13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	65h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.5.126 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_F_16) - Offset 980h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + 980h	44001700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Synchronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved**
12:10	5h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.5.127 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_F_16) - Offset 984h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + 984h	00000066h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RO	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	66h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.5.128 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_F_17) - Offset 990h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + 990h	44001700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	5h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.5.129 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_F_17) - Offset 994h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + 994h	00000067h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RO	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behavior of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	67h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.5.130 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_F_18) - Offset 9A0h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + 9A0h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Synchronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.5.131 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_F_18) - Offset 9A4h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + 9A4h	00000068h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RO	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. 20.5.132 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_F_19) - Offset 9B0h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + 9B0h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Synchronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)

Bit Range	Default & Access	Field Name (ID): Description
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.5.133 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_F_19) - Offset 9B4h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + 9B4h	00000069h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RO	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	69h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.5.134 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_F_20) - Offset 9C0h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + 9C0h	44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.5.135 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_F_20) - Offset 9C4h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + 9C4h	0000006Ah

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RO	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup

20.5.136 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_F_21) - Offset 9D0h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + 9D0h	44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Synchronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.5.137 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_F_21) - Offset 9D4h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + 9D4h	0000006Bh

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RO	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	6Bh RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.5.138 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_F_22) - Offset 9E0h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + 9E0h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Synchronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.5.139 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_F_22) - Offset 9E4h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + 9E4h	0000006Ch

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RO	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	6Ch RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.5.140 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_F_23) - Offset 9F0h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + 9F0h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.5.141 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_F_23) - Offset 9F4h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + 9F4h	0000006Dh

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RO	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	6Dh RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.5.142 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_0) - Offset A70h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + A70h	44001B00h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved**
12:10	6h RW/V	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.5.143 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_0) - Offset A74h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + A74h	00000026h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	26h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + A80h	44001B00h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved**
12:10	6h RW/V	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.5.145 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_1) - Offset A84h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + A84h	00000027h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behavior of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	27h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.5.146 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_2) - Offset A90h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + A90h	44001B00h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Synchronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved**
12:10	6h RW/V	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.5.147 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_2) - Offset A94h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + A94h	00000028h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	28h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.5.148 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_3) - Offset AA0h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + AA0h	44001B00h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	6h RW/V	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.5.149 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_3) - Offset AA4h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + AA4h	00000029h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	29h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.5.150 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_4) - Offset AB0h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + AB0h	44001B00h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	6h RW/V	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.5.151 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_4) - Offset AB4h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + AB4h	00000030h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	30h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.5.152 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_5) - Offset AC0h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + AC0h	44001B00h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	6h RW/V	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.5.153 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_5) - Offset AC4h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + AC4h	000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	6h RW/V	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.5.155 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_6) - Offset AD4h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + AD4h	00000032h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	32h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.5.156 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_7) - Offset AE0h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + AE0h	44001B00h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	6h RW/V	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.5.157 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_7) - Offset AE4h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + AE4h	00000033h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. 20.5.158 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_8) - Offset AF0h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + AF0h	44001B00h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	6h RW/V	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.5.159 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_8) - Offset AF4h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + AF4h	00000034h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	34h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.5.160 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_9) - Offset B00h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + B00h	44001B00h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RW	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved**
12:10	6h RW/V	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.5.161 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_9) - Offset B04h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + B04h	00000035h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.

MMIO	32 bit	FD6A0000h + B10h	44001B00h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved**
12:10	6h RW/V	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.5.163 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_10) - Offset B14h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + B14h	00000036h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	36h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.5.164 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_11) - Offset B20h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + B20h	44001B00h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved**
12:10	6h RW/V	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.5.165 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_11) - Offset B24h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + B24h	00000037h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. 9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behavior of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	37h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.5.166 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_12) - Offset B30h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + B30h	44001B00h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved**
12:10	6h RW/V	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.5.167 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_12) - Offset B34h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + B34h	00000038h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	38h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.5.168 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_13) - Offset B40h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + B40h	44001B00h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved**
12:10	6h RW/V	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.5.169 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_13) - Offset B44h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + B44h	00000039h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.

20.5.170 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_14) - Offset B50h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + B50h	44001B00h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Synchronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	6h RW/V	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.5.171 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_14) - Offset B54h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + B54h	0000003Ah

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	3Ah RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.5.172 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_15) - Offset B60h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + B60h	44000B00h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	2h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.5.173 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_15) - Offset B64h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + B64h	0000003Bh

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	3Bh RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.5.174 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_16) - Offset B70h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + B70h	44000B00h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Synchronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	2h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.5.175 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_16) - Offset B74h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + B74h	0000003Ch

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behavior of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	3Ch RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.5.176 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_17) - Offset B80h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + B80h	44001B00h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	6h RW/V	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.5.177 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_17) - Offset B84h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + B84h	0000003Dh

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	3Dh RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.5.178 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_18) - Offset B90h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + B90h	44001700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	5h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.5.179 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_18) - Offset B94h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + B94h	00003C3Eh

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	Fh RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.

