 kHz, 44.1 kHz) 001=Divide by 2 (24 kHz, 22.05 kHz) 010=Divide by 3 (16 kHz, 32 kHz) 011=Divide by 4 (11.025 kHz) 100=Divide by 5 (9.6 kHz) 101=Divide by 6 (8 kHz) 110=Divide by 7 111=Divide by 8 (6 kHz)
7	0h RO	**Reserved**
6:4	0h RW	**Bits per Sample (BITS):** 000=8 bits. The data will be packed in memory in 8bit containers on 16bit boundaries 001=16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries 010=20 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 011=24 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 100=32 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 101-111=Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: 0000=1 0001=2 ... 1111=16

5.2.133 Input/Output Stream Descriptor x FIFO Limit (OSD1FIFOL) - Offset 194h

This register controls the effective FIFO size for energy efficient audio operation.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 194h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW/L	**GNL:** Granularity associated with LMT field definition. The LMT value needs to be multiplied with 125 us or 1 ms to get the access limit in time domain. 0 = 125 us 1 = 1 ms This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO). **Locked by:** GCAP2.EEAC
13:0	0000h RW/L	**FIFO Limit (FIFOL):** Indicate how far the media player / application intend to process ahead, in units of time. HW can extend the effective FIFO size to fetch (for output stream) or evict (for input stream) more data in the cyclic buffer beyond the minimum FIFO size advertised in FIFOS register, up to this access limit. Need to multiply with the granularity (125 us vs. 1 ms) as defined in GNL bit, to get the actual processing ahead time.0 = Disabled (FIFOS is the limit)0001h 3FFFh = 1 16383 units. When value) 0 (enabled), setting FIFOLC bit will trigger HW to evaluate the access limit change and update effective FIFO size (depending on the capability supported). SW shall make sure the FIFOL field is not changed in the progress of access limit change sequence. This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO). **Locked by:** GCAP2.EEAC

5.2.134 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (OSD1BDLPLBA) - Offset 198h

This register specifies the base address (lower 32 bits) of Buffer Descriptor List.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 198h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0000000h RW	**Buffer Descriptor List Lower Base Address (BDLPLBA):** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted.
6:0	0h RO	**Reserved**

5.2.135 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (OSD1BDLPUBA) - Offset 19Ch

This register specifies the base address (upper 32 bits) of Buffer Descriptor List.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 19Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/L	**Buffer Descriptor List Upper Base Address (BDLPUBA):** Upper 32bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. Locked when GCAP.64OK = 0. **Locked by:** GCAP.ADD64OK

5.2.136 Input/Output Stream Descriptor x Control (OSD2CTLB0) - Offset 1A0h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 1A0h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RW/V/L	**FIFO Limit Change (FIFOLC):** Writing a 1 to this bit indicates a new update to the FIFOL register has been made. After the HW has completed sequencing into the new effective FIFO size, it will clear this bit. This bit is RO if GCAP2.EEAC = 0. If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 0 (static), this bit will only have effect when the stream is idle (before the first time RUN bit is set). If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 1 (dynamic), on top of supporting the static behavior describe above, this bit also has effect when the stream is active (after the first time RUN bit is set). **Locked by:** SBPR.FNCFG.BCLD
4	0h RW	**Descriptor Error Interrupt Enable (DEIE):** Controls whether an interrupt is generated when the Descriptor Error Status (DESE) bit is set.
3	0h RW	**FIFO Error Interrupt Enable (FEIE):** This bit controls whether the occurrence of a FIFO error (overrun for input or under run for output) will cause an interrupt or not. If this bit is not set, bit 3 in the Status register will be set, but the interrupt will not occur. Either way, the samples will be dropped.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Interrupt On Completion Enable (IOCE):** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set, bit 2 in the Status register will beset, but the interrupt will not occur
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the streams registers. The RUN bit must be cleared before SRST is asserted.

5.2.137 Input/Output Stream Descriptor x Status (OSD2STS) - Offset 1A3h

This register provides the status of the stream DMA.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 1A3h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RO/V	**FIFO Ready (FIFORDY):** This bit defaults to 0 on reset because the FIFO is cleared on a reset. Input Stream: For input streams, the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. Output Stream: For output streams, the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on the link.
4	0h RW/1C/V	**Descriptor Error (DESE):** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort, a Parity or ECC error on the bus, or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error, as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/1C/V	**FIFO Error (FIFOE):** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. Input Stream: For an input stream, this indicates a FIFO overrun occurring while the RUN bit is set. When this happens, the FIFO pointers don't increment and the incoming data is not written into the FIFO, thereby being lost. Output Stream: For an output stream, this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send.
2	0h RW/1C/V	**Buffer Completion Interrupt Status (BCIS):** This bit is set to 1 by the hardware after the last sample of a buffer has been processed, AND if the Interrupt on Completion (IOC) bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
1:0	0h RO	**Reserved**

5.2.138 Input/Output Stream Descriptor x Link Position in Buffer (OSD2LPIB) - Offset 1A4h

This register reports the link position in buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1A4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Link Position in Buffer (LPIB):** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.139 Input/Output Stream Descriptor x Cyclic Buffer Length (OSD2CBL) - Offset 1A8h

This register specifies the cyclic buffer size.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1A8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Cyclic Buffer Length (CBL):** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer (LPIB) will be reset when it reaches this value. Software may only write to this register after Global Reset, Controller Reset, or Stream Reset has occurred. This value should only be modified when the RUN bit is'0'. Once the RUN bit has been set to enable the engine, software must not write to this register until after the next reset is asserted, or transfers may be corrupted.

5.2.140 Input/Output Stream Descriptor x Last Valid Index (OSD2LVI) - Offset 1ACh

This register specifies the last valid buffer descriptor index.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 1ACh	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved**
7:0	00h RW	**Last Valid Index (LVI):** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor, it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1, i.e., there must be at least two valid entries in the buffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is '0'

5.2.141 Input/Output Stream Descriptor x FIFO Eviction Watermark (OSD2FIFOW) - Offset 1AEh

This register reports the threshold of the FIFO that triggers an access to cyclic buffer.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 1AEh	0004h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0h RO	**Reserved**
2:0	4h RO/V	**FIFOW:** Indicates the minimum number of bytes accumulated (for input) or free (for output) in the FIFO before the controller will start an eviction (for input) or fetch (for output) of data. The PCH HD Audio controller hardwires the FIFO Watermark, either 32B or 64B based on the following. Bit(2:0) Description 000-011 Reserved 100 32 B Supported. The 32 B request is aligned to 32 B boundaries. 101 64 B Supported. The 64 B request is aligned to 64 B boundaries. 110-111 Reserved Input Stream: For input streams, the FIFOW value is determined by the EM3.ISRWS (SEM3.ISRWS) field. Output Stream: For output streams, the FIFOW value is determined by the EM4.OSRWS (SEM4.OSRWS) field.

5.2.142 Input/Output Stream Descriptor x FIFO Size (OSD2FIFOS) - Offset 1B0h

This register reports the FIFO size of the stream DMA.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 1B0h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW/V	**FIFO Size (FIFOS):** When GCAP2.EEAC = 0, indicates the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time. This is the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on the stream format programmed in (I/O) SD x FMT register, the min frame of buffering setting inEM(3/4)(SEM(3/4)).(I/O)SBSMFA[1:0] field, and the minimum buffer size threshold setting in EM2.BSMT[1:0] field. As the default value is zero, SW must write to the (I/O) SD x FMT register to kick off the FIFO size calculation, and read back to find out the HW allocated FIFO size. When GCAP2.EEAC = 1, this FIFOS value represent the minimum FIFO size HW required to operate efficiently. SW can program FIFOL register to extend the effective FIFO size in HW beyond this minimum value advertised. In this case, the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time, the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and also the maximum possible value that the PICB count will increase by one time, all these maximum values could be larger than FIFOS value, depending on the FIFOL register setting. When EM2.HWFIFOL = 1, this FIFOS value will reflect the larger FIFO size of up to 10 ms, if extra buffer space is available.

5.2.143 Input/Output Stream Descriptor x Format (OSD2FMT) - Offset 1B2h

This register specifies the audio format of the stream DMA.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 1B2h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW	**Sample Base Rate (BASE):** 0=48 kHz 1=44.1 kHz
13:11	0h RW	**Sample Base Rate Multiple (MULT):** 000=48 kHz/44.1 kHz or less 001=x2 (96 kHz, 88.2 kHz, 32 kHz) 010=x3 (144 kHz) 011=x4 (192 kHz, 176.4 kHz) 100-111=Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** 000=Divide by 1 (48 kHz, 44.1 kHz) 001=Divide by 2 (24 kHz, 22.05 kHz) 010=Divide by 3 (16 kHz, 32 kHz) 011=Divide by 4 (11.025 kHz) 100=Divide by 5 (9.6 kHz) 101=Divide by 6 (8 kHz) 110=Divide by 7 111=Divide by 8 (6 kHz)
7	0h RO	**Reserved**
6:4	0h RW	**Bits per Sample (BITS):** 000=8 bits. The data will be packed in memory in 8bit containers on 16bit boundaries 001=16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries 010=20 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 011=24 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 100=32 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 101-111=Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: 0000=1 0001=2 ... 1111=16

5.2.144 Input/Output Stream Descriptor x FIFO Limit (OSD2FIFOL) - Offset 1B4h

This register controls the effective FIFO size for energy efficient audio operation.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 1B4h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW/L	**GNL:** Granularity associated with LMT field definition. The LMT value needs to be multiplied with 125 us or 1 ms to get the access limit in time domain. 0 = 125 us 1 = 1 ms This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO). **Locked by:** GCAP2.EEAC
13:0	0000h RW/L	**FIFO Limit (FIFOL):** Indicate how far the media player / application intend to process ahead, in units of time. HW can extend the effective FIFO size to fetch (for output stream) or evict (for input stream) more data in the cyclic buffer beyond the minimum FIFO size advertised in FIFOS register, up to this access limit. Need to multiply with the granularity (125 us vs. 1 ms) as defined in GNL bit, to get the actual processing ahead time.0 = Disabled (FIFOS is the limit)0001h 3FFFh = 1 16383 units When value) 0 (enabled), setting FIFOLC bit will trigger HW to evaluate the access limit change and update effective FIFO size (depending on the capability supported). SW shall make sure the FIFOL field is not changed in the progress of access limit change sequence. This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO). **Locked by:** GCAP2.EEAC

5.2.145 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (OSD2BDLPLBA) - Offset 1B8h

This register specifies the base address (lower 32 bits) of Buffer Descriptor List.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1B8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0000000h RW	**Buffer Descriptor List Lower Base Address (BDLPLBA):** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted.
6:0	0h RO	**Reserved**

5.2.146 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (OSD2BDLPUBA) - Offset 1BCh

This register specifies the base address (upper 32 bits) of Buffer Descriptor List.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1BCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/L	**Buffer Descriptor List Upper Base Address (BDLPUBA):** Upper 32bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. Locked when GCAP.64OK = 0. **Locked by:** GCAP.ADD64OK

5.2.147 Input/Output Stream Descriptor x Control (OSD3CTLB0) - Offset 1C0h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 1C0h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RW/V/L	**FIFO Limit Change (FIFOLC):** Writing a 1 to this bit indicates a new update to the FIFOL register has been made. After the HW has completed sequencing into the new effective FIFO size, it will clear this bit. This bit is RO if GCAP2.EEAC = 0.If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 0 (static), this bit will only have effect when the stream is idle (before the first-time RUN bit is set).If GCAP2.EEAC = 1 and GCAP2. DFIFOLCC = 1 (dynamic), on top of supporting the static behavior describe above, this bit also has effect when the stream is active (after the first-time RUN bit is set). **Locked by:** SBPR.FNCFG.BCLD
4	0h RW	**Descriptor Error Interrupt Enable (DEIE):** Controls whether an interrupt is generated when the Descriptor Error Status (DESE) bit is set.
3	0h RW	**FIFO Error Interrupt Enable (FEIE):** This bit controls whether the occurrence of a FIFO error (overrun for input or under run for output) will cause an interrupt or not. If this bit is not set, bit 3 in the Status register will be set, but the interrupt will not occur. Either way, the samples will be dropped.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Interrupt On Completion Enable (IOCE):** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set, bit 2 in the Status register will beset, but the interrupt will not occur
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the streams registers. The RUN bit must be cleared before SRST is asserted.

5.2.148 Input/Output Stream Descriptor x Status (OSD3STS) - Offset 1C3h

This register provides the status of the stream DMA.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 1C3h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RO/V	**FIFO Ready (FIFORDY):** This bit defaults to 0 on reset because the FIFO is cleared on a reset. Input Stream: For input streams, the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. Output Stream: For output streams, the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on the link.
4	0h RW/1C/V	**Descriptor Error (DESE):** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort, a Parity or ECC error on the bus, or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error, as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/1C/V	**FIFO Error (FIFOE):** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. Input Stream: For an input stream, this indicates a FIFO overrun occurring while the RUN bit is set. When this happens, the FIFO pointers don't increment and the incoming data is not written into the FIFO, thereby being lost. Output Stream: For an output stream, this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send.
2	0h RW/1C/V	**Buffer Completion Interrupt Status (BCIS):** This bit is set to 1 by the hardware after the last sample of a buffer has been processed, AND if the Interrupt on Completion (IOC) bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
1:0	0h RO	**Reserved**

5.2.149 Input/Output Stream Descriptor x Link Position in Buffer (OSD3LPIB) - Offset 1C4h

This register reports the link position in buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1C4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Link Position in Buffer (LPIB):** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.150 Input/Output Stream Descriptor x Cyclic Buffer Length (OSD3CBL) - Offset 1C8h

This register specifies the cyclic buffer size.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1C8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Cyclic Buffer Length (CBL):** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer (LPIB) will be reset when it reaches this value. Software may only write to this register after Global Reset, Controller Reset, or Stream Reset has occurred. This value should only be modified when the RUN bit is'0'. Once the RUN bit has been set to enable the engine, software must not write to this register until after the next reset is asserted, or transfers may be corrupted.

5.2.151 Input/Output Stream Descriptor x Last Valid Index (OSD3LVI) - Offset 1CCh

This register specifies the last valid buffer descriptor index.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 1CCh	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved**
7:0	00h RW	**Last Valid Index (LVI):** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor, it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1, i.e., there must be at least two valid entries in the buffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is '0'

5.2.152 Input/Output Stream Descriptor x FIFO Eviction Watermark (OSD3FIFOW) - Offset 1CEh

This register reports the threshold of the FIFO that triggers an access to cyclic buffer.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 1CEh	0004h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0h RO	**Reserved**
2:0	4h RO/V	**FIFOW:** Indicates the minimum number of bytes accumulated (for input) or free (for output) in the FIFO before the controller will start an eviction (for input) or fetch (for output) of data. The PCH HD Audio controller hardwires the FIFO Watermark, either 32B or 64B based on the following. Bit(2:0) Description 000-011 Reserved 100 32 B Supported. The 32 B request is aligned to 32 B boundaries. 101 64 B Supported. The 64 B request is aligned to 64 B boundaries. 110-111 Reserved Input Stream: For input streams, the FIFOW value is determined by the EM3.ISRWS (SEM3.ISRWS) field. Output Stream: For output streams, the FIFOW value is determined by the EM4.OSRWS (SEM4.OSRWS) field.

5.2.153 Input/Output Stream Descriptor x FIFO Size (OSD3FIFOS) - Offset 1D0h

This register reports the FIFO size of the stream DMA.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 1D0h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW/V	**FIFO Size (FIFOS):** When GCAP2.EEAC = 0, indicates the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time. This is the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on the stream format programmed in (I/O) SD x FMT register, the min frame of buffering setting inEM(3/4)(SEM(3/4)).(I/O)SBSMFA[1:0] field, and the minimum buffer size threshold setting in EM2.BSMT[1:0] field. As the default value is zero, SW must write to the (I/O) SD x FMT register to kick off the FIFO size calculation, and read back to find out the HW allocated FIFO size. When GCAP2.EEAC = 1, this FIFOS value represent the minimum FIFO size HW required to operate efficiently. SW can program FIFOL register to extend the effective FIFO size in HW beyond this minimum value advertised. In this case, the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time, the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and also the maximum possible value that the PICB count will increase by one time, all these maximum values could be larger than FIFOS value, depending on the FIFOL register setting. When EM2.HWFIFOL = 1, this FIFOS value will reflect the larger FIFO size of up to 10 ms, if extra buffer space is available.

5.2.154 Input/Output Stream Descriptor x Format (OSD3FMT) - Offset 1D2h

This register specifies the audio format of the stream DMA.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 1D2h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW	**Sample Base Rate (BASE):** 0=48 kHz 1=44.1 kHz
13:11	0h RW	**Sample Base Rate Multiple (MULT):** 000=48 kHz/44.1 kHz or less 001=x2 (96 kHz, 88.2 kHz, 32 kHz) 010=x3 (144 kHz) 011=x4 (192 kHz, 176.4 kHz) 100-111=Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** 000=Divide by 1 (48 kHz, 44.1 kHz) 001=Divide by 2 (24 kHz, 22.05 kHz) 010=Divide by 3 (16 kHz, 32 kHz) 011=Divide by 4 (11.025 kHz) 100=Divide by 5 (9.6 kHz) 101=Divide by 6 (8 kHz) 110=Divide by 7 111=Divide by 8 (6 kHz)
7	0h RO	**Reserved**
6:4	0h RW	**Bits per Sample (BITS):** 000=8 bits. The data will be packed in memory in 8bit containers on 16bit boundaries 001=16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries 010=20 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 011=24 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 100=32 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 101-111=Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: 0000=1 0001=2 ... 1111=16

5.2.155 Input/Output Stream Descriptor x FIFO Limit (OSD3FIFOL) - Offset 1D4h

This register controls the effective FIFO size for energy efficient audio operation.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 1D4h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW/L	**GNL:** Granularity associated with LMT field definition. The LMT value needs to be multiplied with 125 us or 1 ms to get the access limit in time domain. 0 = 125 us 1 = 1 ms This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO). **Locked by:** GCAP2.EEAC
13:0	0000h RW/L	**FIFO Limit (FIFOL):** Indicate how far the media player / application intend to process ahead, in units of time. HW can extend the effective FIFO size to fetch (for output stream) or evict (for input stream) more data in the cyclic buffer beyond the minimum FIFO size advertised in FIFOS register, up to this access limit. Need to multiply with the granularity (125 us vs. 1 ms) as defined in GNL bit, to get the actual processing ahead time.0 = Disabled (FIFOS is the limit)0001h 3FFFh = 1 16383 units When value) 0 (enabled), setting FIFOLC bit will trigger HW to evaluate the access limit change and update effective FIFO size (depending on the capability supported). SW shall make sure the FIFOL field is not changed in the progress of access limit change sequence. This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO). **Locked by:** GCAP2.EEAC

5.2.156 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (OSD3BDLPLBA) - Offset 1D8h

This register specifies the base address (lower 32 bits) of Buffer Descriptor List.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0000000h RW	**Buffer Descriptor List Lower Base Address (BDLPLBA):** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted.
6:0	0h RO	**Reserved**

5.2.157 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (OSD3BDLPUBA) - Offset 1DCh

This register specifies the base address (upper 32 bits) of Buffer Descriptor List.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1DCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/L	**Buffer Descriptor List Upper Base Address (BDLPUBA):** Upper 32bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. Locked when GCAP.64OK = 0. **Locked by:** GCAP.ADD64OK

5.2.158 Input/Output Stream Descriptor x Control (OSD4CTLB0) - Offset 1E0h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 1E0h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RW/V/L	**FIFO Limit Change (FIFOLC):** Writing a 1 to this bit indicates a new update to the FIFOL register has been made. After the HW has completed sequencing into the new effective FIFO size, it will clear this bit. This bit is RO if GCAP2.EEAC = 0.If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 0 (static), this bit will only have effect when the stream is idle (before the first time RUN bit is set).If GCAP2.EEAC = 1 and GCAP2. DFIFOLCC = 1 (dynamic), on top of supporting the static behavior describe above, this bit also has effect when the stream is active (after the first time RUN bit is set). **Locked by:** SBPR.FNCFG.BCLD
4	0h RW	**Descriptor Error Interrupt Enable (DEIE):** Controls whether an interrupt is generated when the Descriptor Error Status (DESE) bit is set.
3	0h RW	**FIFO Error Interrupt Enable (FEIE):** This bit controls whether the occurrence of a FIFO error (overrun for input or under run for output) will cause an interrupt or not. If this bit is not set, bit 3 in the Status register will be set, but the interrupt will not occur. Either way, the samples will be dropped.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Interrupt On Completion Enable (IOCE):** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set, bit 2 in the Status register will be set, but the interrupt will not occur
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

5.2.159 Input/Output Stream Descriptor x Status (OSD4STS) - Offset 1E3h

This register provides the status of the stream DMA.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 1E3h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RO/V	**FIFO Ready (FIFORDY):** This bit defaults to 0 on reset because the FIFO is cleared on a reset. Input Stream: For input streams, the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. Output Stream: For output streams, the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on the link.
4	0h RW/1C/V	**Descriptor Error (DESE):** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort, a Parity or ECC error on the bus, or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error, as the stream cannot continue running. The RUN bit will be cleared and the stream will stop Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/1C/V	**FIFO Error (FIFOE):** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. Input Stream: For an input stream, this indicates a FIFO overrun occurring while the RUN bit is set. When this happens, the FIFO pointers don't increment and the incoming data is not written into the FIFO, thereby being lost. Output Stream: For an output stream, this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send.
2	0h RW/1C/V	**Buffer Completion Interrupt Status (BCIS):** This bit is set to 1 by the hardware after the last sample of a buffer has been processed, AND if the Interrupt on Completion (IOC) bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
1:0	0h RO	**Reserved**

5.2.160 Input/Output Stream Descriptor x Link Position in Buffer (OSD4LPIB) - Offset 1E4h

This register reports the link position in buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Link Position in Buffer (LPIB):** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.161 Input/Output Stream Descriptor x Cyclic Buffer Length (OSD4CBL) - Offset 1E8h

This register specifies the cyclic buffer size.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1E8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Cyclic Buffer Length (CBL):** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer (LPIB) will be reset when it reaches this value. Software may only write to this register after Global Reset, Controller Reset, or Stream Reset has occurred. This value should only be modified when the RUN bit is'0'. Once the RUN bit has been set to enable the engine, software must not write to this register until after the next reset is asserted, or transfers may be corrupted.

5.2.162 Input/Output Stream Descriptor x Last Valid Index (OSD4LVI) - Offset 1ECh

This register specifies the last valid buffer descriptor index.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 1ECh	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved**
7:0	00h RW	**Last Valid Index (LVI):** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor, it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1, i.e., there must be at least two valid entries in the buffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is '0'

5.2.163 Input/Output Stream Descriptor x FIFO Eviction Watermark (OSD4FIFOW) - Offset 1EEh

This register reports the threshold of the FIFO that triggers an access to cyclic buffer.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 1EEh	0004h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0h RO	**Reserved**
2:0	4h RO/V	**FIFOW:** Indicates the minimum number of bytes accumulated (for input) or free (for output) in the FIFO before the controller will start an eviction (for input) or fetch (for output) of data. The PCH HD Audio controller hardwires the FIFO Watermark, either 32B or 64B based on the following. Bit(2:0) Description 000-011 Reserved 100 32 B Supported. The 32 B request is aligned to 32 B boundaries. 101 64 B Supported. The 64 B request is aligned to 64 B boundaries. 110-111 Reserved Input Stream: For input streams, the FIFOW value is determined by the EM3.ISRWS (SEM3.ISRWS) field. Output Stream: For output streams, the FIFOW value is determined by the EM4.OSRWS (SEM4.OSRWS) field.

5.2.164 Input/Output Stream Descriptor x FIFO Size (OSD4FIFOS) - Offset 1F0h

This register reports the FIFO size of the stream DMA.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 1F0h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW/V	**FIFO Size (FIFOS):** When GCAP2.EEAC = 0, indicates the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time. This is the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on the stream format programmed in (I/O) SD x FMT register, the min frame of buffering setting inEM(3/4)(SEM(3/4)).(I/O)SBSMFA[1:0] field, and the minimum buffer size threshold setting in EM2.BSMT[1:0] field. As the default value is zero, SW must write to the (I/O) SD x FMT register to kick off the FIFO size calculation, and read back to find out the HW allocated FIFO size. When GCAP2.EEAC = 1, this FIFOS value represent the minimum FIFO size HW required to operate efficiently. SW can program FIFOL register to extend the effective FIFO size in HW beyond this minimum value advertised. In this case, the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time, the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and also the maximum possible value that the PICB count will increase by one time, all these maximum values could be larger than FIFOS value, depending on the FIFOL register setting. When EM2.HWFIFOL = 1, this FIFOS value will reflect the larger FIFO size of up to 10 ms, if extra buffer space is available.

5.2.165 Input/Output Stream Descriptor x Format (OSD4FMT) - Offset 1F2h

This register specifies the audio format of the stream DMA.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 1F2h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW	**Sample Base Rate (BASE):** 0=48 kHz 1=44.1 kHz
13:11	0h RW	**Sample Base Rate Multiple (MULT):** 000=48 kHz/44.1 kHz or less 001=x2 (96 kHz, 88.2 kHz, 32 kHz) 010=x3 (144 kHz) 011=x4 (192 kHz, 176.4 kHz) 100-111=Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** 000=Divide by 1 (48 kHz, 44.1 kHz) 001=Divide by 2 (24 kHz, 22.05 kHz) 010=Divide by 3 (16 kHz, 32 kHz) 011=Divide by 4 (11.025 kHz) 100=Divide by 5 (9.6 kHz) 101=Divide by 6 (8 kHz) 110=Divide by 7 111=Divide by 8 (6 kHz)
7	0h RO	**Reserved**
6:4	0h RW	**Bits per Sample (BITS):** 000=8 bits. The data will be packed in memory in 8bit containers on 16bit boundaries 001=16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries 010=20 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 011=24 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 100=32 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 101-111=Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: 0000=1 0001=2 ... 1111=16

5.2.166 Input/Output Stream Descriptor x FIFO Limit (OSD4FIFOL) - Offset 1F4h

This register controls the effective FIFO size for energy efficient audio operation.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 1F4h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW/L	**GNL:** Granularity associated with LMT field definition. The LMT value needs to be multiplied with 125 us or 1 ms to get the access limit in time domain. 0 = 125 us 1 = 1 ms This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO). **Locked by:** GCAP2.EEAC
13:0	0000h RW/L	**FIFO Limit (FIFOL):** Indicate how far the media player / application intend to process ahead, in units of time. HW can extend the effective FIFO size to fetch (for output stream) or evict (for input stream) more data in the cyclic buffer beyond the minimum FIFO size advertised in FIFOS register, up to this access limit. Need to multiply with the granularity (125 us vs. 1 ms) as defined in GNL bit, to get the actual processing ahead time. 0 = Disabled (FIFOS is the limit) 0001h 3FFFh = 1 16383 units When value 0 (enabled), setting FIFOLC bit will trigger HW to evaluate the access limit change and update effective FIFO size (depending on the capability supported). SW shall make sure the FIFOL field is not changed in the progress of access limit change sequence. This bit is locked if GCAP2. EEAC = 0 (thus appear to be RO). **Locked by:** GCAP2.EEAC

5.2.167 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (OSD4BDLPLBA) - Offset 1F8h

This register specifies the base address (lower 32 bits) of Buffer Descriptor List.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1F8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0000000h RW	**Buffer Descriptor List Lower Base Address (BDLPLBA):** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted.
6:0	0h RO	**Reserved**

5.2.168 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (OSD4BDLPUBA) - Offset 1FCh

This register specifies the base address (upper 32 bits) of Buffer Descriptor List.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1FCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/L	**Buffer Descriptor List Upper Base Address (BDLPUBA):** Upper 32bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. Locked when GCAP.64OK = 0. **Locked by:** GCAP.ADD64OK

5.2.169 Input/Output Stream Descriptor x Control (OSD5CTLB0) - Offset 200h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 200h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RW/V/L	**FIFO Limit Change (FIFOLC):** Writing a 1 to this bit indicates a new update to the FIFOL register has been made. After the HW has completed sequencing into the new effective FIFO size, it will clear this bit. This bit is RO if GCAP2.EEAC = 0. If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 0 (static), this bit will only have effect when the stream is idle (before the first time RUN bit is set).If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 1 (dynamic), on top of supporting the static behavior describe above, this bit also has effect when the stream is active (after the first time RUN bit is set). **Locked by:** SBPR.FNCFG.BCLD
4	0h RW	**Descriptor Error Interrupt Enable (DEIE):** Controls whether an interrupt is generated when the Descriptor Error Status (DESE) bit is set.
3	0h RW	**FIFO Error Interrupt Enable (FEIE):** This bit controls whether the occurrence of a FIFO error (overrun for input or under run for output) will cause an interrupt or not. If this bit is not set, bit 3 in the Status register will be set, but the interrupt will not occur. Either way, the samples will be dropped.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Interrupt On Completion Enable (IOCE):** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set, bit 2 in the Status register will beset, but the interrupt will not occur
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the streams registers. The RUN bit must be cleared before SRST is asserted.

5.2.170 Input/Output Stream Descriptor x Status (OSD5STS) - Offset 203h

This register provides the status of the stream DMA.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 203h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RO/V	**FIFO Ready (FIFORDY):** This bit defaults to 0 on reset because the FIFO is cleared on a reset. Input Stream: For input streams, the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. Output Stream: For output streams, the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on the link.
4	0h RW/1C/V	**Descriptor Error (DESE):** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort, a Parity or ECC error on the bus, or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error, as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/1C/V	**FIFO Error (FIFOE):** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. Input Stream: For an input stream, this indicates a FIFO overrun occurring while the RUN bit is set. When this happens, the FIFO pointers don't increment and the incoming data is not written into the FIFO, thereby being lost. Output Stream: For an output stream, this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send.
2	0h RW/1C/V	**Buffer Completion Interrupt Status (BCIS):** This bit is set to 1 by the hardware after the last sample of a buffer has been processed, AND if the Interrupt on Completion (IOC) bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
1:0	0h RO	**Reserved**

5.2.171 Input/Output Stream Descriptor x Link Position in Buffer (OSD5LPIB) - Offset 204h

This register reports the link position in buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 204h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Link Position in Buffer (LPIB):** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1).Once RUN bit is set, the register will become read only until SRST occurs.

5.2.172 Input/Output Stream Descriptor x Cyclic Buffer Length (OSD5CBL) - Offset 208h

This register specifies the cyclic buffer size.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 208h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Cyclic Buffer Length (CBL):** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer (LPIB) will be reset when it reaches this value. Software may only write to this register after Global Reset, Controller Reset, or Stream Reset has occurred. This value should only be modified when the RUN bit is'0'. Once the RUN bit has been set to enable the engine, software must not write to this register until after the next reset is asserted, or transfers may be corrupted.

5.2.173 Input/Output Stream Descriptor x Last Valid Index (OSD5LVI) - Offset 20Ch

This register specifies the last valid buffer descriptor index.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 20Ch	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved**
7:0	00h RW	**Last Valid Index (LVI):** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor, it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1, i.e., there must be at least two valid entries in the buffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is '0'

5.2.174 Input/Output Stream Descriptor x FIFO Eviction Watermark (OSD5FIFOW) - Offset 20Eh

This register reports the threshold of the FIFO that triggers an access to cyclic buffer.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 20Eh	0004h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0h RO	**Reserved**
2:0	4h RO/V	**FIFOW:** Indicates the minimum number of bytes accumulated (for input) or free (for output) in the FIFO before the controller will start an eviction (for input) or fetch (for output) of data. The PCH HD Audio controller hardwires the FIFO Watermark, either 32B or 64B based on the following. Bit(2:0) Description 000-011 Reserved 100 32 B Supported. The 32 B request is aligned to 32 B boundaries. 101 64 B Supported. The 64 B request is aligned to 64 B boundaries. 110-111 Reserved Input Stream: For input streams, the FIFOW value is determined by the EM3.ISRWS (SEM3.ISRWS) field. Output Stream: For output streams, the FIFOW value is determined by the EM4.OSRWS (SEM4.OSRWS) field.

5.2.175 Input/Output Stream Descriptor x FIFO Size (OSD5FIFOS) - Offset 210h

This register reports the FIFO size of the stream DMA.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 210h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW/V	**FIFO Size (FIFOS):** When GCAP2.EEAC = 0, indicates the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time. This is the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on the stream format programmed in (I/O) SDxFMT register, the min frame of buffering setting inEM(3/4)(SEM(3/4)).(I/O)SBSMFA[1:0] field, and the minimum buffer size threshold setting in EM2.BSMT[1:0] field. As the default value is zero, SW must write to the (I/O) SDxFMT register to kick off the FIFO size calculation, and read back to find out the HW allocated FIFO size. When GCAP2.EEAC = 1, this FIFOS value represent the minimum FIFO size HW required to operate efficiently. SW can program FIFOL register to extend the effective FIFO size in HW beyond this minimum value advertised. In this case, the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time, the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and also the maximum possible value that the PICB count will increase by one time, all these maximum values could be larger than FIFOS value, depending on the FIFOL register setting. When EM2.HWFIFOL = 1, this FIFOS value will reflect the larger FIFO size of up to 10 ms, if extra buffer space is available.

5.2.176 Input/Output Stream Descriptor x Format (OSD5FMT) - Offset 212h

This register specifies the audio format of the stream DMA.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 212h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW	**Sample Base Rate (BASE):** 0=48 kHz 1=44.1 kHz
13:11	0h RW	**Sample Base Rate Multiple (MULT):** 000=48 kHz/44.1 kHz or less 001=x2 (96 kHz, 88.2 kHz, 32 kHz) 010=x3 (144 kHz) 011=x4 (192 kHz, 176.4 kHz) 100-111=Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** 000=Divide by 1 (48 kHz, 44.1 kHz) 001=Divide by 2 (24 kHz, 22.05 kHz) 010=Divide by 3 (16 kHz, 32 kHz) 011=Divide by 4 (11.025 kHz) 100=Divide by 5 (9.6 kHz) 101=Divide by 6 (8 kHz) 110=Divide by 7 111=Divide by 8 (6 kHz)
7	0h RO	**Reserved**
6:4	0h RW	**Bits per Sample (BITS):** 000=8 bits. The data will be packed in memory in 8bit containers on 16bit boundaries 001=16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries 010=20 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 011=24 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 100=32 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 101-111=Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: 0000=1 0001=2 ... 1111=16

5.2.177 Input/Output Stream Descriptor x FIFO Limit (OSD5FIFOL) - Offset 214h

This register controls the effective FIFO size for energy efficient audio operation.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 214h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW/L	**GNL:** Granularity associated with LMT field definition. The LMT value needs to be multiplied with 125 us or 1 ms to get the access limit in time domain. 0 = 125 us 1 = 1 ms This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO). **Locked by:** GCAP2.EEAC
13:0	0000h RW/L	**FIFO Limit (FIFOL):** Indicate how far the media player / application intend to process ahead, in units of time. HW can extend the effective FIFO size to fetch (for output stream) or evict (for input stream) more data in the cyclic buffer beyond the minimum FIFO size advertised in FIFOS register, up to this access limit. Need to multiply with the granularity (125 us vs. 1 ms) as defined in GNL bit, to get the actual processing ahead time. 0 = Disabled (FIFOS is the limit) 0001h 3FFFh = 1 16383 units When value) 0 (enabled), setting FIFOLC bit will trigger HW to evaluate the access limit change and update effective FIFO size (depending on the capability supported). SW shall make sure the FIFOL field is not changed in the progress of access limit change sequence. This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO). **Locked by:** GCAP2.EEAC

5.2.178 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (OSD5BDLPLBA) - Offset 218h

This register specifies the base address (lower 32 bits) of Buffer Descriptor List.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 218h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0000000h RW	**Buffer Descriptor List Lower Base Address (BDLPLBA):** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted.
6:0	0h RO	**Reserved**

5.2.179 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (OSD5BDLPUBA) - Offset 21Ch

This register specifies the base address (upper 32 bits) of Buffer Descriptor List.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 21Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/L	**Buffer Descriptor List Upper Base Address (BDLPUBA):** Upper 32bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. Locked when GCAP.64OK = 0. **Locked by:** GCAP.ADD64OK

5.2.180 Input/Output Stream Descriptor x Control (OSD6CTLB0) - Offset 220h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 220h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RW/V/L	**FIFO Limit Change (FIFOLC):** Writing a 1 to this bit indicates a new update to the FIFOL register has been made. After the HW has completed sequencing into the new effective FIFO size, it will clear this bit. This bit is RO if GCAP2.EEAC = 0.If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 0 (static), this bit will only have effect when the stream is idle (before the first time RUN bit is set).If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 1 (dynamic), on top of supporting the static behavior describe above, this bit also has effect when the stream is active (after the first time RUN bit is set). **Locked by:** SBPR.FNCFG.BCLD
4	0h RW	**Descriptor Error Interrupt Enable (DEIE):** Controls whether an interrupt is generated when the Descriptor Error Status (DESE) bit is set.
3	0h RW	**FIFO Error Interrupt Enable (FEIE):** This bit controls whether the occurrence of a FIFO error (overrun for input or underrun for output) will cause an interrupt or not. If this bit is not set, bit 3 in the Status register will be set, but the interrupt will not occur. Either way, the samples will be dropped.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Interrupt On Completion Enable (IOCE):** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set, bit 2 in the Status register will beset, but the interrupt will not occur
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the streams registers. The RUN bit must be cleared before SRST is asserted.

5.2.181 Input/Output Stream Descriptor x Status (OSD6STS) - Offset 223h

This register provides the status of the stream DMA.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 223h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RO/V	**FIFO Ready (FIFORDY):** This bit defaults to 0 on reset because the FIFO is cleared on a reset. Input Stream: For input streams, the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. Output Stream: For output streams, the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on the link.
4	0h RW/1C/V	**Descriptor Error (DESE):** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort, a Parity or ECC error on the bus, or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error, as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/1C/V	**FIFO Error (FIFOE):** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. Input Stream: For an input stream, this indicates a FIFO overrun occurring while the RUN bit is set. When this happens, the FIFO pointers don't increment and the incoming data is not written into the FIFO, thereby being lost. Output Stream: For an output stream, this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send.
2	0h RW/1C/V	**Buffer Completion Interrupt Status (BCIS):** This bit is set to 1 by the hardware after the last sample of a buffer has been processed, AND if the Interrupt on Completion (IOC) bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
1:0	0h RO	**Reserved**

5.2.182 Input/Output Stream Descriptor x Link Position in Buffer (OSD6LPIB) - Offset 224h

This register reports the link position in buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 224h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Link Position in Buffer (LPIB):** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.183 Input/Output Stream Descriptor x Cyclic Buffer Length (OSD6CBL) - Offset 228h

This register specifies the cyclic buffer size.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 228h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Cyclic Buffer Length (CBL):** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer (LPIB) will be reset when it reaches this value. Software may only write to this register after Global Reset, Controller Reset, or Stream Reset has occurred. This value should only be modified when the RUN bit is '0'. Once the RUN bit has been set to enable the engine, software must not write to this register until after the next reset is asserted, or transfers may be corrupted.

5.2.184 Input/Output Stream Descriptor x Last Valid Index (OSD6LVI) - Offset 22Ch

This register specifies the last valid buffer descriptor index.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 22Ch	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved**
7:0	00h RW	**Last Valid Index (LVI):** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor, it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1, i.e., there must be at least two valid entries in the buffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is '0'

5.2.185 Input/Output Stream Descriptor x FIFO Eviction Watermark (OSD6FIFOW) - Offset 22Eh

This register reports the threshold of the FIFO that triggers an access to cyclic buffer.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 22Eh	0004h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0h RO	**Reserved**
2:0	4h RO/V	**FIFOW:** Indicates the minimum number of bytes accumulated (for input) or free (for output) in the FIFO before the controller will start an eviction (for input) or fetch (for output) of data. The PCH HD Audio controller hardwires the FIFO Watermark, either 32B or 64B based on the following. Bit(2:0) Description 000-011 Reserved 100 32 B Supported. The 32 B request is aligned to 32 B boundaries. 101 64 B Supported. The 64 B request is aligned to 64 B boundaries. 110-111 Reserved Input Stream: For input streams, the FIFOW value is determined by the EM3.ISRWS (SEM3.ISRWS) field. Output Stream: For output streams, the FIFOW value is determined by the EM4.OSRWS (SEM4.OSRWS) field.

5.2.186 Input/Output Stream Descriptor x FIFO Size (OSD6FIFOS) - Offset 230h

This register reports the FIFO size of the stream DMA.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 230h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW/V	**FIFO Size (FIFOS):** When GCAP2.EEAC = 0, indicates the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time. This is the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on the stream format programmed in (I/O) SDxFMT register, the mainframe of buffering setting inEM(3/4)(SEM(3/4)).(I/O)SBSMFA[1:0] field, and the minimum buffer size threshold setting in EM2.BSMT[1:0] field. As the default value is zero, SW must write to the (I/O) SDxFMT register to kick off the FIFO size calculation, and read back to find out the HW allocated FIFO size. When GCAP2.EEAC = 1, this FIFOS value represent the minimum FIFO size HW required to operate efficiently. SW can program FIFOL register to extend the effective FIFO size in HW beyond this minimum value advertised. In this case, the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time, the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and also the maximum possible value that the PICB count will increase by one time, all these maximum values could be larger than FIFOS value, depending on the FIFOL register setting. When EM2.HWFIFOL = 1, this FIFOS value will reflect the larger FIFO size of up to 10 ms, if extra buffer space is available.

5.2.187 Input/Output Stream Descriptor x Format (OSD6FMT) - Offset 232h

This register specifies the audio format of the stream DMA.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 232h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW	**Sample Base Rate (BASE):** 0=48 kHz 1=44.1 kHz
13:11	0h RW	**Sample Base Rate Multiple (MULT):** 000=48 kHz/44.1 kHz or less 001=x2 (96 kHz, 88.2 kHz, 32 kHz) 010=x3 (144 kHz) 011=x4 (192 kHz, 176.4 kHz) 100-111=Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** 000=Divide by 1 (48 kHz, 44.1 kHz) 001=Divide by 2 (24 kHz, 22.05 kHz) 010=Divide by 3 (16 kHz, 32 kHz) 011=Divide by 4 (11.025 kHz) 100=Divide by 5 (9.6 kHz) 101=Divide by 6 (8 kHz) 110=Divide by 7 111=Divide by 8 (6 kHz)
7	0h RO	**Reserved**
6:4	0h RW	**Bits per Sample (BITS):** 000=8 bits. The data will be packed in memory in 8bit containers on 16bit boundaries 001=16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries 010=20 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 011=24 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 100=32 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 101-111=Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: 0000=1 0001=2 ... 1111=16

5.2.188 Input/Output Stream Descriptor x FIFO Limit (OSD6FIFOL) - Offset 234h

This register controls the effective FIFO size for energy efficient audio operation.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 234h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW/L	**GNL:** Granularity associated with LMT field definition. The LMT value needs to be multiplied with 125 us or 1 ms to get the access limit in time domain. 0 = 125 us 1 = 1 ms This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO). **Locked by:** GCAP2.EEAC
13:0	0000h RW/L	**FIFO Limit (FIFOL):** Indicate how far the media player / application intend to process ahead, in units of time. HW can extend the effective FIFO size to fetch (for output stream) or evict (for input stream) more data in the cyclic buffer beyond the minimum FIFO size advertised in FIFOS register, up to this access limit. Need to multiply with the granularity (125 us vs. 1 ms) as defined in GNL bit, to get the actual processing ahead time. 0 = Disabled (FIFOS is the limit) 0001h 3FFFh = 1 16383 units When value 0 (enabled), setting FIFOLC bit will trigger HW to evaluate the access limit change and update effective FIFO size (depending on the capability supported). SW shall make sure the FIFOL field is not changed in the progress of access limit change sequence. This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO). **Locked by:** GCAP2.EEAC

5.2.189 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (OSD6BDLPLBA) - Offset 238h

This register specifies the base address (lower 32 bits) of Buffer Descriptor List.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 238h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0000000h RW	**Buffer Descriptor List Lower Base Address (BDLPLBA):** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted.
6:0	0h RO	**Reserved**

5.2.190 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (OSD6BDLPUBA) - Offset 23Ch

This register specifies the base address (upper 32 bits) of Buffer Descriptor List.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 23Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/L	**Buffer Descriptor List Upper Base Address (BDLPUBA):** Upper 32bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. Locked when GCAP.64OK = 0. **Locked by:** GCAP.ADD64OK

5.2.191 Input/Output Stream Descriptor x Control (OSD7CTLB0) - Offset 240h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 240h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RW/V/L	**FIFO Limit Change (FIFOLC):** Writing a 1 to this bit indicates a new update to the FIFOL register has been made. After the HW has completed sequencing into the new effective FIFO size, it will clear this bit. This bit is RO if GCAP2.EEAC = 0. If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 0 (static), this bit will only have effect when the stream is idle (before the first time RUN bit is set).If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 1 (dynamic), on top of supporting the static behavior describe above, this bit also has effect when the stream is active (after the first time RUN bit is set). **Locked by:** SBPR.FNCFG.BCLD
4	0h RW	**Descriptor Error Interrupt Enable (DEIE):** Controls whether an interrupt is generated when the Descriptor Error Status (DESE) bit is set.
3	0h RW	**FIFO Error Interrupt Enable (FEIE):** This bit controls whether the occurrence of a FIFO error (overrun for input or underrun for output) will cause an interrupt or not. If this bit is not set, bit 3 in the Status register will be set, but the interrupt will not occur. Either way, the samples will be dropped.
2	0h RW	**Interrupt On Completion Enable (IOCE):** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set, bit 2 in the Status register will beset, but the interrupt will not occur
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the streams registers. The RUN bit must be cleared before SRST is asserted.

5.2.192 Input/Output Stream Descriptor x Status (OSD7STS) - Offset 243h

This register provides the status of the stream DMA.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 243h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RO/V	**FIFO Ready (FIFORDY):** This bit defaults to 0 on reset because the FIFO is cleared on a reset. Input Stream: For input streams, the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. Output Stream: For output streams, the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on the link.
4	0h RW/1C/V	**Descriptor Error (DESE):** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort, a Parity or ECC error on the bus, or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error, as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.
3	0h RW/1C/V	**FIFO Error (FIFOE):** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. Input Stream: For an input stream, this indicates a FIFO overrun occurring while the RUN bit is set. When this happens, the FIFO pointers don't increment and the incoming data is not written into the FIFO, thereby being lost. Output Stream: For an output stream, this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send.
2	0h RW/1C/V	**Buffer Completion Interrupt Status (BCIS):** This bit is set to 1 by the hardware after the last sample of a buffer has been processed, AND if the Interrupt on Completion (IOC) bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
1:0	0h RO	**Reserved**

5.2.193 Input/Output Stream Descriptor x Link Position in Buffer (OSD7LPIB) - Offset 244h

This register reports the link position in buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 244h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Link Position in Buffer (LPIB):** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.194 Input/Output Stream Descriptor x Cyclic Buffer Length (OSD7CBL) - Offset 248h

This register specifies the cyclic buffer size.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 248h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Cyclic Buffer Length (CBL):** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer (LPIB) will be reset when it reaches this value. Software may only write to this register after Global Reset, Controller Reset, or Stream Reset has occurred. This value should only be modified when the RUN bit is'0'. Once the RUN bit has been set to enable the engine, software must not write to this register until after the next reset is asserted, or transfers may be corrupted.

5.2.195 Input/Output Stream Descriptor x Last Valid Index (OSD7LVI) - Offset 24Ch

This register specifies the last valid buffer descriptor index.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 24Ch	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved**
7:0	00h RW	**Last Valid Index (LVI):** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor, it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1, i.e., there must be at least two valid entries in the buffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is '0'

5.2.196 Input/Output Stream Descriptor x FIFO Eviction Watermark (OSD7FIFOW) - Offset 24Eh

This register reports the threshold of the FIFO that triggers an access to cyclic buffer.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 24Eh	0004h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0h RO	**Reserved**
2:0	4h RO/V	**FIFOW:** Indicates the minimum number of bytes accumulated (for input) or free (for output) in the FIFO before the controller will start an eviction (for input) or fetch (for output) of data. The PCH HD Audio controller hardwires the FIFO Watermark, either 32B or 64B based on the following. Bit(2:0) Description 000-011 Reserved 100 32 B Supported. The 32 B request is aligned to 32 B boundaries. 101 64 B Supported. The 64 B request is aligned to 64 B boundaries. 110-111 Reserved Input Stream: For input streams, the FIFOW value is determined by the EM3.ISRWS (SEM3.ISRWS) field. Output Stream: For output streams, the FIFOW value is determined by the EM4.OSRWS (SEM4.OSRWS) field.

5.2.197 Input/Output Stream Descriptor x FIFO Size (OSD7FIFOS) - Offset 250h

This register reports the FIFO size of the stream DMA.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 250h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW/V	**FIFO Size (FIFOS):** When GCAP2.EEAC = 0, indicates the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time. This is the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on the stream format programmed in (I/O) SDxFMT register, the min frame of buffering setting inEM(3/4)(SEM(3/4)).(I/O)SBSMFA[1:0] field, and the minimum buffer size threshold setting in EM2.BSMT[1:0] field. As the default value is zero, SW must write to the (I/O) SDxFMT register to kick off the FIFO size calculation, and read back to find out the HW allocated FIFO size. When GCAP2.EEAC = 1, this FIFOS value represent the minimum FIFO size HW required to operate efficiently. SW can program FIFOL register to extend the effective FIFO size in HW beyond this minimum value advertised. In this case, the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time, the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and also the maximum possible value that the PICB count will increase by one time, all these maximum values could be larger than FIFOS value, depending on the FIFOL register setting. When EM2.HWFIFOL = 1, this FIFOS value will reflect the larger FIFO size of up to 10 ms, if extra buffer space is available.

5.2.198 Input/Output Stream Descriptor x Format (OSD7FMT) - Offset 252h

This register specifies the audio format of the stream DMA.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 252h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW	**Sample Base Rate (BASE):** 0=48 kHz 1=44.1 kHz
13:11	0h RW	**Sample Base Rate Multiple (MULT):** 000=48 kHz/44.1 kHz or less 001=x2 (96 kHz, 88.2 kHz, 32 kHz) 010=x3 (144 kHz) 011=x4 (192 kHz, 176.4 kHz) 100-111=Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** 000=Divide by 1 (48 kHz, 44.1 kHz) 001=Divide by 2 (24 kHz, 22.05 kHz) 010=Divide by 3 (16 kHz, 32 kHz) 011=Divide by 4 (11.025 kHz) 100=Divide by 5 (9.6 kHz) 101=Divide by 6 (8 kHz) 110=Divide by 7 111=Divide by 8 (6 kHz)

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Reserved**
6:4	0h RW	**Bits per Sample (BITS):** 000=8 bits. The data will be packed in memory in 8bit containers on 16bit boundaries 001=16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries 010=20 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 011=24 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 100=32 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 101-111=Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: 0000=1 0001=2 ... 1111=16

5.2.199 Input/Output Stream Descriptor x FIFO Limit (OSD7FIFOL) - Offset 254h

This register controls the effective FIFO size for energy efficient audio operation.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 254h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW/L	**GNL:** Granularity associated with LMT field definition. The LMT value needs to be multiplied with 125 us or 1 ms to get the access limit in time domain. 0 = 125 us 1 = 1 ms This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO). **Locked by:** GCAP2.EEAC
13:0	0000h RW/L	**FIFO Limit (FIFOL):** Indicate how far the media player / application intend to process ahead, in units of time. HW can extend the effective FIFO size to fetch (for output stream) or evict (for input stream) more data in the cyclic buffer beyond the minimum FIFO size advertised in FIFOS register, up to this access limit. Need to multiply with the granularity (125 us vs. 1 ms) as defined in GNL bit, to get the actual processing ahead time. 0 = Disabled (FIFOS is the limit) 0001h 3FFFh = 1 16383 units When value 0 (enabled), setting FIFOLC bit will trigger HW to evaluate the access limit change and update effective FIFO size (depending on the capability supported). SW shall make sure the FIFOL field is not changed in the progress of access limit change sequence. This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO). **Locked by:** GCAP2.EEAC

5.2.200 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (OSD7BDLPLBA) - Offset 258h

This register specifies the base address (lower 32 bits) of Buffer Descriptor List.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 258h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0000000h RW	**Buffer Descriptor List Lower Base Address (BDLPLBA):** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted.
6:0	0h RO	**Reserved**

5.2.201 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (OSD7BDLPUBA) - Offset 25Ch

This register specifies the base address (upper 32 bits) of Buffer Descriptor List.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 25Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/L	**Buffer Descriptor List Upper Base Address (BDLPUBA):** Upper 32bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. Locked when GCAP.64OK = 0. **Locked by:** GCAP.ADD64OK

5.2.202 Input/Output Stream Descriptor x Control (OSD8CTLB0) - Offset 260h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 260h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RW/V/L	**FIFO Limit Change (FIFOLC):** Writing a 1 to this bit indicates a new update to the FIFOL register has been made. After the HW has completed sequencing into the new effective FIFO size, it will clear this bit. This bit is RO if GCAP2.EEAC = 0. If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 0 (static), this bit will only have effect when the stream is idle (before the first time RUN bit is set).If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 1 (dynamic), on top of supporting the static behavior describe above, this bit also has effect when the stream is active (after the first time RUN bit is set). **Locked by:** SBPR.FNCFG.BCLD
4	0h RW	**Descriptor Error Interrupt Enable (DEIE):** Controls whether an interrupt is generated when the Descriptor Error Status (DESE) bit is set.
3	0h RW	**FIFO Error Interrupt Enable (FEIE):** This bit controls whether the occurrence of a FIFO error (overrun for input or underrun for output) will cause an interrupt or not. If this bit is not set, bit 3 in the Status register will be set, but the interrupt will not occur. Either way, the samples will be dropped.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Interrupt On Completion Enable (IOCE):** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set, bit 2 in the Status register will beset, but the interrupt will not occur.
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the streams registers. The RUN bit must be cleared before SRST is asserted.

5.2.203 Input/Output Stream Descriptor x Status (OSD8STS) - Offset 263h

This register provides the status of the stream DMA.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + 263h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved**
5	0h RO/V	**FIFO Ready (FIFORDY):** This bit defaults to 0 on reset because the FIFO is cleared on a reset. Input Stream: For input streams, the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. Output Stream: For output streams, the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on the link.
4	0h RW/1C/V	**Descriptor Error (DESE):** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort, a Parity or ECC error on the bus, or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error, as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/1C/V	**FIFO Error (FIFOE):** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. Input Stream: For an input stream, this indicates a FIFO overrun occurring while the RUN bit is set. When this happens, the FIFO pointers don't increment and the incoming data is not written into the FIFO, thereby being lost. Output Stream: For an output stream, this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send.
2	0h RW/1C/V	**Buffer Completion Interrupt Status (BCIS):** This bit is set to 1 by the hardware after the last sample of a buffer has been processed, AND if the Interrupt on Completion (IOC) bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
1:0	0h RO	**Reserved**

5.2.204 Input/Output Stream Descriptor x Link Position in Buffer (OSD8LPIB) - Offset 264h

This register reports the link position in buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 264h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Link Position in Buffer (LPIB):** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.205 Input/Output Stream Descriptor x Cyclic Buffer Length (OSD8CBL) - Offset 268h

This register specifies the cyclic buffer size.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 268h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Cyclic Buffer Length (CBL):** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer (LPIB) will be reset when it reaches this value. Software may only write to this register after Global Reset, Controller Reset, or Stream Reset has occurred. This value should only be modified when the RUN bit is'0'. Once the RUN bit has been set to enable the engine, software must not write to this register until after the next reset is asserted, or transfers may be corrupted.

5.2.206 Input/Output Stream Descriptor x Last Valid Index (OSD8LVI) - Offset 26Ch

This register specifies the last valid buffer descriptor index.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 26Ch	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved**
7:0	00h RW	**Last Valid Index (LVI):** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor, it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1, i.e., there must be at least two valid entries in the buffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is '0'

5.2.207 Input/Output Stream Descriptor x FIFO Eviction Watermark (OSD8FIFOW) - Offset 26Eh

This register reports the threshold of the FIFO that triggers an access to cyclic buffer.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 26Eh	0004h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0h RO	**Reserved**
2:0	4h RO/V	**FIFOW:** Indicates the minimum number of bytes accumulated (for input) or free (for output) in the FIFO before the controller will start an eviction (for input) or fetch (for output) of data. The PCH HD Audio controller hardwires the FIFO Watermark, either 32B or 64B based on the following. Bit(2:0) Description 000-011 Reserved 100 32 B Supported. The 32 B request is aligned to 32 B boundaries. 101 64 B Supported. The 64 B request is aligned to 64 B boundaries. 110-111 Reserved Input Stream: For input streams, the FIFOW value is determined by the EM3.ISRWS (SEM3.ISRWS) field. Output Stream: For output streams, the FIFOW value is determined by the EM4.OSRWS (SEM4.OSRWS) field.

5.2.208 Input/Output Stream Descriptor x FIFO Size (OSD8FIFOS) - Offset 270h

This register reports the FIFO size of the stream DMA.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 270h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW/V	**FIFO Size (FIFOS):** When GCAP2.EEAC = 0, indicates the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time. This is the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on the stream format programmed in (I/O) SDxFMT register, the min frame of buffering setting inEM(3/4)(SEM(3/4)).(I/O)SBSMFA[1:0] field, and the minimum buffer size threshold setting in EM2.BSMT[1:0] field. As the default value is zero, SW must write to the (I/O) SDxFMT register to kick off the FIFO size calculation, and read back to find out the HW allocated FIFO size. When GCAP2.EEAC = 1, this FIFOS value represent the minimum FIFO size HW required to operate efficiently. SW can program FIFOL register to extend the effective FIFO size in HW beyond this minimum value advertised. In this case, the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time, the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and also the maximum possible value that the PICB count will increase by one time, all these maximum values could be larger than FIFOS value, depending on the FIFOL register setting. When EM2.HWFIFOL = 1, this FIFOS value will reflect the larger FIFO size of up to 10 ms, if extra buffer space is available.

5.2.209 Input/Output Stream Descriptor x Format (OSD8FMT) - Offset 272h

This register specifies the audio format of the stream DMA.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 272h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW	**Sample Base Rate (BASE):** 0=48 kHz 1=44.1 kHz
13:11	0h RW	**Sample Base Rate Multiple (MULT):** 000=48 kHz/44.1 kHz or less 001=x2 (96 kHz, 88.2 kHz, 32 kHz) 010=x3 (144 kHz) 011=x4 (192 kHz, 176.4 kHz) 100-111=Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** 000=Divide by 1 (48 kHz, 44.1 kHz) 001=Divide by 2 (24 kHz, 22.05 kHz) 010=Divide by 3 (16 kHz, 32 kHz) 011=Divide by 4 (11.025 kHz) 100=Divide by 5 (9.6 kHz) 101=Divide by 6 (8 kHz) 110=Divide by 7 111=Divide by 8 (6 kHz)
7	0h RO	**Reserved**
6:4	0h RW	**Bits per Sample (BITS):** 000=8 bits. The data will be packed in memory in 8bit containers on 16bit boundaries 001=16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries 010=20 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 011=24 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 100=32 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 101-111=Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: 0000=1 0001=2 ... 1111=16

5.2.210 Input/Output Stream Descriptor x FIFO Limit (OSD8FIFOL) - Offset 274h

This register controls the effective FIFO size for energy efficient audio operation.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 274h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW/L	**GNL:** Granularity associated with LMT field definition. The LMT value needs to be multiplied with 125 us or 1 ms to get the access limit in time domain. 0 = 125 us 1 = 1 ms This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO). **Locked by:** GCAP2.EEAC
13:0	0000h RW/L	**FIFO Limit (FIFOL):** Indicate how far the media player / application intend to process ahead, in units of time. HW can extend the effective FIFO size to fetch (for output stream) or evict (for input stream) more data in the cyclic buffer beyond the minimum FIFO size advertised in FIFOS register, up to this access limit. Need to multiply with the granularity (125 us vs. 1 ms) as defined in GNL bit, to get the actual processing ahead time. 0 = Disabled (FIFOS is the limit) 0001h 3FFFh = 1 16383 units When value 0 (enabled), setting FIFOLC bit will trigger HW to evaluate the access limit change and update effective FIFO size (depending on the capability supported). SW shall make sure the FIFOL field is not changed in the progress of access limit change sequence. This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO). **Locked by:** GCAP2.EEAC

5.2.211 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (OSD8BDLPLBA) - Offset 278h

This register specifies the base address (lower 32 bits) of Buffer Descriptor List.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 278h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0000000h RW	**Buffer Descriptor List Lower Base Address (BDLPLBA):** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted.
6:0	0h RO	**Reserved**

5.2.212 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (OSD8BDLPUBA) - Offset 27Ch

This register specifies the base address (upper 32 bits) of Buffer Descriptor List.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 27Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/L	**Buffer Descriptor List Upper Base Address (BDLPUBA):** Upper 32bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. Locked when GCAP.64OK = 0. **Locked by:** GCAP.ADD64OK

5.2.213 Global Time Synchronization Capability Header (GTSCH) - Offset 500h

This register declares the global time synchronization capability structure.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 500h	00011F00h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW/L	**Capability Version (VER):** This field is an Intel HD Audio Specification defined version number that indicates the version of the capability structure present. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
27:16	001h RW/L	**Capability Identifier (ID):** This field is an Intel HD Audio Specification defined ID number that indicates the nature and format of the capability. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
15:0	1F00h RW/L	**Next Capability Pointer (PTR):** This field contains the offset to the next capability structure or 000h if no other items exist in the linked list of capabilities. Point to DMA resume capability. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD

5.2.214 Global Time Synchronization Capability Declaration (GTSCD) - Offset 504h

This register identifies the general global time synchronization associated capabilities.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 504h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2	0h RO	**Controller Based Synchronization Adjust Supported (CTLSAS):** When set, it indicates that the controller based synchronization adjustment is supported. By adjusting the global link clock which is used as reference clock for the codecs DAC / ADC, the codec will indirectly changing the rate of all its active streams. Locked when FNCFG.BCLD = 1.
1:0	0h RO	**Reserved**

5.2.215 Global Time Synchronization Capture Control (GTSCC0) - Offset 520h

This register controls the global time synchronization capture operation, and snapshots ART value as the global time stamp counter value.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 520h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**Time Stamp Counter Capture Done (TSCCD):** This bit is set when a valid TSC value has been captured: WALFCC, TSCCL, TSCCU, LLPFOC, LLPCL, and LLPCH contain valid data. The Intel HD Audio driver software must acknowledge the completion by writing 1 to clear this bit.
30	0h RW	**Time Stamp Counter Capture Done Interrupt Enable (TSCCDIE):** If set to 1, TSCCD bit can pass through to cause an interrupt status reported in INTSTS.CIS bit, and cause an interrupt to CPU if INTCTL.CIE = 1 and INTCTL.GIE = 1.
29:6	0h RO	**Reserved**
5	0h RW/1S/V	**Time Stamp Counter Capture Initiate (TSCCI):** Write to 1 to initiate Global Time Synchronization capture for measuring TSC offset to local wall frame info. Cleared to 0 by hardware when the process is completed.
4:0	00h RW	**Capture DMA Select (CDMAS):** To select which DMA's LLPL, and LLPU value to be captured together with the TSC value. Bit 4 = 1 for ODMA, 0 for IDMA Bit 3:0 indicates the respective DMA engine index. Programmed before TSCCI = 1.

5.2.216 Wall Frame Counter Captured (WALFCC0) - Offset 524h

This register reports the wall frame counter captured.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 524h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:9	000000h RO/V	**Frame Number (FN):** Indicates the 23 bit frame number captured as a result of Global Time Synchronization capture request. Valid and static when GTSCC.TSCCD = 1.
8:0	000h RO/V	**Clock in Frame (CIF):** Indicates the 9 bit clock in frame value captured as a result of Global Time Synchronization capture request. Valid and static when GTSCC.TSCCD = 1.

5.2.217 Time Stamp Counter Captured Lower (TSCCL0) - Offset 528h

This register reports the ART value snapshot as the global time stamp counter captured (lower 32 bits).

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 528h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Counter Captured Lower (CCL):** Indicates the lower 32 bit TSC value captured as a result of Global Time Synchronization capture request. Valid and static when GTSCC.TSCCD = 1.

5.2.218 Time Stamp Counter Captured Upper (TSCCU0) - Offset 52Ch

This register reports the ART value snapshot as the global time stamp counter captured (upper 32 bits).

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 52Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Counter Captured Upper (CCU):** Indicates the upper 32 bit TSC value captured as a result of Global Time Synchronization capture request. Valid and static when GTSCC.TSCCD = 1.

5.2.219 Linear Link Position Frame Offset Captured (LLPFOC0) - Offset 534h

This register is to report additional accuracy details for captures made in between of two updates of LLP values, in number of 48 KHz HD Audio frames of the corresponding link. Audio streams with 44.1 KHz base rate and non-zero divider FMT value will skip frames periodically on the Intel HD Audio link and Intel iDisplay Audio link in order to normalize its sampling rate to the 48 KHz HD Audio frame rate; hence; the frame offset will be useful in these cases.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 534h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3:0	0h RO/V	**Frame Offset Captured (FOC):** When the LLPCL and LLPCU registers are updated, this field records the elapsed number of 48 KHz HD Audio frames since the last LLP value change. Valid and static when GTSCC.TSCCD = 1

5.2.220 Linear Link Position Captured Lower (LLPCL0) - Offset 538h

This register reports the linear link position counter captured (lower 32 bits).

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 538h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Linear Link Position Captured Lower (LLPCL):** Indicates the lower 32 bit linear link position value of the link DMA captured as a result of Global Time Synchronization capture request. Note that the LLPCL value that is captured is the LLPL value at the previous HD Audio frame boundary, not the live LLPL register value which may be changing in the middle of the current frame. Valid and static when GTSCC.TSCCD = 1.

5.2.221 Linear Link Position Captured Upper (LLPCU0) - Offset 53Ch

This register reports the time stamp counter captured (upper 32 bits).

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 53Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Linear Link Position Captured Upper (LLPCU):** Indicates the upper 32 bit linear link position value of the link DMA captured as a result of Global Time Synchronization capture request. Note that the LLPCU value that is captured is the LLPU value at the previous HD Audio frame boundary, not the live LLPU register value which may be changing in the middle of the current frame. Valid and static when GTSCC.TSCCD = 1.

5.2.222 Global Time Synchronization Capture Control (GTSCC1) - Offset 540h

This register controls the global time synchronization capture operation, and snapshots ART value as the global time stamp counter value.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 540h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**Time Stamp Counter Capture Done (TSCCD):** This bit is set when a valid TSC value has been captured: WALFCC, TSCCL, TSCCU, LLPFOC, LLPCL, and LLPCH contain valid data. The Intel HD Audio driver software must acknowledge the completion by writing 1 to clear this bit.
30	0h RW	**Time Stamp Counter Capture Done Interrupt Enable (TSCCDIE):** If set to 1, TSCCD bit can pass through to cause an interrupt status reported in INTSTS.CIS bit, and cause an interrupt to CPU if INTCTL.CIE = 1 and INTCTL.GIE = 1.
29:6	0h RO	**Reserved**
5	0h RW/1S/V	**Time Stamp Counter Capture Initiate (TSCCI):** Write to 1 to initiate Global Time Synchronization capture for measuring TSC offset to local wall frame info. Cleared to 0 by hardware when the process is completed.
4:0	00h RW	**Capture DMA Select (CDMAS):** To select which DMA's LLPL, and LLPU value to be captured together with the TSC value. Bit 4 = 1 for ODMA, 0 for IDMA Bit 3:0 indicates the respective DMA engine index. Programmed before TSCCI = 1.

5.2.223 Wall Frame Counter Captured (WALFCC1) - Offset 544h

This register reports the wall frame counter captured.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 544h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:9	000000h RO/V	**Frame Number (FN):** Indicates the 23 bit frame number captured as a result of Global Time Synchronization capture request. Valid and static when GTSCC.TSCCD = 1.
8:0	000h RO/V	**Clock in Frame (CIF):** Indicates the 9 bit clock in frame value captured as a result of Global Time Synchronization capture request. Valid and static when GTSCC.TSCCD = 1.

5.2.224 Time Stamp Counter Captured Lower (TSCCL1) - Offset 548h

This register reports the ART value snapshot as the global time stamp counter captured (lower 32 bits).

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 548h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Counter Captured Lower (CCL):** Indicates the lower 32 bit TSC value captured as a result of Global Time Synchronization capture request. Valid and static when GTSCC.TSCCD = 1.

5.2.225 Time Stamp Counter Captured Upper (TSCCU1) - Offset 54Ch

This register reports the ART value snapshot as the global time stamp counter captured (upper 32 bits).

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 54Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Counter Captured Upper (CCU):** Indicates the upper 32 bit TSC value captured as a result of Global Time Synchronization capture request. Valid and static when GTSCC.TSCCD = 1.

5.2.226 Linear Link Position Frame Offset Captured (LLPFOC1) - Offset 554h

This register is to report additional accuracy details for captures made in

between of two updates of LLP values, in number of 48 KHz HD Audio frames of the corresponding link. Audio streams with 44.1 KHz base rate and non-zero divider FMT value will skip frames periodically on the Intel HD Audio link and Intel iDisplay Audio link in order to normalize its sampling rate to the 48 KHz HD Audio frame rate; hence; the frame offset will be useful in these cases.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 554h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3:0	0h RO/V	**Frame Offset Captured (FOC):** When the LLPCL and LLPCU registers are updated, this field records the elapsed number of 48 KHz HD Audio frames since the last LLP value change. Valid and static when GTSCC.TSCCD = 1

5.2.227 Linear Link Position Captured Lower (LLPCL1) - Offset 558h

This register reports the linear link position counter captured (lower 32 bits).

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 558h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Linear Link Position Captured Lower (LLPCL):** Indicates the lower 32 bit linear link position value of the link DMA captured as a result of Global Time Synchronization capture request.Note that the LLPCL value that is captured is the LLPL value at the previous HD Audio frame boundary, not the live LLPL register value which may be changing in the middle of the current frame.Valid and static when GTSCC.TSCCD = 1.

5.2.228 Linear Link Position Captured Upper (LLPCU1) - Offset 55Ch

This register reports the time stamp counter captured (upper 32 bits).

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 55Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Linear Link Position Captured Upper (LLPCU):** Indicates the upper 32 bit linear link position value of the link DMA captured as a result of Global Time Synchronization capture request. Note that the LLPCU value that is captured is the LLPU value at the previous HD Audio frame boundary, not the live LLPU register value which may be changing in the middle of the current frame. Valid and static when GTSCC.TSCCD = 1.

5.2.229 Software Position Based FIFO Capability Header (SPBFCH) - Offset 700h

This register declares the software position FIFO capability structure.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 700h	00040000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW/L	**Capability Version (VER):** This field is an Intel HD Audio Specification defined version number that indicates the version of the capability structure present. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
27:16	004h RW/L	**Capability Identifier (ID):** This field is an Intel HD Audio Specification defined ID number that indicates the nature and format of the capability. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
15:0	0000h RW/L	**Next Capability Pointer (PTR):** This field contains the offset to the next capability structure or 000h if no other items exist in the linked list of capabilities. This is the last capability in the linked list Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD

5.2.230 Software Position Based FIFO Control (SPBFCTL) - Offset 704h

The number of SPIBE bits in this register is depending on the total number of streams DMA implemented, represented as x in the register table. The x value is determined by the parameter equation: HSTISC + HSTOSC. For SPT implementation, x = 16.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 704h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0000h RW	**Software Position in Buffer Enable (SPIBE):** When set to 1, the SPIB register is the limit where the DMA will not access beyond the value programmed. When clear to 0, the SPIB register is ignored and DMA will operate in legacy mode with the minimum FIFO size. Note that it is possible for SW to set this SPIBE bit after the RUN bit is set as SW may only update the SPIB after it fills up a large portion of the ring buffer. However, once set, it must remain set until SRST take place.

5.2.231 Input/Output Stream Descriptor x Software Position in Buffer (ISD0SPIB) - Offset 708h

This register specifies the current SW read (for input stream) or write (for output stream) location in the SW ring buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 708h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Software Position in Buffer (SPIB):** Indicates the number of bytes that SW has read from (for input stream) or write to (for output stream) the SW ring buffer. This register value should count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.232 Input/Output Stream Descriptor x Max FIFO Size (ISD0MAXFIFOS) - Offset 70Ch

This register reports the max FIFO size for software position based FIFO operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 70Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RO/V	**Max FIFO Size (MAXFIFOS):** Indicates the maximum FIFO size HW is able to buffer if SW allows through the use of SPIB register, hence reduce the interval of waking up the system to evict (for input) or fetch (for output) audio sample, achieving low power operation.

5.2.233 Input/Output Stream Descriptor x Software Position in Buffer (ISD1SPIB) - Offset 710h

This register specifies the current SW read (for input stream) or write (for output stream) location in the SW ring buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 710h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Software Position in Buffer (SPIB):** Indicates the number of bytes that SW has read from (for input stream) or write to (for output stream) the SW ring buffer. This register value should count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.234 Input/Output Stream Descriptor x Max FIFO Size (ISD1MAXFIFOS) - Offset 714h

This register reports the max FIFO size for software position based FIFO operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 714h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RO/V	**Max FIFO Size (MAXFIFOS):** Indicates the maximum FIFO size HW is able to buffer if SW allows through the use of SPIB register, hence reduce the interval of waking up the system to evict (for input) or fetch (for output) audio sample, achieving low power operation.

5.2.235 Input/Output Stream Descriptor x Software Position in Buffer (ISD2SPIB) - Offset 718h

This register specifies the current SW read (for input stream) or write (for output stream) location in the SW ring buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 718h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Software Position in Buffer (SPIB):** Indicates the number of bytes that SW has read from (for input stream) or write to (for output stream) the SW ring buffer. This register value should count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.236 Input/Output Stream Descriptor x Max FIFO Size (ISD2MAXFIFOS) - Offset 71Ch

This register reports the max FIFO size for software position based FIFO operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 71Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RO/V	**Max FIFO Size (MAXFIFOS):** Indicates the maximum FIFO size HW is able to buffer if SW allows through the use of SPIB register, hence reduce the interval of waking up the system to evict (for input) or fetch (for output) audio sample, achieving low power operation.

5.2.237 Input/Output Stream Descriptor x Software Position in Buffer (ISD3SPIB) - Offset 720h

This register specifies the current SW read (for input stream) or write (for output stream) location in the SW ring buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 720h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Software Position in Buffer (SPIB):** Indicates the number of bytes that SW has read from (for input stream) or write to (for output stream) the SW ring buffer. This register value should count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.238 Input/Output Stream Descriptor x Max FIFO Size (ISD3MAXFIFOS) - Offset 724h

This register reports the max FIFO size for software position based FIFO operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 724h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RO/V	**Max FIFO Size (MAXFIFOS):** Indicates the maximum FIFO size HW is able to buffer if SW allows through the use of SPIB register, hence reduce the interval of waking up the system to evict (for input) or fetch (for output) audio sample, achieving low power operation.

5.2.239 Input/Output Stream Descriptor x Software Position in Buffer (ISD4SPIB) - Offset 728h

This register specifies the current SW read (for input stream) or write (for output stream) location in the SW ring buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 728h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Software Position in Buffer (SPIB):** Indicates the number of bytes that SW has read from (for input stream) or write to (for output stream) the SW ring buffer. This register value should count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.240 Input/Output Stream Descriptor x Max FIFO Size (ISD4MAXFIFOS) - Offset 72Ch

This register reports the max FIFO size for software position based FIFO operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 72Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RO/V	**Max FIFO Size (MAXFIFOS):** Indicates the maximum FIFO size HW is able to buffer if SW allows through the use of SPIB register, hence reduce the interval of waking up the system to evict (for input) or fetch (for output) audio sample, achieving low power operation.

5.2.241 Input/Output Stream Descriptor x Software Position in Buffer (ISD5SPIB) - Offset 730h

This register specifies the current SW read (for input stream) or write (for output stream) location in the SW ring buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 730h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Software Position in Buffer (SPIB):** Indicates the number of bytes that SW has read from (for input stream) or write to (for output stream) the SW ring buffer. This register value should count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.242 Input/Output Stream Descriptor x Max FIFO Size (ISD5MAXFIFOS) - Offset 734h

This register reports the max FIFO size for software position based FIFO operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 734h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RO/V	**Max FIFO Size (MAXFIFOS):** Indicates the maximum FIFO size HW is able to buffer if SW allows through the use of SPIB register, hence reduce the interval of waking up the system to evict (for input) or fetch (for output) audio sample, achieving low power operation.

5.2.243 Input/Output Stream Descriptor x Software Position in Buffer (ISD6SPIB) - Offset 738h

This register specifies the current SW read (for input stream) or write (for output stream) location in the SW ring buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 738h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Software Position in Buffer (SPIB):** Indicates the number of bytes that SW has read from (for input stream) or write to (for output stream) the SW ring buffer. This register value should count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.244 Input/Output Stream Descriptor x Max FIFO Size (ISD6MAXFIFOS) - Offset 73Ch

This register reports the max FIFO size for software position based FIFO operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 73Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RO/V	**Max FIFO Size (MAXFIFOS):** Indicates the maximum FIFO size HW is able to buffer if SW allows through the use of SPIB register, hence reduce the interval of waking up the system to evict (for input) or fetch (for output) audio sample, achieving low power operation.

5.2.245 Input/Output Stream Descriptor x Software Position in Buffer (OSD0SPIB) - Offset 740h

This register specifies the current SW read (for input stream) or write (for output stream) location in the SW ring buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 740h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Software Position in Buffer (SPIB):** Indicates the number of bytes that SW has read from (for input stream) or write to (for output stream) the SW ring buffer. This register value should count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.246 Input/Output Stream Descriptor x Max FIFO Size (OSD0MAXFIFOS) - Offset 744h

This register reports the max FIFO size for software position based FIFO operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 744h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RO/V	**Max FIFO Size (MAXFIFOS):** Indicates the maximum FIFO size HW is able to buffer if SW allows through the use of SPIB register, hence reduce the interval of waking up the system to evict (for input) or fetch (for output) audio sample, achieving low power operation.

5.2.247 Input/Output Stream Descriptor x Software Position in Buffer (OSD1SPIB) - Offset 748h

This register specifies the current SW read (for input stream) or write (for output stream) location in the SW ring buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 748h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Software Position in Buffer (SPIB):** Indicates the number of bytes that SW has read from (for input stream) or write to (for output stream) the SW ring buffer. This register value should count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.248 Input/Output Stream Descriptor x Max FIFO Size (OSD1MAXFIFOS) - Offset 74Ch

This register reports the max FIFO size for software position based FIFO operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 74Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RO/V	**Max FIFO Size (MAXFIFOS):** Indicates the maximum FIFO size HW is able to buffer if SW allows through the use of SPIB register, hence reduce the interval of waking up the system to evict (for input) or fetch (for output) audio sample, achieving low power operation.

5.2.249 Input/Output Stream Descriptor x Software Position in Buffer (OSD2SPIB) - Offset 750h

This register specifies the current SW read (for input stream) or write (for output stream) location in the SW ring buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 750h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Software Position in Buffer (SPIB):** Indicates the number of bytes that SW has read from (for input stream) or write to (for output stream) the SW ring buffer. This register value should count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.250 Input/Output Stream Descriptor x Max FIFO Size (OSD2MAXFIFOS) - Offset 754h

This register reports the max FIFO size for software position based FIFO operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 754h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RO/V	**Max FIFO Size (MAXFIFOS):** Indicates the maximum FIFO size HW is able to buffer if SW allows through the use of SPIB register, hence reduce the interval of waking up the system to evict (for input) or fetch (for output) audio sample, achieving low power operation.

5.2.251 Input/Output Stream Descriptor x Software Position in Buffer (OSD3SPIB) - Offset 758h

This register specifies the current SW read (for input stream) or write (for output stream) location in the SW ring buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 758h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Software Position in Buffer (SPIB):** Indicates the number of bytes that SW has read from (for input stream) or write to (for output stream) the SW ring buffer. This register value should count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.252 Input/Output Stream Descriptor x Max FIFO Size (OSD3MAXFIFOS) - Offset 75Ch

This register reports the max FIFO size for software position based FIFO operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 75Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RO/V	**Max FIFO Size (MAXFIFOS):** Indicates the maximum FIFO size HW is able to buffer if SW allows through the use of SPIB register, hence reduce the interval of waking up the system to evict (for input) or fetch (for output) audio sample, achieving low power operation.

5.2.253 Input/Output Stream Descriptor x Software Position in Buffer (OSD4SPIB) - Offset 760h

This register specifies the current SW read (for input stream) or write (for output stream) location in the SW ring buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 760h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Software Position in Buffer (SPIB):** Indicates the number of bytes that SW has read from (for input stream) or write to (for output stream) the SW ring buffer. This register value should count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.254 Input/Output Stream Descriptor x Max FIFO Size (OSD4MAXFIFOS) - Offset 764h

This register reports the max FIFO size for software position based FIFO operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 764h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RO/V	**Max FIFO Size (MAXFIFOS):** Indicates the maximum FIFO size HW is able to buffer if SW allows through the use of SPIB register, hence reduce the interval of waking up the system to evict (for input) or fetch (for output) audio sample, achieving low power operation.

5.2.255 Input/Output Stream Descriptor x Software Position in Buffer (OSD5SPIB) - Offset 768h

This register specifies the current SW read (for input stream) or write (for output stream) location in the SW ring buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 768h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Software Position in Buffer (SPIB):** Indicates the number of bytes that SW has read from (for input stream) or write to (for output stream) the SW ring buffer. This register value should count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.256 Input/Output Stream Descriptor x Max FIFO Size (OSD5MAXFIFOS) - Offset 76Ch

This register reports the max FIFO size for software position based FIFO operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 76Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RO/V	**Max FIFO Size (MAXFIFOS):** Indicates the maximum FIFO size HW is able to buffer if SW allows through the use of SPIB register, hence reduce the interval of waking up the system to evict (for input) or fetch (for output) audio sample, achieving low power operation.

5.2.257 Input/Output Stream Descriptor x Software Position in Buffer (OSD6SPIB) - Offset 770h

This register specifies the current SW read (for input stream) or write (for output stream) location in the SW ring buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 770h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Software Position in Buffer (SPIB):** Indicates the number of bytes that SW has read from (for input stream) or write to (for output stream) the SW ring buffer. This register value should count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.258 Input/Output Stream Descriptor x Max FIFO Size (OSD6MAXFIFOS) - Offset 774h

This register reports the max FIFO size for software position based FIFO operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 774h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RO/V	**Max FIFO Size (MAXFIFOS):** Indicates the maximum FIFO size HW is able to buffer if SW allow through the use of SPIB register, hence reduce the interval of waking up the system to evict (for input) or fetch (for output) audio sample, achieving low power operation.

5.2.259 Input/Output Stream Descriptor x Software Position in Buffer (OSD7SPIB) - Offset 778h

This register specifies the current SW read (for input stream) or write (for output stream) location in the SW ring buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 778h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Software Position in Buffer (SPIB):** Indicates the number of bytes that SW has read from (for input stream) or write to (for output stream) the SW ring buffer. This register value should count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.260 Input/Output Stream Descriptor x Max FIFO Size (OSD7MAXFIFOS) - Offset 77Ch

This register reports the max FIFO size for software position based FIFO operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 77Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RO/V	**Max FIFO Size (MAXFIFOS):** Indicates the maximum FIFO size HW is able to buffer if SW allows through the use of SPIB register, hence reduce the interval of waking up the system to evict (for input) or fetch (for output) audio sample, achieving low power operation.

5.2.261 Input/Output Stream Descriptor x Software Position in Buffer (OSD8SPIB) - Offset 780h

This register specifies the current SW read (for input stream) or write (for output stream) location in the SW ring buffer.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 780h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Software Position in Buffer (SPIB):** Indicates the number of bytes that SW has read from (for input stream) or write to (for output stream) the SW ring buffer. This register value should count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.262 Input/Output Stream Descriptor x Max FIFO Size (OSD8MAXFIFOS) - Offset 784h

This register reports the max FIFO size for software position based FIFO operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 784h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RO/V	**Max FIFO Size (MAXFIFOS):** Indicates the maximum FIFO size HW is able to buffer if SW allows through the use of SPIB register, hence reduce the interval of waking up the system to evict (for input) or fetch (for output) audio sample, achieving low power operation.

5.2.263 Processing Pipe Capability Header (PPCH) - Offset 800h

This register declares the processing pipe capability structure.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 800h	00030500h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW/L	**Capability Version (VER):** This field is an Intel HD Audio Specification defined version number that indicates the version of the capability structure present. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
27:16	003h RW/L	**Capability Identifier (ID):** This field is an Intel HD Audio Specification defined ID number that indicates the nature and format of the capability. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
15:0	0500h RW/L	**Next Capability Pointer (PTR):** This field contains the offset to the next capability structure or 000h if no other item sexist in the linked list of capabilities. Point to Global Time Synchronization capability. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD

5.2.264 Processing Pipe Control (PPCTL) - Offset 804h

This register is not affected by stream reset.

Note that the PROCEN bit should only be modified when the corresponding host DMA and link DMA are idle, i.e. RUN bits are cleared, and the DMA contexts have been destroyed through SRST bits if it was previously activated.

Note that GPROCEN bit does not really enable or disable the Audio DSP operation, but mainly to work around some legacy Intel HD Audio driver software such that if GPROCEN = 0, ADSPxBA (BAR2) is mapped to the Intel HD Audio memory mapped configuration registers, for compliance with some legacy SW implementation. If GPROCEN = 1, only then ADSPxBA (BAR2) is mapped to the actual Audio DSP memory mapped configuration registers.

The number of PROCEN bits in this register is depending on the total number of streams DMA implemented, represented as x in the register table. The x value is determined by the parameter equation: HSTISC + HSTOSC. For SPT implementation, x = 16.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 804h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Processing Interrupt Enable (PIE):** Enables the general interrupt for the Audio DSP function. When set to 1 (and GIE is enabled), the Audio DSP generates an interrupt when the PIS bit gets set.

Bit Range	Default & Access	Field Name (ID): Description
30	0h RW	**Global Processing Enable (GPROCEN):** When set to 1, it indicates that the Audio DSP is enabled for operation.
29:16	0h RO	**Reserved**
15:0	0000h RW	**Processing Enable (PROCEN):** When set to 1 the DMA engine associated with this stream will be enabled to route the audio stream to DSP audio pipes in the Audio DSP for processing. When cleared to 0 the DMA engine associated with this stream will be bypassing the Audio DSP and route the audio stream directly to the audio link.

5.2.265 Processing Pipe Status (PPSTS) - Offset 808h

This register provides the status of the processing pipe operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 808h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Processing Interrupt Status (PIS):** Status of general interrupt for the Audio DSP function. A 1 indicates that an interrupt condition occurred in the Audio DSP function. The exact cause can be determined by interrogating the ADSPIS register. Note that HW interrupt will not be generated unless the corresponding enable bit is set. This bit is an OR of all of the interrupt status bits in ADSPIS register.
30:0	0h RO	**Reserved**

5.2.266 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (IPPHC0LLPL) - Offset 810h

his register reports the linear link position (lower 32 bits) on the host connection end of the processing pipe.