29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	Fh RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	3Fh RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.5.182 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_20) - Offset BB0h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + BB0h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Synchronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.5.183 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_20) - Offset BB4h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + BB4h	00000040h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.

20.5.184 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_21) - Offset BC0h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + BC0h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.5.185 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_21) - Offset BC4h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + BC4h	00000041h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	41h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.5.186 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_22) - Offset BD0h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + BD0h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.5.187 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_22) - Offset BD4h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + BD4h	00000042h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.

20.5.188 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_23) - Offset BE0h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + BE0h	44000200h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) or Global Reset (i.e global_rst_b) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved**
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.5.189 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_23) - Offset BE4h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + BE4h	00000043h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	43h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.6 GPIO Community 5 Registers Summary

This chapter documents GPIO 5 Registers.

Table 20-6. Summary of GPIO 5 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
8h	4	Family Base Address (FAMBAR)	00000300h
Ch	4	Pad Base Address (PADBAR)	00000700h
10h	4	Miscellaneous Configuration (MISCCFG)	37043200h
20h	4	Pad Ownership (PAD_OWN_GPP_R_0)	00000000h
80h	4	Pad Configuration Lock (PADCFGLOCK_GPP_R_0)	00000000h
84h	4	Pad Configuration Lock GPIO TxState Register (PADCFGLOCKTX_GPP_R_0)	00000000h
B0h	4	Host Software Pad Ownership (HOSTSW_OWN_GPP_R_0)	00000000h
100h	4	GPI Interrupt Status (GPI_IS_GPP_R_0)	00000000h
120h	4	GPI Interrupt Enable (GPI_IE_GPP_R_0)	00000000h
140h	4	GPI General Purpose Events Status (GPI_GPE_STS_GPP_R_0)	00000000h
160h	4	GPI General Purpose Events Enable (GPI_GPE_EN_GPP_R_0)	00000000h
180h	4	SMI Status (GPI_SMI_STS_GPP_R_0)	00000000h
1A0h	4	SMI Enable (GPI_SMI_EN_GPP_R_0)	00000000h
1C0h	4	NMI Status (GPI_NMI_STS_GPP_R_0)	00000000h
1E0h	4	NMI Enable (GPI_NMI_EN_GPP_R_0)	00000000h
700h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_R_0)	44000700h
704h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPP_R_0)	00000070h
710h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_R_1)	44000700h
714h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPP_R_1)	00003C71h
720h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_R_2)	44000600h
724h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPP_R_2)	00003C72h
730h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_R_3)	44000700h
734h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPP_R_3)	00003C73h
740h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_R_4)	44000700h
74Ch	4	Pad Configuration DW3 (PAD_CFG_DW1_GPP_R_4)	00000000h
750h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_R_5)	44000300h
754h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPP_R_5)	00000075h
760h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_R_6)	44000300h
764h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPP_R_6)	00000076h
770h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_R_7)	44000300h
774h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPP_R_7)	00000077h

20.6.1 Family Base Address (FAMBAR) - Offset 8h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD690000h + 8h	00000300h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0300h RO	**Family Base Address (FAMBAR):** This field provides the starting byte-align address of Family0 register sets within a Community. It is meant for software to discover from where the very first Family register (i.e. Family0 register) starts to compute the next Families address offsets.

20.6.2 Pad Base Address (PADBAR) - Offset Ch

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD690000h + Ch	00000700h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0700h RO	**Pad Base Address (PADBAR):** This field provides the starting byte-align address of Pad0 register sets within a Community. It is meant for software to discover from where the very first Pad register (i.e. Pad0 register) starts to compute the next Pad address offsets.

20.6.3 Miscellaneous Configuration (MISCCFG) - Offset 10h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD690000h + 10h	37043200h

Bit Range	Default & Access	Field Name (ID): Description
31:24	37h RW	**GPIO Driver Mode Interrupt Select (GPDMINTSEL):** IRQ globally for all pads (GPI_IS with corresponding GPI_IE enable). 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255
23:20	0h RO	**Reserved**
19:16	4h RW	**Reserved**
15:12	3h RW	**GPIO Group to GPE_DW1 assignment encoding (GPE0_DW1):** This register assigns a specific GPIO Group to the ACPI GPE0[63:32]. The setting is processor specific.
11:8	2h RW	**GPIO Group to GPE_DW0 assignment encoding (GPE0_DW0):** This register assigns a specific GPIO Group to the ACPI GPE0[:0]. The setting is processor specific.
7	0h RW	**GPIO IOSF Sideband VNNREQ Enable (GPVNNREQEN):** Specify whether the GPIO Community should take part in IOSFSB VNNREQ/ACK handshake 0 = Disable participation in IOSF SB VNNREQ and VNNACK handshake 1 = Enable participation in IOSF SB VNNREQ and VNNACK handshake When this bit set to 1, GPIO controller will de-assert the VNNREQ when there is no outstanding IOSF SB upstream cycle from GPIO controller. When this bit set to 1 and MISCSECCFG.SBTRIGDIS is 0, GPIO controller will assert the VNNREQ to request for the following list of IOSF-SB Message initiation. Event list: IRQ NMI SMI SSMI Fuse/Soft strap pull VNNREQ shall de-assert when MISCSECCFG.SBTRIGDIS is set to 1. As VNNAON IP, GPIO controller will assert the VNNREQ when in reset. The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pwrgate_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For processor that does not have the soft strap defined for this power gating, this register always default to 1.
6	0h RW	**GPIO PGCB Clock Dynamic Partition Clock Gating Enable (GPPGCBDPCGEN):** Specify whether the GPIO Community PGCB clock should take part in partition clock gating 0 = Disable participation in PGCB clock dynamic partition clock gating 1 = Enable participation in PGCB clock dynamic partition clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For processor that does not have the soft strap defined for this clock gating, this register always default to 0

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**GPIO IOSF Sideband Dynamic Partition Clock Gating Enable (GPSIDEDPCGEN):** Specify whether the GPIO Community IOSF sideband clock should take part in partition clock gating 0 = Disable participation in IOSF sideband clock dynamic partition clock gating 1 = Enable participation in IOSF sideband clock dynamic partition clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For processor that does not have the soft strap defined for this clock gating, this register always default to 0
4	0h RW	**GPIO RCOMP clock Dynamic Local Clock Gating (GPRCOMPCDLCGEN):** Specify whether the GPIO Community should perform local clock gating on RCOMP clock 0 = Disable dynamic RCOMP clock local clock gating 1 = Enable dynamic RCOMP clock local clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For processor that does not have the soft strap defined for this clock gating, this register always default to 0
3	0h RW	**GPIO RTC clock Dynamic Local Clock Gating (GPRTCDLCGEN):** Specify whether the GPIO Community should perform local clock gating on RTC clock 0 = Disable dynamic RTC clock local clock gating 1 = Enable dynamic RTC clock local clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For processor that does not have the soft strap defined for this clock gating, this register always default to 0
2	0h RO	**Reserved**
1	0h RW	**GPIO Dynamic Partition Clock Gating Enable (GPDPCGEN):** Specify whether the GPIO Community should take part in partition clock gating 0 = Disable participation in dynamic partition clock gating 1 = Enable participation in dynamic partition clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For processor that does not have the soft strap defined for this clock gating, this register always default to 0
0	0h RW	**GPIO Dynamic Local Clock Gating Enable (GPDLCGEN):** Specify whether the GPIO Community should perform local clock gating 0 = Disable dynamic local clock gating 1 = Enable dynamic local clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For processor that does not have the soft strap defined for this clock gating, this register always default to 0