This register provides the status of the processing pipe operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 810h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1).Once RUN bit is set, the register will become read only until SRST occurs.

5.2.267 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (IPPHC0LLPU) - Offset 814h

This register reports the linear link position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 814h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1).Once RUN bit is set, the register will become read only until SRST occurs.

5.2.268 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (IPPHC0LDPL) - Offset 818h

This register reports the linear DMA position (lower 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 818h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.269 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (IPPHC0LDPU) - Offset 81Ch

This register reports the linear DMA position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 81Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.270 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (IPPHC1LLPL) - Offset 820h

his register reports the linear link position (lower 32 bits) on the host connection end of the processing pipe.

This register provides the status of the processing pipe operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 820h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1).Once RUN bit is set, the register will become read only until SRST occurs.

5.2.271 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (IPPHC1LLPU) - Offset 824h

This register reports the linear link position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 824h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1).Once RUN bit is set, the register will become read only until SRST occurs.

5.2.272 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (IPPHC1LDPL) - Offset 828h

This register reports the linear DMA position (lower 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 828h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.273 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (IPPHC1LDPU) - Offset 82Ch

This register reports the linear DMA position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 82Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.274 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (IPPHC2LLPL) - Offset 830h

This register reports the linear link position (lower 32 bits) on the host connection end of the processing pipe.

This register provides the status of the processing pipe operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 830h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1).Once RUN bit is set, the register will become read only until SRST occurs.

5.2.275 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (IPPHC2LLPU) - Offset 834h

This register reports the linear link position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 834h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1).Once RUN bit is set, the register will become read only until SRST occurs.

5.2.276 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (IPPHC2LDPL) - Offset 838h

This register reports the linear DMA position (lower 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 838h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.277 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (IPPHC2LDPU) - Offset 83Ch

This register reports the linear DMA position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 83Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.278 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (IPPHC3LLPL) - Offset 840h

his register reports the linear link position (lower 32 bits) on the host connection end of the processing pipe.

This register provides the status of the processing pipe operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 840h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1).Once RUN bit is set, the register will become read only until SRST occurs.

5.2.279 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (IPPHC3LLPU) - Offset 844h

This register reports the linear link position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 844h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1).Once RUN bit is set, the register will become read only until SRST occurs.

5.2.280 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (IPPHC3LDPL) - Offset 848h

This register reports the linear DMA position (lower 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 848h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.281 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (IPPHC3LDPU) - Offset 84Ch

This register reports the linear DMA position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 84Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.282 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (IPPHC4LLPL) - Offset 850h

his register reports the linear link position (lower 32 bits) on the host connection end of the processing pipe.

This register provides the status of the processing pipe operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 850h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.283 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (IPPHC4LLPU) - Offset 854h

This register reports the linear link position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 854h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.284 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (IPPHC4LDPL) - Offset 858h

This register reports the linear DMA position (lower 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 858h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.285 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (IPPHC4LDPU) - Offset 85Ch

This register reports the linear DMA position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 85Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.286 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (IPPHC5LLPL) - Offset 860h

This register reports the linear link position (lower 32 bits) on the host connection end of the processing pipe.

This register provides the status of the processing pipe operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 860h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1).Once RUN bit is set, the register will become read only until SRST occurs.

5.2.287 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (IPPHC5LLPU) - Offset 864h

This register reports the linear link position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 864h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1).Once RUN bit is set, the register will become read only until SRST occurs.

5.2.288 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (IPPHC5LDPL) - Offset 868h

This register reports the linear DMA position (lower 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 868h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.289 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (IPPHC5LDPU) - Offset 86Ch

This register reports the linear DMA position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 86Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.290 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (IPPHC6LLPL) - Offset 870h

This register reports the linear link position (lower 32 bits) on the host connection end of the processing pipe.

This register provides the status of the processing pipe operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 870h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1).Once RUN bit is set, the register will become read only until SRST occurs.

5.2.291 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (IPPHC6LLPU) - Offset 874h

This register reports the linear link position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 874h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1).Once RUN bit is set, the register will become read only until SRST occurs.

5.2.292 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (IPPHC6LDPL) - Offset 878h

This register reports the linear DMA position (lower 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 878h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.293 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (IPPHC6LDPU) - Offset 87Ch

This register reports the linear DMA position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 87Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.294 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (OPPHC0LLPL) - Offset 880h

This register reports the linear link position (lower 32 bits) on the host connection end of the processing pipe.

This register provides the status of the processing pipe operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 880h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1).Once RUN bit is set, the register will become read only until SRST occurs.

5.2.295 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (OPPHC0LLPU) - Offset 884h

This register reports the linear link position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 884h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1).Once RUN bit is set, the register will become read only until SRST occurs.

5.2.296 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (OPPHC0LDPL) - Offset 888h

This register reports the linear DMA position (lower 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 888h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.297 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (OPPHC0LDPU) - Offset 88Ch

This register reports the linear DMA position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 88Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.298 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (OPPHC1LLPL) - Offset 890h

This register reports the linear link position (lower 32 bits) on the host connection end of the processing pipe.

This register provides the status of the processing pipe operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 890h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1).Once RUN bit is set, the register will become read only until SRST occurs.

5.2.299 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (OPPHC1LLPU) - Offset 894h

This register reports the linear link position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 894h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1).Once RUN bit is set, the register will become read only until SRST occurs.

5.2.300 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (OPPHC1LDPL) - Offset 898h

This register reports the linear DMA position (lower 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 898h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.301 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (OPPHC1LDPU) - Offset 89Ch

This register reports the linear DMA position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 89Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.302 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (OPPHC2LLPL) - Offset 8A0h

This register reports the linear link position (lower 32 bits) on the host connection end of the processing pipe.

This register provides the status of the processing pipe operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 8A0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.303 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (OPPHC2LLPU) - Offset 8A4h

This register reports the linear link position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 8A4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.304 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (OPPHC2LDPL) - Offset 8A8h

This register reports the linear DMA position (lower 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 8A8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.305 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (OPPHC2LDPU) - Offset 8ACh

This register reports the linear DMA position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 8ACh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.306 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (OPPHC3LLPL) - Offset 8B0h

This register reports the linear link position (lower 32 bits) on the host connection end of the processing pipe.

This register provides the status of the processing pipe operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 8B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.307 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (OPPHC3LLPU) - Offset 8B4h

This register reports the linear link position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 8B4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.308 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (OPPHC3LDPL) - Offset 8B8h

This register reports the linear DMA position (lower 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 8B8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.309 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (OPPHC3LDPU) - Offset 8BCh

This register reports the linear DMA position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 8BCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.310 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (OPPHC4LLPL) - Offset 8C0h

This register reports the linear link position (lower 32 bits) on the host connection end of the processing pipe.

This register provides the status of the processing pipe operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 8C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1).Once RUN bit is set, the register will become read only until SRST occurs.

5.2.311 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (OPPHC4LLPU) - Offset 8C4h

This register reports the linear link position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 8C4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.312 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (OPPHC4LDPL) - Offset 8C8h

This register reports the linear DMA position (lower 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 8C8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.313 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (OPPHC4LDPU) - Offset 8CCh

This register reports the linear DMA position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 8CCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.314 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (OPPHC5LLPL) - Offset 8D0h

This register reports the linear link position (lower 32 bits) on the host connection end of the processing pipe.

This register provides the status of the processing pipe operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 8D0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1).Once RUN bit is set, the register will become read only until SRST occurs.

5.2.315 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (OPPHC5LLPU) - Offset 8D4h

This register reports the linear link position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 8D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1).Once RUN bit is set, the register will become read only until SRST occurs.

5.2.316 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (OPPHC5LDPL) - Offset 8D8h

This register reports the linear DMA position (lower 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 8D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.317 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (OPPHC5LDPU) - Offset 8DCh

This register reports the linear DMA position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 8DCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.318 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (OPPHC6LLPL) - Offset 8E0h

his register reports the linear link position (lower 32 bits) on the host connection end of the processing pipe.

This register provides the status of the processing pipe operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 8E0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.319 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (OPPHC6LLPU) - Offset 8E4h

This register reports the linear link position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 8E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.320 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (OPPHC6LDPL) - Offset 8E8h

This register reports the linear DMA position (lower 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 8E8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.321 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (OPPHC6LDPU) - Offset 8ECh

This register reports the linear DMA position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 8ECh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.322 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (OPPHC7LLPL) - Offset 8F0h

This register reports the linear link position (lower 32 bits) on the host connection end of the processing pipe.

This register provides the status of the processing pipe operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 8F0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1).Once RUN bit is set, the register will become read only until SRST occurs.

5.2.323 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (OPPHC7LLPU) - Offset 8F4h

This register reports the linear link position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 8F4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1).Once RUN bit is set, the register will become read only until SRST occurs.

5.2.324 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (OPPHC7LDPL) - Offset 8F8h

This register reports the linear DMA position (lower 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 8F8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.325 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (OPPHC7LDPU) - Offset 8FCh

This register reports the linear DMA position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 8FCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.326 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (OPPHC8LLPL) - Offset 900h

This register reports the linear link position (lower 32 bits) on the host connection end of the processing pipe.

This register provides the status of the processing pipe operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 900h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.327 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (OPPHC8LLPU) - Offset 904h

This register reports the linear link position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 904h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.328 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (OPPHC8LDPL) - Offset 908h

This register reports the linear DMA position (lower 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 908h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.329 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (OPPHC8LDPU) - Offset 90Ch

This register reports the linear DMA position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 90Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.330 Input/Output Processing Pipe's Link Connection x Control (IPPLC0CTL) - Offset 910h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 910h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. 0000=Reserved (Indicates Unused) 0001=Stream 1 ... 1110=Stream 14 1111=Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream: When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.

Bit Range	Default & Access	Field Name (ID): Description
19:2	0h RO	**Reserved**
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this stream will be enabled to transfer data between FIFO and main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. For output streams, the cadence generator is reset whenever the RUN bit is set. When cleared to 0 the DMA engine associated with this stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

5.2.331 Input/Output Processing Pipe's Link Connection x Format (IPPLC0FMT) - Offset 914h

This register specifies the audio format on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 914h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW	**Sample Base Rate (BASE):** 0=48 kHz 1=44.1 kHz
13:11	0h RW	**Sample Base Rate Multiple (MULT):** 000=48 kHz/44.1 kHz or less 001=x2 (96 kHz, 88.2 kHz, 32 kHz) 010=x3 (144 kHz) 011=x4 (192 kHz, 176.4 kHz) 100-111=Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** 000=Divide by 1 (48 kHz, 44.1 kHz) 001=Divide by 2 (24 kHz, 22.05 kHz) 010=Divide by 3 (16 kHz, 32 kHz) 011=Divide by 4 (11.025 kHz) 100=Divide by 5 (9.6 kHz) 101=Divide by 6 (8 kHz) 110=Divide by 7 111=Divide by 8 (6 kHz)

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Reserved**
6:4	0h RW	**Bits per Sample (BITS):** 000=8 bits. The data will be packed in memory in 8-bit containers on 16-bit boundaries 001=16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries 010=20 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 011=24 bits. 3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: 0000=1 0001=2 ... 1111=16

5.2.332 Input/Output Processing Pipe's Link Connection x Linear Link Position Lower (IPPLC0LLPL) - Offset 918h

This register reports the linear link position (lower 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 918h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.333 Input/Output Processing Pipe's Link Connection x Linear Link Position Upper (IPPLC0LLPU) - Offset 91Ch

This register reports the linear link position (upper 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 91Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.334 Input/Output Processing Pipe's Link Connection x Control (IPPLC1CTL) - Offset 920h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 920h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. 0000=Reserved (Indicates Unused) 0001=Stream 1 ... 1110=Stream 14 1111=Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream: When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.

5.2.344 Input/Output Processing Pipe's Link Connection x Linear Link Position Lower (IPPLC3LLPL) - Offset 948h

This register reports the linear link position (lower 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 948h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.345 Input/Output Processing Pipe's Link Connection x Linear Link Position Upper (IPPLC3LLPU) - Offset 94Ch

This register reports the linear link position (upper 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 94Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.346 Input/Output Processing Pipe's Link Connection x Control (IPPLC4CTL) - Offset 950h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 950h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. 0000=Reserved (Indicates Unused) 0001=Stream 1 ... 1110=Stream 14 1111=Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream: When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.

Bit Range	Default & Access	Field Name (ID): Description
19:2	0h RO	**Reserved**
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this stream will be enabled to transfer data between FIFO and main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. For output streams, the cadence generator is reset whenever the RUN bit is set. When cleared to 0 the DMA engine associated with this stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

5.2.347 Input/Output Processing Pipe's Link Connection x Format (IPPLC4FMT) - Offset 954h

This register specifies the audio format on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 954h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW	**Sample Base Rate (BASE):** 0=48 kHz 1=44.1 kHz

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Reserved**
6:4	0h RW	**Bits per Sample (BITS):** 000=8 bits. The data will be packed in memory in 8-bit containers on 16-bit boundaries 001=16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries 010=20 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 011=24 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 100=32 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 101-111=Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: 0000=1 0001=2 ... 1111=16

5.2.348 Input/Output Processing Pipe's Link Connection x Linear Link Position Lower (IPPLC4LLPL) - Offset 958h

This register reports the linear link position (lower 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 958h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.349 Input/Output Processing Pipe's Link Connection x Linear Link Position Upper (IPPLC4LLPU) - Offset 95Ch

This register reports the linear link position (upper 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 95Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.350 Input/Output Processing Pipe's Link Connection x Control (IPPLC5CTL) - Offset 960h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 960h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. 0000=Reserved (Indicates Unused) 0001=Stream 1 ... 1110=Stream 14 1111=Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream: When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.

Bit Range	Default & Access	Field Name (ID): Description
19:2	0h RO	**Reserved**
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this stream will be enabled to transfer data between FIFO and main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. For output streams, the cadence generator is reset whenever the RUN bit is set. When cleared to 0 the DMA engine associated with this stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

5.2.351 Input/Output Processing Pipe's Link Connection x Format (IPPLC5FMT) - Offset 964h

This register specifies the audio format on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 964h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW	**Sample Base Rate (BASE):** 0=48 kHz 1=44.1 kHz
13:11	0h RW	**Sample Base Rate Multiple (MULT):** 000=48 kHz/44.1 kHz or less 001=x2 (96 kHz, 88.2 kHz, 32 kHz) 010=x3 (144 kHz) 011=x4 (192 kHz, 176.4 kHz) 100-111=Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** 000=Divide by 1 (48 kHz, 44.1 kHz) 001=Divide by 2 (24 kHz, 22.05 kHz) 010=Divide by 3 (16 kHz, 32 kHz) 011=Divide by 4 (11.025 kHz) 100=Divide by 5 (9.6 kHz) 101=Divide by 6 (8 kHz) 110=Divide by 7 111=Divide by 8 (6 kHz)

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Reserved**
6:4	0h RW	**Bits per Sample (BITS):** 000=8 bits. The data will be packed in memory in 8-bit containers on 16-bit boundaries 001=16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries 010=20 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 011=24 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 100=32 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 101-111=Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: 0000=1 0001=2 ... 1111=16

5.2.352 Input/Output Processing Pipe's Link Connection x Linear Link Position Lower (IPPLC5LLPL) - Offset 968h

This register reports the linear link position (lower 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 968h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.353 Input/Output Processing Pipe's Link Connection x Linear Link Position Upper (IPPLC5LLPU) - Offset 96Ch

This register reports the linear link position (upper 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 96Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.354 Input/Output Processing Pipe's Link Connection x Control (IPPLC6CTL) - Offset 970h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 970h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. 0000=Reserved (Indicates Unused) 0001=Stream 1 ... 1110=Stream 14 1111=Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. 3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: 0000=1 0001=2 ... 1111=16

5.2.356 Input/Output Processing Pipe's Link Connection x Linear Link Position Lower (IPPLC6LLPL) - Offset 978h

This register reports the linear link position (lower 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 978h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.357 Input/Output Processing Pipe's Link Connection x Linear Link Position Upper (IPPLC6LLPU) - Offset 97Ch

This register reports the linear link position (upper 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 97Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.358 Input/Output Processing Pipe's Link Connection x Control (OPPLC0CTL) - Offset 980h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 980h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. 0000=Reserved (Indicates Unused) 0001=Stream 1 ... 1110=Stream 14 1111=Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. 5.2.364 Input/Output Processing Pipe's Link Connection x Linear Link Position Lower (OPPLC1LLPL) - Offset 998h

This register reports the linear link position (lower 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 998h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.365 Input/Output Processing Pipe's Link Connection x Linear Link Position Upper (OPPLC1LLPU) - Offset 99Ch

This register reports the linear link position (upper 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 99Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.366 Input/Output Processing Pipe's Link Connection x Control (OPPLC2CTL) - Offset 9A0h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 9A0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. 0000=Reserved (Indicates Unused) 0001=Stream 1 ... 1110=Stream 14 1111=Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream: When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.

Bit Range	Default & Access	Field Name (ID): Description
19:2	0h RO	**Reserved**
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this stream will be enabled to transfer data between FIFO and main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. For output streams, the cadence generator is reset whenever the RUN bit is set. When cleared to 0 the DMA engine associated with this stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

5.2.367 Input/Output Processing Pipe's Link Connection x Format (OPPLC2FMT) - Offset 9A4h

This register specifies the audio format on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 9A4h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW	**Sample Base Rate (BASE):** 0=48 kHz 1=44.1 kHz
13:11	0h RW	**Sample Base Rate Multiple (MULT):** 000=48 kHz/44.1 kHz or less 001=x2 (96 kHz, 88.2 kHz, 32 kHz) 010=x3 (144 kHz) 011=x4 (192 kHz, 176.4 kHz) 100-111=Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** 000=Divide by 1 (48 kHz, 44.1 kHz) 001=Divide by 2 (24 kHz, 22.05 kHz) 010=Divide by 3 (16 kHz, 32 kHz) 011=Divide by 4 (11.025 kHz) 100=Divide by 5 (9.6 kHz) 101=Divide by 6 (8 kHz) 110=Divide by 7 111=Divide by 8 (6 kHz)

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Reserved**
6:4	0h RW	**Bits per Sample (BITS):** 000=8 bits. The data will be packed in memory in 8-bit containers on 16-bit boundaries 001=16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries 010=20 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 011=24 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 100=32 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 101-111=Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: 0000=1 0001=2 ... 1111=16

5.2.368 Input/Output Processing Pipe's Link Connection x Linear Link Position Lower (OPPLC2LLPL) - Offset 9A8h

This register reports the linear link position (lower 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 9A8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.369 Input/Output Processing Pipe's Link Connection x Linear Link Position Upper (OPPLC2LLPU) - Offset 9ACh

This register reports the linear link position (upper 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 9ACh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.370 Input/Output Processing Pipe's Link Connection x Control (OPPLC3CTL) - Offset 9B0h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 9B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. 0000=Reserved (Indicates Unused) 0001=Stream 1 ... 1110=Stream 14 1111=Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream: When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.

Bit Range	Default & Access	Field Name (ID): Description
19:2	0h RO	**Reserved**
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this stream will be enabled to transfer data between FIFO and main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. For output streams, the cadence generator is reset whenever the RUN bit is set. When cleared to 0 the DMA engine associated with this stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

5.2.371 Input/Output Processing Pipe's Link Connection x Format (OPPLC3FMT) - Offset 9B4h

This register specifies the audio format on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 9B4h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW	**Sample Base Rate (BASE):** 0=48 kHz 1=44.1 kHz

5.2.384 Input/Output Processing Pipe's Link Connection x Linear Link Position Lower (OPPLC6LLPL) - Offset 9E8h

This register reports the linear link position (lower 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 9E8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.385 Input/Output Processing Pipe's Link Connection x Linear Link Position Upper (OPPLC6LLPU) - Offset 9ECh

This register reports the linear link position (upper 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 9ECh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.386 Input/Output Processing Pipe's Link Connection x Control (OPPLC7CTL) - Offset 9F0h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 9F0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. 0000=Reserved (Indicates Unused) 0001=Stream 1 ... 1110=Stream 14 1111=Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream: When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.

Bit Range	Default & Access	Field Name (ID): Description
19:2	0h RO	**Reserved**
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this stream will be enabled to transfer data between FIFO and main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. For output streams, the cadence generator is reset whenever the RUN bit is set. When cleared to 0 the DMA engine associated with this stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

5.2.387 Input/Output Processing Pipe's Link Connection x Format (OPPLC7FMT) - Offset 9F4h

This register specifies the audio format on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 9F4h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW	**Sample Base Rate (BASE):** 0=48 kHz 1=44.1 kHz
13:11	0h RW	**Sample Base Rate Multiple (MULT):** 000=48 kHz/44.1 kHz or less 001=x2 (96 kHz, 88.2 kHz, 32 kHz) 010=x3 (144 kHz) 011=x4 (192 kHz, 176.4 kHz) 100-111=Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** 000=Divide by 1 (48 kHz, 44.1 kHz) 001=Divide by 2 (24 kHz, 22.05 kHz) 010=Divide by 3 (16 kHz, 32 kHz) 011=Divide by 4 (11.025 kHz) 100=Divide by 5 (9.6 kHz) 101=Divide by 6 (8 kHz) 110=Divide by 7 111=Divide by 8 (6 kHz)

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Reserved**
6:4	0h RW	**Bits per Sample (BITS):** 000=8 bits. The data will be packed in memory in 8-bit containers on 16-bit boundaries 001=16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries 010=20 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 011=24 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 100=32 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 101-111=Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: 0000=1 0001=2 ... 1111=16

5.2.388 Input/Output Processing Pipe's Link Connection x Linear Link Position Lower (OPPLC7LLPL) - Offset 9F8h

This register reports the linear link position (lower 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 9F8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.389 Input/Output Processing Pipe's Link Connection x Linear Link Position Upper (OPPLC7LLPU) - Offset 9FCh

This register reports the linear link position (upper 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 9FCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.390 Input/Output Processing Pipe's Link Connection x Control (OPPLC8CTL) - Offset A00h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + A00h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. 0000=Reserved (Indicates Unused) 0001=Stream 1 ... 1110=Stream 14 1111=Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream: When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.

Bit Range	Default & Access	Field Name (ID): Description
19:2	0h RO	**Reserved**
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this stream will be enabled to transfer data between FIFO and main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. For output streams, the cadence generator is reset whenever the RUN bit is set. When cleared to 0 the DMA engine associated with this stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

5.2.391 Input/Output Processing Pipe's Link Connection x Format (OPPLC8FMT) - Offset A04h

This register specifies the audio format on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + A04h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW	**Sample Base Rate (BASE):** 0=48 kHz 1=44.1 kHz
13:11	0h RW	**Sample Base Rate Multiple (MULT):** 000=48 kHz/44.1 kHz or less 001=x2 (96 kHz, 88.2 kHz, 32 kHz) 010=x3 (144 kHz) 011=x4 (192 kHz, 176.4 kHz) 100-111=Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** 000=Divide by 1 (48 kHz, 44.1 kHz) 001=Divide by 2 (24 kHz, 22.05 kHz) 010=Divide by 3 (16 kHz, 32 kHz) 011=Divide by 4 (11.025 kHz) 100=Divide by 5 (9.6 kHz) 101=Divide by 6 (8 kHz) 110=Divide by 7 111=Divide by 8 (6 kHz)

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Reserved**
6:4	0h RW	**Bits per Sample (BITS):** 000=8 bits. The data will be packed in memory in 8-bit containers on 16-bit boundaries 001=16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries 010=20 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 011=24 bits. 3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: 0000=1 0001=2 ... 1111=16

5.2.392 Input/Output Processing Pipe's Link Connection x Linear Link Position Lower (OPPLC8LLPL) - Offset A08h

This register reports the linear link position (lower 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + A08h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.393 Input/Output Processing Pipe's Link Connection x Linear Link Position Upper (OPPLC8LLPU) - Offset A0Ch

This register reports the linear link position (upper 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + A0Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.394 Multiple Links Capability Header (MLCH) - Offset C00h

This register declares the multiple links capability structure.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + C00h	00020800h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW/L	**Capability Version (VER):** This field is an Intel HD Audio Specification defined version number that indicates the version of the capability structure present. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
27:16	002h RW/L	**Capability Identifier (ID):** This field is an Intel HD Audio Specification defined ID number that indicates the nature and format of the capability. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
15:0	0800h RW/L	**Next Capability Pointer (PTR):** This field contains the offset to the next capability structure or 000h if no other item sexist in the linked list of capabilities. Point to Processing Pipe capability. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD

5.2.395 Multiple Links Capability Declaration (MLCD) - Offset C04h

This register identifies the general multiple links associated capabilities.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + C04h	00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3:0	1h RO	**Link Count (LCOUNT):** Indicates the number of links. Up to 15 links can be supported. A '0' indicates 1 link, and '1110' indicates 15 links. ***Note***: '1111' is reserved. Note that this Link Count is the cumulative total number of links where the links can be heterogeneous. This field is hard coded to parameter LNKC-1.

5.2.396 Link x Capabilities (LCAP0) - Offset C40h

This register identifies the specific link associated capabilities

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + C40h	00000007h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW/L	**Audio Link Type (ALT):** Indicates which Link Type this link belongs to. 0001-1111 = Reserved 0000 = Intel HD Audio Link Reset value is hard coded to parameter LCAPALT[x*4+3:x*4]. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
27:26	0h RO	**Reserved**
25:24	0h RW/L	**Number of Serial Data Out Signals (NSDO):** 00b indicates that the Intel HD Audio controller supports one Serial Data Output signal. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
23:6	0h RO	**Reserved**
5	0h RW/L	**192 MHz Supported (S192):** Indicates 192 MHz clock is supported. Reset value is hard coded to parameter DEFLCAPS192[x]. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
4	0h RW/L	**96 MHz Supported (S96):** Indicates 96 MHz clock is supported. Reset value is hard coded to parameter DEFLCAPS96[x]. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
3	0h RW/L	**48 MHz Supported (S48):** Indicates 48 MHz clock is supported. Reset value is hard coded to parameter DEFLCAPS48[x]. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD

Bit Range	Default & Access	Field Name (ID): Description
2	1h RW/L	**24 MHz Supported (S24):** Indicates 24 MHz clock is supported. Reset value is hard coded to parameter DEFLCAPS24[x]. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
1	1h RW/L	**12 MHz Supported (S12):** Indicates 12 MHz clock is supported. Reset value is hard coded to parameter DEFLCAPS12[x]. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
0	1h RW/L	**6 MHz Supported (S6):** Indicates 6 MHz clock is supported. Reset value is hard coded to parameter DEFLCAPS6[x]. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD

5.2.397 Link x Control (LCTL0) - Offset C44h

Link x Control

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + C44h	00010002h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	0h RO/V	**Current Power Active (CPA):** This value changes to the value set by SPA when the power of the link has reached that state. Software sets SPA, then monitors CPA to know when the link has changed state.
22:17	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
16	1h RW	**Set Power Active (SPA):** Software sets this bit to '1' to turn the link on (provided CRSTB = 1), and clears it to '0'when it wishes to turn the link off. When CPA matches the value of this bit, the achieved power state has been reached. Software is expected to wait for CPA to match SPA before it can program SPA again. Any deviation may result in undefined behavior.
15:4	0h RO	**Reserved**
3:0	2h RW	**Set Clock Frequency (SCF):** Indicates the frequency that software wishes the link to run at. Changing this value to a value not supported by Link Capabilities shall result in indeterminate results. The possible encodings are: Encoding Frequency 0000 6 MHz 0001 12 MHz 0010 24 MHz 0011 48 MHz 0100 96 MHz 0101 Reserved for 192 MHz 0110-1111 Reserved

5.2.398 Link x Output Stream ID Mapping Valid (LOSIDV0) - Offset C48h

This register maps the output stream connection for specific link.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + C48h	0000FFFEh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	1h RW	**Output Stream ID of 15 is Valid for this Link (L1OSIDV15):** This link will claim / forward output cycles with Stream ID = 1111b.
14	1h RW	**Output Stream ID of 14 is Valid for this Link (L1OSIDV14):** This link will claim / forward output cycles with Stream ID = 1110b.
13	1h RW	**Output Stream ID of 13 is Valid for this Link (L1OSIDV13):** This link will claim / forward output cycles with Stream ID = 1101b.
12	1h RW	**Output Stream ID of 12 is Valid for this Link (L1OSIDV12):** This link will claim / forward output cycles with Stream ID = 1100b.
11	1h RW	**Output Stream ID of 11 is Valid for this Link (L1OSIDV11):** This link will claim / forward output cycles with Stream ID = 1011b.
10	1h RW	**Output Stream ID of 10 is Valid for this Link (L1OSIDV10):** This link will claim / forward output cycles with Stream ID = 1010b.
9	1h RW	**Output Stream ID of 9 is Valid for this Link (L1OSIDV9):** This link will claim / forward output cycles with Stream ID = 1001b.

Bit Range	Default & Access	Field Name (ID): Description
8	1h RW	**Output Stream ID of 8 is Valid for this Link (L1OSIDV8):** This link will claim / forward output cycles with Stream ID = 1000b.
7	1h RW	**Output Stream ID of 7 is Valid for this Link (L1OSIDV7):** This link will claim / forward output cycles with Stream ID = 0111b.
6	1h RW	**Output Stream ID of 6 is Valid for this Link (L1OSIDV6):** This link will claim / forward output cycles with Stream ID = 0110b.
5	1h RW	**Output Stream ID of 5 is Valid for this Link (L1OSIDV5):** This link will claim / forward output cycles with Stream ID = 0101b.
4	1h RW	**Output Stream ID of 4 is Valid for this Link (L1OSIDV4):** This link will claim / forward output cycles with Stream ID = 0100b.
3	1h RW	**Output Stream ID of 3 is Valid for this Link (L1OSIDV3):** This link will claim / forward output cycles with Stream ID = 0011b.
2	1h RW	**Output Stream ID of 2 is Valid for this Link (L1OSIDV2):** This link will claim / forward output cycles with Stream ID = 0010b.
1	1h RW	**Output Stream ID of 1 is Valid for this Link (L1OSIDV1):** This link will claim / forward output cycles with Stream ID = 0001b.
0	0h RO	**Reserved**

5.2.399 Link x SDI Identifier (LSDIID0) - Offset C4Ch

Link x SDI Identifier

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + C4Ch	00000003h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	**Reserved**
14	0h RO	**SDI 14 (SDIID14):** This link uses SDI 14. This bit is hard coded per parameter LSDIID14 assignment.
13	0h RO	**SDI 13 (SDIID13):** This link uses SDI 13. This bit is hard coded per parameter LSDIID13 assignment.
12	0h RO	**SDI 12 (SDIID12):** This link uses SDI 12. This bit is hard coded per parameter LSDIID12 assignment.
11	0h RO	**SDI 11 (SDIID11):** This link uses SDI 11. This bit is hard coded per parameter LSDIID11 assignment.
10	0h RO	**SDI 10 (SDIID10):** This link uses SDI 10. This bit is hard coded per parameter LSDIID10 assignment.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RO	**SDI 9 (SDIID9):** This link uses SDI 9. This bit is hard coded per parameter LSDIID9 assignment.
8	0h RO	**SDI 8 (SDIID8):** This link uses SDI 8. This bit is hard coded per parameter LSDIID8 assignment.
7	0h RO	**SDI 7 (SDIID7):** This link uses SDI 7. This bit is hard coded per parameter LSDIID7 assignment.
6	0h RO	**SDI 6 (SDIID6):** This link uses SDI 6. This bit is hard coded per parameter LSDIID6 assignment.
5	0h RO	**SDI 5 (SDIID5):** This link uses SDI 5. This bit is hard coded per parameter LSDIID5 assignment.
4	0h RO	**SDI 4 (SDIID4):** This link uses SDI 4. This bit is hard coded per parameter LSDIID4 assignment.
3	0h RO	**SDI 3 (SDIID3):** This link uses SDI 3. This bit is hard coded per parameter LSDIID3 assignment.
2	0h RO	**SDI 2 (SDIID2):** This link uses SDI 2. This bit is hard coded per parameter LSDIID2 assignment.
1	1h RO	**SDI 1 (SDIID1):** This link uses SDI 1. This bit is hard coded per parameter LSDIID1 assignment.
0	1h RO	**SDI 0 (SDIID0):** This link uses SDI 0. This bit is hard coded per parameter LSDIID0 assignment.

5.2.400 Link x Per Stream Output Overhead (LPSOO0) - Offset C50h

This register reports the output stream overhead for specific link.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + C50h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RO/V	**Per Stream Output Overhead (PSOO):** Indicates the SDO Output Overhead on a per stream basis. This does not include bandwidth used for command and control. This measurement is in byte quantities per 48 kHz frame. Software calculates available link bandwidth in bytes with the following formula: (2 * LOUTPAY) - (NumOfStreams * LPSOO).

5.2.401 Link x Per Stream Input Overhead (LPSIO0) - Offset C52h

This register reports the input stream overhead for specific link.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + C52h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RO/V	**Per Stream Input Overhead (PSIO):** Indicates the SDI Input Overhead on a per stream basis. This does not include bandwidth used for response. This measurement is in byte quantities per 48 kHz frame. Software calculates available link bandwidth in bytes with the following formula: (2 * LINPAY) - (NumOfStreams * LPSIO).

5.2.402 Link x Wall Frame Counter (LWALFC0) - Offset C58h

This register reports the wall frame counter for specific link.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + C58h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:9	000000h RO/V	**Frame Number (FN):** 23 bit counter that is incremented when CIF rolls over from 499 to 0. This counter will roll over to zero with a period of approximately 174 seconds.
8:0	000h RO/V	**Clock in Frame (CIF):** 9 bit counter that is incremented on each link BCLK period and rolls over from 499 to 0. This counter will roll over to zero with a period of 48 KHz HD Audio frame. With the introduction of multiple link segments for the Intel HD Audio controller, and the capability of running each link segment at different clock speed, the BCLK definition is fixed at 24 MHz equivalent rate always, independent of the physical link clock speed.

5.2.403 Link x Output Payload Capability (LOUTPAY6M0) - Offset C60h

Link x Output Payload Capability

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + C60h	000Dh

Bit Range	Default & Access	Field Name (ID): Description
15:0	000Dh RO/V	**Output Payload Capability (OUTPAY):** Indicates the total output payload available on the link at a given frequency. This does not include bandwidth used for command and control. This measurement is in 16-bit word quantities per 48 kHz frame. Reset value is dependent on the default clock frequency specified in parameter DEFLOUTPAY[x*96+95:x*96]. Note that this value does not reflect any bandwidth increase due to support for multiple SDO lines. 00h: 0 words 01h: 1 word payload ... FFh: 255h word payload Offset Frequency Encoding Frequency 40h+(40h*x) + 20h[15:0] 6 MHz 40h+(40h*x) + 28h[15:0] Reserved for 96 MHz 40h+(40h*x) + 22h[15:0] 12 MHz 40h+(40h*x) + 2Ah[15:0] Reserved for 192 MHz 40h+(40h*x) + 24h[15:0] 24 MHz 40h+(40h*x) + 26h[15:0] Reserved for 48 MHz The audio bus driver queries this lookup register & LPSOO to derive the potential nett output bandwidth before deciding whether to switch frequency.

5.2.404 Link x Output Payload Capability (LOUTPAY12M0) - Offset C62h

Link x Output Payload Capability

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + C62h	001Ch

Bit Range	Default & Access	Field Name (ID): Description
15:0	001Ch RO/V	**Output Payload Capability (OUTPAY):** Indicates the total output payload available on the link at a given frequency. This does not include bandwidth used for command and control. This measurement is in 16-bit word quantities per 48 kHz frame. Reset value is dependent on the default clock frequency specified in parameter DEFLOUTPAY[x*96+95:x*96]. Note that this value does not reflect any bandwidth increase due to support for multiple SDO lines. 00h: 0 words 01h: 1 word payload ... FFh: 255h word payload Offset Frequency Encoding Frequency 40h+(40h*x) + 20h[15:0] 6 MHz 40h+(40h*x) + 28h[15:0] Reserved for 96 MHz 40h+(40h*x) + 22h[15:0] 12 MHz 40h+(40h*x) + 2Ah[15:0] Reserved for 192 MHz 40h+(40h*x) + 24h[15:0] 24 MHz 40h+(40h*x) + 26h[15:0] Reserved for 48 MHz The audio bus driver queries this lookup register & LPSOO to derive the potential nett output bandwidth before deciding whether to switch frequency.

5.2.405 Link x Output Payload Capability (LOUTPAY24M0) - Offset C64h

Link x Output Payload Capability

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + C64h	003Ch

5.2.415 Link x Capabilities (LCAP1) - Offset C80h

This register identifies the specific link associated capabilities

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + C80h	0000001Fh

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW/L	**Audio Link Type (ALT):** Indicates which Link Type this link belongs to. 0001-1111 = Reserved 0000 = Intel HD Audio Link Reset value is hard coded to parameter LCAPALT[x*4+3:x*4]. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
27:26	0h RO	**Reserved**
25:24	0h RW/L	**Number of Serial Data Out Signals (NSDO):** 00b indicates that the Intel HD Audio controller supports one Serial Data Output signal. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
23:6	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW/L	**192 MHz Supported (S192):** Indicates 192 MHz clock is supported. Reset value is hard coded to parameter DEFLCAPS192[x]. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
4	1h RW/L	**96 MHz Supported (S96):** Indicates 96 MHz clock is supported. Reset value is hard coded to parameter DEFLCAPS96[x]. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
3	1h RW/L	**48 MHz Supported (S48):** Indicates 48 MHz clock is supported. Reset value is hard coded to parameter DEFLCAPS48[x]. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
2	1h RW/L	**24 MHz Supported (S24):** Indicates 24 MHz clock is supported. Reset value is hard coded to parameter DEFLCAPS24[x]. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
1	1h RW/L	**12 MHz Supported (S12):** Indicates 12 MHz clock is supported. Reset value is hard coded to parameter DEFLCAPS12[x]. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
0	1h RW/L	**6 MHz Supported (S6):** Indicates 6 MHz clock is supported. Reset value is hard coded to parameter DEFLCAPS6[x]. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD

5.2.416 Link x Control (LCTL1) - Offset C84h

Link x Control

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + C84h	00010004h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	0h RO/V	**Current Power Active (CPA):** This value changes to the value set by SPA when the power of the link has reached that state. Software sets SPA, then monitors CPA to know when the link has changed state.
22:17	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
16	1h RW	**Set Power Active (SPA):** Software sets this bit to '1' to turn the link on (provided CRSTB = 1), and clears it to '0'when it wishes to turn the link off. When CPA matches the value of this bit, the achieved power state has been reached. Software is expected to wait for CPA to match SPA before the program SPA again. Any deviation may result in undefined behavior.
15:4	0h RO	**Reserved**
3:0	4h RW	**Set Clock Frequency (SCF):** Indicates the frequency that software wishes the link to run at. Changing this value to a value not supported by Link Capabilities shall result in indeterminate results. The possible encodings are: Encoding Frequency 0000 6 MHz 0001 12 MHz 0010 24 MHz 0011 48 MHz 0100 96 MHz 0101 Reserved for 192 MHz 0110-1111 Reserved

5.2.417 Link x Output Stream ID Mapping Valid (LOSIDV1) - Offset C88h

This register maps the output stream connection for specific link.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + C88h	0000FFFEh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	1h RW	**Output Stream ID of 15 is Valid for this Link (L1OSIDV15):** This link will claim / forward output cycles with Stream ID = 1111b.
14	1h RW	**Output Stream ID of 14 is Valid for this Link (L1OSIDV14):** This link will claim / forward output cycles with Stream ID = 1110b.
13	1h RW	**Output Stream ID of 13 is Valid for this Link (L1OSIDV13):** This link will claim / forward output cycles with Stream ID = 1101b.
12	1h RW	**Output Stream ID of 12 is Valid for this Link (L1OSIDV12):** This link will claim / forward output cycles with Stream ID = 1100b.
11	1h RW	**Output Stream ID of 11 is Valid for this Link (L1OSIDV11):** This link will claim / forward output cycles with Stream ID = 1011b.
10	1h RW	**Output Stream ID of 10 is Valid for this Link (L1OSIDV10):** This link will claim / forward output cycles with Stream ID = 1010b.
9	1h RW	**Output Stream ID of 9 is Valid for this Link (L1OSIDV9):** This link will claim / forward output cycles with Stream ID = 1001b.

Bit Range	Default & Access	Field Name (ID): Description
8	1h RW	**Output Stream ID of 8 is Valid for this Link (L1OSIDV8):** This link will claim / forward output cycles with Stream ID = 1000b.
7	1h RW	**Output Stream ID of 7 is Valid for this Link (L1OSIDV7):** This link will claim / forward output cycles with Stream ID = 0111b.
6	1h RW	**Output Stream ID of 6 is Valid for this Link (L1OSIDV6):** This link will claim / forward output cycles with Stream ID = 0110b.
5	1h RW	**Output Stream ID of 5 is Valid for this Link (L1OSIDV5):** This link will claim / forward output cycles with Stream ID = 0101b.
4	1h RW	**Output Stream ID of 4 is Valid for this Link (L1OSIDV4):** This link will claim / forward output cycles with Stream ID = 0100b.
3	1h RW	**Output Stream ID of 3 is Valid for this Link (L1OSIDV3):** This link will claim / forward output cycles with Stream ID = 0011b.
2	1h RW	**Output Stream ID of 2 is Valid for this Link (L1OSIDV2):** This link will claim / forward output cycles with Stream ID = 0010b.
1	1h RW	**Output Stream ID of 1 is Valid for this Link (L1OSIDV1):** This link will claim / forward output cycles with Stream ID = 0001b.
0	0h RO	**Reserved**

5.2.418 Link x SDI Identifier (LSDIID1) - Offset C8Ch

Link x SDI identifier

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + C8Ch	00000004h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	**Reserved**
14	0h RO	**SDI 14 (SDIID14):** This link uses SDI 14. This bit is hard coded per parameter LSDIID14 assignment.
13	0h RO	**SDI 13 (SDIID13):** This link uses SDI 13. This bit is hard coded per parameter LSDIID13 assignment.
12	0h RO	**SDI 12 (SDIID12):** This link uses SDI 12. This bit is hard coded per parameter LSDIID12 assignment.
11	0h RO	**SDI 11 (SDIID11):** This link uses SDI 11. This bit is hard coded per parameter LSDIID11 assignment.
10	0h RO	**SDI 10 (SDIID10):** This link uses SDI 10. This bit is hard coded per parameter LSDIID10 assignment.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RO	**SDI 9 (SDIID9):** This link uses SDI 9. This bit is hard coded per parameter LSDIID9 assignment.
8	0h RO	**SDI 8 (SDIID8):** This link uses SDI 8. This bit is hard coded per parameter LSDIID8 assignment.
7	0h RO	**SDI 7 (SDIID7):** This link uses SDI 7. This bit is hard coded per parameter LSDIID7 assignment.
6	0h RO	**SDI 6 (SDIID6):** This link uses SDI 6. This bit is hard coded per parameter LSDIID6 assignment.
5	0h RO	**SDI 5 (SDIID5):** This link uses SDI 5. This bit is hard coded per parameter LSDIID5 assignment.
4	0h RO	**SDI 4 (SDIID4):** This link uses SDI 4. This bit is hard coded per parameter LSDIID4 assignment.
3	0h RO	**SDI 3 (SDIID3):** This link uses SDI 3. This bit is hard coded per parameter LSDIID3 assignment.
2	1h RO	**SDI 2 (SDIID2):** This link uses SDI 2. This bit is hard coded per parameter LSDIID2 assignment.
1	0h RO	**SDI 1 (SDIID1):** This link uses SDI 1. This bit is hard coded per parameter LSDIID1 assignment.
0	0h RO	**SDI 0 (SDIID0):** This link uses SDI 0. This bit is hard coded per parameter LSDIID0 assignment.

5.2.419 Link x Per Stream Output Overhead (LPSOO1) - Offset C90h

This register reports the output stream overhead for specific link.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + C90h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RO/V	**Per Stream Output Overhead (PSOO):** Indicates the SDO Output Overhead on a per stream basis. This does not include bandwidth used for command and control. This measurement is in byte quantities per 48 kHz frame. Software calculates available link bandwidth in bytes with the following formula: (2 * LOUTPAY) - (NumOfStreams * LPSOO).

5.2.420 Link x Per Stream Input Overhead (LPSIO1) - Offset C92h

This register reports the input stream overhead for specific link.

Type	Size	Offset	Default
MMIO	8 bit	HDA BAR + C92h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RO/V	**Per Stream Input Overhead (PSIO):** Indicates the SDI Input Overhead on a per stream basis. This does not include bandwidth used for response. This measurement is in byte quantities per 48 kHz frame. Software calculates available link bandwidth in bytes with the following formula: (2 * LINPAY) - (NumOfStreams * LPSIO).

5.2.421 Link x Wall Frame Counter (LWALFC1) - Offset C98h

This register reports the wall frame counter for specific link.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + C98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:9	000000h RO/V	**Frame Number (FN):** 23 bit counter that is incremented when CIF rolls over from 499 to 0. This counter will roll over to zero with a period of approximately 174 seconds.
8:0	000h RO/V	**Clock in Frame (CIF):** 9 bit counter that is incremented on each link BCLK period and rolls over from 499 to 0. This counter will roll over to zero with a period of 48 KHz HD Audio frame. With the introduction of multiple link segments for the Intel HD Audio controller, and the capability of running each link segment at different clock speed, the BCLK definition is fixed at 24 MHz equivalent rate always, independent of the physical link clock speed.

5.2.422 Link x Output Payload Capability (LOUTPAY6M1) - Offset CA0h

Link x Output Payload Capability

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + CA0h	0003h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0003h RO/V	**Output Payload Capability (OUTPAY):** Indicates the total output payload available on the link at a given frequency. This does not include bandwidth used for command and control. This measurement is in 16-bit word quantities per 48 kHz frame. Reset value is dependent on the default clock frequency specified in parameter DEFLOUTPAY[x*96+95:x*96]. Note that this value does not reflect any bandwidth increase due to support for multiple SDO lines. 00h: 0 words 01h: 1 word payload ... FFh: 255h word payload Offset Frequency Encoding Frequency 40h+(40h*x) + 20h[15:0] 6 MHz 40h+(40h*x) + 28h[15:0] Reserved for 96 MHz 40h+(40h*x) + 22h[15:0] 12 MHz 40h+(40h*x) + 2Ah[15:0] Reserved for 192 MHz 40h+(40h*x) + 24h[15:0] 24 MHz 40h+(40h*x) + 26h[15:0] Reserved for 48 MHz The audio bus driver queries this lookup register & LPSOO to derive the potential nett output bandwidth before deciding whether to switch frequency.

5.2.434 DMA Resume Capability Header (DRSMCH) - Offset 1F00h

This register resides in Primary well (always on), or resides in Primary well (gated-controller) with state retention, and reset by platform reset.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1F00h	00050700h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW/L	**Capability Version (VER):** This field is an Intel HD Audio Specification defined version number that indicates the version of the capability structure present. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
27:16	005h RW/L	**Capability Identifier (ID):** This field is an Intel HD Audio Specification defined ID number that indicates the nature and format of the capability. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD
15:0	0700h RW/L	**Next Capability Pointer (PTR):** This field contains the offset to the next capability structure or 000h if no other items exist in the linked list of capabilities. Point to SW position based FIFO capability. Locked when FNCFG.BCLD = 1. **Locked by:** SBPR.FNCFG.BCLD

5.2.435 DMA Resume Control (DRSMCTL) - Offset 1F04h

The number of RSM bits in this register is depending on the total number of streams DMA implemented,

represented as x in the register table. The x value is determined by the parameter equation: HSTISC + HSTOSC.

For SPT implementation, x = 16.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1F04h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0000h RW/1S/V	**RSM:** This field is an Intel HD Audio Specification defined version number that indicates the version of the capability structure present. Locked when FNCFG.BCLD = 1.

5.2.436 DMA Position in Buffer Resume (ISD0DPIBR) - Offset 1F08h

This register specifies the DPIB resume position.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1F08h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

5.2.437 DMA Position in Buffer Resume (ISD1DPIBR) - Offset 1F10h

This register specifies the DPIB resume position.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1F10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

5.2.438 DMA Position in Buffer Resume (ISD2DPIBR) - Offset 1F18h

This register specifies the DPIB resume position.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1F18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

5.2.439 DMA Position in Buffer Resume (ISD3DPIBR) - Offset 1F20h

This register specifies the DPIB resume position.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1F20h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

5.2.440 DMA Position in Buffer Resume (ISD4DPIBR) - Offset 1F28h

This register specifies the DPIB resume position.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1F28h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

5.2.441 DMA Position in Buffer Resume (ISD5DPIBR) - Offset 1F30h

This register specifies the DPIB resume position.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1F30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

5.2.442 DMA Position in Buffer Resume (ISD6DPIBR) - Offset 1F38h

This register specifies the DPIB resume position.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1F38h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

5.2.443 DMA Position in Buffer Resume (OSD0DPIBR) - Offset 1F40h

This register specifies the DPIB resume position.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1F40h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

5.2.444 DMA Position in Buffer Resume (OSD1DPIBR) - Offset 1F48h

This register specifies the DPIB resume position.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1F48h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

5.2.445 DMA Position in Buffer Resume (OSD2DPIBR) - Offset 1F50h

This register specifies the DPIB resume position.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1F50h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

5.2.446 DMA Position in Buffer Resume (OSD3DPIBR) - Offset 1F58h

This register specifies the DPIB resume position.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1F58h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

5.2.447 DMA Position in Buffer Resume (OSD4DPIBR) - Offset 1F60h

This register specifies the DPIB resume position.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1F60h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

5.2.448 DMA Position in Buffer Resume (OSD5DPIBR) - Offset 1F68h

This register specifies the DPIB resume position.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1F68h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

5.2.449 DMA Position in Buffer Resume (OSD6DPIBR) - Offset 1F70h

This register specifies the DPIB resume position.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1F70h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

5.2.450 DMA Position in Buffer Resume (OSD7DPIBR) - Offset 1F78h

This register specifies the DPIB resume position.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1F78h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

5.2.451 DMA Position in Buffer Resume (OSD8DPIBR) - Offset 1F80h

This register specifies the DPIB resume position.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1F80h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

5.2.452 DMA Position in Buffer Resume (ISD7DPIBR) - Offset 1F88h

This register specifies the DPIB resume position.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1F88h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

5.2.453 DMA Position in Buffer Resume (ISD8DPIBR) - Offset 1F90h

This register specifies the DPIB resume position.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1F90h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

5.2.454 DMA Position in Buffer Resume (ISD9DPIBR) - Offset 1F98h

This register specifies the DPIB resume position.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1F98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

5.2.455 DMA Position in Buffer Resume (ISD10DPIBR) - Offset 1FA0h

This register specifies the DPIB resume position.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1FA0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

5.2.456 DMA Position in Buffer Resume (ISD11DPIBR) - Offset 1FA8h

This register specifies the DPIB resume position.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1FA8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

5.2.457 DMA Position in Buffer Resume (ISD12DPIBR) - Offset 1FB0h

This register specifies the DPIB resume position.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1FB0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

5.2.458 DMA Position in Buffer Resume (ISD13DPIBR) - Offset 1FB8h

This register specifies the DPIB resume position.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1FB8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

5.2.459 DMA Position in Buffer Resume (ISD14DPIBR) - Offset 1FC0h

This register specifies the DPIB resume position.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1FC0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

5.2.460 DMA Position in Buffer Resume (OSD9DPIBR) - Offset 1FC8h

This register specifies the DPIB resume position.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1FC8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

5.2.461 DMA Position in Buffer Resume (OSD10DPIBR) - Offset 1FD0h

This register specifies the DPIB resume position.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1FD0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

5.2.462 DMA Position in Buffer Resume (OSD11DPIBR) - Offset 1FD8h

This register specifies the DPIB resume position.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1FD8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

5.2.463 DMA Position in Buffer Resume (OSD12DPIBR) - Offset 1FE0h

This register specifies the DPIB resume position.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1FE0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

5.2.464 DMA Position in Buffer Resume (OSD13DPIBR) - Offset 1FE8h

This register specifies the DPIB resume position.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1FE8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

5.2.465 DMA Position in Buffer Resume (OSD14DPIBR) - Offset 1FF0h

This register specifies the DPIB resume position.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 1FF0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

5.2.466 Wall Clock Alias (WLCLKA) - Offset 2030h

This register is shadowed from the WALCLK register. Refer to the corresponding section for details of the register.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 2030h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Wall Clock Counter Alias (WALCLK):** This is an alias of the WALCK register. 32 bit counter that is incremented on each link BCLK period and rolls over from FFFF_FFFFh to0000_0000h. This counter will roll over to zero with a period of approximately 179 seconds. This counter is enabled while the BCLK bit is set to 1. Software uses this counter to synchronize between multiple controllers. Will be reset on controller reset. With the introduction of multiple link segments for the Intel HD Audio controller, and the capability of running each link segment at different clock speed, the BCLK definition for this counter is fixed at 24 MHz equivalent rate always, independent of the physical link clock speed, and reports the link 0 wall clock value.

5.2.467 Input Stream Descriptor 0 Link Position in Buffer Alias (ISD0LPIBA) - Offset 2084h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Refer to the corresponding section for details of the register.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 2084h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.468 Input Stream Descriptor 0 Link Position in Buffer Alias (ISD1LPIBA) - Offset 20A4h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Refer to the corresponding section for details of the register.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 20A4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.469 Input Stream Descriptor 0 Link Position in Buffer Alias (ISD2LPIBA) - Offset 20C4h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Refer to the corresponding section for details of the register.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 20C4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.470 Input Stream Descriptor 0 Link Position in Buffer Alias (ISD3LPIBA) - Offset 20E4h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Refer to the corresponding section for details of the register.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 20E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.471 Input Stream Descriptor 0 Link Position in Buffer Alias (ISD4LPIBA) - Offset 2104h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Refer to the corresponding section for details of the register.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 2104h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.472 Input Stream Descriptor 0 Link Position in Buffer Alias (ISD5LPIBA) - Offset 2124h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Refer to the corresponding section for details of the register.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 2124h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.473 Input Stream Descriptor 0 Link Position in Buffer Alias (ISD6LPIBA) - Offset 2144h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Refer to the corresponding section for details of the register.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 2144h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.474 Input Stream Descriptor 0 Link Position in Buffer Alias (OSD0LPIBA) - Offset 2164h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Refer to the corresponding section for details of the register.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 2164h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.475 Input Stream Descriptor 0 Link Position in Buffer Alias (OSD1LPIBA) - Offset 2184h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Refer to the corresponding section for details of the register.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 2184h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.476 Input Stream Descriptor 0 Link Position in Buffer Alias (OSD2LPIBA) - Offset 21A4h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Refer to the corresponding section for details of the register.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 21A4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.477 Input Stream Descriptor 0 Link Position in Buffer Alias (OSD3LPIBA) - Offset 21C4h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Refer to the corresponding section for details of the register.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 21C4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.478 Input Stream Descriptor 0 Link Position in Buffer Alias (OSD4LPIBA) - Offset 21E4h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Refer to the corresponding section for details of the register.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 21E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.479 Input Stream Descriptor 0 Link Position in Buffer Alias (OSD5LPIBA) - Offset 2204h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Refer to the corresponding section for details of the register.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 2204h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.480 Input Stream Descriptor 0 Link Position in Buffer Alias (OSD6LPIBA) - Offset 2224h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Refer to the corresponding section for details of the register.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 2224h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.481 Input Stream Descriptor 0 Link Position in Buffer Alias (OSD7LPIBA) - Offset 2244h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Refer to the corresponding section for details of the register.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 2244h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.482 Input Stream Descriptor 0 Link Position in Buffer Alias (OSD8LPIBA) - Offset 2264h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Refer to the corresponding section for details of the register.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 2264h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.483 Input Stream Descriptor 0 Link Position in Buffer Alias (ISD7LPIBA) - Offset 2284h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Refer to the corresponding section for details of the register.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 2284h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.484 Input Stream Descriptor 0 Link Position in Buffer Alias (ISD8LPIBA) - Offset 22A4h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Refer to the corresponding section for details of the register.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 22A4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.485 Input Stream Descriptor 0 Link Position in Buffer Alias (ISD9LPIBA) - Offset 22C4h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Refer to the corresponding section for details of the register.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 22C4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.486 Input Stream Descriptor 0 Link Position in Buffer Alias (ISD10LPIBA) - Offset 22E4h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Refer to the corresponding section for details of the register.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 22E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.487 Input Stream Descriptor 0 Link Position in Buffer Alias (ISD11LPIBA) - Offset 2304h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Refer to the corresponding section for details of the register.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 2304h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.488 Input Stream Descriptor 0 Link Position in Buffer Alias (ISD12LPIBA) - Offset 2324h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Refer to the corresponding section for details of the register.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 2324h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.489 Input Stream Descriptor 0 Link Position in Buffer Alias (ISD13LPIBA) - Offset 2344h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Refer to the corresponding section for details of the register.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 2344h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.490 Input Stream Descriptor 0 Link Position in Buffer Alias (ISD14LPIBA) - Offset 2364h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Refer to the corresponding section for details of the register.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 2364h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.491 Input Stream Descriptor 0 Link Position in Buffer Alias (OSD9LPIBA) - Offset 2384h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Refer to the corresponding section for details of the register.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 2384h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.492 Input Stream Descriptor 0 Link Position in Buffer Alias (OSD10LPIBA) - Offset 23A4h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Refer to the corresponding section for details of the register.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 23A4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.493 Input Stream Descriptor 0 Link Position in Buffer Alias (OSD11LPIBA) - Offset 23C4h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Refer to the corresponding section for details of the register.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 23C4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.494 Input Stream Descriptor 0 Link Position in Buffer Alias (OSD12LPIBA) - Offset 23E4h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Refer to the corresponding section for details of the register.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 23E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.495 Input Stream Descriptor 0 Link Position in Buffer Alias (OSD13LPIBA) - Offset 2404h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Refer to the corresponding section for details of the register.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 2404h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.496 Input Stream Descriptor 0 Link Position in Buffer Alias (OSD14LPIBA) - Offset 2424h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Refer to the corresponding section for details of the register.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 2424h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

5.2.497 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (IPPHC7LLPL) - Offset 4A10h

This register reports the linear link position (lower 32 bits) on the host connection end of the processing pipe.

This register provides the status of the processing pipe operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.498 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (IPPHC7LLPU) - Offset 4A14h

This register reports the linear link position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.499 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (IPPHC7LDPL) - Offset 4A18h

This register reports the linear DMA position (lower 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.500 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (IPPHC7LDPU) - Offset 4A1Ch

This register reports the linear DMA position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.501 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (IPPHC8LLPL) - Offset 4A20h

This register reports the linear link position (lower 32 bits) on the host connection end of the processing pipe. This register provides the status of the processing pipe operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A20h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.502 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (IPPHC8LLPU) - Offset 4A24h

This register reports the linear link position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A24h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.503 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (IPPHC8LDPL) - Offset 4A28h

This register reports the linear DMA position (lower 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A28h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.504 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (IPPHC8LDPU) - Offset 4A2Ch

This register reports the linear DMA position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.505 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (IPPHC9LLPL) - Offset 4A30h

This register reports the linear link position (lower 32 bits) on the host connection end of the processing pipe. This register provides the status of the processing pipe operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.506 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (IPPHC9LLPU) - Offset 4A34h

This register reports the linear link position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A34h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.507 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (IPPHC9LDPL) - Offset 4A38h

This register reports the linear DMA position (lower 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A38h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.508 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (IPPHC9LDPU) - Offset 4A3Ch

This register reports the linear DMA position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A3Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.509 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (IPPHC10LLPL) - Offset 4A40h

This register reports the linear link position (lower 32 bits) on the host connection end of the processing pipe.

This register provides the status of the processing pipe operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A40h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.510 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (IPPHC10LLPU) - Offset 4A44h

This register reports the linear link position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A44h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.511 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (IPPHC10LDPL) - Offset 4A48h

This register reports the linear DMA position (lower 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A48h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.512 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (IPPHC10LDPU) - Offset 4A4Ch

This register reports the linear DMA position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A4Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.513 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (IPPHC11LLPL) - Offset 4A50h

his register reports the linear link position (lower 32 bits) on the host connection end of the processing pipe.

This register provides the status of the processing pipe operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A50h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.514 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (IPPHC11LLPU) - Offset 4A54h

This register reports the linear link position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A54h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.515 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (IPPHC11LDPL) - Offset 4A58h

This register reports the linear DMA position (lower 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A58h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.516 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (IPPHC11LDPU) - Offset 4A5Ch

This register reports the linear DMA position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A5Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.517 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (IPPHC12LLPL) - Offset 4A60h

This register reports the linear link position (lower 32 bits) on the host connection end of the processing pipe.

This register provides the status of the processing pipe operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A60h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.518 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (IPPHC12LLPU) - Offset 4A64h

This register reports the linear link position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A64h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.519 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (IPPHC12LDPL) - Offset 4A68h

This register reports the linear DMA position (lower 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A68h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.520 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (IPPHC12LDPU) - Offset 4A6Ch

This register reports the linear DMA position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A6Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.521 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (IPPHC13LLPL) - Offset 4A70h

This register reports the linear link position (lower 32 bits) on the host connection end of the processing pipe.

This register provides the status of the processing pipe operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A70h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.522 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (IPPHC13LLPU) - Offset 4A74h

This register reports the linear link position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A74h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.523 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (IPPHC13LDPL) - Offset 4A78h

This register reports the linear DMA position (lower 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A78h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.524 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (IPPHC13LDPU) - Offset 4A7Ch

This register reports the linear DMA position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A7Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.525 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (IPPHC14LLPL) - Offset 4A80h

This register reports the linear link position (lower 32 bits) on the host connection end of the processing pipe.

This register provides the status of the processing pipe operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A80h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.526 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (IPPHC14LLPU) - Offset 4A84h

This register reports the linear link position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A84h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.527 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (IPPHC14LDPL) - Offset 4A88h

This register reports the linear DMA position (lower 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A88h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.528 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (IPPHC14LDPU) - Offset 4A8Ch

This register reports the linear DMA position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A8Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.529 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (OPPHC9LLPL) - Offset 4A90h

This register reports the linear link position (lower 32 bits) on the host connection end of the processing pipe.

This register provides the status of the processing pipe operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A90h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.530 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (OPPHC9LLPU) - Offset 4A94h

This register reports the linear link position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A94h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.531 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (OPPHC9LDPL) - Offset 4A98h

This register reports the linear DMA position (lower 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.532 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (OPPHC9LDPU) - Offset 4A9Ch

This register reports the linear DMA position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4A9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.533 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (OPPHC10LLPL) - Offset 4AA0h

This register reports the linear link position (lower 32 bits) on the host connection end of the processing pipe.

This register provides the status of the processing pipe operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4AA0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.534 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (OPPHC10LLPU) - Offset 4AA4h

This register reports the linear link position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4AA4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.535 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (OPPHC10LDPL) - Offset 4AA8h

This register reports the linear DMA position (lower 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4AA8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.536 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (OPPHC10LDPU) - Offset 4AACh

This register reports the linear DMA position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4AACh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.537 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (OPPHC11LLPL) - Offset 4AB0h

This register reports the linear link position (lower 32 bits) on the host connection end of the processing pipe.

This register provides the status of the processing pipe operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4AB0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.538 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (OPPHC11LLPU) - Offset 4AB4h

This register reports the linear link position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4AB4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.539 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (OPPHC11LDPL) - Offset 4AB8h

This register reports the linear DMA position (lower 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4AB8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.540 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (OPPHC11LDPU) - Offset 4ABCh

This register reports the linear DMA position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4ABCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.541 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (OPPHC12LLPL) - Offset 4AC0h

This register reports the linear link position (lower 32 bits) on the host connection end of the processing pipe.

This register provides the status of the processing pipe operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4AC0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.542 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (OPPHC12LLPU) - Offset 4AC4h

This register reports the linear link position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4AC4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.543 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (OPPHC12LDPL) - Offset 4AC8h

This register reports the linear DMA position (lower 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4AC8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.544 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (OPPHC12LDPU) - Offset 4ACCh

This register reports the linear DMA position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4ACCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.545 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (OPPHC13LLPL) - Offset 4AD0h

This register reports the linear link position (lower 32 bits) on the host connection end of the processing pipe.

This register provides the status of the processing pipe operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4AD0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.546 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (OPPHC13LLPU) - Offset 4AD4h

This register reports the linear link position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4AD4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.547 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (OPPHC13LDPL) - Offset 4AD8h

This register reports the linear DMA position (lower 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4AD8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.548 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (OPPHC13LDPU) - Offset 4ADCh

This register reports the linear DMA position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4ADCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.549 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (OPPHC14LLPL) - Offset 4AE0h

This register reports the linear link position (lower 32 bits) on the host connection end of the processing pipe.

This register provides the status of the processing pipe operation.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4AE0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.550 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (OPPHC14LLPU) - Offset 4AE4h

This register reports the linear link position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4AE4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.551 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (OPPHC14LDPL) - Offset 4AE8h

This register reports the linear DMA position (lower 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4AE8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.552 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (OPPHC14LDPU) - Offset 4AECh

This register reports the linear DMA position (upper 32 bits) on the host connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4AECh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the PCH backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.553 Input/Output Processing Pipe's Link Connection x Control (IPPLC7CTL) - Offset 4AF0h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4AF0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. 0000=Reserved (Indicates Unused) 0001=Stream 1 ... 1110=Stream 14 1111=Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream: When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.

Bit Range	Default & Access	Field Name (ID): Description
19:2	0h RO	**Reserved**
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this stream will be enabled to transfer data between FIFO and main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. For output streams, the cadence generator is reset whenever the RUN bit is set. When cleared to 0 the DMA engine associated with this stream will be disabled. Hardware will report a 0 in this bit when t he DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

5.2.554 Input/Output Processing Pipe's Link Connection x Format (IPPLC7FMT) - Offset 4AF4h

This register specifies the audio format on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 4AF4h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW	**Sample Base Rate (BASE):** 0=48 kHz 1=44.1 kHz
13:11	0h RW	**Sample Base Rate Multiple (MULT):** 000=48 kHz/44.1 kHz or less 001=x2 (96 kHz, 88.2 kHz, 32 kHz) 010=x3 (144 kHz) 011=x4 (192 kHz, 176.4 kHz) 100-111=Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** 000=Divide by 1 (48 kHz, 44.1 kHz) 001=Divide by 2 (24 kHz, 22.05 kHz) 010=Divide by 3 (16 kHz, 32 kHz) 011=Divide by 4 (11.025 kHz) 100=Divide by 5 (9.6 kHz) 101=Divide by 6 (8 kHz) 110=Divide by 7 111=Divide by 8 (6 kHz)

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Reserved**
6:4	0h RW	**Bits per Sample (BITS):** 000=8 bits. The data will be packed in memory in 8-bit containers on 16-bit boundaries 001=16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries 010=20 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 011=24 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 100=32 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 101-111=Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: 0000=1 0001=2 ... 1111=16

5.2.555 Input/Output Processing Pipe's Link Connection x Linear Link Position Lower (IPPLC7LLPL) - Offset 4AF8h

This register reports the linear link position (lower 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4AF8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.556 Input/Output Processing Pipe's Link Connection x Linear Link Position Upper (IPPLC7LLPU) - Offset 4AFCh

This register reports the linear link position (upper 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4AFCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.557 Input/Output Processing Pipe's Link Connection x Control (IPPLC8CTL) - Offset 4B00h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4B00h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. 0000=Reserved (Indicates Unused) 0001=Stream 1 ... 1110=Stream 14 1111=Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream: When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.

Bit Range	Default & Access	Field Name (ID): Description
19:2	0h RO	**Reserved**
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this stream will be enabled to transfer data between FIFO and main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. For output streams, the cadence generator is reset whenever the RUN bit is set. When cleared to 0 the DMA engine associated with this stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

5.2.558 Input/Output Processing Pipe's Link Connection x Format (IPPLC8FMT) - Offset 4B04h

This register specifies the audio format on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 4B04h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW	**Sample Base Rate (BASE):** 0=48 kHz 1=44.1 kHz

5.2.571 Input/Output Processing Pipe's Link Connection x Linear Link Position Lower (IPPLC11LLPL) - Offset 4B38h

This register reports the linear link position (lower 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4B38h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.572 Input/Output Processing Pipe's Link Connection x Linear Link Position Upper (IPPLC11LLPU) - Offset 4B3Ch

This register reports the linear link position (upper 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4B3Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.573 Input/Output Processing Pipe's Link Connection x Control (IPPLC12CTL) - Offset 4B40h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4B40h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. 0000=Reserved (Indicates Unused) 0001=Stream 1 ... 1110=Stream 14 1111=Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream: When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.

Bit Range	Default & Access	Field Name (ID): Description
19:2	0h RO	**Reserved**
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this stream will be enabled to transfer data between FIFO and main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. For output streams, the cadence generator is reset whenever the RUN bit is set. When cleared to 0 the DMA engine associated with this stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

5.2.574 Input/Output Processing Pipe's Link Connection x Format (IPPLC12FMT) - Offset 4B44h

This register specifies the audio format on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 4B44h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW	**Sample Base Rate (BASE):** 0=48 kHz 1=44.1 kHz
13:11	0h RW	**Sample Base Rate Multiple (MULT):** 000=48 kHz/44.1 kHz or less 001=x2 (96 kHz, 88.2 kHz, 32 kHz) 010=x3 (144 kHz) 011=x4 (192 kHz, 176.4 kHz) 100-111=Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** 000=Divide by 1 (48 kHz, 44.1 kHz) 001=Divide by 2 (24 kHz, 22.05 kHz) 010=Divide by 3 (16 kHz, 32 kHz) 011=Divide by 4 (11.025 kHz) 100=Divide by 5 (9.6 kHz) 101=Divide by 6 (8 kHz) 110=Divide by 7 111=Divide by 8 (6 kHz)

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Reserved**
6:4	0h RW	**Bits per Sample (BITS):** 000=8 bits. The data will be packed in memory in 8-bit containers on 16-bit boundaries 001=16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries 010=20 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 011=24 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 100=32 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 101-111=Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: 0000=1 0001=2 ... 1111=16

5.2.575 Input/Output Processing Pipe's Link Connection x Linear Link Position Lower (IPPLC12LLPL) - Offset 4B48h

This register reports the linear link position (lower 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4B48h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.576 Input/Output Processing Pipe's Link Connection x Linear Link Position Upper (IPPLC12LLPU) - Offset 4B4Ch

This register reports the linear link position (upper 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4B4Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.577 Input/Output Processing Pipe's Link Connection x Control (IPPLC13CTL) - Offset 4B50h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4B50h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. 0000=Reserved (Indicates Unused) 0001=Stream 1 ... 1110=Stream 14 1111=Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream: When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.

Bit Range	Default & Access	Field Name (ID): Description
19:2	0h RO	**Reserved**
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this stream will be enabled to transfer data between FIFO and main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. For output streams, the cadence generator is reset whenever the RUN bit is set. When cleared to 0 the DMA engine associated with this stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

5.2.578 Input/Output Processing Pipe's Link Connection x Format (IPPLC13FMT) - Offset 4B54h

This register specifies the audio format on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 4B54h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW	**Sample Base Rate (BASE):** 0=48 kHz 1=44.1 kHz

5.2.591 Input/Output Processing Pipe's Link Connection x Linear Link Position Lower (OPPLC10LLPL) - Offset 4B88h

This register reports the linear link position (lower 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4B88h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.592 Input/Output Processing Pipe's Link Connection x Linear Link Position Upper (OPPLC10LLPU) - Offset 4B8Ch

This register reports the linear link position (upper 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4B8Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.593 Input/Output Processing Pipe's Link Connection x Control (OPPLC11CTL) - Offset 4B90h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4B90h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. 0000=Reserved (Indicates Unused) 0001=Stream 1 ... 1110=Stream 14 1111=Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream: When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.

Bit Range	Default & Access	Field Name (ID): Description
19:2	0h RO	**Reserved**
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this stream will be enabled to transfer data between FIFO and main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. For output streams, the cadence generator is reset whenever the RUN bit is set. When cleared to 0 the DMA engine associated with this stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

5.2.594 Input/Output Processing Pipe's Link Connection x Format (OPPLC11FMT) - Offset 4B94h

This register specifies the audio format on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 4B94h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW	**Sample Base Rate (BASE):** 0=48 kHz 1=44.1 kHz
13:11	0h RW	**Sample Base Rate Multiple (MULT):** 000=48 kHz/44.1 kHz or less 001=x2 (96 kHz, 88.2 kHz, 32 kHz) 010=x3 (144 kHz) 011=x4 (192 kHz, 176.4 kHz) 100-111=Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** 000=Divide by 1 (48 kHz, 44.1 kHz) 001=Divide by 2 (24 kHz, 22.05 kHz) 010=Divide by 3 (16 kHz, 32 kHz) 011=Divide by 4 (11.025 kHz) 100=Divide by 5 (9.6 kHz) 101=Divide by 6 (8 kHz) 110=Divide by 7 111=Divide by 8 (6 kHz)

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Reserved**
6:4	0h RW	**Bits per Sample (BITS):** 000=8 bits. The data will be packed in memory in 8-bit containers on 16-bit boundaries 001=16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries 010=20 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 011=24 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 100=32 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 101-111=Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: 0000=1 0001=2 ... 1111=16

5.2.595 Input/Output Processing Pipe's Link Connection x Linear Link Position Lower (OPPLC11LLPL) - Offset 4B98h

This register reports the linear link position (lower 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4B98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.596 Input/Output Processing Pipe's Link Connection x Linear Link Position Upper (OPPLC11LLPU) - Offset 4B9Ch

This register reports the linear link position (upper 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4B9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.597 Input/Output Processing Pipe's Link Connection x Control (OPPLC12CTL) - Offset 4BA0h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4BA0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. 0000=Reserved (Indicates Unused) 0001=Stream 1 ... 1110=Stream 14 1111=Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream: When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.

Bit Range	Default & Access	Field Name (ID): Description
19:2	0h RO	**Reserved**
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this stream will be enabled to transfer data between FIFO and main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. For output streams, the cadence generator is reset whenever the RUN bit is set. When cleared to 0 the DMA engine associated with this stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

5.2.598 Input/Output Processing Pipe's Link Connection x Format (OPPLC12FMT) - Offset 4BA4h

This register specifies the audio format on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 4BA4h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW	**Sample Base Rate (BASE):** 0=48 kHz 1=44.1 kHz
13:11	0h RW	**Sample Base Rate Multiple (MULT):** 000=48 kHz/44.1 kHz or less 001=x2 (96 kHz, 88.2 kHz, 32 kHz) 010=x3 (144 kHz) 011=x4 (192 kHz, 176.4 kHz) 100-111=Reserved

3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: 0000=1 0001=2 ... 1111=16

5.2.599 Input/Output Processing Pipe's Link Connection x Linear Link Position Lower (OPPLC12LLPL) - Offset 4BA8h

This register reports the linear link position (lower 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4BA8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.600 Input/Output Processing Pipe's Link Connection x Linear Link Position Upper (OPPLC12LLPU) - Offset 4BACh

This register reports the linear link position (upper 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4BACh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.601 Input/Output Processing Pipe's Link Connection x Control (OPPLC13CTL) - Offset 4BB0h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4BB0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. 0000=Reserved (Indicates Unused) 0001=Stream 1 ... 1110=Stream 14 1111=Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream: When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.

Bit Range	Default & Access	Field Name (ID): Description
19:2	0h RO	**Reserved**
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this stream will be enabled to transfer data between FIFO and main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. For output streams, the cadence generator is reset whenever the RUN bit is set. When cleared to 0 the DMA engine associated with this stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

5.2.602 Input/Output Processing Pipe's Link Connection x Format (OPPLC13FMT) - Offset 4BB4h

This register specifies the audio format on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 4BB4h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW	**Sample Base Rate (BASE):** 0=48 kHz 1=44.1 kHz
13:11	0h RW	**Sample Base Rate Multiple (MULT):** 000=48 kHz/44.1 kHz or less 001=x2 (96 kHz, 88.2 kHz, 32 kHz) 010=x3 (144 kHz) 011=x4 (192 kHz, 176.4 kHz) 100-111=Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** 000=Divide by 1 (48 kHz, 44.1 kHz) 001=Divide by 2 (24 kHz, 22.05 kHz) 010=Divide by 3 (16 kHz, 32 kHz) 011=Divide by 4 (11.025 kHz) 100=Divide by 5 (9.6 kHz) 101=Divide by 6 (8 kHz) 110=Divide by 7 111=Divide by 8 (6 kHz)

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Reserved**
6:4	0h RW	**Bits per Sample (BITS):** 000=8 bits. The data will be packed in memory in 8-bit containers on 16-bit boundaries 001=16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries 010=20 bits. The data will be packed in memory in 32-bit containers on 32- bit boundaries 011=24 bits. 3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: 0000=1 0001=2 ... 1111=16

5.2.603 Input/Output Processing Pipe's Link Connection x Linear Link Position Lower (OPPLC13LLPL) - Offset 4BB8h

This register reports the linear link position (lower 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4BB8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.604 Input/Output Processing Pipe's Link Connection x Linear Link Position Upper (OPPLC13LLPU) - Offset 4BBCh

This register reports the linear link position (upper 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4BBCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.605 Input/Output Processing Pipe's Link Connection x Control (OPPLC14CTL) - Offset 4BC0h

SRST bit is not affected by stream reset.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4BC0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. 0000=Reserved (Indicates Unused) 0001=Stream 1 ... 1110=Stream 14 1111=Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream: When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.

Bit Range	Default & Access	Field Name (ID): Description
19:2	0h RO	**Reserved**
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this stream will be enabled to transfer data between FIFO and main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. For output streams, the cadence generator is reset whenever the RUN bit is set. When cleared to 0 the DMA engine associated with this stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

5.2.606 Input/Output Processing Pipe's Link Connection x Format (OPPLC14FMT) - Offset 4BC4h

This register specifies the audio format on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	16 bit	HDA BAR + 4BC4h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved**
14	0h RW	**Sample Base Rate (BASE):** 0=48 kHz 1=44.1 kHz
13:11	0h RW	**Sample Base Rate Multiple (MULT):** 000=48 kHz/44.1 kHz or less 001=x2 (96 kHz, 88.2 kHz, 32 kHz) 010=x3 (144 kHz) 011=x4 (192 kHz, 176.4 kHz) 100-111=Reserved

3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: 0000=1 0001=2 ... 1111=16

5.2.607 Input/Output Processing Pipe's Link Connection x Linear Link Position Lower (OPPLC14LLPL) - Offset 4BC8h

This register reports the linear link position (lower 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4BC8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

5.2.608 Input/Output Processing Pipe's Link Connection x Linear Link Position Upper (OPPLC14LLPU) - Offset 4BCCh

This register reports the linear link position (upper 32 bits) on the link connection end of the processing pipe.

Type	Size	Offset	Default
MMIO	32 bit	HDA BAR + 4BCCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become Referread only until SRST occurs.

5.3 cAVS PCR Registers Summary

Table 5-3. Summary of cAVS PCR Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
530h	4	Function Configuration (FNCFG)	0000002Ah

5.3.1 Function Configuration (FNCFG) - Offset 530h

This register is for configuring the Intel HD Audio subsystem behavior as a device function in SOC.

If FUSVAL.ADSPD = 1, HW should treat ADSPD bit = 1.

If FUSVAL.CGD = 1, HW should treat CGD bit = 1.

Type	Size	Offset	Default
MMIO	32 bit	FDD70000h + 530h	0000002Ah

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5	1h RW	**Power Gating Disable (PGDIS):** When cleared, it allows power gating to take place per their associated enable and idle conditions. When set, it globally disables all power gating.
4	0h RW/O/L	**BIOS Configuration Lock Down (BCLD):** BIOS Configuration Lock Down (BCLD): When set, it indicates BIOS configuration is done and ready for operations. It also locks down related RW/L bits. **Locked by:** FNCFG.BCLD
3	1h RW	**Clock Gating Disable (CGD):** Clock Gating Disabled (CGD): When cleared, it allows local / dynamic clock gating and trunk clock gating to take place per their associated enable and idle conditions. When set, it globally disables all clock gating.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW/L	**Audio DSP Disable (ADSPD):** Audio DSP Disable (ADSPD): When set, the Audio DSP is disabled and all register access associated with Audio DSP are treated as unsupported request, and return UR response if it is non-posted cycle. This bit does not affect cycles from IOSF Sideband Interface. Locked when FNCFG.BCLD = 1. **Locked by:** FNCFG.BCLD
1	1h RW/L	**HD Audio Subsystem as PCI Device (HDASPCID):** HD Audio Subsystem as PCI Device (HDASPCID): When this bit is set to 1, the Intel HD Audio subsystem will appear as a PCI device to SW. When this bit is 0, the Intel HD Audio subsystem will appear as a PCI-Express device to SW. Locked when FNCFG.BCLD = 1. **Locked by:** FNCFG.BCLD
0	0h RW/L	**HD Audio Subsystem Disable (HDASD):** HD Audio Subsystem Disable (HDASD): When set, the Intel HD Audio subsystem (including Audio DSP) is disabled and all register access are treated as unsupported request, and return UR response if it is non-posted cycle. This bit does not affect cycles from IOSF Sideband Interface. Locked when FNCFG.BCLD = 1. **Locked by:** FNCFG.BCLD

6 System Management Bus (SMBus) Controller

6.1 SMBus Configuration Registers Summary

This chapter documents the registers in Bus: 0, Device 31, Function 4.

Table 6-1. Summary of Bus: 0, Device: 31, Function: 4 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	2	Vendor ID (VID)	8086h
2h	2	Device ID (DID)	4B23h
4h	2	Command Register (CMD)	0000h
6h	2	Device Status (DS)	0280h
8h	1	Revision ID (RID)	00h
9h	1	Programming Interface (PI)	00h
Ah	1	Sub Class Code (SCC)	05h
Bh	1	Base Class Code (BCC)	0Ch
10h	4	SMBus Memory Base Address_31_0 (SMBMBAR_31_0)	00000004h
14h	4	SMBus Memory Base Address_63_32 (SMBMBAR_63_32)	00000000h
20h	4	SMB Base Address (SBA)	00000001h
2Ch	2	Subsystem Vendor Identifiers (SVID)	0000h
2Eh	2	Subsystem Identifiers (SID)	0000h
3Ch	1	Interrupt Line (INTLN)	00h
3Dh	1	Interrupt Pin (INTPN)	01h
40h	1	Host Configuration (HCFG)	00h
50h	4	TCO Base Address (TCOBASE)	00000001h
54h	4	TCO Control (TCOCTL)	00000000h
90h	4	SAI IOSF Primary Access Control Policy (SAIPRIAC0)	01210000h
94h	4	SAI IOSF Primary Access Control Policy (SAIPRIAC1)	00000C00h
98h	4	SAI IOSF Primary Read/Write Policy (SAIPRIRW0)	0120001Fh
9Ch	4	SAI IOSF Primary Read/Write Policy (SAIPRIRW1)	00000E00h
F0h	4	Unsupported Request Error Status (URES)	00000000h
F4h	4	Unsupported Request Error Control (UREC)	00000000h
F8h	4	Manufacturer's ID (MANID)	08000F80h

6.1.1 Vendor ID (VID) - Offset 0h

Vendor ID

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:31, F:4] + 0h	8086h

Bit Range	Default & Access	Field Name (ID): Description
15:0	8086h RO	**Vendor ID (VID):** Value indicates Intel as the vendor

6.1.2 Device ID (DID) - Offset 2h

Device ID

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:31, F:4] + 2h	4B23h

Bit Range	Default & Access	Field Name (ID): Description
15:0	4B23h RO/V	**Device ID (DID):** Indicates the device number assigned by the SIG.

6.1.3 Command Register (CMD) - Offset 4h

Command Register

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:31, F:4] + 4h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	**Reserved**
10	0h RW	**Interrupt Disable (INTD):** 1 = Disables SMBus to assert its PIRQB# signal. Defaults to 0.
9	0h RO	**Fast Back to Back Enable (FBE):** Reserved
8	0h RW	**SERR# Enable (SERRE):** 1 = Enables SERR# generation
7	0h RO	**Wait Cycle Control (WCC):** Reserved
6	0h RW	**Parity Error Response (PER):** 1 = Sets Detected Parity Error bit when parity error is detected
5	0h RO	**VGA Palette Snoop (VGAPS):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO	**Postable Memory Write Enable (PMWE):** Reserved
3	0h RO	**Special Cycle Enable (SCE):** Reserved
2	0h RO	**Bus Master Enable (BME):** Reserved
1	0h RW	**Memory Space Enable (MSE):** 1= Enables memory mapped configuration space.
0	0h RW	**I/O Space Enable (IOSE):** 1= enables access to the SM Bus I/O space registers as defined by the Base Address Register.

6.1.4 Device Status (DS) - Offset 6h

Device Status

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:31, F:4] + 6h	0280h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C	**Detected Parity Error (DPE):** Detected Parity Error
14	0h RW/1C	**Signaled System Error (SSE):** Signaled System Error
13	0h RO	**Received Master Abort (RMA):** Reserved
12	0h RO	**Received Target Abort (RTA):** Reserved
11	0h RW/1C	**Signaled Target-Abort Status (STA):** Reserved
10:9	1h RO	**DEVSEL# Timing Status (DEVT):** This 2-bit field defines the timing for DEVSEL# assertion. These read only bits indicate the Intel PCH's DEVSEL# timing when performing a positive decode. Note: Intel PCH generates DEVSEL# with medium time. Note: It is not clear if a PCI master can write to SMBus controller.
8	0h RO	**Data Parity Error Detected (DPED):** Reserved
7	1h RO	**Fast Back-to-Back Capable (FBC):** Reserved
6	0h RO	**User Definable Features (UDF):** Reserved
5	0h RO	**66 MHz Capable (C_66M):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO	**Capabilities List Indicator (CLI):** Hardwired to 0 because there are no capability list structures in this function.
3	0h RO	**Interrupt Status (INTS):** This bit indicates that an interrupt is pending. It is independent from the state of the Interrupt Enable bit in the command register.
2:0	0h RO	**Reserved**

6.1.5 Revision ID (RID) - Offset 8h

Revision ID

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:31, F:4] + 8h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RO	**Revision ID (RID):** The value reported in this register depends on the global revision ID for the PCH.

6.1.6 Programming Interface (PI) - Offset 9h

Programming Interface

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:31, F:4] + 9h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RO	**Programming Interface (PI):** No programming interface defined.

6.1.7 Sub Class Code (SCC) - Offset Ah

Sub Class Code

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:31, F:4] + Ah	05h

Bit Range	Default & Access	Field Name (ID): Description
7:0	05h RO	**Sub Class Code (SCC):** A value of 05h indicates that this device is a SM Bus serial controller.