20.6.4 Pad Ownership (PAD_OWN_GPP_R_0) - Offset 20h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD690000h + 20h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:28	0h RW	**Pad Ownership (PAD_OWN_GPP_R_7):** This register can be written by CSME GPIO Function** only. Write access without CSME GPIO Function SAI shall be dropped. There is no SAI restriction on register read. Status update: GPIO input event notification (if enabled) to embedded system owner via IOSF-SB Virtual Wire message, or Host SMI (if implemented), NMI (if implemented), SCI/GPE or GPI_INT status update All subsequent read/write accesses to the corresponding pad's Pad Configuration Register are verified with the owner's GPIO Function SAI. PAD_OWN[1:0] encoding: '00' = Host GPIO ACPI Mode or GPIO Driver Mode. Host software (ACPI or GPIO Driver) has ownership of the pad. In Host GPIO Driver Mode (refer to HOSTSW_OWN), GPIO input event update is limited to GPI_STS update only. Otherwise in Host ACPI Mode, updates are limited to GPI_GPE_STS, GPI_NMI_STS and/or GPI_SMI_STS. No read/write restriction to the Pad Configuration register set during host ownership. During host ownership, CSME, and PSE do not own this pad and are not notified of the GPIO input event. '01' = CSME GPIO Mode. CSME has ownership of the pad. All accesses to Pad Configuration register set must be verified with CSME GPIO Function SAI **. Non-posted cycle access without CSME SAI shall result into successful Completion status. Posted cycle access without CSME SAI shall be dropped. In CSME GPIO Mode, the host related status registers related to the pad (refer to host ownership above) are masked from being updated by GPIO input event. If IOSF-SB Virtual Wire message generation is enabled for this pad, GPIO hardware sends the Virtual Wire message to CSME GPIO Function. Only CSME GPIO Function is notified of the GPIO input event. '10' = PSE GPIO Mode. Same description as CSME GPIO Mode above except verifying PSE GPIO Function SAI for pad related register accesses and the Virtual Wire message is delivered to the PSE GPIO Function. '11' = Reserved. All other values are reserved. Implementation shall treat reserved values the same as 0h.
27:26	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
25:24	0h RW	**Pad Ownership (PAD_OWN_GPP_R_6):** This register can be written by CSME GPIO Function** only. Write access without CSME GPIO Function SAI shall be dropped. There is no SAI restriction on register read. Status update: GPIO input event notification (if enabled) to embedded system owner via IOSF-SB Virtual Wire message, or Host SMI (if implemented), NMI (if implemented), SCI/GPE or GPI_INT status update All subsequent read/write accesses to the corresponding pad's Pad Configuration Register are verified with the owner's GPIO Function SAI. PAD_OWN[1:0] encoding: '00' = Host GPIO ACPI Mode or GPIO Driver Mode. Host software (ACPI or GPIO Driver) has ownership of the pad. In Host GPIO Driver Mode (refer to HOSTSW_OWN), GPIO input event update is limited to GPI_STS update only. Otherwise in Host ACPI Mode, updates are limited to GPI_GPE_STS, GPI_NMI_STS and/or GPI_SMI_STS. No read/write restriction to the Pad Configuration register set during host ownership. During host ownership, CSME, and PSE do not own this pad and are not notified of the GPIO input event. '01' = CSME GPIO Mode. CSME has ownership of the pad. All accesses to Pad Configuration register set must be verified with CSME GPIO Function SAI **. Non-posted cycle access without CSME SAI shall result into successful Completion status. Posted cycle access without CSME SAI shall be dropped. In CSME GPIO Mode, the host related status registers related to the pad (refer to host ownership above) are masked from being updated by GPIO input event. If IOSF-SB Virtual Wire message generation is enabled for this pad, GPIO hardware sends the Virtual Wire message to CSME GPIO Function. Only CSME GPIO Function is notified of the GPIO input event. '10' = PSE GPIO Mode. Same description as CSME GPIO Mode above except verifying PSE GPIO Function SAI for pad related register accesses and the Virtual Wire message is delivered to the PSE GPIO Function. '11' = Reserved. All other values are reserved. Implementation shall treat reserved values the same as 0h.
23:22	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
21:20	0h RW	**Pad Ownership (PAD_OWN_GPP_R_5):** This register can be written by CSME GPIO Function** only. Write access without CSME GPIO Function SAI shall be dropped. There is no SAI restriction on register read. Status update: GPIO input event notification (if enabled) to embedded system owner via IOSF-SB Virtual Wire message, or Host SMI (if implemented), NMI (if implemented), SCI/GPE or GPI_INT status update All subsequent read/write accesses to the corresponding pad's Pad Configuration Register are verified with the owner's GPIO Function SAI. PAD_OWN[1:0] encoding: '00' = Host GPIO ACPI Mode or GPIO Driver Mode. Host software (ACPI or GPIO Driver) has ownership of the pad. In Host GPIO Driver Mode (refer to HOSTSW_OWN), GPIO input event update is limited to GPI_STS update only. Otherwise in Host ACPI Mode, updates are limited to GPI_GPE_STS, GPI_NMI_STS and/or GPI_SMI_STS. No read/write restriction to the Pad Configuration register set during host ownership. 20.6.16 Pad Configuration DW0 (PAD_CFG_DW0_GPP_R_0) - Offset 700h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD690000h + 700h	44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Synchronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved**
12:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.6.17 Pad Configuration DW1 (PAD_CFG_DW1_GPP_R_0) - Offset 704h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD690000h + 704h	00000070h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	70h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.6.18 Pad Configuration DW0 (PAD_CFG_DW0_GPP_R_1) - Offset 710h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD690000h + 710h	44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved**
11:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.6.19 Pad Configuration DW1 (PAD_CFG_DW1_GPP_R_1) - Offset 714h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD690000h + 714h	00003C71h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	Fh RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behavior of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Synchronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved**
12:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.6.21 Pad Configuration DW1 (PAD_CFG_DW1_GPP_R_2) - Offset 724h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD690000h + 724h	00003C72h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions.These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions.These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions.These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions.These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions.These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions.These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions.These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):**See CFIO HIP Interface for details on these control bit descriptions.These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions.These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions.These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	Fh RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	72h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.6.22 Pad Configuration DW0 (PAD_CFG_DW0_GPP_R_3) - Offset 730h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD690000h + 730h	44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved**
12:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.6.23 Pad Configuration DW1 (PAD_CFG_DW1_GPP_R_3) - Offset 734h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD690000h + 734h	00003C73h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions.These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions.These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions.These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	Fh RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behavior of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	73h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.6.24 Pad Configuration DW0 (PAD_CFG_DW0_GPP_R_4) - Offset 740h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD690000h + 740h	44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved**
12:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.6.25 Pad Configuration DW1 (PAD_CFG_DW1_GPP_R_4) - Offset 744h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD690000h + 744h	00000074h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	74h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.6.26 Pad Configuration DW0 (PAD_CFG_DW0_GPP_R_5) - Offset 750h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD690000h + 750h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Synchronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved**
12:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.6.27 Pad Configuration DW1 (PAD_CFG_DW1_GPP_R_5) - Offset 754h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD690000h + 754h	00000075h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	75h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.6.28 Pad Configuration DW0 (PAD_CFG_DW0_GPP_R_6) - Offset 760h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD690000h + 760h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Synchronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved**
12:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.6.29 Pad Configuration DW1 (PAD_CFG_DW1_GPP_R_6) - Offset 764h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD690000h + 764h	00000076h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	76h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

20.6.30 Pad Configuration DW0 (PAD_CFG_DW0_GPP_R_7) - Offset 770h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD690000h + 770h	44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the processor responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved**
12:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

20.6.31 Pad Configuration DW1 (PAD_CFG_DW1_GPP_R_7) - Offset 774h

More details to Register Field.

Type	Size	Offset	Default
MMIO	32 bit	FD690000h + 774h	00000077h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is processor specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily. The recommended settings are [3:0]: 0 000: Disable 0 001: 1k wpd 0 010: 5k wpd 0 100: 20k wpd 1 000: 20k & 5k & 1k wpu 1 001: 1k wpu 1 010: 5k wpu 1 011: 1k & 5k wpu 1 100: 20k wpu 1 101: 20k & 1k wpu 1 110: 20k & 5k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination Note: Not all settings above represent a valid combination. The setting is only applicable if the buffer coupled with the pad has the corresponding weak pull-up and/or pull-down support (e.g. for a buffer that do not implement the 1K wpu, following settings should be treated as Reserved: b'1000, b'1001, b'1011', b'1101'. Hardware must ensure the CFIO wpu/wpd signals do not glitch.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	77h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

21 8254 Timer

21.1 8254 Timer Registers Summary

Table 21-1. Summary of 8254 Timer Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
40h	1	Counter 0_Interval Timer Status Byte Format Register (C0_ITSBFR)	C4h
42h	1	Counter 2_Interval Timer Status Byte Format Register (C2_ITSBFR)	C4h
43h	1	Timer Control Word Register (TCW)	00h

21.1.1 Counter 0_Interval Timer Status Byte Format Register (C0_ITSBFR) - Offset 40h

Each counter's status byte can be read following a Read Back Command. If latch status is chosen (bit 4=0, Read Back Command) as a read back option for a given counter, the next read from the counter's Counter Access Ports Register (40h for counter 0 and 42h for counter 2) returns the status byte. The status byte returns the following:

Type	Size	Offset	Default
IO	8 bit	40h	C4h

Bit Range	Default & Access	Field Name (ID): Description
7	1h RO	**Counter OUT Pin State (COPS):** When this bit is a 1, the OUT pin of the counter is also a 1. When this bit is a 0, the OUT pin of the counter is also a 0.
6	1h RO	**Count Register Status (CRSTS):** This bit indicates when the last count written to the Count Register (CR) has been loaded into the counting element (CE). The exact time this happens depends on the counter mode, but until the count is loaded into the counting element (CE), the count value will be incorrect. 0 Count has been transferred from CR to CE and is available for reading. 1 Null Count. Count has not been transferred from CR to CE and is not yet available for reading.

Bit Range	Default & Access	Field Name (ID): Description
5:4	0h RO	**Read/Write Selection Status (RW_SLT_STS):** These reflect the read/write selection made through bits[5:4] of the control register. The binary codes returned during the status read match the codes used to program the counter read/write selection. 00 Counter Latch Command 01 Read/Write Least Significant Byte (LSB) 10 Read/Write Most Significant Byte (MSB) 11 Read/Write LSB then MSB
3:1	2h RO	**Mode Selection Status (MD_SLT_STS):** These bits return the counter mode programming. The binary code returned matches the code used to program the counter mode, as listed under the bit function above. 000 0 Out signal on end of count (=0) 001 1 Hardware retriggerable one-shot x10 2 Rate generator (divide by n counter) x11 3 Square wave output 100 4 Software triggered strobe 101 5 Hardware triggered strobe
0	0h RO	**Countdown Type Status (CDT_STS):** This bit reflects the current countdown type, ether 0 for binary countdown or a 1 for binary coded decimal (BCD) countdown.