6.1.8 Base Class Code (BCC) - Offset Bh

Base Class Code

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:31, F:4] + Bh	0Ch

Bit Range	Default & Access	Field Name (ID): Description
7:0	0Ch RO	**Base Class Code (BCC):** A value of 0Ch indicates that this device is a serial controller.

6.1.9 SMBus Memory Base Address_31_0 (SMBMBAR_31_0) - Offset 10h

SMBus Memory Base Address_31_0

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:4] + 10h	00000004h

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RW	**Base Address (BA):** Provides the 32 byte system memory base address for the Intel PCH SMB logic.
7:4	0h RO	**HARDWIRED_0:** Hardwired to 0.
3	0h RO	**PREF:** Hardwired to 0. Indicated that SMBMBAR is not pre- fetch-able
2:1	2h RO	**Address Range (ADDRNG):** Indicates that this SMBMBAR can be located anywhere in 64 bit address space
0	0h RO	**Memory Space Indicator (MSI):** Indicates that the SMB logic is memory mapped.

6.1.10 SMBus Memory Base Address_63_32 (SMBMBAR_63_32) - Offset 14h

SMBus Memory Base Address_63_32

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:4] + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address (BA):** Bits 63-32 of SMBus Memory Base Address

6.1.11 SMB Base Address (SBA) - Offset 20h

SMB Base Address

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:4] + 20h	00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:5	000h RW	**Base Address (BA):** Provides the 32 byte t system I/O base address for the SMB logic.
4:1	0h RO	**Reserved**
0	1h RO	**IO Space Indicator (IOSI):** This read-only bit always is 1, indicating that the SMB logic is I/O mapped.

6.1.12 Subsystem Vendor Identifiers (SVID) - Offset 2Ch

Subsystem Vendor ID

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:31, F:4] + 2Ch	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW/O	**Subsystem Vendor ID (SVID):** BIOS sets the value in this register to identify the Subsystem Vendor ID. The SMBus SVID register, in combination with the SMBus Subsystem ID register, enables the operating system to distinguish each subsystem from the others. Note: The software can write to this register only once per core well reset. Writes should be done as a single 16-bit cycle.

6.1.13 Subsystem Identifiers (SID) - Offset 2Eh

Subsystem ID

Type	Size	Offset	Default
PCI	16 bit	[B:0, D:31, F:4] + 2Eh	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW/O	**Subsystem ID (SID):** BIOS can write to this register to identify the Subsystem ID. The SID register, in combination with the SVID, enable the operating system to distinguish each subsystem from other(s). Note: The software can write to this register only once per core well reset. Writes should be done as a single 16-bit cycle.

6.1.14 Interrupt Line (INTLN) - Offset 3Ch

Interrupt Line

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:31, F:4] + 3Ch	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW	**Interrupt Line (INTLN):** This data is not used by the hardware. It is to communicate to software the interrupt line that the interrupt pin is connected to PIRQB#.

6.1.15 Interrupt Pin (INTPN) - Offset 3Dh

Interrupt Pin

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:31, F:4] + 3Dh	01h

Bit Range	Default & Access	Field Name (ID): Description
7:0	01h RW/O	**Interrupt Pin (INTPN):** This defines the interrupt pin to be used by the SMBus controller. Bits: Pins 0h: No Interrupt 1h: INTA# 2h: INTB# 3h: INTC# 4h: INTD# 5h-Fh: Reserved

6.1.16 Host Configuration (HCFG) - Offset 40h

Host Configuration

Type	Size	Offset	Default
PCI	8 bit	[B:0, D:31, F:4] + 40h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	**Reserved**
4	0h RW/1L	**SPD Write Disable (SPDWD):** This bit must be set to '1' to disable writes to SPD which are on Host SMB address ranges A0h - AEh. The SMBus range is unwriteable until next platform reset. HW Default is '0.' **Note:** This bit is RW O and will be reset on PLTRST# reset. This should be set by BIOS memory reference code to '1'. SW can only program this bit when both HCTL(6) = 0 (START) and HSTS(0) = 0 (HBSY), else it may result in an undefined behavior. [Noted in HSTS.HBSY that states "No SMB registers should be accessed while HSTS.HBSY bit is set, the same will apply to SPD write disable. 3 RW 0 SSRESET: Soft SMBUS Reset: When this bit is 1,
3	0h RW	**SSRESET:** Soft SMBUS Reset: When this bit is 1, the SMBus state machine and logic in PCH is reset. The HW will reset this bit to 0 when reset operation is completed.
2	0h RW	**I2CEN:** When this bit is 1, the Intel PCH is enabled to communicate with I2C devices. This will change the formatting of some commands. When this bit is 0, behavior is for SMBus.
1	0h RW	**SSEN:** When this bit is set, any source of an SMB interrupt will instead be routed to generate an SMI#.
0	0h RW	**HSTEN:** When set, the SMB Host Controller interface is enabled to execute commands. The HST_INT_EN bit needs to be enabled in order for the SMB Host Controller to interrupt or SMI#. Additionally, the SMB Host Controller will not respond to any new requests until all interrupt requests have been cleared.

6.1.17 TCO Base Address (TCOBASE) - Offset 50h

TCO Base Address

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:4] + 50h	00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:5	000h RW/L	**TCO Base Address (TCOBA):** When set to 1, this bit locks down the TCO Base Address Register (TCOBASE) at offset 50h. The Base Address Field becomes read-only. This bit becomes locked when a value of 1b is written to it. Writes of 0 to this bit are always ignored. Once locked by writing 1, the only way to clear this bit is to perform a platform reset. **Locked by:** TCOCTL.TCO_BASE_LOCK
4:1	0h RO	**Reserved**
0	1h RO	**I/O Space (IOS):** Indicates an I/O Space

6.1.18 TCO Control (TCOCTL) - Offset 54h

TCO Control

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:4] + 54h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved**
8	0h RW	**TCO Base Enable (TCO_BASE_EN):** When set, decode of the I/O range pointed to by the TCO base register is enabled.
7:1	0h RO	**Reserved**
0	0h RW/O	**TCO Base Lock (TCO_BASE_LOCK):** When set to 1, this bit locks down the TCO Base Address Register (TCOBASE) at offset 50h. The Base Address Field becomes read-only. This bit becomes locked when a value of 1b is written to it. Writes of 0 to this bit are always ignored. Once locked by writing 1, the only way to clear this bit is to perform a platform reset.

6.1.19 SAI IOSF Primary Access Control Policy (SAIPRIAC0) - Offset 90h

SAI IOSF Primary Access Control Policy

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:4] + 90h	01210000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	01210000h RW	**SAI IOSF Primary Access Control Policy (SAIPRIAC0):** Bit wise register where each bit represent the 6-bit SAI Index that mapped to a particular 8-bit SAI value or values. A value 1in this register bit means that a IOSF Primary cycle with SAI value that matches the mapped 8-bit SAI value or values has the write access to the SAIPRIAC and SAIPRIRW register. A value 0in this register bit means that a IOSF Primary Cycle with SAI value that does not match the mapped 8-bit SAI value or values has no write access to the SAIPRIAC and SAIPRIRW register. IOSF Primary Cycle to the SAIPRIAC and SAIPRIRW registers always has read access disregard of the value of this register.

6.1.20 SAI IOSF Primary Access Control Policy (SAIPRIAC1) - Offset 94h

SAI IOSF Primary Access Control Policy

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:4] + 94h	00000C00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000C00h RW	**SAI IOSF Primary Access Control Policy (SAIPRIAC1):** Bit wise register where each bit represent the 6-bit SAI Index that mapped to a particular 8-bit SAI value or values. A value 1in this register bit means that a IOSF Primary cycle with SAI value that matches the mapped 8-bit SAI value or values has the write access to the SAIPRIAC and SAIPRIRW register. A value 0in this register bit means that a IOSF Primary Cycle with SAI value that does not match the mapped 8-bit SAI value or values has no write access to the SAIPRIAC and SAIPRIRW register. IOSF Primary Cycle to the SAIPRIAC and SAIPRIRW registers always has read access disregard of the value of this register.

6.1.21 SAI IOSF Primary Read/Write Policy (SAIPRIRW0) - Offset 98h

SAI IOSF Primary Read/Write Policy

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:4] + 98h	0120001Fh

Bit Range	Default & Access	Field Name (ID): Description
31:0	0120001Fh RW	**SAI IOSF Primary Read/Write Policy (SAIPRIRW0):** Bit wise register where each bit represent the 6-bit SAI Index that mapped to a particular 8-bit SAI value or values. A value 1 in this register bit means that an IOSF Primary Cycle with SAI value that matches the mapped 8-bit SAI value or values has both the read and write access to the IOSF Primary register space (CFG/MMIO/IO). A value 0iin this register bit means that an IOSF Primary Cycle with SAI value that does not match the mapped 8-bit SAI value or values. So, there is no read and write access to the IOSF Primary register space (CFG/MMIO/IO).

6.1.22 SAI IOSF Primary Read/Write Policy (SAIPRIRW1) - Offset 9Ch

SAI IOSF Primary Read/Write Policy

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:4] + 9Ch	00000E00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000E00h RW	**SAI IOSF Primary Read/Write Policy (SAIPRIRW1):** Bit wise register where each bit represent the 6-bit SAI Index that mapped to a particular 8-bit SAI value or values. A value 1 in this register bit means that an IOSF Primary Cycle with SAI value that matches the mapped 8-bit SAI value or values has both the read and write access to the IOSF Primary register space (CFG/MMIO/IO). A value 0in this register bit means that an IOSF Primary Cycle with SAI value that does not match the mapped 8-bit SAI value or values. So, there is no read and write access to the IOSF Primary register space (CFG/MMIO/IO).

6.1.23 Unsupported Request Error Status (URES) - Offset F0h

This register denotes the status for the unsupported request on IOSF Primary I/F

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:4] + F0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**Unsupported Request Detected (URD):** Set to 1 by hardware upon detecting an Unsupported Request on IOSF Primary interface that is not considered Advisory Non-Fatal. Cleared to 0 by SW. URD bit is only set based on IOSF primary bus interface activity. It is not set based on IOSF sideband bus interface activity.

6.1.24 Unsupported Request Error Control (UREC) - Offset F4h

This register denotes the control for the unsupported request on IOSF Primary I/F

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:4] + F4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**Unsupported Request Reporting Enable (URRE):** If set to 1 by software, it allows reporting of an Unsupported Request as a system error.

6.1.25 Manufacturer's ID (MANID) - Offset F8h

This reflects the value of the Manufacturers ID which provides information on the details of the chip revision.

Implementation Note: A single Manufacturers ID is implemented based on information in the Fuse block and distributed to the devices via a message.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:4] + F8h	08000F80h

Bit Range	Default & Access	Field Name (ID): Description
31:0	08000F80h RO/P	**Manufacturers ID Field (MANID)**: Manufacturer ID: Default value comes from straps

6.2 SMBus Memory Mapped Registers Summary

Table 6-2. Summary of SMBus Memory Mapped Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	1	Host Status Register Address (HSTS)	00h
2h	1	Host Control Register (HCTL)	00h
3h	1	Host Command Register (HCMD)	00h
4h	1	Transmit Slave Address Register (TSA)	00h
5h	1	Data 0 Register (HD0)	00h
6h	1	Data 1 Register (HD1)	00h
7h	1	Host Block Data (HBD)	00h
8h	1	Packet Error Check Data Register (PEC)	00h
9h	1	Receive Slave Address Register (RSA)	44h
Ah	2	Slave Data Register (SD)	0000h
Ch	1	Auxiliary Status (AUXS)	00h
Dh	1	Auxiliary Control (AUXC)	00h
Eh	1	SMLINK_PIN_CTL Register (SMLC)	04h
Fh	1	SMBUS_PIN_CTL Register (SMBC)	04h
10h	1	Slave Status Register (SSTS)	00h
11h	1	Slave Command Register (SCMD)	00h
14h	1	Notify Device Address Register (NDA)	00h
16h	1	Notify Data Low Byte Register (NDLB)	00h
17h	1	Notify Data High Byte Register (NDHB)	00h

6.2.1 Host Status Register Address (HSTS) - Offset 0h

All status bits are set by hardware and cleared by the software writing a one to the particular bit position. Writing a zero to any bit position has no affect.

Type	Size	Offset	Default
MMIO	8 bit	SMBMBAR + 0h	00h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW/1C	**BDS:** This bit will be set to 1 when the host controller has received a byte (for Block Read commands) or if it has completed transmission of a byte (for Block Write commands) when the 32-byte buffer is not being used. Note that this bit will be set, even on the last byte of the transfer. Software clears the bit by writing a 1 to the bit position. This bit is not set when transmission is due to the D110 interface heartbeat. This bit has no meaning for block transfers when the 32- byte buffer is enabled. Note: When the last byte of a block message is received, the host controller will set this bit. However, it will not immediately set the INTR bit (bit 1 in this register). When the interrupt handler clears the BYTE_DONE_STS bit, the message is considered complete, and the host controller will then set the INTR bit (and generate another interrupt). Thus, for a block message of n bytes, the Intel PCH will generate n+1 interrupts. The interrupt handler needs to be implemented to handle these cases.
6	0h RW/1C	**In Use Status (IUS):** After a full PCI reset, a read to this bit returns a 0. After the first read, subsequent reads will return a 1. A write of a 1 to this bit will reset the next read value to 0. Writing a 0 to this bit has no effect. Software can poll this bit until it reads a 0, and will then own the usage of the host controller. This bit has no other effect on the hardware, and is only used as semaphore among various independent software threads that may need to use the Intel PCHs SMBus logic.
5	0h RW/1C	**SMSTS:** Intel PCH sets this bit to a 1 to indicates source of the interrupt or SMI# was the SMBAlert# signal. Software resets this bit by writing a 1 to this location. This bit should also be cleared by RSMRST# (but not PLTRST#).
4	0h RW/1C	**FAIL:** When set, this indicates that the source of the interrupt or SMI# was a failed bus transaction. This is set in response to the KILL bit being set to terminate the host transaction.
3	0h RW/1C	**Bus Error (BERR):** When set, this indicates the source of the interrupt or SMI# was a transaction collision.
2	0h RW/1C	**Device Error (DERR):** When set, this indicates that the source of the interrupt or SMI# was due one of the following: Illegal Command Field Unclaimed Cycle (host initiated) Host Device Time-out Error. CRC Error
1	0h RW/1C	**INTR:** When set, this indicates that the source of the interrupt or SMI# was the successful completion of its last command.
0	0h RW/1C	**Host Busy (HBSY):** A 1 indicates that the Intel PCH is running a command from the host interface. No SMB registers should be accessed while this bit is set. Exception: The BLOCK DATA REGISTER can be accessed when this bit is set ONLY when the SMB_CMD bits (in Host control register) are programmed for Block command or I2C Read command. This is necessary in order to check the DONE_STS bit.

6.2.2 Host Control Register (HCTL) - Offset 2h

Note: A read to this register will clear the pointer in the 32-byte buffer.

Type	Size	Offset	Default
MMIO	8 bit	SMBMBAR + 2h	00h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**PEC_EN:** When set to 1, this bit causes the host controller to perform the SMBus transaction with the Packet Error Checking phase appended. For writes, the value of the PEC byte is transferred from the PEC Register. For reads, the PEC byte is loaded in to the PEC Register. When this bit is cleared to 0, the SMBus host controller does not perform the transaction with the PEC phase appended. This bit must be written prior to the write in which the START bit is set.
6	0h RW	**START:** This write-only bit is used to initiate the command described in the SMB_CMD field. All registers should be setup prior to writing a 1 to this bit position. This bit always reads zero. The HOST_BUSY bit in the Host Status register (offset 00h) can be used to identify when the Intel PCH has finished the command.
5	0h RW	**LAST_BYTE:** Used for I2C Read commands as an indication that the next byte will be the last one to be received for that block. The algorithm and usage model for this bit will be as follows (assume a message of n bytes): A. When the software sees the BYTE_DONE_STS bit set (bit 7 in the SMBus Host Status Register) for each of bytes 1 through n-2 of the message, the software should then read the Block Data Byte Register to get the byte that was just received. B. After reading each of bytes 1 to n-2 of the message, the software will then clear the BYTE_DONE_STS bit. C. After receiving byte n-1 of the message, the software will then set the LAST BYTE bit. The software will then clear the BYTE_DONE_STS bit. D. The Intel PCH will then receive the last byte of the message (byte n). However, the Intel PCH state machine will see the LAST BYTE bit set, and instead of sending an ACK after receiving the last byte, it will instead send a NAK. E. After receiving the last byte (byte n), the software will still clear the BYTE_DONE_STS bit. However, the LAST_BYTE bit will be irrelevant at that point. Note: This bit may be set when the TCO timer causes the SECOND_TO_STS bit to be set. See the TCO2_STS Register in Volume 1, bit 1 for more details on that bit. The SMBus device driver should clear the LAST_BYTE bit (if it is set) before starting any new command. Note: In addition to I2C Read Commands, the LAST_BYTE bit will also cause Block Read/Write cycles to stop prematurely (at the end of the next byte).

Bit Range	Default & Access	Field Name (ID): Description
4:2	0h RW	**SMB_CMD:** As shown by the bit encoding below, indicates which command the Intel PCH is to perform. If enabled, the Intel PCH will generate an interrupt or SMI# when the command has completed. If the value is for a non-supported or reserved command, the Intel PCH will set the device error (DEV_ERR) status bit and generate an interrupt when the START bit is set. The Intel PCH will perform no command, and will not operate until DEV_ERR is cleared. Val - Command Description: 000 - Quick: The slave address and read/write value (bit 0) are stored in the tx slave address register. 001 - Byte: This command uses the transmit slave address and command registers. Bit 0 of the slave address register determines if this is a read or write command. 010 - Byte Data: This command uses the transmit slave address, command, and DATA0 registers. Bit 0 of the slave address register determines if this is a read or write command. If it is a read, the DATA0 register will contain the read data. 011 - Word Data: This command uses the transmit slave address, command, DATA0 and DATA1 registers. Bit 0 of the slave address register determines if this is a read or write command. If it is a read, after the command completes the DATA0 and DATA1 registers will contain the read data. 100 - Process Call: This command uses the transmit slave address, command, DATA0 and DATA1 registers. Bit 0 of the slave address register determines if this is a read or write command. After the command completes, the DATA0 and DATA1 registers will contain the read data. 101 - Block: This command uses the transmit slave address, command, and DATA0 registers, and the Block Data Byte register. For block write, the count is stored in the DATA0 register and indicates how many bytes of data will be transferred. For block reads, the count is received and stored in the DATA0 register. Bit 0 of the slave address register selects if this is a read or write command. For writes, data is retrieved from the first n (where n is equal to the specified count) addresses of the SRAM array. For reads, the data is stored in the Block Data Byte register. 110 - I2C Read: This command uses the transmit slave address, command, DATA0, DATA1 registers, and the Block Data Byte register. The read data is stored in the Block Data Byte register. The Intel PCH will continue reading data until the NAK is received. 111 - Block-Process: This command uses the transmit slave address, command, DATA0 and the Block Data Byte register. For block write, the count is stored in the DATA0 register and indicates how many bytes of data will be transferred. For block read, the count is received and stored in the DATA0 register. Bit 0 of the slave address register always indicate a write command. For writes, data is retrieved from the first m (where m is equal to the specified count) addresses of the SRAM array. For reads, the data is stored in the Block Data Byte register. Note: E32B bit in the Auxiliary Control Register must be set for this command to work.
1	0h RW	**KILL:** When set, kills the current host transaction taking place, sets the FAILED status bit, and asserts the interrupt (or SMI#) selected by the SMB_INTRSEL field. This bit, once set, must be cleared to allow the SMB Host Controller to function normally.
0	0h RW	**INTREN:** Enable the generation of an interrupt or SMI# upon the completion of the command.

6.2.3 Host Command Register (HCMD) - Offset 3h

Host Command Register

Type	Size	Offset	Default
MMIO	8 bit	SMBMBAR + 3h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW	**Host Command Register (HCMD):** This eight bit field is transmitted by the host controller in the command field of the SMB protocol during the execution of any command.

6.2.4 Transmit Slave Address Register (TSA) - Offset 4h

This register is transmitted by the host controller in the slave address field of the SMB protocol. This is the address of the target.

Type	Size	Offset	Default
MMIO	8 bit	SMBMBAR + 4h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:1	00h RW	**ADDR:** 7-bit address of the targeted slave. Note: Writes to TSA values of A0h - AEh are blocked depending on the setting of the SPD write disable bit in HCFG - Host Configuration.
0	0h RW	**RW:** Direction of the host transfer. 1 = read, 0 = write

6.2.5 Data 0 Register (HD0) - Offset 5h

Data 0 Register

Type	Size	Offset	Default
MMIO	8 bit	SMBMBAR + 5h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW	**DATA0_COUNT:** This field contains the eight bit data sent in the DATA0 field of the SMB protocol. For block write commands, this register reflects the number of bytes to transfer. This register should be programmed to a value between 1 and 32 for block counts. A count of 0 or a count above 32 will result in unpredictable behavior. The host controller does not check or log illegal block counts.

6.2.6 Data 1 Register (HD1) - Offset 6h

Data 1 Register

Type	Size	Offset	Default
MMIO	8 bit	SMBMBAR + 6h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW	**DATA1:** This eight bit register is transmitted in the DATA1 field of the SMB protocol during the execution of any command.

6.2.7 Host Block Data (HBD) - Offset 7h

Host Block Data

Type	Size	Offset	Default
MMIO	8 bit	SMBMBAR + 7h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW	**Block Data (BDTA):** This is either a register, or a pointer into a 32- byte block array, depending upon whether the E32B bit is set in the Auxiliary Control register. When the E32B bit is cleared, this is a register containing a byte of data to be sent on a block write or read from on a block read, just as it behaved on the INTEL PCH. When the E32B bit is set, reads and writes to this register are used to access the 32-byte block data storage array. An internal index pointer is used to address the array, which is reset to 0 by reading the HCTL register (offset 02h). The index pointer then increments automatically upon each access to this register. The transfer of block data into (read) or out of (write) this storage array during an SMBus transaction always starts at index address 0. When the E2B bit is set, for writes, software will write up to 32-bytes to this register as part of the setup for the command. After the Host Controller has sent the Address, Command, and Byte Count fields, it will send the bytes in the SRAM pointed to by this register. When the E2B bit is cleared for writes, software will place a single byte in this register. After the host controller has sent the address, command, and byte count fields, it will send the byte in this register. If there is more data to send, software will write the next series of bytes to the SRAM pointed to by this register and clear the DONE_STS bit. The controller will then send the next byte. During the time between the last byte being transmitted to the next byte being transmitted, the controller will insert wait-states on the interface. When the E2B bit is set for reads, after receiving the byte count into the Data0 register, the first series of data bytes go into the SRAM pointed to by this register. If the byte count has been exhausted or the 32-byte SRAM has been filled, the controller will generate an SMI# or interrupt (depending on configuration) and set the DONE_STS bit. Software will then read the data. During the time between when the last byte is read from the SRAM to when the DONE_STS bit is cleared, the controller will insert wait states on the interface.

6.2.8 Packet Error Check Data Register (PEC) - Offset 8h

Note: This register may reside in either the core well or the suspend well. To simplify the implementation, this register will be in the suspend well with the suspend well version of PCI reset (URST33B).

This register contains the 8-bit CRC value that is used as the Packet Error Check on SMBus. For writes, this register is written by software prior to running the command. For reads, this register is read by software after the read command is completed on SMBus.

Type	Size	Offset	Default
MMIO	8 bit	SMBMBAR + 8h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW	**PEC_DATA:** This 8-bit register is written with the SMBus PEC data prior to a write transaction. For read transactions, the PEC data is loaded from the SMBus into this register and is then read by software. Software must ensure that the INUSE_STS bit is properly maintained to avoid having this field over-written by a write transaction following a read transaction.

6.2.9 Receive Slave Address Register (RSA) - Offset 9h

Receive Slave Address Register

Type	Size	Offset	Default
MMIO	8 bit	SMBMBAR + 9h	44h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Reserved**
6:0	44h RW	**SA_6_0:** This field is the slave address that the Intel PCH decodes for read and write cycles. The default is not 0 so that it can respond even before the CPU comes up (or if the CPU is dead). This register is reset by RSMRST#, but not by PLTRST#.

6.2.10 Slave Data Register (SD) - Offset Ah

Slave Data Register

Type	Size	Offset	Default
MMIO	16 bit	SMBMBAR + Ah	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RO/V	**SD_15_0:** This field is the 16-bit data value written by the external SMBus master. The CPU can then read the value from this register. This register is reset by RSMRST#, but not by PLTRST#. SLAVE_DATA[7:0] corresponds to the Data Message Byte 0 at Slave Write Register 4 in the table. SLAVE_[15:8] corresponds to the Data Message Byte 1 at Slave Write Register 5 in the table.

6.2.11 Auxiliary Status (AUXS) - Offset Ch

All bits in this register are in the core well.

Type	Size	Offset	Default
MMIO	8 bit	SMBMBAR + Ch	00h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	**Reserved**
4	0h RO/V	**SMT3EN:** Register value determines if SMT3 is enabled and connected on SMLink1. Disabled means the device is not connected to the pins 0: Disable 1: Enable
3	0h RO/V	**SMT2EN:** Register value determines if SMT2 is enabled and connected on SMLink0. Disabled means the device is not connected to the pins 0: Disable 1: Enable
2	0h RO/V	**SMT1EN:** Register value determines if SMT1 is enabled and connected on SMBus. Disabled means the device is not connected to the pins 0: Disables 1: Enable
1	0h RO	**Reserved**
0	0h RW/1C	**CRC Error (CRCE):** This bit is set if a received message contained a CRC error. When this bit is set, the DERR bit of the host status register will also be set. This bit will be set by the controller if a software abort occurs in the middle of the CRC portion of the cycle or an abort happens after Intel PCH has received the final data bit transmitted by external slave.

6.2.12 Auxiliary Control (AUXC) - Offset Dh

All bits in this register are in the resume well.

Type	Size	Offset	Default
MMIO	8 bit	SMBMBAR + Dh	00h

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	**Reserved**
1	0h RW	**Enable 32-byte Buffer (E32B):** When set, the Host Block Data register is a pointer into a 32-byte buffer, as opposed to a single register. This enables the block commands to transfer or receive up to 32-bytes before the Intel PCH generates an interrupt.
0	0h RW	**Automatically Append CRC (AAC):** When set, the Intel PCH will automatically append the CRC. This bit must not be changed during SM Bus transactions, or undetermined behavior will result. It should be programmed only once during the lifetime of the function.

6.2.13 SMLINK_PIN_CTL Register (SMLC) - Offset Eh

Note: This register is in the resume well and is reset by RSMRST#

Type	Size	Offset	Default
MMIO	8 bit	SMBMBAR + Eh	04h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	**Reserved**
2	1h RW	**SMLINK_CLK_CTL:** 0 = Intel PCH will drive the SMLINK[0] pin low, independent of what the other SMLINK logic would otherwise indicate for the SMLINK(0) pin. 1 = The SMLINK[0] pin is Not overdriven low. The other SMLINK logic controls the state of the pin.
1	0h RO/V	**SMLINK1_CUR_STS:** This bit has a default value that is dependent on an external signal level. This returns the value on the SMLINK[1] pin. It will be 1 to indicate high, 0 to indicate low. This allows software to read the current state of the pin.
0	0h RO/V	**SMLINK0_CUR_STS:** This bit has a default value that is dependent on an external signal level. This returns the value on the SMLINK[0] pin. It will be 1 to indicate high, 0 to indicate low. This allows software to read the current state of the pin.

6.2.14 SMBUS_PIN_CTL Register (SMBC) - Offset Fh

Note: This register is in the resume well and is reset by RSMRST#

Type	Size	Offset	Default
MMIO	8 bit	SMBMBAR + Fh	04h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	**Reserved**
2	1h RW	**SMBCLK_CTL:** 0 = Intel PCH will drive the SMBCLK pin low, independent of what the other SMB logic would otherwise indicate for the SMBCLK pin. 1 = The SMBCLK pin is Not overdriven low. The other SMBus logic controls the state of the pin.
1	0h RO/V	**SMBDATA_CUR_STS:** This bit has a default value that is dependent on an external signal level. This returns the value on the SMBDATA pin. It will be 1 to indicate high, 0 to indicate low. This allows software to read the current state of the pin.
0	0h RO/V	**SMBCLK_CUR_STS:** This bit has a default value that is dependent on an external signal level. This returns the value on the SMBCLK pin. It will be 1 to indicate high, 0 to indicate low. This allows software to read the current state of the pin.

6.2.15 Slave Status Register (SSTS) - Offset 10h

All bits in this register are implemented in the 64 kHz clock domain. Therefore, software must poll the register until a write takes effect before assuming that a write has completed internally.

Type	Size	Offset	Default
MMIO	8 bit	SMBMBAR + 10h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:1	0h RO	**Reserved**
0	0h RW/1C	**HNS:** The Intel PCH sets this bit to a 1 when it has completely received a successful Host Notify Command on the SMBus pins. Software reads this bit to determine that the source of the interrupt or SMI# was the reception of the Host Notify Command. Software clears this bit after reading any information needed from the Notify address and data registers by writing a 1 to this bit. Note that the Intel PCH will allow the Notify Address and Data registers to be over-written once this bit has been cleared. When this bit is 1, the Intel PCH will NACK the first byte (host address) of any new Host Notify commands on the SMBus. Writing a 0 to this bit has no effect.

6.2.16 Slave Command Register (SCMD) - Offset 11h

All bits in this register are implemented in the 64 kHz clock domain. Therefore, software must poll the register until a write takes effect before assuming that a write has completed internally. Also, software must confirm the prior written value before writing to the register again.

Type	Size	Offset	Default
MMIO	8 bit	SMBMBAR + 11h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	**Reserved**
2	0h RW	**SMB_D:** Software sets this bit to 1 to block the generation of the interrupt or SMI# due to the SMBALERT# source. This bit is logically inverted and ANDed with the SMBALERT_STS bit. The resulting signal is distributed to the SMI# and/or interrupt generation logic. This bit does not effect the wake logic.
1	0h RW	**HNW:** Software sets this bit to 1 to enable the reception of a Host Notify command as a wake event. When enabled this event is ORed in with the other SMBus wake events and is reflected in the SMB_WAK_STS bit of the General Purpose Event 0 Status register.
0	0h RW	**HNI:** Software sets this bit to 1 to enable the generation of interrupt or SMI# when HOST_NOTIFY_STS is 1. This enable does not affect the setting of the HOST_NOTIFY_STS bit. When the interrupt is generated, either PIRQB or SMI# is generated, depending on the value of the SMB_SMI_EN bit (D31, F3, Off40h, B1). If the HOST_NOTIFY_STS bit is set when this bit is written to a 1, then the interrupt (or SMI#) will be generated. The interrupt (or SMI#) is logically generated by ANDing the STS and INTREN bits.

6.2.17 Notify Device Address Register (NDA) - Offset 14h

Notify Device Address Register

Type	Size	Offset	Default
MMIO	8 bit	SMBMBAR + 14h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:1	00h RO/V	**DEV_ADDR:** This field contains the 7-bit device address received during the Host Notify protocol of the SMBus 2.0 specification. Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1.
0	0h RO	**Reserved**

6.2.18 Notify Data Low Byte Register (NDLB) - Offset 16h

Notify Data Low Byte Register

Type	Size	Offset	Default
MMIO	8 bit	SMBMBAR + 16h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RO	**DLB:** This field contains the first (low) byte of data received during the Host Notify protocol of the SMBus 2.0 specification. Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1.

6.2.19 Notify Data High Byte Register (NDHB) - Offset 17h

Notify Data High Byte Register

Type	Size	Offset	Default
MMIO	8 bit	SMBMBAR + 17h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RO	**DHB:** This field contains the second (high) byte of data received during the Host Notify protocol of the SMBus 2.0 specification. Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1.

6.3 SMBus PCR Registers Summary

Table 6-3. Summary of SMBus PCR Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	TCO Configuration (TCOCFG)	00000000h
Ch	4	General Control (GC)	00000000h
10h	4	Power Control Enable (PCE)	00000009h

6.3.1 TCO Configuration (TCOCFG) - Offset 0h

TCO Configuration

Type	Size	Offset	Default
MMIO	32 bit	FDC60000h + 0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7	0h RW	**TCO IRQ Enable (IE):** When set, TCO IRQ is enabled, as selected by the TCO_IRQ_SEL field. When cleared, TCO IRQ is disabled.
6:3	0h RO	**Reserved**
2:0	0h RW	**TCO IRQ Select (IRQSEL):** Specifies on which IRQ the TCO will internally appear. If not using the APIC, the TCO interrupt must be routed to IRQ9-11, and that interrupt is not sharable with the SERIRQ stream, but is shareable with other PCI interrupts. If using the APIC, the TCO interrupt can also be mapped to IRQ20-23, and can be shared with other interrupt. Bits TCO Map 000 IRQ9 (maps to 8259 and APIC) 001 IRQ10 (maps to 8259 and APIC) 010 IRQ11 (maps to 8259 and APIC) 011 Reserved 100 IRQ20 (maps to APIC) 101 IRQ21 (maps to APIC) 110 IRQ22 (maps to APIC) 111 IRQ23 (maps to APIC) When setting the these bits, the IE bit should be cleared to prevent glitching. When the interrupt is mapped to APIC interrupts 9, 10 or 11, the APIC should be programmed for active-high reception. When the interrupt is mapped to APIC interrupts 20 through 23, the APIC should be programmed for active-low reception.

6.3.2 General Control (GC) - Offset Ch

General Control

Type	Size	Offset	Default
MMIO	32 bit	FDC60000h + Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved**
8	0h RW	**SMB Slave Support (SMBSLV):** "0" : SMB controller as slave is supported "1" : SMB controller as slave is not supported Note: This bit has no other effect on the hardware, and is only used as semaphore and exposed into the BIOS menu for use by customer that has SMBus controller usage model as Slave, i.e. TCO Slave. This shall be enabled in BIOS menu to also prevent Platform from entering S0i3.4.
7:3	0h RO	**Reserved**
2	0h RW	**SMB Static Clock Gating Enable (SMBSCGE):** "0" : SMB cluster static clock gating is disabled "1" : SMB cluster static clock gating is enabled Note: Setting this bit will also clock gate all the TCO logic functionality.
1	0h RO	**Reserved**
0	0h RW	**Function Disable (FD):** When set to one, this disables the PCI configuration register space for the SMBus device.

6.3.3 Power Control Enable (PCE) - Offset 10h

Power Control Enable

Type	Size	Offset	Default
MMIO	32 bit	FDC60000h + 10h	00000009h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5	0h RW	**Hardware Autonomous Enable (HAE):** When set, SMB will automatically engage power gating when it has reached its idle condition.
4	0h RO	**Reserved**
3	1h RO	**Sleep Enable (SE):** When this bit is clear, the SMB will never asset Sleep to the retention flops. If set, then SMB may assert sleep during power gating.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RO	**D3-Hot Enable (D3HE):** No support for D3 Hot power gating.
1	0h RO	**I3 Enable (I3E):** No support for S0i3 power gating.
0	1h RW	**PMC Request Enable (PMCRE):** When set to 1, the SMB will engage power gating if it is idle and the pmc_smb_sw_pg_req_b signal is asserted.

7 Serial Peripheral Interface (SPI) Controller

7.1 SPI Configuration Registers Summary

This chapter documents the registers in Bus: 0, Device 31, Function 5.

Table 7-1. Summary of Bus: 0, Device: 31, Function: 5 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	Device ID and Vendor ID (BIOS_SPI_DID_VID)	4B248086h
4h	4	Status and Command (BIOS_SPI_STS_CMD)	00000400h
8h	4	Revision ID and Class Code (BIOS_SPI_CC_RID)	0C800000h
Ch	4	BIST, Header Type, Latency Timer, Cache Line Size (BIOS_SPI_BIST_HTYPE_LT_CLS)	00000000h
10h	4	SPI BAR0 MMIO (BIOS_SPI_BAR0)	00000000h
2Ch	4	Subsystem and Vendor ID (BIOS_SPI_SID_SVID)	00000000h
D0h	4	SPI Unsupported Request Status (BIOS_SPI_UR_STS_CTL)	00000000h
D8h	4	BIOS Decode Enable (BIOS_SPI_BDE)	0000FFCFh
DCh	4	BIOS Control (BIOS_SPI_BC)	00000028h
F8h	4	Manufacturer's ID (BIOS_SPI_MANID)	00000F00h

7.1.1 Device ID and Vendor ID (BIOS_SPI_DID_VID) - Offset 0h

Device ID and Vendor ID.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:5] + 0h	4B248086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	4B24h RO/V	**Device Identification (DID):** Identifier for the SPI Flash Controller in Host Root Space. The upper 9-bits of this field can be overridden by the SetID Value IOSF-SB Message. The value of the lower 7 bits is parameterized to allow different SOCs to configure the SPI IP.
15:0	8086h RO	**Vendor Identification (VID):** This field identifies the manufacturer of the device. Valid vendor identifiers are allocated by the PCI SIG to ensure uniqueness. 0x8086 indicates Intel

7.1.2 Status and Command (BIOS_SPI_STS_CMD) - Offset 4h

This is a standard PCI configuration register. See the PCI spec for bit descriptions.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:5] + 4h	00000400h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**Detected Parity Error (DPE):** See the PCI spec.
30	0h RW/1C/V	**Signaled System Error (SSE):** See the PCI spec.
29	0h RO	**Received Master Abort (RMA):** See the PCI spec.
28	0h RO	**Received Target Abort (RTA):** See the PCI spec.
27	0h RW/1C/V	**Signaled Target Abort (STA):** See the PCI spec.
26:25	0h RO	**Devsel Timing (DEVT):** See the PCI spec.
24	0h RO	**Master Data Parity Error (MDPE):** See the PCI spec.
23	0h RO	**Fast Back to Back Capable (FBTBC):** Has no meaning on the internal backbone.
22	0h RO	**Reserved**
21	0h RO	**66 Mhz Capable (MCAP):** Not 66 MHz capable device. Has no meaning on the internal backbone.
20	0h RO	**Capabilities List (CAPL):** See the PCI spec.
19	0h RO	**Interrupt Status (INTS):** See the PCI spec.
18:11	0h RO	**Reserved**
10	1h RO	**Interrupt Disable (INTD):** See the PCI spec.
9	0h RO	**Fast Back to Back Enable (FBTBEN):** See the PCI spec.
8	0h RW	**System Error Enable (SERREN):** See the PCI spec.
7	0h RO	**Reserved**
6	0h RW	**Parity Error Response (PERRR):** See the PCI spec.
5	0h RO	**VGA Palette Snoop (VGAPS):** See the PCI spec.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO	**Memory Write and Invalidate Enable (MWRIEN):** See the PCI spec.
3	0h RO	**Special Cycles (SPCYC):** See the PCI spec.
2	0h RW	**Bus Master Enable (BME):** See the PCI spec.
1	0h RW	**Memory Space Enable (MSE):** Memory Space Enable may default False because the BIOS boot fetch decoding is hardcoded and does not rely on a BAR in configuration space.
0	0h RO	**IO Space Enable (IOSE):** See the PCI spec.

7.1.3 Revision ID and Class Code (BIOS_SPI_CC_RID) - Offset 8h

Revision ID and Class Code.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:5] + 8h	0C800000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0Ch RO	**Base Class Code (BCC):** Base Class Code
23:16	80h RO	**Sub-Class Code (SCC):** Sub-Class Code
15:8	00h RO	**Programming Interface (PI):** Programming Interface
7:0	00h RO/V	**Revision ID (RID):** Indicates the part revision. This will reset to 0 but will overridden by the SetID IOSF-SB message during the power-up sequence.

7.1.4 BIST, Header Type, Latency Timer, Cache Line Size (BIOS_SPI_BIST_HTYPE_LT_CLS) - Offset Ch

BIST, Header Type, Latency Timer, Cache Line Size.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:5] + Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	0h RO	**Multi-function Device (MFD):** See the PCI spec.
22:16	00h RO	**Header Type (HTYPE):** See the PCI spec.
15:8	00h RO	**Latency Timer (LT):** See the PCI spec.
7:0	00h RO	**Cache Line Size (CLSZ):** See the PCI spec.

7.1.5 SPI BAR0 MMIO (BIOS_SPI_BAR0) - Offset 10h

Base Address for BAR0 - MMIO Registers.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:5] + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Memory BAR (MEMBAR):** Software programs this register with the base address of the device's memory region. The Host/BIOS MMIO registers in the flash controller are offset from this BAR.
11:4	00h RO	**Memory Size (MEMSIZE):** Hardwired to 0 to indicate 4KB of memory space.
3	0h RO	**PREFETCH:** A device can mark a range as prefetchable if there are no side effects on reads, the device returns all bytes on reads regardless of the byte enables.
2:1	0h RO	**TYP:** Hardwired to 0 to indicate that Base register is 32 bits wide and mapping can be done anywhere in the 32-bit Memory Space.
0	0h RO	**Memory Space Indicator (MEMSPACE):** Hardwired to 0 to identify a Memory BAR.

7.1.6 Subsystem and Vendor ID (BIOS_SPI_SID_SVID) - Offset 2Ch

Subsystem and Vendor ID.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:5] + 2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O	**Subsystem ID (SSID):** Subsystem ID
15:0	0000h RW/O	**Subsystem Vendor ID (SSVID):** Subsystem Vendor ID

7.1.7 SPI Unsupported Request Status (BIOS_SPI_UR_STS_CTL) - Offset D0h

See the IOSF Specification for required behavior.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:5] + D0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1	0h RW/1C/V	**Unsupported Request Detected (URD):** Set to 1 by hardware upon detecting an Unsupported Request that is not considered an Advisory Non-Fatal error. Cleared to 0 when software writes a 1 to this register.
0	0h RW	**Unsupported Request Reporting Enabled (URRE):** If set to 1 by software, the flash controller generates a DoSERR sideband message when the URD bit transitions from 0 to 1.

7.1.8 BIOS Decode Enable (BIOS_SPI_BDE) - Offset D8h

This register only effects BIOS decode if BIOS is resident on SPI.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:5] + D8h	0000FFCFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**BDE Lock Enable (BLE):** When this bit is set, the RW bits of this BDE register are locked down. Once set, this bit can only be cleared by PLTRST#. **Locked by:** BIOS_SPI_BDE.BLE
30:16	0h RO	**Reserved**
15	1h RO	**F8-FF Enable (EF8):** Enables decoding of 512K of the following BIOS ranges: FFF80000h - FFFFFFFFh FFB80000h - FFBFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
14	1h RW/L	**F0-F8 Enable (EF0):** Enables decoding of 512K of the following BIOS ranges: FFF00000h - FFF7FFFFh FFB00000h - FFB7FFFFh **Locked by:** BIOS_SPI_BDE.BLE
13	1h RW/L	**E8-EF Enable (EE8):** Enables decoding of 512K of the following BIOS ranges: FFE80000h - FFEFFFFFh FFA80000h - FFAFFFFFh **Locked by:** BIOS_SPI_BDE.BLE
12	1h RW/L	**E0-E8 Enable (EE0):** Enables decoding of 512K of the following BIOS ranges: FFE00000h - FFE7FFFFh FFA00000h - FFA7FFFFh **Locked by:** BIOS_SPI_BDE.BLE
11	1h RW/L	**D8-DF Enable (ED8):** Enables decoding of 512K of the following BIOS ranges: FFD80000h - FFDFFFFFh FF980000h - FF9FFFFFh **Locked by:** BIOS_SPI_BDE.BLE
10	1h RW/L	**D0-D7 Enable (ED0):** Enables decoding of 512K of the following BIOS ranges: FFD00000h - FFD7FFFFh FF900000h - FF97FFFFh **Locked by:** BIOS_SPI_BDE.BLE
9	1h RW/L	**C8-CF Enable (EC8):** Enables decoding of 512K of the following BIOS ranges: FFC80000h - FFCFFFFFh FF880000h - FF8FFFFFh **Locked by:** BIOS_SPI_BDE.BLE
8	1h RW/L	**C0-C7 Enable (EC0):** Enables decoding of 512K of the following BIOS ranges: FFC00000h - FFC7FFFFh FF800000h - FF87FFFFh **Locked by:** BIOS_SPI_BDE.BLE
7	1h RW/L	**Legacy F Segment Enable (LFE):** This enables the decoding of the legacy 64KB range at F0000h - FFFFFh. Note that decode for the BIOS legacy F segment is enabled by the LFE bit only. It is not affected by the GEN_PMCON_1.iA64_EN bit. **Locked by:** BIOS_SPI_BDE.BLE
6	1h RW/L	**Legacy E Segment Enable (LEE):** This enables the decoding of the legacy 64KB range at E0000h - EFFFFh. Note that decode for the BIOS legacy E segment is enabled by the LEE bit only. It is not affected by the GEN_PMCON_1.iA64_EN bit. **Locked by:** BIOS_SPI_BDE.BLE
5:4	0h RO	**Reserved**
3	1h RW/L	**70-7F Enable (E70):** Enables decoding of 1MB of the following BIOS ranges: FF700000h - FF7FFFFFh FF300000h - FF3FFFFFh **Locked by:** BIOS_SPI_BDE.BLE

Bit Range	Default & Access	Field Name (ID): Description
2	1h RW/L	**60-6F Enable (E60):** Enables decoding of 1MB of the following BIOS ranges: FF600000h - FF6FFFFFh FF200000h - FF2FFFFFh **Locked by:** BIOS_SPI_BDE.BLE
1	1h RW/L	**50-5F Enable (E50):** Enables decoding of 1MB of the following BIOS ranges: FF500000h - FF5FFFFFh FF100000h - FF1FFFFFh **Locked by:** BIOS_SPI_BDE.BLE
0	1h RW/L	**40-4F Enable (E40):** Enables decoding of 1MB of the following BIOS ranges: FF400000h - FF4FFFFFh FF000000h - FF0FFFFFh **Locked by:** BIOS_SPI_BDE.BLE

7.1.9 BIOS Control (BIOS_SPI_BC) - Offset DCh

This register collects bits that were previously distributed in various IPs and input to the SPI controller via discrete wires.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:5] + DCh	00000028h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW/L	**Extended BIOS Range Lock (EXT_BIOS_LOCK):** When set, prevents EXT_BIOS_EN and EXT_BIOS_LIMIT_OFFSET from being changed. This bit can only be written from 0 to 1 once. This field is only used when the extended BIOS direct read range decoding is supported. (SPI_EXT_BIOS_BAR1_EN=1). **Locked by:** BIOS_SPI_BC.EXT_BIOS_LOCK
27	0h RW/L	**Extended BIOS Range Enable (EXT_BIOS_EN):** When set, enables the extended BIOS range decoding on SPI BAR1.This field is only used when the extended BIOS direct read range decoding is supported. (SPI_EXT_BIOS_BAR1_EN=1). **Locked by:** BIOS_SPI_BC.EXT_BIOS_LOCK
26:12	0000h RW/L	**Extended BIOS Range Limit Offset (EXT_BIOS_LIMIT_OFFSET):** This field defines the offset of the extended BIOS range upper limit from the upper limit of the BIOS region in the flash. This field is only used when the extended BIOS direct read range decoding is supported. (SPI_EXT_BIOS_BAR1_EN=1). **Locked by:** BIOS_SPI_BC.EXT_BIOS_LOCK
11	0h RW/L	**Async SMI Enable for BIOS Write Protection (ASE_BWP):** When set to '1', the flash controller will generate an SMI when it blocks a BIOS write or erase. The value in this field can be written by software as long as the BIOS Interface Lock-Down (BILD) is not set. **Locked by:** BIOS_SPI_BC.BILD

Bit Range	Default & Access	Field Name (ID): Description
10	0h RO/V	**Asynchronous SMI Status (SPI_ASYNC_SS):** Status indication that the SPI Flash Controller has asserted an asynchronous SMI. Hardware clears the bit when it sends the De-assert SMI message. 0: default state 1: SPI flash controller asserted Asynchronous SMI
9	0h RW/L	**OS Function Hide (OSFH):** This bit controls read access over IOSF Primary to SPI's Device ID, Vendor ID PCI Configuration register. This bit does not affect access to any other PCI Configuration registers. This bit is locked with BILD. Trusted BIOS must set this bit prior to starting the OS. 0: DeviceID, VendorID can be read 1: reads to Device ID, Vendor ID return a UR **Note:** This bit is still implemented as a RW/L bit, but is no longer used by the hardware to return UR as specified above. **Locked by:** BIOS_SPI_BC.BILD
8	0h RW/1C/V	**Synchronous SMI Status (SPI_SYNC_SS):** Status indication that the SPI Flash Controller has asserted a synchronous SMI. Hardware clears the bit when it sends the De-assert Synchronous SMI message. 0: default state 1: SPI flash controller asserted Synchronous SMI
7	0h RW/L	**BIOS Interface Lock-Down (BILD):** When set, prevents BBS and ASE_BWP from being changed. This bit can only be written from 0 to 1 once. **Locked by:** BIOS_SPI_BC.BILD
6	0h RW/V/L	**Boot BIOS Strap (BBS):** This field determines the destination of accesses to the BIOS memory range. 0 SPI 1 Reserved When SPI is selected, the range that is decoded is further qualified by the BIOS Decode Enable (BDE) register. The initial value of this bit is determined by the BBS pinstrap. The value in this field can be overwritten by software as long as the BIOS Interface Lock-Down (BILD) is not set. **Locked by:** BIOS_SPI_BC.BILD
5	1h RW/L	**Enable InSMM.STS (EISS):** When this bit is set, the BIOS region is not writable until the CPU is in SMM mode. SPI receives this indication either via the InSMM.STS bit discrete wire input or via SAI. If this bit [5] is set, then WPD must be a '1' and the CPU must be in SMM mode in order to write to BIOS regions of SPI Flash. If this bit [5] is clear, then SMM mode is a don't care. This bit is locked by LE (bit 1 of this register). **Locked by:** BIOS_SPI_BC.LE
4	0h RO/V	**Top Swap Status (TSS):** This bit provides a read-only path to view the state of the Top Swap bit.

Bit Range	Default & Access	Field Name (ID): Description
3:2	2h RW	**SPI Read Configuration (SRC):** These bits are located in PCI Configuration space to allow them to be set early in the boot flow. This 2-bit field controls two policies related to BIOS reads on the SPI interface: Bit 3 - Prefetch Enable Bit 2 - Cache Disable Settings are summarized below: Bits 3:2 -- Description 00 **No prefetching, but caching enabled.** Direct Memory reads load the read buffer cache with 'valid' data, allowing repeated reads to the same range to complete quickly 01 **No prefetching and no caching.** One-to-one correspondence of host BIOS reads to SPI cycles. This value can be used to invalidate the cache. 10 **Prefetching and Caching enabled.** This mode is used for long sequences of short reads to consecutive addresses (i.e. shadowing) 11 **Illegal.** Caching must be enabled when Prefetching is enabled. This eliminates the need for a complex prefetch-flushing mechanism
1	0h RW/L	**Lock Enable (LE):** When set, setting the WPD bit will cause a synchronous SMI. When cleared, setting the WPD bit will not cause SMI. Once set, this bit can only be cleared by a PLTRST#. When this bit is set, EISS - bit [5] of this register is locked down. **Locked by:** BIOS_SPI_BC.LE
0	0h RW	**Write Protect Disable (WPD):** When set, access to the BIOS space is enabled for both read and write cycles to BIOS. When cleared, only read cycles are permitted to the SPI flash. When this bit is written from a '0' to a '1' and the LE bit is also set, a synchronous SMI is generated. This ensures that only SMM code can update BIOS.

7.1.10 Manufacturer's ID (BIOS_SPI_MANID) - Offset F8h

This register is assigned during the boot flow using the SetID message based on values found in the fuse block. All fields except MID will be reset by hardware to zero and set only by the SetID Value message.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:31, F:5] + F8h	00000F00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000F00h RO/P	**Manufacturers ID Field (MANID)**:Manufacturer ID: Default value comes from straps.

7.2 SPI Memory Mapped Registers Summary

Table 7-2. Summary of SPI Memory Mapped Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	BIOS Flash Primary Region (BIOS_BFPREG)	00000000h
4h	4	Hardware Sequencing Flash Status and Control (BIOS_HSFSTS_CTL)	00002000h
8h	4	Flash Address (BIOS_FADDR)	00000000h
Ch	4	Discrete Lock Bits (BIOS_DLOCK)	00000000h
10h	4	Flash Data (BIOS_FDATA0)	00000000h
14h	4	Flash Data (BIOS_FDATA1)	00000000h
18h	4	Flash Data (BIOS_FDATA2)	00000000h
1Ch	4	Flash Data (BIOS_FDATA3)	00000000h
20h	4	Flash Data (BIOS_FDATA4)	00000000h
24h	4	Flash Data (BIOS_FDATA5)	00000000h
28h	4	Flash Data (BIOS_FDATA6)	00000000h
2Ch	4	Flash Data (BIOS_FDATA7)	00000000h
30h	4	Flash Data (BIOS_FDATA8)	00000000h
34h	4	Flash Data (BIOS_FDATA9)	00000000h
38h	4	Flash Data (BIOS_FDATA10)	00000000h
3Ch	4	Flash Data (BIOS_FDATA11)	00000000h
40h	4	Flash Data (BIOS_FDATA12)	00000000h
44h	4	Flash Data (BIOS_FDATA13)	00000000h
48h	4	Flash Data (BIOS_FDATA14)	00000000h
4Ch	4	Flash Data (BIOS_FDATA15)	00000000h
50h	4	Flash Region Access Permissions (BIOS_FRACC)	000042C2h
54h	4	Flash Region (BIOS_FREG0)	00000000h
58h	4	Flash Region (BIOS_FREG1)	00000000h
5Ch	4	Flash Region (BIOS_FREG2)	00000000h
60h	4	Flash Region (BIOS_FREG3)	00000000h
64h	4	Flash Region (BIOS_FREG4)	00000000h
68h	4	Flash Region (BIOS_FREG5)	00000000h
6Ch	4	Flash Region (BIOS_FREG6)	00000000h
70h	4	Flash Region (BIOS_FREG7)	00000000h
74h	4	Flash Region (BIOS_FREG8)	00000000h
78h	4	Flash Region (BIOS_FREG9)	00000000h
7Ch	4	Flash Region (BIOS_FREG10)	00000000h
80h	4	Flash Region (BIOS_FREG11)	00000000h
84h	4	Flash Protected Range (BIOS_FPR0)	00000000h
88h	4	Flash Protected Range (BIOS_FPR1)	00000000h
8Ch	4	Flash Protected Range (BIOS_FPR2)	00000000h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
90h	4	Flash Protected Range (BIOS_FPR3)	00000000h
94h	4	Flash Protected Range (BIOS_FPR4)	00000000h
98h	4	Global Protected Range 0 (BIOS_GPR0)	00000000h
A0h	4	Software Sequencing Flash Status and Control (BIOS_SSFSTS_CTL)	06000000h
A4h	4	Prefix Opcode and Opcode Type Configuration (BIOS_PREOP_OPTYPE)	00000000h
A8h	4	Opcode Menu0 Configuration (BIOS_OPMENU0)	00000000h
ACh	4	Opcode Menu1 Configuration (BIOS_OPMENU1)	00000000h
B0h	4	Secondary Flash Region Access Permissions (BIOS_SFRACC)	00000000h
B4h	4	Flash Descriptor Observability Control (BIOS_FDOC)	00000000h
B8h	4	Flash Descriptor Observability Data (BIOS_FDOD)	00000000h
C0h	4	Additional Flash Control (BIOS_AFC)	00000000h
C4h	4	Vendor Specific Component Capabilities for Component 0 (BIOS_SFDP0_VSCC0)	00002000h
C8h	4	Vendor Specific Component Capabilities for Component 1 (BIOS_SFDP1_VSCC1)	00002000h
CCh	4	Parameter Table Index (BIOS_PTINX)	00000000h
D0h	4	Parameter Table Data (BIOS_PTDATA)	00000000h
D4h	4	SPI Bus Requester Status (BIOS_SBRS)	00000000h
E0h	4	Flash Region (BIOS_FREG12)	00000000h
E4h	4	Flash Region (BIOS_FREG13)	00000000h
E8h	4	Flash Region (BIOS_FREG14)	00000000h
ECh	4	Flash Region (BIOS_FREG15)	00000000h
118h	4	BIOS Master Read Access Permissions (BIOS_BM_RAP)	000000C2h
11Ch	4	BIOS Master Write Access Permissions (BIOS_BM_WAP)	00000042h
184h	4	CSXE Flash Protected Range (BIOS_CSXE_PR0)	00000000h
188h	4	CSXE Flash Protected Range (BIOS_CSXE_PR1)	00000000h
18Ch	4	CSXE Flash Protected Range (BIOS_CSXE_PR2)	00000000h
190h	4	CSXE Flash Protected Range (BIOS_CSXE_PR3)	00000000h
194h	4	CSXE Flash Protected Range (BIOS_CSXE_PR4)	00000000h
198h	4	Write Protected Range 0 (BIOS_CSXE_WPR0)	00000000h

7.2.1 BIOS Flash Primary Region (BIOS_BFPREG) - Offset 0h

BIOS Flash Primary Region.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Shadowed BIOS Region Select (SBRS):** This bit reflects the CSXEFCTRL.BRS bit under the CSME SPI CSME root space configuration register.
30:16	0000h RO/V	**BIOS Flash Primary Region Limit (PRL):** This specifies address bits 26:12 for the Primary Region Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG1.Region Limit, or the Flash Descriptor.FLREG6.Region Limit depending on the BFPREG.SBRS bit.
15	0h RO	**Reserved**
14:0	0000h RO/V	**BIOS Flash Primary Region Base (PRB):** This specifies address bits 26:12 for the Primary Region Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG1.Region Base, or the Flash Descriptor.FLREG6.Region Base depending on the BFPREG.SBRS bit.

7.2.2 Hardware Sequencing Flash Status and Control (BIOS_HSFSTS_CTL) - Offset 4h

Several hardware sequenced operations are not supported in slave-attach flash mode.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 4h	00002000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Flash SPI SMI# Enable (FSMIE):** When set to 1, the SPI asserts an SMI# request whenever the Flash Cycle Done bit is 1.
30	0h RO	**Reserved**
29:24	00h RW	**Flash Data Byte Count (FDBC):** This field specifies the number of bytes to shift in or out during the data portion of the SPI cycle. The contents of this register are 0s based with 0b representing 1 byte and 3Fh representing 64 bytes. The number of bytes transferred is the value of this field plus 1. This field is ignored for the Block Erase command.
23:22	0h RO	**Reserved**
21	0h RW	**Write Enable Type (WET):** 0: Use 06h as the write enable instruction 1: Use 50h as the write enable instruction Note: No supported flash devices require the 50h opcode to enable a non-volatile status register write. This bit is no longer required.

Bit Range	Default & Access	Field Name (ID): Description
20:17	0h RW	**Flash Cycle (FCYCLE):** This field defines the Flash SPI cycle type generated to the FLASH when the FGO bit is set as defined below: 0h: Read (1 up to 64 bytes by setting FDBC) 1h: Reserved 2h: Write (1 up to 64 bytes by setting FDBC) 3h: 4k Block Erase 4h: 64k Sector erase 5h: Read SFDP 6h: Read JEDEC ID 7h: write status 8h: read status 9h: Reserved Ah: Reserved Bh: Reserved Ch: Reserved Dh: Reserved Eh: Reserved Fh: Reserved Flash controller hardware automatically inserts a write enable opcode prior to Write and erase operations. Hardware automatically polls for device not-busy using read status after write and erase operations. If the device does not support 64k erase size (or if it doesn't support SFDP) then only 4k is allowed. See Program Register Access section for opcode values. Note: If reserved '1' is programmed to this field, flash controller will handle it as if it is 0 (Read) (Preserves legacy behavior.) Other reserved operations, set the FCERR bit and do not issue a cycle on the SPI bus.
16	0h RW/1S/V	**Flash Cycle Go (FGO):** A write to this register with a '1' in this bit initiates a request to the Flash SPI Arbiter to start a cycle. This register is cleared by hardware when the cycle is granted by the SPI arbiter to run the cycle on the SPI bus. When the cycle is complete, the FDONE bit is set. Software is forbidden to write to any register in the HSFLCTL register between the FGO bit getting set and the FDONE bit being cleared. Any attempt to violate this rule will be ignored by hardware. Hardware allows other bits in this register to be programmed for the same transaction when writing this bit to 1. This saves an additional memory write. This bit remains set until the transaction is granted by the SPI Controller's internal arbiter.
15	0h RW/L	**Flash Configuration Lock-Down (FLOCKDN):** When set to 1, those Flash Program Registers that are locked down by this FLOCKDN bit cannot be written. Once set to 1, this bit can only be cleared by a hardware reset. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN
14	0h RO/V	**Flash Descriptor Valid (FDV):** This bit is set to a 1 if the Flash Controller read the correct Flash Descriptor Signature. If the Flash Descriptor Valid bit is not 1, software cannot use the Hardware Sequencing registers, but must use the software sequencing registers. Any attempt to use the Hardware Sequencing registers will result in the FCERR bit being set.
13	1h RO/V	**Flash Descriptor Override Pin-Strap Status (FDOPSS):** This register indicates whether the flash controller is overriding descriptor permissions due to the Pin-Strap. Note: the register value is the inversion of the level sampled on the external pinstrap. 1: No override 0: The Flash Descriptor Override strap is set

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW/L	**PRR3 PRR4 Lock-Down (PRR34_LOCKDN):** When set to 1, the BIOS PRR3 and PRR4 registers cannot be written. Once set to 1, this bit can only be cleared by a hardware reset. See also the BIOS PR3 and BIOS PR4 register descriptions. **Locked by:** BIOS_HSFSTS_CTL.PRR34_LOCKDN
11	0h RW/L	**Write Status Disable (WRSDIS):** 0: Write status operation may be issued using Hardware Sequencing. 1: Write status is not allowed as a Hardware Sequencing operation. The flash controller will block the operation and set the FCERR bit when software sets the 'go' bit. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN
10:9	0h RO	**Reserved**
8	0h RW/1C/V	**SAF Ctype error (H_SAF_CE):** Hardware sets this bit to 1 when a transaction is returned from the eSPI controller with Ctype error.
7	0h RO/V	**SAF Mode Active (H_SAF_MODE_ACTIVE):** 0: indicates flash is attached directly to the PCH via the SPI bus 1: indicates flash is attached to the EC/BMC and is accessed via tunneled eSPI commands
6	0h RW/1C/V	**SAF link Error (H_SAF_LE):** Hardware sets this bit to 1 when a transaction is returned from the eSPI channel with link error.
5	0h RO/V	**SPI Cycle In Progress (H_SCIP):** Hardware sets this bit when software sets the Flash Cycle Go (FGO) bit in the Hardware Sequencing Flash Control register. This bit remains set until the cycle completes on the SPI interface or the transaction is prevented due to any protection policy violation (descriptor, address range, protected region, etc). Hardware automatically sets and clears this bit so that software can determine when read data is valid and/or when it is safe to begin programming the next command. Software must only program the next command when this bit is 0.
4	0h RW/1C/V	**SAF Data length Error (H_SAF_DLE):** Hardware sets this bit to 1 when a transaction is returned from the eSPI channel with an incorrect data length.
3	0h RW/1C/V	**SAF Error (H_SAF_ERROR):** Hardware sets this bit to 1 when a transaction is requested that is not supported by slave-attached flash, e.g. read status.
2	0h RW/1C/V	**Access Error Log (H_AEL):** Hardware sets this bit to a 1 when an attempt was made to access the BIOS region using the direct access method or an access to the BIOS Program Registers that violated the security restrictions. This bit is simply a log of an access security violation. This bit is cleared by software writing a '1'.
1	0h RW/1C/V	**Flash Cycle Error (FCERR):** Hardware sets this bit to 1 when a program register access is blocked to the FLASH due to one of the protection policies or when any of the programmed cycle registers is written while a programmed access is already in progress. This bit remains asserted until cleared by software writing a 1 or until a partition reset occurs. Software must clear this bit before setting the FLASH Cycle GO bit in this register.
0	0h RW/1C/V	**Flash Cycle Done (FDONE):** The PCH sets this bit to 1 when the SPI Cycle completes after software previously set the FGO bit. This bit remains asserted until cleared by software writing a 1 or partition reset. Software must make sure this bit is cleared prior to enabling the SPI SMI assertion for a new programmed access.

7.2.3 Flash Address (BIOS_FADDR) - Offset 8h

Flash Address.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved**
26:0	0000000h RW	**Flash Linear Address (FLA):** The FLA is the starting byte linear address of a SPI Read or Write cycle or an address within a Block for the Block Erase command. The Flash Linear Address must fall within a region for which this master has access permissions. Hardware must convert the FLA into a Flash Physical Address (FPA) before running this cycle on the SPI bus.

7.2.4 Discrete Lock Bits (BIOS_DLOCK) - Offset Ch

Lockable BIOS registers may be locked by either the global FLOCKDN bit or by the individual DLOCK.* bit. Each lockable bit in this register is locked either by itself or by the FLOCKDN bit.

<product specific = *"SPT-LP Astep"*>

Note: Implementation of this registers required in SPT-H, but optional in SPT-LP. This register is not functional in SPT-LP A-step silicon.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	**Reserved**
16	0h RW/L	**SSEQ Lock-Down (SSEQLOCKDN):** BIOS Software Sequencing registers are locked when the logical OR of this bit and FLOCKDN is true. The affected registers are SSFSTS_CTL.SCF, PREOP_OPTYPE, OPMENU0, and OPMENU1.Once set to 1 this register is only cleared by host partition reset. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.SSEQLOCKDN
15:13	0h RO	**Reserved**
12	0h RW/L	**PR4 Lock-Down (PR4LOCKDN):** BIOS PR4 register is locked when the logical OR of this bit and FLOCKDN is true. Once set to 1 this register is only cleared by BIOS partition reset. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.PR4LOCKDN

Bit Range	Default & Access	Field Name (ID): Description
11	0h RW/L	**PR3 Lock-Down (PR3LOCKDN):** BIOS PR3 register is locked when the logical OR of this bit and FLOCKDN is true. Once set to 1 this register is only cleared by BIOS partition reset. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.PR3LOCKDN
10	0h RW/L	**PR2 Lock-Down (PR2LOCKDN):** BIOS PR2 register is locked when the logical OR of this bit and FLOCKDN is true. Once set to 1 this register is only cleared by BIOS partition reset. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.PR2LOCKDN
9	0h RW/L	**PR1 Lock-Down (PR1LOCKDN):** BIOS PR1 register is locked when the logical OR of this bit and FLOCKDN is true. Once set to 1 this register is only cleared by BIOS partition reset. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.PR1LOCKDN
8	0h RW/L	**PR0 Lock-Down (PR0LOCKDN):** BIOS PR0 register is locked when the logical OR of this bit and FLOCKDN is true. Once set to 1 this register is only cleared by BIOS partition reset. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.PR0LOCKDN
7:4	0h RO	**Reserved**
3	0h RW/L	**SBMRAG Lock-Down (SBMRAGLOCKDN):** BIOS SFRACC.BMRAG register bits are locked when the logical OR of this bit and FLOCKDN is true. Once set to 1 this register is only cleared by host partition reset. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.SBMRAGLOCKDN
2	0h RW/L	**SBMWAG Lock-Down (SBMWAGLOCKDN):** BIOS SFRACC.BMWAG register bits are locked when the logical OR of this bit and FLOCKDN is true. Once set to 1 this register is only cleared by host partition reset. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.SBMWAGLOCKDN
1	0h RW/L	**BMRAG Lock-Down (BMRAGLOCKDN):** BIOS FRACC.BMRAG register bits are locked when the logical OR of this bit and FLOCKDN is true. Once set to 1 this register is only cleared by host partition reset. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.BMRAGLOCKDN
0	0h RW/L	**BMWAG Lock-Down (BMWAGLOCKDN):** BIOS FRACC.BMWAG register bits are locked when the logical OR of this bit and FLOCKDN is true. Once set to 1 this register is only cleared by host partition reset. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.BMWAGLOCKDN

7.2.5 Flash Data (BIOS_FDATA0) - Offset 10h

Flash Data.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Flash Data (FD):** This field is shifted out as the SPI Data on the Master-Out Slave-In Data pin during the data portion of the SPI cycle. This register also shifts in the data from the Master-In Slave-Out pin into this register during the data portion of the SPI cycle. The data is always shifted starting with the least significant byte, msb to lsb, followed by the next least significant byte, msb to lsb, etc. Specifically, the shift order on SPI in terms of bits within this register is: 7-6-5-4-3-2-1-0-15-14-13- ... 8-23-22- ... 16-31 ... 24. Bit 24 is the last bit shifted out/in. There are no alignment assumptions; byte 0 always represents the value specified by the cycle address. The registers are shifted in order, starting from register 0. Note that the data in this register may be modified by the hardware during any programmed SPI transaction. Direct Memory Reads do not modify the contents of this register.

7.2.6 Flash Data (BIOS_FDATA1) - Offset 14h

Flash Data.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Flash Data (FD):** This field is shifted out as the SPI Data on the Master-Out Slave-In Data pin during the data portion of the SPI cycle. This register also shifts in the data from the Master-In Slave-Out pin into this register during the data portion of the SPI cycle. The data is always shifted starting with the least significant byte, msb to lsb, followed by the next least significant byte, msb to lsb, etc. Specifically, the shift order on SPI in terms of bits within this register is: 7-6-5-4-3-2-1-0-15-14-13- ... 8-23-22- ... 16-31 ... 24. Bit 24 is the last bit shifted out/in. There are no alignment assumptions; byte 0 always represents the value specified by the cycle address. The registers are shifted in order, starting from register 0. Note that the data in this register may be modified by the hardware during any programmed SPI transaction. Direct Memory Reads do not modify the contents of this register.

7.2.7 Flash Data (BIOS_FDATA2) - Offset 18h

Flash Data.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Flash Data (FD):** This field is shifted out as the SPI Data on the Master-Out Slave-In Data pin during the data portion of the SPI cycle. This register also shifts in the data from the Master-In Slave-Out pin into this register during the data portion of the SPI cycle. The data is always shifted starting with the least significant byte, msb to lsb, followed by the next least significant byte, msb to lsb, etc. Specifically, the shift order on SPI in terms of bits within this register is: 7-6-5-4-3-2-1-0-15-14-13- ... 8-23-22- ... 16-31 ... 24. Bit 24 is the last bit shifted out/in. There are no alignment assumptions; byte 0 always represents the value specified by the cycle address. The registers are shifted in order, starting from register 0. Note that the data in this register may be modified by the hardware during any programmed SPI transaction. Direct Memory Reads do not modify the contents of this register.

7.2.8 Flash Data (BIOS_FDATA3) - Offset 1Ch

Flash Data.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Flash Data (FD):** This field is shifted out as the SPI Data on the Master-Out Slave-In Data pin during the data portion of the SPI cycle. This register also shifts in the data from the Master-In Slave-Out pin into this register during the data portion of the SPI cycle. The data is always shifted starting with the least significant byte, msb to lsb, followed by the next least significant byte, msb to lsb, etc. Specifically, the shift order on SPI in terms of bits within this register is: 7-6-5-4-3-2-1-0-15-14-13- ... 8-23-22- ... 16-31 ... 24. Bit 24 is the last bit shifted out/in. There are no alignment assumptions; byte 0 always represents the value specified by the cycle address. The registers are shifted in order, starting from register 0. Note that the data in this register may be modified by the hardware during any programmed SPI transaction. Direct Memory Reads do not modify the contents of this register.

7.2.9 Flash Data (BIOS_FDATA4) - Offset 20h

Flash Data.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 20h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Flash Data (FD):** This field is shifted out as the SPI Data on the Master-Out Slave-In Data pin during the data portion of the SPI cycle. This register also shifts in the data from the Master-In Slave-Out pin into this register during the data portion of the SPI cycle. The data is always shifted starting with the least significant byte, msb to lsb, followed by the next least significant byte, msb to lsb, etc. Specifically, the shift order on SPI in terms of bits within this register is: 7-6-5-4-3-2-1-0-15-14-13- ... 8-23-22- ... 16-31 ... 24. Bit 24 is the last bit shifted out/in. There are no alignment assumptions; byte 0 always represents the value specified by the cycle address. The registers are shifted in order, starting from register 0. Note that the data in this register may be modified by the hardware during any programmed SPI transaction. Direct Memory Reads do not modify the contents of this register.

7.2.10 Flash Data (BIOS_FDATA5) - Offset 24h

Flash Data.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 24h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Flash Data (FD):** This field is shifted out as the SPI Data on the Master-Out Slave-In Data pin during the data portion of the SPI cycle. This register also shifts in the data from the Master-In Slave-Out pin into this register during the data portion of the SPI cycle. The data is always shifted starting with the least significant byte, msb to lsb, followed by the next least significant byte, msb to lsb, etc. Specifically, the shift order on SPI in terms of bits within this register is: 7-6-5-4-3-2-1-0-15-14-13- ... 8-23-22- ... 16-31 ... 24. Bit 24 is the last bit shifted out/in. There are no alignment assumptions; byte 0 always represents the value specified by the cycle address. The registers are shifted in order, starting from register 0. Note that the data in this register may be modified by the hardware during any programmed SPI transaction. Direct Memory Reads do not modify the contents of this register.

7.2.11 Flash Data (BIOS_FDATA6) - Offset 28h

Flash Data.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 28h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Flash Data (FD):** This field is shifted out as the SPI Data on the Master-Out Slave-In Data pin during the data portion of the SPI cycle. This register also shifts in the data from the Master-In Slave-Out pin into this register during the data portion of the SPI cycle. The data is always shifted starting with the least significant byte, msb to lsb, followed by the next least significant byte, msb to lsb, etc. Specifically, the shift order on SPI in terms of bits within this register is: 7-6-5-4-3-2-1-0-15-14-13- ... 8-23-22- ... 16-31 ... 24. Bit 24 is the last bit shifted out/in. There are no alignment assumptions; byte 0 always represents the value specified by the cycle address. The registers are shifted in order, starting from register 0. Note that the data in this register may be modified by the hardware during any programmed SPI transaction. Direct Memory Reads do not modify the contents of this register.

7.2.12 Flash Data (BIOS_FDATA7) - Offset 2Ch

Flash Data.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Flash Data (FD):** This field is shifted out as the SPI Data on the Master-Out Slave-In Data pin during the data portion of the SPI cycle. This register also shifts in the data from the Master-In Slave-Out pin into this register during the data portion of the SPI cycle. The data is always shifted starting with the least significant byte, msb to lsb, followed by the next least significant byte, msb to lsb, etc. Specifically, the shift order on SPI in terms of bits within this register is: 7-6-5-4-3-2-1-0-15-14-13- ... 8-23-22- ... 16-31 ... 24. Bit 24 is the last bit shifted out/in. There are no alignment assumptions; byte 0 always represents the value specified by the cycle address. The registers are shifted in order, starting from register 0. Note that the data in this register may be modified by the hardware during any programmed SPI transaction. Direct Memory Reads do not modify the contents of this register.

7.2.13 Flash Data (BIOS_FDATA8) - Offset 30h

Flash Data.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Flash Data (FD):** This field is shifted out as the SPI Data on the Master-Out Slave-In Data pin during the data portion of the SPI cycle. This register also shifts in the data from the Master-In Slave-Out pin into this register during the data portion of the SPI cycle. The data is always shifted starting with the least significant byte, msb to lsb, followed by the next least significant byte, msb to lsb, etc. Specifically, the shift order on SPI in terms of bits within this register is: 7-6-5-4-3-2-1-0-15-14-13- ... 8-23-22- ... 16-31 ... 24. Bit 24 is the last bit shifted out/in. There are no alignment assumptions; byte 0 always represents the value specified by the cycle address. The registers are shifted in order, starting from register 0. Note that the data in this register may be modified by the hardware during any programmed SPI transaction. Direct Memory Reads do not modify the contents of this register.

7.2.14 Flash Data (BIOS_FDATA9) - Offset 34h

Flash Data.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 34h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Flash Data (FD):** This field is shifted out as the SPI Data on the Master-Out Slave-In Data pin during the data portion of the SPI cycle. This register also shifts in the data from the Master-In Slave-Out pin into this register during the data portion of the SPI cycle. The data is always shifted starting with the least significant byte, msb to lsb, followed by the next least significant byte, msb to lsb, etc. Specifically, the shift order on SPI in terms of bits within this register is: 7-6-5-4-3-2-1-0-15-14-13- ... 8-23-22- ... 16-31 ... 24. Bit 24 is the last bit shifted out/in. There are no alignment assumptions; byte 0 always represents the value specified by the cycle address. The registers are shifted in order, starting from register 0. Note that the data in this register may be modified by the hardware during any programmed SPI transaction. Direct Memory Reads do not modify the contents of this register.

7.2.15 Flash Data (BIOS_FDATA10) - Offset 38h

Flash Data.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 38h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Flash Data (FD):** This field is shifted out as the SPI Data on the Master-Out Slave-In Data pin during the data portion of the SPI cycle. This register also shifts in the data from the Master-In Slave-Out pin into this register during the data portion of the SPI cycle. The data is always shifted starting with the least significant byte, msb to lsb, followed by the next least significant byte, msb to lsb, etc. Specifically, the shift order on SPI in terms of bits within this register is: 7-6-5-4-3-2-1-0-15-14-13- ... 8-23-22- ... 16-31 ... 24. Bit 24 is the last bit shifted out/in. There are no alignment assumptions; byte 0 always represents the value specified by the cycle address. The registers are shifted in order, starting from register 0. Note that the data in this register may be modified by the hardware during any programmed SPI transaction. Direct Memory Reads do not modify the contents of this register.

7.2.16 Flash Data (BIOS_FDATA11) - Offset 3Ch

Flash Data.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 3Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Flash Data (FD):** This field is shifted out as the SPI Data on the Master-Out Slave-In Data pin during the data portion of the SPI cycle. This register also shifts in the data from the Master-In Slave-Out pin into this register during the data portion of the SPI cycle. The data is always shifted starting with the least significant byte, msb to lsb, followed by the next least significant byte, msb to lsb, etc. Specifically, the shift order on SPI in terms of bits within this register is: 7-6-5-4-3-2-1-0-15-14-13- ... 8-23-22- ... 16-31 ... 24. Bits 24 is the last bit shifted out/in. There are no alignment assumptions; byte 0 always represents the value specified by the cycle address. The registers are shifted in order, starting from register 0. Note that the data in this register may be modified by the hardware during any programmed SPI transaction. Direct Memory Reads do not modify the contents of this register.

7.2.17 Flash Data (BIOS_FDATA12) - Offset 40h

Flash Data.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 40h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Flash Data (FD):** This field is shifted out as the SPI Data on the Master-Out Slave-In Data pin during the data portion of the SPI cycle. This register also shifts in the data from the Master-In Slave-Out pin into this register during the data portion of the SPI cycle. The data is always shifted starting with the least significant byte, msb to lsb, followed by the next least significant byte, msb to lsb, etc. Specifically, the shift order on SPI in terms of bits within this register is: 7-6-5-4-3-2-1-0-15-14-13- ... 8-23-22- ... 16-31 ... 24. Bit 24 is the last bit shifted out/in. There are no alignment assumptions; byte 0 always represents the value specified by the cycle address. The registers are shifted in order, starting from register 0. Note that the data in this register may be modified by the hardware during any programmed SPI transaction. Direct Memory Reads do not modify the contents of this register.

7.2.18 Flash Data (BIOS_FDATA13) - Offset 44h

Flash Data.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 44h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Flash Data (FD):** This field is shifted out as the SPI Data on the Master-Out Slave-In Data pin during the data portion of the SPI cycle. This register also shifts in the data from the Master-In Slave-Out pin into this register during the data portion of the SPI cycle. The data is always shifted starting with the least significant byte, msb to lsb, followed by the next least significant byte, msb to lsb, etc. Specifically, the shift order on SPI in terms of bits within this register is: 7-6-5-4-3-2-1-0-15-14-13- ... 8-23-22- ... 16-31 ... 24. Bits 24 is the last bit shifted out/in. There are no alignment assumptions; byte 0 always represents the value specified by the cycle address. The registers are shifted in order, starting from register 0. Note that the data in this register may be modified by the hardware during any programmed SPI transaction. Direct Memory Reads do not modify the contents of this register.

7.2.19 Flash Data (BIOS_FDATA14) - Offset 48h

Flash Data.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 48h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Flash Data (FD):** This field is shifted out as the SPI Data on the Master-Out Slave-In Data pin during the data portion of the SPI cycle. This register also shifts in the data from the Master-In Slave-Out pin into this register during the data portion of the SPI cycle. The data is always shifted starting with the least significant byte, msb to lsb, followed by the next least significant byte, msb to lsb, etc. Specifically, the shift order on SPI in terms of bits within this register is: 7-6-5-4-3-2-1-0-15-14-13- ... 8-23-22- ... 16-31 ... 24. Bits 24 is the last bit shifted out/in. There are no alignment assumptions; byte 0 always represents the value specified by the cycle address. The registers are shifted in order, starting from register 0. Note that the data in this register may be modified by the hardware during any programmed SPI transaction. Direct Memory Reads do not modify the contents of this register.

7.2.20 Flash Data (BIOS_FDATA15) - Offset 4Ch

Flash Data.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 4Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Flash Data (FD):** This field is shifted out as the SPI Data on the Master-Out Slave-In Data pin during the data portion of the SPI cycle. This register also shifts in the data from the Master-In Slave-Out pin into this register during the data portion of the SPI cycle. The data is always shifted starting with the least significant byte, msb to lsb, followed by the next least significant byte, msb to lsb, etc. Specifically, the shift order on SPI in terms of bits within this register is: 7-6-5-4-3-2-1-0-15-14-13- ... 8-23-22- ... 16-31 ... 24. Bits 24 is the last bit shifted out/in. There are no alignment assumptions; byte 0 always represents the value specified by the cycle address. The registers are shifted in order, starting from register 0. Note that the data in this register may be modified by the hardware during any programmed SPI transaction. Direct Memory Reads do not modify the contents of this register.

7.2.21 Flash Region Access Permissions (BIOS_FRACC) - Offset 50h

Flash Region Access Permissions.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 50h	000042C2h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RW/L	**BIOS Master Write Access Grant (BMWAG):** Each bit [31:24] corresponds to Master[7:0]. BIOS can grant one or more masters write access to the BIOS region 1 overriding the permissions in the Flash Descriptor. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.BMWAGLOCKDN
23:16	00h RW/L	**BIOS Master Read Access Grant (BMRAG):** Each bit [23:16] corresponds to Master[7:0]. BIOS can grant one or more masters read access to the BIOS region 1 overriding the read permissions in the Flash Descriptor. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.BMRAGLOCKDN
15:8	42h RO/V	**BIOS Region Write Access (BRWA):** Each bit [15:8] corresponds to Regions [7:0]. If the bit is set, this master can erase and write that particular region through register accesses. The contents of this register are that of the Flash Descriptor.Flash Master 1.Master Region Write Access OR a particular master has granted BIOS write permissions in their Master Write Access Grant register OR the Flash Descriptor Security Override strap is set.
7:0	C2h RO/V	**BIOS Region Read Access (BRRA):** Each bit [7:0] corresponds to Regions [7:0]. If the bit is set, this master can read that particular region through register accesses. The contents of this register are that of the Flash Descriptor.Flash Master 1.Master Region Read Access OR a particular master has granted BIOS read permissions in their Master Read Access Grant register OR the Flash Descriptor Security Override strap is set.

7.2.22 Flash Region (BIOS_FREG0) - Offset 54h

Flash Region.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 54h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:16	0000h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREGX.Region Limit.
15	0h RO	**Reserved**
14:0	0000h RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREGX.Region Base.

7.2.23 Flash Region (BIOS_FREG1) - Offset 58h

Flash Region.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 58h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:16	0000h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREGX.Region Limit.
15	0h RO	**Reserved**
14:0	0000h RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREGX.Region Base.

7.2.24 Flash Region (BIOS_FREG2) - Offset 5Ch

Flash Region.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 5Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:16	0000h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREGX.Region Limit.
15	0h RO	**Reserved**
14:0	0000h RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREGX.Region Base.

7.2.25 Flash Region (BIOS_FREG3) - Offset 60h

Flash Region.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 60h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:16	0000h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREGX.Region Limit.
15	0h RO	**Reserved**
14:0	0000h RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREGX.Region Base.

7.2.26 Flash Region (BIOS_FREG4) - Offset 64h

Flash Region.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 64h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:16	0000h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREGX.Region Limit.
15	0h RO	**Reserved**
14:0	0000h RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREGX.Region Base.

7.2.27 Flash Region (BIOS_FREG5) - Offset 68h

Flash Region.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 68h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:16	0000h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREGX.Region Limit.
15	0h RO	**Reserved**
14:0	0000h RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREGX.Region Base.

7.2.28 Flash Region (BIOS_FREG6) - Offset 6Ch

Flash Region.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 6Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:16	0000h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREGX.Region Limit.
15	0h RO	**Reserved**
14:0	0000h RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREGX.Region Base.

7.2.29 Flash Region (BIOS_FREG7) - Offset 70h

Flash Region.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 70h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:16	0000h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREGX.Region Limit.
15	0h RO	**Reserved**
14:0	0000h RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREGX.Region Base.

7.2.30 Flash Region (BIOS_FREG8) - Offset 74h

Flash Region.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 74h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:16	0000h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREGX.Region Limit.
15	0h RO	**Reserved**
14:0	0000h RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREGX.Region Base.

7.2.31 Flash Region (BIOS_FREG9) - Offset 78h

Flash Region.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 78h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:16	0000h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREGX.Region Limit.
15	0h RO	**Reserved**
14:0	0000h RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREGX.Region Base.

7.2.32 Flash Region (BIOS_FREG10) - Offset 7Ch

Flash Region.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 7Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:16	0000h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREGX.Region Limit.
15	0h RO	**Reserved**
14:0	0000h RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREGX.Region Base.

7.2.33 Flash Region (BIOS_FREG11) - Offset 80h

Flash Region.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 80h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:16	0000h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREGX.Region Limit.
15	0h RO	**Reserved**
14:0	0000h RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREGX.Region Base.

7.2.34 Flash Protected Range (BIOS_FPR0) - Offset 84h

This register cannot be written when the FLOCKDN bit is set to 1.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 84h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.PR0LOCKDN
30:16	0000h RW/L	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.PR0LOCKDN
15	0h RW/L	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that reads directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.PR0LOCKDN
14:0	0000h RW/L	**Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.PR0LOCKDN

7.2.35 Flash Protected Range (BIOS_FPR1) - Offset 88h

This register cannot be written when the FLOCKDN bit is set to 1.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 88h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.PR1LOCKDN
30:16	0000h RW/L	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.PR1LOCKDN
15	0h RW/L	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that reads directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.PR1LOCKDN
14:0	0000h RW/L	**Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.PR1LOCKDN

7.2.36 Flash Protected Range (BIOS_FPR2) - Offset 8Ch

This register cannot be written when the FLOCKDN bit is set to 1.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 8Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.PR2LOCKDN
30:16	0000h RW/L	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.PR2LOCKDN
15	0h RW/L	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that reads directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.PR2LOCKDN
14:0	0000h RW/L	**Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.PR2LOCKDN

7.2.37 Flash Protected Range (BIOS_FPR3) - Offset 90h

This register cannot be written when the FLOCKDN bit is set to 1.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 90h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.PR3LOCKDN

Bit Range	Default & Access	Field Name (ID): Description
30:16	0000h RW/L	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.PR3LOCKDN
15	0h RW/L	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that reads directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.PR3LOCKDN
14:0	0000h RW/L	**Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.PR3LOCKDN

7.2.38 Flash Protected Range (BIOS_FPR4) - Offset 94h

This register cannot be written when the FLOCKDN bit is set to 1.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 94h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.PR4LOCKDN
30:16	0000h RW/L	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.PR4LOCKDN
15	0h RW/L	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that reads directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.PR4LOCKDN
14:0	0000h RW/L	**Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.PR4LOCKDN

7.2.39 Global Protected Range 0 (BIOS_GPR0) - Offset 98h

This register is initialized via softstraps. This protected range applies globally to all masters / flash requesters. If SPT users do not want a register that applies across all masters then the enable bits must be set false. Since this register is a descriptor-based protection, it is disabled (both enable bits are treated as false) when the Flash Descriptor Security Override pinstrap is asserted.