21.1.2 Counter 2_Interval Timer Status Byte Format Register (C2_ITSBFR) - Offset 42h

Each counter's status byte can be read following a Read Back Command. If latch status is chosen (bit 4=0, Read Back Command) as a read back option for a given counter, the next read from the counter's Counter Access Ports Register (40h for counter 0 and 42h for counter 2) returns the status byte. The status byte returns the following:

Type	Size	Offset	Default
IO	8 bit	42h	C4h

Bit Range	Default & Access	Field Name (ID): Description
7	1h RO	**Counter OUT Pin State (COPS):** When this bit is a 1, the OUT pin of the counter is also a 1 When this bit is a 0, the OUT pin of the counter is also a 0
6	1h RO	**Count Register Status (CRSTS):** This bit indicates when the last count written to the Count Register (CR) has been loaded into the counting element (CE). The exact time this happens depends on the counter mode, but until the count is loaded into the counting element (CE), the count value will be incorrect. 0 Count has been transferred from CR to CE and is available for reading 1 Null Count. Count has not been transferred from CR to CE and is not yet available for reading
5:4	0h RO	**Read/Write Selection Status (RW_SLT_STS):** These reflect the read/write selection made through bits[5:4] of the control register. The binary codes returned during the status read match the codes used to program the counter read/write selection. 00 Counter Latch Command 01 Read/Write Least Significant Byte (LSB) 10 Read/Write Most Significant Byte (MSB) 11 Read/Write LSB then MSB
3:1	2h RO	**Mode Selection Status (MD_SLT_STS):** These bits return the counter mode programming. The binary code returned matches the code used to program the counter mode, as listed under the bit function above. 000 0 Out signal on end of count (=0) 001 1 Hardware retriggerable one-shot x10 2 Rate generator (divide by n counter) x11 3 Square wave output 100 4 Software triggered strobe 101 5 Hardware triggered strobe
0	0h RO	**Countdown Type Status (CDT_STS):** This bit reflects the current countdown type, ether 0 for binary countdown or a 1 for binary coded decimal (BCD) countdown.

21.1.3 Timer Control Word Register (TCW) - Offset 43h

This register is programmed prior to any counter being accessed to specify counter modes. Following reset, the control words for each register are undefined and each counter output is 0. Each timer must be programmed to bring it into a known state.

There are two special commands that can be issued to the counters through this register, the Read Back Command and the Counter Latch Command. When these commands are chosen, several bits within this register are redefined.

Type	Size	Offset	Default
IO	8 bit	43h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h WO	**Counter Select (CNT_SLT):** The Counter Selection bits select the counter the control word acts upon as shown below. The Read Back Command is selected when bits[7:6] are both 1 00 Counter 0 select 01 Reserved 10 Counter 2 select 11 Read Back Command
5:4	0h WO	**Read/Write Select: (RW_SLT):** These bits are the read/write control bits. The actual counter programming is done through the counter port (40h for counter 0 and 42h for counter 2) 00 Counter Latch Command 01 Read/Write Least Significant Byte (LSB) 10 Read/Write Most Significant Byte (MSB) 11 Read/Write LSB then MSB
3:1	0h WO	**Counter Mode Selection (CNT_MD_SLTN):** These bits select one of six possible modes of operation for the selected counter. 000 0 Out signal on end of count (=0) 001 1 Hardware retriggerable one-shot x10 2 Rate generator (divide by n counter) x11 3 Square wave output 100 4 Software triggered strobe 101 5 Hardware triggered strobe
0	0h WO	**Binary/BCD Countdown Select (B_BCD_CNTDWN_SLT):** 0 Binary countdown is used. The largest possible binary count is 2^16 1 Binary coded decimal (BCD) count is used. The largest possible BCD count is 10^4

22 Processor Interface

22.1 Processor Interface Registers Summary

Table 22-1. Summary of Processor Interface Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
61h	1	NMI Status and Control (NMI_STS_CNT)	20h
70h	1	NMI Enable (and Real Time Clock Index) (NMI_EN)	80h
92h	1	Init Register (PORT92)	00h
CF9h	1	Reset Control Register (RST_CNT)	00h

22.1.1 NMI Status and Control (NMI_STS_CNT) - Offset 61h

NMI Status and Control Register.