Note: Since this register is a RO view of the softstraps the underlying values are only reset when softstraps are reset.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0000h RO/V	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range. Note: If either Write or Read protection is enabled, then Limit must be configured greater than or equal to Base.
15	0h RO/V	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that reads directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0000h RO/V	**Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range. Note: If either Write or Read protection is enabled, then Limit must be configured greater than or equal to Base.

7.2.40 Software Sequencing Flash Status and Control (BIOS_SSFSTS_CTL) - Offset A0h

The Software Sequencing control and status registers are intended to be used only as a back-up mode to the hardware sequencing control and status registers.**When HSSEN = 0 the SCGO bit must become read-only.** It is an implementation decision whether to make all register bits RO when HSSEN=0. Software sequencing is not supported in slave-attach flash mode.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + A0h	06000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved**
26:24	6h RW/L	**SPI Cycle Frequency (SCF):** 000: source clock is not divided 001: divide source clock by 2 010: divide source clock by 2.5 (not recommended) 011: divide source clock by 3 100: divide source clock by 4 101: divide source clock by 5 110: divide source clock by 7 All others: Reserved This register sets frequency to use for all SPI Software Sequencing cycles (write, erase, fast read, read status, etc) except for the Read cycle which always runs at divide by 7. This register is locked when the SPI Configuration Lock-Down (FLOCKDN) bit is set. Note: Fast Reset Testmode overrides the value programmed into this register. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.SSEQLOCKDN
23	0h RW	**SPI SMI Enable (SME):** When set to 1, the SPI sends an assert SMI when the Cycle Done Status bit changes to a 1.
22	0h RW	**Data Cycle (DS):** When set to 1, there is data that corresponds to this transaction. When 0, no data is delivered for this cycle, and the DBC and data fields themselves are do not care.
21:16	00h RW	**Data Byte Count (DBC):** This field specifies the number of bytes to shift in or out during the data portion of the SPI cycle. The valid settings (in decimal) are any value from 0 to 63. The number of bytes transferred is the value of this field plus 1. Note that when this field is 00_0000b, then there is 1 byte to transfer and that 11_1111b means there are 64 bytes to transfer.
15	0h RO	**Reserved**
14:12	0h RW	**Cycle Opcode Pointer (COP):** This field selects one of the programmed opcodes in the Opcode Menu to be used as the SPI Command/Opcode. In the case of an Atomic Cycle Sequence, this determines the second command.
11	0h RW	**Sequence Prefix Opcode Pointer (SPOP):** This field selects one of the two programmed prefix opcodes for use when performing an Atomic Cycle Sequence. A value of 0 points to the opcode in the least significant byte of the Prefix Opcodes register. By making this programmable, the PCH supports flash devices that have different opcodes for enabling writes to the data space vs. status register.
10	0h RW	**Atomic Cycle Sequence (ACS):** When set to 1 along with the SCGO assertion, the PCH will execute a sequence of commands on the SPI interface without allowing another master to arbitrate and interleave cycles. The sequence is composed of: - Atomic Sequence Prefix Command (8-bit opcode only) - Primary Command specified below by software (can include address and data) - Polling the Flash Status Register (opcode 05h) until bit 0 becomes 0b. The SPI Cycle in Progress bit remains set and the Cycle Done Status bit remains unset until the Busy bit in the Flash Status Register returns 0.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW/1S/V	**SPI Cycle Go (SCGO):** This bit always returns 0 on reads. A write to this register with a '1' in this bit starts the SPI cycle defined by the other bits of this register. The SPI Cycle in Progress (SCIP) bit gets set by this action. Hardware must ignore writes to this bit while the Cycle In Progress bit is set. Hardware allows other bits in this register to be programmed for the same transaction when writing this bit to 1. This saves an additional memory write. This bit remains set until the transaction is granted by the SPI Controller's internal arbiter.
8	0h RO	**Reserved**
7	0h RO/V	**Fast Read Supported (FAST_READ_SUPPORT):** This bit reflects the value of the Fast Read Support bit in the Flash Descriptor Component Section.
6	0h RO/V	**Dual Output Fast Read Supported (DUAL_FAST_READ_SUPPORT):** This bit reflects the value of the Dual Output Fast Read Support bit in the Flash Descriptor Component Section.
5	0h RW/1C/V	**SAF Error (S_SAF_ERROR):** Hardware sets this bit to 1 when a transaction is targeted to slave-attached flash regardless of the opcode.
4	0h RO/V	**Access Error Log (AEL):** This bit reflects the value of the Hardware Sequencing Status.AEL register.
3	0h RW/1C/V	**Flash Cycle Error (FCERR):** Hardware sets this bit to 1 when a programmed access is blocked from running on the SPI interface due to one of the protection policies or when any of the programmed cycle registers is written while a programmed access is already in progress. This bit remains asserted until cleared by software writing a 1 or partition reset.
2	0h RW/1C/V	**Cycle Done Status (CYCLE_DONE_STS):** The PCH sets this bit to 1 when the SPI Cycle completes (i.e., SCIP bit is 0) after software sets the GO bit. This bit remains asserted until cleared by software writing a 1 or hardware reset. When this bit is set and the SPI SMI# Enable bit is set, an internal signal is asserted to the SMI# generation block. Software must make sure this bit is cleared prior to enabling the SPI SMI# assertion for a new programmed access.
1	0h RO	**Reserved**
0	0h RO/V	**SPI Cycle In Progress (SCIP):** Hardware sets this bit when software sets the SPI Cycle Go bit in the Command register. This bit remains set until the cycle completes on the SPI interface or the transaction is prevented due to any protection policy violation (descriptor, address range, protected region, etc). Hardware automatically sets and clears this bit so that software can determine when read data is valid and/or when it is safe to begin programming the next command. Software must only program the next command when this bit is 0.

7.2.41 Prefix Opcode and Opcode Type Configuration (BIOS_PREOP_OPTYPE) - Offset A4h

This register is not writable when the Flash Configuration Lock-Down (FLOCKDN) bit is set. Entries in this register correspond to the entries in the Opcode Menu Configuration register. Note that the definition below only provides write protection for opcodes that have addresses associated with them. Therefore, any erase or write opcodes that do not use an address should be avoided (for example, 'Chip Erase' and 'Auto-Address Increment Byte Program').

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + A4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW/L	**Opcode Type 7 (OPCODE_TYPE7):** See the description for OPCODE_TYPE0. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.SSEQLOCKDN
29:28	0h RW/L	**Opcode Type 6 (OPCODE_TYPE6):** See the description for OPCODE_TYPE0. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.SSEQLOCKDN
27:26	0h RW/L	**Opcode Type 5 (OPCODE_TYPE5):** See the description for OPCODE_TYPE0. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.SSEQLOCKDN
25:24	0h RW/L	**Opcode Type 4 (OPCODE_TYPE4):** See the description for OPCODE_TYPE0. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.SSEQLOCKDN
23:22	0h RW/L	**Opcode Type 3 (OPCODE_TYPE3):** See the description for OPCODE_TYPE0. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.SSEQLOCKDN
21:20	0h RW/L	**Opcode Type 2 (OPCODE_TYPE2):** See the description for OPCODE_TYPE0. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.SSEQLOCKDN
19:18	0h RW/L	**Opcode Type 1 (OPCODE_TYPE1):** See the description for OPCODE_TYPE0. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.SSEQLOCKDN
17:16	0h RW/L	**Opcode Type 0 (OPCODE_TYPE0):** This field specifies information about the corresponding Opcode 0. This information allows the hardware to 1) know whether to use the address field and 2) provide BIOS and Shared Flash protection capabilities. The hardware implementation also uses the read vs. write information for modifying the behavior of the SPI interface logic. The encoding of the two bits is: 00: No Address associated with this Opcode and Read Cycle type 01: No Address associated with this Opcode and Write Cycle type 10: Address required; Read cycle type 11: Address required; Write cycle type **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.SSEQLOCKDN
15:8	00h RW/L	**Prefix Opcode 1 (PREFIX_OPCODE1):** Software programs an SPI opcode into this field that is permitted to run as the first command in an atomic cycle sequence. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.SSEQLOCKDN
7:0	00h RW/L	**Prefix Opcode 0 (PREFIX_OPCODE0):** Software programs an SPI opcode into this field that is permitted to run as the first command in an atomic cycle sequence. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.SSEQLOCKDN

7.2.42 Opcode Menu0 Configuration (BIOS_OPMENU0) - Offset A8h

This register is not writable when the SPI Configuration Lock-Down bit (FLOCKDN) is set.

Eight entries are available in this register to give a sufficient set of commands for communicating with the flash device, while also restricting what malicious software can do. This keeps the hardware flexible enough to operate with a wide variety of SPI devices.

It is recommended to avoid programming Write Enable opcodes in this menu. Malicious software could then perform writes and erases to the SPI flash without using the atomic cycle mechanism. This could cause functional failures in a shared flash environment. Write Enable opcodes should only be programmed in the Prefix Opcodes.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + A8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RW/L	**Allowable Opcode 3 (OPCODE3):** See the description for OPCODE0. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.SSEQLOCKDN
23:16	00h RW/L	**Allowable Opcode 2 (OPCODE2):** See the description for OPCODE0. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.SSEQLOCKDN
15:8	00h RW/L	**Allowable Opcode 1 (OPCODE1):** See the description for OPCODE0. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.SSEQLOCKDN
7:0	00h RW/L	**Allowable Opcode 0 (OPCODE0):** Software programs an SPI opcode into this field for use when initiating SPI commands through the Control Register. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.SSEQLOCKDN

7.2.43 Opcode Menu1 Configuration (BIOS_OPMENU1) - Offset ACh

See description for the 'OPMENU0 -- Opcode Menu0 Configuration'.

7.2.44 Secondary Flash Region Access Permissions (BIOS_SFRACC) - Offset B0h

Secondary Flash Region Access Permissions

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RW/L	**Secondary BIOS Master Write Access Grant (SECONDARYBIOS_MWAG):** Each bit [31:29] corresponds to Master[7:0]. BIOS can grant one or more masters write access to the Secondary BIOS region 6 overriding the permissions in the Flash Descriptor. Bits for unassigned masters are reserved. The contents of this register are locked by the FLOCKDN bit. See section 'DLOCK -- Discrete Lock Bits' or a description of how this register is locked. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.SBMWAGLOCKDN
23:16	00h RW/L	**Secondary BIOS Master Read Access Grant (SECONDARYBIOS_MRAG):** Each bit [28:16] corresponds to Master[7:0]. BIOS can grant one or more masters read access to the Secondary BIOS region 6 overriding the read permissions in the Flash Descriptor. Bits for unassigned masters are reserved. The contents of this register are locked by the FLOCKDN bit. See section 'DLOCK -- Discrete Lock Bits' or a description of how this register is locked. **Locked by:** BIOS_HSFSTS_CTL.FLOCKDN, BIOS_DLOCK.SBMRAGLOCKDN
15:0	0h RO	**Reserved**

7.2.45 Flash Descriptor Observability Control (BIOS_FDOC) - Offset B4h

This is a test mode only register that can be used to observe the contents of the Flash Descriptor that is stored internally in the PCH Flash Controller. The CPU Complex soft straps are not observable in PCH as these are forwarded to the CPU Complex and not stored.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + B4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	**Reserved**
14:12	0h RW	**Flash Descriptor Section Select (FDSS):** Selects which section within the loaded Flash Descriptor to observe. 000: Flash Signature and Descriptor Map 001: Component 010: Region 011: Master 100: PCH Soft Straps Other: Reserved
11:2	000h RW	**Flash Descriptor Section Index (FDSI):** Selects the DW offset within the Flash Descriptor Section to observe.
1:0	0h RO	**Reserved**

7.2.46 Flash Descriptor Observability Data (BIOS_FDOD) - Offset B8h

Flash Descriptor Observability Data.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + B8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Flash Descriptor Section Data (FDSD):** Returns the DW of data to observe as selected in the Flash Descriptor Observability Control.

7.2.47 Additional Flash Control (BIOS_AFC) - Offset C0h

Additional Flash Control.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW/V/P	**Stop Prefetch on Flush Pending (SPFP):** When set to '1', the progress of a pre-fetch will be ended if subsequence access from the master of the same Root Space is detected to be a cache-miss and read cache will be flushed. When set to '0', the prefetch will be allowed to complete prior to flushing. This register is only reset on an Early boot reset of both the Host and the CSME partitions. Hardware loads this bit from the PCH soft strap SPI_SPFP when the strap completion is received from the strap pull message.

7.2.48 Vendor Specific Component Capabilities for Component 0 (BIOS_SFDP0_VSCC0) - Offset C4h

Support for non-SFDP capable flash devices is deprecated.

Hardware uses the data it loads from the flash device's SFDP tables. Hardware copies some SFDP data to the SFDP_VSCCn registers for the convenience of BIOS/FW, but does not directly use the data in those registers.

Hardware locks the SFDP_VSCCn registers after copying SFDP data into them and setting the CPPTV bit.

Firmware requirements:

The QER bits are not used by the hardware. The QER bits are used by software/ firmware to ensure the QE bit is not changed while doing status register write.

The QER field in SFDP_VSCC is only valid if the flash device contains a rev 1.5 or higher SFDP table. Firmware must use PTINX/PTDATA to read the Parameter Table Header to determine the SFDP revision.

If the SFDP revision is < 1.5 then firmware must use some other means to determine QER, e.g. the Flash Upper Map VSCC tables.

The fields in this register pertain to cycles targeting addresses within Component 0. The lockable bits in this register are locked when either CPPTV is set to '1' by hardware or when VCL is '1'.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + C4h	00002000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Component Property Parameter Table Valid (CPPTV):** This bit is set to a 1 if the Flash Controller detects a valid SFDP Component Property Parameter Table in Component 0. Note: If this bit is set software must not overwrite bits that were initialized by hardware via SFDP discovery.
30	0h RW/L	**Vendor Component Lock (VCL):** 0: The lock bit is not set. 1: The Vendor Component Lock bit is set. This register locks itself when set. **Locked by:** BIOS_SFDP0_VSCC0.VCL
29	0h RW/V/L	**64k Erase Valid (EO_64K_VALID):** 0: The EO_64k opcode is not valid. 1: The EO_64k opcode is valid. **Locked by:** BIOS_SFDP0_VSCC0.VCL
28	0h RW/V/L	**4k Erase Valid (EO_4K_VALID):** 0: The EO_4k opcode is not valid. 1: The EO_4k opcode is valid. **Locked by:** BIOS_SFDP0_VSCC0.VCL
27	0h RW/L	**RPMC Supported (RPMC_SUPPORTED):** 0: The device does not support RPMC. 1: The device supports RPMC. **Locked by:** BIOS_SFDP0_VSCC0.VCL
26	0h RW/V/L	**Deep Powerdown Supported (DEEP_PWRDN_SUPPORTED):** 0: The device does not support Deep Powerdown. 1: The device supports Deep Powerdown. **Locked by:** BIOS_SFDP0_VSCC0.VCL
25	0h RW/V/L	**Suspend/Resume Supported (SUSPEND_RESUME_SUPPORTED):** 1: The device does not support Suspend/Resume. 0: The device supports Suspend/Resume. **Locked by:** BIOS_SFDP0_VSCC0.VCL
24	0h RW/V/L	**Soft Reset Supported (SOFT_RST_SUPPORTED):** 0: The device does not support Soft Reset. 1: The device supports Soft Reset. **Locked by:** BIOS_SFDP0_VSCC0.VCL
23:16	00h RW/V/L	**64k Erase Opcode (EO_64K):** This register is programmed with the Flash 64k sector erase instruction opcode for component 0. This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit. **Locked by:** BIOS_SFDP0_VSCC0.VCL
15:8	20h RW/V/L	**4k Erase Opcode (EO_4K):** This register is programmed with the Flash 4k subsector erase instruction opcode for component 0. Software must program this register if the SFDP table for this component does not show 4 kByte erase capability. This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit. **Locked by:** BIOS_SFDP0_VSCC0.VCL

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RW/V/L	**Quad Enable Requirements (QER):** This field is defined by the JEDEC JESD216A standard for SFDP, reference 2. Information is copied here for reference. The JEDEC standard shall take precedence in the event of a discrepancy. This field describes whether the device contains a Quad Enable (QE) bit used to enable 1-1-4 and 1-4-4 quad read or quad program operations. If QE exists, this field also identifies the bit location and method to set/clear the bit. In this specification, status register 1 refers to the first data byte transferred on a Read Status (05h) or Write Status (01h) command. Status register 2 refers to the byte read using instruction 35h. Status register 2 is the second byte transferred in a Write Status (01h) command. Bits are numbered from 7 to 0, where bit 7 is transferred first on the wire. Note: Industry naming and definitions of these status registers may differ. The user will typically perform a read-modify-write sequence of operations to maintain the state of all other writable status register bits. For example read both status registers, set/clear QE, Write Status with both data bytes. 000b: Device does not have a QE bit. Device detects 1-1-4 and 1-4-4 reads based on instruction. DQ3/HOLD# functions as hold during instruction phase. 001b: QE is bit 1 of status register 2. It is set via Write Status with two data bytes where bit 1 of the second byte is one. It is cleared via Write Status with two data bytes where bit 1 of the second byte is zero. Writing only one byte to the status register has the side-effect of clearing status register 2, including the QE bit. The 100b code is used if writing one byte to the status register does not modify status register 2. 010b: QE is bit 6 of status register 1. It is set via Write Status with one data byte where bit 6 is one. It is cleared via Write Status with one data byte where bit 6 is zero. 011b: QE is bit 7 of status register 2. It is set via Write status register 2 instruction 3Eh with one data byte where bit 7 is one. It is cleared via Write status register 2 instruction 3Eh with one data byte where bit 7 is zero. The status register 2 is read using instruction 3Fh. 100b: QE is bit 1 of status register 2. It is set via Write Status with two data bytes where bit 1 of the second byte is one. It is cleared via Write Status with two data bytes where bit 1 of the second byte is zero. In contrast to the 001b code, writing one byte to the status register does not modify status register 2. 101b: QE is bit 1 of the status register 2. Status register 1 is read using Read Status instruction 05h. Status register 2 is read using instruction 35h. QE is set via Write Status instruction 01h with two data bytes where bit 1 of the second byte is one. It is cleared via Write Status with two data bytes where bit 1 of the second byte is zero. Other: Reserved. This register is locked by the Vendor Component Lock (VCL) bit. The flash controller hardware does not use this field. NOTE: This field is only valid for SFDP revision 1.5 and above. Firmware must check the revision prior to acting on the contents of this register. **Locked by:** BIOS_SFDP0_VSCC0.VCL
4	0h RW/V/L	**Write Enable on Write Status (WEWS):** 0: 50h is the opcode to enable a status register write. 1: 06h is the opcode to enable a status register write. This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit. Note: Hardware ignores the state of this bit and only issues 06h as a write enable. **Locked by:** BIOS_SFDP0_VSCC0.VCL

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/V/L	**Write Status Required (WSR):** 0: No requirement to write to the Write Status Register prior to a write. 1: A write is required to the Write Status Register prior to write and erase to remove any protection. This is required for SST components. This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit. Note: Hardware ignores the state of this bit and behaves as if WSR=0. Flash devices that contain a 1 in this field are no longer supported by the flash controller. **Locked by:** BIOS_SFDP0_VSCC0.VCL
2	0h RW/V/L	**Write Granularity (WG):** 0: Reserved. 1: 64 Byte. This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit. Note: Hardware ignores the state of this bit. **Locked by:** BIOS_SFDP0_VSCC0.VCL
1:0	0h RO	**Reserved**

7.2.49 Vendor Specific Component Capabilities for Component 1 (BIOS_SFDP1_VSCC1) - Offset C8h

The fields in this register pertain to cycles targeting addresses outside of Component 0. The lockable bits in this register are locked when either CPPTV is set to '1' by hardware or when VCL is '1'.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + C8h	00002000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Component Property Parameter Table Valid (CPPTV):** This bit is set to a 1 if the Flash Controller detects a valid SFDP Component Property Parameter Table in Component 1. Note: If this bit is set software must not overwrite bits that were initialized by hardware via SFDP discovery.

7.2.50 Parameter Table Index (BIOS_PTINX) - Offset CCh

Observability Control for Component Property Tables.

Note: The PTINX and PTDATA registers do not have any meaning in slave-attach flash mode because the SPI controller does not perform SFDP discovery.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + CCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:14	0h RW	**Supported Parameter Table (SPT):** Selects which supported parameter table to observe. 00: Component 0 Property Parameter Table. 01: Component 1 Property Parameter Table. 10 - 11: Reserved.
13:12	0h RW	**Header or Data (HORD):** Select parameter table header DW vs Data DW. 00: SFDP Header. 01: Parameter Table Header. 10: Data. 11: Reserved.
11:2	000h RW	**Parameter Table DW Index (PTDWI):** Selects the DW offset within the parameter table to observe. The returned data is undefined if the index is programmed to a value greater than the size of the header or table.
1:0	0h RO	**Reserved**

7.2.51 Parameter Table Data (BIOS_PTDATA) - Offset D0h

Parameter Table Data

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + D0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**Parameter Table DW Data (PTDWD):** Returns the DW of data to observe as selected in the Parameter Table Index register. Note: The returned value of reserved fields in the SFDP header or table must be ignored by software. The flash controller may return either 0 or 1 for these fields.

7.2.52 SPI Bus Requester Status (BIOS_SBRS) - Offset D4h

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**TPM Access Ongoing (TPM_ACC_ONG):** Indicates that a TPM access is in progress.
30	0h RO/V	**eSPI Access Ongoing (ESPI_ACC_ONG):** This bit is only defined if eSPI and SPI are sharing the SPI bus.
29	0h RO/V	**Touch Access Ongoing (TOUCH_ACC_ONG):** Indicates that a Touch access is in progress.
28	0h RO/V	**CSME accessing the Huffman Decompression (CSME_ACC_HWD):** Indicates that CSME has a HW Decompression cycle in progress.
27:18	0h RO	**Reserved**
17:15	0h RO/V	**Master 5 Status (M5STATUS):** See description under M1STATUS.
14:12	0h RO/V	**Master 6 Status (M6STATUS):** See description under M1STATUS.
11:9	0h RO/V	**Master 4 Status (M4STATUS):** See description under M1STATUS.
8:6	0h RO/V	**Master 3 Status (M3STATUS):** See description under M1STATUS.
5:3	0h RO/V	**Master 2 Status (M2STATUS):** See description under M1STATUS.
2:0	0h RO/V	**Master 1 Status (M1STATUS):** Indicates whether this master has an outstanding transaction enqueued or in flight and the transaction type. 0xx: No transaction. 100: Flash read transaction. 101: Flash write transaction. 110: Flash erase transaction. 111: Flash RPMC transaction.

7.2.53 Flash Region (BIOS_FREG12) - Offset E0h

Flash Region.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + E0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
30:16	0000h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREGX.Region Limit.
15	0h RO	**Reserved**
14:0	0000h RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREGX.Region Base.

7.2.54 Flash Region (BIOS_FREG13) - Offset E4h

Flash Region.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:16	0000h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREGX.Region Limit.
15	0h RO	**Reserved**
14:0	0000h RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREGX.Region Base.

7.2.55 Flash Region (BIOS_FREG14) - Offset E8h

Flash Region.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + E8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
30:16	0000h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREGX.Region Limit.
15	0h RO	**Reserved**
14:0	0000h RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREGX.Region Base.

7.2.56 Flash Region (BIOS_FREG15) - Offset ECh

Flash Region.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + ECh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:16	0000h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREGX.Region Limit.
15	0h RO	**Reserved**
14:0	0000h RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREGX.Region Base.

7.2.57 BIOS Master Read Access Permissions (BIOS_BM_RAP) - Offset 118h

BIOS Master Read Access Permissions.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 118h	000000C2h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	00C2h RO/V	**BIOS Master Read Access Permissions (BMRAP):** Each bit [15:0] corresponds to Regions [15:0]. If the bit is set, this master can read that particular region through register accesses. The contents of this register are that of the Flash Descriptor.Flash Master 1.Master Region Read Access OR a particular master has granted BIOS read permissions in their Master Read Access Grant register OR the Flash Descriptor Security Override strap is set. BIOS has read access to its own Region 1, 6 and 7 by default. Thus, the reset default of this field will be read as *"C2h"*.

7.2.58 BIOS Master Write Access Permissions (BIOS_BM_WAP) - Offset 11Ch

BIOS Master Write Access Permissions.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 11Ch	00000042h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0042h RO/V	**BIOS Master Write Access Permissions (BMWAP):** Each bit [15:0] corresponds to Regions [15:0]. If the bit is set, this master can erase and write that particular region through register accesses. The contents of this register are that of the Flash Descriptor.Flash Master 1.Master Region Write Access OR a particular master has granted BIOS write permissions in their Master Write Access Grant register OR the Flash Descriptor Security Override strap is set. BIOS has write access to its own Region 1 and 6 by default. Thus, the reset default of this field will be read as *"42h"*.

7.2.59 CSXE Flash Protected Range (BIOS_CSXE_PR0) - Offset 184h

These are not physical registers in the memory space. These addresses provide the host with a read-only view of the values stored in the CSxE Protected Range registers.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 184h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Write Protection Enable (WPE):** Write Protection Enable: When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0000h RO/V	**Protected Range Limit (PRL):** Protected Range Limit: This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0h RO/V	**Read Protection Enable (RPE):** Read Protection Enable: When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0000h RO/V	**Protected Range Base (PRB):** Protected Range Base: This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

7.2.60 CSXE Flash Protected Range (BIOS_CSXE_PR1) - Offset 188h

These are not physical registers in the memory space. These addresses provide the host with a read-only view of the values stored in the CSxE Protected Range registers.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 188h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Write Protection Enable (WPE):** Write Protection Enable: When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0000h RO/V	**Protected Range Limit (PRL):** Protected Range Limit: This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0h RO/V	**Read Protection Enable (RPE):** Read Protection Enable: When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0000h RO/V	**Protected Range Base (PRB):** Protected Range Base: This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

7.2.61 CSXE Flash Protected Range (BIOS_CSXE_PR2) - Offset 18Ch

These are not physical registers in the memory space. These addresses provide the host with a read-only view of the values stored in the CSxE Protected Range registers.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 18Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Write Protection Enable (WPE):** Write Protection Enable: When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0000h RO/V	**Protected Range Limit (PRL):** Protected Range Limit: This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0h RO/V	**Read Protection Enable (RPE):** Read Protection Enable: When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0000h RO/V	**Protected Range Base (PRB):** Protected Range Base: This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

7.2.62 CSXE Flash Protected Range (BIOS_CSXE_PR3) - Offset 190h

These are not physical registers in the memory space. These addresses provide the host with a read-only view of the values stored in the CSxE Protected Range registers.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 190h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Write Protection Enable (WPE):** Write Protection Enable: When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0000h RO/V	**Protected Range Limit (PRL):** Protected Range Limit: This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0h RO/V	**Read Protection Enable (RPE):** Read Protection Enable: When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0000h RO/V	**Protected Range Base (PRB):** Protected Range Base: This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

7.2.63 CSXE Flash Protected Range (BIOS_CSXE_PR4) - Offset 194h

These are not physical registers in the memory space. These addresses provide the host with a read-only view of the values stored in the CSxE Protected Range registers.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 194h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Write Protection Enable (WPE):** Write Protection Enable: When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0000h RO/V	**Protected Range Limit (PRL):** Protected Range Limit: This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0h RO/V	**Read Protection Enable (RPE):** Read Protection Enable: When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0000h RO/V	**Protected Range Base (PRB):** Protected Range Base: This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

7.2.64 Write Protected Range 0 (BIOS_CSXE_WPR0) - Offset 198h

This is not a physical register in the memory space. This address provides the Host with a read-only view of the values stored in the CSXE Write Protected Range register.

Type	Size	Offset	Default
MMIO	32 bit	BIOS_SPI_BAR + 198h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0000h RO/V	**Blocked Range Limit (BRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0h RO	**Reserved**
14:0	0000h RO/V	**Blocked Range Base (BRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

8 Universal Asynchronous Receiver/Transmitter (UART) Controller

8.1 UART Configuration Registers Summary

This chapter documents the registers in Bus: 0, Device 30, Function 0 and 1. Also lists the registers in Bus 0, Device 25, Function 2.

DID Values:

- UART Controller #0:- D30:F0 - 4B28h
- UART Controller #1:- D30:F1 - 4B29h
- UART Controller #2:- D25:F2 - 4B4Dh

Table 8-1. Summary of Bus: 0, Design: 30, Function: 0 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	Device ID And Vendor ID Register (DEVVENDID)	4B288086h
4h	4	Status and Command (STATUSCOMMAND)	00100000h
8h	4	Revision ID and Class Code (REVCLASSCODE)	07800000h
Ch	4	Cache Line Latency Header and BIST (CLLATHEADERBIST)	00800000h
10h	4	Base Address Register (BAR)	00000000h
14h	4	Base Address Register High (BAR_HIGH)	00000000h
18h	4	Base Address Register1 (BAR1)	00000004h
1Ch	4	Base Address Register1 High (BAR1_HIGH)	00000000h
2Ch	4	Subsystem Vendor and Subsystem ID (SUBSYSTEMID)	00000000h
30h	4	Expansion ROM Base Address (EXPANSION_ROM_BASEADDR)	00000000h
34h	4	Capabilities Pointer Register (CAPABILITYPTR)	00000080h
3Ch	4	Interrupt Register (INTERRUPTREG)	00000000h
80h	4	Power Management Capability ID (POWERCAPID)	00039001h
84h	4	Power Management Control and Status Register (PMECTRLSTATUS)	00000008h
90h	4	PCI Device Idle Vendor Capability Register (PCIDEVIDLE_CAP_RECORD)	F0140009h
94h	4	Vendor Specific Extended Capability Register (DEVID_VEND_SPECIFIC_REG)	01400010h
98h	4	Software LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG)	00002101h
9Ch	4	Device Idle Pointer Register (DEVICE_IDLE_POINTER_REG)	000024C1h
A0h	4	D0i3 and Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG)	000F0800h
B0h	4	General Purpose Read Write Register1 (GEN_REGRW1)	00000000h
B4h	4	General Purpose Read Write Register2 (GEN_REGRW2)	00000000h
B8h	4	General Purpose Read Write Register3 (GEN_REGRW3)	00000000h
BCh	4	General Purpose Read Write Register4 (GEN_REGRW4)	00000000h
C0h	4	General Purpose Input Register (GEN_INPUT_REG)	00000000h
F8h	4	Manufacturers ID (MANID)	00000000h

8.1.1 Device ID And Vendor ID Register (DEVVENDID) - Offset 0h

Device ID and Vendor ID.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:0] + 0h	4B288086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	4B28h RO/P	**Device ID Field (DEVICEID):** Device ID identifies the particular PCI device
15:0	8086h RO	**Vendor ID Field (VENDORID):** Vendor ID is a unique ID provided by the PCI SIG which identifies the manufacturer of the device

8.1.2 Status And Command (STATUSCOMMAND) - Offset 4h

Command register and Status register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:0] + 4h	00100000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29	0h RW/1C	**RMA Field (RMA):** Received Master Abort
28	0h RW/1C	**RTA Field (RTA):** Received Target Abort
27:21	0h RO	**Reserved**
20	1h RO	**Cap List Field (CAPLIST):** Capabilities List: Indicates that the controller contains a capabilities pointer list
19	0h RO	**Interrupt Status Field (INTR_STATUS):** Interrupt Status: This bit reflects state of interrupt in the device
18:11	0h RO	**Reserved**
10	0h RW	**Interrupt Disable Field (INTR_DISABLE):** Interrupt Disable
9	0h RO	**Reserved**
8	0h RW	**SERR Enable Field (SERR_ENABLE):** SERR Enable Not implemented
7:3	0h RO	**Reserved**
2	0h RW	**BME Field (BME):** Bus Master Enable
1	0h RW	**MSE Field (MSE):** Memory Space Enable
0	0h RO	**Reserved**

8.1.3 Revision ID And Class Code (REVCLASSCODE) - Offset 8h

Revision ID register and Class Code register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:0] + 8h	07800000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	078000h RO	**Revision ID Field (CLASS_CODES):** Class Code register is read-only and is used to identify the generic function of the device and in some cases a specific register-level programming interface
7:0	00h RO/P	**Class Code Field (RID):** Revision ID identifies the revision of particular PCI device.

8.1.4 Cache Line Latency Header And BIST (CLLATHEADERBIST) - Offset Ch

Cache Line size as RW with def 0 Latency timer RW with def 0 Header type with Type 0 configuration header and Reserved BIST register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:0] + Ch	00800000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	1h RO	**Multi Function Device Field (MULFNDEV):** Multi-Function Device
22:16	00h RO	**Header Type Field (HEADERTYPE):** Header Type: Implements Type 0 Configuration header
15:8	00h RO	**Latency Timer Field (LATTIMER):** Latency Timer: This register is implemented as R/W with default as 0
7:0	00h RW/P	**Cache Line Size Field (CACHELINE_SIZE):** Cache Line Size

8.1.5 Base Address Register (BAR) - Offset 10h

Base Address Register Low [31:2] type[2:1] in 32-bit or 64-bit address range and memory space indicator [0].

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:0] + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR):** Base Address Register Low Base address of the OCP fabric memory space. Taken from Strap values as ones
11:4	00h RO	**Size Field (SIZEINDICATOR):** Size Indicator RO Always returns 0 The size of this register depends on the size of the memory space
3	0h RO	**Prefetchable Field (PREFETCHABLE):** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**Type Field (TYPE0):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE):** Memory Space Indicator: 0 indicates this BAR is present in the memory space.

8.1.6 Base Address Register High (BAR_HIGH) - Offset 14h

Base Address Register High enabled if [2:1] of BAR_HIGH is 10.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:0] + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR_HIGH):** Base Address High - MSB

8.1.7 Base Address Register1 (BAR1) - Offset 18h

Base Address Register1 accesses to PCI configuration space and is always 4K type in [2:1] and Memory Space Indicator in [0].

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:0] + 18h	00000004h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR1):** Base Address1 This field is present if BAR1 is enabled through private configuration space.
11:4	00h RO	**Size Field (SIZEINDICATOR1):** Always is 0 as minimum size is 4K

Bit Range	Default & Access	Field Name (ID): Description
3	0h RO	**Prefetchable Field (PREFETCHABLE1):** Prefetchable: Indicates that this BAR is not prefetchable.
2:1	2h RO	**Type Field (TYPE1):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE1):** Memory Space Indicator: 0 Indicates this BAR is present in the memory space

8.1.8 Base Address Register1 High (BAR1_HIGH) - Offset 1Ch

Base Address Register1 High enabled only if [2:1] of BAR1 register is 10.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:0] + 1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR1_HIGH):** Base Address: Base address of the OCP fabric memory space. Taken from Strap values as ones

8.1.9 Subsystem Vendor And Subsystem ID (SUBSYSTEMID) - Offset 2Ch

SVID register along with SID register is to distinguish subsystem from another.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:0] + 2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O/P	**Subsystem ID Field (SUBSYSTEMID):** Subsystem ID: This register is implemented for any function that can be instantiated more than once in a given system.
15:0	0000h RW/O/P	**Subsystem Vendor Field (SUBSYSTEMVENDORID):** Subsystem Vendor ID: This register must be implemented for any function that can be instantiated more than once in a given system

8.1.10 Expansion ROM Base Address (EXPANSION_ROM_BASEADDR) - Offset 30h

Expansion ROM Base Address register is a RO indicates support for Expansion ROMs.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:0] + 30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**EXPANSION ROM base address field (EXPANSION_ROM_BASE):** Expansion ROM Base Address: Value of all zeros indicates no support for Expansion ROM

8.1.11 Capabilities Pointer Register (CAPABILITYPTR) - Offset 34h

Capabilities Pointer register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:0] + 34h	00000080h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	80h RO	**Capabilities Pointer Field (CAPPTR_POWER):** Capabilities Pointer: Indicates what the next capability is.

8.1.12 Interrupt Register (INTERRUPTREG) - Offset 3Ch

Interrupt line Register isn't used in Bridge directly Interrupt Pin register reflects the IPIN value in private configuration space. Min_GNT register indicating the requirements of latency timers and max_LAT register max latency.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:0] + 3Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Max Latency Field (MAX_LAT):** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	00h RO	**Min GNT Field (MIN_GNT):** Value of 0 indicates device has no major requirements for the settings of latency timers // Re-Check Desc Padma

Bit Range	Default & Access	Field Name (ID): Description
15:12	0h RO	**Reserved**
11:8	0h RO	**Interrupt Pin Field (INTPIN):** Interrupt Pin: Value in this register is reflected from the IPIN value in the private configuration space.
7:0	00h RW/P	**Int Line Field (INTLINE):** Interrupt Line: It is used to communicate to software the interrupt line to which the interrupt pin is connected

8.1.13 Power Management Capability ID (POWERCAPID) - Offset 80h

Power Management Capability ID register points to Next Capability Structure and Power Management Capability with Power Management Capabilities register for PME Support and Version.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:0] + 80h	00039001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	00h RO	**PME Support Field (PMESUPPORT):** This 5-bit field indicates the power states in which the function can assert the PME#
26:19	0h RO	**Reserved**
18:16	3h RO	**Version Field (VERSION):** Indicates support for Revision 1.2 of the PCI Power Management Specification
15:8	90h RO	**Next Cap Field (NXTCAP):** Next Capability: Points to the next capability structure.
7:0	01h RO	**Power Capability ID Field (POWER_CAP):** Power Management Capability: Indicates this is power management capability

8.1.14 Power Management Control And Status Register (PMECTRLSTATUS) - Offset 84h

Power Management Control and Status Register to set and read PME Status, PME enable, No Soft Reset and Power State.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:0] + 84h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW/1C/P	**PME Status Field (PMESTATUS):** PME Status
14:9	0h RO	**Reserved**
8	0h RW/P	**PME Enable Field (PMEENABLE):** PME Enable
7:4	0h RO	**Reserved**
3	1h RO	**No Soft Reset Field (NO_SOFT_RESET):** This bit indicates that devices transitioning from D3hot to D0 because of Power State commands do not perform an internal reset
2	0h RO	**Reserved**
1:0	0h RW	**Power State Field (POWERSTATE):** Power State: This field is used both to determine the current Power State and to set a new Power State

8.1.15 PCI Device Idle Vendor Capability Register (PCIDEVIDLE_CAP_RECORD) - Offset 90h

PCI Device Vendor Specific Capability register defines Vendor Specific Capability ID, Revision, Length, Next Capability and CAPID.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:0] + 90h	F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**Vendor Cap Field (VEND_CAP):** Vendor Specific Capability ID
27:24	0h RO	**Revision ID Field (REVID):** Revision ID of capability structure
23:16	14h RO	**Cap Length Field (CAP_LENGTH):** Vendor Specific Capability Length
15:8	00h RO	**Next Capability Field (NEXT_CAP):** Next Capability
7:0	09h RO	**Capability ID Field (CAPID):** Capability ID

8.1.16 Vendor Specific Extended Capability Register (DEVID_VEND_SPECIFIC_REG) - Offset 94h

Extended Vendor capability register for VSEC Length, Revision and ID.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:0] + 94h	01400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	014h RO	**Vendor Specific ID Field (VSEC_LENGTH):** Vendor Specific Extended Capability Length
19:16	0h RO	**Vendor Specific Revision Field (VSEC_REV):** Vendor specific Extended Capability revision
15:0	0010h RO	**Vendor Specific Length Field (VSECID):** Vendor Specific Extended Capability ID

8.1.17 Software LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG) - Offset 98h

Software location pointer in MMIO space as an offset specified by BAR.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:0] + 98h	00002101h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000210h RO	**SW LTR Dword Offset Field (SW_LAT_DWORD_OFFSET):** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**SW LTR BAR Number Field (SW_LAT_BAR_NUM):** Indicates that the SW LTR update MMIO location is always at BAR0
0	1h RO	**SW LTR Valid Field (SW_LAT_VALID):** This value is reflected from the SW LTR valid strap at the top level

8.1.18 Device Idle Pointer Register (DEVICE_IDLE_POINTER_REG) - Offset 9Ch

Device IDLE pointer register giving details on Device MMIO offset Location, BAR NUM and D0i3 Valid Strap.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:0] + 9Ch	000024C1h

Bit Range	Default & Access	Field Name (ID): Description
31:4	000024Ch RO	**D0i3 Dword Offset Field (DWORD_OFFSET):** contains the location pointer to the SW LTR register in MMIO space as an offset from the specified BAR
3:1	0h RO	**BAR NUM Field (BAR_NUM):** Bar num: Indicates that the D0i3 MMIO location is always at BAR0
0	1h RO	**D0i3 Valid Field (VALID):** Valid: This value is reflected from the D0i3 valid strap at the top level.

8.1.19 D0i3 And Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG) - Offset A0h

D0idle_Max_Power_On_Latency register set at boot and power control enable register to enable communication with the PGCB block below the Bridge.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:0] + A0h	000F0800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21	0h RW/P	**HAE Field (HAE):** Hardware Autonomous Enable
20	0h RO	**Reserved**
19	1h RW/P	**Sleep Enable Field (SLEEP_EN):** Sleep Enable
18	1h RW/P	**D3 Hen Field (PGE):** DEVIDLE Enable (DEVIDLEN): If '1' then the function will power gate when idle and the DevIdle register (DevIdleC[2] = '1') is set.
17	1h RW/P	**Device Idle En Field (I3E):** PMCRE: PMC Request Enable
16	1h RW/P	**PMC Request Enable Field (PMCRE):** D3-Hot Enable (D3HEN): If '1' then function will power gate when idle and the PMCSR[1:0] register in the function ='11' (D3).
15:13	0h RO	**Reserved**
12:10	2h RW/O/P	**Power Latency Scale Field (POW_LAT_SCALE):** Power On Latency Scale
9:0	000h RW/O/P	**Power Latency Value Field (POW_LAT_VALUE):** Power On Latency value

8.1.20 General Purpose Read Write Register1 (GEN_REGRW1) - Offset B0h

General Purpose PCI Read Write Register1.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:0] + B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Read Write Field (GEN_REG_RW1):** General Purpose PCI Register: This register value is brought out as GEN_REG_RW1

8.1.21 General Purpose Read Write Register2 (GEN_REGRW2) - Offset B4h

General Purpose PCI Read Write Register2.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:0] + B4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Read Write Field (GEN_REG_RW2):** General Purpose PCI Register: This register value is brought out as GEN_REG_RW2

8.1.22 General Purpose Read Write Register3 (GEN_REGRW3) - Offset B8h

General Purpose PCI Read Write Register3.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:0] + B8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Read Write Field (GEN_REG_RW3):** General Purpose PCI Register: This register value is brought out as GEN_REG_RW3

8.1.23 General Purpose Read Write Register4 (GEN_REGRW4) - Offset BCh

General Purpose PCI Read Write Register4.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:0] + BCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Read Write Field (GEN_REG_RW4):** General Purpose PCI Register: This register value is brought out as GEN_REG_RW4

8.1.24 General Purpose Input Register (GEN_INPUT_REG) - Offset C0h

General Purpose Input Register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:0] + C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**General Purpose Input Field (GEN_REG_INPUT_RW):** General Purpose Input Register: This register value reflects the value of GEN_REG_INPUT_RW

8.1.25 Manufacturers ID (MANID) - Offset F8h

Manufacturers ID register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:0] + F8h	00000000h

B28h	4	REG MaskDstTran (MASKDSTTRAN)	00000000h
B30h	4	REG MaskErr (MASKERR)	00000000h
B38h	4	REG ClearTfr (CLEARTFR)	00000000h
B40h	4	REG ClearBlock (CLEARBLOCK)	00000000h
B48h	4	REG ClearSrcTran (CLEARSRCTRAN)	00000000h
B50h	4	REG ClearDstTran (CLEARDSTTRAN)	00000000h
B58h	4	REG ClearErr (CLEARERR)	00000000h
B60h	4	REG StatusInt (STATUSINT)	00000000h
B98h	4	REG DmaCfgReg (DMACFGREG)	00000000h
BA0h	4	REG ChEnReg (CHENREG)	00000000h

8.2.1 REG RBR (RBR) - Offset 0h

Receive Buffer Register. RBR mode is only available when LCR register [7] (DLAB bit) = 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h R0	**Reserved**
7:0	00h RO	**RBR:** Data byte received on the serial input port (sin) in UART mode. The data in this register is valid only if the Data Ready (DR) bit in the Line Status Register (LCR) is set. If FIFOs are disabled (FCR[0] set to zero), the data in the RBR must be read before the next data arrives, otherwise it is overwritten, resulting in an over-run error. If FIFOs are enabled (FCR[0] set to one), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO is preserved, but any incoming data are lost and an over-run error occurs.

8.2.2 REG DLH (DLH) - Offset 4h

Divisor Latch (High). DLH mode is only available when LCR register [7] (DLAB bit) = 1

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h R0	**Reserved**
7:0	00h NA	**DLH:** Upper 8-bits of a 16-bit, read/write, Divisor Latch register that contains the baud rate divisor for the UART. This register may be accessed only when the DLAB bit (LCR[7]) is set. The output baud rate is equal to the serial clock frequency divided by sixteen times the value of the baud rate divisor, as follows: baud rate = (serial clock freq) / (16 * divisor).

8.2.3 REG IIR (IIR) - Offset 8h

Interrupt Control Register. The following table indicates the Interrupt Control

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8h	00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	**Reserved**
7:6	0h RO	**FIFOSE:** FIFOs Enabled. This is used to indicate whether the FIFOs are enabled or disabled. 00 = disabled 11 = enabled
5:4	0h RO	**Reserved**
3:0	1h RO	**IID:** Interrupt ID. This indicates the highest priority pending interrupt which can be one of the following types: 0000 = modem status 0001 = no interrupt pending 0010 = THR empty 0100 = received data available 0110 = receiver line status 0111 = busy detect 1100 = character timeout

8.2.4 REG LCR (LCR) - Offset Ch

Line Control Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	**Reserved**
7	0h RW	**DLAB:** Divisor Latch Access Bit. If UART_16550_COMPATIBLE == NO, then writeable only when UART is not busy (USR[0] is zero); otherwise always writable, always readable. This bit is used to enable reading and writing of the Divisor Latch register (DLL and DLH) to set the baud rate of the UART. This bit must be cleared after initial baud rate setup in order to access other registers. Reset Value: 0x0
6	0h RW	**BREAK:** Break Control Bit. This is used to cause a break condition to be transmitted to the receiving device. If set to one the serial output is forced to the spacing (logic 0) state. When not in Loopback Mode, as determined by MCR[4], the sout line is forced low until the Break bit is cleared. If SIR_MODE == Enabled and active (MCR[6] set to one) the sir_out_n line is continuously pulsed. When in Loopback Mode, the break condition is internally looped back to the receiver and the sir_out_n line is forced low
5	0h RO	**Reserved**
4	0h RW	**EPS:** Even Parity Select. If UART_16550_COMPATIBLE == NO, then writeable only when UART is not busy (USR[0] is zero); otherwise always writable, always readable. This is used to select between even and odd parity, when parity is enabled (PEN set to one). If set to one, an even number of logic 1s is transmitted or checked. If set to zero, an odd number of logic 1s is transmitted or checked. Reset Value: 0x0

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**PEN:** Parity Enable. If UART_16550_COMPATIBLE == NO, then writeable only when UART is not busy (USR[0] is zero); otherwise always writable, always readable. This bit is used to enable and disable parity generation and detection in transmitted and received serial character respectively. 0 = parity disabled 1 = parity enabled Reset Value: 0x0
2	0h RW	**STOP:** Number of stop bits. If UART_16550_COMPATIBLE == NO, then writeable only when UART is not busy (USR[0] is zero); otherwise always writable, always readable. This is used to select the number of stop bits per character that the peripheral transmits and receives. If set to zero, one stop bit is transmitted in the serial data. If set to one and the data bits are set to 5 (LCR[1:0] set to zero) one and a half stop bit is transmitted. Otherwise, two stop bits are transmitted. Note that regardless of the number of stop bits selected, the receiver checks only the first stop bit. 0 = 1 stop bit 1 = 1.5 stop bits when DLS (LCR[1:0]) is zero, else 2 stop bit Reset Value: 0x0
1:0	0h RW	**DLS:** Data Length Select. If UART_16550_COMPATIBLE == NO, then writeable only when UART is not busy (USR[0] is zero); otherwise always writable, always readable. This is used to select the number of data bits per character that the peripheral transmits and receives. The number of bit that may be selected areas follows: 00 = 5 bits 01 = 6 bits 10 = 7 bits 11 = 8 bits Reset Value: 0x0

8.2.5 REG MCR (MCR) - Offset 10h

Modem Control Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5	0h RW	**AFCE:** Auto Flow Control Enable. Writeable only when AFCE_MODE == Enabled, always readable. When FIFOs are enabled and the Auto Flow Control Enable (AFCE) bit is set. 0 = Auto Flow Control Mode disabled 1 = Auto Flow Control Mode enabled Reset Value: 0x0
4	0h RW	**LOOPBACK:** LoopBack Bit. This is used to put the UART into a diagnostic mode for test purposes. If operating in UART mode (SIR_MODE != Enabled or not active, MCR[6] set to zero), data on the sout line is held high, while serial data output is looped back to the sin line, internally. In this mode all the interrupts are fully functional. Also, in loopback mode, the modem control inputs (dsr_n, cts_n, ri_n, dcd_n) are disconnected and the modem control outputs (dtr_n, rts_n, out1_n, out2_n) are looped back to the inputs, internally. If operating in infrared mode (SIR_MODE == Enabled AND active, MCR[6] set to one), data on the sir_out_n line is held low, while serial data output is inverted and looped back to the sir_in line. Reset Value: 0x0
3:2	0h RO	**Reserved**
1	0h RW	**RTS:** Request to Send. This is used to directly control the Request to Send (rts_n) output. The Request To Send (rts_n) output is used to inform the modem or data set that the UART is ready to exchange data. When Auto RTS Flow Control is not enabled (MCR[5] set to zero), the rts_n signal is set low by programming MCR[1] (RTS) to a high.In Auto Flow Control, AFCE_MODE == Enabled and active (MCR[5] set to one) and FIFOs enable (FCR[0] set to one), the rts_n output is controlled in the same way, but is also gated with the receiver FIFO threshold trigger (rts_n is inactive high when above the threshold). The rts_n signal is de-asserted when MCR[1] is set low. Note that in Loopback mode (MCR[4] set to one), the rts_n output is held inactive high while the value of this location is internally looped back to an input. Reset Value: 0x0
0	0h RO	**Reserved**

8.2.6 REG LSR (LSR) - Offset 14h

Line Status Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14h	00000060h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7	0h RW	**RFE:** Receiver FIFO Error bit. This bit is only relevant when FIFO_MODE != NONE AND FIFOs are enabled (FCR[0] set to one). This is used to indicate if there is at least one parity error, framing error, or break indication in the FIFO. 0 = no error in RX FIFO 1 = error in RX FIFO This bit is cleared when the LSR is read and the character with the error is at the top of the receiver FIFO and there are no subsequent errors in the FIFO. Reset Value: 0x0
6	1h RW	**TEMT:** Transmitter Empty bit. If in FIFO mode (FIFO_MODE != NONE) and FIFOs enabled (FCR[0] set to one), this bit is set whenever the Transmitter Shift Register and the FIFO are both empty. If in non-FIFO mode or FIFOs are disabled, this bit is set whenever the Transmitter Holding Register and the Transmitter Shift Register are both empty. Reset Value: 0x1
5	1h RW	**THRE:** Transmit Holding Register Empty bit. If THRE_MODE_USER == Disabled or THRE mode is disabled (IER[7] set to zero) and regardless of FIFO's being implemented/enabled or not, this bit indicates that the THR or TX FIFO is empty. This bit is set whenever data is transferred from the THR or TX FIFO to the transmitter shift register and no new data has been written to the THR or TX FIFO. This also causes a THRE Interrupt to occur, if the THRE Interrupt is enabled. If THRE_MODE_USER == Enabled AND FIFO_MODE != NONE and both modes are active (IER[7] set to one and FCR[0] set to one respectively), the functionality is switched to indicate the transmitter FIFO is full, and no longer controls THRE interrupts, which are then controlled by the FCR[5:4] threshold setting. Reset Value: 0x1
4	0h RW	**BI:** Break Interrupt bit. This is used to indicate the detection of a break sequence on the serial input data. If in UART mode (SIR_MODE == Disabled), it is set whenever the serial input, sin, is held in a logic '0' state for longer than the sum of start time + data bits + parity + stop bits. If in infrared mode (SIR_MODE == Enabled), it is set whenever the serial input, sir_in, is continuously pulsed to logic '0' for longer than the sum of start time + data bits + parity + stop bits. A break condition on serial input causes one and only one character, consisting of all zeros, to be received by the UART. In the FIFO mode, the character associated with the break condition is carried through the FIFO and is revealed when the character is at the top of the FIFO. Reading the LSR clears the BI bit. In the non-FIFO mode, the BI indication occurs immediately and persists until the LSR is read. Reset Value: 0x0

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**FE:** Framing Error bit. This is used to indicate the occurrence of a framing error in the receiver. A framing error occurs when the receiver does not detect a valid STOP bit in the received data. In the FIFO mode, since the framing error is associated with a character received, it is revealed when the character with the framing error is at the top of the FIFO. When a framing error occurs, the UART tries to resynchronize. It does this by assuming that the error was due to the start bit of the next character and then continues receiving the other bit i.e. data, and/or parity and stop. It should be noted that the Framing Error (FE) bit (LSR[3]) is set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]). 0 = no framing error 1 = framing error Reading the LSR clears the FE bit. Reset Value: 0x0
2	0h RW	**PE:** Parity Error bit. This is used to indicate the occurrence of a parity error in the receiver if the Parity Enable (PEN) bit (LCR[3]) is set. In the FIFO mode, since the parity error is associated with a character received, it is revealed when the character with the parity error arrives at the top of the FIFO. It should be noted that the Parity Error (PE) bit (LSR[2]) is set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]). 0 = no parity error 1 = parity error Reading the LSR clears the PE bit. Reset Value: 0x0
1	0h RW	**OE:** Overrun error bit. This is used to indicate the occurrence of an overrun error. This occurs if a new data character was received before the previous data was read. In the non-FIFO mode, the OE bit is set when a new character arrives in the receiver before the previous character was read from the RBR. When this happens, the data in the RBR is overwritten. In the FIFO mode, an overrun error occurs when the FIFO is full and a new character arrives at the receiver. The data in the FIFO is retained and the data in the receive shift register is lost. 0 = no overrun error 1 = overrun error Reading the LSR clears the OE bit. Reset Value: 0x0
0	0h RW	**DR:** Data Ready bit. This is used to indicate that the receiver contains at least one character in the RBR or the receiver FIFO. 0 = no data ready 1 = data ready This bit is cleared when the RBR is read in non-FIFO mode, or when the receiver FIFO is empty, in FIFO mode. Reset Value: 0x0

8.2.7 REG MSR (MSR) - Offset 18h

Modem Status Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4	0h RO	**CTS:** Clear to Send. This is used to indicate the current state of the modem control line cts_n.This bit is the complement of cts_n. When the Clear to Send input (cts_n) is asserted it is an indication that the modem or data set is ready to exchange data with the UART. 0 = cts_n input is de-asserted (logic 1) 1 = cts_n input is asserted (logic 0)
3:1	0h RO	**Reserved**
0	0h RO	**DCTS:** Delta Clear to Send. This is used to indicate that the modem control line cts_n has changed since the last time the MSR was read. 0 = no change on cts_n since last read of MSR 1 = change on cts_n since last read of MSR Reading the MSR clears the DCTS bit. In Loopback Mode (MCR[4] = 1), DCTS reflects changes on MCR[1] (RTS).Note, if the DCTS bit is not set and the cts_n signal is asserted (low) and a reset occurs(software or otherwise), then the DCTS bit is set when the reset is removed if the cts_nsignal remains asserted.

8.2.8 REG SCR (SCR) - Offset 1Ch

Scratchpad Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	**Reserved**
7:0	00h RW	**SCR:** This register is for programmers to use as a temporary storage space. It has no defined purpose in the DW_apb_uart. Reset Value: 0x0

8.2.9 REG SRBR_STHR0 (SRBR_STHR0) - Offset 30h

Shadow Receive Buffer Register and Shadow Transmit Holding Register 0

Type	Size	Offset	Default
MMIO	32 bit	BAR + 30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**SRBR_STHR0:** This is a shadow register for the RBR and has been allocated sixteen 32-bit locations so as to accommodate burst accesses from the master. This register contains the data byte received on the serial input port (sin) in UART mode or the serial infrared input (sir_in) in infrared mode. The data in this register is valid only if the Data Ready (DR) bit in the Line status Register (LSR) is set. If in non-FIFO mode (FIFO_MODE == NONE) or FIFOs are disabled (FCR[0] set to zero), the data in the RBR must be read before the next data arrives, otherwise it is overwritten, resulting in an overrun error. If in FIFO mode (FIFO_MODE != NONE) and FIFOs are enabled (FCR[0] set to one), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO are preserved, but any incoming data is lost. An overrun error also occurs. Reset Value: 0x0

8.2.10 REG SRBR_STHR1 (SRBR_STHR1) - Offset 34h

Shadow Receive Buffer Register and Shadow Transmit Holding Register 1

Type	Size	Offset	Default
MMIO	32 bit	BAR + 34h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**SRBR_STHR1:** This is a shadow register for the RBR and has been allocated sixteen 32-bit locations so as to accommodate burst accesses from the master. This register contains the data byte received on the serial input port (sin) in UART mode or the serial infrared input (sir_in) in infrared mode. The data in this register is valid only if the Data Ready (DR) bit in the Line status Register (LSR) is set. If in non-FIFO mode (FIFO_MODE == NONE) or FIFOs are disabled (FCR[0] set to zero), the data in the RBR must be read before the next data arrives, otherwise it is overwritten, resulting in an overrun error. If in FIFO mode

8.2.11 REG SRBR_STHR2 (SRBR_STHR2) - Offset 38h

Shadow Receive Buffer Register and Shadow Transmit Holding Register 2

Type	Size	Offset	Default
MMIO	32 bit	BAR + 38h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**SRBR_STHR2:** This is a shadow register for the RBR and has been allocated sixteen 32-bit locations so as to accommodate burst accesses from the master. This register contains the data byte received on the serial input port (sin) in UART mode or the serial infrared input (sir_in) in infrared mode. The data in this register is valid only if the Data Ready (DR) bit in the Line status Register (LSR) is set. If in non-FIFO mode (FIFO_MODE == NONE) or FIFOs are disabled (FCR[0] set to zero), the data in the RBR must be read before the next data arrives, otherwise

8.2.12 REG SRBR_STHR3 (SRBR_STHR3) - Offset 3Ch

Shadow Receive Buffer Register and Shadow Transmit Holding Register 3

Type	Size	Offset	Default
MMIO	32 bit	BAR + 3Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**SRBR_STHR3:** This is a shadow register for the RBR and has been allocated sixteen 32-bit locations so as to accommodate burst accesses from the master. This register contains the data byte received on the serial input port (sin) in UART mode or the serial infrared input (sir_in) in infrared mode. The data in this register is valid only if the Data Ready (DR) bit in the Line status Register (LSR) is set. If in non-FIFO mode (FIFO_MODE == NONE) or FIFOs are disabled (FCR[0] set to zero), the data in the RBR must be read before the next data arrives, otherwise it is overwritten, resulting in an overrun error. If in FIFO mode (FIFO_MODE != NONE) and FIFOs are enabled (FCR[0] set to one), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO are preserved, but any incoming data is lost. An overrun error also occurs. Reset Value: 0x0

8.2.13 REG SRBR_STHR4 (SRBR_STHR4) - Offset 40h

Shadow Receive Buffer Register and Shadow Transmit Holding Register 4

Type	Size	Offset	Default
MMIO	32 bit	BAR + 40h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**SRBR_STHR4:** This is a shadow register for the RBR and has been allocated sixteen 32-bit locations so as to accommodate burst accesses from the master. This register contains the data byte received on the serial input port (sin) in UART mode or the serial infrared input (sir_in) in infrared mode. The data in this register is valid only if the Data Ready (DR) bit in the Line status Register (LSR) is set. If in non-FIFO mode (FIFO_MODE == NONE) or FIFOs are disabled (FCR[0] set to zero), the data in the RBR must be read before the next data arrives, otherwise it is overwritten, resulting in an overrun error. If in FIFO mode (FIFO_MODE != NONE) and FIFOs are enabled (FCR[0] set to one), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO are preserved, but any incoming data is lost. An overrun error also occurs. Reset Value: 0x0

8.2.14 REG SRBR_STHR5 (SRBR_STHR5) - Offset 44h

Shadow Receive Buffer Register and Shadow Transmit Holding Register 5

Type	Size	Offset	Default
MMIO	32 bit	BAR + 44h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**SRBR_STHR5:** This is a shadow register for the RBR and has been allocated sixteen 32-bit locations so as to accommodate burst accesses from the master. This register contains the data byte received on the serial input port (sin) in UART mode or the serial infrared input (sir_in) in infrared mode. The data in this register.

8.2.15 REG SRBR_STHR6 (SRBR_STHR6) - Offset 48h

Shadow Receive Buffer Register and Shadow Transmit Holding Register 6

Type	Size	Offset	Default
MMIO	32 bit	BAR + 48h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**SRBR_STHR6:** This is a shadow register for the RBR and has been allocated sixteen 32-bit locations so as to accommodate burst accesses from the master. This register contains the data byte received on the serial input port (sin) in UART mode or the serial infrared input (sir_in) in infrared mode. The data in this register is valid only if the Data Ready (DR) bit in the Line status Register (LSR) is set. If in non-FIFO mode (FIFO_MODE == NONE) or FIFOs are disabled (FCR[0] set to zero), the data in the RBR must be read before the next data arrives, otherwise it is overwritten, resulting in an overrun error. If in FIFO mode (FIFO_MODE != NONE) and FIFOs are enabled (FCR[0] set to one), this register accesses the head of the receive FIFO. An overrun error also occurs. Reset Value: 0x0

8.2.16 REG SRBR_STHR7 (SRBR_STHR7) - Offset 4Ch

Shadow Receive Buffer Register and Shadow Transmit Holding Register 7

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**SRBR_STHR7:** This is a shadow register for the RBR and has been allocated sixteen 32-bit locations so as to accommodate burst accesses from the master. This register contains the data byte received on the serial input port (sin) in UART mode or the serial infrared input (sir_in) in infrared mode. The data in this register is valid only if the Data Ready (DR) bit in the Line status Register (LSR) is set. If in non-FIFO mode (FIFO_MODE == NONE) or FIFOs are disabled (FCR[0] set to zero), the data in the RBR must be read before the next data arrives, otherwise it is overwritten, resulting in an overrun error. If in FIFO mode (FIFO_MODE != NONE) and FIFOs are enabled (FCR[0] set to one), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO are preserved, but any incoming data is lost. An overrun error also occurs. Reset Value: 0x

8.2.17 REG SRBR_STHR8 (SRBR_STHR8) - Offset 50h

Shadow Receive Buffer Register and Shadow Transmit Holding Register 8

Type	Size	Offset	Default
MMIO	32 bit	BAR + 50h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**SRBR_STHR8:** This is a shadow register for the RBR and has been allocated sixteen 32-bit locations so as to accommodate burst accesses from the master. This register contains the data byte received on the serial input port (sin) in UART mode or the serial infrared input (sir_in) in infrared mode. The data in this register is valid only if the Data Ready (DR) bit in the Line status Register (LSR) is set. If in non-FIFO mode (FIFO_MODE == NONE) or FIFOs are disabled (FCR[0] set to zero), the data in the RBR must be read before the next data arrives, otherwise it is overwritten, resulting in an overrun error. If in FIFO mode (FIFO_MODE != NONE) and FIFOs are enabled (FCR[0] set to one), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO are preserved, but any incoming data is lost. An overrun error also occurs. Reset Value: 0x0

8.2.18 REG SRBR_STHR9 (SRBR_STHR9) - Offset 54h

Shadow Receive Buffer Register and Shadow Transmit Holding Register 9

Type	Size	Offset	Default
MMIO	32 bit	BAR + 54h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**SRBR_STHR9:** This is a shadow register for the RBR and has been allocated sixteen 32-bit locations so as to accommodate burst accesses from the master. This register contains the data byte received on the serial input port (sin) in UART mode or the serial infrared input (sir_in) in infrared mode. The data in this register is valid only if the Data Ready (DR) bit in the Line status Register (LSR) is set. If in non-FIFO mode (FIFO_MODE == NONE) or FIFOs are disabled (FCR[0] set to zero), the data in the RBR must be read before the next data arrives, otherwise it is overwritten, resulting in an overrun error. If in FIFO mode (FIFO_MODE != NONE) and FIFOs are enabled (FCR[0] set to one), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO are preserved, but any incoming data is lost. An overrun error also occurs. Reset Value: 0x0

8.2.19 REG SRBR_STHR10 (SRBR_STHR10) - Offset 58h

Shadow Receive Buffer Register and Shadow Transmit Holding Register 10

Type	Size	Offset	Default
MMIO	32 bit	BAR + 58h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**SRBR_STHR10:** This is a shadow register for the RBR and has been allocated sixteen 32-bit locations so as to accommodate burst accesses from the master. This register contains the data byte received on the serial input port (sin) in UART mode or the serial infrared input (sir_in) in infrared mode. The data in this register is valid only if the Data Ready (DR) bit in the Line status Register (LSR) is set. If in non-FIFO mode (FIFO_MODE == NONE) or FIFOs are disabled (FCR[0] set to zero), the data in the RBR must be read before the next data arrives, otherwise it is overwritten, resulting in an overrun error. If in FIFO mode (FIFO_MODE != NONE) and FIFOs are enabled (FCR[0] set to one), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO are preserved, but any incoming data is lost. An overrun error also occurs. Reset Value: 0x0

8.2.20 REG SRBR_STHR11 (SRBR_STHR11) - Offset 5Ch

Shadow Receive Buffer Register and Shadow Transmit Holding Register 11

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**SRBR_STHR11:** This is a shadow register for the RBR and has been allocated sixteen 32-bit locations so as to accommodate burst accesses from the master. This register contains the data byte received on the serial input port (sin) in UART mode or the serial infrared input (sir_in) in infrared mode. The data in this register is valid only if the Data Ready (DR) bit in the Line status Register (LSR) is set. If in non-FIFO mode (FIFO_MODE == NONE) or FIFOs are disabled (FCR[0] set to zero), the data in the RBR must be read before the next data arrives, otherwise it is overwritten, resulting in an overrun error. If in FIFO mode (FIFO_MODE != NONE) and FIFOs are enabled (FCR[0] set to one), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO are preserved, but any incoming data is lost. An overrun error also occurs. Reset Value: 0x0

8.2.21 REG SRBR_STHR12 (SRBR_STHR12) - Offset 60h

Shadow Receive Buffer Register and Shadow Transmit Holding Register 12

Type	Size	Offset	Default
MMIO	32 bit	BAR + 60h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**SRBR_STHR12:** This is a shadow register for the RBR and has been allocated sixteen 32-bit locations so as to accommodate burst accesses from the master. This register contains the data byte received on the serial input port (sin) in UART mode or the serial infrared input (sir_in) in infrared mode. The data in this register is valid only if the Data Ready (DR) bit in the Line status Register (LSR) is set. If in non-FIFO mode (FIFO_MODE == NONE) or FIFOs are disabled (FCR[0] set to zero), the data in the RBR must be read before the next data arrives, otherwise it is overwritten, resulting in an overrun error. If in FIFO mode (FIFO_MODE != NONE) and FIFOs are enabled (FCR[0] set to one), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO are preserved, but any incoming data is lost. An overrun error also occurs. Reset Value: 0x0

8.2.22 REG SRBR_STHR13 (SRBR_STHR13) - Offset 64h

Shadow Receive Buffer Register and Shadow Transmit Holding Register 13

Type	Size	Offset	Default
MMIO	32 bit	BAR + 64h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**SRBR_STHR13:** This is a shadow register for the RBR and has been allocated sixteen 32-bit locations so as to accommodate burst accesses from the master. This register contains the data byte received on the serial input port (sin) in UART mode or the serial infrared input (sir_in) in infrared mode. The data in this register is valid only if the Data Ready (DR) bit in the Line status Register (LSR) is set. If in non-FIFO mode (FIFO_MODE == NONE) or FIFOs are disabled (FCR[0] set to zero), the data in the RBR must be read before the next data arrives, otherwise it is overwritten, resulting in an overrun error. If in FIFO mode (FIFO_MODE != NONE) and FIFOs are enabled (FCR[0] set to one), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO are preserved, but any incoming data is lost. An overrun error also occurs. Reset Value: 0x0

8.2.23 REG SRBR_STHR14 (SRBR_STHR14) - Offset 68h

Shadow Receive Buffer Register and Shadow Transmit Holding Register 14

Type	Size	Offset	Default
MMIO	32 bit	BAR + 68h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**SRBR_STHR14:** This is a shadow register for the RBR and has been allocated sixteen 32-bit locations so as to accommodate burst accesses from the master. This register contains the data byte received on the serial input port (sin) in UART mode or the serial infrared input (sir_in) in infrared mode. The data in this register is valid only if the Data Ready (DR) bit in the Line status Register (LSR) is set. If in non-FIFO mode (FIFO_MODE == NONE) or FIFOs are disabled (FCR[0] set to zero), the data in the RBR must be read before the next data arrives, otherwise it is overwritten, resulting in an overrun error. If in FIFO mode (FIFO_MODE != NONE) and FIFOs are enabled (FCR[0] set to one), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO are preserved, but any incoming data is lost. An overrun error also occurs. Reset Value: 0x0

8.2.24 REG SRBR_STHR15 (SRBR_STHR15) - Offset 6Ch

Shadow Receive Buffer Register and Shadow Transmit Holding Register 15

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**SRBR_STHR15:** This is a shadow register for the RBR and has been allocated sixteen 32-bit locations so as to accommodate burst accesses from the master. This register contains the data byte received on the serial input port (sin) in UART mode or the serial infrared input (sir_in) in infrared mode. The data in this register is valid only if the Data Ready (DR) bit in the Line status Register (LSR) is set. If in non-FIFO mode (FIFO_MODE == NONE) or FIFOs are disabled (FCR[0] set to zero), the data in the RBR must be read before the next data arrives, otherwise it is overwritten, resulting in an overrun error. If in FIFO mode (FIFO_MODE != NONE) and FIFOs are enabled (FCR[0] set to one), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO are preserved, but any incoming data is lost. An overrun error also occurs. Reset Value: 0x0

8.2.25 REG FAR (FAR) - Offset 70h

FIFO Access Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 70h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**SRBR_STHR:** Writes have no effect when FIFO_ACCESS == No, always readable. This register is used to enable a FIFO access mode for testing, so that the receive FIFO can be written by the master and the transmit FIFO can be read by the master when FIFOs are implemented and enabled. When FIFOs are not implemented or not enabled it allows the RBR to be written by the master and the THR to be read by the master. 0 = FIFO access mode disabled 1 = FIFO access mode enabled Note, that when the FIFO access mode is enabled/disabled, the control portion of the receive FIFO and transmit FIFO is reset and the FIFOs are treated as empty. Reset Value: 0x0

8.2.26 REG TFR (TFR) - Offset 74h

Transmit FIFO Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 74h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO	**TFR:** Transmit FIFO Read. These bits are only valid when FIFO access mode is enabled (FAR[0] is set to one). When FIFOs are implemented and enabled, reading this register gives the data at the top of the transmit FIFO. Each consecutive read pops the transmit FIFO and gives the next data value that is currently at the top of the FIFO. When FIFOs are not implemented or not enabled, reading this register gives the data in the THR. Reset Value: 0x0

8.2.27 REG RFW (RFW) - Offset 78h

Receive FIFO Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + 78h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	000000h RO	**Reserved**
9	0h WO	**RFFE:** Receive FIFO Framing Error. These bits are only valid when FIFO access mode is enabled (FAR[0] is set to one). When FIFOs are enabled, this bit is used to write framing error detection information to the receive FIFO. When FIFOs are not implemented or not enabled, this bit is used to write framing error detection information to the RBR.
8	0h WO	**RFPE:** Receive FIFO Parity Error. These bits are only valid when FIFO access mode is enabled (FAR[0] is set to one). When FIFOs are enabled, this bit is used to write parity error detection information to the receive FIFO. When FIFOs are not implemented or not enabled, this bit is used to write parity error detection information to the RBR.
7:0	00h WO	**RFWD:** Receive FIFO Write Data. These bits are only valid when FIFO access mode is enabled(FAR[0] is set to one). When FIFOs are enabled, the data that is written to the RFWD is pushed into the receive FIFO. Each consecutive write pushes the new data to the next write location in the receive FIFO. When FIFOs are not implemented or not enabled, the data that is written to the RFWD is pushed into the RBR.

8.2.28 REG USR (USR) - Offset 7Ch

UART Status Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7Ch	00000006h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4	0h RO	**RFF:** Receive FIFO Full. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the receive FIFO is completely full. 0 = Receive FIFO not full 1 = Receive FIFO Full This bit is cleared when the RX FIFO is no longer full. Reset Value: 0x0
3	0h RO	**RFNE:** Receive FIFO Not Empty. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the receive FIFO contains one or more entries. 0 = Receive FIFO is empty 1 = Receive FIFO is not empty This bit is cleared when the RX FIFO is empty. Reset Value: 0x0

Bit Range	Default & Access	Field Name (ID): Description
2	1h RO	**TFE:** Transmit FIFO Empty. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the transmit FIFO is completely empty. 0 = Transmit FIFO is not empty 1 = Transmit FIFO is empty This bit is cleared when the TX FIFO is no longer empty. Reset Value: 0x1
1	1h RO	**TFNF:** Transmit FIFO Not Full. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the transmit FIFO in not full. 0 = Transmit FIFO is full 1 = Transmit FIFO is not full This bit is cleared when the TX FIFO is full. Reset Value: 0x1
0	0h RO	**BUSY:** UART Busy. This bit is valid only when UART_16550_COMPATIBLE == NO and indicates that a serial transfer is in progress, when cleared, indicates that the DW_apb_uart is idle or inactive. 0 = DW_apb_uart is idle or inactive 1 = DW_apb_uart is busy (actively transferring data) NOTE: It is possible for the UART Busy bit to be cleared even though a new character may have been sent from another device. That is, if the DW_apb_uart has no data in THR and RBR and there is no transmission in progress and a start bit of a new character has just reached the DW_apb_uart. This is due to the fact that a valid start is not seen until the middle of the bit period and this duration is dependent on the baud divisor that has been programmed. If a second system clock has been implemented (CLOCK_MODE == Enabled), the assertion of this bit is also delayed by several cycles of the slower clock. Reset Value: 0x0

8.2.29 REG TFL (TFL) - Offset 80h

Transmit FIFO Level

Type	Size	Offset	Default
MMIO	32 bit	BAR + 80h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4:0	00h RO	**TFL:** Transmit FIFO Level. This indicates the number of data entries in the transmit FIFO. Reset Value: 0x0

8.2.30 REG RFL (RFL) - Offset 84h

Receive FIFO Level

Type	Size	Offset	Default
MMIO	32 bit	BAR + 84h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4:0	00h RO	**RFL:** Receive FIFO Level. This indicates the number of data entries in the receive FIFO. Reset Value: 0x0

8.2.31 REG SRR (SRR) - Offset 88h

Software Reset Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 88h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2	0h RW	**XFR:** XMIT FIFO Reset. This is a shadow register for the XMIT FIFO Reset bit (FCR[2]). This can be used to remove the burden on software having to store previously written FCR values (which are pretty static) just to reset the transmit FIFO. This resets the control portion of the transmit FIFO and treats the FIFO as empty. This also de-asserts the DMA TX request and single signals when additional DMA handshaking signals are selected (DMA_EXTRA == YES). Note that this bit is 'self-clearing'. It is not necessary to clear this bit. Reset Value: 0x0 Dependencies: Writes have no effect when FIFO_MODE == None.
1	0h RW	**RFR:** RCVR FIFO Reset. This is a shadow register for the RCVR FIFO Reset bit (FCR[1]). This can be used to remove the burden on software having to store previously written FCR values (which are pretty static) just to reset the receive FIFO. This resets the control portion of the receive FIFO and treats the FIFO as empty. This also de-asserts the DMA RX request and single signals when additional DMA handshaking signals are selected (DMA_EXTRA == YES). Note that this bit is 'self-clearing'. It is not necessary to clear this bit. Reset Value: 0x0 Dependencies: Writes have no effect when FIFO_MODE == None.
0	0h RW	**UR:** UART Reset. This asynchronously resets the DW_apb_uart and synchronously removes the reset assertion. For a two clock implementation both pclk and sclk domains are reset. Reset Value: 0x0

8.2.32 REG SRTS (SRTS) - Offset 8Ch

Shadow Request to Send

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**SRTS:** Shadow Request to Send. This is a shadow register for the RTS bit (MCR[1]), this can be used to remove the burden of having to performing a read-modify-write on the MCR. This is used to directly control the Request to Send (rts_n) output. The Request To Send (rts_n) output is used to inform the modem or data set that the DW_apb_uart is ready to exchange data. When Auto RTS Flow Control is not enabled (MCR[5] = 0), the rts_n signal is set low by programming MCR[1] (RTS) to a high. In Auto Flow Control, AFCE_MODE == Enabled and active (MCR[5] = 1) and FIFOs enable (FCR[0] = 1), the rts_n output is controlled in the same way, but is also gated with the receiver FIFO threshold trigger (rts_n is inactive high when above the threshold). Note that in Loopback mode (MCR[4] = 1), the rts_n output is held inactive-high while the value of this location is internally looped back to an input. Reset Value: 0x0

8.2.33 REG SBCR (SBCR) - Offset 90h

Shadow Break Control Bit.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 90h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**SBCB:** Shadow Break Control Register

8.2.34 REG SDMAM (SDMAM) - Offset 94h

Shadow DMA Mode

Type	Size	Offset	Default
MMIO	32 bit	BAR + 94h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**SDMAM:** Shadow DMA Mode. This is a shadow register for the DMA mode bit (FCR[3]). This can be used to remove the burden of having to store the previously written value to the FCR in memory and having to mask this value so that only the DMA Mode bit gets updated. This determines the DMA signaling mode used for the dma_tx_req_n and dma_rx_req_n output signals when additional DMA handshaking signals are not selected (DMA_EXTRA == NO). 0 = mode 0 1 = mode 1 Reset Value: 0x0

8.2.35 REG SFE (SFE) - Offset 98h

Shadow FIFO Enable

Type	Size	Offset	Default
MMIO	32 bit	BAR + 98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**SFE:** Shadow FIFO Enable. This is a shadow register for the FIFO enable bit (FCR[0]). This can be used to remove the burden of having to store the previously written value to the FCR in memory and having to mask this value so that only the FIFO enable bit gets updated. This enables/disables the transmit (XMIT) and receive (RCVR) FIFOs. If this bit is set to zero (disabled) after being enabled then both the XMIT and RCVR controller portion of FIFOs are reset. Reset Value: 0x0

8.2.36 REG SRT (SRT) - Offset 9Ch

Shadow RCVR Trigger

Type	Size	Offset	Default
MMIO	32 bit	BAR + 9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RW	**SRT:** Shadow RCVR Trigger. This is a shadow register for the RCVR trigger bits (FCR[7:6]). This can be used to remove the burden of having to store the previously written value to the FCR in memory and having to mask this value so that only the RCVR trigger bit gets updated. This is used to select the trigger level in the receiver FIFO at which the Received Data Available Interrupt is generated. It also determines when the dma_rx_req_n signal is asserted when DMA Mode (FCR[3]) = 1. The following trigger levels are supported: 00 = 1 character in the FIFO 01 = FIFO full 10 = FIFO full 11 = FIFO 2 less than full Reset Value: 0x0

8.2.37 REG STET (STET) - Offset A0h

Shadow TX Empty Trigger.

Type	Size	Offset	Default
MMIO	32 bit	BAR + A0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RW	**STET:** Shadow TX Empty Trigger: This is a shadow register for the TX empty trigger bits(FCR[5:4]). This can be used to remove the burden of having to store the previously written value to the FCR in memory and having to mask this value so that only the TX empty trigger bit gets updated. This is used to select the empty threshold level at which the THRE Interrupts are generated when the mode is active. The following trigger levels are supported: 00 = FIFO empty 01 = 2 characters in the FIFO 10 = FIFO 1/4 full 11 = FIFO 1/2 full

8.2.38 REG HTX (HTX) - Offset A4h

Halt TX

Type	Size	Offset	Default
MMIO	32 bit	BAR + A4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**HTX:** This register is used to halt transmissions for testing, so that the transmit FIFO can be filled by the master when FIFOs are implemented and enabled. 0 = Halt TX disabled 1 = Halt TX enabled Note, if FIFOs are implemented and not enabled, the setting of the halt TX register has no effect on operation. Reset Value: 0x0 Dependencies: Writes have no effect when FIFO_MODE == None.

8.2.39 REG DMASA (DMASA) - Offset A8h

DMA Software Acknowledge

Type	Size	Offset	Default
MMIO	32 bit	BAR + A8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h WO	**DMASA:** This register is used to perform a DMA software acknowledge if a transfer needs to be terminated due to an error condition. For example, if the DMA disables the channel, then the DW_apb_uart should clear its request. This causes the TX request, TX single, RX request and RX single signals to de-assert. Note that this bit is 'self-clearing'. It is not necessary to clear this bit. Reset Value: 0x0 Dependencies: Writes have no effect when DMA_EXTRA == No.

8.2.40 REG CPR (CPR) - Offset F4h

Component Parameter Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + F4h	00043F32h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:16	04h RO	**FIFO_MODE:** 0x00 = 0 0x01 = 16 0x02 = 32 to 0x80 = 2048
15:14	0h RO	**Reserved**
13	1h RO	**DMA_EXTRA:** 0 = FALSE, 1 = TRUE
12	1h RO	**UART_ADD_ENCODED_PARAMS:** 0 = FALSE, 1 = TRUE
11	1h RO	**SHADOW:** 0 = FALSE, 1 = TRUE
10	1h RO	**FIFO_STAT:** 0 = FALSE, 1 = TRUE
9	1h RO	**FIFO_ACCESS:** 0 = FALSE, 1 = TRUE
8	1h RO	**ADDITIONAL_FEAT:** 0 = FALSE, 1 = TRUE
7	0h RO	**SIR_LP_MODE:** 0 = FALSE, 1 = TRUE
6	0h RO	**SIR_MODE:** 0 = FALSE, 1 = TRUE
5	1h RO	**THRE_MODE:** 0 = FALSE, 1 = TRUE
4	1h RO	**AFCE_MODE:** 0 = FALSE, 1 = TRUE
3:2	0h RO	**Reserved**
1:0	2h RO	**APB_DATA_WIDTH:** 00 = 8 bits

8.2.41 REG CLOCKS (CLOCKS) - Offset 200h

Private Clock Configuration

Type	Size	Offset	Default
MMIO	32 bit	BAR + 200h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**CLK_UPDATE:** Update the clock divider after setting new m and n values, 0 - No clock Update , 1 - Clock gets updated.
30:16	0000h RW	**N_VAL:** This is the denominator value (N) for the M over N divider logic that creates CLK_OUT. Used to generate the input CLK to the UART.
15:1	0000h RW	**M_VAL:** The numerator value (M) for the M over N divider logic that creates the CLK_OUT. Used to generate the input CLK to the UART.
0	0h RW	**CLK_EN:** UART Serial Clock (output of M/N, input to UART) Clock Enable 0 Clock disabled 1 Clock Enabled.

8.2.42 REG RESETS (RESETS) - Offset 204h

Software Reset

Type	Size	Offset	Default
MMIO	32 bit	BAR + 204h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2	0h RW	**RESET_DMA:** reset the DMA controller, 0 = IP is in reset (Reset Asserted) 1 = IP is NOT at reset (Reset Released)
1:0	0h RW	**RESET_IP:** IUART Host Controller reset. Used to reset the I2C Host Controller by SW control. All I2C Configuration State and Operational State will be forced to the Default state. There is no timing requirement (SW can assert and de-assert in back to back transactions) This reset does NOT impact the LPSS cluster level settings by BIOS, the PCI configuration header information, DMA channel configuration and interrupt assignment/mapping/etc. Driver should re-initialize registers related to Driver context following an UART host controller reset. 00 = UART Host Controller is in reset (Reset Asserted) 01 = Reserved 10 = Reserved 11 = UART Host Controller is NOT at reset (Reset Released)

8.2.43 REG ACTIVELTR_VALUE (ACTIVELTR_VALUE) - Offset 210h

ACTIVELTR_VALUE_Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 210h	00000800h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW	**SNOOP_REQUIRMENT:** If the Requirement (bit 15) is clear, that indicates that the device has no LTR requirement for this type of traffic (i.e. it can wait for service indefinitely). If the 10 -bit latency value is zero it indicates that the device cannot tolerate any delay and needs the best possible service/response time.
14:13	0h RO	**Reserved**
12:10	2h RW	**SNOOP_LATENCY_SCALE:** Support for codes 010 (1us) or 011 (32us) for Snoop Latency Scale(1us -> 32ms total span) only. Writes to this CSR which do not match those values will be dropped completely, next read will return previous value.
9:0	000h RW	**SNOOP_VALUE:** 10-bit latency value

8.2.44 REG IDLELTR_VALUE (IDLELTR_VALUE) - Offset 214h

IDLELTR_VALUE_Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 214h	00000800h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW	**SNOOP_REQUIRMENT:** If the Requirement (bit 15) is clear, that indicates that the device has no LTR requirement for this type of traffic (i.e. it can wait for service indefinitely). If the 10 -bit latency value is zero it indicates that the device cannot tolerate any delay and needs the best possible service/response time.

Bit Range	Default & Access	Field Name (ID): Description
14:13	0h RO	**Reserved**
12:10	2h RW	**SNOOP_LATENCY_SCALE:** Support for codes 010 (1us) or 011 (32us) for Snoop Latency Scale(1us -> 32ms total span) only. Writes to this CSR which do not match those values will be dropped completely, next read will return previous value.
9:0	000h RW	**SNOOP_VALUE:** 10-bit latency value

8.2.45 REG TX_BYTE_COUNT (TX_BYTE_COUNT) - Offset 218h

TX_BYTE_COUNT_Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 218h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**TX_COUNT_OVERFLOW:** 0= count valid 1= count overflow/invalid
30:24	0h RO	**Reserved**
23:0	000000h RO	**TX_BYTE_COUNT:** tx_byte_count

8.2.46 REG RX_BYTE_COUNT (RX_BYTE_COUNT) - Offset 21Ch

RX_BYTE_COUNT_Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 21Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**RX_COUNT_OVERFLOW:** 0= count valid 1= count overflow/invalid
30:24	0h RO	**Reserved**
23:0	000000h RO	**RX_BYTE_COUNT:** rx_byte_count

8.2.47 REG SW_SCRATCH_0 (SW_SCRATCH_0) - Offset 228h

SW_SCRATCH_0_Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 228h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SW_SCRATCH_0:** Scratch Pad Register for SW to generated Local DATA for iDMA

8.2.48 REG CLOCK_GATE (CLOCK_GATE) - Offset 238h

CLOCK_GATE_Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 238h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3:2	0h RW	**SW_DMA_CLK_CTL:** Dma Clock Gate Control bits, 00-hw clk en, 01-rsv, 10-force off, 11-force on
1:0	0h RW	**SW_IP_CLK_CTL:** IP Clock Gate Control bits, 00-hw clk en, 01-rsv, 10-force off, 11-force on

8.2.49 REG REMAP_ADDR_LO (REMAP_ADDR_LO) - Offset 240h

REMAP_ADDR_LO_Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 240h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**UART_REMAP_ADDR_LOW:** Low 32 bits of BAR address read by SW

8.2.50 REG REMAP_ADDR_HI (REMAP_ADDR_HI) - Offset 244h

REMAP_ADDR_HI_Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 244h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**UART_REMAP_ADDR_HIGH:** High 32 bits of BAR address read by SW

8.2.51 REG DEVIDLE_CONTROL (DEVIDLE_CONTROL) - Offset 24Ch

This register allows a device driver to enable/disable a devices entry into DevIdle. By enabling DevIdle, SW specifies that it will not touch the device without accessing this register prior to accessing any other MMIO device register. Detailed SW DevIdle entry/exit flows are defined in the Chassis Power Management and Device Idle PFAS specifications

Type	Size	Offset	Default
MMIO	32 bit	BAR + 24Ch	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4	0h RO	**INTR_REQ_CAPABLE:** Set to 1 by HW if it is capable of generating an interrupt on command completion, else 0.
3	1h RW/1C	**RESTORE_REQUIRED:** When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up.
2	0h RW	**DEVIDLE:** SW sets this bit to 1 to move the function into the DevIdle state. Writing this bit to 0 will return the function to the fully active D0 state (D0i0)
1	0h RO	Reserved
0	0h RO	**CMD_IN_PROGRESS:** HW sets this bit on a 1->0 or 0->1 transition of DEVIDLE. While set, the other bits in this register are not valid and it is illegal for SW to write to any bit in this register. HW clears this bit upon completing the DevIdle transition command. When clear, all the other bits in the register are valid and SW may write to any bit. If Interrupt Request (IR) was set for the current command, HW may clear this bit before the interrupt has been made visible to SW, since when SW actually handles a particular interrupt is not visible to the HW. SW writes to this bit have no effect.

8.2.52 REG UART_HVM_MISR_CRCOUT (UART_HVM_MISR_CRCOUT) - Offset 280h

UART HVM MISR CRCOUT

Type	Size	Offset	Default
MMIO	32 bit	BAR + 280h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	FFFFh RO	**UART_HVM_MISR_CRCOUT:** UART MISR Output for HVM

8.2.53 REG CAPABLITIES (CAPABLITIES) - Offset 2FCh

Capabilities Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 2FCh	00000010h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved**
8	0h RO	**IDMA_PRESENT:** 0= DMA present 1= DMA not present
7:4	1h RO	**INSTANCE_TYPE:** I2C, SPI or UART
3:0	0h RO	**INSTANCE_NUMBER:** Instance number

8.2.54 REG SAR_LO0 (SAR_LO0) - Offset 800h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer. Source Address Register for lower 32-bits for Channels 0-1

Type	Size	Offset	Default
MMIO	32 bit	BAR + 800h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SAR_LO:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP-based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected). 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.2.55 REG SAR_HI0 (SAR_HI0) - Offset 804h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer. Source Address Register for upper 32-bits for Channels 0-1

Type	Size	Offset	Default
MMIO	32 bit	BAR + 804h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SAR_HI:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.2.56 REG DAR_LO0 (DAR_LO0) - Offset 808h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer. Destination Address Register for Channels 0-1

Type	Size	Offset	Default
MMIO	32 bit	BAR + 808h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DAR_LO:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.2.57 REG DAR_HI0 (DAR_HI0) - Offset 80Ch

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer. Destination Address Register for Upper 32-bits for Channels 0-1

Type	Size	Offset	Default
MMIO	32 bit	BAR + 80Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DAR_HI:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.2.58 REG LLP_LO0 (LLP_LO0) - Offset 810h

You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled. The LLP register has two functions: The logical result of the equation LLP.LOC!= 0is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC!= 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists. The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 810h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0h RO	**Reserved**

8.2.59 REG LLP_HI0 (LLP_HI0) - Offset 814h

You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled. The LLP register has two functions: The logical result of the equation LLP.LOC != 0is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC!= 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 814h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot b changed or programmed to anything other than 32-bit.

8.2.60 REG CTL_LO0 (CTL_LO0) - Offset 818h

This register contains fields that control the DMA transfer. The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 818h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0h RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
21:20	0h RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Reserved (00) Memory to Peripheral (01) Peripheral to Memory (10) Reserved (11) Flow Control is always assigned to the DMA.
19	0h RO	**Reserved**
18	0h RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0h RW	**SRC_GATHER_EN:** Source gathers enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control
16:14	0h RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. Source BURST SIZE (in DW) = (2 ^ SRC_TR_WIDTH)
13:11	0h RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination.
10	0h RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0h RO	**Reserved**
8	0h RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
6:4	0h RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE (IN DW) = (2^ MSIZE) (i.e. 2 to-the-power-of MSIZE) 1.Transferred Bytes Per Burst = BURST_SIZE * (2 ^ TR_WIDTH) Since Max Burst Length is limited by the OCP fabric to 16 DW, encodings 101 (32 DW), 110 (64 DW) and 111 (128 DW) are not supported by the fabric. 2.For incrementing addresses and (Transfer_Width < 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations)
3:1	0h RW	**DST_TR_WIDTH:** BURST SIZE (in DW) = (2^ MSIZE) (i.e. 2 to-the-power-of MSIZE) Transferred Bytes Per Burst = BURST_SIZE * (2 ^ TR_WIDTH) Since Max Burst Length is limited by the South-Complex OCP fabric to 16 DW, encodings 101 (32 DW), 110 (64 DW) and 111 (128 DW) are not supported by the fabric. For incrementing addresses and (Transfer_Width < 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations)
0	0h RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

8.2.61 REG CTL_HI0 (CTL_HI0) - Offset 81Ch

This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled. If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 81Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior.

Bit Range	Default & Access	Field Name (ID): Description
28:18	0h RO	**Reserved**
17	0h RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	00000h RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It does not mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register.

8.2.62 REG SSTAT0 (SSTAT0) - Offset 820h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block

Type	Size	Offset	Default
MMIO	32 bit	BAR + 820h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

8.2.63 REG DSTAT0 (DSTAT0) - Offset 828h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI.

This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 828h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface

8.2.64 REG SSTATAR_LO0 (SSTATAR_LO0) - Offset 830h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 830h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SSTATAR_LO:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block

8.2.65 REG SSTATAR_HI0 (SSTATAR_HI0) - Offset 834h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 834h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SSTATAR_HI:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block

8.2.66 REG DSTATAR_LO0 (DSTATAR_LO0) - Offset 838h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 838h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DSTATAR_LO:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

8.2.67 REG DSTATAR_HI0 (DSTATAR_HI0) - Offset 83Ch

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 83Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DSTATAR_HI:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

8.2.68 REG CFG_LO0 (CFG_LO0) - Offset 840h

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Type	Size	Offset	Default
MMIO	32 bit	BAR + 840h	00000203h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated
30	0h RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0h RO	**Reserved**
21	0h RW	**SRC_OPT_BL:** Optimize Source Burst Length: 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE))
20	0h RW	**DST_OPT_BL:** Optimize Destination Burst Length: 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE))
19	0h RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0h RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17:11	0h RO	**Reserved**
10	0h RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit affects only when CH_SUSPEND is asserted
9	1h RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0h RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0h RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0h RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0h RO	**Reserved**
3	0h RW	**HSHAKE_NP_WR:** 0x1: Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0: Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of block writes which will be Non-Posted)
2	0h RW	**ALL_NP_WR:** 0x1: Forces ALL writes to be Non-Posted on DMA Write Port 0x0: Non-Posted Writes will only be used at end of block transfers and in HW Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used
1	1h RW	**SRC_BURST_ALIGN:** 0x1: SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0: SRC Burst Transfers are not broken at a Burst Length aligned boundary
0	1h RW	**DST_BURST_ALIGN:** 0x1: DST Burst Transfers are broken at a Burst Length aligned boundary 0x0: DST Burst Transfers are not broken at a Burst Length aligned boundary

8.2.69 REG CFG_HI0 (CFG_HI0) - Offset 844h

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Type	Size	Offset	Default
MMIO	32 bit	BAR + 844h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27:18	000h RW	**WR_ISSUE_THD:** Write Issue Threshold. Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.

Bit Range	Default & Access	Field Name (ID): Description
17:8	000h RW	**RD_ISSUE_THD:** Read Issue Threshold. Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.
7:4	0h RW	**DST_PER:** Destination Peripheral ID: Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface.
3:0	0h RW	**SRC_PER:** Source Peripheral ID: Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface.

8.2.70 REG SGR0 (SGR0) - Offset 848h

The Source Gather register contains two fields: Source gathers count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gathers interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 848h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	000h RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	00000h RW	**SGI:** Source gather interval.

8.2.71 REG DSR0 (DSR0) - Offset 850h

The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC). Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI). Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 850h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	000h RW	**DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries
19:0	00000h RW	**DSI:** Destination scatter interval.

8.2.72 REG RawTfr (RAWTFR) - Offset AC0h

Interrupt events are stored in this Raw Interrupt Status registers before masking: RawBlock, RawDstTran, RawErr, RawSrcTran, and RawTfr. Each Raw Interrupt Status register has a bit allocated per channel, for example, RawTfr(2) is the Channel 2 raw transfer complete interrupt. Each bit in these registers is cleared by writing a 1 to the corresponding location in the ClearTfr, ClearBlock, ClearSrcTran, ClearDstTran, ClearErr registers

Type	Size	Offset	Default
MMIO	32 bit	BAR + AC0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RO	**RAW:** Raw Interrupt Status for Ch1 And Ch0

8.2.73 REG RawBlock (RAWBLOCK) - Offset AC8h

RawBlock - Raw Status for Block Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + AC8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RO	**RAW:** Raw Interrupt Status for Ch1 And Ch0

8.2.74 REG RawSrcTran (RAWSRCTRAN) - Offset AD0h

RawSrcTran - Raw Status for Source Transaction Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + AD0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RO	**RAW:** Raw Interrupt Status for Ch1 And Ch0

8.2.75 REG RawDstTran (RAWDSTTRAN) - Offset AD8h

RawDstTran - Raw Status for Destination Transaction Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + AD8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RO	**RAW:** Raw Interrupt Status for Ch1 And Ch0

8.2.76 REG RawErr (RAWERR) - Offset AE0h

RawErr - Raw Status for Error Interrupts Register Error interrupt will be asserted by the DMA in the following cases:

IOSF Fabric returns an Unsuccessful Completion with UR Completion Status for a Non-Posted transaction issued by the DMA to Memory. This error occurs when an invalid address range is programed into the DMA SRC/Dest Field outside of the Host memory region on the memory side of the DMA transaction IOSF2OCP bridge will return error (triggering error interrupt from DMA) if the IOSF2OCP Bridge is programmed incorrectly.

Peripheral side transactions where invalid addressing can result in an OCP fabric error which will be translated into an Error Interrupt The SW should view this error as a serious programming error and handle it according to the specified error handling procedures for the product and OS.

Type	Size	Offset	Default
MMIO	32 bit	BAR + AE0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RO	**RAW:** Raw Interrupt Status for Ch1 And Ch0

8.2.77 REG StatusTfr (STATUSTFR) - Offset AE8h

Status for Transfer Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + AE8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RO	**STATUS:** Status for Interrupt for Ch1 And Ch0

8.2.78 REG StatusBlock (STATUSBLOCK) - Offset AF0h

StatusBlock: Status for Block Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + AF0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RO	**STATUS:** Status for Interrupt for Ch1 And Ch0

8.2.79 REG StatusSrcTran (STATUSSRCTRAN) - Offset AF8h

StatusSrcTran: Status for Source Transaction Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + AF8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RO	**STATUS:** Status for Interrupt for Ch1 And Ch0

8.2.80 REG StatusDstTran (STATUSDSTTRAN) - Offset B00h

StatusDstTran: Status for Destination Transaction Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B00h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RO	**STATUS:** Status for Interrupt for Ch1 And Ch0

8.2.81 REG StatusErr (STATUSERR) - Offset B08h

StatusErr, Status for Error Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B08h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RO	**STATUS** Status for Interrupt for Ch1 And Ch0

8.2.82 REG MaskTfr (MASKTFR) - Offset B10h

Mask for Transfer Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:8	0h WO	**INT_MASK_WE:** Interrupt Mask Write Enable Ch1 and Ch0. 0 = write disabled 1 = write enabled
7:2	0h RO	**Reserved**
1:0	0h RW	**INT_MASK:** Interrupt Mask per Ch1 and Ch0. 0 = mask 1 = unmask

8.2.83 REG MaskBlock (MASKBLOCK) - Offset B18h

MaskBlock: Mask for Block Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:8	0h WO	**INT_MASK_WE:** Interrupt Mask Write Enable Ch1 and Ch0. 0 = write disabled 1 = write enabled
7:2	0h RO	**Reserved**
1:0	0h RW	**INT_MASK:** Interrupt Mask Ch1 and Ch0. 0 = mask 1 = unmask

8.2.84 REG MaskSrcTran (MASKSRCTRAN) - Offset B20h

Mask for Source Transaction Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B20h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:8	0h WO	**INT_MASK_WE:** Interrupt Mask Write Enable Ch1 and Ch0. 0 = write disabled 1 = write enabled
7:2	0h RO	**Reserved**
1:0	0h RW	**INT_MASK:** Interrupt Mask Ch1 and Ch0. 0 = mask 1 = unmask

8.2.85 REG MaskDstTran (MASKDSTTRAN) - Offset B28h

Mask for Destination Transaction Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B28h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:8	0h WO	**INT_MASK_WE:** Interrupt Mask Write Enable Ch1 and Ch0. 0 = write disabled 1 = write enabled
7:2	0h RO	**Reserved**
1:0	0h RW	**INT_MASK:** Interrupt Mask Ch1 and Ch0. 0 = mask 1 = unmask

8.2.86 REG MaskErr (MASKERR) - Offset B30h

Mask for Error Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:8	0h WO	**INT_MASK_WE:** Interrupt Mask Write Enable Ch1 and Ch0. 0 = write disabled 1 = write enabled
7:2	0h RO	**Reserved**
1:0	0h RW	**INT_MASK:** Interrupt Mask Ch1 and Ch0. 0 = mask 1 = unmask

8.2.87 REG ClearTfr (CLEARTFR) - Offset B38h

Clear for Transfer Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B38h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h WO	**CLEAR:** Interrupt Clear Ch1 and Ch0. 0 = no effect 1 = clear interrupt

8.2.88 REG ClearBlock (CLEARBLOCK) - Offset B40h

Clear for Block Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B40h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h WO	**CLEAR:** Interrupt Clear Ch1 and Ch0. 0 = no effect 1 = clear interrupt

8.2.89 REG ClearSrcTran (CLEARSRCTRAN) - Offset B48h

Clear for Source Transaction Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B48h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h WO	**CLEAR:** Interrupt Clear Ch1 and Ch0. 0 = no effect 1 = clear interrupt

8.2.90 REG ClearDstTran (CLEARDSTTRAN) - Offset B50h

Clear for Destination Transaction Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B50h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h WO	**CLEAR:** Interrupt Clear Ch1 and Ch0. 0 = no effect 1 = clear interrupt

8.2.91 REG ClearErr (CLEARERR) - Offset B58h

Clear for Error Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B58h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h WO	**CLEAR:** Interrupt Clear Ch1 and Ch0. 0 = no effect 1 = clear interrupt

8.2.92 REG StatusInt (STATUSINT) - Offset B60h

The contents of each of the five Status registers StatusTfr, StatusBlock, StatusSrcTran, StatusDstTran, StatusErr is ORed to produce a single bit for each interrupt type in the Combined Status register (StatusInt). This register is read-only.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B60h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4	0h RO	**ERR:** OR of the contents of StatusErr register.
3	0h RO	**DSTT:** OR of the contents of StatusDst register.
2	0h RO	**SRCT:** OR of the contents of StatusSrcTran register
1	0h RO	**BLOCK:** OR of the contents of StatusBlock register.
0	0h RO	**TFR:** OR of the contents of StatusTfr register.

8.2.93 REG DmaCfgReg (DMACFGREG) - Offset B98h

This register is used to enable the DMA, which must be done before any channel activity can begin. If the global channel enable bit is cleared while any channel is still active, then DmaCfgReg.DMA_EN still returns 1 to indicate that there are channels still active until hardware has terminated all activity on all channels, at which point the DmaCfgReg.DMA_EN bit returns 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**DMA_EN:** DMA Enable bit. 0 = DMA Disabled 1 = DMA Enabled

8.2.94 REG ChEnReg (CHENREG) - Offset BA0h

This is the DMA Channel Enable Register. If software needs to set up a new channel, then it can read this register in order to find out which channels are currently inactive, it can then enable an inactive channel with the required priority.

All bits of this register are cleared to 0 when the global DMA channel enable bit, DmaCfgReg(0), is 0. When the global channel enable bit is 0, then a write to the ChEnReg register is ignored and a read will always read back 0. The channel enable bit, ChEnReg.CH_EN, is written only if the corresponding channel write enable bit, ChEnReg.CH_EN_WE, is asserted on the same OCP write transfer.

Type	Size	Offset	Default
MMIO	32 bit	BAR + BA0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:8	0h WO	**CH_EN_WE:** Channel Enable Write Enable
7:2	0h RO	**Reserved**
1:0	0h RW	**CH_EN:** Enables/Disables the channel. Setting this bit enables a channel, clearing this bit disables the channel. 0 = Disable the Channel 1 = Enable the Channel The ChEnReg.CH_EN bit is automatically cleared by hardware to disable the channel after the last OCP transfer of the DMA transfer to the destination has completed. Software can therefore poll this bit to determine when this channel is free for a new DMA transfer.

8.3 UART PCR Registers Summary

Table 8-3. Summary of UART PCR Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
218h	4	PCICFGCTR7 PCI Configuration Control 7 Register (PCICFGCTR7)	00000100h
21Ch	4	PCICFGCTR8 PCI Configuration Control 8 Register (PCICFGCTR8)	00000100h
220h	4	PCICFGCTR9 PCI Configuration Control 9 Register (PCICFGCTR9)	00000100h
224h	4	PCICFGCTR10 PCI Configuration Control 10 Register (PCICFGCTR10)	00000100h
228h	4	PCICFGCTR11 PCI Configuration Control 11 Register (PCICFGCTR11)	00000100h
22Ch	4	PCICFGCTR12 PCI Configuration Control 12 Register (PCICFGCTR12)	00000100h

8.3.1 PCICFGCTR7 PCI Configuration Control 7 Register (PCICFGCTR7) - Offset 218h

Controls The PCI Configuration Space

Type	Size	Offset	Default
MMIO	32 bit	FDCD0000h + 218h	00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RO	**Reserved**
27:20	00h RW	**PCI_IRQ7:** IRQ number to be sent in the message with data field for PCI Assert_IRQ and PCI_Deassert_IRQ message
19:12	00h RW	**ACPI_IRQ7:** IRQ number to be sent in the message with data field for ACPI Assert_IRQ and ACPI_Deassert_IRQ message
11:8	1h RW	**IPIN7:** Interrupt Pin: This register indicates the values to be used for Global Interrupts.
7	0h RW	**BAR1_DISABLE7:** BAR1_Disable: BAR1 register in the PCOS space becomes Read only when this bit is set.
6:2	00h RW	**PME_SUPPORT7:** The value in this register is XOR with the value in the PME_support strap and reflected in the PME_Support register in the PCI configuration space
1	0h RW	**ACPI_INTR_EN7:** When set, the Bridge uses ACPI Sideband opcodes for messages When cleared, the Bridge uses global IOSF opcodes
0	0h RW	**PCI_CFG_DIS7:** When set, PCI configuration accesses return UR response When 0, PCI configuration accesses are supported

8.3.2 PCICFGCTR8 PCI Configuration Control 8 Register (PCICFGCTR8) - Offset 21Ch

Controls The PcI Configuration Space

Type	Size	Offset	Default
MMIO	32 bit	FDCD0000h + 21Ch	00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RO	**Reserved**
27:20	00h RW	**PCI_IRQ8:** IRQ number to be sent in the message with data field for PCI Assert_IRQ and PCI_Deassert_IRQ message
19:12	00h RW	**ACPI_IRQ8:** IRQ number to be sent in the message with data field for ACPI Assert_IRQ and ACPI_Deassert_IRQ message
11:8	1h RW	**IPIN8:** Interrupt Pin: This register indicates the values to be used for Global Interrupts.
7	0h RW	**BAR1_DISABLE8:** BAR1_Disable: BAR1 register in the PCOS space becomes Read only when this bit is set.
6:2	00h RW	**PME_SUPPORT8:** The value in this register is XOR with the value in the PME_support strap and reflected in the PME_Support register in the PCI configuration space
1	0h RW	**ACPI_INTR_EN8:** When set, the Bridge uses ACPI Sideband opcodes for messages When cleared, the Bridge uses global IOSF opcodes
0	0h RW	**PCI_CFG_DIS8:** When set, PCI configuration accesses return UR response When 0, PCI configuration accesses are supported

8.3.3 PCICFGCTR9 PCI Configuration Control 9 Register (PCICFGCTR9) - Offset 220h

Controls the PCI configuration space

Type	Size	Offset	Default
MMIO	32 bit	FDCD0000h + 220h	00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RO	**Reserved**
27:20	00h RW	**PCI_IRQ9:** IRQ number to be sent in the message with data field for PCI Assert_IRQ and PCI_Deassert_IRQ message
19:12	00h RW	**ACPI_IRQ9:** IRQ number to be sent in the message with data field for ACPI Assert_IRQ and ACPI_Deassert_IRQ message
11:8	1h RW	**IPIN9:** Interrupt Pin: This register indicates the values to be used for Global Interrupts.
7	0h RW	**BAR1_DISABLE9:** BAR1_Disable: BAR1 register in the PCOS space becomes Read only when this bit is set.
6:2	00h RW	**PME_SUPPORT9:** The value in this register is XOR with the value in the PME_support strap and reflected in the PME_Support register in the PCI configuration space
1	0h RW	**ACPI_INTR_EN9:** When set, the Bridge uses ACPI Sideband opcodes for messages When cleared, the Bridge uses global IOSF opcodes
0	0h RW	**PCI_CFG_DIS9:** When set, PCI configuration accesses return UR response When 0, PCI configuration accesses are supported

8.3.4 PCICFGCTR10 PCI Configuration Control 10 Register (PCICFGCTR10) - Offset 224h

Controls The PCI Configuration Space

Type	Size	Offset	Default
MMIO	32 bit	FDCD0000h + 224h	00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RO	**Reserved**
27:20	00h RW	**PCI_IRQ10:** IRQ number to be sent in the message with data field for PCI Assert_IRQ and PCI_Deassert_IRQ message
19:12	00h RW	**ACPI_IRQ10:** IRQ number to be sent in the message with data field for ACPI Assert_IRQ and ACPI_Deassert_IRQ message
11:8	1h RW	**IPIN10:** Interrupt Pin: This register indicates the values to be used for Global Interrupts.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**BAR1_DISABLE10:** BAR1_Disable: BAR1 register in the PCOS space becomes Read only when this bit is set.
6:2	00h RW	**PME_SUPPORT10:** The value in this register is XOR with the value in the PME_support strap and reflected in the PME_Support register in the PCI configuration space
1	0h RW	**ACPI_INTR_EN10:** When set, the Bridge uses ACPI Sideband opcodes for messages When cleared, the Bridge uses global IOSF opcodes
0	0h RW	**PCI_CFG_DIS10:** When set, PCI configuration accesses return UR response When 0, PCI configuration accesses are supported

8.3.5 PCICFGCTR11 PCI Configuration Control 11 Register (PCICFGCTR11) - Offset 228h

Controls the PCI configuration space

Type	Size	Offset	Default
MMIO	32 bit	FDCD0000h + 228h	00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RO	**Reserved**
27:20	00h RW	**PCI_IRQ11:** IRQ number to be sent in the message with data field for PCI Assert_IRQ and PCI_Deassert_IRQ message
19:12	00h RW	**ACPI_IRQ11:** IRQ number to be sent in the message with data field for ACPI Assert_IRQ and ACPI_Deassert_IRQ message
11:8	1h RW	**IPIN11:** Interrupt Pin: This register indicates the values to be used for Global Interrupts.
7	0h RW	**BAR1_DISABLE11:** BAR1_Disable: BAR1 register in the PCOS space becomes Read only when this bit is set.
6:2	00h RW	**PME_SUPPORT11:** The value in this register is XOR with the value in the PME_support strap and reflected in the PME_Support register in the PCI configuration space
1	0h RW	**ACPI_INTR_EN11:** When set, the Bridge uses ACPI Sideband opcodes for messages When cleared, the Bridge uses global IOSF opcodes
0	0h RW	**PCI_CFG_DIS11:** When set, PCI configuration accesses return UR response When 0, PCI configuration accesses are supported

8.3.6 PCICFGCTR12 PCI Configuration Control 12 Register (PCICFGCTR12) - Offset 22Ch

Controls the PCI configuration space

Type	Size	Offset	Default
MMIO	32 bit	FDCD0000h + 22Ch	00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RO	**Reserved**
27:20	00h RW	**PCI_IRQ12:** IRQ number to be sent in the message with data field for PCI Assert_IRQ and PCI_Deassert_IRQ message
19:12	00h RW	**ACPI_IRQ12:** IRQ number to be sent in the message with data field for ACPI Assert_IRQ and ACPI_Deassert_IRQ message
11:8	1h RW	**IPIN12:** Interrupt Pin: This register indicates the values to be used for Global Interrupts.
7	0h RW	**BAR1_DISABLE12:** BAR1_Disable: BAR1 register in the PCOS space becomes Read only when this bit is set.
6:2	00h RW	**PME_SUPPORT12:** The value in this register is XOR with the value in the PME_support strap and reflected in the PME_Support register in the PCI configuration space
1	0h RW	**ACPI_INTR_EN12:** When set, the Bridge uses ACPI Sideband opcodes for messages When cleared, the Bridge uses global IOSF opcodes
0	0h RW	**PCI_CFG_DIS12:** When set, PCI configuration accesses return UR response When 0, PCI configuration accesses are supported

9 Generic Serial Peripheral Interface (GSPI) Controller

9.1 GSPI Configuration Registers Summary

This chapter documents the registers in Bus: 0, Device 30, Function 2 and 3. Also lists the registers in Bus 0, Device 18, Function 0.

DID Values:

- GSPI Controller #0:- D30:F2 - 4B2Ah
- GSPI Controller #1:- D30:F3 - 4B2Bh
- GSPI Controller #2:- D18:F0 - 4B37h

Table 9-1. Summary of Bus: 0, Device: 30, Function: 2 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	Device ID And Vendor ID Register (DEVVENDID)	4B2A8086h
4h	4	Status And Command (STATUSCOMMAND)	00100000h
8h	4	Revision ID And Class Code (REVCLASSCODE)	0C800000h
Ch	4	Cache Line Latency Header And BIST (CLLATHEADERBIST)	00800000h
10h	4	Base Address Register (BAR)	00000000h
14h	4	Base Address Register High (BAR_HIGH)	00000000h
18h	4	Base Address Register1 (BAR1)	00000004h
1Ch	4	Base Address Register1 High (BAR1_HIGH)	00000000h
2Ch	4	Subsystem Vendor And Subsystem ID (SUBSYSTEMID)	00000000h
30h	4	Expansion ROM Base Address (EXPANSION_ROM_BASEADDR)	00000000h
34h	4	Capabilities Pointer Register (CAPABILITYPTR)	00000080h
3Ch	4	Interrupt Register (INTERRUPTREG)	00000000h
80h	4	PowerManagement Capability ID (POWERCAPID)	00039001h
84h	4	Power Management Control And Status Register (PMECTRLSTATUS)	00000008h
90h	4	PCI Device Idle Vendor Capability Register (PCIDEVIDLE_CAP_RECORD)	F0140009h
94h	4	Vendor Specific Extended Capability Register (DEVID_VEND_SPECIFIC_REG)	01400010h
98h	4	Software LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG)	00002101h
9Ch	4	Device Idle Pointer Register (DEVICE_IDLE_POINTER_REG)	000024C1h
A0h	4	D0i3 And Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG)	000F0800h
B0h	4	General Purpose Read Write Register1 (GEN_REGRW1)	00000000h
B4h	4	General Purpose Read Write Register2 (GEN_REGRW2)	00000000h
B8h	4	General Purpose Read Write Register3 (GEN_REGRW3)	00000000h
BCh	4	General Purpose Read Write Register4 (GEN_REGRW4)	00000000h
C0h	4	General Purpose Input Register (GEN_INPUT_REG)	00000000h
F8h	4	Manufacturers ID (MANID)	00000000h

9.1.1 Device ID And Vendor ID Register (DEVVENDID) - Offset 0h

Device ID and Vendor ID.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:2] + 0h	A0AA8086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	4B2Ah RO/P	**Device ID Field (DEVICEID):** Device ID identifies the particular PCI device
15:0	8086h RO	**Vendor ID Field (VENDORID):** Vendor ID is a unique ID provided by the PCI SIG which identifies the manufacturer of the device

9.1.2 Status And Command (STATUSCOMMAND) - Offset 4h

Command register and Status register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:2] + 4h	00100000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29	0h RW/1C	**RMA Field (RMA):** Received Master Abort
28	0h RW/1C	**RTA Field (RTA):** Received Target Abort
27:21	0h RO	**Reserved**
20	1h RO	**Cap List Field (CAPLIST):** Capabilities List: Indicates that the controller contains a capabilities pointer list
19	0h RO	**Interrupt Status Field (INTR_STATUS):** Interrupt Status: This bit reflects state of interrupt in the device
18:11	0h RO	**Reserved**
10	0h RW	**Interrupt Disable Field (INTR_DISABLE):** Interrupt Disable
9	0h RO	**Reserved**
8	0h RW	**SERR Enable Field (SERR_ENABLE):** SERR Enable Not implemented
7:3	0h RO	**Reserved**
2	0h RW	**BME Field (BME):** Bus Master Enable
1	0h RW	**MSE Field (MSE):** Memory Space Enable
0	0h RO	**Reserved**

9.1.3 Revision ID And Class Code (REVCLASSCODE) - Offset 8h

Revision ID register and Class Code register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:2] + 8h	0C800000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0C8000h RO	**Revision ID Field (CLASS_CODES):** Class Code register is read-only and is used to identify the generic function of the device and in some cases a specific register-level programming interface
7:0	00h RO/P	**Class Code Field (RID):** Revision ID identifies the revision of particular PCI device.

9.1.4 Cache Line Latency Header and BIST (CLLATHEADERBIST) - Offset Ch

Cache Line Size as RW with def 0 Latency Timer RW with def 0 Header Type with Type 0 configuration header and Reserved BIST register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:2] + Ch	00800000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	1h RO	**Multi-Function Device Field (MULFNDEV):** Multi-Function Device
22:16	00h RO	**Header Type Field (HEADERTYPE):** Header Type: Implements Type 0 Configuration header
15:8	00h RO	**Latency Timer Field (LATTIMER):** Latency Timer: This register is implemented as R/W with default as 0
7:0	00h RW/P	**Cache Line Size Field (CACHELINE_SIZE):** Cache Line Size

9.1.5 Base Address Register (BAR) - Offset 10h

Base Address Register Low [31:2] type[2:1] in 32bit or 64bit address range and memory space indicator [0].

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:2] + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR):** Base Address Register Low Base address of the OCP fabric memory space. Taken from Strap values as ones
11:4	00h RO	**Size Field (SIZEINDICATOR):** Size Indicator RO Always returns 0 The size of this register depends on the size of the memory space
3	0h RO	**Prefetchable Field (PREFETCHABLE):** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**Type Field (TYPE0):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range. If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE):** Memory Space Indicator: 0 indicates this BAR is present in the memory space.

9.1.6 Base Address Register High (BAR_HIGH) - Offset 14h

Base Address Register High enabled if [2:1] of BAR_HIGH is 10.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:2] + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR_HIGH):** Base Address High - MSB

9.1.7 Base Address Register1 (BAR1) - Offset 18h

Base Address Register1 accesses to PCI configuration space and is always 4K type in [2:1] and memory space indicator in [0].

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:2] + 18h	00000004h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR1):** Base Address1 This field is present if BAR1 is enabled through private configuration space.
11:4	00h RO	**Size Field (SIZEINDICATOR1):** Always is 0 as minimum size is 4K

Bit Range	Default & Access	Field Name (ID): Description
3	0h RO	**Prefetchable Field (PREFETCHABLE1):** Prefetchable: Indicates that this BAR is not pre-fetchable.
2:1	2h RO	**Type Field (TYPE1):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE1):** Memory Space Indicator: 0 Indicates this BAR is present in the memory space

9.1.8 Base Address Register1 High (BAR1_HIGH) - Offset 1Ch

Base Address Register1 High enabled only if [2:1] of BAR1 register is 10.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:2] + 1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR1_HIGH):** Base Address: Base address of the OCP fabric memory space. Taken from Strap values as ones

9.1.9 Subsystem Vendor And Subsystem ID (SUBSYSTEMID) - Offset 2Ch

SVID register along with SID register is to distinguish subsystem from another.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:2] + 2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O/P	**Subsystem ID Field (SUBSYSTEMID):** Subsystem ID: This register is implemented for any function that can be instantiated more than once in a given system.
15:0	0000h RW/O/P	**Subsystem Vendor Field (SUBSYSTEMVENDORID):** Subsystem Vendor ID: This register must be implemented for any function that can be instantiated more than once in a given system

9.1.10 Expansion ROM Base Address (EXPANSION_ROM_BASEADDR) - Offset 30h

Expansion ROM Base Address register is a RO indicates support for Expansion ROMs

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:2] + 30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**EXPANSION ROM base address field (EXPANSION_ROM_BASE):** Expansion ROM Base Address: Value of all zeros indicates no support for Expansion ROM

9.1.11 Capabilities Pointer Register (CAPABILITYPTR) - Offset 34h

Capabilities Pointer register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:2] + 34h	00000080h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	80h RO	**Capabilities Pointer Field (CAPPTR_POWER):** Capabilities Pointer: Indicates what the next capability is.

9.1.12 Interrupt Register (INTERRUPTREG) - Offset 3Ch

Interrupt line Register isn't used in Bridge directly Interrupt Pin register reflects the IPIN value in private configuration space. Min_GNT register indicating the requirements of latency timers and Max_LAT register max latency.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:2] + 3Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Max Latency Field (MAX_LAT):** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	00h RO	**Min GNT Field (MIN_GNT):** Value of 0 indicates device has no major requirements for the settings of latency timers // Re-Check Desc Padma

Bit Range	Default & Access	Field Name (ID): Description
15:12	0h RO	**Reserved**
11:8	0h RO	**Interrupt Pin Field (INTPIN):** Interrupt Pin: Value in this register is reflected from the IPIN value in the private configuration space.
7:0	00h RW/P	**Int Line Field (INTLINE):** Interrupt Line: It is used to communicate to software the interrupt line to which the interrupt pin is connected

9.1.13 Power Management Capability ID (POWERCAPID) - Offset 80h

Power Management Capability ID register points to Next Capability Structure and Power Management Capability with Power Management Capabilities register for PME Support and Version.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:2] + 80h	00039001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	00h RO	**PME Support Field (PMESUPPORT):** This 5-bit field indicates the power states in which the function can assert the PME#
26:19	0h RO	**Reserved**
18:16	3h RO	**Version Field (VERSION):** Indicates support for Revision 1.2 of the PCI Power Management Specification
15:8	90h RO	**Next Cap Field (NXTCAP):** Next Capability: Points to the next capability structure.
7:0	01h RO	**Power Capability ID Field (POWER_CAP):** Power Management Capability: Indicates this is power management capability

9.1.14 Power Management Control and Status Register (PMECTRLSTATUS) - Offset 84h

Power Management Control and Status Register to set and read PME Status, PME Enable, No Soft Reset and Power State.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:2] + 84h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW/1C/P	**PME Status Field (PMESTATUS):** PME Status
14:9	0h RO	**Reserved**
8	0h RW/P	**PME Enable Field (PMEENABLE):** PME Enable
7:4	0h RO	**Reserved**
3	1h RO	**No Soft Reset Field (NO_SOFT_RESET):** This bit indicates that devices transitioning from D3hot to D0 because of Power State commands do not perform an internal reset
2	0h RO	**Reserved**
1:0	0h RW	**Power State Field (POWERSTATE):** Power State: This field is used both to determine the current Power State and to set a new Power State

9.1.15 PCI Device Idle Vendor Capability Register (PCIDEVIDLE_CAP_RECORD) - Offset 90h

PCI Device Vendor Specific Capability register defines Vendor Specific Capability ID, Revision, Length, Next Capability and CAPID.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:2] + 90h	F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**Vendor Cap Field (VEND_CAP):** Vendor Specific Capability ID
27:24	0h RO	**Revision ID Field (REVID):** Revision ID of capability structure
23:16	14h RO	**Cap Length Field (CAP_LENGTH):** Vendor Specific Capability Length
15:8	00h RO	**Next Capability Field (NEXT_CAP):** Next Capability
7:0	09h RO	**Capability ID Field (CAPID):** Capability ID

9.1.16 Vendor Specific Extended Capability Register (DEVID_VEND_SPECIFIC_REG) - Offset 94h

Extended Vendor capability register for VSEC Length, Revision and ID.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:2] + 94h	01400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	014h RO	**Vendor Specific ID Field (VSEC_LENGTH):** Vendor Specific Extended Capability Length
19:16	0h RO	**Vendor Specific Revision Field (VSEC_REV):** Vendor specific Extended Capability revision
15:0	0010h RO	**Vendor Specific Length Field (VSECID):** Vendor Specific Extended Capability ID

9.1.17 Software LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG) - Offset 98h

Software location pointer in MMIO space as an offset specified by BAR.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:2] + 98h	00002101h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000210h RO	**SW LTR Dword Offset Field (SW_LAT_DWORD_OFFSET):** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**SW LTR BAR Number Field (SW_LAT_BAR_NUM):** Indicates that the SW LTR update MMIO location is always at BAR0
0	1h RO	**SW LTR Valid Field (SW_LAT_VALID):** This value is reflected from the SW LTR valid strap at the top level

9.1.18 Device Idle Pointer Register (DEVICE_IDLE_POINTER_REG) - Offset 9Ch

Device IDLE pointer register giving details on Device MMIO Offset Location, BAR NUM and D0i3 Valid Strap.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:2] + 9Ch	000024C1h

Bit Range	Default & Access	Field Name (ID): Description
31:4	000024Ch RO	**D0i3 Dword Offset Field (DWORD_OFFSET):** contains the location pointer to the SW LTR register in MMIO space as an offset from the specified BAR
3:1	0h RO	**BAR NUM Field (BAR_NUM):** Bar Num: Indicates that the D0i3 MMIO location is always at BAR0
0	1h RO	**D0i3 Valid Field (VALID):** Valid: This value is reflected from the D0i3 valid strap at the top level.

9.1.19 D0i3 And Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG) - Offset A0h

D0idle_Max_Power_On_Latency register set at boot and power control enable register to enable communication with the PGCB block below the Bridge.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:2] + A0h	000F0800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21	0h RW/P	**HAE Field (HAE):** Hardware Autonomous Enable
20	0h RO	**Reserved**
19	1h RW/P	**Sleep Enable Field (SLEEP_EN):** Sleep Enable
18	1h RW/P	**D3 Hen Field (PGE):** DEVIDLE Enable (DEVIDLEN): If '1' then the function will power gate when idle and the DevIdle register (DevIdleC[2] = '1') is set.
17	1h RW/P	**Device Idle En Field (I3E):** PMCRE: PMC Request Enable
16	1h RW/P	**PMC Request Enable Field (PMCRE):** D3-Hot Enable (D3HEN): If '1' then function will power gate when idle and the PMCSR[1:0] register in the function ='11' (D3).
15:13	0h RO	**Reserved**
12:10	2h RW/O/P	**Power Latency Scale Field (POW_LAT_SCALE):** Power On Latency Scale
9:0	000h RW/O/P	**Power Latency Value Field (POW_LAT_VALUE):** Power On Latency value

9.1.20 General Purpose Read Write Register1 (GEN_REGRW1) - Offset B0h

General Purpose PCI Read Write Register1.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:2] + B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Read Write Field (GEN_REG_RW1):** General Purpose PCI Register: This register value is brought out as GEN_REG_RW1

9.1.21 General Purpose Read Write Register2 (GEN_REGRW2) - Offset B4h

General Purpose PCI Read Write Register2.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:2] + B4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Read Write Field (GEN_REG_RW2):** General Purpose PCI Register: This register value is brought out as GEN_REG_RW2

9.1.22 General Purpose Read Write Register3 (GEN_REGRW3) - Offset B8h

General Purpose PCI Read Write Register3.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:2] + B8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Read Write Field (GEN_REG_RW3):** General Purpose PCI Register: This register value is brought out as GEN_REG_RW3

9.1.23 General Purpose Read Write Register4 (GEN_REGRW4) - Offset BCh

General Purpose PCI Read Write Register4.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:2] + BCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Read Write Field (GEN_REG_RW4):** General Purpose PCI Register: This register value is brought out as GEN_REG_RW4

9.1.24 General Purpose Input Register (GEN_INPUT_REG) - Offset C0h

General Purpose Input Register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:2] + C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**General Purpose Input Field (GEN_REG_INPUT_RW):** General Purpose Input Register: This register value reflects the value of GEN_REG_INPUT_RW

9.1.25 Manufacturers ID (MANID) - Offset F8h

Manufacturers ID register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:2] + F8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/P	**Manufacturers ID Field (MANID):** Manufacturer ID: Default value comes from straps.

9.2 GSPI Memory Mapped Registers Summary

Table 9-2. Summary of GSPI Memory Mapped Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	REG SSCR0 (SSCR0)	00000000h
4h	4	REG SSCR1 (SSCR1)	00000000h
8h	4	REG SSSR (SSSR)	00000004h

9.2.1 REG SSCR0 (SSCR0) - Offset 0h

The Enhanced SSP Control 0 registers contain twelve different bit fields that control various functions within the Enhanced SSP. All bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits must be zeroes, and Read values of these bits is undetermined.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**MOD:** Set to 0 - Normal SSP Mode: Full Duplex Serial peripheral interface. 1 = reserved
30	0h RW	**ACS:** Set to 0 for Clock selection which is determined by the NCS and ECS bits in this register. 1 = reserved
29	0h RO	**Reserved**
28:24	0h RO	**Reserved**
23	0h RW	**TIM:** Transmit FIFO Under Run Interrupt Mask When set, this bit will mask the Transmit FIFO Under Run (TUR) event from generating an SSP interrupt. The SSSR status register will still indicate that an TUR event has occurred. This bit can be written to at any time (before or after SSP is enabled). 0 = Transmit FIFO Under Run(TUR) events will generate an SSP interrupt 1 = TUR events will be masked
22	0h RW	**RIM:** Receive FIFO Over Run Interrupt Mask When set, this bit will mask the Receive FIFO Over Run (ROR) event from generating an SSP interrupt. The SSSR status register will still indicate that an ROR event has occurred. This bit can be written to at any time (before or after SSP is enabled) 0 = Receive FIFO Over Run (ROR) events will generate an SSP interrupt 1 = ROR events will be masked
21	0h RW	**NCS:** Network Clock Select The SSCR0.NCS bit in conjunction with SSCR0.ECS determines which clock is used. 0 = Clock selection is determined by ECS bit 1 = Reserved
20	0h RW	**EDSS:** Extended Data Size Select The 1-bit extended field is used in conjunction with the data size select SSCR0.DSS bits to select the size of the data transmitted and received by the Enhanced SSP. 0 =A zero is prepended to the DSS value which sets the DSS range from 4 -16 bits 1 =A one is pre-appended to the DSS value which sets the DSS range from 17-32 bits
19:8	000h RW	**SCR:** Serial Clock Rate Value used to generate transmission rate of SSP. Note: The SPI Interface Controller (SSP) baud rate (or Serial bit-rate clock SPI_CLK_OUT) can be generated either by the M/N divider or internally to the SSP (SSCR0.SCR) by dividing the on-chip SSP_CLK (output of M/N) to generate baud rates up to: MCC: 25 Megabits per second

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**SSE:** Synchronous Serial Port Enable The SSP enable bit, SSCR0.SSE, enables and disables all SSP operations. WhenSSCR0.SSE=0, the Enhanced SSP is disabled; when SSCR0.SSE=1, it is enabled. When the Enhanced SSP is disabled, all of its clocks can be stopped by programmers to minimize power consumption. On reset, the Enhanced SSP is disabled. When the SSCR0.SSE bit is cleared during active operation, the Enhanced SSP is disabled immediately, terminating the current frame being transmitted or received.Clearing SSCR0.SSE resets the Enhanced SSP FIFOs and the Enhanced SSP status bits; however, the Enhanced SSP Control registers are not reset. Note: After reset or after clearing the SSCR0.SSE, users must ensure that the SSCR1, SSITR and SSTO control registers are properly re-configured and that the SSSR register is reset before re- enabling the Enhanced SSP with the SSCR0.SSE. Also, the SSCR0.SSE bit must be cleared before reconfiguring the SSCR0, SSCR1, registers; other control bits in SSCR0 can be written at the same time as the SSCR0.SSE. When any SSP is disabled, its five pins can be used as GPIOs. 0 = SSP operation disabled 1 = SSP operation enabled

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**ECS:** External Clock Select: 0 = use On-chip clock (output of M/N Divider) to produce the SSP's serial clock(SSPSCLK). Selects the use of the output of the M/N Divider (MBAR0 + 0x800, CLOCK_PARAMS) to create the SSP's serial clock (SSPCLK) Note: Setting M=N=1 will provide a pass through of the M/N Divider of the serial clock. See SCR for Serial Clock Rate generation. Note: The input (SSPEXTCLK) is treated as SSPSCLKEN, a clock enable used to gate the SSPSCLK output. When the external signal SSPSCLKEN changes, there will be a 1 -2 clock lag before the SSPSCLK is started or stopped due to the internal synchronization of this signal. 1 = Reserved
5:4	0h RW	**FRF:** Frame Format: Set to 00 - Motorola Serial Peripheral Interface (SPI) MCC: Only Motorola interface supported 01 = reserved 10 = reserved 11 = reserved
3:0	0h RW	**DSS:** Data Size Select With EDSS as MSB. The CPU or DMA access data through the Enhanced SSP Ports Transmit and Receive FIFOs. A CPU access takes the form of programmed I/O, transferring one FIFO entry per access. CPU accesses would normally be triggered off of an SSSR Interrupt and must always be 32 bits wide. CPU Writes to the FIFOs are 32 bits wide, but the serializing logic will ignore all bits beyond the programmed FIFO data size (EDSS/DSS value). CPU Reads to the FIFOs are also 32 bits wide, but the Receive data written into the RX FIFO (from the RXD line) is stored with zeroes in the MSBs down to the programmed data size. The FIFOs can also be accessed by DMA Single transactions, which must be 1, 2 or 4 bytes, depending upon the EDSS value, and must also transfer one FIFO entry per access. When the SSCR0.EDSS bit is set, DMA Single transactions must be 4 bytes (the DMA must have the Enhanced SSP configured as a 32-bit peripheral).The DMAs_TR.width register must be at least the SSP data size programmed into the SSP control registers EDSS and DSS. The FIFO is seen as one 32-bit location by the processor. For Writes, the Enhanced SSP port takes the data from the Transmit FIFO, serializes it, and sends it over the serial wire (SSPTXD) to the external peripheral. Receive data from the external peripheral (on SSPRXD) is converted to parallel words and stored in the Receive FIFO. A programmable FIFO trigger threshold, when exceeded, generates an Interrupt or DMA service request that, if enabled, signals the CPU or DMA respectively to empty the Receive FIFO or to refill the Transmit FIFO. The Transmit and Receive FIFOs are differentiated by whether the access is a Read or a Write transfer. Reads automatically target the Receive FIFO, while Writes will write data to the Transmit FIFO. From a memory-map perspective, they are at the same address. FIFOs are 64 samples deep by 32 bits wide. Each read or write is to 1 SSP sample. The 4-bit Data Size Select SSCR0.DSS field is used in conjunction with the extended data size select SSCR0.EDSS bit to select the size of the data transmitted and received by the Enhanced SSP. The concatenated 5-bit value of SSCR0.EDSS and SSCR0.DSS provides a data range from 4 to 32 bits in length. Note: When data is programmed to be less than 32 bits, the FIFO should be programmed right-justified. Although it is possible to program data sizes of 1, 2, and 3 bits, these sizes are reserved and produce unpredictable results in the Enhanced SSP. 0011 4 bits 0111 8 bits 1111 16, 32 bits (Note: To differentiate between 16 bits and 32 bits check the EDSS bit, for 32 bit data EDSS = 1)

9.2.2 REG SSCR1 (SSCR1) - Offset 4h

The Enhanced SSP Control 1 registers contain bit fields that control various SSP functions. Bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits should be zeroes, and Read value of these bits are undetermined.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:24	00h NA	**RES_29_24:** Reserved
23	0h RW	**RWOT:** Receive With Out Transmit The SSCR1.RWOT bit is a read-write bit used to put the Enhanced SSP into a mode similar to half duplex. When the Enhanced SSP is in Transmit/Receive mode as determined SSCR1.RWOT=0, the Enhanced SSP simultaneously transmits and receives data (as supported by the individual protocols, i.e., normally all modes are full duplex except microwire) and the serial clock SSPSCLK only toggles while an active data transfer is underway. When in Receive-without-Transmit mode as determined by SSCR1.RWOT=1, the Enhanced SSP will continue to clock in receive data despite data existing or not in the Transmit FIFO. Data is sent/ received according to the selected format immediately after the Enhanced SSP enable bit (SSCR0.SSE) is set. This allows the Enhanced SSP to receive data without transmitting data (half-duplex only). During this mode, if there is no data to send, programmers should disable the DMA service requests and Interrupts for the Transmit FIFO (clear the SSCR1.TSRE and SSCR1.TIE bits). If the Transmit FIFO is empty, the SSPTXD line will be driven to 0. The Transmit FIFO underrun condition will not occur when SSCR1.RWOT=1. When RWOT is enabled, the SSSR.BUSY bit will remain active (set to 1) until software clears the RWOT bit. If the Enhanced SSP has been in RWOT mode, and software disables this by clearing the RWOT bit, an extra frame cycle may occur due to the synchronization between clock domains. This bit must not be used when the SSCR0.MOD bit is set. 0 = Transmit/Receive mode 1 = Receive without transmit mode Warning: When RWOT =1, the first entry of the TX FIFO must be initialized with all zeros. Note: RWOT is not used in Windows drivers at all. When you enable RWOT you have no control on the data flow (the clock is free-running). Even if there have half-duplex operation support from windows, it need to control how many data that need to read without transmit. Use full-duplex operation to do that putting dummy data into the TX FIFO. Registers SIRFL, TX_BIT_COUNT and RX_BIT_COUNT cannot be referred when using RWOT mode.
22	0h RW	**TRAIL:** 0 = Processor based, trailing bytes are handled by processor 1 = DMA based, trailing bytes are handled by DMA

Bit Range	Default & Access	Field Name (ID): Description
21	0h RW	**TSRE:** Transmit FIFO Service Request Enable The SSCR1.TSRE bit enables the Transmit FIFO DMA Service Request. When SSCR1.TSRE=0, the DMA Service Request is masked, and the state of the transmit FIFO service request (SSSR.TFS) bit within the Enhanced SSP Status register is ignored. When SSCR1.TSRE=1, the DMA Service Request is enabled, and whenever SSSR.TFS is set to one, a DMA Service Request is made to the DMA. Note that programming SSCR1.TSRE=0 does not affect the current state of SSSR.TFS or the ability of the Transmit FIFO logic to set and clear SSSR.TFS it only blocks the generation of the DMA Service Request. Also, the state of SSCR1.TSRE does not affect the generation of the Interrupt, which is asserted whenever the SSSR.TFS is set to 1.
20	0h RW	**RSRE:** Receive FIFO Service Request Enable The SSCR1.RSRE bit enables the Receive FIFO DMA Service Request. WhenSSCR1.RSRE=0, the DMA Service Request is masked, and the state of the receive FIFO service request SSSR.RFS bit within the Enhanced SSP Status register is ignored. When SSCR1.RSRE=1, the DMA Service Request is enabled, and whenever SSSR.RFS is set to one, a DMA Service Request is made to the DMA. Note that programming SSCR1.RSRE=0 does not affect the current state of SSSR.RFS or the ability of the Receive FIFO logic to set and clear SSSR.RFS it only blocks the generation of the DMA Service Request. Also, the state of SSCR1.RFRS does not affect the generation of the Interrupt, which is asserted whenever the SSSR.RFS is set to 1. 0 = DMA Service Request is disabled 1 = DMA Service Request is enabled
19	0h RW	**TINTE:** Receive FIFO Time-out Interrupt Enable The SSCR1.TINTE is a read-write bit used to mask or enable the Receiver Time-out Interrupt. When SSCR1.TINTE=0, the Interrupt is masked and the state of the SSSR.TINT bit is ignored by the Interrupt controller. When SSCR1.TINTE=1, the Interrupt is enabled, and whenever the SSSR.TINT bit is set to one an Interrupt request is made to the Interrupt controller. Note that programming SSCR1.TINTE=0 does not affect the current state of the SSSR.TINT or the ability of logic to set and clear the SSSR.TINT; it only blocks the generation of the Interrupt request. 0 = Receiver Time-out interrupts are disabled 1 = Receiver Time-out interrupts are enabled
18	0h RW	**PINTE:** Peripheral Trailing Byte Interrupts Enable This feature is not recommended for use in the LPSS implementation. 0 = Peripheral Trailing Byte Interrupts are disabled 1 = Peripheral Trailing Byte Interrupts are enabled.
17	0h RO	**Reserved**
16	0h RW	**IFS:** Invert Frame Signal 0 - Frame signal (Chip Select) is active low 1 - Frame signal (Chip Select) is active high
15	0h RW	**STRF:** Select FIFO for Enable FIFO Write/Read (STRF) This is a test mode bit that selects whether the Transmit or Receive FIFO is enabled for Writes and Reads whenever the SSCR1. EFWR is programmed to 1, which puts the Enhanced SSP in a Test mode. 0 = Transmit FIFO is selected for both writes and reads through the SSP Data Register (SSDR) 1 = Receive FIFO is selected for both writes and reads through the SSP Data Register (SSDR)

Bit Range	Default & Access	Field Name (ID): Description
14	0h RW	**EFWR:** Enable FIFO Write/Read (test mode bit) This bit enables a Test mode for the Enhanced SSP. When SSCR1.EFWR = 0, the Enhanced SSP operates in the Normal mode. WhenSSCR1.EFWR = 1, the Enhanced SSP enters a mode that whenever the CPU reads or writes to the Enhanced SSP Data register, it actually reads and writes directly to either the Transmit FIFO or the Receive FIFO, depending on the programmed state of the select FIFO for enable FIFO write/read (SSCR1.STRF) bit. With SSCR1.STRF = 0, all Writes to the SSDR are performed on the Transmit FIFO, and Reads to the SSDR will read back the data written to the Transmit FIFO in first-in-first-out order. WithSSCR1.STRF = 1, all Writes to the SSDR are performed on the Receive FIFO, and Reads to the SSDR will read back the data written to the Receive FIFO in first-in-first out order. In EFWR Test mode, data will not be transmitted on the SSPTXD pin, data input on the SSPRXD pin will not be stored, and the busy and ROR bits will not work. The Interrupt Test Register, however, will still be functional. Using software, this mode can test whether or not the Transmit FIFO or the Receive FIFO operates properly as a FIFO memory stack. Software should verify that the SSSR.CSS bit has gone from a 1 to a 0 before reading the TX FIFO. 0 = FIFO write/read special function is disabled (normal SSP operational mode) 1 = FIFO write/read special function is enabled.
13:5	000h RO	**Reserved**
4	0h RW	**SPH:** Motorola SPI SSPSCLK phase setting The SSCR1.SPH bit determines the phase relationship between the SSPSCLK and the serial frame (SSPSFRM) pins when the Motorola* SPI format is selected (SSCR0.FRF=00). WhenSSCR1.SPH=0, SSPSCLK remains in its Inactive/Idle state (as determined by theSSCR1.SPO setting) for one full cycle after SSPSFRM is asserted low at the beginning of a frame. SSPSCLK continues to transition for the rest of the frame and is then held in its Inactive state for one-half of an SSPSCLK period before SSPSFRM is de-asserted high at the end of the frame. When SSCR1.SPH=1, SSPSCLK remains in its Inactive/Idle state (as determined by the SSCR1.SPO setting) for one-half cycle after SSPSFRM is asserted low at the beginning of a frame. SSPSCLK continues to transition for the remainder of the frame, and is then held in its Inactive state for one full SSPSCLK period before SSPSFRM is de-asserted high at the end of the frame. The combination of the SSCR1.SPO and SSCR1.SPH settings determines when SSPSCLK is active during the assertion of SSPSFRM, and which SSPSCLK edge transmits and receives data on the SSPTXD and SSPRXD pins. When SSCR1.SPO and SSCR1.SPH are programmed to the same value (both 0 or both1) Transmit data is driven on the falling edge of SSPSCLK, and Receive data is latched on the rising edge of SSPSCLK. When SSCR1.SPO and SSCR1.SPH are programmed to opposite values (one 0 and the other 1), Transmit data is driven on the rising edge of SSPSCLK, and Receive data is latched on the falling edge of SSPSCLK. 0 - SSPSCLK is inactive one cycle at the start of a frame and cycle at the end of a frame 1 - SSPSCLK is inactive for one half cycle at the start of a frame and one cycle at the end of a frame

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**SPO:** Motorola SPI SSPSCLK polarity setting The SSCR1.SPO bit selects the polarity of the inactive state of the SSPSCLK pin when the Motorola* SPI format is selected (SSCR0.FRF=00). For S SCR1.SPO=0, the SSPSCLK is held low in the Inactive or Idle state when the Enhanced SSP is not transmitting/receiving data. For SSCR1.SPO=1, the SSPSCLK is held high during the Inactive/Idle state. The programmed setting of the SSCR1.SPOalone does not determine which SSPSCLK edge transmits or receives data theSSCR1.SPO setting in combination with the SSPSCLK phase bit SSCR1.SPH does. 0 - The inactive or idle state of SSPSCLK is low 1 - The inactive or idle state of SSPSCLK is high
2	0h RW	**LBM:** Loop-Back Mode (test mode bit) The SSCR1.LBM bit is a test mode bit that enables and disables the ability of the Enhanced SSP Transmit and Receive logic to communicate. When SSCR1.LBM=0, the Enhanced SSP operates normally. The Transmit and Receive data paths are independent and communicate via their respective pins. When SSCR1.LBM=1, the output of the Transmit serial shifter is connected directly to the input of the Receive serial shifter internally. During Loop-Back mode, the Transmit pin (SSPTXD) continues to function as normal. 0 = Normal serial port operation enabled 1 = Output of transmit serial shifter connected to input of receive serial shifter, internally
1	0h RW	**TIE:** Transmit FIFO Interrupt Enable The SSCR1.TIE bit enables the Transmit FIFO Service Request Interrupt. WhenSSCR1.TIE=0, the Interrupt is masked, and the state of the transmit FIFO service request (SSSR.TFS) bit within the Enhanced SSP Status register is ignored. When SSCR1.TIE=1, the Interrupt is enabled, and whenever SSSR.TFS is set to one, an Interrupt request is made to the Interrupt controller. Note that programming SSCR1.TIE=0 does not affect the current state of SSSR.TFS or the ability of the Transmit FIFO logic to set and clearSSSR.TFS it only blocks the generation of the Interrupt request. Also, the state ofSSCR1.TIE does not affect the generation of the Transmit FIFO DMA service request, which is asserted whenever the SSSR.TFS is set to 1. 0 - Transmit FIFO level interrupt is disabled 1 - Transmit FIFO level interrupt is enabled
0	0h RW	**RIE:** Receive FIFO Interrupt Enable The SSCR1.RIE bit enables the Receive FIFO Service Request Interrupt. WhenSSCR1.RIE=0, the Interrupt is masked, and the state of the receive FIFO service request SSSR.RFS bit within the Enhanced SSP Status register is ignored. When SSCR1.RIE=1, the Interrupt is enabled, and whenever SSSR.RFS is set to one, an Interrupt request is made to the Interrupt controller. Note that programming SSCR1.RIE=0 does not affect the current state ofSSSR.RFS or the ability of the Receive FIFO logic to set and clear SSSR.RFS it only blocks the generation of the Interrupt request. Also, the state of SSCR1.RIE does not affect the generation of the Receive FIFO DMA service request, which is asserted whenever the SSSR.RFS bit is set to 1. 0 - Receive FIFO level interrupt is disabled 1 - Receive FIFO level interrupt is enabled

9.2.3 REG SSSR (SSSR) - Offset 8h

The Enhanced SSP Status registers contain bits that signal overrun errors as well as the Transmit and Receive FIFO service requests. Each of these hardware-detected events signals an Interrupt request to the Interrupt controller. The Status register also contains flags that indicate when the Enhanced SSP is actively transmitting data, when the Transmit FIFO is not full, and when the Receive FIFO is not empty. One Interrupt signal is sent to the Interrupt Controller for each SSP. These events can cause an

Interrupt: End-of-Chain, Receiver Time-out, Peripheral Trailing Byte, Receive FIFO overrun, Receive FIFO request, and Transmit FIFO request

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8h	00000004h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21	0h RW/1C	**TUR:** Transmit FIFO Under Run The SSSR.TUR bit is a read-write, one-to-clear status bit that indicates that the transmitter tried to send data from the Transmit FIFO when the Transmit FIFO was empty. When the SSSR.TUR bit is set, an Interrupt is generated to the CPU that can be locally masked by the SSCR0.TIM bit. The setting of the SSSR.TUR bit does not, however, generate any DMA service request. The SSSR.TUR bit remains set until cleared by software writing a 1 to this bit which will also reset its Interrupt request; writing a 0 to this bit does not affect SSSR.TUR status. This bit can only be set when the Enhanced SSP is a slave to the FRAME signal (SSCR1.SFRMDIR = 1), or if the Enhanced SSP is a master to the FRAME signal and the Enhanced SSP is in Network mode, and will not be set if the Enhanced SSP is in Receive-Without- Transmit mode(SSCR1.RWOT =1). 0 = Transmit FIFO has not experienced an under run 1 = Attempted read from the transmit FIFO when the FIFO was empty, request interrupt
20	0h RO	**Reserved**
19	0h RW/1C	**TINT:** Receiver Time-out Interrupt The SSSR.TINT bit is a read-write bit that is set to 1 when the Receive FIFO has been idle (no samples received) for a period of time defined by the value programmed within the Time-Out register (SSTO). This interrupt can be masked by the SSCR1.TINTE bit. The SSSR.TINT bit is cleared by programmers by writing a 1 to it. 0 = No receiver time-out pending 1 = Receive FIFO has been idle for period defined by SSTO
18	0h RW/1C	**PINT:** Peripheral Trailing Byte Interrupt This feature is not recommended for use in the LPSS implementation. 0 = No peripheral trailing byte interrupt pending 1 = Peripheral trailing byte interrupt pending
17:8	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW/1C	**ROR:** Receive FIFO Overrun The receiver overrun status bit SSSR.ROR is a read-write bit that is set when the Receive logic attempts to place data into the Receive FIFO after it has been completely filled. If the Receive FIFO is full and new data is received, the SSSR.ROR bit is set, and the newly received data is discarded. This process is repeated for each new data-chunk received until at least one empty FIFO entry exists. When the SSSR.ROR bit is set, an Interrupt is generated to the CPU that can be locally masked by theSSCR0.RIM bit. The setting of the SSSR.ROR bit does not, however, generate any DMA service request. The SSSR.ROR bit remains set until cleared by software writing a 1 to this bit which will also reset its Interrupt request; writing a 0 to this bit does not affect SSSR.ROR status. 0 = Receive FIFO has not experienced an overrun 1 = Attempted data write to full receive FIFO, request interrupt
6	0h RO	**RFS:** Receive FIFO Service Request The receive FIFO service request flag SSSR.RFS is a read-only bit that is set to generate an Interrupt when the Receive FIFO requires service to prevent an overrun.SSSR.RFS is set any time the Receive FIFO has more entries of valid data than the number indicated by the Receive FIFO Trigger threshold, and it is cleared when it has the same or fewer entries than the threshold value. When the SSSR.RFS bit is set, an Interrupt is generated unless the receive FIFO interrupt request enable (SSCR1.RIE) bit is cleared. Also, the setting of the SSSR.RFS bit will signal a DMA service request if the SSCR1.RSRE bit is set. After the CPU or DMA reads the FIFO such that it has the same or fewer entries than the SIRF.WMRF value, the SSSR.RFS flag (and the service request and/or Interrupt) is automatically cleared. Software should not set both the SSCR1.RSRE and the SSCR1.RIE bits. 0 = Receive FIFO level is at or below the water mark for the SPI receive FIFO (WMRF) or SSP disabled 1 = Receive FIFO level exceeds the water mark for the SPI receive FIFO (WMRF), request interrupt
5	0h RO	**TFS:** Transmit FIFO Service Request The transmit FIFO service request flag SSSR.TFS is a read-only bit that is set to generate an Interrupt when the Transmit FIFO requires service to prevent an underrun.SSSR.TFS is set any time the Transmit FIFO has the same or fewer entries of valid data than indicated by the Transmit FIFO Trigger threshold, and it is cleared when it has more entries of valid data than the threshold value (the service request is triggered when the number of FIFO entries is less than or equal to 1 + LWMTF). When the SSSR.TFSbit is set, an Interrupt is generated unless the transmit FIFO interrupt request enables(SSCR1.TIE) bit is cleared. Also, the setting of the SSSR.TFS bit will generate a DMA service request if the SSCR.TSRE bit was set. After the CPU or the DMA fills the FIFO such that it exceeds the threshold, the SSSR.TFS flag (and the service request and/or Interrupt) is automatically cleared. If the threshold has not been exceeded, another request will be made. Software should not set both the SSCR1.TSRE and theSSCR1.TIE bits. 0 = Transmit FIFO level exceeds the Low Water Mark Transmit FIFO (SITF.LWMTF), or SSP disabled 1 = Transmit FIFO level is at or below the Low Water Mark Transmit FIFO (SITF.LWMTF), request interrupt
4	0h RO	**BSY:** The Enhanced SSP busy SSSR.BSY flag is a read-only bit that is set when the SSP is actively transmitting and/or receiving data, and is cleared when the SSP is idle or disabled (SSCR0.SSE=0). This bit does not generate an Interrupt. 0 = SSP is idle or disabled 1 = SSP currently transmitting or receiving a frame

Bit Range	Default & Access	Field Name (ID): Description
3	0h RO	**RNE:** Receive FIFO Not Empty The receive FIFO not empty flag SSSR.RNE is a read-only bit that is set whenever the Receive FIFO contains one or more entries of valid data, and is cleared when it no longer contains any valid data. This bit can be polled when using programmed I/O to remove remaining bytes of data from the Receive FIFO since CPU Interrupt requests are made only when the Receive FIFO Trigger threshold has been met or exceeded. This bit does not generate an Interrupt. 0 = Receive FIFO is empty 1 = Receive FIFO is not empty
2	1h RO	**TNF:** Transmit FIFO Not Full The receive FIFO not empty flag SSSR.RNE is a read-only bit that is set whenever the Receive FIFO contains one or more entries of valid data, and is cleared when it no longer contains any valid data. This bit can be polled when using programmed I/O to remove remaining bytes of data from the Receive FIFO since CPU Interrupt requests are made only when the Receive FIFO Trigger threshold has been met or exceeded. This bit does not generate an Interrupt. 0 = Transmit FIFO is full 1 = Transmit FIFO is not full
1:0	0h RO	**Reserved**

9.2.4 REG SSDR (SSDR) - Offset 10h

The Enhanced SSP Data registers are single address locations that Read-Write data transfers can access. The SSDR represents two physical registers: the first is temporary storage for data on its way out through the Transmit FIFO, the other is temporary storage for data coming in through the Receive FIFO. As the system accesses the register, FIFO Control logic transfers data automatically between register and FIFO as fast as the system moves it. Data in the FIFO shifts up or down to accommodate the new word (unless it's an attempted Write to a full Transmit FIFO). Status bits (such as SSSR.RNE, and SSSR.TNF) show users whether the FIFO is full, above/below a programmable FIFO trigger threshold, or empty. For Transmit data transfers (Write from system to SSP peripheral), the register can be loaded (written) by the system processor anytime it falls below its threshold level when using programmed I/O. When a data size of less than 32-bits is selected, users should not left-justify data written to the Transmit FIFO. Transmit logic left-justifies the data and ignores any unused bits. Received data of less than 32 -bits is automatically right-justified in the Receive FIFO.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DATA:** Data word to be written to/read from transmit/receive FIFO

9.2.5 REG SSTO (SSTO) - Offset 28h

The Enhanced SSP Time-Out registers have single bit fields that specify the time-out value used to signal a period of inactivity within the Receive FIFO. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 28h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RW	**TIMEOUT:** Timeout Value Is the value that defines the timeout interval for the RcV FIFO. The Interval is given by TIMEOUT/Parallel (Bus) Clock Frequency. When the number of samples in the Receive FIFO is less than RcV FIFO trigger threshold level, and no additional data is received, the Timeout timer will decrement. The time-out timer is reset after a new sample is received. In DMA Mode of operation this value needs to be set when the RcV FIFO Trigger Threshold is greater than 1 RcV FIFO Entry (the required Msize (Single Burst) for SSP DMA peripheral transfers); When in PIO mode of operation this value needs to be set when the total transfer size is not an even division of the RcV FIFO trigger threshold level. Is such a case the TIMEOUT value is calculated to be greater than the time to transfer the FIFO Entry size at the desired Bit Rate. Example Calculation: Timeout is greater than (RcV FIFO Entry Size) x (1/Serial Bit Rate)/ (1/Bus CLK) = Guard Band x (RcV FIFO Entry Size) x (1/Serial Bit Rate)/ (1/Bus CLK) Example: RcV FIFO Entry = 32 Bits Serial Bit Rate = 1 Mbs Bus CLK = 120 MHz Guard Band = 2x TIMEOUT = (32 (1x10-6))/(8.33 x10-9) = 3840 x 2 = 7680.

9.2.6 REG SITF (SITF) - Offset 44h

The SPI Transmit FIFO register is for writing the water mark for the SPI transmit FIFO and also for reading the number of entries in the SPI transmit FIFO

Type	Size	Offset	Default
MMIO	32 bit	BAR + 44h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21:16	00h RO	**SITFL:** SPI Transmit FIFO Level Number of entries in SPI Transmit FIFO.
15:14	0h RO	**Reserved**
13:8	00h RW	**LWMTF:** Low Water Mark Transmit FIFO. Set the low water mark of the SPI transmit FIFO.
7:6	0h RO	**Reserved**
5:0	00h RW	**HWMTF:** High Water Mark Transmit FIFO. Set the high water mark of the SPI transmit FIFO.

9.2.7 REG SIRF (SIRF) - Offset 48h

The SPI Receive FIFO register is for writing the water mark for the SPI receive FIFO and also for reading the number of entries in the SPI receive FIFO

Type	Size	Offset	Default
MMIO	32 bit	BAR + 48h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13:8	00h RO	**SIRFL:** SPI Receive FIFO Level Number of entries in SPI Receive FIFO.
7:6	0h RO	**Reserved**
5:0	00h RW	**WMRF:** Water Mark Receive FIFO. Set the water mark of the SPI receive FIFO.

9.2.8 REG CLOCKS (CLOCKS) - Offset 200h

Private Clock Configuration

Type	Size	Offset	Default
MMIO	32 bit	BAR + 200h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**CLK_UPDATE:** 0 No clock update 1 Clock gets updated
30:16	0000h RW	**N_VAL:** This is the denominator value (N) for the M over N divider logic that creates the SPI_CLK_OUT for the SSP. Used to generate the input CLK to SSP.
15:1	0000h RW	**M_VAL:** The numerator value (M) for the M over N divider logic that creates the SPI_CLK_OUT for the SSP. Used to generate the input CLK to SSP.
0	0h RW	**CLK_EN:** IP Functional (SPI Serial Clock) Clock Enable 0 - Clock Disabled 1 - Clock Enabled

9.2.9 REG RESETS (RESETS) - Offset 204h

Software Reset

Type	Size	Offset	Default
MMIO	32 bit	BAR + 204h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2	0h RW	**RESET_DMA:** 0 = IP is in reset (Reset Asserted) 1 = IP is NOT at reset (Reset Released)
1:0	0h RW	**RESET_IP:** SSP Host Controller reset. Used to reset the SSP Host Controller by SW control. All SSP Configuration State and Operational State will be forced to the Default state. There is no timing requirement (SW can assert and de-assert in back to back transactions) This reset does NOT impact the LPSS cluster level settings by BIOS, the MMIO configuration header information, DMA channel configuration and interrupt assignment/mapping/etc. Driver should re-initialize registers related to Driver context following an SSP host controller reset. 00 = SSP Host Controller is in reset (Reset Asserted) 01 = Reserved 10 = Reserved 11 = SSP Host Controller is NOT at reset (Reset Released)

9.2.10 REG ACTIVELTR_VALUE (ACTIVELTR_VALUE) - Offset 210h

ActiveLTR_Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 210h	00000800h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW	**SNOOP_REQUIRMENT:** If the Requirement (bit 15) is clear, that indicates that the device has no LTR requirement for this type of traffic (i.e. it can wait for service indefinitely). If the 10-bit latency value is zero it indicates that the device cannot tolerate any delay and needs the best possible service/response time.
14:13	0h RO	**Reserved**
12:10	2h RW	**SNOOP_LATENCY_SCALE:** Support for codes 010 (1us) or 011 (32us) for Snoop Latency Scale(1us -> 32ms total span) only. Writes to this CSR which do not match those values will be dropped completely, next read will return previous value.
9:0	000h RW	**SNOOP_VALUE:** 10-bit latency value

9.2.11 REG IDLELTR_VALUE (IDLELTR_VALUE) - Offset 214h

IdleLTR_Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 214h	00000800h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW	**SNOOP_REQUIRMENT:** If the Requirement (bit 15) is clear, that indicates that the device has no LTR requirement for this type of traffic (i.e. it can wait for service indefinitely). If the 10 -bit latency value is zero it indicates that the device cannot tolerate any delay and needs the best possible service/response time.

Bit Range	Default & Access	Field Name (ID): Description
14:13	0h RO	**Reserved**
12:10	2h RW	**SNOOP_LATENCY_SCALE:** Support for codes 010 (1us) or 011 (32us) for Snoop Latency Scale(1us -> 32ms total span) only. Writes to this CSR which do not match those values will be dropped completely, next read will return previous value.
9:0	000h RW	**SNOOP_VALUE:** 10-bit latency value

9.2.12 REG TX_BIT_COUNT (TX_BIT_COUNT) - Offset 218h

TX_BIT_COUNT_Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 218h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**TX_COUNT_OVERFLOW:** 0= count valid 1= count overflow/invalid
30:24	0h RO	**Reserved**
23:0	000000h RO	**TX_BIT_COUNT:** 24-bit up-counter which counts the number of TX bits on the Serial bus. The counter is forced to be cleared by software Read

9.2.13 REG RX_BIT_COUNT (RX_BIT_COUNT) - Offset 21Ch

RX_BIT_COUNT_Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 21Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**RX_COUNT_OVERFLOW:** 0= count valid 1= count overflow/invalid
30:24	0h RO	**Reserved**
23:0	000000h RO	**RX_BIT_COUNT:** 24-bit up-counter which counts the number of RX Bits on the Serial bus. The counter is forced to be cleared by software Read

9.2.14 REG SSP_REG (SSP_REG) - Offset 220h

SSP_Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 220h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**DISABLE_SSP_DMA_FINISH:** This bit needs to be set to 1 if SPI is using DMA multi-Block Chaining and the SW driver does not plan to re-enable the DMA manually after every Link List completion; 1 DMA finish disabled Note: Required for multi-block transfer 0 DMA finish not disabled

9.2.15 REG SPI_CS_CONTROL (SPI_CS_CONTROL) - Offset 224h

SPI_CS_CONTROL_Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 224h	0000F000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	1h RW	**CS3_POLARITY:** This Bit selects the Inactive/Idle polarity of SPI CS3 Signal. The steering logic will ensure that when switching to another active SPI CS port the inactive port will be forced to the inactive polarity, 0 = Low 1 = High
14	1h RW	**CS2_POLARITY:** This Bit selects the Inactive/Idle polarity of SPI CS2 Signal. The steering logic will ensure that when switching to another active SPI CS port the inactive port will be forced to the inactive polarity, 0 = Low 1 = High
13	1h RW	**CS1_POLARITY:** This Bit selects the Inactive/Idle polarity of SPI CS1 Signal. The steering logic will ensure that when switching to another active SPI CS port the inactive port will be forced to the inactive polarity, 0 = Low 1 = High

Bit Range	Default & Access	Field Name (ID): Description
12	1h RW	**CS0_POLARITY:** This Bit selects the Inactive/Idle polarity of SPI CS0 Signal. The steering logic will ensure that when switching to another active SPI CS port the inactive port will be forced to the inactive polarity, 0 = Low 1 = High
11:10	0h RO	**Reserved**
9:8	0h RW	**CS1_OUTPUT_SEL:** These Bits select which SPI CS Signal is to be driven by the SSP Frame (CS). The steering logic will ensure that when switching to another active SPI CS port the inactive port will be forced to the inactive polarity defined by the corresponding SPI CS Polarity Bit, 00 = CS 0 01 = CS 1 10 = CS 2 11 = CS 3
7:2	0h RO	**Reserved**
1	0h RW	**CS_STATE:** Manual SW control of SPI Chip Select (CS) 0 = CS is set to low 1 = CS is set to high MCC: The state of this bit 0=>CS asserted; 1 => CS de-asserted. The state of the CS pin also includes the polarity setting in bits 15:12 of this register.
0	0h RW	**CS_MODE:** SPI Chip Select Mode Section. 0 = HW Mode- CS is under SSP control 1 = SW Mode CS is under SW Control using cs_state bit

9.2.16 REG SW_SCRATCH_0 (SW_SCRATCH_0) - Offset 228h

SW_SCRATCH_0_Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 228h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**REG_SW_SCRATCH_0:** Scratch Pad Register for SW to generated Local DATA for iDMA

9.2.17 REG SW_SCRATCH_1 (SW_SCRATCH_1) - Offset 22Ch

SW_SCRATCH_1_Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 22Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**REG_SW_SCRATCH_1:** Scratch Pad Register for SW to generated Local DATA for iDMA

9.2.18 REG SW_SCRATCH_2 (SW_SCRATCH_2) - Offset 230h

SW_SCRATCH_2_Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 230h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**REG_SW_SCRATCH_2:** Scratch Pad Register for SW to generated Local DATA for iDMA

9.2.19 REG SW_SCRATCH_3 (SW_SCRATCH_3) - Offset 234h

SW_SCRATCH_3_Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 234h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**REG_SW_SCRATCH_3:** Scratch Pad Register for SW to generated Local DATA for iDMA

9.2.20 REG CLOCK_GATE (CLOCK_GATE) - Offset 238h

CLOCK_GATE_Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 238h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3:2	0h RW	**SW_DMA_CLK_CTL:** DMA Clock Gate Control bits, 00-hw clk en 01-rsv 10-force off 11-force on
1:0	0h RW	**SW_IP_CLK_CTL:** IP Clock Gate Control bits, 00-hw clk en 01-rsv 10-force off 11-force on

9.2.21 REG REMAP_ADDR_LO (REMAP_ADDR_LO) - Offset 240h

REMAP_ADDR_LO_Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 240h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SPI_REMAP_ADDR_LOW:** Low 32 bits of BAR address read by SW

9.2.22 REG REMAP_ADDR_HI (REMAP_ADDR_HI) - Offset 244h

REMAP_ADDR_HI_Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 244h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SPI_REMAP_ADDR_HIGH:** High 32 bits of BAR address read by SW

9.2.23 REG DEVIDLE_CONTROL (DEVIDLE_CONTROL) - Offset 24Ch

This register allows a device driver to enable/disable a devices entry into DevIdle. By enabling DevIdle, SW specifies that it will not touch the device without accessing this register prior to accessing any other MMIO device register. Detailed SW DevIdle entry/exit flows are defined in the Chassis Power Management and Device Idle PFAS specifications, reference

Type	Size	Offset	Default
MMIO	32 bit	BAR + 24Ch	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4	0h RO	**INTR_REQ_CAPABLE:** Set to 1 by HW if it is capable of generating an interrupt on command completion, else 0.
3	1h RW/1C	**RESTORE_REQUIRED:** When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up. Note: If SW is setting bit 3 together with any other bit of this register, only bit 3 is written; SW is required to do 2 writes in this case: bit 3 first and all other bits second. This (Restore Required) field of the D0i3C register needs to be preserved during the S0ix restore window even though the D0i3C register is being restored (during restore window, RR bit should be restored to 1.
2	0h RW	**DEVIDLE:** SW sets this bit to 1 to move the function into the DevIdle state. Writing this bit to 0 will return the function to the fully active D0 state (D0i0).
1	0h RO	**Reserved**
0	0h RO	**CMD_IN_PROGRESS:** HW sets this bit on a 1->0 or 0->1 transition of DEVIDLE. While set, the other bits in this register are not valid and it is illegal for SW to write to any bit in this register. HW clears this bit upon completing the DevIdle transition command. When clear, all the other bits in the register are valid and SW may write to any bit. If Interrupt Request (IR) was set for the current command, HW may clear this bit before the interrupt has been made visible to SW, since when SW actually handles a particular interrupt is not visible to the HW. SW writes to this bit have no effect.

9.2.24 REG DEL_RX_CLK (DEL_RX_CLK) - Offset 250h

MMIO (Convergence Layer) bit per SPI Controller allows selection of the Delayed Rx Clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 250h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RW	**RX_CLK_SEL:** 2'b00: The output of the internal (M/N and/or baud rate) clock divider is used as-is to clock in the receive data to the RxFIFO. 2'b01: An internally delayed version of the internal clock divider output is used to clock in the receive data to the RxFIFO. This allows some additional setup time on the PCH side. 2'b10: The receive data is clocked on the subsequent negedge of the Tx clock, allowing a full cycle propagation delay on the platform. 2'b11: The receive data is clocked on the subsequent negedge of the delayed Rx clock, maximizing the amount of delay allowed for capturing the receive data. This mode is required for 50 MHz operation.

9.2.25 REG SPI_HVM_MISR_CRCOUT (SPI_HVM_MISR_CRCOUT) - Offset 280h

SPI HVM MISR CRCOUT

Type	Size	Offset	Default
MMIO	32 bit	BAR + 280h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	FFFFh RO	**SPI_HVM_MISR_CRCOUT:** SPI MISR Output for HVM

9.2.26 REG CAPABLITIES (CAPABLITIES) - Offset 2FCh

Capabilities Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 2FCh	00000620h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	**Reserved**
12	0h RO	**SPI_CS3_OE_STAT:** 0 = unconnected 1 = connected
11	0h RO	**SPI_CS2_OE_STAT:** 0 = unconnected 1 = connected
10	1h RO	**SPI_CS1_OE_STAT:** 0 = unconnected 1 = connected
9	1h RO	**SPI_CS0_OE_STAT:** 0 = unconnected 1 = connected
8	0h RO	**IDMA_PRESENT:** 0= DMA present 1= DMA not present
7:4	2h RO	**INSTANCE_TYPE:** I2C, SPI or UART
3:0	0h RO	**INSTANCE_NUMBER:** Instance number

9.2.27 REG SAR_LO0 (SAR_LO0) - Offset 800h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer. Source Address Register for lower 32-bits for Channels 0-1

Type	Size	Offset	Default
MMIO	32 bit	BAR + 800h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SAR_LO:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected)6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

9.2.28 REG SAR_HI0 (SAR_HI0) - Offset 804h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer. Source Address Register for upper 32-bits for Channels 0-1

Type	Size	Offset	Default
MMIO	32 bit	BAR + 804h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SAR_HI:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

9.2.29 REG DAR_LO0 (DAR_LO0) - Offset 808h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer. Destination Address Register for Channels 0-1

Type	Size	Offset	Default
MMIO	32 bit	BAR + 808h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DAR_LO:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e.CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected(i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

9.2.30 REG DAR_HI0 (DAR_HI0) - Offset 80Ch

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer. Destination Address Register for Upper 32-bits for Channels 0-1

Type	Size	Offset	Default
MMIO	32 bit	BAR + 80Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DAR_HI:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e.CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected(i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

9.2.31 REG LLP_LO0 (LLP_LO0) - Offset 810h

You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled. The LLP register has two functions: The logical result of the equation LLP.LOC!=0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC!= 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC!= 0 contains the pointer to the next LLI for block chaining using linked lists. The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 810h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0h RO	**Reserved**

9.2.32 REG LLP_HI0 (LLP_HI0) - Offset 814h

You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled. The LLP register has two functions: The logical result of the equation LLP.LOC ! 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC!= 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 814h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.