Type	Size	Offset	Default
IO	8 bit	61h	20h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**SERR NMI Source Status (SERR_NMI_STS):** This bit is set by any of the sources of the internal SERR on the PCH backbone, this includes SERR assertions forwarded from the secondary PCI bus, error from a PCIe port, Do_SERR or standard PCIe error message from DMI, or internal Bus 0 functions that generate SERR#. Bit 2 must be cleared in this register in order for this bit to be set. This interrupt source is enabled by setting bit 2 to 0. To reset the interrupt, set bit 2 to 1 and then set it to 0. This bit is read-only. When writing to port 61h, this bit must be 0.
6	0h RO	**IOCHK NMI Source Status (IOCHK_NMI_STS):** This bit is set if an ISA agent (via SERIRQ) asserts IOCHK# and bit 3 is cleared in this register. This interrupt source is enabled by setting bit 3 to 0. To reset the interrupt, set bit 3 to 1 and then set it to 0. This bit is read-only. When writing to port 61h, this bit must be a 0.
5	1h RO	**Timer Counter 2 OUT Status (TMR2_OUT_STS):** This bit reflects the current state of the 8254 counter 2 output. Counter 2 must be programmed following any PCI reset for this bit to have a determinate value. When writing to port 61h, this bit must be a 0.
4	0h RO/V	**REF_TOGGLE field (REF_TOGGLE):** Refresh Cycle Toggle. This signal toggles from either 0 to 1 or 1 to 0 at a rate approximately to the low and high duty cycle times of the RTC clock operating at 32.5kHz.
3	0h RW	**IOCHK NMI Enable (IOCHK_NMI_EN):** When this bit is a 1, IOCHK# NMIs are disabled and cleared. When this bit is a 0, IOCHK# NMIs are enabled.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**PCI SERR Enable (PCI_SERR_EN):** When this bit is a 1, the SERR# NMIs are disabled and cleared. When this bit is a 0, SERR# NMIs are enabled.
1	0h RW	**Speaker Data Enable (SPKR_DAT_EN):** When this bit is a 0, the SPKR output is a 0. When this bit is a 1, the SPKR output is equivalent to the Counter 2 OUT signal value.
0	0h RW	**Timer Counter 2 Enable (TIM_CNT2_EN):** When this bit is a 0, Counter 2 counting is disabled. Counting is enabled when this bit is 1.

22.1.2 NMI Enable (and Real Time Clock Index) (NMI_EN) - Offset 70h

This register is write-only for normal operation. In Alt-Access mode, this register can be read to find the NMI Enable status and the RTC index value.

*Read/Write (Special), Use RW/V because there is no equivalent register access attribute in RDL.

Type	Size	Offset	Default
IO	8 bit	70h	80h

Bit Range	Default & Access	Field Name (ID): Description
7	1h WO	**NMI_EN field (NMI_EN):** When this bit is a 1, all NMI sources are disabled. When this bit is a 0, NMI source is enabled.
6:0	00h WO	**Real Time Clock Index (Address) (RTC_INDX):** This data goes to the RTC to select which register or CMOS RAM address is being accessed.

22.1.3 Init Register (PORT92) - Offset 92h

Port92 Init register.

Type	Size	Offset	Default
IO	8 bit	92h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:1	0h RO	**Reserved**
0	0h RW	**INIT NOW (INIT_NOW):** When this bit transitions from a 0 to a 1, the PCH will force INIT# active for 16 PCI clocks.

22.1.4 Reset Control Register (RST_CNT) - Offset CF9h

Reset Control register.

Type	Size	Offset	Default
IO	8 bit	CF9h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0h RO	**Reserved**
3	0h RW	**Full Reset (FULL_RST):** When this bit is set to 1 and bit 1 is set to 1 (indicating Hard Reset, not Soft Reset), and the RST_CPU bit (bit 2) is written from 0 to 1, the PCH will do a full reset, including driving SLP_S3#, SLP_S4# and SLP_S5# active (low) for at least 3 (and no more than 5) seconds. When this bit is set, it also causes the full power cycle (SLP_S3/4/5# assertion) in response to SYSRESET#, PWROK#, and Watchdog timer reset sources.
2	0h RW	**Reset CPU (RST_CPU):** This bit will cause either a hard or soft reset to the CPU depending on the state of the SYS_RST bit (bit 1 in this same register). The software will cause the reset by setting bit 2 from a 0 to a 1.
1	0h RW	**System Reset (SYS_RST):** The bit determines the type of reset caused via RST_CPU (bit 2 of this register). If SYS_RST is 0 when RST_CPU goes from 0 to 1, then the PCH will force INIT# active for 16 PCI clocks. If SYS_RST is 1 when RST_CPU goes from 0 to 1, then the PCH will force PCI reset active for about 1 ms, however the SLP_S3#, SLP_S4# and SLP_S5# signals assertion is dependent on the value of the FULL_RST (bit3 of this register).
0	0h RO	**Reserved**

23 Advanced Programmable Interrupt Controller (APIC)

23.1 APIC Indirect Registers Summary

APIC Indirect Registers lists the registers that can be accessed within the APIC using the Index Register. When accessing these registers, accesses must be done one DWord at a time. For example, software should never access byte 2 from the Data register before accessing bytes 0 and 1. The hardware will not attempt to recover from a bad programming model in this case.