9.2.33 REG CTL_LO0 (CTL_LO0) - Offset 818h

This register contains fields that control the DMA transfer. The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 818h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0h RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
21:20	0h RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Reserved (00) Memory to Peripheral (01) Peripheral to Memory (10) Reserved (11) Flow Control is always assigned to the DMA.
19	0h RO	**Reserved**
18	0h RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0h RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control
16:14	0h RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. Source BURST SIZE (in DW) = (2 ^ SRC_TR_WIDTH)
13:11	0h RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination.
10	0h RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0h RO	**Reserved**
8	0h RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
6:4	0h RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE (IN DW) = (2^ MSIZE) (i.e. 2 to-the-power-of MSIZE) 1.Transferred Bytes Per Burst = BURST_SIZE * (2 ^ TR_WIDTH) Since Max Burst Length is limited by the OCP fabric to 16 DW, encodings 101 (32 DW), 110 (64 DW) and 111 (128 DW) are not supported by the fabric. 2.For incrementing addresses and (Transfer_Width < 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations)
3:1	0h RW	**DST_TR_WIDTH:** BURST SIZE (in DW) = (2^ MSIZE) (i.e. 2 to-the-power-of MSIZE) Transferred Bytes Per Burst = BURST_SIZE * (2 ^ TR_WIDTH) Since Max Burst Length is limited by the South-Complex OCP fabric to 16 DW, encodings 101 (32 DW), 110 (64 DW) and 111 (128 DW) are not supported by the fabric. For incrementing addresses and (Transfer_Width < 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations)
0	0h RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

9.2.34 REG CTL_HI0 (CTL_HI0) - Offset 81Ch

This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled. If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 81Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior.

Bit Range	Default & Access	Field Name (ID): Description
28:18	0h RO	**Reserved**
17	0h RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	00000h RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It does not means Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register.

9.2.35 REG SSTAT0 (SSTAT0) - Offset 820h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block

Type	Size	Offset	Default
MMIO	32 bit	BAR + 820h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

9.2.36 REG DSTAT0 (DSTAT0) - Offset 828h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI.

Note: This register is a temporary placeholder for the destination status information on its way to the DSTATx register

location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 828h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface

9.2.37 REG SSTATAR_LO0 (SSTATAR_LO0) - Offset 830h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 830h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SSTATAR_LO:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block

9.2.38 REG SSTATAR_HI0 (SSTATAR_HI0) - Offset 834h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 834h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SSTATAR_HI:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block

9.2.39 REG DSTATAR_LO0 (DSTATAR_LO0) - Offset 838h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 838h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DSTATAR_LO:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

9.2.40 REG DSTATAR_HI0 (DSTATAR_HI0) - Offset 83Ch

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 83Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DSTATAR_HI:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

9.2.41 REG CFG_LO0 (CFG_LO0) - Offset 840h

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Type	Size	Offset	Default
MMIO	32 bit	BAR + 840h	00000203h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated
30	0h RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0h RO	**Reserved**
21	0h RW	**SRC_OPT_BL:** Optimize Source Burst Length: 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE))
20	0h RW	**DST_OPT_BL:** Optimize Destination Burst Length: 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE))
19	0h RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0h RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17:11	0h RO	**Reserved**
10	0h RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit affects only when CH_SUSPEND ia asserted
9	1h RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0h RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0h RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0h RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0h RO	**Reserved**
3	0h RW	**HSHAKE_NP_WR:** 0x1: Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0: Issues Posted writes on HW-Handshake on DMA Write Port (Except end-ofblock writes which will be Non-Posted)
2	0h RW	**ALL_NP_WR:** 0x1: Forces ALL writes to be Non-Posted on DMA Write Port 0x0: Non-Posted Writes will only be used at end of block transfers and in HWHandshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used
1	1h RW	**SRC_BURST_ALIGN:** 0x1: SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0: SRC Burst Transfers are not broken at a Burst Length aligned boundary
0	1h RW	**DST_BURST_ALIGN:** 0x1: DST Burst Transfers are broken at a Burst Length aligned boundary 0x0: DST Burst Transfers are not broken at a Burst Length aligned boundary

9.2.42 REG CFG_HI0 (CFG_HI0) - Offset 844h

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Type	Size	Offset	Default
MMIO	32 bit	BAR + 844h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27:18	000h RW	**WR_ISSUE_THD:** Write Issue Threshold. Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.

Bit Range	Default & Access	Field Name (ID): Description
17:8	000h RW	**RD_ISSUE_THD:** Read Issue Threshold. Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.
7:4	0h RW	**DST_PER:** Destination Peripheral ID: Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface.
3:0	0h RW	**SRC_PER:** Source Peripheral ID: Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface.

9.2.43 REG SGR0 (SGR0) - Offset 848h

The Source Gather register contains two fields: Source gathers count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gathers interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 848h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	000h RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	00000h RW	**SGI:** Source gather interval.

9.2.44 REG DSR0 (DSR0) - Offset 850h

The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC). Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI). Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 850h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	000h RW	**DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries
19:0	00000h RW	**DSI:** Destination scatter interval.

9.2.45 REG SAR_LO1 (SAR_LO1) - Offset 858h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer. Source Address Register for lower 32-bits for Channels 0-1

Type	Size	Offset	Default
MMIO	32 bit	BAR + 858h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SAR_LO:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

9.2.46 REG RawTfr (RAWTFR) - Offset AC0h

Interrupt events are stored in this Raw Interrupt Status registers before masking: RawBlock, RawDstTran, RawErr, RawSrcTran, and RawTfr. Each Raw Interrupt Status register has a bit allocated per channel, for example, RawTfr(2) is the Channel 2 raw transfer complete interrupt. Each bit in these registers is cleared by writing a 1 to the corresponding location in the ClearTfr, ClearBlock, ClearSrcTran, ClearDstTran, ClearErr registers.

Type	Size	Offset	Default
MMIO	32 bit	BAR + AC0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RO	**RAW:** Raw interrupt status for ch 1 and ch0

9.2.47 REG RawBlock (RAWBLOCK) - Offset AC8h

RawBlock - Raw Status for Block Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + AC8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RO	**RAW:** Raw interrupt status for ch 1 and ch0

9.2.48 REG RawSrcTran (RAWSRCTRAN) - Offset AD0h

RawSrcTran - Raw Status for Source Transaction Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + AD0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RO	**RAW:** Raw interrupt status for ch 1 and ch0

9.2.49 REG RawDstTran (RAWDSTTRAN) - Offset AD8h

RawDstTran - Raw Status for Destination Transaction Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + AD8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RO	**RAW:** Raw interrupt status for ch 1 and ch0

9.2.50 REG RawErr (RAWERR) - Offset AE0h

RawErr - Raw Status for Error Interrupts Register Error interrupt will be asserted by the DMA in the following cases: IOSF Fabric returns an Unsuccessful Completion with UR Completion Status for a Non-Posted transaction issued by the DMA to Memory. This error occurs when an invalid address range is programed into the DMA SRC/Dest Field outside of the Host memory region on the memory side of the DMA transaction IOSF2OCP bridge will return error (triggering error interrupt from DMA) if the IOSF2OCP Bridge is programmed incorrectly. Peripheral side transaction where invalid addressing can result in an OCP fabric error which will be translated into an Error Interrupt. The SW should view this error as a serious programming error and handle it according to the specified error handling procedures for the product and OS.

Type	Size	Offset	Default
MMIO	32 bit	BAR + AE0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RO	**RAW:** Raw interrupt status for ch 1 and ch0

9.2.51 REG StatusTfr (STATUSTFR) - Offset AE8h

Status for Transfer Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + AE8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RO	**STATUS:** Status for interrupt for ch 1 and ch0

9.2.52 REG StatusBlock (STATUSBLOCK) - Offset AF0h

statusBlock: Status for Block Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + AF0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RO	**STATUS:** Status for interrupt for ch 1 and ch0

9.2.53 REG StatusSrcTran (STATUSSRCTRAN) - Offset AF8h

StatusSrcTran: Status for Source Transaction Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + AF8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RO	**STATUS:** Status for interrupt for ch 1 and ch0

9.2.54 REG StatusDstTran (STATUSDSTTRAN) - Offset B00h

StatusDstTran: Status for Destination Transaction Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B00h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RO	**STATUS:** Status for interrupt for ch 1 and ch0

9.2.55 REG StatusErr (STATUSERR) - Offset B08h

StatusErr, Status for Error Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B08h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RO	**STATUS:** Status for interrupt for ch 1 and ch0

9.2.56 REG MaskTfr (MASKTFR) - Offset B10h

Mask for Transfer Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:8	0h WO	**INT_MASK_WE:** Interrupt Mask Write Enable ch 1 and ch0. 0 = write disabled 1 = write enabled
7:2	0h RO	**Reserved**
1:0	0h RW	**INT_MASK:** Interrupt mask per ch1 and ch0. 0-mask 1-unmask

9.2.57 REG MaskBlock (MASKBLOCK) - Offset B18h

MaskBlock: Mask for Block Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:8	0h WO	**INT_MASK_WE:** Interrupt Mask Write Enable ch1 and ch0. 0 = write disabled 1 = write enabled
7:2	0h RO	**Reserved**
1:0	0h RW	**INT_MASK:** Interrupt mask ch1 and ch0. 0-mask 1-unmask

9.2.58 REG MaskSrcTran (MASKSRCTRAN) - Offset B20h

Mask for Source Transaction Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B20h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:8	0h WO	**INT_MASK_WE:** Interrupt Mask Write Enable ch1 and ch0. 0 = write disabled 1 = write enabled
7:2	0h RO	**Reserved**
1:0	0h RW	**INT_MASK:** Interrupt mask ch1 and ch0. 0-mask 1-unmask

9.2.59 REG MaskDstTran (MASKDSTTRAN) - Offset B28h

Mask for Destination Transaction Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B28h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:8	0h WO	**INT_MASK_WE:** Interrupt Mask Write Enable ch1 and ch0. 0 = write disabled 1 = write enabled
7:2	0h RO	**Reserved**
1:0	0h RW	**INT_MASK:** Interrupt mask ch1 and ch0. 0-mask 1-unmask

9.2.60 REG MaskErr (MASKERR) - Offset B30h

Mask for Error Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:8	0h WO	**INT_MASK_WE:** Interrupt Mask Write Enable ch1 and ch0. 0 = write disabled 1 = write enabled
7:2	0h RO	**Reserved**
1:0	0h RW	**INT_MASK:** Interrupt mask ch1 and ch0. 0-mask 1-unmask

9.2.61 REG ClearTfr (CLEARTFR) - Offset B38h

Clear for Transfer Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B38h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h WO	**CLEAR:** Interrupt clear ch1 and ch0. 0 = no effect 1 = clear interrupt

9.2.62 REG ClearBlock (CLEARBLOCK) - Offset B40h

Clear for Block Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B40h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h WO	**CLEAR:** Interrupt clear ch1 and ch0. 0 = no effect 1 = clear interrupt

9.2.63 REG ClearSrcTran (CLEARSRCTRAN) - Offset B48h

Clear for Source Transaction Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B48h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h WO	**CLEAR:** Interrupt clear ch1 and ch0. 0 = no effect 1 = clear interrupt

9.2.64 REG ClearDstTran (CLEARDSTTRAN) - Offset B50h

Clear for Destination Transaction Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B50h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h WO	**CLEAR:** Interrupt clear ch1 and ch0. 0 = no effect 1 = clear interrupt

9.2.65 REG ClearErr (CLEARERR) - Offset B58h

Clear for Error Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + B58h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h WO	**CLEAR:** Interrupt clear ch1 and ch0. 0 = no effect 1 = clear interrupt

9.2.66 REG StatusInt (STATUSINT) - Offset B60h

The contents of each of the five Status registers StatusTfr, StatusBlock, StatusSrcTran, StatusDstTran, StatusErr is Ored to produce a single bit for each interrupt type in the Combined Status register (StatusInt). This register is read-only.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B60h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4	0h RO	**ERR:** OR of the contents of StatusErr register.
3	0h RO	**DSTT:** OR of the contents of StatusDst register.
2	0h RO	**SRCT:** OR of the contents of StatusSrcTran register
1	0h RO	**BLOCK:** OR of the contents of StatusBlock register.
0	0h RO	**TFR:** OR of the contents of StatusTfr register.

9.2.67 REG DmaCfgReg (DMACFGREG) - Offset B98h

This register is used to enable the DMA, which must be done before any channel activity can begin. If the global channel enable bit is cleared while any channel is still active, then DmaCfgReg.DMA_EN still returns 1 to indicate that there are channels still active until hardware has terminated all activity on all channels, at which point the DmaCfgReg.DMA_EN bit returns 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**DMA_EN:** DMA Enable bit. 0 = DMA Disabled 1 = DMA Enabled

9.2.68 REG ChEnReg (CHENREG) - Offset BA0h

This is the DMA Channel Enable Register. If software needs to set up a new channel, then it can read this register in

order to find out which channels are currently inactive, it can then enable an inactive channel with the required priority. All bits of this register are cleared to 0 when the global DMA channel enable bit, DmaCfgReg(0), is 0. When the global channel enable bit is 0, then a write to the ChEnReg register is ignored and a read will always read back 0. The channel enable bit, ChEnReg.CH_EN, is written only if the corresponding channel write enable bit, ChEnReg.CH_EN_WE, is asserted on the same OCP write transfer.

Type	Size	Offset	Default
MMIO	32 bit	BAR + BA0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
9:8	0h WO	**CH_EN_WE:** Channel enable write enable.
7:2	0h RO	**Reserved**
1:0	0h RW	**CH_EN:** Enables/Disables the channel. Setting this bit enables a channel, clearing this bit disables the channel. 0 = Disable the Channel 1 = Enable the Channel The ChEnReg.CH_EN bit is automatically cleared by hardware to disable the channel after the last OCP transfer of the DMA transfer to the destination has completed. Software can therefore poll this bit to determine when this channel is free for a new DMA transfer.

9.3 GSPI PCR Registers Summary

Table 9-3. Summary of GSPI PCR Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
224h	4	PCICFGCTR10 PCI Configuration Control 10 Register (PCICFGCTR10)	00000100h
228h	4	PCICFGCTR11 PCI Configuration Control 11 Register (PCICFGCTR11)	00000100h
22Ch	4	PCICFGCTR12 PCI Configuration Control 12 Register (PCICFGCTR12)	00000100h

9.3.1 PCICFGCTR10 PCI Configuration Control 10 Register (PCICFGCTR10) - Offset 224h

Controls The Pci Configuration Space

Type	Size	Offset	Default
MMIO	32 bit	FDCD0000h + 224h	00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RO	**Reserved**
27:20	00h RW	**PCI_IRQ10:** IRQ number to be sent in the message with data field for PCI Assert_IRQ and PCI_Deassert_IRQ message
19:12	00h RW	**ACPI_IRQ10:** IRQ number to be sent in the message with data field for ACPI Assert_IRQ and ACPI_Deassert_IRQ message
11:8	1h RW	**IPIN10:** Interrupt Pin: This register indicates the values to be used for Global Interrupts.
7	0h RW	**BAR1_DISABLE10:** BAR1_Disable: BAR1 register in the PCOS space becomes Read only when this bit is set.
6:2	00h RW	**PME_SUPPORT10:** The value in this register is XOR with the value in the PME_support strap and reflected in the PME_Support register in the PCI configuration space
1	0h RW	**ACPI_INTR_EN10:** When set, the Bridge uses ACPI Sideband opcodes for messages When cleared, the Bridge uses global IOSF opcodes
0	0h RW	**PCI_CFG_DIS10:** When set, PCI configuration accesses return UR response When 0, PCI configuration accesses are supported

9.3.2 PCICFGCTR11 PCI Configuration Control 11 Register (PCICFGCTR11) - Offset 228h

Controls the PCI configuration space

Type	Size	Offset	Default
MMIO	32 bit	FDCD0000h + 228h	00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RO	**Reserved**
27:20	00h RW	**PCI_IRQ11:** IRQ number to be sent in the message with data field for PCI Assert_IRQ and PCI_Deassert_IRQ message
19:12	00h RW	**ACPI_IRQ11:** IRQ number to be sent in the message with data field for ACPI Assert_IRQ and ACPI_Deassert_IRQ message
11:8	1h RW	**IPIN11:** Interrupt Pin: This register indicates the values to be used for Global Interrupts.
7	0h RW	**BAR1_DISABLE11:** BAR1_Disable: BAR1 register in the PCOS space becomes Read only when this bit is set.
6:2	00h RW	**PME_SUPPORT11:** The value in this register is XOR with the value in the PME_support strap and reflected in the PME_Support register in the PCI configuration space
1	0h RW	**ACPI_INTR_EN11:** When set, the Bridge uses ACPI Sideband opcodes for messages When cleared, the Bridge uses global IOSF opcodes
0	0h RW	**PCI_CFG_DIS11:** When set, PCI configuration accesses return UR response When 0, PCI configuration accesses are supported

9.3.3 PCICFGCTR12 PCI Configuration Control 12 Register (PCICFGCTR12) - Offset 22Ch

Controls the PCI configuration space

Type	Size	Offset	Default
MMIO	32 bit	FDCD0000h + 22Ch	00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RO	**Reserved**
27:20	00h RW	**PCI_IRQ12:** IRQ number to be sent in the message with data field for PCI Assert_IRQ and PCI_Deassert_IRQ message
19:12	00h RW	**ACPI_IRQ12:** IRQ number to be sent in the message with data field for ACPI Assert_IRQ and ACPI_Deassert_IRQ message
11:8	1h RW	**IPIN12:** Interrupt Pin: This register indicates the values to be used for Global Interrupts.
7	0h RW	**BAR1_DISABLE12:** BAR1_Disable: BAR1 register in the PCOS space becomes Read only when this bit is set.
6:2	00h RW	**PME_SUPPORT12:** The value in this register is XOR with the value in the PME_support strap and reflected in the PME_Support register in the PCI configuration space
1	0h RW	**ACPI_INTR_EN12:** When set, the Bridge uses ACPI Sideband opcodes for messages When cleared, the Bridge uses global IOSF opcodes
0	0h RW	**PCI_CFG_DIS12:** When set, PCI configuration accesses return UR response When 0, PCI configuration accesses are supported

10 TSN GbE Controller

10.1 TSN GbE Configuration Registers Summary

This chapter documents the registers in Bus: 0, Device: 30, Function: 4.

DID Values:

• TSN GbE Controller - D30: F4

- 4B30h (Reserved)

- 4B32h (SGMII: 1Gb and 2.5Gb Mode)

Note: SGMII 1Gb & 2.5Gb Modes share the same Device ID. The GCR.LINK_MODE register field shall be used to configure operation at 1Gb or 2.5Gb.

The Function is discovered by software as a Root Complex integrated Endpoint (RCiEP). The PCI Bus Number, Device Number, and Function Number are assigned by the PCH design and not enumerated. Because it is an RCiEP, some of the register fields are designed to be altered by BIOS for a particular system implementation.

Note: BIOS has the capability to disable software access to the PCI Configuration Space of this Function. When disabled, the Function returns Unsupported Request (UR) to requests to access its configuration registers.

Table 10-1. Summary of Bus: 0, Device: 30, Function: 4 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	Device ID and Vendor ID Register (DEVVENDID)	4B320000h
4h	4	Status and Command (STATUSCOMMAND)	00100000h
8h	4	Revision ID and Class Code (REVCLASSCODE)	00000000h
Ch	4	Cache Line Latency Header and BIST (CLLATHEADERBIST)	00000000h
10h	4	Base Address Register (BAR)	00000000h
14h	4	Base Address Register High (BAR_HIGH)	00000000h
18h	4	Base Address Register1 (BAR1)	00000000h
1Ch	4	Base Address Register1 High (BAR1_HIGH)	00000000h
2Ch	4	Subsystem Vendor and Subsystem ID (SUBSYSTEMID)	00000000h
30h	4	Expansion ROM Base Address (EXPANSION_ROM_BASEADDR)	00000000h
34h	4	Capabilities Pointer (CAPABILITYPTR)	00000080h
3Ch	4	Interrupt Register (INTERRUPTREG)	00000100h
40h	4	PCIe Capabilities Register (PCIECAPREG)	00920010h
44h	4	PCIe Device Capability Register (DEVCAPREG)	10008FC0h
48h	4	PCIe Device Control Status Register (DEVCTRLSTAT)	00000000h
64h	4	PCIe Device Capability2 Register (DEVCAPREG2)	00000000h
68h	4	PCIe Device Control2 Status Register (DEVCTRLSTAT2)	00000000h
80h	4	Power Management Capability ID (POWERCAPID)	48030001h
84h	4	Power Management Control And Status Register (PMECTRLSTATUS)	00000008h
90h	4	PCI Device Idle Vendor Capability Register (PCIDEVIDLE_CAP_RECORD)	F0140009h
94h	4	Vendor Specific Extended Capability Register (DEVID_VEND_SPECIFIC_REG)	01400010h
98h	4	Software LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG)	00000000h
9Ch	4	Device Idle Pointer Register (DEVICE_IDLE_POINTER_REG)	00000000h
A0h	4	D0i3 and Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG)	00000800h
B0h	4	General Purpose Read Write Register1 (GEN_PCI_REGRW1)	00000000h
B4h	4	General Purpose Read Write Register2 (GEN_PCI_REGRW2)	00000000h
B8h	4	General Purpose Read Write Register3 (GEN_PCI_REGRW3)	00000000h
BCh	4	General Purpose Read Write Register4 (GEN_PCI_REGRW4)	00000000h
C0h	4	General Purpose Input Register (GEN_INPUT_REG)	00000000h
D0h	4	MSI Capability Register (MSI_CAP_REG)	01800005h
D4h	4	MSI Message Low Address (MSI_ADDR_LOW)	00000000h
D8h	4	MSI Message High Address (MSI_ADDR_HIGH)	00000000h
DCh	4	MSI Message Data (MSI_MSG_DATA)	00000000h
E0h	4	MSI Mask Register (MSI_MASK)	00000000h
E4h	4	MSI Pending Register (MSI_PENDING)	00000000h
F8h	4	Manufacturers ID (MANID)	00000000h

10.1.1 Device ID and Vendor ID Register (DEVVENDID) — Offset 0h

Device ID and Vendor ID.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + 0h	4B320000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	4B32h RO/P	**Device ID Field (DEVICEID):** Device ID identifies the particular PCI device - 4B30h (Reserved) - 4B32h (SGMII: 1Gb and 2.5Gb Mode) ***Note:*** SGMII 1Gb & 2.5Gb Modes share the same Device ID. The GCR.LINK_MODE register field shall be used to configure operation at 1Gb or 2.5Gb.
15:0	0000h RO	**Vendor ID Field (VENDORID):** Vendor ID is a unique ID provided by the PCI SIG which identifies the manufacturer of the device

10.1.2 Status and Command (STATUSCOMMAND) — Offset 4h

Command Register and Status Register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + 4h	00100000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C	**Detected Parity Error (DPE):** Detected Parity Error
30	0h RW/1C	**Signaled System Error (SSE):** Signaled System Error
29	0h RW/1C	**RMA Field (RMA):** Received Master Abort
28	0h RW/1C	**RTA Field (RTA):** Received Target Abort
27:25	0h RO	**Reserved**
24	0h RW/1C	**Master Data Parity Error (MDPE):** Master Data Parity Error
23:21	0h RO	**Reserved**
20	1h RO	**Cap List Field (CAPLIST):** Capabilities List: Indicates that the controller contains a capabilities pointer list
19	0h RO	**Interrupt Status Field (INTR_STATUS):** Interrupt Status: This bit reflects state of interrupt in the device

Bit Range	Default & Access	Field Name (ID): Description
18:11	0h RO	**Reserved**
10	0h RW	**Interrupt Disable Field (INTR_DISABLE):** If '1', SB Interrupt generation is disabled If '0', SB Interrupt generation is enabled
9	0h RO	**Reserved**
8	0h RW	**SERR Enable Field (SERR_ENABLE):** SERR Enable Not implemented
7	0h RO	**Reserved**
6	0h RW	**Parity Error Response Enable (PERE):** Parity Error Response Enable
5:3	0h RO	**Reserved**
2	0h RW	**BME Field (BME):** Bus Master Enable
1	0h RW	**MSE Field (MSE):** Memory Space Enable
0	0h RO	**Reserved**

10.1.3 Revision ID and Class Code (REVCLASSCODE) — Offset 8h

Revision ID register and Class Code Register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + 8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	**Revision Id Field (CLASS_CODES):** Class Code register is read-only and is used to identify the generic function of the device and in some cases a specific register-level programming interface
7:0	00h RO/P	**Class Code Field (RID):** Revision ID identifies the revision of particular PCI device.

10.1.4 Cache Line Latency Header and BIST (CLLATHEADERBIST) — Offset Ch

Cache Line size as RW with def 0 Latency timer RW with def 0 Header type with Type 0 configuration header and Reserved BIST Register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	0h RO	**MultifunctionDevice Field (MULFNDEV):** Multi-Function Device: This bit is set only if the device has multiple functions. For VF, this bit is set to 0
22:16	00h RO	**Header Type Field (HEADERTYPE):** Header Type: Implements Type 0 Configuration header
15:8	00h RO	**Latency Timer Field (LATTIMER):** Latency Timer:. This register is implemented as R/W with default as 0
7:0	00h RW/P	**Cache Line Size Field (CACHELINE_SIZE):** Cache Line Size: Does not apply to PCI Express. PCI Express spec requires this to be implemented as an R/W register but has no functional impact on the AMBA Device connected. This field is RO and tied to 0 for VFs.

10.1.5 Base Address Register (BAR) — Offset 10h

Base Address Register low [31:2] type[2:1] in 32bit or 64bit address range and memory space indicator [0].

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR):** Base Address Register Low Base address of the AXI fabric memory space. Taken from Strap values as ones
11:4	00h RO	**Size Field (SIZEINDICATOR):** Size Indicator RO Always returns 0 The size of this register depends on the size of the memory space
3	0h RO	**Prefetchable Field (PREFETCHABLE):** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**Type Field (TYPE0):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE):** Memory Space Indicator: 0 indicates this BAR is present in the memory space.

10.1.6 Base Address Register High (BAR_HIGH) — Offset 14h

Base Address Register High enabled if [2:1] of BAR_HIGH is 10.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR_HIGH):** Base Address High - MSB

10.1.7 Base Address Register1 (BAR1) — Offset 18h

Base Address Register1 accesses to PCI configuration space and is always 4K type in [2:1] and memory space indicator in [0].

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + 18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR1):** Base Address1 This field is present if BAR1 is enabled through private configuration space.
11:4	00h RO	**Size Field (SIZEINDICATOR1):** Always is 0 as minimum size is 4K
3	0h RO	**Prefetchable Field (PREFETCHABLE1):** Prefetchable: Indicates that this BAR is not prefetchable.
2:1	0h RO	**Type Field (TYPE1):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE1):** Memory Space Indicator: 0 Indicates this BAR is present in the memory space

10.1.8 Base Address Register1 High (BAR1_HIGH) — Offset 1Ch

Base Address Register1 High enabled only if [2:1] of BAR1_HIGH Register is 10.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + 1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR1_HIGH):** Base Address: Base address of the AXI fabric memory space. Taken from Strap values as ones

10.1.9 Subsystem Vendor and Subsystem ID (SUBSYSTEMID) — Offset 2Ch

SVID Register along with SID Register is to distinguish subsystem from another.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + 2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O/P	**Subsystem ID Field (SUBSYSTEMID):** Subsystem ID: This register is implemented for any function that can be instantiated more than once in a given system.
15:0	0000h RW/O/P	**Subsystem Vendor Field (SUBSYSTEMVENDORID):** Subsystem Vendor ID: This register must be implemented for any function that can be instantiated more than once in a given system

10.1.10 Expansion ROM Base Address (EXPANSION_ROM_BASEADDR) — Offset 30h

Expansion ROM Base Address Register is a RO indicates support for Expansion ROMs

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + 30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Expansion Rom Base Address Field (EXPANSION_ROM_BASE):** Expansion ROM Base Address: Value of all zeros indicates no support for Expansion ROM

10.1.11 Capabilities Pointer (CAPABILITYPTR) — Offset 34h

Capabilities Pointer Register indicates what the next capability is.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + 34h	00000080h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	80h RO	**Capabilities Pointer Field (CAPPTR_POWER):** Capabilities Pointer: Indicates what the next capability is.

10.1.12 Interrupt Register (INTERRUPTREG) — Offset 3Ch

Interrupt Line Register isn't used in Bridge directly Interrupt Pin Register reflects the IPIN value in private configuration space. MIN_GNT Register indicating the requirement of latency timers and MAX_LAT Register max latency.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + 3Ch	00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Max Latency Field (MAX_LAT):** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	00h RO	**Min GNT Field (MIN_GNT):** Value of 0 indicates device has no major requirements for the settings of latency timers
15:12	0h RO	**Reserved**
11:8	1h RO	**Interrupt Pin Field (INTPIN):** Interrupt Pin: Value in this register is reflected from the IPIN value in the private configuration space.
7:0	00h RW/P	**Interrupt Line Field (INTLINE):** Interrupt Line: It is used to communicate to software the interrupt line to which the interrupt pin is connected

10.1.13 PCIe Capabilities Register (PCIECAPREG) — Offset 40h

PCIe Capabilities Register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + 40h	00920010h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:25	00h RO/V	**Interrupt Message Number Field (INTR_MSG_NUM):** PCIe Interrupt Message Number
24	0h RO	**Slot Implemented Field (SLOT_IMPLEMENTED):** Slot Implemented. Tied to 0
23:20	9h RO	**Dev Port Type Field (DEV_PORT_TYPE):** Device Port Type. Taken from strap
19:16	2h RO	**Cap Version Field (CAP_VER):** PCI Capability Version
15:8	00h RO	**Next Capability Pointer Field (NEXT_CAP_PTR):** Next Capability Pointer
7:0	10h RO	**Capability ID Field (PCIE_CAP_ID):** PCIe Capability ID

10.1.14 PCIe Device Capability Register (DEVCAPREG) — Offset 44h

PCIe Device Cap Register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + 44h	10008FC0h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	1h RO	**FLR Capability Field (FLR_CAP):** FLR Capability
27:26	0h RO	**Captured Slot Power Limit Scale Field (CAP_SLOT_PWR_LIM_SCALE):** Captured Slot Power Limit Scale. Tied to 0
25:18	00h RO	**Captured Slot Power Limit Value Field (CAP_SLOT_PWR_LIM_VAL):** Captured Slot Power Limit Value. Tied to 0
17:16	0h RO	**Reserved**
15	1h RO	**RB error PTR Field (RB_ERR_RPTR):** Role Based Error Reporting
14:12	0h RO	**Reserved**
11:9	7h RO	**EP L01 Acceptable Latency Field (EP_L1_ACC_LAT):** L1 Acceptable Latency
8:6	7h RO	**EP L0 Acceptable Latency Field (EP_L0_ACC_LAT):** L0 Acceptable Latency
5	0h RO	**ETF Support Field (ETF_SUPPORT):** Extended Tag Field Support
4:3	0h RO	**Phantom Functions Support Field (PHANTOM_FUNC_SUPPORT):** Phantom Functions SUPPORT. NA for Bridge
2:0	0h RO	**Max Pl Size Support Field (MAX_PL_SIZE_SUPPORT):** Max Payload Size

10.1.15 PCIe Device Control Status Register (DEVCTRLSTAT) — Offset 48h

PCIe Device Status Register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + 48h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21	0h RO/V	**TXN Pending Field (TXN_PENDING):** Transaction Pending bit
20	0h RO	**Aux Power Detected Field (AUX_PWR_DETECTED):** Aux Power Detected. Always tied to 0
19	0h RW/1C	**UR Field (UR_DETECTED):** Unsupported Request Detected
18	0h RW/1C	**Fatal Error Detected Field (FER_DETECTED):** Fatal Error Detected
17	0h RO	**Non Fatal Err Detected Field (NFER_DETECTED):** Non Fatal Error Detected
16	0h RO	**Correctable Error Detected Field (CER_DETECTED):** Correctable Error Detected
15	0h WO	**Initiate FLR Field (INITIATE_FLR):** Initiate Function Level Reset
14:12	0h RO	**Max Read Request Size Field (MAX_RD_REQ_SIZE):** Max Read Request Size
11	0h RW	**Enable No Snoop Field (EN_NS):** Enable No Snoop
10	0h RO	**Aux Power Detected Field (AUX_PWR_PM_EN):** Aux Power Enable
9	0h RO	**Phantom Function En Field (PHANTOM_FUNC_EN):** Phantom Function Enable. Not support by Bridge
8	0h RW	**ETF En Field (ETF_EN):** Extended Tag Field Enable
7:5	0h RO	**Max Payload Size Field (MAX_PL_SIZE):** Maximum Payload Size
4	0h RW	**Enable Relaxed Ordering Field (EN_RO):** Enable Relaxed Ordering
3	0h RW	**UR Reporting En Field (URR_EN):** Unsupported Request Reporting Enable
2	0h RW	**Fatal Err Reporting En Field (FER_EN):** Fatal Error Reporting Enable
1	0h RW	**Non Fatal Err Reporting En Field (NFER_EN):** Non Fatal Error Reporting Enable
0	0h RW	**Correctable Error Reporting En Field (CER_EN):** Correctable Error Reporting Enable

10.1.16 PCIe Device Capability2 Register (DEVCAPREG2) — Offset 64h

PCIe Device Cap Register2.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + 64h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:22	0h RO	**Max End2end TLP Prefix Field (MAX_EE_TLP_PREFIXES):** Max End2End TLP Prefixes
21	0h RO	**End2end TLP Prefix Supported Field (EE_TLP_PREFIX_SUPPORT):** End2End TLP Prefixes Support
20	0h RO	**Ext Format Support Field (EXTD_FMT_SUPPORT):** Extended Format Support
19:18	0h RO	**OBFF Support Field (OBFF_SUPPORT):** PCI OBFF Support
17:14	0h RO	**Reserved**
13:12	0h RO	**TPH Completer Supported Field (TPH_CPL_SUPPORT):** TPH Completer Support
11	0h RO	**LTR Support Field (LTR_SUPPORT):** LTR Support
10	0h RO	**No RO Enable Field (NRO_EN_PRPR_PASS):** No RO based PR-PR Passing
9	0h RO	**CAS Cpl 128 Support Field (CAS_CPL_SUPPORT_128):** CAS128 Support
8	0h RO	**CAS Cpl 64 Support Field (ATM_OP_CPL_SUPPORT_64):** CAS64 Completion Support
7	0h RO	**CAS Cpl 32 Support Field (ATM_OP_CPL_SUPPORT_32):** CAS32 Completion Support
6	0h RO	**Atomic Operation Routing Field (ATOR_SUPPORT):** Atomic Operation Routing Support
5	0h RO	**PCI Ari Forwarding Support Field (ARI_FWD_SUPPORT):** ARI Forwarding Support
4	0h RO	**Cpl Timeout Disable Support Field (CPL_TO_DIS_SUPPORT):** Completion Timeout Disable Support
3:0	0h RO	**Cpl Timeout Range Support Field (CPL_TO_RNG_SUPPORT):** Completion Timeout Ranges Support

10.1.17 PCIe Device Control2 Status Register (DEVCTRLSTAT2) — Offset 68h

PCIe Device Status Register2.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + 68h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RO	**End2end TLP Prefix Blocking Field (EE_TLP_PREFIX_EN):** End2End TLP Prefixes Blocking
14:13	0h RO	**OBFF Enable Field (OBFF_EN):** OBFF Enable
12:11	0h RO	**Reserved**
10	0h RW	**LTR Mechanism Enable Field (LTR_MECH_EN):** LTR Mechanism Enable
9	0h RO	**IDO Based Cpl Enable Field (IDO_CPL_EN):** IDO Completion Enable
8	0h RO	**IDO Based Request Enable Field (IDO_REQ_EN):** IDO Request Enable
7	0h RO	**Atomic Op Egress Blocking Field (ATM_OP_EGR_BLK):** Atomic Operation Egress Blocking
6	0h RO	**Atomic Op Requester Enable Field (ATM_OP_REQ_EN):** Atomic Operation Requester Enable
5	0h RO	**ARI Fwd Enable Field (ARI_FWD_EN):** ARI Forwarding Enable
4	0h RW	**Cpl Timeout Disable Field (CPL_TO_DIS):** Completion Timeout Disable Support
3:0	0h RW	**Cpl Timeout Value Field (CPL_TO_VAL):** Completion Timeout Value

10.1.18 Power Management Capability ID (POWERCAPID) — Offset 80h

Power Management Capability ID Register points to Next Capability Structure and Power Management Capability with pOwer Management Capabilities Register for PME Support and Version.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + 80h	48030001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	09h RO	**PME Support Field (PMESUPPORT):** This 5-bit field indicates the power states in which the function can assert the PME#
26:19	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
18:16	3h RO	**Version Field (VERSION):** Indicates support for Revision 1.2 of the PCI Power Management Specification
15:8	00h RO	**Next Cap Field (NXTCAP):** Next Capability: Points to the next capability structure.
7:0	01h RO	**Power Capability ID Field (POWER_CAP):** Power Management Capability: Indicates this is power management capability

10.1.19 Power Management Control and Status Register (PMECTRLSTATUS) — Offset 84h

Power Management Control and Status Register to set and read PME Status, PME Enable No Soft Reset and Power State.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + 84h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW/1C/P	**PME Status Field (PMESTATUS):** PME Status: 0 = Software clears the bit by writing a 1 to it. 1 = This bit is set when the AMBA Device would normally assert the PME# signal independent of the state of the PME Enable bit (bit 8 in this register)
14:9	0h RO	**Reserved**
8	0h RW/P	**PME Enable Field (PMEENABLE):** PME Enable: A 1 enables the function to assert PME#. When 0, PME# message on Sideband is disabled.
7:4	0h RO	**Reserved**
3	1h RO	**No Soft Reset Field (NO_SOFT_RESET):** This bit indicates that devices transitioning from D3hot to D0 because of Power State commands do not perform an internal reset
2	0h RO	**Reserved**
1:0	0h RW	**Power State Field (POWERSTATE):** Power State: This field is used both to determine the current power state and to set a new power state

10.1.20 PCI Device Idle Vendor Capability Register (PCIDEVIDLE_CAP_RECORD) — Offset 90h

PCI Device Vendor Specific Capability Register defines Vendor Specific Capability ID, Revision Length, Next Capability and CAPID.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + 90h	F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**Vendor Cap Field (VEND_CAP):** Vendor Specific Capability ID
27:24	0h RO	**Revision ID Field (REVID):** Revision ID of capability structure
23:16	14h RO	**Cap Length Field (CAP_LENGTH):** Vendor Specific Capability Length
15:8	00h RO	**Next Capability Field (NEXT_CAP):** Next Capability
7:0	09h RO	**Capability ID Field (CAPID):** Capability ID

10.1.21 Vendor Specific Extended Capability Register (DEVID_VEND_SPECIFIC_REG) — Offset 94h

Extended Vendor Capability Register for VSEC Length, Revision and ID.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + 94h	01400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	014h RO	**Vendor Specific ID Field (VSEC_LENGTH):** Vendor Specific Extended Capability Length
19:16	0h RO	**Vendor Specific Revision Field (VSEC_REV):** Vendor specific Extended Capability revision
15:0	0010h RO	**Vendor Specific Length Field (VSECID):** Vendor Specific Extended Capability ID

10.1.22 Software LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG) — Offset 98h

Software Location Pointer in MMIO space as an offset specified by BAR.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + 98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RO	**SW LTR DWord Offset Field (SW_LAT_DWORD_OFFSET):** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**SW LTR Bar Number Field (SW_LAT_BAR_NUM):** Indicates that the SW LTR update MMIO location is always at BAR0
0	0h RO	**SW LTR Valid Field (SW_LAT_VALID):** This value is reflected from the SW LTR valid strap at the top level

10.1.23 Device Idle Pointer Register (DEVICE_IDLE_POINTER_REG) — Offset 9Ch

Device IDLE Pointer Register giving details on Device MMIO Offset, Location BAR NUM and D0i3 Valid Strap.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + 9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RO	**D0i3 DWord Offset Field (DWORD_OFFSET):** contains the location pointer to the SW LTR register in MMIO space as an offset from the specified BAR
3:1	0h RO	**BAR NUM Field (BAR_NUM):** BAR NUM: Indicates that the D0i3 MMIO location is always at BAR0
0	0h RO	**D0i3 Valid Field (VALID):** Valid: This value is reflected from the D0i3 valid strap at the top level.

10.1.24 D0i3 and Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG) — Offset A0h

D0idle_Max_Power_On_Latency Register set at boot and Power Control Enable Register to enable communication with the PGCB block below the Bridge.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + A0h	00000800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21	0h RW/P	**HAE:** Hardware Autonomous Enable: If 1, then hardware may request power gating whenever it has reached an idle condition.
20	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
19	0h RW/P	**Sleep Enable Field (SLEEP_EN):** SE: Sleep Enable: If 1, then the function may assert Sleep during power gating. If 0, then function will never asset Sleep to the retention flops. Note that some platforms may default this bit to 0, others to 1.
18	0h RW/P	**D3 Hen Field (D3HEN):** DEVIDLE Enable (DEVIDLEN): If '1' then the function will power gate when idle and the DevIdle register (DevIdleC[2] = '1') is set.
17	0h RW/P	**Device Idle En Field (DEVIDLEN):** PMCRE: PMC Request Enable
16	0h RW/P	**PMC Request Enable Field (PMCRE):** D3-Hot Enable (D3HEN): If 1, then function will power gate when idle and the PMCSR[1:0] register in the function ='11' (D3).
15:13	0h RO	**Reserved**
12:10	2h RW/O/P	**Power Latency Scale Field (POW_LAT_SCALE):** Power On Latency Scale
9:0	000h RW/O/P	**Power Latency Value Field (POW_LAT_VALUE):** Power On Latency Value

10.1.25 General Purpose Read Write Register1 (GEN_PCI_REGRW1) — Offset B0h

General Purpose PCI Read Write Register1.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Read Write Field (GEN_PCI_REG_RW1):** General Purpose PCI Register: This register value is brought out as GEN_PCI_REG_RW1

10.1.26 General Purpose Read Write Register2 (GEN_PCI_REGRW2) — Offset B4h

General Purpose PCI Read Write Register2.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + B4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Read Write Field (GEN_PCI_REG_RW2):** General Purpose PCI Register: This register value is brought out as GEN_PCI_REG_RW2

10.1.27 General Purpose Read Write Register3 (GEN_PCI_REGRW3) — Offset B8h

General Purpose PCI Read Write Register3.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + B8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Read Write Field (GEN_PCI_REG_RW3):** General Purpose PCI Register: This register value is brought out as GEN_PCI_REG_RW3

10.1.28 General Purpose Read Write Register4 (GEN_PCI_REGRW4) — Offset BCh

General Purpose PCI Read Write Register4.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + BCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Read Write Field (GEN_PCI_REG_RW4):** General Purpose PCI Register: This register value is brought out as GEN_PCI_REG_RW4

10.1.29 General Purpose Input Register (GEN_INPUT_REG) — Offset C0h

General Purpose Input Register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**General Purpose Input Field (GEN_REG_INPUT_RW):** General Purpose Input Register: This register value reflects the value of GEN_REG_INPUT_RW

10.1.30 MSI Capability Register (MSI_CAP_REG) — Offset D0h

MSI Capability Register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + D0h	01800005h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	1h RO	**Per Vector Masking Capability Field (PER_VECTOR_MSK_CAP):** Per Vector Masking Capability
23	1h RO	**MSI Capability Field (MSI_CAP_64B):** 64 bit message address capability
22:20	0h RW	**Multi Message En Field (MUL_MSG_EN):** Multiple Message Enable
19:17	0h RO	**Multi Message Cap Field (MUL_MSG_CAP):** Multiple Message Capable
16	0h RW	**MSI Enable Field (MSG_MSI_ENABLE):** MSI Enable: If 1, then the PCI Device is allowed to use MSI to request service. The PCI Device is prohibited to use INTx, when MSI is enabled If 0, then the PCI Device is prohibited from using MSI to request service.
15:8	00h RO	**Next Pointer Field (MSG_NXT_PTR):** Next Capability Pointer
7:0	05h RO	**MSI Capability Field (MSG_CAP_ID):** MSI Capability ID

10.1.31 MSI Message Low Address (MSI_ADDR_LOW) — Offset D4h

MSI Message Low Address.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RW	**MSI Message Low Address Field (MSI_ADDR_LOW):** MSI Message Low Address
1:0	0h RO	**Reserved**

10.1.32 MSI Message High Address (MSI_ADDR_HIGH) — Offset D8h

MSI Message High Address.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSI Message High Address Field (MSI_ADDR_HIGH):** MSI Message High Address

10.1.33 MSI Message Data (MSI_MSG_DATA) — Offset DCh

MSI Message Data.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + DCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0000h RW	**MSI Message Data Field (MSI_MSG_DATA):** MSI Message Data

10.1.34 MSI Mask Register (MSI_MASK) — Offset E0h

MSI Mask Bits.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + E0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSI Mask Field (MSI_MASK):** MSI Mask bits

10.1.35 MSI Pending Register (MSI_PENDING) — Offset E4h

MSI Pending Bits.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**MSI Pending Field (MSI_PENDING):** MSI Pending bits

10.1.36 Manufacturers ID (MANID) — Offset F8h

Manufacturers ID register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:30, F:4] + F8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/P	**Manufacturers ID Field (MANID):** Manufacturer ID: Default value comes from straps.

10.2 TSN GbE Memory Mapped Registers Summary

These are the I/O Registers in Memory Space for this Function that are accessible to BIOS and software running on the Host Root (RS0) processor. The Base Address Register (BAR) is located at offset 10h in PCI Configuration Space.

Table 10-2. Summary of TSN GbE Memory Mapped Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	MAC_CONFIGURATION	00000000h
4h	4	MAC_EXT_CONFIGURATION	00000000h
8h	4	MAC_PACKET_FILTER	00000000h
Ch	4	MAC_WATCHDOG_TIMEOUT	00000000h
10h	4	MAC_HASH_TABLE_REG0	00000000h
14h	4	MAC_HASH_TABLE_REG1	00000000h
50h	4	MAC_VLAN_TAG_CTRL	00000000h
54h	4	MAC_VLAN_TAG_DATA	00000000h
58h	4	MAC_VLAN_HASH_TABLE	00000000h
60h	4	MAC_VLAN_INCL	00000000h
64h	4	MAC_INNER_VLAN_INCL	00000000h
70h	4	MAC_Q0_TX_FLOW_CTRL	00000000h
74h	4	MAC_Q1_TX_FLOW_CTRL	00000000h
78h	4	MAC_Q2_TX_FLOW_CTRL	00000000h
7Ch	4	MAC_Q3_TX_FLOW_CTRL	00000000h
80h	4	MAC_Q4_TX_FLOW_CTRL	00000000h
84h	4	MAC_Q5_TX_FLOW_CTRL	00000000h
88h	4	MAC_Q6_TX_FLOW_CTRL	00000000h
8Ch	4	MAC_Q7_TX_FLOW_CTRL	00000000h
90h	4	MAC_RX_FLOW_CTRL	00000000h
94h	4	MAC_RXQ_CTRL4	00000000h
98h	4	MAC_TXQ_PRTY_MAP0	00000000h
9Ch	4	MAC_TXQ_PRTY_MAP1	00000000h
A0h	4	MAC_RXQ_CTRL0	00000000h
A4h	4	MAC_RXQ_CTRL1	00000000h
A8h	4	MAC_RXQ_CTRL2	00000000h
ACh	4	MAC_RXQ_CTRL3	00000000h
B0h	4	MAC_INTERRUPT_STATUS	00000000h
B4h	4	MAC_INTERRUPT_ENABLE	00000000h
B8h	4	MAC_RX_TX_STATUS	00000000h
C0h	4	MAC_PMT_CONTROL_STATUS	00000000h
C4h	4	MAC_RWK_PACKET_FILTER	00000000h
D0h	4	MAC_LPI_CONTROL_STATUS	00000000h
D4h	4	MAC_LPI_TIMERS_CONTROL	03E80000h
D8h	4	MAC_LPI_ENTRY_TIMER	00000000h
DCh	4	MAC_1US_TIC_COUNTER	00000063h
F8h	4	MAC_PHYIF_CONTROL_STATUS	00000000h
110h	4	MAC_VERSION	00005152h
114h	4	MAC_DEBUG	00000000h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
11Ch	4	MAC_HW_FEATURE0	0EFD73F7h
120h	4	MAC_HW_FEATURE1	119F7A28h
124h	4	MAC_HW_FEATURE2	22DF71C7h
128h	4	MAC_HW_FEATURE3	2C395632h
140h	4	MAC_DPP_FSM_INTERRUPT_STATUS	00000000h
144h	4	MAC_AXI_SLV_DPE_ADDR_STATUS	00000000h

10.2.1 MAC_CONFIGURATION — Offset 0h

The MAC Configuration Register establishes the operating mode of the MAC.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**ARP Offload Enable (ARPEN):** When this bit is set, the MAC can recognize an incoming ARP request packet and schedules the ARP packet for transmission. It forwards the ARP packet to the application and also indicate the events in the RxStatus. When this bit is reset, the MAC receiver does not recognize any ARP packet and indicates them as Type frame in the RxStatus. This bit is available only when the Enable IPv4 ARP Offload is selected. 0x0 (DISABLE): ARP Offload is disabled. 0x1 (ENABLE): ARP Offload is enabled.
30:28	0h RW	**Source Address Insertion or Replacement Control (SARC):** This field controls the source address insertion or replacement for all transmitted packets. Bit 30 specifies which MAC Address register (0 or 1) is used for source address insertion or replacement based on the values of Bits[29:28]: 2'b0x: - The mti_sa_ctrl_i and ati_sa_ctrl_i input signals control the SA field generation. 2'b10: - If Bit 30 is set to 0, the MAC inserts the content of the MAC Address 0 registers in the SA field of all transmitted packets. - If Bit 30 is set to 1 and the Enable MAC Address Register 1 option is selected while configuring the core, the MAC inserts the content of the MAC Address 1 registers in the SA field of all transmitted packets. 2'b11: - If Bit 30 is set to 0, the MAC replaces the content of the MAC Address 0 registers in the SA field of all transmitted packets. - If Bit 30 is set to 1 and the MAC Address Register 1 is enabled, the MAC replaces the content of the MAC Address 1 registers in the SA field of all transmitted packets. Note: - Changes to this field take effect only on the start of a packet. If you write to this register field when a packet is being transmitted, only the subsequent packet can use the updated value, that is, the current packet does not use the updated value. 0x0 (SA_CTRL_IN): mti_sa_ctrl_i and ati_sa_ctrl_i input signals control the SA field generation. 0x2 (MAC0_INS_SA): Contents of MAC Addr-0 inserted in SA field. 0x3 (MAC0_REP_SA): Contents of MAC Addr-0 replaces SA field. 0x6 (MAC1_INS_SA): Contents of MAC Addr-1 inserted in SA field. 0x7 (MAC1_REP_SA): Contents of MAC Addr-1 replaces SA field.
27	0h RW	**Checksum Offload (IPC):** When set, this bit enables the IPv4 header checksum checking and IPv4 or IPv6 TCP, UDP, or ICMP payload checksum checking. When this bit is reset, the COE function in the receiver is disabled. The Layer 3 and Layer 4 Packet Filter and Enable Split Header features automatically selects the IPC Full Checksum Offload Engine on the Receive side. When any of these features are enabled, you must set the IPC bit. 0x0 (DISABLE): IP header/payload checksum checking is disabled. 0x1 (ENABLE): IP header/payload checksum checking is enabled.

Bit Range	Default & Access	Field Name (ID): Description
26:24	0h RW	**Inter-Packet Gap (IPG):** These bits control the minimum IPG between packets during transmission. This range of minimum IPG is valid in full-duplex mode. In the half-duplex mode, the minimum IPG can be configured only for 64-bit times (IPG = 100). Lower values are not considered. When a JAM pattern is being transmitted because of backpressure activation, the MAC does not consider the minimum IPG. The above function (IPG less than 96 bit times) is valid only when EIPGEN bit in MAC_Ext_Configuration register is reset. When EIPGEN is set, then the minimum IPG (greater than 96 bit times) is controlled as per the description given in EIPG field in MAC_Ext_Configuration register. 0x0 (IPG96): 96 bit times IPG. 0x1 (IPG88): 88 bit times IPG. 0x2 (IPG80): 80 bit times IPG. 0x3 (IPG72): 72 bit times IPG. 0x4 (IPG64): 64 bit times IPG. 0x5 (IPG56): 56 bit times IPG. 0x6 (IPG48): 48 bit times IPG. 0x7 (IPG40): 40 bit times IPG.
23	0h RW	**Giant Packet Size Limit Control Enable (GPSLCE):** When this bit is set, the MAC considers the value in GPSL field in MAC_Ext_Configuration register to declare a received packet as Giant packet. This field must be programmed to more than 1,518 bytes. Otherwise, the MAC considers 1,518 bytes as giant packet limit. When this bit is reset, the MAC considers a received packet as Giant packet when its size is greater than 1,518 bytes (1522 bytes for tagged packet). The watchdog timeout limit, Jumbo Packet Enable and 2K Packet Enable have higher precedence over this bit, that is the MAC considers a received packet as Giant packet when its size is greater than 9,018 bytes (9,022 bytes for tagged packet) with Jumbo Packet Enabled and greater than 2,000 bytes with 2K Packet Enabled. The watchdog timeout, if enabled, terminates the received packet when watchdog limit is reached. Therefore, the programmed giant packet limit should be less than the watchdog limit to get the giant packet status. 0x0 (DISABLE): Giant Packet Size Limit Control is disabled. 0x1 (ENABLE): Giant Packet Size Limit Control is enabled.
22	0h RW	**IEEE 802.3as Support for 2K Packets (S2KP):** When this bit is set, the MAC considers all packets with up to 2,000 bytes length as normal packets. When the JE bit is not set, the MAC considers all received packets of size more than 2K bytes as Giant packets. When this bit is reset and the JE bit is not set, the MAC considers all received packets of size more than 1,518 bytes (1,522 bytes for tagged) as giant packets. Note: When the JE bit is set, setting this bit has no effect on the giant packet status. 0x0 (DISABLE): Support upto 2K packet is disabled. 0x1 (ENABLE): Support upto 2K packet is Enabled.
21	0h RW	**CRC stripping for Type packets (CST):** When this bit is set, the last four bytes (FCS) of all packets of Ether type (type field greater than 1,536) are stripped and dropped before forwarding the packet to the application. 0x0 (DISABLE): CRC stripping for Type packets is disabled. 0x1 (ENABLE): CRC stripping for Type packets is enabled.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**Automatic Pad or CRC Stripping (ACS):** When this bit is set, the MAC strips the Pad or FCS field on the incoming packets only if the value of the length field is less than 1,536 bytes. All received packets with length field greater than or equal to 1,536 bytes are passed to the application without stripping the Pad or FCS field. When this bit is reset, the MAC passes all incoming packets to the application, without any modification. 0x0 (DISABLE): Automatic Pad or CRC Stripping is disabled. 0x1 (ENABLE): Automatic Pad or CRC Stripping is enabled.
19	0h RW	**Watchdog Disable (WD):** When this bit is set, the MAC disables the watchdog timer on the receiver. The MAC can receive packets of up to 16,383 bytes. When this bit is reset, the MAC does not allow more than 2,048 bytes (10,240 if JE is set high) of the packet being received. The MAC cuts off any bytes received after 2,048 bytes. 0x0 (ENABLE): Watchdog is enabled. 0x1 (DISABLE): Watchdog is disabled.
18	0h RW	**Packet Burst Enable (BE):** When this bit is set, the MAC allows packet bursting during transmission in the GMII half-duplex mode. 0x0 (DISABLE): Packet Burst is disabled. 0x1 (ENABLE): Packet Burst is enabled.
17	0h RW	**Jabber Disable (JD):** When this bit is set, the MAC disables the jabber timer on the transmitter. The MAC can transfer packets of up to 16,383 bytes. When this bit is reset, if the application sends more than 2,048 bytes of data (10,240 if JE is set high) during transmission, the MAC does not send rest of the bytes in that packet. 0x0 (ENABLE): Jabber is enabled. 0x1 (DISABLE): Jabber is disabled.
16	0h RW	**Jumbo Packet Enable (JE):** When this bit is set, the MAC allows jumbo packets of 9,018 bytes (9,022 bytes for VLAN tagged packets) without reporting a giant packet error in the Rx packet status. 0x0 (DISABLE): Jumbo packet is disabled. 0x1 (ENABLE): Jumbo packet is enabled.
15	0h RW	**Port Select (PS):** This bit selects the Ethernet line speed. This bit, along with Bit 14, selects the exact line speed. In the 10/100 Mbps-only (always 1) or 1000 Mbps-only (always 0) configurations, this bit is read-only (RO) with appropriate value. In default 10/100/1000 Mbps configurations, this bit is read-write (R/W). 0x0 (M_1000_2500M): For 1000 or 2500 Mbps operations. 0x1 (M_10_100M): For 10 or 100 Mbps operations.
14	0h RW	**FES:** This bit selects the speed mode. 0x0 (M_10_1000M): 10 Mbps when PS bit is 1 and 1 Gbps when PS bit is 0. 0x1 (M_100_2500M): 100 Mbps when PS bit is 1 and 2.5 Gbps when PS bit is 0.
13	0h RW	**Duplex Mode (DM):** When this bit is set, the MAC operates in the full-duplex mode in which it can transmit and receive simultaneously. This bit is RO with default value of 1'b1 in the full-duplex-only configurations. 0x0 (HDUPLX): Half-duplex mode. 0x1 (FDUPLX): Full-duplex mode.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW	**Loopback Mode (LM):** When this bit is set, the MAC operates in the loopback mode at GMII or MII. The (G)MII Rx clock input (clk_rx_i) is required for the loopback to work properly. This is because the Tx clock is not internally looped back. 0x0 (DISABLE): Loopback is disabled. 0x1 (ENABLE): Loopback is enabled.
11	0h RW	**Enable Carrier Sense Before Transmission in Full-Duplex Mode (ECRSFD):** When this bit is set, the MAC transmitter checks the CRS signal before packet transmission in the full-duplex mode. The MAC starts the transmission only when the CRS signal is low. When this bit is reset, the MAC transmitter ignores the status of the CRS signal. 0x0 (DISABLE): ECRSFD is disabled. 0x1 (ENABLE): ECRSFD is enabled.
10	0h RW	**Disable Receive Own (DO):** When this bit is set, the MAC disables the reception of packets when the GMII signal TX_EN is asserted in the half-duplex mode. When this bit is reset, the MAC receives all packets given by the PHY. This bit is not applicable in the full-duplex mode. 0x0 (ENABLE): Enable Receive Own. 0x1 (DISABLE): Disable Receive Own.
9	0h RW	**Disable Carrier Sense During Transmission (DCRS):** When this bit is set, the MAC transmitter ignores the (G)MII CRS signal during packet transmission in the half-duplex mode. As a result, no errors are generated because of Loss of Carrier or No Carrier during transmission. When this bit is reset, the MAC transmitter generates errors because of Carrier Sense. The MAC can even abort the transmission. 0x0 (ENABLE): Enable Carrier Sense During Transmission. 0x1 (DISABLE): Disable Carrier Sense During Transmission.
8	0h RW	**Disable Retry (DR):** When this bit is set, the MAC attempts only one transmission. When a collision occurs on the GMII or MII interface, the MAC ignores the current packet transmission and reports a Packet Abort with excessive collision error in the Tx packet status. When this bit is reset, the MAC retries based on the settings of the BL field. This bit is applicable only in the half-duplex mode. 0x0 (ENABLE): Enable Retry. 0x1 (DISABLE): Disable Retry.
7	0h RO	**Reserved**
6:5	0h RW	**Back-Off Limit (BL):** The back-off limit determines the random integer number (r) of slot time delays (4,096 bit times for 1000/2500 Mbps; 512 bit times for 10/100 Mbps) for which the MAC waits before rescheduling a transmission attempt during retries after a collision. n = retransmission attempt. The random integer r takes the value in the range 0 <= r < 2^k This bit is applicable only in the half-duplex mode. 0x0 (MIN_N_10): k = min(n,10). 0x1 (MIN_N_8): k = min(n,8). 0x2 (MIN_N_4): k = min(n,4). 0x3 (MIN_N_1): k = min(n,1).

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	**Deferral Check (DC):** When this bit is set, the deferral check function is enabled in the MAC. The MAC issues a Packet Abort status, along with the excessive deferral error bit set in the Tx packet status, when the Tx state machine is deferred for more than 24,288 bit times in 10 or 100 Mbps mode. If the MAC is configured for 1000/2500 Mbps operation, the threshold for deferral is 155,680 bits times. Deferral begins when the transmitter is ready to transmit, but it is prevented because of an active carrier sense signal (CRS) on GMII or MII. The defer time is not cumulative. For example, if the transmitter defers for 10,000 bit times because the CRS signal is active and the CRS signal becomes inactive, the transmitter transmits and collision happens. Because of collision, the transmitter needs to back off and then defer again after back off completion. In such a scenario, the deferral timer is reset to 0, and it is restarted. When this bit is reset, the deferral check function is disabled and the MAC defers until the CRS signal goes inactive. This bit is applicable only in the half-duplex mode. 0x0 (DISABLE): Deferral check function is disabled. 0x1 (ENABLE): Deferral check function is enabled.
3:2	0h RW	**Preamble Length for Transmit packets (PRELEN):** These bits control the number of preamble bytes that are added to the beginning of every Tx packet. The preamble reduction occurs only when the MAC is operating in the full-duplex mode. 0x0 (M_7BYTES): 7 bytes of preamble. 0x1 (M_5BYTES): 5 bytes of preamble. 0x2 (M_3BYTES): 3 bytes of preamble. 0x3 (RESERVED): Reserved.
1	0h RW	**Transmitter Enable (TE):** When this bit is set, the Tx state machine of the MAC is enabled for transmission on the GMII or MII interface. When this bit is reset, the MAC Tx state machine is disabled after it completes the transmission of the current packet. The Tx state machine does not transmit any more packets. 0x0 (DISABLE): Transmitter is disabled. 0x1 (ENABLE): Transmitter is enabled.
0	0h RW	**Receiver Enable (RE):** When this bit is set, the Rx state machine of the MAC is enabled for receiving packets from the GMII or MII interface. When this bit is reset, the MAC Rx state machine is disabled after it completes the reception of the current packet. The Rx state machine does not receive any more packets from the GMII or MII interface. 0x0 (DISABLE): Receiver is disabled. 0x1 (ENABLE): Receiver is enabled.

10.2.2 MAC_EXT_CONFIGURATION — Offset 4h

The MAC Extended Configuration Register establishes the operating mode of the MAC.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30	0h RW	**ARP Packet Drop if IP Mismatch (APDIM):** When set, Packet for which Target Protocol Address does not match IPv4 address is dropped in the MTL layer. When reset, when target Protocol Address does not match, packet is forwarded to MTL maintaining backward compatibility. 0x0 (DISABLE): mux select to drop the arp packet if Trgt prot address mismatches IPv4 address disabled. 0x1 (ENABLE): mux select to drop the arp packet if Trgt prot address mismatches IPv4 address enabled.
29:25	00h RW	**Extended Inter-Packet Gap (EIPG):** The value in this field is applicable when the EIPGEN bit is set. This field (as Most Significant bits), along with IPG field in MAC_Configuration register, gives the minimum IPG greater than 96 bit times in steps of 8 bit times: {EIPG, IPG} 8'h00 - 104 bit times 8'h01 - 112 bit times 8'h02 - 120 bit times ---------- 8'hFF - 2144 bit times
24	0h RW	**Extended Inter-Packet Gap Enable (EIPGEN):** When this bit is set, the MAC interprets EIPG field and IPG field in MAC_Configuration register together as minimum IPG greater than 96 bit times in steps of 8 bit times. When this bit is reset, the MAC ignores EIPG field and interprets IPG field in MAC_Configuration register as minimum IPG less than or equal to 96 bit times in steps of 8 bit times. Note: The extended Inter-Packet Gap feature must be enabled when operating in Full-Duplex mode only. There might be undesirable effects on back-pressure function and frame transmission if it is enabled in Half-Duplex mode. 0x0 (DISABLE): Extended Inter-Packet Gap is disabled. 0x1 (ENABLE): Extended Inter-Packet Gap is enabled.
23	0h RO	**Reserved**
22:20	0h RW	**Maximum Size for Splitting the Header Data (HDSMS):** These bits indicate the maximum header size allowed for splitting the header data in the received packet. 0x0 (M_64BYTES): Maximum Size for Splitting the Header Data is 64 bytes. 0x1 (M_128BYTES): Maximum Size for Splitting the Header Data is 128 bytes. 0x2 (M_256BYTES): Maximum Size for Splitting the Header Data is 256 bytes. 0x3 (M_512BYTES): Maximum Size for Splitting the Header Data is 512 bytes. 0x4 (M_1024BYTES): Maximum Size for Splitting the Header Data is 1024 bytes. 0x5 (RSVD): Reserved.
19	0h RW	**Packet Duplication Control (PDC):** When this bit is set, the received packet with Multicast/Broadcast Destination address is routed to multiple Receive DMA Channels. The Receive DMA Channels is identified by the DCS field of MAC_Address(#i)_High register corresponding to the MAC Address register that matches the Multicast/Broadcast Destination address in the received packet. The DCS field is interpreted to be a one-hot value, each bit corresponding to the Receive DMA Channel. When this bit is reset, the received packet is routed to single Receive DMA Channel. The Receive DMA Channel is identified by the DCS field of MAC_Address(#i)_High register corresponding to the MAC Address register that matches the Destination address in the received packet. The DCS field is interpreted as a binary value. 0x0 (DISABLE): Packet Duplication Control is disabled. 0x1 (ENABLE): Packet Duplication Control is enabled.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RW	**Unicast Slow Protocol Packet Detect (USP):** When this bit is set, the MAC detects the Slow Protocol packets with unicast address of the station specified in the MAC_Address0_High and MAC_Address0_Low registers. The MAC also detects the Slow Protocol packets with the Slow Protocols multicast address (01-80-C2-00-00-02). When this bit is reset, the MAC detects only Slow Protocol packets with the Slow Protocol multicast address specified in the IEEE 802.3-2015, Section 5. 0x0 (DISABLE): Unicast Slow Protocol Packet Detection is disabled. 0x1 (ENABLE): Unicast Slow Protocol Packet Detection is enabled.
17	0h RW	**Slow Protocol Detection Enable (SPEN):** When this bit is set, MAC processes the Slow Protocol packets (Ether Type 0x8809) and provides the Slow Protocol Sub-Type and Code fields in Rx status. When this bit is reset, the MAC forwards all error-free Slow Protocol packets to the application. The MAC considers such packets as normal Type packets. 0x0 (DISABLE): Slow Protocol Detection is disabled. 0x1 (ENABLE): Slow Protocol Detection is enabled.
16	0h RW	**Disable CRC Checking for Received Packets (DCRCC):** When this bit is set, the MAC receiver does not check the CRC field in the received packets. When this bit is reset, the MAC receiver always checks the CRC field in the received packets. 0x0 (ENABLE): CRC Checking is enabled. 0x1 (DISABLE): CRC Checking is disabled.
15:14	0h RO	**Reserved**
13:0	0000h RW	**Giant Packet Size Limit (GPSL):** If the received packet size is greater than the value programmed in this field in units of bytes, the MAC declares the received packet as Giant packet. The value programmed in this field must be greater than or equal to 1,518 bytes. Any other programmed value is considered as 1,518 bytes. For VLAN tagged packets, the MAC adds 4 bytes to the programmed value. When the Enable Double VLAN Processing option is selected, the MAC adds 8 bytes to the programmed value for double VLAN tagged packets. The value in this field is applicable when the GPSLCE bit is set in MAC_Configuration register.

10.2.3 MAC_PACKET_FILTER — Offset 8h

The MAC Packet Filter register contains the filter controls for receiving packets. Some of the controls from this register go to the address check block of the MAC which performs the first level of address filtering. The second level of filtering is performed on the incoming packet based on other controls such as Pass Bad Packets and Pass Control Packets.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Receive All (RA):** When this bit is set, the MAC Receiver module passes all received packets to the application, irrespective of whether they pass the address filter or not. The result of the SA or DA filtering is updated (pass or fail) in the corresponding bit in the Rx Status Word. When this bit is reset, the Receiver module passes only those packets to the application that pass the SA or DA address filter. 0x0 (DISABLE): Receive All is disabled. 0x1 (ENABLE): Receive All is enabled.
30:22	0h RO	**Reserved**
21	0h RW	**Drop Non-TCP/UDP over IP Packets (DNTU):** When this bit is set, the MAC drops the non-TCP or UDP over IP packets. The MAC forward only those packets that are processed by the Layer 4 filter. When this bit is reset, the MAC forwards all non-TCP or UDP over IP packets. 0x0 (FWD): Forward Non-TCP/UDP over IP Packets. 0x1 (DROP): Drop Non-TCP/UDP over IP Packets.
20	0h RW	**Layer 3 and Layer 4 Filter Enable (IPFE):** When this bit is set, the MAC drops packets that do not match the enabled Layer 3 and Layer 4 filters. If Layer 3 or Layer 4 filters are not enabled for matching, this bit does not have any effect. When this bit is reset, the MAC forwards all packets irrespective of the match status of the Layer 3 and Layer 4 fields. 0x0 (DISABLE): Layer 3 and Layer 4 Filters are disabled. 0x1 (ENABLE): Layer 3 and Layer 4 Filters are enabled.
19:17	0h RO	**Reserved**
16	0h RW	**VLAN Tag Filter Enable (VTFE):** When this bit is set, the MAC drops the VLAN tagged packets that do not match the VLAN Tag. When this bit is reset, the MAC forwards all packets irrespective of the match status of the VLAN Tag. 0x0 (DISABLE): VLAN Tag Filter is disabled. 0x1 (ENABLE): VLAN Tag Filter is enabled.
15:11	0h RO	**Reserved**
10	0h RW	**Hash or Perfect Filter (HPF):** When this bit is set, the address filter passes a packet if it matches either the perfect filtering or hash filtering as set by the HMC or HUC bit. When this bit is reset and the HUC or HMC bit is set, the packet is passed only if it matches the Hash filter. 0x0 (DISABLE): Hash or Perfect Filter is disabled. 0x1 (ENABLE): Hash or Perfect Filter is enabled.
9	0h RW	**Source Address Filter Enable (SAF):** When this bit is set, the MAC compares the SA field of the received packets with the values programmed in the enabled SA registers. If the comparison fails, the MAC drops the packet. When this bit is reset, the MAC forwards the received packet to the application with updated SAF bit of the Rx Status depending on the SA address comparison. Note: According to the IEEE specification, Bit 47 of the SA is reserved. However, in GbE Controller, the MAC compares all 48 bits. The software driver should take this into consideration while programming the MAC address registers for SA. 0x0 (DISABLE): SA Filtering is disabled. 0x1 (ENABLE): SA Filtering is enabled.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**SA Inverse Filtering (SAIF):** When this bit is set, the Address Check block operates in the inverse filtering mode for SA address comparison. If the SA of a packet matches the values programmed in the SA registers, it is marked as failing the SA Address filter. When this bit is reset, if the SA of a packet does not match the values programmed in the SA registers, it is marked as failing the SA Address filter. 0x0 (DISABLE): SA Inverse Filtering is disabled. 0x1 (ENABLE): SA Inverse Filtering is enabled.
7:6	0h RW	**Pass Control Packets (PCF):** These bits control the forwarding of all control packets (including unicast and multicast Pause packets). 0x0 (FLTR_ALL): MAC filters all control packets from reaching the application. 0x1 (FW_XCPT_PAU): MAC forwards all control packets except Pause packets to the application even if they fail the Address filter. 0x2 (FW_ALL): MAC forwards all control packets to the application even if they fail the Address filter. 0x3 (FW_PASS): MAC forwards the control packets that pass the Address filter.
5	0h RW	**Disable Broadcast Packets (DBF):** When this bit is set, the AFM module blocks all incoming broadcast packets. In addition, it overrides all other filter settings. When this bit is reset, the AFM module passes all received broadcast packets. 0x0 (ENABLE): Enable Broadcast Packets. 0x1 (DISABLE): Disable Broadcast Packets.
4	0h RW	**Pass All Multicast (PM):** When this bit is set, it indicates that all received packets with a multicast destination address (first bit in the destination address field is '1') are passed. When this bit is reset, filtering of multicast packet depends on HMC bit. 0x0 (DISABLE): Pass All Multicast is disabled. 0x1 (ENABLE): Pass All Multicast is enabled.
3	0h RW	**DA Inverse Filtering (DAIF):** When this bit is set, the Address Check block operates in inverse filtering mode for the DA address comparison for both unicast and multicast packets. When this bit is reset, normal filtering of packets is performed. 0x0 (DISABLE): DA Inverse Filtering is disabled. 0x1 (ENABLE): DA Inverse Filtering is enabled.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Hash Multicast (HMC):** When this bit is set, the MAC performs the destination address filtering of received multicast packets according to the hash table. When this bit is reset, the MAC performs the perfect destination address filtering for multicast packets, that is, it compares the DA field with the values programmed in DA registers. 0x0 (DISABLE): Hash Multicast is disabled. 0x1 (ENABLE): Hash Multicast is enabled.
1	0h RW	**Hash Unicast (HUC):** When this bit is set, the MAC performs the destination address filtering of unicast packets according to the hash table. When this bit is reset, the MAC performs a perfect destination address filtering for unicast packets, that is, it compares the DA field with the values programmed in DA registers. 0x0 (DISABLE): Hash Unicast is disabled. 0x1 (ENABLE): Hash Unicast is enabled.
0	0h RW	**Promiscuous Mode (PR):** When this bit is set, the Address Filtering module passes all incoming packets irrespective of the destination or source address. The SA or DA Filter Fails status bits of the Rx Status Word are always cleared when PR is set. 0x0 (DISABLE): Promiscuous Mode is disabled. 0x1 (ENABLE): Promiscuous Mode is enabled.

10.2.4 MAC_WATCHDOG_TIMEOUT — Offset Ch

The Watchdog Timeout register controls the watchdog timeout for received packets.

Type	Size	Offset	Default
MMIO	32 bit	BAR + Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**Programmable Watchdog Enable (PWE):** When this bit is set and the WD bit of the MAC_Configuration register is reset, the WTO field is used as watchdog timeout for a received packet. When this bit is cleared, the watchdog timeout for a received packet is controlled by setting of WD and JE bits in MAC_Configuration register. 0x0 (DISABLE): Programmable Watchdog is disabled. 0x1 (ENABLE): Programmable Watchdog is enabled.
7:4	0h RO	**Reserved**
3:0	0h RW	**Watchdog Timeout (WTO):** When the PWE bit is set and the WD bit of the MAC_Configuration register is reset, this field is used as watchdog timeout for a received packet. If the length of a received packet exceeds the value of this field, such packet is terminated and declared as an error packet. Note: When the PWE bit is set, the value in this field should be more than 1,522 (0x05F2). Otherwise, the IEEE 802.3-specified valid tagged packets are declared as error packets and then dropped. 0x0 (M_2KBYTES): 2 KB. 0x1 (M_3KBYTES): 3 KB. 0x2 (M_4KBYTES): 4 KB. 0x3 (M_5KBYTES): 5 KB. 0x4 (M_6KBYTES): 6 KB. 0x5 (M_7KBYTES): 7 KB. 0x6 (M_8KBYTES): 8 KB. 0x7 (M_9KBYTES): 9 KB. 0x08 (M_10KBYTES): 10 KB. 0x09 (M_11KBYTES): 11 KB. 0x0A (M_12KBYTES): 12 KB. 0x0B (M_13KBYTES): 13 KB. 0x0C (M_14KBYTES): 14 KB. 0x0D (M_15KBYTES): 15 KB. 0x0E (M_16383BYTES): 16383 Bytes. 0x0F (RESERVED): Reserved.

10.2.5 MAC_HASH_TABLE_REG0 — Offset 10h

The Hash Table Register 0 contains the first 32 bits of the hash table, when the width of the hash table is 128 or 256 bits. This design has set the Hash Table Size (width of the hash table) to 64.

The Hash table is used for group address filtering. For hash filtering, the content of the destination address in the incoming packet is passed through the CRC logic and the upper six (seven in 128-bit Hash or eight in 256-bit Hash) bits of the CRC register are used to index the content of the Hash table. The most significant bits determines the register to be used (Hash Table Register X), and the least significant five bits determine the bit within the register. For example, a hash value of 6'b100000 (in 64-bit Hash) selects Bit 0 of the Hash Table Register 1, a value of 7b'1110000 (in 128-bit Hash) selects Bit 16 of the Hash Table Register 3 and a value of 8b'10111111 (in 256-bit Hash) selects Bit 31 of the Hash Table Register 5.

The hash value of the destination address is calculated in the following way:

- Calculate the 32-bit CRC for the DA (See IEEE 802.3, Section 3.2.8 for the steps to calculate CRC32).

- Perform bitwise reversal for the value obtained in Step 1.

- Take the upper 6 (or 7 or 8) bits from the value obtained in Step 2.

If the corresponding bit value of the register is 1'b1, the packet is accepted. Otherwise, it is rejected. If the PM bit is set in MAC_Packet_Filter, all multicast packets are accepted regardless of the multicast hash values.

If the Hash Table register is configured to be double-synchronized to the (G)MII clock domain, the synchronization is triggered only when Bits[31:24] of the Hash Table Register X registers are written.

If double-synchronization is enabled, consecutive writes to this register should be performed after at least four clock cycles in the destination clock domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MAC Hash Table First 32 Bits (HT31T0):** This field contains the first 32 Bits [31:0] of the Hash table.

10.2.6 MAC_HASH_TABLE_REG1 — Offset 14h

The Hash Table Register 1 contains the second 32 bits of the hash table.

The Hash table is used for group address filtering. For hash filtering, the content of the destination address in the incoming packet is passed through the CRC logic and the upper six (seven in 128-bit Hash or eight in 256-bit Hash) bits of the CRC register are used to index the content of the Hash table. The most significant bits determines the register to be used (Hash Table Register X), and the least significant five bits determine the bit within the register. For example, a hash value of 6'b100000 (in 64-bit Hash) selects Bit 0 of the Hash Table Register 1, a value of 7b'1110000 (in 128-bit Hash) selects Bit 16 of the Hash Table Register 3 and a value of 8b'10111111 (in 256-bit Hash) selects Bit 31 of the Hash Table Register 5.

The hash value of the destination address is calculated in the following way:

- Calculate the 32-bit CRC for the DA (See IEEE 802.3, Section 3.2.8 for the steps to calculate CRC32).

- Perform bitwise reversal for the value obtained in Step 1.

- Take the upper 6 (or 7 or 8) bits from the value obtained in Step 2.

If the corresponding bit value of the register is 1'b1, the packet is accepted. Otherwise, it is rejected. If the PM bit is set in MAC_Packet_Filter, all multicast packets are accepted regardless of the multicast hash values.

If the Hash Table register is configured to be double-synchronized to the (G)MII clock domain, the synchronization is triggered only when Bits[31:24] of the Hash Table Register X registers are written.

If double-synchronization is enabled, consecutive writes to this register should be performed after at least four clock cycles in the destination clock domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14h	00000000h

31:0	00000000h RW	**MAC Hash Table Second 32 Bits (HT63T32):** This field contains the second 32 Bits [63:32] of the Hash table.

10.2.7 MAC_VLAN_TAG_CTRL — Offset 50h

This register is the redefined format of the MAC VLAN Tag Register. It is used for indirect addressing. It contains the address offset, command type and Busy Bit for CSR access of the Per VLAN Tag registers.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 50h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable Inner VLAN Tag in Rx Status (EIVLRXS):** When this bit is set, the MAC provides the inner VLAN Tag in the Rx status. When this bit is reset, the MAC does not provide the inner VLAN Tag in Rx status. 0x0 (DISABLE): Inner VLAN Tag in Rx status is disabled. 0x1 (ENABLE): Inner VLAN Tag in Rx status is enabled.
30	0h RO	**Reserved**
29:28	0h RW	**Enable Inner VLAN Tag Stripping on Receive (EIVLS):** This field indicates the stripping operation on inner VLAN Tag in received packet. 0x0 (DONOT): Do not strip. 0x1 (IFPASS): Strip if VLAN filter passes. 0x2 (IFFAIL): Strip if VLAN filter fails. 0x3 (ALWAYS): Always strip.
27	0h RW	**Enable Inner VLAN Tag Comparison (ERIVLT):** When this bit, VTHM bit and the EDVLP field are set, the MAC receiver enables VLAN Hash filtering operation on the inner VLAN Tag (if present). When this bit is reset and VTHM bit is set, the MAC receiver enables VLAN Hash filtering operation on the outer VLAN Tag (if present). The ERSVLM bit and DOVLTC bit determines which VLAN type is enabled for filtering. 0x0 (DISABLE): Inner VLAN tag is disabled. 0x1 (ENABLE): Inner VLAN tag is enabled.
26	0h RW	**Enable Double VLAN Processing (EDVLP):** When this bit is set, the MAC enables processing of up to two VLAN Tags on Tx and Rx (if present). When this bit is reset, the MAC enables processing of up to one VLAN Tag on Tx and Rx (if present). 0x0 (DISABLE): Double VLAN Processing is disabled. 0x1 (ENABLE): Double VLAN Processing is enabled.

Bit Range	Default & Access	Field Name (ID): Description
25	0h RW	**VLAN Tag Hash Table Match Enable (VTHM):** When this bit is set, the most significant four bits of CRC of VLAN Tag are used to index the content of the MAC_VLAN_Hash_Table register. A value of 1 in the VLAN Hash Table register, corresponding to the index, indicates that the packet matched the VLAN hash table. When the ETV bit is set, the CRC of the 12-bit VLAN Identifier (VID) is used for comparison. When the ETV bit is reset, the CRC of the 16-bit VLAN tag is used for comparison. When this bit is reset, the VLAN Hash Match operation is not performed. 0x0 (DISABLE): VLAN Tag Hash Table Match is disabled. 0x1 (ENABLE): VLAN Tag Hash Table Match is enabled.
24	0h RW	**Enable VLAN Tag in Rx status (EVLRXS):** When this bit is set, MAC provides the outer VLAN Tag in the Rx status. When this bit is reset, the MAC does not provide the outer VLAN Tag in Rx status. 0x0 (DISABLE): VLAN Tag in Rx status is disabled. 0x1 (ENABLE): VLAN Tag in Rx status is enabled.
23	0h RO	**Reserved**
22:21	0h RW	**Enable VLAN Tag Stripping on Receive (EVLS):** This field indicates the stripping operation on the outer VLAN Tag in received packet. 0x0 (DONOT): Do not strip. 0x1 (IFPASS): Strip if VLAN filter passes. 0x2 (IFFAIL): Strip if VLAN filter fails. 0x3 (ALWAYS): Always strip.
20	0h RW	**Disable VLAN Type Check for VLAN Hash Filtering (DOVLTC):** When this bit is set, the MAC VLAN Hash Filter does not check whether the VLAN Tag specified by the ERIVLT bit is of type S-VLAN or C-VLAN. When this bit is reset, the MAC VLAN Hash Filter filters or matches the VLAN Tag specified by the ERIVLT bit only when VLAN Tag type is similar to the one specified by the ERSVLM bit. 0x0 (ENABLE): VLAN Type Check is enabled. 0x1 (DISABLE): VLAN Type Check is disabled.
19	0h RW	**Enable Receive S-VLAN Match for VLAN Hash Filtering (ERSVLM):** When this bit is set, the MAC receiver enables VLAN Hash filtering or matching for S-VLAN (Type = 0x88A8) packets. When this bit is reset, the MAC receiver enables VLAN Hash filtering or matching for C-VLAN (Type = 0x8100) packets. The ERIVLT bit determines the VLAN tag position considered for VLAN Hash filtering or matching. 0x0 (DISABLE): Receive S-VLAN Match is disabled. 0x1 (ENABLE): Receive S-VLAN Match is enabled.
18	0h RW	**Enable S-VLAN (ESVL):** When this bit is set, the MAC transmitter and receiver consider the S-VLAN packets (Type = 0x88A8) as valid VLAN tagged packets. 0x0 (DISABLE): S-VLAN is disabled. 0x1 (ENABLE): S-VLAN is enabled.
17	0h RW	**VLAN Tag Inverse Match Enable (VTIM):** When this bit is set, this bit enables the VLAN Tag inverse matching. The packets without matching VLAN Tag are marked as matched. When reset, this bit enables the VLAN Tag perfect matching. The packets with matched VLAN Tag are marked as matched. 0x0 (DISABLE): VLAN Tag Inverse Match is disabled. 0x1 (ENABLE): VLAN Tag Inverse Match is enabled.

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**Enable 12-Bit VLAN Tag Comparison for VLAN Hash Filtering (ETV):** When this bit is set, a 12-bit VLAN identifier is used for VLAN Hash filtering instead of the complete 16-bit VLAN tag. Bits[11:0] of VLAN tag in the received VLAN-tagged packet are used for hash-based VLAN filtering. When this bit is reset, all 16 bits of the 15th and 16th bytes of the received VLAN packet are used for VLAN hash filtering. 0x0 (DISABLE): 12-Bit VLAN Tag Comparison is disabled. 0x1 (ENABLE): 12-Bit VLAN Tag Comparison is enabled.
15:5	0h RO	**Reserved**
4:2	0h RW	**OFS:** This field holds the address offset of the MAC VLAN Tag Filter Register which the application is trying to access. The width of the field depends on the number of MAC VLAN Tag Registers enabled.
1	0h RW	**Command Type (CT):** This bit indicates if the current register access is a read or a write. When set, it indicate a read operation. When reset, it indicates a write operation. 0x0 (WRITE): Write operation. 0x1 (READ): Read operation.
0	0h RW	**Operation Busy (OB):** This bit is set along with a read or write command for initiating the indirect access to per VLAN Tag Filter register. This bit is reset when the read or write command to per VLAN Tag Filter indirect access register is complete. The next indirect register access can be initiated only after this bit is reset. During a write operation, the bit is reset only after the data has been written into the Per VLAN Tag register. During a read operation, the data should be read from the MAC_VLAN_Tag_Data register only after this bit is reset. 0x0 (DISABLE): Operation Busy is disabled. 0x1 (ENABLE): Operation Busy is enabled.

10.2.8 MAC_VLAN_TAG_DATA — Offset 54h

This register holds the read/write data for Indirect Access of the Per VLAN Tag registers. During the read access, this field contains valid read data only after the OB bit is reset.

During the write access, this field should be valid prior to setting the OB bit in the MAC_VLAN_Tag_Ctrl Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 54h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27:25	0h RW	**DMA Channel Number (DMACHN):** The DMA Channel number to which the VLAN Tagged Frame is to be routed if it passes this VLAN Tag Filter is programmed in this field. If the Routing based on VLAN Tag Filter is not necessary, this field need not be programmed.
24	0h RW	**DMA Channel Number Enable (DMACHEN):** This bit is the Enable for the DMA Channel Number value programmed in the field DMACH. When this bit is reset, the Routing does not occur based on VLAN Filter result. The frame is routed based on DA Based DMA Channel Routing. 0x0 (DISABLE): DMA Channel Number is disabled. 0x1 (ENABLE): DMA Channel Number is enabled.
23:21	0h RO	**Reserved**
20	0h RW	**Enable Inner VLAN Tag Comparison (ERIVLT):** This bit is valid only when Double VLAN Tag Enable of the Filter is set. When this bit and the EDVLP field are set, the MAC receiver enables operation on the inner VLAN Tag (if present). When this bit is reset, the MAC receiver enables operation on the outer VLAN Tag (if present). 0x0 (DISABLE): Inner VLAN tag comparison is disabled. 0x1 (ENABLE): Inner VLAN tag comparison is enabled.
19	0h RW	**Enable S-VLAN Match for received Frames (ERSVLM):** This bit is valid only when VLAN Tag Enable of the Filter is set. When this bit is set, the MAC receiver enables filtering or matching for S-VLAN (Type = 0x88A8) packets. When this bit is reset, the MAC receiver enables filtering or matching for C-VLAN (Type = 0x8100) packets. 0x0 (DISABLE): Receive S-VLAN Match is disabled. 0x1 (ENABLE): Receive S-VLAN Match is enabled.
18	0h RW	**Disable VLAN Type Comparison (DOVLTC):** This bit is valid only when VLAN Tag Enable of the Filter is set. When this bit is set, the MAC does not check whether the VLAN Tag specified by the Enable Inner VLAN Tag Comparison bit is of type S-VLAN or C-VLAN. When this bit is reset, the MAC filters or matches the VLAN Tag specified by the Enable Inner VLAN Tag Comparison bit only when VLAN Tag type is similar to the one specified by the Enable S-VLAN Match for received Frames bit. 0x0 (ENABLE): VLAN type comparison is enabled. 0x1 (DISABLE): VLAN type comparison is disabled.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**12bits or 16bits VLAN comparison (ETV):** This bit is valid only when VEN of the Filter is set. When this bit is set, a 12-bit VLAN identifier is used for comparing and filtering instead of the complete 16-bit VLAN tag. Bits [11:0] of VLAN tag are compared with the corresponding field in the received VLAN-tagged packet. 0x0 (M_16BIT): 16 bit VLAN comparison. 0x1 (M_12BIT): 12 bit VLAN comparison.
16	0h RW	**VLAN Tag Enable (VEN):** This bit is used to enable or disable the VLAN Tag. When this bit is set, the MAC compares the VLAN Tag of received packet with the VLAN Tag ID. When this bit is reset, no comparison is performed irrespective of the programming of the other fields. 0x0 (DISABLE): VLAN Tag is disabled. 0x1 (ENABLE): VLAN Tag is enabled.
15:0	0000h RW	**VLAN Tag ID (VID):** This field holds the VLAN Tag value which is used by the MAC for perfect comparison. It is valid when VLAN Tag Enable is set.

10.2.9 MAC_VLAN_HASH_TABLE — Offset 58h

When VTHM bit of the MAC_VLAN_Tag register is set, the 16-bit VLAN Hash Table register is used for group address filtering based on the VLAN tag. For hash filtering, the content of the 16-bit VLAN tag or 12-bit VLAN ID (based on the ETV bit of MAC_VLAN_Tag Register) in the incoming packet is passed through the CRC logic. The upper four bits of the calculated hash value are used to index the contents of the VLAN Hash table. For example, hash value of 4b'1000 selects Bit 8 of the VLAN Hash table.

The hash value of the destination address is calculated in the following way:

- Calculate the 32-bit CRC for the VLAN tag or ID (For steps to calculate CRC32, see Section 3.2.8 of IEEE 802.3).

- Perform bitwise reversal for the value obtained in step 1.

- Take the upper four bits from the value obtained in step 2.

If the VLAN hash Table register is configured to be double-synchronized to the (G)MII clock domain, the synchronization is triggered only when Bits[15:8] of this register are written.

- If double-synchronization is enabled, consecutive writes to this register should be performed after at least four clock cycles in the destination clock domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 58h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0000h RW	**VLAN Hash Table (VLHT):** This field contains the 16-bit VLAN Hash Table.

10.2.10 MAC_VLAN_INCL — Offset 60h

The VLAN Tag Inclusion or Replacement register contains the VLAN tag for insertion or replacement in the Transmit packets. It also contains the VLAN tag insertion controls.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 60h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**BUSY:** This bit indicates the status of the read/write operation of indirect access to the queue/channel specific VLAN inclusion register. For write operation write to a register is complete when this bit is reset. For read operation the read data is valid when the bit is reset. The application must make sure that this bit is reset before attempting subsequent access to this register. 0x0 (INACTIVE): Busy status not detected. 0x1 (ACTIVE): Busy status detected.
30	0h RW	**Read write control (RDWR):** This bit controls the read or write operation for indirectly accessing the queue/channel specific VLAN Inclusion register. When set indicates write operation and when reset indicates read operation. This does not have any effect when CBTI is reset. 0x0 (READ): Read operation of indirect access. 0x1 (WRITE): Write operation of indirect access.
29:27	0h RO	**Reserved**
26:24	0h RW	**ADDR:** This field selects one of the queue/channel specific VLAN Inclusion register for read/write access. This does not have any effect when CBTI is reset.
23:22	0h RO	**Reserved**
21	0h RW	**Channel based tag insertion (CBTI):** When this bit is set, outer VLAN tag is inserted for every packets transmitted by the MAC. The tag value is taken from the queue/channel specific VLAN tag register. The VLTI, VLP, VLC, and VLT fields of this register are ignored when this bit is set. When this bit is set, a write operation to byte 3 of this register initiates the read/write access to the indirect register. When reset, outer VLAN operation is based on the setting of VLTI, VLP, VLC and VLT fields of this register. 0x0 (DISABLE): Channel based tag insertion is disabled. 0x1 (ENABLE): Channel based tag insertion is enabled.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**VLAN Tag Input (VLTI):** When this bit is set, it indicates that the VLAN tag to be inserted or replaced in Tx packet should be taken from: - The Tx descriptor 0x0 (DISABLE): VLAN Tag Input is disabled. 0x1 (ENABLE): VLAN Tag Input is enabled.
19	0h RW	**C-VLAN or S-VLAN (CSVL):** When this bit is set, S-VLAN type (0x88A8) is inserted in the 13th and 14th bytes of transmitted packets. When this bit is reset, C-VLAN type (0x8100) is inserted in the 13th and 14th bytes of transmitted packets. 0x0 (C_VLAN): C-VLAN type (0x8100) is inserted. 0x1 (S_VLAN): S-VLAN type (0x88A8) is inserted.
18	0h RW	**VLAN Priority Control (VLP):** When this bit is set, the control bits[17:16] are used for VLAN deletion, insertion, or replacement. When this bit is reset, the mti_vlan_ctrl_i control input is used and bits[17:16] are ignored. 0x0 (DISABLE): VLAN Priority Control is disabled. 0x1 (ENABLE): VLAN Priority Control is enabled.
17:16	0h RW	**VLC:** VLAN Tag Control in Transmit Packets - 2'b00: No VLAN tag deletion, insertion, or replacement - 2'b01: VLAN tag deletion The MAC removes the VLAN type (bytes 13 and 14) and VLAN tag (bytes 15 and 16) of all transmitted packets with VLAN tags. - 2'b10: VLAN tag insertion The MAC inserts VLT in bytes 15 and 16 of the packet after inserting the Type value (0x8100 or 0x88a8) in bytes 13 and 14. This operation is performed on all transmitted packets, irrespective of whether they already have a VLAN tag. - 2'b11: VLAN tag replacement The MAC replaces VLT in bytes 15 and 16 of all VLAN-type transmitted packets (Bytes 13 and 14 are 0x8100 or 0x88a8). Note: Changes to this field take effect only on the start of a packet. If you write this register field when a packet is being transmitted, only the subsequent packet can use the updated value, that is, the current packet does not use the updated value. 0x0 (NONE): No VLAN tag deletion, insertion, or replacement. 0x1 (DELETE): VLAN tag deletion. 0x2 (INSERT): VLAN tag insertion. 0x3 (REPLACE): VLAN tag replacement.
15:0	0000h RW	**VLAN Tag for Transmit Packets (VLT):** This field contains the value of the VLAN tag to be inserted. The value must only be changed when the transmit lines are inactive or during the initialization phase. Bits[15:13] are the User Priority field, Bit 12 is the CFI/DEI field, and Bits[11:0] are the VID field in the VLAN tag. The following list describes the bits of this field: - Bits[15:13]: User Priority - Bit 12: Canonical Format Indicator (CFI) or Drop Eligible Indicator (DEI) - Bits[11:0]: VLAN Identifier (VID) field of VLAN tag

10.2.11 MAC_INNER_VLAN_INCL — Offset 64h

The Inner VLAN Tag Inclusion or Replacement register contains the inner VLAN tag to be inserted or replaced in the Transmit packet. It also contains the inner VLAN tag insertion controls.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 64h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved**
20	0h RW	**VLAN Tag Input (VLTI):** When this bit is set, it indicates that the VLAN tag to be inserted or replaced in Tx packet should be taken from: - The Tx descriptor 0x0 (DISABLE): VLAN Tag Input is disabled. 0x1 (ENABLE): VLAN Tag Input is enabled.
19	0h RW	**C-VLAN or S-VLAN (CSVL):** When this bit is set, S-VLAN type (0x88A8) is inserted or replaced in the 17th and 18th bytes of transmitted packets. When this bit is reset, C-VLAN type (0x8100) is inserted or replaced in the 17th and 18th bytes of transmitted packets. 0x0 (C_VLAN): C-VLAN type (0x8100) is inserted. 0x1 (S_VLAN): S-VLAN type (0x88A8) is inserted.
18	0h RW	**VLAN Priority Control (VLP):** When this bit is set, the VLC field is used for VLAN deletion, insertion, or replacement. When this bit is reset, the mti_vlan_ctrl_i control input is used and the VLC field is ignored. 0x0 (DISABLE): VLAN Priority Control is disabled. 0x1 (ENABLE): VLAN Priority Control is enabled.
17:16	0h RW	**VLC:** VLAN Tag Control in Transmit Packets - 2'b00: No VLAN tag deletion, insertion, or replacement - 2'b01: VLAN tag deletion The MAC removes the VLAN type (bytes 17 and 18) and VLAN tag (bytes 19 and 20) of all transmitted packets with VLAN tags. - 2'b10: VLAN tag insertion The MAC inserts VLT in bytes 19 and 20 of the packet after inserting the Type value (0x8100 or 0x88a8) in bytes 17 and 18. This operation is performed on all transmitted packets, irrespective of whether they already have a VLAN tag. - 2'b11: VLAN tag replacement The MAC replaces VLT in bytes 19 and 20 of all VLAN-type transmitted packets (Bytes 17 and 18 are 0x8100 or 0x88a8). Note: Changes to this field take effect only on the start of a packet. If you write this register field when a packet is being transmitted, only the subsequent packet can use the updated value, that is, the current packet does not use the updated value. 0x0 (NONE): No VLAN tag deletion, insertion, or replacement. 0x1 (DELETE): VLAN tag deletion. 0x2 (INSERT): VLAN tag insertion. 0x3 (REPLACE): VLAN tag replacement.
15:0	0000h RW	**VLAN Tag for Transmit Packets (VLT):** This field contains the value of the VLAN tag to be inserted or replaced. The value must only be changed when the transmit lines are inactive or during the initialization phase. Bits[15:13] are the User Priority field, Bit 12 is the CFI/DEI field, and Bits[11:0] are the VID field in the VLAN tag. The following list describes the bits of this field: - Bits[15:13]: User Priority - Bit 12: Canonical Format Indicator (CFI) or Drop Eligible Indicator (DEI) - Bits[11:0]: VLAN Identifier (VID) field of VLAN tag

10.2.12 MAC_Q0_TX_FLOW_CTRL — Offset 70h

The Flow Control register controls the generation and reception of the Control (Pause Command) packets by the Flow control module of the MAC. A Write to a register with the Busy bit set to 1 triggers the Flow Control block to generate a Pause packet. The fields of the control packet are selected as specified in the 802.3x specification, and the Pause Time value from this register is used in the Pause Time field of the control packet. The Busy bit remains set until the control packet is transferred onto the cable. The application must make sure that the Busy bit is cleared before writing to the register.

When the PFCE bit in the MAC_Rx_Flow_Ctrl register is enabled, this register controls the generation of Priority Flow Control (PFC) frames with priorities mapped according to PSRQ0 in the MAC_RxQ_Ctrl2 register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 70h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**Pause Time (PT):** This field holds the value to be used in the Pause Time field in the Tx control packet. If the Pause Time bits are configured to be double-synchronized to the (G)MII clock domain, consecutive writes to this register should be performed only after at least four clock cycles in the destination clock domain.
15:8	0h RO	**Reserved**
7	0h RW	**Disable Zero-Quanta Pause (DZPQ):** When this bit is set, it disables the automatic generation of the zero-quanta Pause packets on de-assertion of the flow-control signal from the FIFO layer (MTL or external sideband flow control signal sbd_flowctrl_i or mti_flowctrl_i). When this bit is reset, normal operation with automatic zero-quanta Pause packet generation is enabled. 0x0 (ENABLE): Zero-Quanta Pause packet generation is enabled. 0x1 (DISABLE): Zero-Quanta Pause packet generation is disabled.
6:4	0h RW	**Pause Low Threshold (PLT):** This field configures the threshold of the Pause timer at which the input flow control signal mti_flowctrl_i (or sbd_flowctrl_i) is checked for automatic retransmission of the Pause packet. The threshold values should be always less than the Pause Time configured in Bits[31:16]. For example, if PT = 100H (256 slot times), and PLT = 001, a second Pause packet is automatically transmitted if the mti_flowctrl_i signal is asserted at 228 (256-28) slot times after the first Pause packet is transmitted. The following list provides the threshold values for different values. The slot time is defined as the time taken to transmit 512 bits (64 bytes) on the GMII or MII interface. This (approximate) computation is based on the packet size (64, 1518, 2000, 9018, 16384, or 32768) + 2 Pause Packet Size + IPG in Slot Times. 0x0 (PT4): Pause Time minus 4 Slot Times (PT -4 slot times). 0x1 (PT28): Pause Time minus 28 Slot Times (PT -28 slot times). 0x2 (PT36): Pause Time minus 36 Slot Times (PT -36 slot times). 0x3 (PT144): Pause Time minus 144 Slot Times (PT -144 slot times). 0x4 (PT256): Pause Time minus 256 Slot Times (PT -256 slot times). 0x5 (PT512): Pause Time minus 512 Slot Times (PT -512 slot times). 0x6 (RSVD): Reserved.

Bit Range	Default & Access	Field Name (ID): Description
3:2	0h RO	**Reserved**
1	0h RW	**Transmit Flow Control Enable (TFE):** Full-Duplex Mode: In the full-duplex mode, when this bit is set, the MAC enables the flow control operation to Tx Pause packets. When this bit is reset, the flow control operation in the MAC is disabled, and the MAC does not transmit any Pause packets. Half-Duplex Mode: In the half-duplex mode, when this bit is set, the MAC enables the backpressure operation. When this bit is reset, the backpressure feature is disabled. 0x0 (DISABLE): Transmit Flow Control is disabled. 0x1 (ENABLE): Transmit Flow Control is enabled.
0	0h RW	**Flow Control Busy or Backpressure Activate (FCB_BPA):** This bit initiates a Pause packet in the full-duplex mode and activates the backpressure function in the half-duplex mode if the TFE bit is set. Full-Duplex Mode: In the full-duplex mode, this bit should be read as 1'b0 before writing to this register. To initiate a Pause packet, the application must set this bit to 1'b1. During Control packet transfer, this bit continues to be set to indicate that a packet transmission is in progress. When Pause packet transmission is complete, the MAC resets this bit to 1'b0. You should not write to this register until this bit is cleared. Half-Duplex Mode: When this bit is set (and TFE bit is set) in the half-duplex mode, the MAC asserts the backpressure. During backpressure, when the MAC receives a new packet, the transmitter starts sending a JAM pattern resulting in a collision. This control register bit is logically ORed with the mti_flowctrl_i input signal for the backpressure function. When the MAC is configured for the full-duplex mode, the BPA is automatically disabled. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Flow Control Busy or Backpressure Activate is disabled. 0x1 (ENABLE): Flow Control Busy or Backpressure Activate is enabled.

10.2.13 MAC_Q1_TX_FLOW_CTRL — Offset 74h

This register controls the generation of PFC Control packets of priorities mapped as per the PSRQi field in the MAC_RxQ_Ctrl2/MAC_RxQ_Ctrl3 registers.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 74h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**Pause Time (PT):** This field holds the value to be used in the Pause Time field in the Tx control packet. If the Pause Time bits are configured to be double-synchronized to the (G)MII clock domain, consecutive writes to this register should be performed only after at least four clock cycles in the destination clock domain.
15:8	0h RO	**Reserved**
7	0h RW	**Disable Zero-Quanta Pause (DZPQ):** When this bit is set, it disables the automatic generation of the zero-quanta Pause packets on de-assertion of the flow-control signal from the FIFO layer (MTL or external sideband flow control signal sbd_flowctrl_i or mti_flowctrl_i). When this bit is reset, normal operation with automatic zero-quanta Pause packet generation is enabled. 0x0 (ENABLE): Zero-Quanta Pause packet generation is enabled. 0x1 (DISABLE): Zero-Quanta Pause packet generation is disabled.
6:4	0h RW	**Pause Low Threshold (PLT):** This field configures the threshold of the Pause timer at which the input flow control signal mti_flowctrl_i (or sbd_flowctrl_i) is checked for automatic retransmission of the Pause packet. The threshold values should be always less than the Pause Time configured in Bits[31:16]. For example, if PT = 100H (256 slot times), and PLT = 001, a second Pause packet is automatically transmitted if the mti_flowctrl_i signal is asserted at 228 (256-28) slot times after the first Pause packet is transmitted. For example, if PT = 100H (256 slot times), and PLT = 001, a second Pause packet is automatically transmitted if the mti_flowctrl_i signal is asserted at 228 (256-28) slot times after the first Pause packet is transmitted. The following list provides the threshold values for different values. The slot time is defined as the time taken to transmit 512 bits (64 bytes) on the GMII or MII interface. This (approximate) computation is based on the packet size (64, 1518, 2000, 9018, 16384, or 32768) + 2 Pause Packet Size + IPG in Slot Times. 0x0 (PT4): Pause Time minus 4 Slot Times (PT -4 slot times). 0x1 (PT28): Pause Time minus 28 Slot Times (PT -28 slot times). 0x2 (PT36): Pause Time minus 36 Slot Times (PT -36 slot times). 0x3 (PT144): Pause Time minus 144 Slot Times (PT -144 slot times). 0x4 (PT256): Pause Time minus 256 Slot Times (PT -256 slot times). 0x5 (PT512): Pause Time minus 512 Slot Times (PT -512 slot times). 0x6 (RSVD): Reserved.

Bit Range	Default & Access	Field Name (ID): Description
3:2	0h RO	**Reserved**
1	0h RW	**Transmit Flow Control Enable (TFE):** When this bit is set in full-duplex mode, the MAC enables the flow control operation to Tx Pause packets. When this bit is reset, the flow control operation in the MAC is disabled, and the MAC does not transmit any Pause packets. 0x0 (DISABLE): Transmit Flow Control is disabled. 0x1 (ENABLE): Transmit Flow Control is enabled.
0	0h RW	**Flow Control Busy (FCB_BPA):** This bit initiates a PFC packet if the TFE bit is set. To initiate a PFC packet, the application must set this bit to 1'b1. During Control packet transfer, this bit continues to be set to indicate that a packet transmission is in progress. When PFC packet transmission is complete, the MAC resets this bit to 1'b0. You should not write to this register until this bit is cleared. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Flow Control Busy or Backpressure Activate is disabled. 0x1 (ENABLE): Flow Control Busy or Backpressure Activate is enabled.

10.2.18 MAC_Q6_TX_FLOW_CTRL — Offset 88h

This register controls the generation of PFC Control packets of priorities mapped as per the PSRQi field in the MAC_RxQ_Ctrl2/MAC_RxQ_Ctrl3 registers.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 88h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**Pause Time (PT):** This field holds the value to be used in the Pause Time field in the Tx control packet. If the Pause Time bits are configured to be double-synchronized to the (G)MII clock domain, consecutive writes to this register should be performed only after at least four clock cycles in the destination clock domain.
15:8	0h RO	**Reserved**
7	0h RW	**Disable Zero-Quanta Pause (DZPQ):** When this bit is set, it disables the automatic generation of the zero-quanta Pause packets on de-assertion of the flow-control signal from the FIFO layer (MTL or external sideband flow control signal sbd_flowctrl_i or mti_flowctrl_i). When this bit is reset, normal operation with automatic zero-quanta Pause packet generation is enabled. 0x0 (ENABLE): Zero-Quanta Pause packet generation is enabled. 0x1 (DISABLE): Zero-Quanta Pause packet generation is disabled.

Bit Range	Default & Access	Field Name (ID): Description
6:4	0h RW	**Pause Low Threshold (PLT):** This field configures the threshold of the Pause timer at which the input flow control signal mti_flowctrl_i (or sbd_flowctrl_i) is checked for automatic retransmission of the Pause packet. The threshold values should be always less than the Pause Time configured in Bits[31:16]. For example, if PT = 100H (256 slot times), and PLT = 001, a second Pause packet is automatically transmitted if the mti_flowctrl_i signal is asserted at 228 (256-28) slot times after the first Pause packet is transmitted. The following list provides the threshold values for different values. The slot time is defined as the time taken to transmit 512 bits (64 bytes) on the GMII or MII interface. This (approximate) computation is based on the packet size (64, 1518, 2000, 9018, 16384, or 32768) + 2 Pause Packet Size + IPG in Slot Times. 0x0 (PT4): Pause Time minus 4 Slot Times (PT -4 slot times). 0x1 (PT28): Pause Time minus 28 Slot Times (PT -28 slot times). 0x2 (PT36): Pause Time minus 36 Slot Times (PT -36 slot times). 0x3 (PT144): Pause Time minus 144 Slot Times (PT -144 slot times). 0x4 (PT256): Pause Time minus 256 Slot Times (PT -256 slot times). 0x5 (PT512): Pause Time minus 512 Slot Times (PT -512 slot times). 0x6 (RSVD): Reserved.
3:2	0h RO	**Reserved**
1	0h RW	**Transmit Flow Control Enable (TFE):** When this bit is set in full-duplex mode, the MAC enables the flow control operation to Tx Pause packets. When this bit is reset, the flow control operation in the MAC is disabled, and the MAC does not transmit any Pause packets. 0x0 (DISABLE): Transmit Flow Control is disabled. 0x1 (ENABLE): Transmit Flow Control is enabled.
0	0h RW	**Flow Control Busy (FCB_BPA):** This bit initiates a PFC packet if the TFE bit is set. To initiate a PFC packet, the application must set this bit to 1'b1. During Control packet transfer, this bit continues to be set to indicate that a packet transmission is in progress. When PFC packet transmission is complete, the MAC resets this bit to 1'b0. You should not write to this register until this bit is cleared. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Flow Control Busy or Backpressure Activate is disabled. 0x1 (ENABLE): Flow Control Busy or Backpressure Activate is enabled.

10.2.19 MAC_Q7_TX_FLOW_CTRL — Offset 8Ch

This register controls the generation of PFC Control packets of priorities mapped as per the PSRQi field in the MAC_RxQ_Ctrl2/MAC_RxQ_Ctrl3 registers.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**Pause Time (PT):** This field holds the value to be used in the Pause Time field in the Tx control packet. If the Pause Time bits are configured to be double-synchronized to the (G)MII clock domain, consecutive writes to this register should be performed only after at least four clock cycles in the destination clock domain.
15:8	0h RO	**Reserved**
7	0h RW	**Disable Zero-Quanta Pause (DZPQ):** When this bit is set, it disables the automatic generation of the zero-quanta Pause packets on de-assertion of the flow-control signal from the FIFO layer (MTL or external sideband flow control signal sbd_flowctrl_i or mti_flowctrl_i). When this bit is reset, normal operation with automatic zero-quanta Pause packet generation is enabled. 0x0 (ENABLE): Zero-Quanta Pause packet generation is enabled. 0x1 (DISABLE): Zero-Quanta Pause packet generation is disabled.
6:4	0h RW	**Pause Low Threshold (PLT):** This field configures the threshold of the Pause timer at which the input flow control signal mti_flowctrl_i (or sbd_flowctrl_i) is checked for automatic retransmission of the Pause packet. The threshold values should be always less than the Pause Time configured in Bits[31:16]. For example, if PT = 100H (256 slot times), and PLT = 001, a second Pause packet is automatically transmitted if the mti_flowctrl_i signal is asserted at 228 (256-28) slot times after the first Pause packet is transmitted. The following list provides the threshold values for different values. The slot time is defined as the time taken to transmit 512 bits (64 bytes) on the GMII or MII interface. This (approximate) computation is based on the packet size (64, 1518, 2000, 9018, 16384, or 32768) + 2 Pause Packet Size + IPG in Slot Times. 0x0 (PT4): Pause Time minus 4 Slot Times (PT -4 slot times). 0x1 (PT28): Pause Time minus 28 Slot Times (PT -28 slot times). 0x2 (PT36): Pause Time minus 36 Slot Times (PT -36 slot times). 0x3 (PT144): Pause Time minus 144 Slot Times (PT -144 slot times). 0x4 (PT256): Pause Time minus 256 Slot Times (PT -256 slot times). 0x5 (PT512): Pause Time minus 512 Slot Times (PT -512 slot times). 0x6 (RSVD): Reserved.
3:2	0h RO	**Reserved**
1	0h RW	**Transmit Flow Control Enable (TFE):** When this bit is set in full-duplex mode, the MAC enables the flow control operation to Tx Pause packets. When this bit is reset, the flow control operation in the MAC is disabled, and the MAC does not transmit any Pause packets. 0x0 (DISABLE): Transmit Flow Control is disabled. 0x1 (ENABLE): Transmit Flow Control is enabled.
0	0h RW	**Flow Control Busy (FCB_BPA):** This bit initiates a PFC packet if the TFE bit is set. To initiate a PFC packet, the application must set this bit to 1'b1. During Control packet transfer, this bit continues to be set to indicate that a packet transmission is in progress. When PFC packet transmission is complete, the MAC resets this bit to 1'b0. You should not write to this register until this bit is cleared. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Flow Control Busy or Backpressure Activate is disabled. 0x1 (ENABLE): Flow Control Busy or Backpressure Activate is enabled.

10.2.20 MAC_RX_FLOW_CTRL — Offset 90h

The Receive Flow Control register controls the pausing of MAC Transmit based on the received Pause packet.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 90h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved**
8	0h RW	**Priority Based Flow Control Enable (PFCE):** When this bit is set, it enables generation and reception of priority-based flow control (PFC) packets. When this bit is reset, it enables generation and reception of 802.3x Pause control packets. 0x0 (DISABLE): Priority Based Flow Control is disabled. 0x1 (ENABLE): Priority Based Flow Control is enabled.
7:2	0h RO	**Reserved**
1	0h RW	**Unicast Pause Packet Detect (UP):** A pause packet is processed when it has the unique multicast address specified in the IEEE 802.3. When this bit is set, the MAC can also detect Pause packets with unicast address of the station. This unicast address should be as specified in MAC_Address0_High and MAC_Address0_Low. When this bit is reset, the MAC only detects Pause packets with unique multicast address. Note: The MAC does not process a Pause packet if the multicast address is different from the unique multicast address. This is also applicable to the received PFC packet when the Priority Flow Control (PFC) is enabled. The unique multicast address (0x01_80_C2_00_00_01) is as specified in IEEE 802.1 Qbb-2011. 0x0 (DISABLE): Unicast Pause Packet Detect disabled. 0x1 (ENABLE): Unicast Pause Packet Detect enabled.
0	0h RW	**Receive Flow Control Enable (RFE):** When this bit is set and the MAC is operating in full-duplex mode, the MAC decodes the received Pause packet and disables its transmitter for a specified (Pause) time. When this bit is reset or the MAC is operating in half-duplex mode, the decode function of the Pause packet is disabled. When PFC is enabled, flow control is enabled for PFC packets. The MAC decodes the received PFC packet and disables the Transmit queue, with matching priorities, for a duration of received Pause time. 0x0 (DISABLE): Receive Flow Control is disabled. 0x1 (ENABLE): Receive Flow Control is enabled.

10.2.21 MAC_RXQ_CTRL4 — Offset 94h

The Receive Queue Control 4 register controls the routing of unicast and multicast packets that fail the Destination or Source address filter to the Rx queues.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 94h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19:17	0h RW	**VLAN Tag Filter Fail Packets Queue (VFFQ):** This field holds the Rx queue number to which the tagged packets failing the Destination or Source Address filter (and UFFQE/MFFQE not enabled) or failing the VLAN tag filter must be routed to. This field is valid only when the VFFQE bit is set.
16	0h RW	**VLAN Tag Filter Fail Packets Queuing Enable (VFFQE):** When this bit is set, the tagged packets which fail the Destination or Source address filter or fail the VLAN tag filter, are routed to the Rx Queue Number programmed in the VFFQ. When this bit is reset, the tagged packets which fail the Destination or Source address filter or fail the VLAN tag filter are routed based on other routing options. This bit is valid only when the RA bit of the MAC_Packet_Filter register is set. 0x0 (DISABLE): VLAN tag Filter Fail Packets Queuing is disabled. 0x1 (ENABLE): VLAN tag Filter Fail Packets Queuing is enabled.
15:12	0h RO	**Reserved**
11:9	0h RW	**Multicast Address Filter Fail Packets Queue. (MFFQ):** This field holds the Rx queue number to which the Multicast packets failing the Destination or Source Address filter are routed to. This field is valid only when the MFFQE bit is set.
8	0h RW	**Multicast Address Filter Fail Packets Queuing Enable. (MFFQE):** When this bit is set, the Multicast packets which fail the Destination or Source address filter is routed to the Rx Queue Number programmed in the MFFQ. When this bit is reset, the Multicast packets which fail the Destination or Source address filter is routed based on other routing options. This bit is valid only when the RA bit of the MAC_Packet_Filter register is set. 0x0 (DISABLE): Multicast Address Filter Fail Packets Queuing is disabled. 0x1 (ENABLE): Multicast Address Filter Fail Packets Queuing is enabled.
7:4	0h RO	**Reserved**
3:1	0h RW	**Unicast Address Filter Fail Packets Queue. (UFFQ):** This field holds the Rx queue number to which the Unicast packets failing the Destination or Source Address filter are routed to. This field is valid only when the UFFQE bit is set.
0	0h RW	**Unicast Address Filter Fail Packets Queuing Enable. (UFFQE):** When this bit is set, the Unicast packets which fail the Destination or Source address filter is routed to the Rx Queue Number programmed in the UFFQ. When this bit is reset, the Unicast packets which fail the Destination or Source address filter is routed based on other routing options. This bit is valid only when the RA bit of the MAC_Packet_Filter register is set. 0x0 (DISABLE): Unicast Address Filter Fail Packets Queuing is disabled. 0x1 (ENABLE): Unicast Address Filter Fail Packets Queuing is enabled.

10.2.22 MAC_TXQ_PRTY_MAP0 — Offset 98h

The Transmit Queue Priority Mapping 0 register contains the priority values assigned to Tx Queue 0 through Tx Queue 3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RW	**Priorities Selected in Transmit Queue 3 (PSTQ3):** This bit is similar to the PSTQ0 bit.
23:16	00h RW	**Priorities Selected in Transmit Queue 2 (PSTQ2):** This bit is similar to the PSTQ0 bit.
15:8	00h RW	**Priorities Selected in Transmit Queue 1 (PSTQ1):** This bit is similar to the PSTQ0 bit.
7:0	00h RW	**Priorities Selected in Transmit Queue 0 (PSTQ0):** This field holds the priorities assigned to Tx Queue 0 by the software. This field determines if Tx Queue 0 should be blocked from transmitting specified pause time when a PFC packet is received with priorities matching the priorities programmed in this field. If the content of this field is not mutually exclusive to corresponding fields of other Transmit queues, that is, same priority is mapped to multiple Tx queues, the MAC blocks all queues with matching priority for specified time.

10.2.23 MAC_TXQ_PRTY_MAP1 — Offset 9Ch

The Transmit Queue Priority Mapping 1 register contains the priority values assigned to Tx Queue 4 through Tx Queue 7.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RW	**Priorities Selected in Transmit Queue 7 (PSTQ7):** This bit is similar to the PSTQ4 bit.
23:16	00h RW	**Priorities Selected in Transmit Queue 6 (PSTQ6):** This bit is similar to the PSTQ4 bit.
15:8	00h RW	**Priorities Selected in Transmit Queue 5 (PSTQ5):** This bit is similar to the PSTQ4 bit.
7:0	00h RW	**Priorities Selected in Transmit Queue 4 (PSTQ4):** This field holds the priorities assigned to Tx Queue 4 by the software. This field determines if Tx Queue 4 should be blocked from transmitting specified pause time when a PFC packet is received with priorities matching the priorities programmed in this field. If the content of this field is not mutually exclusive to corresponding fields of other Transmit queues, that is, same priority is mapped to multiple Tx queues, the MAC blocks all queues with matching priority for specified time.

10.2.24 MAC_RXQ_CTRL0 — Offset A0h

The Receive Queue Control 0 register controls the queue management in the MAC Receiver.

Note: In multiple Rx queues configuration, all the queues are disabled by default. Enable the Rx queue by programming the corresponding field in this register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + A0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:14	0h RW	**Receive Queue 7 Enable (RXQ7EN):** This field is similar to the RXQ0EN field. 0x0 (DISABLE): Queue not enabled. 0x1 (EN_AV): Queue enabled for AV. 0x2 (EN_DCB_GEN): Queue enabled for DCB/Generic. 0x3 (RSVD): Reserved.
13:12	0h RW	**Receive Queue 6 Enable (RXQ6EN):** This field is similar to the RXQ0EN field. 0x0 (DISABLE): Queue not enabled. 0x1 (EN_AV): Queue enabled for AV. 0x2 (EN_DCB_GEN): Queue enabled for DCB/Generic. 0x3 (RSVD): Reserved.
11:10	0h RW	**Receive Queue 5 Enable (RXQ5EN):** This field is similar to the RXQ0EN field. 0x0 (DISABLE): Queue not enabled. 0x1 (EN_AV): Queue enabled for AV. 0x2 (EN_DCB_GEN): Queue enabled for DCB/Generic. 0x3 (RSVD): Reserved.
9:8	0h RW	**Receive Queue 4 Enable (RXQ4EN):** This field is similar to the RXQ0EN field. 0x0 (DISABLE): Queue not enabled. 0x1 (EN_AV): Queue enabled for AV. 0x2 (EN_DCB_GEN): Queue enabled for DCB/Generic. 0x3 (RSVD): Reserved.
7:6	0h RW	**Receive Queue 3 Enable (RXQ3EN):** This field is similar to the RXQ0EN field. 0x0 (DISABLE): Queue not enabled. 0x1 (EN_AV): Queue enabled for AV. 0x2 (EN_DCB_GEN): Queue enabled for DCB/Generic. 0x3 (RSVD): Reserved.

Bit Range	Default & Access	Field Name (ID): Description
5:4	0h RW	**Receive Queue 2 Enable (RXQ2EN):** This field is similar to the RXQ0EN field. 0x0 (DISABLE): Queue not enabled. 0x1 (EN_AV): Queue enabled for AV. 0x2 (EN_DCB_GEN): Queue enabled for DCB/Generic. 0x3 (RSVD): Reserved.
3:2	0h RW	**Receive Queue 1 Enable (RXQ1EN):** This field is similar to the RXQ0EN field. 0x0 (DISABLE): Queue not enabled. 0x1 (EN_AV): Queue enabled for AV. 0x2 (EN_DCB_GEN): Queue enabled for DCB/Generic. 0x3 (RSVD): Reserved.
1:0	0h RW	**Receive Queue 0 Enable (RXQ0EN):** This field indicates whether Rx Queue 0 is enabled for AV or DCB. 0x0 (DISABLE): Queue not enabled. 0x1 (EN_AV): Queue enabled for AV. 0x2 (EN_DCB_GEN): Queue enabled for DCB/Generic. 0x3 (RSVD): Reserved.

10.2.25 MAC_RXQ_CTRL1 — Offset A4h

The Receive Queue Control 1 register controls the routing of multicast, broadcast, AV, DCB, and untagged packets to the Rx queues.

Type	Size	Offset	Default
MMIO	32 bit	BAR + A4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**OMCBCQ:** 0x0 (DISABLE): overriding MCBCQ priority disabled. 0x1 (ENABLE): overriding MCBCQ priority enabled.
27	0h RO	**Reserved**
26:24	0h RW	**Frame Preemption Residue Queue (FPRQ):** This field holds the Rx queue number to which the residual preemption frames must be forwarded. Preemption frames that are tagged and pass the SA/DA/VLAN filtering are routed based on PSRQ and all other frames are treated as residual frames and is routed to the queue number mentioned in this field. The Queue-0 is used as a default queue for express frames, so this field cannot be programmed to a value 0.

Bit Range	Default & Access	Field Name (ID): Description
23:22	0h RW	**Tagged PTP over Ethernet Packets Queuing Control. (TPQC):** This field controls the routing of the VLAN Tagged PTPoE packets. The following programmable options are allowed. - 2'b00: VLAN Tagged PTPoE packets are routed as generic VLAN Tagged packet (based on PSRQ for only non-AV enabled Rx Queues). - 2'b01: VLAN Tagged PTPoE packets are routed to Rx Queue specified by PTPQ field (That Rx Queue can be enabled for AV or non-AV traffic). - 2'b10: VLAN Tagged PTPoE packets are routed to only AV enabled Rx Queues based on PSRQ. - 2'b11: Reserved
21	0h RW	**Tagged AV Control Packets Queuing Enable. (TACPQE):** When set, the MAC routes the received Tagged AV Control packets to the Rx queue specified by AVCPQ field. When reset, the MAC routes the received Tagged AV Control packets based on the tag priority matching the PSRQ fields in MAC_RxQ_Ctrl2 and MAC_RxQ_Ctrl3 registers. 0x0 (DISABLE): Tagged AV Control Packets Queuing is disabled. 0x1 (ENABLE): Tagged AV Control Packets Queuing is enabled.
20	0h RW	**Multicast and Broadcast Queue Enable (MCBCQEN):** This bit specifies that Multicast or Broadcast packets routing to the Rx Queue is enabled and the Multicast or Broadcast packets must be routed to Rx Queue specified in MCBCQ field. 0x0 (DISABLE): Multicast and Broadcast Queue is disabled. 0x1 (ENABLE): Multicast and Broadcast Queue is enabled.
19	0h RO	**Reserved**
18:16	0h RW	**Multicast and Broadcast Queue (MCBCQ):** This field specifies the Rx Queue onto which Multicast or Broadcast Packets are routed. Any Rx Queue enabled for Generic/DCB/AV traffic can be used to route the Multicast or Broadcast Packets. 0x0 (QUEUE0): Receive Queue 0. 0x1 (QUEUE1): Receive Queue 1. 0x2 (QUEUE2): Receive Queue 2. 0x3 (QUEUE3): Receive Queue 3. 0x4 (QUEUE4): Receive Queue 4. 0x5 (QUEUE5): Receive Queue 5. 0x6 (QUEUE6): Receive Queue 6. 0x7 (QUEUE7): Receive Queue 7.
15	0h RO	**Reserved**
14:12	0h RW	**Untagged Packet Queue (UPQ):** This field indicates the Rx Queue to which Untagged Packets are to be routed. Any Rx Queue enabled for Generic/DCB/AV traffic can be used to route the Untagged Packets. 0x0 (QUEUE0): Receive Queue 0. 0x1 (QUEUE1): Receive Queue 1. 0x2 (QUEUE2): Receive Queue 2. 0x3 (QUEUE3): Receive Queue 3. 0x4 (QUEUE4): Receive Queue 4. 0x5 (QUEUE5): Receive Queue 5. 0x6 (QUEUE6): Receive Queue 6. 0x7 (QUEUE7): Receive Queue 7.
11	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
10:8	0h RW	**DCB Control Packets Queue (DCBCPQ):** This field specifies the Rx queue on which the received DCB control packets are routed. The DCB data packets are routed based on the PSRQ field of the Transmit Flow Control Register of corresponding queue. 0x0 (QUEUE0): Receive Queue 0. 0x1 (QUEUE1): Receive Queue 1. 0x2 (QUEUE2): Receive Queue 2. 0x3 (QUEUE3): Receive Queue 3. 0x4 (QUEUE4): Receive Queue 4. 0x5 (QUEUE5): Receive Queue 5. 0x6 (QUEUE6): Receive Queue 6. 0x7 (QUEUE7): Receive Queue 7.
7	0h RO	**Reserved**
6:4	0h RW	**PTP Packets Queue (PTPQ):** This field specifies the Rx queue on which the PTP packets sent over the Ethernet payload (not over IPv4 or IPv6) are routed. When the AV8021ASMEN bit of MAC_Timestamp_Control register is set, only untagged PTP over Ethernet packets are routed on an Rx Queue. If the bit is not set, then based on programming of TPQC field, both tagged and untagged PTPoE packets can be routed to this Rx Queue. 0x0 (QUEUE0): Receive Queue 0. 0x1 (QUEUE1): Receive Queue 1. 0x2 (QUEUE2): Receive Queue 2. 0x3 (QUEUE3): Receive Queue 3. 0x4 (QUEUE4): Receive Queue 4. 0x5 (QUEUE5): Receive Queue 5. 0x6 (QUEUE6): Receive Queue 6. 0x7 (QUEUE7): Receive Queue 7.
3	0h RO	**Reserved**
2:0	0h RW	**AV Untagged Control Packets Queue (AVCPQ):** This field specifies the Receive queue on which the received AV tagged and untagged control packets are routed. The AV tagged (when TACPQE bit is set) and untagged control packets are routed to Receive queue specified by this field. 0x0 (QUEUE0): Receive Queue 0. 0x1 (QUEUE1): Receive Queue 1. 0x2 (QUEUE2): Receive Queue 2. 0x3 (QUEUE3): Receive Queue 3. 0x4 (QUEUE4): Receive Queue 4. 0x5 (QUEUE5): Receive Queue 5. 0x6 (QUEUE6): Receive Queue 6. 0x7 (QUEUE7): Receive Queue 7.

10.2.26 MAC_RXQ_CTRL2 — Offset A8h

This register controls the routing of tagged packets based on the USP (user Priority) field of the received packets to the RxQueues 0 to 3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + A8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RW	**Priorities Selected in the Receive Queue 3 (PSRQ3):** This field decides the priorities assigned to Rx Queue 3. All packets with priorities that match the values set in this field are routed to Rx Queue 3. For example, if PSRQ3[6, 3] are set, packets with USP field equal to 3 or 6 are routed to Rx Queue 3. The software must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues. this field also determines the priorities to be included in the PFC packet sent to remote station when Rx Queue 3 crosses the flow control threshold settings.
23:16	00h RW	**Priorities Selected in the Receive Queue 2 (PSRQ2):** This field decides the priorities assigned to Rx Queue 2. All packets with priorities that match the values set in this field are routed to Rx Queue 2. For example, if PSRQ2[1, 0] are set, packets with USP field equal to 1 or 0 are routed to Rx Queue 2. The software must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues. this field also determines the priorities to be included in the PFC packet sent to remote station when Rx Queue 2 crosses the flow control threshold settings.
15:8	00h RW	**Priorities Selected in the Receive Queue 1 (PSRQ1):** This field decides the priorities assigned to Rx Queue 1. All packets with priorities that match the values set in this field are routed to Rx Queue 1. For example, if PSRQ1[4] is set, packets with USP field equal to 4 are routed to Rx Queue 1. The software must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues. this field also determines the priorities to be included in the PFC packet sent to remote station when Rx Queue 1 crosses the flow control threshold settings.
7:0	00h RW	**Priorities Selected in the Receive Queue 0 (PSRQ0):** This field decides the priorities assigned to Rx Queue 0. All packets with priorities that match the values set in this field are routed to Rx Queue 0. For example, if PSRQ0[5] is set, packets with USP field equal to 5 are routed to Rx Queue 0. The software must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues. this field also determines the priorities to be included in the PFC packet sent to remote station when Rx Queue 0 crosses the flow control threshold settings.

10.2.27 MAC_RXQ_CTRL3 — Offset ACh

This register controls the routing of tagged packets based on the USP (user Priority) field of the received packets to the RxQueues 4 to 7.

Type	Size	Offset	Default
MMIO	32 bit	BAR + ACh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RW	**Priorities Selected in the Receive Queue 7 (PSRQ7):** This field decides the priorities assigned to Rx Queue 7. All packets with priorities that match the values set in this field are routed to Rx Queue 7. For example, if PSRQ7[7, 4] are set, packets with USP field equal to 7 or 4 are routed to Rx Queue 7. The software must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues. this field also determines the priorities to be included in the PFC packet sent to remote station when Rx Queue 7 crosses the flow control threshold settings.
23:16	00h RW	**Priorities Selected in the Receive Queue 6 (PSRQ6):** This field decides the priorities assigned to Rx Queue 6. All packets with priorities that match the values set in this field are routed to Rx Queue 6. For example, if PSRQ6[5] are set, packets with USP field equal to 5 are routed to Rx Queue 6. The software must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues. this field also determines the priorities to be included in the PFC packet sent to remote station when Rx Queue 6 crosses the flow control threshold settings.
15:8	00h RW	**Priorities Selected in the Receive Queue 5 (PSRQ5):** This field decides the priorities assigned to Rx Queue 5. All packets with priorities that match the values set in this field are routed to Rx Queue 5. For example, if PSRQ5[6] is set, packets with USP field equal to 6 are routed to Rx Queue 5. The software must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues. this field also determines the priorities to be included in the PFC packet sent to remote station when Rx Queue 5 crosses the flow control threshold settings.
7:0	00h RW	**Priorities Selected in the Receive Queue 4 (PSRQ4):** This field decides the priorities assigned to Rx Queue 4. All packets with priorities that match the values set in this field are routed to Rx Queue 4. For example, if PSRQ4[7:4] is set, packets with USP field equal to 7, 6, 5, or 4 are routed to Rx Queue 4. The software must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues. this field also determines the priorities to be included in the PFC packet sent to remote station when Rx Queue 4 crosses the flow control threshold settings.

10.2.28 MAC_INTERRUPT_STATUS — Offset B0h

The Interrupt Status register contains the status of interrupts.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved**
20	0h RO	**MMC FPE Receive Interrupt Status (MFRIS):** This bit is set high when an interrupt is generated in the MMC FPE Receive Interrupt Register. This bit is cleared when all bits in this interrupt register are cleared. This bit is valid only when you select the Enable MAC Management Counters (MMC) option along with FPE support. 0x0 (INACTIVE): MMC FPE Receive Interrupt status not active. 0x1 (ACTIVE): MMC FPE Receive Interrupt status active.
19	0h RO	**MMC FPE Transmit Interrupt Status (MFTIS):** This bit is set high when an interrupt is generated in the MMC FPE Transmit Interrupt Register. This bit is cleared when all bits in this interrupt register are cleared. This bit is valid only when you select the Enable MAC Management Counters (MMC) option along with FPE support. 0x0 (INACTIVE): MMC FPE Transmit Interrupt status not active. 0x1 (ACTIVE): MMC FPE Transmit Interrupt status active.
18	0h RO	**MDIO Interrupt Status (MDIOIS):** This bit indicates an interrupt event after the completion of MDIO operation. To reset this bit, the application has to read this bit/Write 1 to this bit when RCWE bit of MAC_CSR_SW_Ctrl register is set. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): MDIO Interrupt status not active. 0x1 (ACTIVE): MDIO Interrupt status active.
17	0h RO	**Frame Preemption Interrupt Status (FPEIS):** This bit indicates an interrupt event during the operation of Frame Preemption (Bits[19:16] of MAC_FPE_CTRL_STS register is set). To reset this bit, the application must clear the event in MAC_FPE_CTRL_STS that has caused the Interrupt. 0x0 (INACTIVE): Frame Preemption Interrupt status not active. 0x1 (ACTIVE): Frame Preemption Interrupt status active.
16	0h RO	**Reserved**
15	0h RO	**GPI Interrupt Status (GPIIS):** When the GPIO feature is enabled, this bit is set when any active event (LL or LH) occurs on the GPIS field of the MAC_GPIO_Status register and the corresponding GPIE bit is enabled in the MAC_GPIO_Control register. This bit is cleared on reading lane 0 (GPIS) of the MAC_GPIO_Status register. 0x0 (INACTIVE): GPI Interrupt status not active. 0x1 (ACTIVE): GPI Interrupt status active.
14	0h RO	**Receive Status Interrupt (RXSTSIS):** This bit indicates the status of received packets. This bit is set when the RWT bit is set in the MAC_Rx_Tx_Status register. This bit is cleared when the corresponding interrupt source bit is read (or corresponding interrupt source bit is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set) in the MAC_Rx_Tx_Status register. 0x0 (INACTIVE): Receive Interrupt status not active. 0x1 (ACTIVE): Receive Interrupt status active.

Bit Range	Default & Access	Field Name (ID): Description
13	0h RO	**Transmit Status Interrupt (TXSTSIS):** This bit indicates the status of transmitted packets. This bit is set when any of the following bits is set in the MAC_Rx_Tx_Status register: - Excessive Collision (EXCOL) - Late Collision (LCOL) - Excessive Deferral (EXDEF) - Loss of Carrier (LCARR) - No Carrier (NCARR) - Jabber Timeout (TJT) This bit is cleared when the corresponding interrupt source bit is read (or corresponding interrupt source bit is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set) in the MAC_Rx_Tx_Status register. 0x0 (INACTIVE): Transmit Interrupt status not active. 0x1 (ACTIVE): Transmit Interrupt status active.
12	0h RO	**Timestamp Interrupt Status (TSIS):** If the Timestamp feature is enabled, this bit is set when any of the following conditions is true: - The system time value is equal to or exceeds the value specified in the Target Time High and Low registers. - There is an overflow in the Seconds register. - The Target Time Error occurred, that is, programmed target time already elapsed. If the Auxiliary Snapshot feature is enabled, this bit is set when the auxiliary snapshot trigger is asserted. In configurations other than EQOS_CORE, when drop transmit status is enabled in MTL, this bit is set when the captured transmit timestamp is updated in the MAC_Tx_Timestamp_Status_Nanoseconds and Mac_TxTimestamp_Status_Seconds registers. When PTP offload feature is enabled, this bit is set when the captured transmit timestamp is updated in the MAC_Tx_Timestamp_Status_Nanoseconds and MAC_Tx_Timestamp_Status_Seconds registers, for PTO generated Delay Request and Pdelay request packets. This bit is cleared when the corresponding interrupt source bit is read (or corresponding interrupt source bit is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set) in the MAC_Timestamp_Status register. 0x0 (INACTIVE): Timestamp Interrupt status not active. 0x1 (ACTIVE): Timestamp Interrupt status active.
11	0h RO	**MMC Receive Checksum Offload Interrupt Status (MMCRXIPIS):** This bit is set high when an interrupt is generated in the MMC Receive Checksum Offload Interrupt Register. This bit is cleared when all bits in this interrupt register are cleared. This bit is valid only when you select the Enable MAC Management Counters (MMC) and Enable Receive TCP/IP Checksum Check options. 0x0 (INACTIVE): MMC Receive Checksum Offload Interrupt status not active. 0x1 (ACTIVE): MMC Receive Checksum Offload Interrupt status active.
10	0h RO	**MMC Transmit Interrupt Status (MMCTXIS):** This bit is set high when an interrupt is generated in the MMC Transmit Interrupt Register. This bit is cleared when all bits in this interrupt register are cleared. This bit is valid only when you select the Enable MAC Management Counters (MMC) option. 0x0 (INACTIVE): MMC Transmit Interrupt status not active. 0x1 (ACTIVE): MMC Transmit Interrupt status active.
9	0h RO	**MMC Receive Interrupt Status (MMCRXIS):** This bit is set high when an interrupt is generated in the MMC Receive Interrupt Register. This bit is cleared when all bits in this interrupt register are cleared. This bit is valid only when you select the Enable MAC Management Counters (MMC) option. 0x0 (INACTIVE): MMC Receive Interrupt status not active. 0x1 (ACTIVE): MMC Receive Interrupt status active.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RO	**MMC Interrupt Status (MMCIS):** This bit is set high when Bit 11, Bit 10, or Bit 9 is set high. This bit is cleared only when all these bits are low. This bit is valid only when you select the Enable MAC Management Counters (MMC) option. 0x0 (INACTIVE): MMC Interrupt status not active. 0x1 (ACTIVE): MMC Interrupt status active.
7:6	0h RO	**Reserved**
5	0h RO	**LPI Interrupt Status (LPIIS):** When the Energy Efficient Ethernet feature is enabled, this bit is set for any LPI state entry or exit in the MAC Transmitter or Receiver. This bit is cleared when the corresponding interrupt source bit of MAC_LPI_Control_Status register is read (or corresponding interrupt source bit of MAC_LPI_Control_Status register is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set). 0x0 (INACTIVE): LPI Interrupt status not active. 0x1 (ACTIVE): LPI Interrupt status active.
4	0h RO	**PMT Interrupt Status (PMTIS):** This bit is set when a Magic packet or Wake-on-LAN packet is received in the power-down mode (RWKPRCVD and MGKPRCVD bits in MAC_PMT_Control_Status register). This bit is cleared when corresponding interrupt source bit are cleared because of a Read operation to the MAC_PMT_Control_Status register (or corresponding interrupt source bit of MAC_PMT_Control_Status register is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set). This bit is valid only when you select the Enable Power Management option. 0x0 (INACTIVE): PMT Interrupt status not active. 0x1 (ACTIVE): PMT Interrupt status active.
3	0h RO	**PHY Interrupt (PHYIS):** This bit is set when rising edge is detected on the phy_intr_i input. This bit is cleared when this register is read (or this bit is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set). 0x0 (INACTIVE): PHY Interrupt not detected. 0x1 (ACTIVE): PHY Interrupt detected.
2:1	0h RO	**Reserved**
0	0h RO	**RGMII or SMII Interrupt Status (RGSMIIIS):** This bit is set because of any change in value of the Link Status of RGMII or SMII interface (LNKSTS bit in MAC_PHYIF_Control_Status register). This bit is cleared when the MAC_PHYIF_Control_Status register is read (or LNKSTS bit of MAC_PHYIF_Control_Status register is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set). This bit is valid only when you select the optional RGMII or SMII PHY interface. 0x0 (INACTIVE): RGMII or SMII Interrupt Status is not active. 0x1 (ACTIVE): RGMII or SMII Interrupt Status is active.

10.2.29 MAC_INTERRUPT_ENABLE — Offset B4h

The Interrupt Enable register contains the masks for generating the interrupts.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	**Reserved**
18	0h RW	**MDIO Interrupt Enable (MDIOIE):** When this bit is set, it enables the assertion of the interrupt when MDIOIS field is set in the MAC_Interrupt_Status register. 0x0 (DISABLE): MDIO Interrupt is disabled. 0x1 (ENABLE): MDIO Interrupt is enabled.
17	0h RW	**Frame Preemption Interrupt Enable (FPEIE):** When this bit is set, it enables the assertion of the interrupt when FPEIS field is set in the MAC_Interrupt_Status register. 0x0 (DISABLE): Frame Preemption Interrupt is disabled. 0x1 (ENABLE): Frame Preemption Interrupt is enabled.
16:15	0h RO	**Reserved**
14	0h RW	**Receive Status Interrupt Enable (RXSTSIE):** When this bit is set, it enables the assertion of the interrupt signal because of the setting of RXSTSIS bit in the MAC_Interrupt_Status register. 0x0 (DISABLE): Receive Status Interrupt is disabled. 0x1 (ENABLE): Receive Status Interrupt is enabled.
13	0h RW	**Transmit Status Interrupt Enable (TXSTSIE):** When this bit is set, it enables the assertion of the interrupt signal because of the setting of TXSTSIS bit in the MAC_Interrupt_Status register. 0x0 (DISABLE): Timestamp Status Interrupt is disabled. 0x1 (ENABLE): Timestamp Status Interrupt is enabled.
12	0h RW	**Timestamp Interrupt Enable (TSIE):** When this bit is set, it enables the assertion of the interrupt signal because of the setting of TSIS bit in MAC_Interrupt_Status register. 0x0 (DISABLE): Timestamp Interrupt is disabled. 0x1 (ENABLE): Timestamp Interrupt is enabled.
11:6	0h RO	**Reserved**
5	0h RW	**LPI Interrupt Enable (LPIIE):** When this bit is set, it enables the assertion of the interrupt signal because of the setting of LPIIS bit in MAC_Interrupt_Status register. 0x0 (DISABLE): LPI Interrupt is disabled. 0x1 (ENABLE): LPI Interrupt is enabled.
4	0h RW	**PMT Interrupt Enable (PMTIE):** When this bit is set, it enables the assertion of the interrupt signal because of the setting of PMTIS bit in MAC_Interrupt_Status register. 0x0 (DISABLE): PMT Interrupt is disabled. 0x1 (ENABLE): PMT Interrupt is enabled.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**PHY Interrupt Enable (PHYIE):** When this bit is set, it enables the assertion of the interrupt signal because of the setting of PHYIS bit in MAC_Interrupt_Status register. 0x0 (DISABLE): PHY Interrupt is disabled. 0x1 (ENABLE): PHY Interrupt is enabled.
2:1	0h RO	**Reserved**
0	0h RW	**RGMII or SMII Interrupt Enable (RGSMIIIE):** When this bit is set, it enables the assertion of the interrupt signal because of the setting of RGSMIIIS bit in MAC_Interrupt_Status register. 0x0 (DISABLE): RGMII or SMII Interrupt is disabled. 0x1 (ENABLE): RGMII or SMII Interrupt is enabled.

10.2.30 MAC_RX_TX_STATUS — Offset B8h

The Receive Transmit Status register contains the Receive and Transmit Error status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved**
8	0h RO	**Receive Watchdog Timeout (RWT):** This bit is set when a packet with length greater than 2,048 bytes is received (10,240 bytes when Jumbo Packet mode is enabled) and the WD bit is reset in the MAC_Configuration register. This bit is set when a packet with length greater than 16,383 bytes is received and the WD bit is set in the MAC_Configuration register. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): No receive watchdog timeout. 0x1 (ACTIVE): Receive watchdog timed out.
7:6	0h RO	**Reserved**
5	0h RO	**Excessive Collisions (EXCOL):** When the DTXSTS bit is set in the MTL_Operation_Mode register, this bit indicates that the transmission aborted after 16 successive collisions while attempting to transmit the current packet. If the DR bit is set in the MAC_Configuration register, this bit is set after the first collision and the packet transmission is aborted. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): No collision. 0x1 (ACTIVE): Excessive collision is sensed.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO	**Late Collision (LCOL):** When the DTXSTS bit is set in the MTL_Operation_Mode register, this bit indicates that the packet transmission aborted because a collision occurred after the collision window (64 bytes including Preamble in MII mode; 512 bytes including Preamble and Carrier Extension in GMII mode). This bit is not valid if the Underflow error occurs. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): No collision. 0x1 (ACTIVE): Late collision is sensed.
3	0h RO	**Excessive Deferral (EXDEF):** When the DTXSTS bit is set in the MTL_Operation_Mode register and the DC bit is set in the MAC_Configuration register, this bit indicates that the transmission ended because of excessive deferral of over 24,288 bit times (155,680 in 1000/2500 Mbps mode or when Jumbo packet is enabled). Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): No Excessive deferral. 0x1 (ACTIVE): Excessive deferral.
2	0h RO	**Loss of Carrier (LCARR):** When the DTXSTS bit is set in the MTL_Operation_Mode register, this bit indicates that the loss of carrier occurred during packet transmission, that is, the phy_crs_i signal was inactive for one or more transmission clock periods during packet transmission. This bit is valid only for packets transmitted without collision. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): Carrier is present. 0x1 (ACTIVE): Loss of carrier.
1	0h RO	**No Carrier (NCARR):** When the DTXSTS bit is set in the MTL_Operation_Mode register, this bit indicates that the carrier signal from the PHY is not present at the end of preamble transmission. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): Carrier is present. 0x1 (ACTIVE): No carrier.
0	0h RO	**Transmit Jabber Timeout (TJT):** This bit indicates that the Transmit Jabber Timer expired which happens when the packet size exceeds 2,048 bytes (10,240 bytes when the Jumbo packet is enabled) and JD bit is reset in the MAC_Configuration register. This bit is set when the packet size exceeds 16,383 bytes and the JD bit is set in the MAC_Configuration register. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): No Transmit Jabber Timeout. 0x1 (ACTIVE): Transmit Jabber Timeout occurred.

10.2.31 MAC_PMT_CONTROL_STATUS — Offset C0h

The PMT Control and Status Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Remote Wake-Up Packet Filter Register Pointer Reset (RWKFILTRST):** When this bit is set, the remote wake-up packet filter register pointer is reset to 3'b000. It is automatically cleared after 1 clock cycle. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Remote Wake-Up Packet Filter Register Pointer is not Reset. 0x1 (ENABLE): Remote Wake-Up Packet Filter Register Pointer is Reset.
30:29	0h RO	**Reserved**
28:24	00h RO	**Remote Wake-up FIFO Pointer (RWKPTR):** This field gives the current value (0 to 7, 15, or 31 when 4, 8, or 16 Remote Wake-up Packet Filters are selected) of the Remote Wake-up Packet Filter register pointer. When the value of this pointer is equal to maximum for the selected number of Remote Wake-up Packet Filters, the contents of the Remote Wake-up Packet Filter Register are transferred to the clk_rx_i domain when a Write occurs to that register.
23:11	0h RO	**Reserved**
10	0h RW	**Remote Wake-up Packet Forwarding Enable (RWKPFE):** When this bit is set along with RWKPKTEN, the MAC receiver drops all received frames until it receives the expected Wake-up frame. All frames after that event including the received wake-up frame are forwarded to application. This bit is then self-cleared on receiving the wake-up packet. The application can also clear this bit before the expected wake-up frame is received. In such cases, the MAC reverts to the default behavior where packets received are forwarded to the application. This bit must only be set when RWKPKTEN is set high and PWRDWN is set low. The setting of this bit has no effect when PWRDWN is set high. Note: If Magic Packet Enable and Wake-Up Frame Enable are both set along with setting of this bit and Magic Packet is received prior to wake-up frame, this bit is self-cleared on receiving Magic Packet, the received Magic packet is dropped, and all frames after received Magic Packet are forwarded to application. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Remote Wake-up Packet Forwarding is disabled. 0x1 (ENABLE): Remote Wake-up Packet Forwarding is enabled.
9	0h RW	**Global Unicast (GLBLUCAST):** When this bit set, any unicast packet filtered by the MAC (DAF) address recognition is detected as a remote wake-up packet. 0x0 (DISABLE): Global unicast is disabled. 0x1 (ENABLE): Global unicast is enabled.
8:7	0h RO	**Reserved**
6	0h RO	**Remote Wake-Up Packet Received (RWKPRCVD):** When this bit is set, it indicates that the power management event is generated because of the reception of a remote wake-up packet. This bit is cleared when this register is read. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): Remote wake-up packet is received. 0x1 (ACTIVE): Remote wake-up packet is received.
5	0h RO	**Magic Packet Received (MGKPRCVD):** When this bit is set, it indicates that the power management event is generated because of the reception of a magic packet. This bit is cleared when this register is read. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): No Magic packet is received. 0x1 (ACTIVE): Magic packet is received.

Bit Range	Default & Access	Field Name (ID): Description
4:3	0h RO	**Reserved**
2	0h RW	**Remote Wake-Up Packet Enable (RWKPKTEN):** When this bit is set, a power management event is generated when the MAC receives a remote wake-up packet. 0x0 (DISABLE): Remote wake-up packet is disabled. 0x1 (ENABLE): Remote wake-up packet is enabled.
1	0h RW	**Magic Packet Enable (MGKPKTEN):** When this bit is set, a power management event is generated when the MAC receives a magic packet. 0x0 (DISABLE): Magic Packet is disabled. 0x1 (ENABLE): Magic Packet is enabled.
0	0h RW	**Power Down (PWRDWN):** When this bit is set, the MAC receiver drops all received packets until it receives the expected magic packet or remote wake-up packet. This bit is then self-cleared and the power-down mode is disabled. The software can clear this bit before the expected magic packet or remote wake-up packet is received. The packets received by the MAC after this bit is cleared are forwarded to the application. This bit must only be set when the Magic Packet Enable, Global Unicast, or Remote Wake-Up Packet Enable bit is set high. Note: You can gate-off the CSR clock during the power-down mode. However, when the CSR clock is gated-off, you cannot perform any read or write operations on this register. Therefore, the Software cannot clear this bit. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Power down is disabled. 0x1 (ENABLE): Power down is enabled.

10.2.32 MAC_RWK_PACKET_FILTER — Offset C4h

The TSN-GbE implements a filter lookup table programmed through the MAC_RWK_Packet_Filter register in which CRC, offset, and byte mask of the pattern embedded in the remote wakeup packet, and the filter-operation commands are programmed.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**RWK Packet Filter (WKUPFRMFTR):** This field contains the various controls of RWK Packet filter.

10.2.33 MAC_LPI_CONTROL_STATUS — Offset D0h

The LPI Control and Status Register controls the LPI functions and provides the LPI interrupt status. The status bits are cleared when this register is read.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21	0h RW	**LPI Tx Clock Stop Enable (LPITCSE):** When this bit is set, the MAC indicates that the Tx clock to MAC can be stopped. When this bit is reset, the MAC does not indicate that the Tx clock to MAC can be stopped after it enters Tx LPI mode. If RGMII Interface is selected, the Tx clock is required for transmitting the LPI pattern. The Tx Clock cannot be gated and so the LPITCSE bit cannot be programmed. 0x0 (DISABLE): LPI Tx Clock Stop is disabled. 0x1 (ENABLE): LPI Tx Clock Stop is enabled.
20	0h RW	**LPI Timer Enable (LPIATE):** This bit controls the automatic entry of the MAC Transmitter into and exit out of the LPI state. When LPIATE, LPITXA and LPIEN bits are set, the MAC Transmitter enters LPI state only when the complete MAC TX data path is IDLE for a period indicated by the MAC_LPI_Entry_Timer register. After entering LPI state, if the data path becomes non-IDLE (due to a new packet being accepted for transmission), the Transmitter exits LPI state but does not clear LPIEN bit. This enables the re-entry into LPI state when it is IDLE again. When LPIATE is 0, the LPI Auto timer is disabled and MAC Transmitter enters LPI state based on the settings of LPITXA and LPIEN bit descriptions. 0x0 (DISABLE): LPI Timer is disabled. 0x1 (ENABLE): LPI Timer is enabled.
19	0h RW	**LPI Tx Automate (LPITXA):** This bit controls the behavior of the MAC when it is entering or coming out of the LPI mode on the Transmit side. This bit is not functional in the EQOS-CORE configurations in which the Tx clock gating is done during the LPI mode. If the LPITXA and LPIEN bits are set to 1, the MAC enters the LPI mode only after all outstanding packets (in the core) and pending packets (in the application interface) have been transmitted. The MAC comes out of the LPI mode when the application sends any packet for transmission or the application issues a Tx FIFO Flush command. In addition, the MAC automatically clears the LPIEN bit when it exits the LPI state. If Tx FIFO Flush is set in the FTQ bit of MTL_TxQ0_Operation_Mode register, when the MAC is in the LPI mode, it exits the LPI mode. When this bit is 0, the LPIEN bit directly controls behavior of the MAC when it is entering or coming out of the LPI mode. 0x0 (DISABLE): LPI Tx Automate is disabled. 0x1 (ENABLE): LPI Tx Automate is enabled.
18	0h RW	**PHY Link Status Enable (PLSEN):** This bit enables the link status received on the RGMII, SGMII, or SMII Receive paths to be used for activating the LPI LS TIMER. When this bit is set, the MAC uses the link-status bits of the MAC_PHYIF_Control_Status register and the PLS bit for the LPI LS Timer trigger. When this bit is reset, the MAC ignores the link-status bits of the MAC_PHYIF_Control_Status register and takes only the PLS bit. 0x0 (DISABLE): PHY Link Status is disabled. 0x1 (ENABLE): PHY Link Status is enabled.
17	0h RW	**PHY Link Status (PLS):** This bit indicates the link status of the PHY. The MAC Transmitter asserts the LPI pattern only when the link status is up (OKAY) at least for the time indicated by the LPI LS TIMER. When this bit is set, the link is considered to be okay (UP) and when this bit is reset, the link is considered to be down. 0x0 (DISABLE): link is down. 0x1 (ENABLE): link is okay (UP).

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**LPI Enable (LPIEN):** When this bit is set, it instructs the MAC Transmitter to enter the LPI state. When this bit is reset, it instructs the MAC to exit the LPI state and resume normal transmission. This bit is cleared when the LPITXA bit is set and the MAC exits the LPI state because of the arrival of a new packet for transmission. 0x0 (DISABLE): LPI state is disabled. 0x1 (ENABLE): LPI state is enabled.
15:10	0h RO	**Reserved**
9	0h RO	**Receive LPI State (RLPIST):** When this bit is set, it indicates that the MAC is receiving the LPI pattern on the GMII or MII interface. 0x0 (INACTIVE): Receive LPI state not detected. 0x1 (ACTIVE): Receive LPI state detected.
8	0h RO	**Transmit LPI State (TLPIST):** When this bit is set, it indicates that the MAC is transmitting the LPI pattern on the GMII or MII interface. 0x0 (INACTIVE): Transmit LPI state not detected. 0x1 (ACTIVE): Transmit LPI state detected.
7:4	0h RO	**Reserved**
3	0h RO	**Receive LPI Exit (RLPIEX):** When this bit is set, it indicates that the MAC Receiver has stopped receiving the LPI pattern on the GMII or MII interface, exited the LPI state, and resumed the normal reception. This bit is cleared by a read into this register (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Note: This bit might not be set if the MAC stops receiving the LPI pattern for a very short duration, such as, less than three clock cycles of CSR clock. 0x0 (INACTIVE): Receive LPI exit not detected. 0x1 (ACTIVE): Receive LPI exit detected.
2	0h RO	**Receive LPI Entry (RLPIEN):** When this bit is set, it indicates that the MAC Receiver has received an LPI pattern and entered the LPI state. This bit is cleared by a read into this register (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Note: This bit might not be set if the MAC stops receiving the LPI pattern for a very short duration, such as, less than three clock cycles of CSR clock. 0x0 (INACTIVE): Receive LPI entry not detected. 0x1 (ACTIVE): Receive LPI entry detected.
1	0h RO	**Transmit LPI Exit (TLPIEX):** When this bit is set, it indicates that the MAC transmitter exited the LPI state after the application cleared the LPIEN bit and the LPI TW Timer has expired. This bit is cleared by a read into this register (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). 0x0 (INACTIVE): Transmit LPI exit not detected. 0x1 (ACTIVE): Transmit LPI exit detected.
0	0h RO	**Transmit LPI Entry (TLPIEN):** When this bit is set, it indicates that the MAC Transmitter has entered the LPI state because of the setting of the LPIEN bit. This bit is cleared by a read into this register (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). 0x0 (INACTIVE): Transmit LPI entry not detected. 0x1 (ACTIVE): Transmit LPI entry detected.

10.2.34 MAC_LPI_TIMERS_CONTROL — Offset D4h

The LPI Timers Control register controls the timeout values in the LPI states. It specifies the time for which the MAC transmits the LPI pattern and also the time for which the MAC waits before resuming the normal transmission.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D4h	03E80000h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved**
25:16	3E8h RW	**LPI LS Timer (LST):** This field specifies the minimum time (in milliseconds) for which the link status from the PHY should be up (OKAY) before the LPI pattern can be transmitted to the PHY. The MAC does not transmit the LPI pattern even when the LPIEN bit is set unless the LPI LS Timer reaches the programmed terminal count. The default value of the LPI LS Timer is 1000 (1 sec) as defined in the IEEE standard.
15:0	0000h RW	**LPI TW Timer (TWT):** This field specifies the minimum time (in microseconds) for which the MAC waits after it stops transmitting the LPI pattern to the PHY and before it resumes the normal transmission. The TLPIEX status bit is set after the expiry of this timer.

10.2.35 MAC_LPI_ENTRY_TIMER — Offset D8h

This register controls the Tx LPI entry timer. This counter is enabled only when bit[20](LPITE) bit of MAC_LPI_Control_Status is set to 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19:3	00000h RW	**LPI Entry Timer (LPIET):** This field specifies the time in microseconds the MAC waits to enter LPI mode, after it has transmitted all the frames. This field is valid and used only when LPITE and LPITXA are set to 1. Bits [2:0] are read-only so that the granularity of this timer is in steps of 8 micro-seconds.
2:0	0h RO	**Reserved**

10.2.36 MAC_1US_TIC_COUNTER — Offset DCh

This register controls the generation of the Reference time (1 microsecond tic) for all the LPI timers. This timer has to be programmed by the software initially.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DCh	00000063h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11:0	063h RW	**1US TIC Counter (TIC_1US_CNTR):** The application must program this counter so that the number of clock cycles of CSR clock is 1us. (Subtract 1 from the value before programming). For example if the CSR clock is 100MHz then this field needs to be programmed to value 100 - 1 = 99 (which is 0x63). This is required to generate the 1US events that are used to update some of the EEE related counters.

10.2.37 MAC_PHYIF_CONTROL_STATUS — Offset F8h

The PHY Interface Control and Status register indicates the status signals received by the SGMII or RGMII interface (selected at reset) from the PHY. This register is optional.

Type	Size	Offset	Default
MMIO	32 bit	BAR + F8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19	0h RO	**Link Status (LNKSTS):** This bit indicates whether the link is up (1'b1) or down (1'b0). 0x0 (INACTIVE): Link down. 0x1 (ACTIVE): Link up.
18:17	0h RO	**Link Speed (LNKSPEED):** This bit indicates the current speed of the link. 0x0 (M_2500K): 2.5 MHz. 0x1 (M_25M): 25 MHz. 0x2 (M_125M): 125 MHz. 0x3 (RSVD): Reserved.
16	0h RO	**Link Mode (LNKMOD):** This bit indicates the current mode of operation of the link. 0x0 (HDUPLX): Half-duplex mode. 0x1 (FDUPLX): Full-duplex mode.

Bit Range	Default & Access	Field Name (ID): Description
15:2	0h RO	**Reserved**
1	0h RW	**Link Up or Down (LUD):** This bit indicates whether the link is up or down during transmission of configuration in the RGMII or SGMII interface. 0x0 (LINKDOWN): Link down. 0x1 (LINKUP): Link up.
0	0h RW	**Transmit Configuration in RGMII or SGMII (TC):** When set, this bit enables the transmission of duplex mode, link speed, and link up or down information to the PHY in the RGMII or SGMII port. When this bit is reset, no such information is driven to the PHY. The details of this feature are provided in the following sections: - "Reduced Gigabit Media Independent Interface" - "Serial Media Independent Interface" - "Serial Gigabit Media Independent Interface" 0x0 (DISABLE): Disable Transmit Configuration in RGMII or SGMII. 0x1 (ENABLE): Enable Transmit Configuration in RGMII or SGMII.

10.2.38 MAC_VERSION — Offset 110h

The version register identifies the version of the GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 110h	00005152h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:8	51h RO	**USERVER:** Version code
7:0	52h RO	**SNPSVER:** Version code

10.2.39 MAC_DEBUG — Offset 114h

The Debug register provides the debug status of various MAC blocks.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 114h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	**Reserved**
18:17	0h RO	**MAC Transmit Packet Controller Status (TFCSTS):** This field indicates the state of the MAC Transmit Packet Controller module. 0x0 (IDLE): Idle state. 0x1 (WAITING): Waiting for one of the following: Status of the previous packet OR IPG or back off period to be over. 0x2 (GEN_TX_PAU): Generating and transmitting a Pause control packet (in full-duplex mode). 0x3 (TRNSFR): Transferring input packet for transmission.
16	0h RO	**MAC GMII or MII Transmit Protocol Engine Status (TPESTS):** When this bit is set, it indicates that the MAC GMII or MII transmit protocol engine is actively transmitting data, and it is not in the Idle state. 0x0 (INACTIVE): MAC GMII or MII Transmit Protocol Engine Status not detected. 0x1 (ACTIVE): MAC GMII or MII Transmit Protocol Engine Status detected.
15:3	0h RO	**Reserved**
2:1	0h RO	**MAC Receive Packet Controller FIFO Status (RFCFCSTS):** When this bit is set, this field indicates the active state of the small FIFO Read and Write controllers of the MAC Receive Packet Controller module.
0	0h RO	**MAC GMII or MII Receive Protocol Engine Status (RPESTS):** When this bit is set, it indicates that the MAC GMII or MII receive protocol engine is actively receiving data, and it is not in the Idle state. 0x0 (INACTIVE): MAC GMII or MII Receive Protocol Engine Status not detected. 0x1 (ACTIVE): MAC GMII or MII Receive Protocol Engine Status detected.

10.2.40 MAC_HW_FEATURE0 — Offset 11Ch

This register indicates the presence of first set of the optional features or functions of the GbE Controller. The software driver can use this register to dynamically enable or disable the programs related to the optional blocks.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11Ch	0EFD73F7h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:28	0h RO	**Active PHY Selected (ACTPHYSEL):** When you have multiple PHY interfaces in your configuration, this field indicates the sampled value of phy_intf_sel_i during reset de-assertion. 0x0 (GMII_MII): GMII or MII. 0x1 (RGMII): RGMII. 0x2 (SGMII): SGMII. 0x3 (TBI): TBI. 0x4 (RMII): RMII. 0x5 (RTBI): RTBI. 0x6 (SMII): SMII. 0x7 (REVMIII): RevMII.
27	1h RO	**Source Address or VLAN Insertion Enable (SAVLANINS):** This bit is set to 1 when the Enable SA and VLAN Insertion on Tx option is selected 0x0 (INACTIVE): Source Address or VLAN Insertion Enable option is not selected. 0x1 (ACTIVE): Source Address or VLAN Insertion Enable option is selected.
26:25	3h RO	**Timestamp System Time Source (TSSTSSEL):** This bit indicates the source of the Timestamp system time: This bit is set to 1 when the Enable IEEE 1588 Timestamp Support option is selected 0x0 (INTRNL): Internal. 0x1 (EXTRNL): External. 0x2 (BOTH): Both. 0x3 (RSVD): Reserved.
24	0h RO	**MAC Addresses 64-127 Selected (MACADR64SEL):** This bit is set to 1 when the Enable Additional 64 MAC Address Registers (64-127) option is selected 0x0 (INACTIVE): MAC Addresses 64-127 Select option is not selected. 0x1 (ACTIVE): MAC Addresses 64-127 Select option is selected.
23	1h RO	**MAC Addresses 32-63 Selected (MACADR32SEL):** This bit is set to 1 when the Enable Additional 32 MAC Address Registers (32-63) option is selected 0x0 (INACTIVE): MAC Addresses 32-63 Select option is not selected. 0x1 (ACTIVE): MAC Addresses 32-63 Select option is selected.
22:18	1Fh RO	**MAC Addresses 1-31 Selected (ADDMACADRSEL):** This bit is set to 1 when the non-zero value is selected for Enable Additional 1-31 MAC Address Registers option
17	0h RO	**Reserved**
16	1h RO	**Receive Checksum Offload Enabled (RXCOESEL):** This bit is set to 1 when the Enable Receive TCP/IP Checksum Check option is selected 0x0 (INACTIVE): Receive Checksum Offload Enable option is not selected. 0x1 (ACTIVE): Receive Checksum Offload Enable option is selected.
15	0h RO	**Reserved**
14	1h RO	**Transmit Checksum Offload Enabled (TXCOESEL):** This bit is set to 1 when the Enable Transmit TCP/IP Checksum Insertion option is selected 0x0 (INACTIVE): Transmit Checksum Offload Enable option is not selected. 0x1 (ACTIVE): Transmit Checksum Offload Enable option is selected.

Bit Range	Default & Access	Field Name (ID): Description
13	1h RO	**Energy Efficient Ethernet Enabled (EEESEL):** This bit is set to 1 when the Enable Energy Efficient Ethernet (EEE) option is selected 0x0 (INACTIVE): Energy Efficient Ethernet Enable option is not selected. 0x1 (ACTIVE): Energy Efficient Ethernet Enable option is selected.
12	1h RO	**IEEE 1588-2008 Timestamp Enabled (TSSEL):** This bit is set to 1 when the Enable IEEE 1588 Timestamp Support option is selected 0x0 (INACTIVE): IEEE 1588-2008 Timestamp Enable option is not selected. 0x1 (ACTIVE): IEEE 1588-2008 Timestamp Enable option is selected.
11:10	0h RO	**Reserved**
9	1h RO	**ARP Offload Enabled (ARPOFFSEL):** This bit is set to 1 when the Enable IPv4 ARP Offload option is selected 0x0 (INACTIVE): ARP Offload Enable option is not selected. 0x1 (ACTIVE): ARP Offload Enable option is selected.
8	1h RO	**RMON Module Enable (MMCSEL):** This bit is set to 1 when the Enable MAC Management Counters (MMC) option is selected 0x0 (INACTIVE): RMON Module Enable option is not selected. 0x1 (ACTIVE): RMON Module Enable option is selected.
7	1h RO	**PMT Magic Packet Enable (MGKSEL):** This bit is set to 1 when the Enable Magic Packet Detection option is selected 0x0 (INACTIVE): PMT Magic Packet Enable option is not selected. 0x1 (ACTIVE): PMT Magic Packet Enable option is selected.
6	1h RO	**PMT Remote Wake-up Packet Enable (RWKSEL):** This bit is set to 1 when the Enable Remote Wake-Up Packet Detection option is selected 0x0 (INACTIVE): PMT Remote Wake-up Packet Enable option is not selected. 0x1 (ACTIVE): PMT Remote Wake-up Packet Enable option is selected.
5	1h RO	**SMA (MDIO) Interface (SMASEL):** This bit is set to 1 when the Enable Station Management (MDIO Interface) option is selected 0x0 (INACTIVE): SMA (MDIO) Interface not selected. 0x1 (ACTIVE): SMA (MDIO) Interface selected.
4	1h RO	**VLAN Hash Filter Selected (VLHASH):** This bit is set to 1 when the Enable VLAN Hash Table Based Filtering option is selected 0x0 (INACTIVE): VLAN Hash Filter not selected. 0x1 (ACTIVE): VLAN Hash Filter selected.
3	0h RO	**PCS Registers (TBI, SGMII, or RTBI PHY interface) (PCSSEL):** This bit is set to 1 when the TBI, SGMII, or RTBI PHY interface option is selected 0x0 (INACTIVE): No PCS Registers (TBI, SGMII, or RTBI PHY interface). 0x1 (ACTIVE): PCS Registers (TBI, SGMII, or RTBI PHY interface).

Bit Range	Default & Access	Field Name (ID): Description
2	1h RO	**Half-duplex Support (HDSEL):** This bit is set to 1 when the half-duplex mode is selected 0x0 (INACTIVE): No Half-duplex support. 0x1 (ACTIVE): Half-duplex support.
1	1h RO	**1000 Mbps Support (GMIISEL):** This bit is set to 1 when 1000 Mbps is selected as the Mode of Operation 0x0 (INACTIVE): No 1000 Mbps support. 0x1 (ACTIVE): 1000 Mbps support.
0	1h RO	**10 or 100 Mbps Support (MIISEL):** This bit is set to 1 when 10/100 Mbps is selected as the Mode of Operation 0x0 (INACTIVE): No 10 or 100 Mbps support. 0x1 (ACTIVE): 10 or 100 Mbps support.

10.2.41 MAC_HW_FEATURE1 — Offset 120h

This register indicates the presence of second set of the optional features or functions of the GbE Controller. The software driver can use this register to dynamically enable or disable the programs related to the optional blocks.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 120h	119F7A28h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:27	2h RO	**Total number of L3 or L4 Filters (L3L4FNUM):** This field indicates the total number of L3 or L4 filters: 0x0 (NOFILT): No L3 or L4 Filter. 0x1 (M_1FILT): 1 L3 or L4 Filter. 0x2 (M_2FILT): 2 L3 or L4 Filters. 0x3 (M_3FILT): 3 L3 or L4 Filters. 0x4 (M_4FILT): 4 L3 or L4 Filters. 0x5 (M_5FILT): 5 L3 or L4 Filters. 0x6 (M_6FILT): 6 L3 or L4 Filters. 0x7 (M_7FILT): 7 L3 or L4 Filters. 0x08 (M_8FILT): 8 L3 or L4 Filters.
26	0h RO	**Reserved**
25:24	1h RO	**Hash Table Size (HASHTBLSZ):** This field indicates the size of the hash table: 0x0 (NO_HT): No hash table. 0x1 (M_64): 64. 0x2 (M_128): 128. 0x3 (M_256): 256.

Bit Range	Default & Access	Field Name (ID): Description
23	1h RO	**One Step for PTP over UDP/IP Feature Enable (POUOST):** This bit is set to 1 when the Enable One step timestamp for PTP over UDP/IP feature is selected. 0x0 (INACTIVE): One Step for PTP over UDP/IP Feature is not selected. 0x1 (ACTIVE): One Step for PTP over UDP/IP Feature is selected.
22	0h RO	**Reserved**
21	0h RO	**Rx Side Only AV Feature Enable (RAVSEL):** This bit is set to 1 when the Enable Audio Video Bridging option on Rx Side Only is selected. 0x0 (INACTIVE): Rx Side Only AV Feature is not selected. 0x1 (ACTIVE): Rx Side Only AV Feature is selected.
20	1h RO	**AV Feature Enable (AVSEL):** This bit is set to 1 when the Enable Audio Video Bridging option is selected. 0x0 (INACTIVE): AV Feature is not selected. 0x1 (ACTIVE): AV Feature is selected.
19	1h RO	**DMA Debug Registers Enable (DBGMEMA):** This bit is set to 1 when the Debug Mode Enable option is selected 0x0 (INACTIVE): DMA Debug Registers option is not selected. 0x1 (ACTIVE): DMA Debug Registers option is selected.
18	1h RO	**TCP Segmentation Offload Enable (TSOEN):** This bit is set to 1 when the Enable TCP Segmentation Offloading for TCP/IP Packets option is selected 0x0 (INACTIVE): TCP Segmentation Offload Feature is not selected. 0x1 (ACTIVE): TCP Segmentation Offload Feature is selected.
17	1h RO	**Split Header Feature Enable (SPHEN):** This bit is set to 1 when the Enable Split Header Structure option is selected 0x0 (INACTIVE): Split Header Feature is not selected. 0x1 (ACTIVE): Split Header Feature is selected.
16	1h RO	**DCB Feature Enable (DCBEN):** This bit is set to 1 when the Enable Data Center Bridging option is selected 0x0 (INACTIVE): DCB Feature is not selected. 0x1 (ACTIVE): DCB Feature is selected.
15:14	1h RO	**Address Width. (ADDR64):** This field indicates the configured address width: 0x0 (M_32): 32. 0x1 (M_40): 40. 0x2 (M_48): 48. 0x3 (RSVD): Reserved.
13	1h RO	**IEEE 1588 High Word Register Enable (ADVTHWORD):** This bit is set to 1 when the Add IEEE 1588 Higher Word Register option is selected 0x0 (INACTIVE): IEEE 1588 High Word Register option is not selected. 0x1 (ACTIVE): IEEE 1588 High Word Register option is selected.
12	1h RO	**PTP Offload Enable (PTOEN):** This bit is set to 1 when the Enable PTP Timestamp Offload Feature is selected. 0x0 (INACTIVE): PTP Offload feature is not selected. 0x1 (ACTIVE): PTP Offload feature is selected.
11	1h RO	**One-Step Timestamping Enable (OSTEN):** This bit is set to 1 when the Enable One-Step Timestamp Feature is selected. 0x0 (INACTIVE): One-Step Timestamping feature is not selected. 0x1 (ACTIVE): One-Step Timestamping feature is selected.

10.2.44 MAC_DPP_FSM_INTERRUPT_STATUS — Offset 140h

This register contains the status of Automotive Safety related Data Path Parity Errors, Interface Timeout Errors, FSM State Parity Errors and FSM State Timeout Errors. All the non-Reserved bits are cleared on read.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 140h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**FSM State Parity Error Status (FSMPES):** This field when set indicates one of the FSMs State registers has a parity error detected. 0x0 (INACTIVE): FSM State Parity Error Status not detected. 0x1 (ACTIVE): FSM State Parity Error Status detected.
23:18	0h RO	**Reserved**
17	0h RW	**Slave Read/Write Timeout Error Status (SLVTES):** This field when set indicates that an Application/CSR Timeout has occurred on the AXI slave interface. 0x0 (INACTIVE): Slave Read/Write Timeout Error Status not detected. 0x1 (ACTIVE): Slave Read/Write Timeout Error Status detected.
16	0h RW	**Master Read/Write Timeout Error Status (MSTTES):** This field when set indicates that an Application/CSR Timeout has occurred on the master (AXI/AHB/ARI/ATI) interface. 0x0 (INACTIVE): Master Read/Write Timeout Error Status not detected. 0x1 (ACTIVE): Master Read/Write Timeout Error Status detected.
15:13	0h RO	**Reserved**
12	0h RW	**PTP FSM Timeout Error Status (PTES):** This field when set indicates that one of the PTP FSM Timeout has occurred. 0x0 (INACTIVE): PTP FSM Timeout Error Status not detected. 0x1 (ACTIVE): PTP FSM Timeout Error Status detected.
11	0h RW	**APP FSM Timeout Error Status (ATES):** This field when set indicates that one of the APP FSM Timeout has occurred. 0x0 (INACTIVE): APP FSM Timeout Error Status not detected. 0x1 (ACTIVE): APP FSM Timeout Error Status detected.
10	0h RW	**CSR FSM Timeout Error Status (CTES):** This field when set indicates that one of the CSR FSM Timeout has occurred. 0x0 (INACTIVE): CSR FSM Timeout Error Status not detected. 0x1 (ACTIVE): CSR FSM Timeout Error Status detected.
9	0h RW	**Rx FSM Timeout Error Status (RTES):** This field when set indicates that one of the Rx FSM Timeout has occurred. 0x0 (INACTIVE): Rx FSM Timeout Error Status not detected. 0x1 (ACTIVE): Rx FSM Timeout Error Status detected.
8	0h RW	**Tx FSM Timeout Error Status (TTES):** This field when set indicates that one of the Tx FSM Timeout has occurred. 0x0 (INACTIVE): Tx FSM Timeout Error Status not detected. 0x1 (ACTIVE): Tx FSM Timeout Error Status detected.
7	0h RW	**AXI Slave Read data path Parity checker Error Status (ASRPES):** This bit when set indicates that parity error is detected at the AXI Slave read data interface. 0x0 (INACTIVE): AXI Slave Read data path Parity checker Error Status not detected. 0x1 (ACTIVE): AXI Slave Read data path Parity checker Error Status detected.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**CSR Write data path Parity checker Error Status (CWPES):** This bit when set indicates that parity error is detected at the CSR write data interface on mci_wdata_i (or at PC8 checker as shown in AXI slave Interface Data path parity protection diagram). When EPSI bit of MTL_DPP_Control register is set and if any parity mis-match is detected on the input slave parity ports (or at PC7 checker in the AXI slave Interface Data path parity protection diagram) sets this bit to one. 0x0 (INACTIVE): CSR Write data path Parity checker Error Status not detected. 0x1 (ACTIVE): CSR Write data path Parity checker Error Status detected.
5	0h RW	**Application Receive interface data path Parity Error Status (ARPES):** This bit when set indicates that a parity error is detected by the hardware internally at the interface with the application. 0x0 (INACTIVE): Application Receive interface data path Parity Error Status not detected. 0x1 (ACTIVE): Application Receive interface data path Parity Error Status detected.
4	0h RW	**MTL TX Status data path Parity checker Error Status (MTSPES):** This filed when set indicates that, parity error is detected on the MTL TX Status data on ati interface (or at PC5 as shown in Transmit data path parity protection diagram). 0x0 (INACTIVE): MTL TX Status data path Parity checker Error Status not detected. 0x1 (ACTIVE): MTL TX Status data path Parity checker Error Status detected.
3	0h RW	**MTL data path Parity checker Error Status (MPES):** This bit when set indicates that a parity error is detected at the MTL transmit write controller parity checker (or at PC4 as shown in Transmit data path parity protection diagram). 0x0 (INACTIVE): MTL data path Parity checker Error Status not detected. 0x1 (ACTIVE): MTL data path Parity checker Error Status detected.
2	0h RW	**Read Descriptor Parity checker Error Status (RDPES):** This bit when set indicates that a parity error is detected at the DMA Read descriptor parity checker (or at PC3 as shown in Transmit data path parity protection diagram). 0x0 (INACTIVE): Read Descriptor Parity checker Error Status not detected. 0x1 (ACTIVE): Read Descriptor Parity checker Error Status detected.
1	0h RW	**TSO data path Parity checker Error Status (TPES):** This bit when set indicates that a parity error is detected at the DMA TSO parity checker (or at PC2 as shown in Transmit data path parity protection diagram). 0x0 (INACTIVE): TSO data path Parity checker Error Status not detected. 0x1 (ACTIVE): TSO data path Parity checker Error Status detected.
0	0h RO	**Reserved**

10.2.45 MAC_AXI_SLV_DPE_ADDR_STATUS — Offset 144h

This register indicates the CSR address corresponding to the CSR write data on which parity error occured.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 144h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13:0	0000h RO	**AXI Slave data path Parity Error Address Status (ASPEAS):** This field holds the CSR address for which parity error is detected on the CSR write data. This field holds the first address for which parity error is detected on the write data and is cleared on read.

10.2.46 MAC_FSM_CONTROL — Offset 148h

This register is used to control the FSM State parity and timeout error injection in Debug mode.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 148h	00000000h

Bit Range	Default & Access	Field Name (ID): Description

15:10	0h RO	**Reserved**
9:0	000h RW	**TMR:** This field indicates the number of CSR clocks required to generate 1us tic.

10.2.48 SNPS_SCS_REG1 — Offset 150h

Reserved

Type	Size	Offset	Default
MMIO	32 bit	BAR + 150h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Reserved**

10.2.49 MAC_MDIO_ADDRESS — Offset 200h

The MDIO Address register controls the management cycles to external PHY through a management interface.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 200h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27	0h RW	**Preamble Suppression Enable (PSE):** When this bit is set, the SMA suppresses the 32-bit preamble and transmits MDIO frames with only 1 preamble bit. When this bit is 0, the MDIO frame always has 32 bits of preamble as defined in the IEEE specifications. 0x0 (DISABLE): Preamble Suppression disabled. 0x1 (ENABLE): Preamble Suppression enabled.
26	0h RW	**Back to Back transactions (BTB):** When this bit is set and the NTC has value greater than 0, then the MAC informs the completion of a read or write command at the end of frame transfer (before the trailing clocks are transmitted). The software can thus initiate the next command which is executed immediately irrespective of the number trailing clocks generated for the previous frame. When this bit is reset, then the read/write command completion (GB is cleared) only after the trailing clocks are generated. In this mode, it is ensured that the NTC is always generated after each frame. This bit must not be set when NTC=0. 0x0 (DISABLE): Back to Back transactions disabled. 0x1 (ENABLE): Back to Back transactions enabled.
25:21	00h RW	**Physical Layer Address (PA):** This field indicates which Clause 22 PHY devices (out of 32 devices) the MAC is accessing. This field indicates which Clause 45 capable PHYs (out of 32 PHYs) the MAC is accessing.
20:16	00h RW	**Register/Device Address (RDA):** These bits select the PHY register in selected Clause 22 PHY device. These bits select the Device (MMD) in selected Clause 45 capable PHY.
15	0h RO	**Reserved**
14:12	0h RW	**Number of Trailing Clocks (NTC):** This field controls the number of trailing clock cycles generated on the MDIO Clock (MDC) after the end of transmission of MDIO frame. The valid values can be from 0 to 7. Programming the value to 3'h3 indicates that there are additional three clock cycles on the MDC line after the end of MDIO frame transfer.

Bit Range	Default & Access	Field Name (ID): Description
11:8	0h RW	**CSR Clock Range (CR):** The CSR Clock Range selection determines the frequency of the MDC clock according to the CSR clock frequency used in your design: - 0000: CSR clock = 60-100 MHz; MDC clock = CSR clock/42 - 0001: CSR clock = 100-150 MHz; MDC clock = CSR clock/62 - 0010: CSR clock = 20-35 MHz; MDC clock = CSR clock/16 - 0011: CSR clock = 35-60 MHz; MDC clock = CSR clock/26 - 0100: CSR clock = 150-250 MHz; MDC clock = CSR clock/102 - 0101: CSR clock = 250-300 MHz; MDC clock = CSR clock/124 - 0110: CSR clock = 300-500 MHz; MDC clock = CSR clock/204 - 0111: CSR clock = 500-800 MHz; MDC clock = CSR clock/324 The suggested range of CSR clock frequency applicable for each value (when Bit 11 = 0) ensures that the MDC clock is approximately between 1.0 MHz to 2.5 MHz freqency range. When Bit 11 is set, you can achieve a higher frequency of the MDC clock than the frequency limit of 2.5 MHz (specified in the IEEE 802.3) and program a clock divider of lower value. For example, when CSR clock is of 100 MHz frequency and you program these bits as 1010, the resultant MDC clock is of 12.5 MHz which is above the range specified in IEEE 802.3. Program the following values only if the interfacing chips support faster MDC clocks: - 1000: CSR clock/4 - 1001: CSR clock/6 - 1010: CSR clock/8 - 1011: CSR clock/10 - 1100: CSR clock/12 - 1101: CSR clock/14 - 1110: CSR clock/16 - 1111: CSR clock/18
7:5	0h RO	**Reserved**
4	0h RW	**Skip Address Packet (SKAP):** When this bit is set, the SMA does not send the address packets before read, write, or post-read increment address packets. This bit is valid only when C45E is set. 0x0 (DISABLE): Skip Address Packet is disabled. 0x1 (ENABLE): Skip Address Packet is enabled.
3	0h RW	**GMII Operation Command 1 (GOC_1):** This bit is higher bit of the operation command to the PHY or GOC_1 and GOC_O are encoded as follows: - 00: Reserved - 01: Write - 10: Post Read Increment Address for Clause 45 PHY - 11: Read When Clause 22 PHY is enabled, only Write and Read commands are valid. 0x0 (DISABLE): GMII Operation Command 1 is disabled. 0x1 (ENABLE): GMII Operation Command 1 is enabled.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**GMII Operation Command 0 (GOC_0):** This is the lower bit of the operation command to the PHY or RevMII. When in SMA mode (MDIO master) this bit along with GOC_1 determines the operation to be performed to the PHY. 0x0 (DISABLE): GMII Operation Command 0 is disabled. 0x1 (ENABLE): GMII Operation Command 0 is enabled.
1	0h RW	**Clause 45 PHY Enable (C45E):** When this bit is set, Clause 45 capable PHY is connected to MDIO. When this bit is reset, Clause 22 capable PHY is connected to MDIO. 0x0 (DISABLE): Clause 45 PHY is disabled. 0x1 (ENABLE): Clause 45 PHY is enabled.
0	0h RW	**GMII Busy (GB):** The application sets this bit to instruct the SMA to initiate a Read or Write access to the MDIO slave. The MAC clears this bit after the MDIO frame transfer is completed. Hence the software must not write or change any of the fields in MAC_MDIO_Address and MAC_MDIO_Data registers as long as this bit is set. For write transfers, the application must first write 16-bit data in the GDI field (and also RA field when C45E is set) in MAC_MDIO_Data register before setting this bit. When C45E is set, it should also write into the RA field of MAC_MDIO_Data register before initiating a read transfer. When a read transfer is completed (GB=0), the data read from the PHY register is valid in the GD field of the MAC_MDIO_Data register. Note: Even if the addressed PHY is not present, there is no change in the functionality of this bit. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): GMII Busy is disabled. 0x1 (ENABLE): GMII Busy is enabled.

10.2.50 MAC_MDIO_DATA — Offset 204h

The MDIO Data register stores the Write data to be written to the PHY register located at the address specified in MAC_MDIO_Address. This register also stores the Read data from the PHY register located at the address specified by MDIO Address register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 204h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**Register Address (RA):** This field is valid only when C45E is set. It contains the Register Address in the PHY to which the MDIO frame is intended for.
15:0	0000h RW	**GMII Data (GD):** This field contains the 16-bit data value read from the PHY or RevMII after a Management Read operation or the 16-bit data value to be written to the PHY or RevMII before a Management Write operation.

10.2.51 MAC_GPIO_CONTROL — Offset 208h

The GPIO Control register controls the GPIO.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 208h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**Reserved**

10.2.52 MAC_GPIO_STATUS — Offset 20Ch

The General Purpose IO register provides the control to drive the following: up to 16 bits of output ports (GPO) and status of up to 16 input ports (GPIS).

Type	Size	Offset	Default
MMIO	32 bit	BAR + 20Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17	0h RW	**Trigger Snapshot (GPO1)**: Active-high signal. The rising edge of this signal triggers snapshot of current PMC ART and System timer values. The system timer value is stored into AUX FIFO. An interrupt is generated upon snapshotting. The PMC ART timer values is stored in 4x 16-bit ART snapshot register and is read through MDIO registers.
16	0h RW	**P2P Clock Selector (GPO0):** Used for selecting the P2P clock 1 -> 19.2MHz Local Clock Always Running Timer (ART) 0 -> 204.8MHz application clock
15:0	0h RO	**Reversed**

10.2.53 MAC_ARP_ADDRESS — Offset 210h

The ARP Address register contains the IPv4 Destination Address of the MAC.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 210h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**ARP Protocol Address (ARPPA):** This field contains the IPv4 Destination Address of the MAC. This address is used for perfect match with the Protocol Address of Target field in the received ARP packet. This field is available only when the Enable IPv4 ARP Offload option is selected.

10.2.54 MAC_CSR_SW_CTRL — Offset 230h

This register contains SW programmable controls for changing the CSR access response and status bits clearing.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 230h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved**
8	0h RW	**Slave Error Response Enable (SEEN):** When this bit is set, the MAC responds with Slave Error for accesses to reserved registers in CSR space. When this bit is reset, the MAC responds with Okay response to any register accessed from CSR space. 0x0 (DISABLE): Slave Error Response is disabled. 0x1 (ENABLE): Slave Error Response is enabled.
7:1	0h RO	**Reserved**
0	0h RW	**Register Clear on Write 1 Enable (RCWE):** When this bit is set, the access mode of some register fields changes to Clear on Write 1, the application needs to set that respective bit to 1 to clear it. When this bit is reset, the access mode of these register fields remain as Clear on Read. 0x0 (DISABLE): Register Clear on Write 1 is disabled. 0x1 (ENABLE): Register Clear on Write 1 is enabled.

10.2.55 MAC_FPE_CTRL_STS — Offset 234h

This register controls the operation of Frame Preemption.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 234h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19	0h RW	**Transmitted Respond Frame (TRSP):** Set when a Respond mPacket is transmitted (triggered by setting SRSP field). An interrupt can be generated for this event if FPEIE bit of MAC_Interrupt_Enable is set. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): Not transmitted Respond Frame. 0x1 (ACTIVE): transmitted Respond Frame.
18	0h RW	**Transmitted Verify Frame (TVER):** Set when a Verify mPacket is transmitted (triggered by setting SVER field). An interrupt can be generated for this event if FPEIE bit of MAC_Interrupt_Enable is set. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): Not transmitted Verify Frame. 0x1 (ACTIVE): transmitted Verify Frame.
17	0h RW	**Received Respond Frame (RRSP):** Set when a Respond mPacket is received. An interrupt can be generated for this event if FPEIE bit of MAC_Interrupt_Enable is set. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): Not received Respond Frame. 0x1 (ACTIVE): Received Respond Frame.
16	0h RW	**Received Verify Frame (RVER):** Set when a Verify mPacket is received. An interrupt can be generated for this event if FPEIE bit of MAC_Interrupt_Enable is set. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): Not received Verify Frame. 0x1 (ACTIVE): Received Verify Frame.
15:4	0h RO	**Reserved**
3	0h RW	**Reserved**
2	0h RW	**Send Respond mPacket (SRSP):** When set indicates hardware to send a Respond mPacket. Reset by hardware after sending the Respond mPacket. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Send Respond mPacket is disabled. 0x1 (ENABLE): Send Respond mPacket is enabled.
1	0h RW	**Send Verify mPacket (SVER):** When set indicates hardware to send a verify mPacket. Reset by hardware after sending the Verify mPacket. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Send Verify mPacket is disabled. 0x1 (ENABLE): Send Verify mPacket is enabled.
0	0h RW	**Enable Tx Frame Preemption (EFPE):** When set Frame Preemption Tx functionality is enabled. 0x0 (DISABLE): Tx Frame Preemption is disabled. 0x1 (ENABLE): Tx Frame Preemption is enabled.

10.2.56 MAC_EXT_CFG1 — Offset 238h

This register contains Split mode control field and offset field for Split Header feature.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 238h	00000002h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:8	0h RW	**Split Mode (SPLM):** These bits indicate the mode of splitting the incoming Rx packets. They are 0x0 (L3L4): Split at L3/L4 header. 0x1 (L2OFST): Split at L2 header with an offset. Always Split at SPLOFST bytes from the beginning of Length/Type field of the Frame. 0x2 (COMBN): Combination mode: Split similar to SPLM=00 for IP packets that are untagged or tagged and VLAN stripped. 0x3 (RSVD): Reserved.
7	0h RO	**Reserved**
6:0	02h RW	**Split Offset (SPLOFST):** These bits indicate the value of offset from the beginning of Length/Type field at which header split should take place when the appropriate SPLM is selected. The reset value of this field is 2 bytes indicating a split at L2 header. Value is in terms of bytes.

10.2.57 MAC_PRESN_TIME_NS — Offset 240h

This register contains the 32-bit binary rollover equivalent time of the PTP System Time in ns.

DWC_EQOS_FLEXI_PPS_OUT_EN=1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 240h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MAC 1722 Presentation Time in ns (MPTN):** These bits indicate the value of the 32-bit binary rollover equivalent time of the PTP System Time in ns

10.2.58 MAC_PRESN_TIME_UPDT — Offset 244h

This field holds the 32-bit value of MAC 1722 Presentation Time in ns, that should be added to the Current Presentation Time Counter value. Init happens when TSINIT is set, and update happens when the TSUPDT bit is set (TSINIT and TSINIT defined in MAC_Timestamp_ Control register).

DWC_EQOS_FLEXI_PPS_OUT_EN=1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 244h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MAC 1722 Presentation Time Update (MPTU):** This field holds the init value or the update value for the presentation time. When used for update, this field holds the 32-bit value in ns, that should be added to the Current Presentation Time Counter value. Init happens when TSINIT is set, and update happens when the TSUPDT bit is set (TSINIT and TSINIT defined in MAC_Timestamp_ Control register). When ADDSUB field of MAC_System_Time_Nanoseconds_Update is set, this value is directly used for subtraction

10.2.59 MAC_ADDRESS0_HIGH — Offset 300h

The MAC Address0 High register holds the upper 16 bits of the first 6-byte MAC address of the station. The first DA byte that is received on the (G)MII interface corresponds to the LS byte (Bits [7:0]) of the MAC Address Low register. For example, if 0x112233445566 is received (0x11 in lane 0 of the first column) on the (G)MII as the destination address, then the MacAddress0 Register [47:0] is compared with 0x665544332211.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, then the synchronization is triggered only when Bits[31:24] of the MAC Address0 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 300h	8000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	1h RO	**Address Enable (AE):** This bit is always set to 1. 0x0 (DISABLE): INVALID : This bit must be always set to 1. 0x1 (ENABLE): This bit is always set to 1.

Bit Range	Default & Access	Field Name (ID): Description
30:24	0h RO	**Reserved**
23:16	00h RW	**DMA Channel Select (DCS):** If the PDC bit of MAC_Ext_Configuration register is not set: This field contains the binary representation of the DMA Channel number to which an Rx packet whose DA matches the MAC Address0 content is routed. If the PDC bit of MAC_Ext_Configuration register is set: This field contains the one-hot representation of one or more DMA Channel numbers to which an Rx packet whose DA matches the MAC Address0 content is routed.
15:0	FFFFh RW	**MAC Address0[47:32] (ADDRHI):** This field contains the upper 16 bits [47:32] of the first 6-byte MAC address. The MAC uses this field for filtering the received packets and inserting the MAC address in the Transmit Flow Control (Pause) Packets.

10.2.60 MAC_ADDRESS0_LOW — Offset 304h

The MAC Address0 Low register holds the lower 32 bits of the 6-byte first MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 304h	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address0[31:0] (ADDRLO):** This field contains the lower 32 bits of the first 6-byte MAC address. The MAC uses this field for filtering the received packets and inserting the MAC address in the Transmit Flow Control (Pause) Packets.

10.2.61 MAC_ADDRESS1_HIGH — Offset 308h

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 308h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the address filter module uses the second MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30	0h RW	**Source Address (SA):** When this bit is set, the MAC Address1[47:0] is used to compare with the SA fields of the received packet. When this bit is reset, the MAC Address1[47:0] is used to compare with the DA fields of the received packet. 0x0 (DA): Compare with Destination Address. 0x1 (SA): Compare with Source Address.
29:24	00h RW	**Mask Byte Control (MBC):** These bits are mask control bits for comparing each of the MAC Address bytes. When set high, the MAC does not compare the corresponding byte of received DA or SA with the contents of MAC Address1 registers. Each bit controls the masking of the bytes as follows: - Bit 29: MAC_Address${i}_High[15:8] - Bit 28: MAC_Address${i}_High[7:0] - Bit 27: MAC_Address${i}_Low[31:24] - .. - Bit 24: MAC_Address${i}_Low[7:0] You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address.
23:16	00h RW	**DMA Channel Select (DCS):** If the PDC bit of MAC_Ext_Configuration register is not set: This field contains the binary representation of the DMA Channel number to which an Rx packet whose DA matches the MAC Address(#i) content is routed. If the PDC bit of MAC_Ext_Configuration register is set: This field contains the one-hot representation of one or more DMA Channel numbers to which an Rx packet whose DA matches the MAC Address(#i) content is routed.
15:0	FFFFh RW	**MAC Address1 [47:32] (ADDRHI):** This field contains the upper 16 bits[47:32] of the second 6-byte MAC address.

10.2.62 MAC_ADDRESS1_LOW — Offset 30Ch

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 30Ch	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address1 [31:0] (ADDRLO):** This field contains the lower 32 bits of second 6-byte MAC address. The content of this field is undefined until loaded by the application after the initialization process.

10.2.63 MAC_ADDRESS2_HIGH — Offset 310h

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 310h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the address filter module uses the second MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30	0h RW	**Source Address (SA):** When this bit is set, the MAC Address1[47:0] is used to compare with the SA fields of the received packet. When this bit is reset, the MAC Address1[47:0] is used to compare with the DA fields of the received packet. 0x0 (DA): Compare with Destination Address. 0x1 (SA): Compare with Source Address.
29:24	00h RW	**Mask Byte Control (MBC):** These bits are mask control bits for comparing each of the MAC Address bytes. When set high, the MAC does not compare the corresponding byte of received DA or SA with the contents of MAC Address1 registers. Each bit controls the masking of the bytes as follows: - Bit 29: MAC_Address${i}_High[15:8] - Bit 28: MAC_Address${i}_High[7:0] - Bit 27: MAC_Address${i}_Low[31:24] - .. - Bit 24: MAC_Address${i}_Low[7:0] You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address.
23:16	00h RW	**DMA Channel Select (DCS):** If the PDC bit of MAC_Ext_Configuration register is not set: This field contains the binary representation of the DMA Channel number to which an Rx packet whose DA matches the MAC Address(#i) content is routed. If the PDC bit of MAC_Ext_Configuration register is set: This field contains the one-hot representation of one or more DMA Channel numbers to which an Rx packet whose DA matches the MAC Address(#i) content is routed.
15:0	FFFFh RW	**MAC Address1 [47:32] (ADDRHI):** This field contains the upper 16 bits[47:32] of the second 6-byte MAC address.

10.2.64 MAC_ADDRESS2_LOW — Offset 314h

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 314h	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address1 [31:0] (ADDRLO):** This field contains the lower 32 bits of second 6-byte MAC address. The content of this field is undefined until loaded by the application after the initialization process.

10.2.65 MAC_ADDRESS3_HIGH — Offset 318h

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 318h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the address filter module uses the second MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30	0h RW	**Source Address (SA):** When this bit is set, the MAC Address1[47:0] is used to compare with the SA fields of the received packet. When this bit is reset, the MAC Address1[47:0] is used to compare with the DA fields of the received packet. 0x0 (DA): Compare with Destination Address. 0x1 (SA): Compare with Source Address.

Bit Range	Default & Access	Field Name (ID): Description
29:24	00h RW	**Mask Byte Control (MBC):** These bits are mask control bits for comparing each of the MAC Address bytes. When set high, the MAC does not compare the corresponding byte of received DA or SA with the contents of MAC Address1 registers. Each bit controls the masking of the bytes as follows: - Bit 29: MAC_Address${i}_High[15:8] - Bit 28: MAC_Address${i}_High[7:0] - Bit 27: MAC_Address${i}_Low[31:24] - .. - Bit 24: MAC_Address${i}_Low[7:0] You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address.
23:16	00h RW	**DMA Channel Select (DCS):** If the PDC bit of MAC_Ext_Configuration register is not set: This field contains the binary representation of the DMA Channel number to which an Rx packet whose DA matches the MAC Address(#i) content is routed. 29:24	00h RW	**Mask Byte Control (MBC):** These bits are mask control bits for comparing each of the MAC Address bytes. When set high, the MAC does not compare the corresponding byte of received DA or SA with the contents of MAC Address1 registers. Each bit controls the masking of the bytes as follows: - Bit 29: MAC_Address${i}_High[15:8] - Bit 28: MAC_Address${i}_High[7:0] - Bit 27: MAC_Address${i}_Low[31:24] - .. - Bit 24: MAC_Address${i}_Low[7:0] You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address.
23:16	00h RW	**DMA Channel Select (DCS):** If the PDC bit of MAC_Ext_Configuration register is not set: This field contains the binary representation of the DMA Channel number to which an Rx packet whose DA matches the MAC Address(#i) content is routed. If the PDC bit of MAC_Ext_Configuration register is set: This field contains the one-hot representation of one or more DMA Channel numbers to which an Rx packet whose DA matches the MAC Address(#i) content is routed.
15:0	FFFFh RW	**MAC Address1 [47:32] (ADDRHI):** This field contains the upper 16 bits[47:32] of the second 6-byte MAC address.

10.2.74 MAC_ADDRESS7_LOW — Offset 33Ch

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 33Ch	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address1 [31:0] (ADDRLO):** This field contains the lower 32 bits of second 6-byte MAC address. The content of this field is undefined until loaded by the application after the initialization process.

10.2.75 MAC_ADDRESS8_HIGH — Offset 340h

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 340h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the address filter module uses the second MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30	0h RW	**Source Address (SA):** When this bit is set, the MAC Address1[47:0] is used to compare with the SA fields of the received packet. When this bit is reset, the MAC Address1[47:0] is used to compare with the DA fields of the received packet. 0x0 (DA): Compare with Destination Address. 0x1 (SA): Compare with Source Address.
29:24	00h RW	**Mask Byte Control (MBC):** These bits are mask control bits for comparing each of the MAC Address bytes. When set high, the MAC does not compare the corresponding byte of received DA or SA with the contents of MAC Address1 registers. Each bit controls the masking of the bytes as follows: - Bit 29: MAC_Address${i}_High[15:8] - Bit 28: MAC_Address${i}_High[7:0] - Bit 27: MAC_Address${i}_Low[31:24] - .. - Bit 24: MAC_Address${i}_Low[7:0] You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address.
23:16	00h RW	**DMA Channel Select (DCS):** If the PDC bit of MAC_Ext_Configuration register is not set: This field contains the binary representation of the DMA Channel number to which an Rx packet whose DA matches the MAC Address(#i) content is routed. MMIO	32 bit	BAR + 384h	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address1 [31:0] (ADDRLO):** This field contains the lower 32 bits of second 6-byte MAC address. The content of this field is undefined until loaded by the application after the initialization process.

10.2.93 MAC_ADDRESS17_HIGH — Offset 388h

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 388h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the address filter module uses the second MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30	0h RW	**Source Address (SA):** When this bit is set, the MAC Address1[47:0] is used to compare with the SA fields of the received packet. When this bit is reset, the MAC Address1[47:0] is used to compare with the DA fields of the received packet. 0x0 (DA): Compare with Destination Address. 0x1 (SA): Compare with Source Address.
29:24	00h RW	**Mask Byte Control (MBC):** These bits are mask control bits for comparing each of the MAC Address bytes. When set high, the MAC does not compare the corresponding byte of received DA or SA with the contents of MAC Address1 registers. Each bit controls the masking of the bytes as follows: - Bit 29: MAC_Address${i}_High[15:8] - Bit 28: MAC_Address${i}_High[7:0] - Bit 27: MAC_Address${i}_Low[31:24] - .. - Bit 24: MAC_Address${i}_Low[7:0] You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address.
23:16	00h RW	**DMA Channel Select (DCS):** If the PDC bit of MAC_Ext_Configuration register is not set: This field contains the binary representation of the DMA Channel number to which an Rx packet whose DA matches the MAC Address(#i) content is routed. If the PDC bit of MAC_Ext_Configuration register is set: This field contains the one-hot representation of one or more DMA Channel numbers to which an Rx packet whose DA matches the MAC Address(#i) content is routed.
15:0	FFFFh RW	**MAC Address1 [47:32] (ADDRHI):** This field contains the upper 16 bits[47:32] of the second 6-byte MAC address.

10.2.94 MAC_ADDRESS17_LOW — Offset 38Ch

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 38Ch	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address1 [31:0] (ADDRLO):** This field contains the lower 32 bits of second 6-byte MAC address. The content of this field is undefined until loaded by the application after the initialization process.

10.2.95 MAC_ADDRESS18_HIGH — Offset 390h

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 390h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the address filter module uses the second MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30	0h RW	**Source Address (SA):** When this bit is set, the MAC Address1[47:0] is used to compare with the SA fields of the received packet. When this bit is reset, the MAC Address1[47:0] is used to compare with the DA fields of the received packet. 0x0 (DA): Compare with Destination Address. 0x1 (SA): Compare with Source Address.

31	0h RW	**Address Enable (AE):** When this bit is set, the address filter module uses the second MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30	0h RW	**Source Address (SA):** When this bit is set, the MAC Address1[47:0] is used to compare with the SA fields of the received packet. When this bit is reset, the MAC Address1[47:0] is used to compare with the DA fields of the received packet. 0x0 (DA): Compare with Destination Address. 0x1 (SA): Compare with Source Address.
29:24	00h RW	**Mask Byte Control (MBC):** These bits are mask control bits for comparing each of the MAC Address bytes. When set high, the MAC does not compare the corresponding byte of received DA or SA with the contents of MAC Address1 registers. Each bit controls the masking of the bytes as follows: - Bit 29: MAC_Address${i}_High[15:8] - Bit 28: MAC_Address${i}_High[7:0] - Bit 27: MAC_Address${i}_Low[31:24] - .. - Bit 24: MAC_Address${i}_Low[7:0] You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address.
23:16	00h RW	**DMA Channel Select (DCS):** If the PDC bit of MAC_Ext_Configuration register is not set: This field contains the binary representation of the DMA Channel number to which an Rx packet whose DA matches the MAC Address(#i) content is routed. If the PDC bit of MAC_Ext_Configuration register is set: This field contains the one-hot representation of one or more DMA Channel numbers to which an Rx packet whose DA matches the MAC Address(#i) content is routed.
15:0	FFFFh RW	**MAC Address1 [47:32] (ADDRHI):** This field contains the upper 16 bits[47:32] of the second 6-byte MAC address.

10.2.112 MAC_ADDRESS26_LOW — Offset 3D4h

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 3D4h	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address1 [31:0] (ADDRLO):** This field contains the lower 32 bits of second 6-byte MAC address. The content of this field is undefined until loaded by the application after the initialization process.

10.2.113 MAC_ADDRESS27_HIGH — Offset 3D8h

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 3D8h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the address filter module uses the second MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30	0h RW	**Source Address (SA):** When this bit is set, the MAC Address1[47:0] is used to compare with the SA fields of the received packet. When this bit is reset, the MAC Address1[47:0] is used to compare with the DA fields of the received packet. 0x0 (DA): Compare with Destination Address. 0x1 (SA): Compare with Source Address.

Bit Range	Default & Access	Field Name (ID): Description
29:24	00h RW	**Mask Byte Control (MBC):** These bits are mask control bits for comparing each of the MAC Address bytes. When set high, the MAC does not compare the corresponding byte of received DA or SA with the contents of MAC Address1 registers. Each bit controls the masking of the bytes as follows: - Bit 29: MAC_Address${i}_High[15:8] - Bit 28: MAC_Address${i}_High[7:0] - Bit 27: MAC_Address${i}_Low[31:24] - .. - Bit 24: MAC_Address${i}_Low[7:0] You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address.
23:16	00h RW	**DMA Channel Select (DCS):** If the PDC bit of MAC_Ext_Configuration register is not set: This field contains the binary representation of the DMA Channel number to which an Rx packet whose DA matches the MAC Address(#i) content is routed. The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 42Ch	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

10.2.135 MAC_ADDRESS38_HIGH — Offset 430h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 430h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the Address filter module uses the 33rd MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30:19	0h RO	**Reserved**
18:16	0h RW	**DMA Channel Select (DCS):** This field contains the DMA Channel number to which an Rx packet whose DA matches the MAC Address32 content is routed.
15:0	FFFFh RW	**MAC Address32 [47:32] (ADDRHI):** This field contains the upper 16 bits (47:32) of the 33rd 6-byte MAC address.

10.2.136 MAC_ADDRESS38_LOW — Offset 434h

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 434h	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

10.2.137 MAC_ADDRESS39_HIGH — Offset 438h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 438h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the Address filter module uses the 33rd MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30:19	0h RO	**Reserved**
18:16	0h RW	**DMA Channel Select (DCS):** This field contains the DMA Channel number to which an Rx packet whose DA matches the MAC Address32 content is routed.
15:0	FFFFh RW	**MAC Address32 [47:32] (ADDRHI):** This field contains the upper 16 bits (47:32) of the 33rd 6-byte MAC address.

10.2.138 MAC_ADDRESS39_LOW — Offset 43Ch

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 43Ch	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

10.2.139 MAC_ADDRESS40_HIGH — Offset 440h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 440h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the Address filter module uses the 33rd MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30:19	0h RO	**Reserved**
18:16	0h RW	**DMA Channel Select (DCS):** This field contains the DMA Channel number to which an Rx packet whose DA matches the MAC Address32 content is routed.
15:0	FFFFh RW	**MAC Address32 [47:32] (ADDRHI):** This field contains the upper 16 bits (47:32) of the 33rd 6-byte MAC address.

10.2.140 MAC_ADDRESS40_LOW — Offset 444h

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 444h	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

10.2.141 MAC_ADDRESS41_HIGH — Offset 448h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 448h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the Address filter module uses the 33rd MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30:19	0h RO	**Reserved**
18:16	0h RW	**DMA Channel Select (DCS):** This field contains the DMA Channel number to which an Rx packet whose DA matches the MAC Address32 content is routed.
15:0	FFFFh RW	**MAC Address32 [47:32] (ADDRHI):** This field contains the upper 16 bits (47:32) of the 33rd 6-byte MAC address.

10.2.142 MAC_ADDRESS41_LOW — Offset 44Ch

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 44Ch	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

10.2.143 MAC_ADDRESS42_HIGH — Offset 450h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 450h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the Address filter module uses the 33rd MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30:19	0h RO	**Reserved**
18:16	0h RW	**DMA Channel Select (DCS):** This field contains the DMA Channel number to which an Rx packet whose DA matches the MAC Address32 content is routed.
15:0	FFFFh RW	**MAC Address32 [47:32] (ADDRHI):** This field contains the upper 16 bits (47:32) of the 33rd 6-byte MAC address.

10.2.144 MAC_ADDRESS42_LOW — Offset 454h

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 454h	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

10.2.145 MAC_ADDRESS43_HIGH — Offset 458h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 458h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the Address filter module uses the 33rd MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30:19	0h RO	**Reserved**
18:16	0h RW	**DMA Channel Select (DCS):** This field contains the DMA Channel number to which an Rx packet whose DA matches the MAC Address32 content is routed.
15:0	FFFFh RW	**MAC Address32 [47:32] (ADDRHI):** This field contains the upper 16 bits (47:32) of the 33rd 6-byte MAC address.

10.2.146 MAC_ADDRESS43_LOW — Offset 45Ch

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 45Ch	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

10.2.147 MAC_ADDRESS44_HIGH — Offset 460h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 460h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the Address filter module uses the 33rd MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30:19	0h RO	**Reserved**
18:16	0h RW	**DMA Channel Select (DCS):** This field contains the DMA Channel number to which an Rx packet whose DA matches the MAC Address32 content is routed.
15:0	FFFFh RW	**MAC Address32 [47:32] (ADDRHI):** This field contains the upper 16 bits (47:32) of the 33rd 6-byte MAC address.

10.2.148 MAC_ADDRESS44_LOW — Offset 464h

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 464h	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

10.2.149 MAC_ADDRESS45_HIGH — Offset 468h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Type	Size	Offset	Default

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4A4h	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

10.2.165 MAC_ADDRESS53_HIGH — Offset 4A8h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4A8h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the Address filter module uses the 33rd MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30:19	0h RO	**Reserved**
18:16	0h RW	**DMA Channel Select (DCS):** This field contains the DMA Channel number to which an Rx packet whose DA matches the MAC Address32 content is routed.
15:0	FFFFh RW	**MAC Address32 [47:32] (ADDRHI):** This field contains the upper 16 bits (47:32) of the 33rd 6-byte MAC address.

10.2.166 MAC_ADDRESS53_LOW — Offset 4ACh

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4ACh	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

10.2.167 MAC_ADDRESS54_HIGH — Offset 4B0h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

10.2.186 MAC_ADDRESS63_LOW — Offset 4FCh

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4FCh	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

10.2.187 MMC_CONTROL — Offset 700h

This register establishes the operating mode of MAC Management Counters.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 700h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved**
8	0h RW	**Update MMC Counters for Dropped Broadcast Packets (UCDBC):** Note: The CNTRST bit has a higher priority than the CNTPRST bit. Therefore, when the software tries to set both bits in the same write cycle, all counters are cleared and the CNTPRST bit is not set. When set, the MAC updates all related MMC Counters for Broadcast packets that are dropped because of the setting of the DBF bit of MAC_Packet_Filter register. When reset, the MMC Counters are not updated for dropped Broadcast packets. 0x0 (DISABLE): Update MMC Counters for Dropped Broadcast Packets is disabled. 0x1 (ENABLE): Update MMC Counters for Dropped Broadcast Packets is enabled.
7:6	0h RO	**Reserved**
5	0h RW	**Full-Half Preset (CNTPRSTLVL):** When this bit is low and the CNTPRST bit is set, all MMC counters get preset to almost-half value. All octet counters get preset to 0x7FFF_F800 (Half 2KBytes) and all packet-counters gets preset to 0x7FFF_FFF0 (Half 16). When this bit is high and the CNTPRST bit is set, all MMC counters get preset to almost-full value. All octet counters get preset to 0xFFFF_F800 (Full 2KBytes) and all packet-counters gets preset to 0xFFFF_FFF0 (Full 16). For 16-bit counters, the almost-half preset values are 0x7800 and 0x7FF0 for the respective octet and packet counters. Similarly, the almost-full preset values for the 16-bit counters are 0xF800 and 0xFFF0. 0x0 (DISABLE): Full-Half Preset is disabled. 0x1 (ENABLE): Full-Half Preset is enabled.
4	0h RW	**Counters Preset (CNTPRST):** When this bit is set, all counters are initialized or preset to almost full or almost half according to the CNTPRSTLVL bit. This bit is cleared automatically after 1 clock cycle. This bit, along with the CNTPRSTLVL bit, is useful for debugging and testing the assertion of interrupts because of MMC counter becoming half-full or full. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets. 0x0 (DISABLE): Counters Preset is disabled. 0x1 (ENABLE): Counters Preset is enabled.
3	0h RW	**MMC Counter Freeze (CNTFREEZ):** When this bit is set, it freezes all MMC counters to their current value. Until this bit is reset to 0, no MMC counter is updated because of any transmitted or received packet. If any MMC counter is read with the Reset on Read bit set, then that counter is also cleared in this mode. 0x0 (DISABLE): MMC Counter Freeze is disabled. 0x1 (ENABLE): MMC Counter Freeze is enabled.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Reset on Read (RSTONRD):** When this bit is set, the MMC counters are reset to zero after Read (self-clearing after reset). The counters are cleared when the least significant byte lane (Bits[7:0]) is read. 0x0 (DISABLE): Reset on Read is disabled. 0x1 (ENABLE): Reset on Read is enabled.
1	0h RW	**Counter Stop Rollover (CNTSTOPRO):** When this bit is set, the counter does not roll over to zero after reaching the maximum value. 0x0 (DISABLE): Counter Stop Rollover is disabled. 0x1 (ENABLE): Counter Stop Rollover is enabled.
0	0h RW	**Counters Reset (CNTRST):** When this bit is set, all counters are reset. This bit is cleared automatically after 1 clock cycle. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets. 0x0 (DISABLE): Counters are not reset. 0x1 (ENABLE): All counters are reset.

10.2.188 MMC_RX_INTERRUPT — Offset 704h

This register maintains the interrupts generated from all Receive statistics counters.

The MMC Receive Interrupt register maintains the interrupts that are generated when the following occur:

- Receive statistic counters reach half of their maximum values (0x8000_0000 for 32 bit counter and 0x8000 for 16 bit counter).

- Receive statistic counters cross their maximum values (0xFFFF_FFFF for 32 bit counter and 0xFFFF for 16 bit counter).

When the Counter Stop Rollover is set, interrupts are set but the counter remains at all-ones. The MMC Receive Interrupt register

is a 32 bit register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read. The least significant byte lane (Bits[7:0]) of the respective counter must be read to clear the interrupt bit.

Note: R_SS_RC means that this register bit is set internally, and it is cleared when the Counter register is read.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 704h	00000000h

10.2.189 MMC_TX_INTERRUPT — Offset 708h

This register maintains the interrupts generated from all Transmit statistics counters.

The MMC Transmit Interrupt register maintains the interrupts generated when transmit statistic counters reach half their maximum values

(0x8000_0000 for 32 bit counter and 0x8000 for 16 bit counter), and when they cross their maximum values (0xFFFF_FFFF for 32-bit counter and 0xFFFF for 16-bit counter).

When Counter Stop Rollover is set, the interrupts are set but the counter remains at all-ones.

The MMC Transmit Interrupt register is a 32 bit register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read.

The least significant byte lane (Bits[7:0]) of the respective counter must be read to clear the interrupt bit.

Type	Size	Offset	Default

10.2.190 MMC_RX_INTERRUPT_MASK — Offset 70Ch

This register maintains the masks for interrupts generated from all Receive statistics counters.

The MMC Receive Interrupt Mask register maintains the masks for the interrupts generated when receive statistic counters reach half of their maximum value or the maximum values.

This register is 32 bit wide.

Type	Size	Offset	Default

1	0h RW	**MMC Receive Good Bad Octet Counter Interrupt Mask (RXGBOCTIM):** Setting this bit masks the interrupt when the rxoctetcount_gb counter reaches half of the maximum value or the maximum value. 0x0 (DISABLE): MMC Receive Good Bad Octet Counter Interrupt Mask is disabled. 0x1 (ENABLE): MMC Receive Good Bad Octet Counter Interrupt Mask is enabled.
0	0h RW	**MMC Receive Good Bad Packet Counter Interrupt Mask (RXGBPKTIM):** Setting this bit masks the interrupt when the rxpacketcount_gb counter reaches half of the maximum value or the maximum value. 0x0 (DISABLE): MMC Receive Good Bad Packet Counter Interrupt Mask is disabled. 0x1 (ENABLE): MMC Receive Good Bad Packet Counter Interrupt Mask is enabled.

10.2.191 MMC_TX_INTERRUPT_MASK — Offset 710h

This register maintains the masks for interrupts generated from all Transmit statistics counters.

The MMC Transmit Interrupt Mask register maintains the masks for the interrupts generated when the transmit statistic counters reach half of their maximum value or the maximum values. This register is 32 bit wide.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 710h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27	0h RW	**MMC Transmit LPI transition counter interrupt Mask (TXLPITRCIM):** Setting this bit masks the interrupt when the Tx_LPI_Tran_Cntr counter reaches half of the maximum value or the maximum value. 0x0 (DISABLE): MMC Transmit LPI transition counter interrupt Mask is disabled. 0x1 (ENABLE): MMC Transmit LPI transition counter interrupt Mask is enabled.
26	0h RW	**MMC Transmit LPI microsecond counter interrupt Mask (TXLPIUSCIM):** Setting this bit masks the interrupt when the Tx_LPI_USEC_Cntr counter reaches half of the maximum value or the maximum value. 0x0 (DISABLE): MMC Transmit LPI microsecond counter interrupt Mask is disabled. 0x1 (ENABLE): MMC Transmit LPI microsecond counter interrupt Mask is enabled.
25	0h RW	**MMC Transmit Oversize Good Packet Counter Interrupt Mask (TXOSIZEGPIM):** Setting this bit masks the interrupt when the txoversize_g counter reaches half of the maximum value or the maximum value. 0x0 (DISABLE): MMC Transmit Oversize Good Packet Counter Interrupt Mask is disabled. 0x1 (ENABLE): MMC Transmit Oversize Good Packet Counter Interrupt Mask is enabled.

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**MMC Transmit VLAN Good Packet Counter Interrupt Mask (TXVLANGPIM):** Setting this bit masks the interrupt when the txvlanpackets_g counter reaches half of the maximum value or the maximum value. 0x0 (DISABLE): MMC Transmit VLAN Good Packet Counter Interrupt Mask is disabled. 0x1 (ENABLE): MMC Transmit VLAN Good Packet Counter Interrupt Mask is enabled.
23	0h RW	**MMC Transmit Pause Packet Counter Interrupt Mask (TXPAUSPIM):** Setting this bit masks the interrupt when the txpausepackets counter reaches half of the maximum value or the maximum value. 0x0 (DISABLE): MMC Transmit Pause Packet Counter Interrupt Mask is disabled. 0x1 (ENABLE): MMC Transmit Pause Packet Counter Interrupt Mask is enabled.
22	0h RW	**MMC Transmit Excessive Deferral Packet Counter Interrupt Mask (TXEXDEFPIM):** Setting this bit masks the interrupt when the txexcessdef counter reaches half of the maximum value or the maximum value. 0x0 (DISABLE): MMC Transmit Excessive Deferral Packet Counter Interrupt Mask is disabled. 0x1 (ENABLE): MMC Transmit Excessive Deferral Packet Counter Interrupt Mask is enabled.
21	0h RW	**MMC Transmit Good Packet Counter Interrupt Mask (TXGPKTIM):** Setting this bit masks the interrupt when the txpacketcount_g counter reaches half of the maximum value or the maximum value. 0x0 (DISABLE): MMC Transmit Good Packet Counter Interrupt Mask is disabled. 0x1 (ENABLE): MMC Transmit Good Packet Counter Interrupt Mask is enabled.

6	0h RW	**MMC Transmit 128 to 255 Octet Good Bad Packet Counter Interrupt Mask (TX128T255OCTGBPIM):** Setting this bit masks the interrupt when the tx128to255octets_gb counter reaches half of the maximum value or the maximum value. 0x0 (DISABLE): MMC Transmit 128 to 255 Octet Good Bad Packet Counter Interrupt Mask is disabled. 0x1 (ENABLE): MMC Transmit 128 to 255 Octet Good Bad Packet Counter Interrupt Mask is enabled.
5	0h RW	**MMC Transmit 65 to 127 Octet Good Bad Packet Counter Interrupt Mask (TX65T127OCTGBPIM):** Setting this bit masks the interrupt when the tx65to127octets_gb counter reaches half of the maximum value or the maximum value. 0x0 (DISABLE): MMC Transmit 65 to 127 Octet Good Bad Packet Counter Interrupt Mask is disabled. 0x1 (ENABLE): MMC Transmit 65 to 127 Octet Good Bad Packet Counter Interrupt Mask is enabled.
4	0h RW	**MMC Transmit 64 Octet Good Bad Packet Counter Interrupt Mask (TX64OCTGBPIM):** Setting this bit masks the interrupt when the tx64octets_gb counter reaches half of the maximum value or the maximum value. 0x0 (DISABLE): MMC Transmit 64 Octet Good Bad Packet Counter Interrupt Mask is disabled. 0x1 (ENABLE): MMC Transmit 64 Octet Good Bad Packet Counter Interrupt Mask is enabled.
3	0h RW	**MMC Transmit Multicast Good Packet Counter Interrupt Mask (TXMCGPIM):** Setting this bit masks the interrupt when the txmulticastpackets_g counter reaches half of the maximum value or the maximum value. 0x0 (DISABLE): MMC Transmit Multicast Good Packet Counter Interrupt Mask is disabled. 0x1 (ENABLE): MMC Transmit Multicast Good Packet Counter Interrupt Mask is enabled.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**MMC Transmit Broadcast Good Packet Counter Interrupt Mask (TXBCGPIM):** Setting this bit masks the interrupt when the txbroadcastpackets_g counter reaches half of the maximum value or the maximum value. 0x0 (DISABLE): MMC Transmit Broadcast Good Packet Counter Interrupt Mask is disabled. 0x1 (ENABLE): MMC Transmit Broadcast Good Packet Counter Interrupt Mask is enabled.
1	0h RW	**MMC Transmit Good Bad Packet Counter Interrupt Mask (TXGBPKTIM):** Setting this bit masks the interrupt when the txpacketcount_gb counter reaches half of the maximum value or the maximum value. 0x0 (DISABLE): MMC Transmit Good Bad Packet Counter Interrupt Mask is disabled. 0x1 (ENABLE): MMC Transmit Good Bad Packet Counter Interrupt Mask is enabled.
0	0h RW	**MMC Transmit Good Bad Octet Counter Interrupt Mask (TXGBOCTIM):** Setting this bit masks the interrupt when the txoctetcount_gb counter reaches half of the maximum value or the maximum value. 0x0 (DISABLE): MMC Transmit Good Bad Octet Counter Interrupt Mask is disabled. 0x1 (ENABLE): MMC Transmit Good Bad Octet Counter Interrupt Mask is enabled.

10.2.192 TX_OCTET_COUNT_GOOD_BAD — Offset 714h

This register provides the number of bytes transmitted by the GbE Controller, exclusive of preamble and retried bytes, in good and bad packets.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 714h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Octet Count Good Bad (TXOCTGB):** This field indicates the number of bytes transmitted, exclusive of preamble and retried bytes, in good and bad packets.

10.2.193 TX_PACKET_COUNT_GOOD_BAD — Offset 718h

This register provides the number of good and bad packets transmitted by GbE Controller, exclusive of retried packets.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 718h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Packet Count Good Bad (TXPKTGB):** This field indicates the number of good and bad packets transmitted, exclusive of retried packets.

10.2.194 TX_BROADCAST_PACKETS_GOOD — Offset 71Ch

This register provides the number of good broadcast packets transmitted by GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 71Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Broadcast Packets Good (TXBCASTG):** This field indicates the number of good broadcast packets transmitted.

10.2.195 TX_MULTICAST_PACKETS_GOOD — Offset 720h

This register provides the number of good multicast packets transmitted by GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 720h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Multicast Packets Good (TXMCASTG):** This field indicates the number of good multicast packets transmitted.

10.2.196 TX_64OCTETS_PACKETS_GOOD_BAD — Offset 724h

This register provides the number of good and bad packets transmitted by GbE Controller with length 64 bytes, exclusive of preamble and retried packets.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 724h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx 64Octets Packets Good_Bad (TX64OCTGB):** This field indicates the number of good and bad packets transmitted with length 64 bytes, exclusive of preamble and retried packets.

10.2.197 TX_65TO127OCTETS_PACKETS_GOOD_BAD — Offset 728h

This register provides the number of good and bad packets transmitted by GbE Controller with length between 65 and 127 (inclusive) bytes, exclusive of preamble and retried packets.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 728h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TX65_127OCTGB:** Tx 65To127Octets Packets Good Bad This field indicates the number of good and bad packets transmitted with length between 65 and 127 (inclusive) bytes, exclusive of preamble and retried packets.

10.2.198 TX_128TO255OCTETS_PACKETS_GOOD_BAD — Offset 72Ch

This register provides the number of good and bad packets transmitted by GbE Controller with length between 128 to 255 (inclusive) bytes, exclusive of preamble and retried packets.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 72Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx 128To255Octets Packets Good Bad (TX128_255OCTGB):** This field indicates the number of good and bad packets transmitted with length between 128 and 255 (inclusive) bytes, exclusive of preamble and retried packets.

10.2.199 TX_256TO511OCTETS_PACKETS_GOOD_BAD — Offset 730h

This register provides the number of good and bad packets transmitted by GbE Controller with length between 256 to 511 (inclusive) bytes, exclusive of preamble and retried packets.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 730h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx 256To511Octets Packets Good Bad (TX256_511OCTGB):** This field indicates the number of good and bad packets transmitted with length between 256 and 511 (inclusive) bytes, exclusive of preamble and retried packets.

10.2.200 TX_512TO1023OCTETS_PACKETS_GOOD_BAD — Offset 734h

This register provides the number of good and bad packets transmitted by GbE Controller with length 512 to 1023 (inclusive) bytes, exclusive of preamble and retried packets.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 734h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx 512To1023Octets Packets Good Bad (TX512_1023OCTGB):** This field indicates the number of good and bad packets transmitted with length between 512 and 1023 (inclusive) bytes, exclusive of preamble and retried packets.

10.2.201 TX_1024TOMAXOCTETS_PACKETS_GOOD_BAD — Offset 738h

This register provides the number of good and bad packets transmitted by GbE Controller with length 1024 to maxsize (inclusive) bytes, exclusive of preamble and retried packets.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 738h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx 1024ToMaxOctets Packets Good Bad (TX1024_MAXOCTGB):** This field indicates the number of good and bad packets transmitted with length between 1024 and maxsize (inclusive) bytes, exclusive of preamble and retried packets.

10.2.202 TX_UNICAST_PACKETS_GOOD_BAD — Offset 73Ch

This register provides the number of good and bad unicast packets transmitted by GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 73Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Unicast Packets Good Bad (TXUCASTGB):** This field indicates the number of good and bad unicast packets transmitted.

10.2.203 TX_MULTICAST_PACKETS_GOOD_BAD — Offset 740h

This register provides the number of good and bad multicast packets transmitted by GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 740h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Multicast Packets Good Bad (TXMCASTGB):** This field indicates the number of good and bad multicast packets transmitted.

10.2.204 TX_BROADCAST_PACKETS_GOOD_BAD — Offset 744h

This register provides the number of good and bad broadcast packets transmitted by GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 744h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Broadcast Packets Good Bad (TXBCASTGB):** This field indicates the number of good and bad broadcast packets transmitted.

10.2.205 TX_UNDERFLOW_ERROR_PACKETS — Offset 748h

This register provides the number of packets aborted by GbE Controller because of packets underflow error.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 748h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Underflow Error Packets (TXUNDRFLW):** This field indicates the number of packets aborted because of packets underflow error.

10.2.206 TX_SINGLE_COLLISION_GOOD_PACKETS — Offset 74Ch

This register provides the number of successfully transmitted packets by GbE Controller after a single collision in the half-duplex mode.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 74Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Single Collision Good Packets (TXSNGLCOLG):** This field indicates the number of successfully transmitted packets after a single collision in the half-duplex mode.

10.2.207 TX_MULTIPLE_COLLISION_GOOD_PACKETS — Offset 750h

This register provides the number of successfully transmitted packets by GbE Controller after multiple collisions in the half-duplex mode.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 750h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Multiple Collision Good Packets (TXMULTCOLG):** This field indicates the number of successfully transmitted packets after multiple collisions in the half-duplex mode.

10.2.208 TX_DEFERRED_PACKETS — Offset 754h

This register provides the number of successfully transmitted by GbE Controller after a deferral in the half-duplex mode.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 754h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Deferred Packets (TXDEFRD):** This field indicates the number of successfully transmitted after a deferral in the half-duplex mode.

10.2.209 TX_LATE_COLLISION_PACKETS — Offset 758h

This register provides the number of packets aborted by GbE Controller because of late collision error.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 758h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Late Collision Packets (TXLATECOL):** This field indicates the number of packets aborted because of late collision error.

10.2.210 TX_EXCESSIVE_COLLISION_PACKETS — Offset 75Ch

This register provides the number of packets aborted by GbE Controller because of excessive (16) collision errors.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 75Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Excessive Collision Packets (TXEXSCOL):** This field indicates the number of packets aborted because of excessive (16) collision errors.

10.2.211 TX_CARRIER_ERROR_PACKETS — Offset 760h

This register provides the number of packets aborted by GbE Controller because of carrier sense error (no carrier or loss of carrier).

Type	Size	Offset	Default
MMIO	32 bit	BAR + 760h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Carrier Error Packets (TXCARR):** This field indicates the number of packets aborted because of carrier sense error (no carrier or loss of carrier).

10.2.212 TX_OCTET_COUNT_GOOD — Offset 764h

This register provides the number of bytes transmitted by GbE Controller, exclusive of preamble, only in good packets.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 764h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Octet Count Good (TXOCTG):** This field indicates the number of bytes transmitted, exclusive of preamble, only in good packets.

10.2.213 TX_PACKET_COUNT_GOOD — Offset 768h

This register provides the number of good packets transmitted by GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 768h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Packet Count Good (TXPKTG):** This field indicates the number of good packets transmitted.

10.2.214 TX_EXCESSIVE_DEFERRAL_ERROR — Offset 76Ch

This register provides the number of packets aborted by GbE Controller because of excessive deferral error (deferred for more than two max-sized packet times).

Type	Size	Offset	Default
MMIO	32 bit	BAR + 76Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Excessive Deferral Error (TXEXSDEF):** This field indicates the number of packets aborted because of excessive deferral error (deferred for more than two max-sized packet times).

10.2.215 TX_PAUSE_PACKETS — Offset 770h

This register provides the number of good Pause packets transmitted by GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 770h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Pause Packets (TXPAUSE):** This field indicates the number of good Pause packets transmitted.

10.2.216 TX_VLAN_PACKETS_GOOD — Offset 774h

This register provides the number of good VLAN packets transmitted by GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 774h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx VLAN Packets Good (TXVLANG):** This field provides the number of good VLAN packets transmitted.

10.2.217 TX_OSIZE_PACKETS_GOOD — Offset 778h

This register provides the number of packets transmitted by GbE Controller without errors and with length greater than the maxsize (1,518 or 1,522 bytes for VLAN tagged packets; 2000 bytes if enabled in S2KP bit of the MAC_Configuration register).

Type	Size	Offset	Default
MMIO	32 bit	BAR + 778h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx OSize Packets Good (TXOSIZG):** This field indicates the number of packets transmitted without errors and with length greater than the maxsize (1,518 or 1,522 bytes for VLAN tagged packets; 2000 bytes if enabled in S2KP bit of the MAC_Configuration register).

10.2.218 RX_PACKETS_COUNT_GOOD_BAD — Offset 780h

This register provides the number of good and bad packets received by GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 780h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Packets Count Good Bad (RXPKTGB):** This field indicates the number of good and bad packets received.

10.2.219 RX_OCTET_COUNT_GOOD_BAD — Offset 784h

This register provides the number of bytes received, exclusive of preamble, in good and bad packets.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 784h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Octet Count Good Bad (RXOCTGB):** This field indicates the number of bytes received, exclusive of preamble, in good and bad packets.

10.2.220 RX_OCTET_COUNT_GOOD — Offset 788h

This register provides the number of bytes received by GbE Controller, exclusive of preamble, only in good packets.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 788h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Octet Count Good (RXOCTG):** This field indicates the number of bytes received, exclusive of preamble, only in good packets.

10.2.221 RX_BROADCAST_PACKETS_GOOD — Offset 78Ch

This register provides the number of good broadcast packets received by GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 78Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Broadcast Packets Good (RXBCASTG):** This field indicates the number of good broadcast packets received.

10.2.222 RX_MULTICAST_PACKETS_GOOD — Offset 790h

This register provides the number of good multicast packets received by GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 790h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Multicast Packets Good (RXMCASTG):** This field indicates the number of good multicast packets received.

10.2.223 RX_CRC_ERROR_PACKETS — Offset 794h

This register provides the number of packets received by GbE Controller with CRC error.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 794h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx CRC Error Packets (RXCRCERR):** This field indicates the number of packets received with CRC error.

10.2.224 RX_ALIGNMENT_ERROR_PACKETS — Offset 798h

This register provides the number of packets received by GbE Controller with alignment (dribble) error. It is valid only in 10/100 mode.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 798h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Alignment Error Packets (RXALGNERR):** This field indicates the number of packets received with alignment (dribble) error. It is valid only in 10/100 mode.

10.2.225 RX_RUNT_ERROR_PACKETS — Offset 79Ch

This register provides the number of packets received by GbE Controller with runt (length less than 64 bytes and CRC error) error.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 79Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Runt Error Packets (RXRUNTERR):** This field indicates the number of packets received with runt (length less than 64 bytes and CRC error) error.

10.2.226 RX_JABBER_ERROR_PACKETS — Offset 7A0h

This register provides the number of giant packets received by GbE Controller with length (including CRC) greater than 1,518 bytes (1,522 bytes for VLAN tagged) and with CRC error. If Jumbo Packet mode is enabled, packets of length greater than 9,018 bytes (9,022 bytes for VLAN tagged) are considered as giant packets.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7A0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Jabber Error Packets (RXJABERR):** This field indicates the number of giant packets received with length (including CRC) greater than 1,518 bytes (1,522 bytes for VLAN tagged) and with CRC error. If Jumbo Packet mode is enabled, packets of length greater than 9,018 bytes (9,022 bytes for VLAN tagged) are considered as giant packets.

10.2.227 RX_UNDERSIZE_PACKETS_GOOD — Offset 7A4h

This register provides the number of packets received by GbE Controller with length less than 64 bytes, without any errors.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7A4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Undersize Packets Good (RXUNDERSZG):** This field indicates the number of packets received with length less than 64 bytes, without any errors.

10.2.228 RX_OVERSIZE_PACKETS_GOOD — Offset 7A8h

This register provides the number of packets received by GbE Controller without errors, with length greater than the maxsize (1,518 bytes or 1,522 bytes for VLAN tagged packets; 2000 bytes if enabled in the S2KP bit of the MAC_Configuration register).

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7A8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Oversize Packets Good (RXOVERSZG):** This field indicates the number of packets received without errors, with length greater than the maxsize (1,518 bytes or 1,522 bytes for VLAN tagged packets; 2000 bytes if enabled in the S2KP bit of the MAC_Configuration register).

10.2.229 RX_64OCTETS_PACKETS_GOOD_BAD — Offset 7ACh

This register provides the number of good and bad packets received by GbE Controller with length 64 bytes, exclusive of the preamble.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7ACh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx 64 Octets Packets Good Bad (RX64OCTGB):** This field indicates the number of good and bad packets received with length 64 bytes, exclusive of the preamble.

10.2.230 RX_65TO127OCTETS_PACKETS_GOOD_BAD — Offset 7B0h

This register provides the number of good and bad packets received by GbE Controller with length between 65 and 127 (inclusive) bytes, exclusive of the preamble.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RX65_127OCTGB:** Rx 65-127 Octets Packets Good Bad This field indicates the number of good and bad packets received with length between 65 and 127 (inclusive) bytes, exclusive of the preamble.

10.2.231 RX_128TO255OCTETS_PACKETS_GOOD_BAD — Offset 7B4h

This register provides the number of good and bad packets received by GbE Controller with length between 128 and 255 (inclusive) bytes, exclusive of the preamble.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7B4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RX128_255OCTGB:** Rx 128-255 Octets Packets Good Bad This field indicates the number of good and bad packets received with length between 128 and 255 (inclusive) bytes, exclusive of the preamble.

10.2.232 RX_256TO511OCTETS_PACKETS_GOOD_BAD — Offset 7B8h

This register provides the number of good and bad packets received by GbE ControllerGbE Controller with length between 256 and 511 (inclusive) bytes, exclusive of the preamble.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7B8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RX256_511OCTGB:** Rx 256-511 Octets Packets Good Bad This field indicates the number of good and bad packets received with length between 256 and 511 (inclusive) bytes, exclusive of the preamble.

10.2.233 RX_512TO1023OCTETS_PACKETS_GOOD_BAD — Offset 7BCh

This register provides the number of good and bad packets received by GbE Controller with length between 512 and 1023 (inclusive) bytes, exclusive of the preamble.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7BCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RX 512-1023 Octets Packets Good Bad (RX512_1023OCTGB):** This field indicates the number of good and bad packets received with length between 512 and 1023 (inclusive) bytes, exclusive of the preamble.

10.2.234 RX_1024TOMAXOCTETS_PACKETS_GOOD_BAD — Offset 7C0h

This register provides the number of good and bad packets received by GbE Controller with length between 1024 and maxsize (inclusive) bytes, exclusive of the preamble.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx 1024-Max Octets Good Bad (RX1024_MAXOCTGB):** This field indicates the number of good and bad packets received with length between 1024 and maxsize (inclusive) bytes, exclusive of the preamble.

10.2.235 RX_UNICAST_PACKETS_GOOD — Offset 7C4h

This register provides the number of good unicast packets received by GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7C4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Unicast Packets Good (RXUCASTG):** This field indicates the number of good unicast packets received.

10.2.236 RX_LENGTH_ERROR_PACKETS — Offset 7C8h

This register provides the number of packets received by GbE Controller with length error (Length Type field not equal to packet size), for all packets with valid length field.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7C8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Length Error Packets (RXLENERR):** This field indicates the number of packets received with length error (Length Type field not equal to packet size), for all packets with valid length field.

10.2.237 RX_OUT_OF_RANGE_TYPE_PACKETS — Offset 7CCh

This register provides the number of packets received by GbE Controller with length field not equal to the valid packet size (greater than 1,500 but less than 1,536).

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7CCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Out of Range Type Packet (RXOUTOFRNG):** This field indicates the number of packets received with length field not equal to the valid packet size (greater than 1,500 but less than 1,536).

10.2.238 RX_PAUSE_PACKETS — Offset 7D0h

This register provides the number of good and valid Pause packets received by GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7D0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Pause Packets (RXPAUSEPKT):** This field indicates the number of good and valid Pause packets received.

10.2.239 RX_FIFO_OVERFLOW_PACKETS — Offset 7D4h

This register provides the number of missed received packets because of FIFO overflow in GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx FIFO Overflow Packets (RXFIFOOVFL):** This field indicates the number of missed received packets because of FIFO overflow.

10.2.240 RX_VLAN_PACKETS_GOOD_BAD — Offset 7D8h

This register provides the number of good and bad VLAN packets received by GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx VLAN Packets Good Bad (RXVLANPKTGB):** This field indicates the number of good and bad VLAN packets received.

10.2.241 RX_WATCHDOG_ERROR_PACKETS — Offset 7DCh

This register provides the number of packets received by GbE Controller with error because of watchdog timeout error (packets with a data load larger than 2,048 bytes (when JE and WD bits are reset in MAC_Configuration register), 10,240 bytes (when JE bit is set and WD bit is reset in MAC_Configuration register), 16,384 bytes (when WD bit is set in MAC_Configuration register) or the value programmed in the MAC_Watchdog_Timeout register).

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7DCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Watchdog Error Packets (RXWDGERR):** This field indicates the number of packets received with error because of watchdog timeout error (packets with a data load larger than 2,048 bytes (when JE and WD bits are reset in MAC_Configuration register), 10,240 bytes (when JE bit is set and WD bit is reset in MAC_Configuration register), 16,384 bytes (when WD bit is set in MAC_Configuration register) or the value programmed in the MAC_Watchdog_Timeout register).

10.2.242 RX_RECEIVE_ERROR_PACKETS — Offset 7E0h

This register provides the number of packets received by GbE Controller with Receive error or Packet Extension error on the GMII or MII interface.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7E0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Receive Error Packets (RXRCVERR):** This field indicates the number of packets received with Receive error or Packet Extension error on the GMII or MII interface.

10.2.243 RX_CONTROL_PACKETS_GOOD — Offset 7E4h

This register provides the number of good control packets received by GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Control Packets Good (RXCTRLG):** This field indicates the number of good control packets received.

10.2.244 TX_LPI_USEC_CNTR — Offset 7ECh

This register provides the number of microseconds Tx LPI is asserted by GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7ECh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx LPI Microseconds Counter (TXLPIUSC):** This field indicates the number of microseconds Tx LPI is asserted. For every Tx LPI Entry and Exit, the Timer value can have an error of +/- 1 microsecond.

10.2.245 TX_LPI_TRAN_CNTR — Offset 7F0h

This register provides the number of times GbE Controller has entered Tx LPI.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7F0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx LPI Transition counter (TXLPITRC):** This field indicates the number of times Tx LPI Entry has occurred. Even if Tx LPI Entry occurs in Automate Mode (because of LPITXA bit set in the LPI Control and Status register), the counter increments.

10.2.246 RX_LPI_USEC_CNTR — Offset 7F4h

This register provides the number of microseconds Rx LPI is sampled by GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7F4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx LPI Microseconds Counter (RXLPIUSC):** This field indicates the number of microseconds Rx LPI is asserted. For every Rx LPI Entry and Exit, the Timer value can have an error of +/- 1 microsecond.

10.2.247 RX_LPI_TRAN_CNTR — Offset 7F8h

This register provides the number of times GbE Controller has entered Rx LPI.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7F8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx LPI Transition counter (RXLPITRC):** This field indicates the number of times Rx LPI Entry has occurred.

10.2.248 MMC_IPC_RX_INTERRUPT_MASK — Offset 800h

This register maintains the mask for the interrupt generated from the receive IPC statistic counters.

The MMC Receive Checksum Off load Interrupt Mask register maintains the masks for the interrupts generated when the receive IPC (Checksum Off load) statistic counters reach half their maximum value, and when they reach their maximum values. This register is 32 bits wide.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 800h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29	0h RW	**MMC Receive ICMP Error Octet Counter Interrupt Mask (RXICMPEROIM):** Setting this bit masks the interrupt when the rxicmp_err_octets counter reaches half of the maximum value or the maximum value. 0x0 (DISABLE): MMC Receive ICMP Error Octet Counter Interrupt Mask is disabled. 0x1 (ENABLE): MMC Receive ICMP Error Octet Counter Interrupt Mask is enabled.
28	0h RW	**MMC Receive ICMP Good Octet Counter Interrupt Mask (RXICMPGOIM):** Setting this bit masks the interrupt when the rxicmp_gd_octets counter reaches half of the maximum value or the maximum value. 0x0 (DISABLE): MMC Receive ICMP Good Octet Counter Interrupt Mask is disabled. 0x1 (ENABLE): MMC Receive ICMP Good Octet Counter Interrupt Mask is enabled.
27	0h RW	**MMC Receive TCP Error Octet Counter Interrupt Mask (RXTCPEROIM):** Setting this bit masks the interrupt when the rxtcp_err_octets counter reaches half of the maximum value or the maximum value. 0x0 (DISABLE): MMC Receive TCP Error Octet Counter Interrupt Mask is disabled. 0x1 (ENABLE): MMC Receive TCP Error Octet Counter Interrupt Mask is enabled.
26	0h RW	**MMC Receive TCP Good Octet Counter Interrupt Mask (RXTCPGOIM):** Setting this bit masks the interrupt when the rxtcp_gd_octets counter reaches half of the maximum value or the maximum value. 0x0 (DISABLE): MMC Receive TCP Good Octet Counter Interrupt Mask is disabled. 0x1 (ENABLE): MMC Receive TCP Good Octet Counter Interrupt Mask is enabled.
25	0h RW	**MMC Receive UDP Good Octet Counter Interrupt Mask (RXUDPEROIM):** Setting this bit masks the interrupt when the rxudp_err_octets counter reaches half of the maximum value or the maximum value. 0x0 (DISABLE): MMC Receive UDP Good Octet Counter Interrupt Mask is disabled. 0x1 (ENABLE): MMC Receive UDP Good Octet Counter Interrupt Mask is enabled.
24	0h RW	**MMC Receive IPV6 No Payload Octet Counter Interrupt Mask (RXUDPGOIM):** Setting this bit masks the interrupt when the rxudp_gd_octets counter reaches half of the maximum value or the maximum value. 0x0 (DISABLE): MMC Receive IPV6 No Payload Octet Counter Interrupt Mask is disabled. 0x1 (ENABLE): MMC Receive IPV6 No Payload Octet Counter Interrupt Mask is enabled.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**MMC Receive IPV6 Header Error Octet Counter Interrupt Mask (RXIPV6NOPAYOIM):** Setting this bit masks the interrupt when the rxipv6_nopay_octets counter reaches half of the maximum value or the maximum value. 0x0 (DISABLE): MMC Receive IPV6 Header Error Octet Counter Interrupt Mask is disabled. 0x1 (ENABLE): MMC Receive IPV6 Header Error Octet Counter Interrupt Mask is enabled.
22	0h RW	**MMC Receive IPV6 Good Octet Counter Interrupt Mask (RXIPV6HEROIM):** Setting this bit masks the interrupt when the rxipv6_hdrerr_octets counter reaches half of the maximum value or the maximum value. 0x0 (DISABLE): MMC Receive IPV6 Good Octet Counter Interrupt Mask is disabled. 0x1 (ENABLE): MMC Receive IPV6 Good Octet Counter Interrupt Mask is enabled.
21	0h RW	**MMC Receive IPV6 Good Octet Counter Interrupt Mask (RXIPV6GOIM):** Setting this bit masks the interrupt when the rxipv6_gd_octets counter reaches half of the maximum value or the maximum value. 0x0 (DISABLE): MMC Receive IPV6 Good Octet Counter Interrupt Mask is disabled. 0x1 (ENABLE): MMC Receive IPV6 Good Octet Counter Interrupt Mask is enabled.
20	0h RW	**MMC Receive IPV4 UDP Checksum Disabled Octet Counter Interrupt Mask (RXIPV4UDSBLOIM):** Setting this bit masks the interrupt when the rxipv4_udsbl_octets counter reaches half of the maximum value or the maximum value. 0x0 (DISABLE): MMC Receive IPV4 UDP Checksum Disabled Octet Counter Interrupt Mask is disabled. 0x1 (ENABLE): MMC Receive IPV4 UDP Checksum Disabled Octet Counter Interrupt Mask is enabled.
19	0h RW	**MMC Receive IPV4 Fragmented Octet Counter Interrupt Mask (RXIPV4FRAGOIM):** Setting this bit masks the interrupt when the rxipv4_frag_octets counter reaches half of the maximum value or the maximum value. 0x0 (DISABLE): MMC Receive IPV4 Fragmented Octet Counter Interrupt Mask is disabled. 0x1 (ENABLE): MMC Receive IPV4 Fragmented Octet Counter Interrupt Mask is enabled.
18	0h RW	**MMC Receive IPV4 No Payload Octet Counter Interrupt Mask (RXIPV4NOPAYOIM):** Setting this bit masks the interrupt when the rxipv4_nopay_octets counter reaches half of the maximum value or the maximum value. 0x0 (DISABLE): MMC Receive IPV4 No Payload Octet Counter Interrupt Mask is disabled. 0x1 (ENABLE): MMC Receive IPV4 No Payload Octet Counter Interrupt Mask is enabled.
17	0h RW	**MMC Receive IPV4 Header Error Octet Counter Interrupt Mask (RXIPV4HEROIM):** Setting this bit masks the interrupt when the rxipv4_hdrerr_octets counter reaches half of the maximum value or the maximum value. 0x0 (DISABLE): MMC Receive IPV4 Header Error Octet Counter Interrupt Mask is disabled. 0x1 (ENABLE): MMC Receive IPV4 Header Error Octet Counter Interrupt Mask is enabled.
16	0h RW	**MMC Receive IPV4 Good Octet Counter Interrupt Mask (RXIPV4GOIM):** Setting this bit masks the interrupt when the rxipv4_gd_octets counter reaches half of the maximum value or the maximum value. 0x0 (DISABLE): MMC Receive IPV4 Good Octet Counter Interrupt Mask is disabled. 0x1 (ENABLE): MMC Receive IPV4 Good Octet Counter Interrupt Mask is enabled.

10.2.249 MMC_IPC_RX_INTERRUPT — Offset 808h

This register maintains the interrupt that the receive IPC statistic counters generate.

The MMC Receive Checksum Offload Interrupt register maintains the interrupts generated when receive IPC statistic counters reach half their maximum values (0x8000_0000 for 32 bit counter and 0x8000 for 16 bit counter), and when they cross their maximum values (0xFFFF_FFFF for 32 bit counter and 0xFFFF for 16 bit counter). When Counter Stop Rollover is set, the interrupts are set but the counter remains at all-ones.

The MMC Receive Checksum Offload Interrupt register is 32 bit wide. When the MMC IPC counter that caused the interrupt is read, its corresponding interrupt bit is cleared. The counter's least-significant byte lane (Bits[7:0]) must be read to clear the interrupt bit.

10.2.250 RXIPV4_GOOD_PACKETS — Offset 810h

This register provides the number of good IPv4 datagrams received by GbE Controller with the TCP, UDP, or ICMP payload.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 810h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxIPv4 Good Packets (RXIPV4GDPKT):** This field indicates the number of good IPv4 datagrams received with the TCP, UDP, or ICMP payload.

10.2.251 RXIPV4_HEADER_ERROR_PACKETS — Offset 814h

RxIPv4 Header Error Packets

This register provides the number of IPv4 datagrams received by GbE Controller with header (checksum, length, or version mismatch) errors.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 814h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxIPv4 Header Error Packets (RXIPV4HDRERRPKT):** This field indicates the number of IPv4 datagrams received with header (checksum, length, or version mismatch) errors.

10.2.252 RXIPV4_NO_PAYLOAD_PACKETS — Offset 818h

This register provides the number of IPv4 datagram packets received by GbE Controller that did not have a TCP, UDP, or ICMP payload.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 818h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxIPv4 Payload Packets (RXIPV4NOPAYPKT):** This field indicates the number of IPv4 datagram packets received that did not have a TCP, UDP, or ICMP payload.

10.2.253 RXIPV4_FRAGMENTED_PACKETS — Offset 81Ch

This register provides the number of good IPv4 datagrams received by GbE Controller with fragmentation.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 81Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxIPv4 Fragmented Packets (RXIPV4FRAGPKT):** This field indicates the number of good IPv4 datagrams received with fragmentation.

10.2.254 RXIPV4_UDP_CHECKSUM_DISABLED_PACKETS — Offset 820h

This register provides the number of good IPv4 datagrams received by GbE Controller that had a UDP payload with checksum disabled.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 820h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxIPv4 UDP Checksum Disabled Packets (RXIPV4UDSBLPKT):** This field indicates the number of good IPv4 datagrams received that had a UDP payload with checksum disabled.

10.2.255 RXIPV6_GOOD_PACKETS — Offset 824h

This register provides the number of good IPv6 datagrams received by GbE Controller with the TCP, UDP, or ICMP payload.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 824h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxIPv6 Good Packets (RXIPV6GDPKT):** This field indicates the number of good IPv6 datagrams received with the TCP, UDP, or ICMP payload.

10.2.256 RXIPV6_HEADER_ERROR_PACKETS — Offset 828h

This register provides the number of IPv6 datagrams received by GbE Controller with header (length or version mismatch) errors.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 828h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxIPv6 Header Error Packets (RXIPV6HDRERRPKT):** This field indicates the number of IPv6 datagrams received with header (length or version mismatch) errors.

10.2.257 RXIPV6_NO_PAYLOAD_PACKETS — Offset 82Ch

This register provides the number of IPv6 datagram packets received by GbE Controller that did not have a TCP, UDP, or ICMP payload. This includes all IPv6 datagrams with fragmentation or security extension headers.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 82Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxIPv6 Payload Packets (RXIPV6NOPAYPKT):** This field indicates the number of IPv6 datagram packets received that did not have a TCP, UDP, or ICMP payload. This includes all IPv6 datagrams with fragmentation or security extension headers.

10.2.258 RXUDP_GOOD_PACKETS — Offset 830h

This register provides the number of good IP datagrams received by GbE Controller with a good UDP payload. This counter is not updated when the RxIPv4_UDP_Checksum_Disabled_Packets counter is incremented.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 830h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxUDP Good Packets (RXUDPGDPKT):** This field indicates the number of good IP datagrams received with a good UDP payload. This counter is not updated when the RxIPv4_UDP_Checksum_Disabled_Packets counter is incremented.

10.2.259 RXUDP_ERROR_PACKETS — Offset 834h

This register provides the number of good IP datagrams received by GbE Controller whose UDP payload has a checksum error.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 834h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxUDP Error Packets (RXUDPERRPKT):** This field indicates the number of good IP datagrams received whose UDP payload has a checksum error.

10.2.260 RXTCP_GOOD_PACKETS — Offset 838h

This register provides the number of good IP datagrams received by GbE Controller with a good TCP payload.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 838h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxTCP Good Packets (RXTCPGDPKT):** This field indicates the number of good IP datagrams received with a good TCP payload.

10.2.261 RXTCP_ERROR_PACKETS — Offset 83Ch

This register provides the number of good IP datagrams received by GbE Controller whose TCP payload has a checksum error.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 83Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxTCP Error Packets (RXTCPERRPKT):** This field indicates the number of good IP datagrams received whose TCP payload has a checksum error.

10.2.262 RXICMP_GOOD_PACKETS — Offset 840h

This register provides the number of good IP datagrams received by GbE Controller with a good ICMP payload.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 840h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxICMP Good Packets (RXICMPGDPKT):** This field indicates the number of good IP datagrams received with a good ICMP payload.

10.2.263 RXICMP_ERROR_PACKETS — Offset 844h

This register provides the number of good IP datagrams received by GbE Controller whose ICMP payload has a checksum error.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 844h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxICMP Error Packets (RXICMPERRPKT):** This field indicates the number of good IP datagrams received whose ICMP payload has a checksum error.

10.2.264 RXIPV4_GOOD_OCTETS — Offset 850h

This register provides the number of bytes received by GbE Controller in good IPv4 datagrams encapsulating TCP, UDP, or ICMP data. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 850h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxIPv4 Good Octets (RXIPV4GDOCT):** This field indicates the number of bytes received in good IPv4 datagrams encapsulating TCP, UDP, or ICMP data. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

10.2.265 RXIPV4_HEADER_ERROR_OCTETS — Offset 854h

This register provides the number of bytes received by GbE Controller in IPv4 datagrams with header errors (checksum, length, version mismatch). The value in the Length field of IPv4 header is used to update this counter. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 854h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxIPv4 Header Error Octets (RXIPV4HDRERROCT):** This field indicates the number of bytes received in IPv4 datagrams with header errors (checksum, length, version mismatch). The value in the Length field of IPv4 header is used to update this counter. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

10.2.266 RXIPV4_NO_PAYLOAD_OCTETS — Offset 858h

This register provides the number of bytes received by GbE Controller in IPv4 datagrams that did not have a TCP, UDP, or ICMP payload. The value in the Length field of IPv4 header is used to update this counter. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 858h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxIPv4 Payload Octets (RXIPV4NOPAYOCT):** This field indicates the number of bytes received in IPv4 datagrams that did not have a TCP, UDP, or ICMP payload. The value in the Length field of IPv4 header is used to update this counter. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

10.2.267 RXIPV4_FRAGMENTED_OCTETS — Offset 85Ch

This register provides the number of bytes received by GbE Controller in fragmented IPv4 datagrams. The value in the Length field of IPv4 header is used to update this counter. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 85Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxIPv4 Fragmented Octets (RXIPV4FRAGOCT):** This field indicates the number of bytes received in fragmented IPv4 datagrams. The value in the Length field of IPv4 header is used to update this counter. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

10.2.268 RXIPV4_UDP_CHECKSUM_DISABLE_OCTETS — Offset 860h

This register provides the number of bytes received by GbE Controller in a UDP segment that had the UDP checksum disabled. This counter does not count IP Header bytes. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 860h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxIPv4 UDP Checksum Disable Octets (RXIPV4UDSBLOCT):** This field indicates the number of bytes received in a UDP segment that had the UDP checksum disabled. This counter does not count IP Header bytes. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

10.2.269 RXIPV6_GOOD_OCTETS — Offset 864h

This register provides the number of bytes received by GbE Controller in good IPv6 datagrams encapsulating TCP, UDP, or ICMP data. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 864h	00000000h

The value in the Length field of IPv6 header is used to update this counter. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

10.2.271 RXIPV6_NO_PAYLOAD_OCTETS — Offset 86Ch

This register provides the number of bytes received by GbE Controller in IPv6 datagrams that did not have a TCP, UDP, or ICMP payload. The value in the Length field of IPv6 header is used to update this counter. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 86Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxIPv6 Payload Octets (RXIPV6NOPAYOCT):** This field indicates the number of bytes received in IPv6 datagrams that did not have a TCP, UDP, or ICMP payload. The value in the Length field of IPv6 header is used to update this counter. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

10.2.272 RXUDP_GOOD_OCTETS — Offset 870h

This register provides the number of bytes received by GbE Controller in a good UDP segment. This counter does not count IP header bytes.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 870h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxUDP Good Octets (RXUDPGDOCT):** This field indicates the number of bytes received in a good UDP segment. This counter does not count IP header bytes.

10.2.273 RXUDP_ERROR_OCTETS — Offset 874h

This register provides the number of bytes received by GbE Controller in a UDP segment that had checksum errors. This counter does not count IP header bytes.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 874h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxUDP Error Octets (RXUDPERROCT):** This field indicates the number of bytes received in a UDP segment that had checksum errors. This counter does not count IP header bytes.

10.2.274 RXTCP_GOOD_OCTETS — Offset 878h

This register provides the number of bytes received by GbE Controller in a good TCP segment. This counter does not count IP header bytes.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 878h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