Index	Mnemonic	Register Name
10-11h	RTE0	Redirection Table Entry 0
12-13h	RTE1	Redirection Table Entry 1
14-15h	RTE2	Redirection Table Entry 2
...	...	...
3E-3Fh	RTE23	Redirection Table Entry 23
40-41h	RTE24	Redirection Table Entry 24
...	...	...
FE-FFh	RTE119	Redirection Table Entry 119

Table 23-1. Summary of APIC Indirect Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	Identification Register (IDR)	00000000h

FAh	8	Redirection Table Entry 117 (RTE117)	0000000000010000h
FCh	8	Redirection Table Entry 118 (RTE118)	0000000000010000h
FEh	8	Redirection Table Entry 119 (RTE119)	0000000000010000h

23.1.1 Identification Register (IDR) - Offset 0h

Offset 00h - 00h

Type	Size	Offset	Default
MMIO	32 bit	FEC00000h +0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27:24	0h RW	**APIC Identification (AID):** Software must program this value before using the APIC.
23:16	0h RO	**Reserved**
15	0h RW	**Scratchpad Field (SPD):** ITSS Scratchpad Field
14:0	0h RO	**Reserved**

23.1.2 Version Register (VS) - Offset 1h

Offset 01h - 01h

Type	Size	Offset	Default
MMIO	32 bit	FEC00000h + 1h	00770020h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:16	77h RW	**Maximum Redirection Entries (MRE):** This is the entry number (0 being the lowest entry) of the highest entry in the redirection table. In PCH this field is defaulted to 17h to indicate 24 interrupts. This field is Read-Write-Once. BIOS must write to this field after PLTRST# to lockdown the value. This allows BIOS to use some of the entries for its own purpose and thus advertising fewer IOxAPIC Redirection Entries to OS. BIOS may to program this field up to 78h (maximum 120 entries).
15	0h RO	**Pin Assertion Register Supported (PRQ):** Indicate that the IOxAPIC does not implement the Pin Assertion Register.
14:8	0h RO	**Reserved**
7:0	20h RO	**Version field (VS):** Identifies the implementation version as IOxAPIC.

23.1.3 Redirection Table Entry 0 (RTE0) - Offset 10h

Offset 10h - 11h

Type	Size	Offset	Default
MMIO	64 bit	FEC00000h + 10h	0000000000010000h

Bit Range	Default & Access	Field Name (ID): Description
63:56	00h RW	**Destination ID (DID):** Destination ID of the local APIC
55:48	00h RW	**Extended Destination ID (EDID):** Extended destination ID of the local APIC.
47:17	0h RO	**Reserved**
16	1h RW	**Mask field (MSK):** When set, interrupts are not delivered nor held pending. When cleared, and edge or level on this interrupt results in the delivery of the interrupt.
15	0h RW	**Trigger Mode (TM):** When cleared, the interrupt is edge sensitive. When set, the interrupt is level sensitive.
14	0h RO/V	**Remote IRR (RIRR):** This is used for level triggered interrupts - its meaning is undefined for edge triggered interrupts. This bit is set when IOxAPIC sends the level interrupt message to the CPU. This bit is cleared when an EOI message is received that matches the VCT field. This bit is never set for SMI, NMI, INIT, or ExtINT delivery modes.
13	0h RW	**Polarity field (POL):** This specifies the polarity of each interrupt input. When cleared, the signal is active high. When set, the signal is active low.
12	0h RO/V	**Delivery Status (DS):** This field contains the current status of the delivery of this interrupt. When set, an interrupt is pending and not yet delivered. When cleared, there is no activity for this entry
11	0h RW	**Destination Mode (DSM):** This field is used by the local APIC to determine whether it is the destination of the message.
10:8	0h RW	**Delivery Mode (DLM):** This field specifies how the APICs listed in the destination field should act on reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are: Val Name Notes 000 Fixed 001 Lowest Priority 010 SMI Not supported (check with 13.2.3 for details). 011 Reserved 100 NMI Not supported (check with 13.2.3 for details). 101 INIT Not supported (check with 13.2.3 for details). 110 Reserved 111 ExtINT
7:0	00h RW	**Vector field (VCT):** This field contains the interrupt vector for this interrupt. Values range between 10h and FEh.

23.1.4 Redirection Table Entry 1 (RTE1) - Offset 12h

Offset 12h - 13h

Type	Size	Offset	Default
MMIO	64 bit	FEC00000h + 12h	0000000000010000h

Bit Range	Default & Access	Field Name (ID): Description
63:56	00h RW	**Destination ID (DID):** Destination ID of the local APIC
55:48	00h RW	**Extended Destination ID (EDID):** Extended destination ID of the local APIC.
47:17	0h RO	**Reserved**
16	1h RW	**Mask field (MSK):** When set, interrupts are not delivered nor held pending. When cleared, and edge or level on this interrupt results in the delivery of the interrupt.
15	0h RW	**Trigger Mode (TM):** When cleared, the interrupt is edge sensitive. When set, the interrupt is level sensitive.
14	0h RO/V	**Remote IRR (RIRR):** This is used for level triggered interrupts - its meaning is undefined for edge triggered interrupts. This bit is set when IOxAPIC sends the level interrupt message to the CPU. This bit is cleared when an EOI message is received that matches the VCT field. This bit is never set for SMI, NMI, INIT, or ExtINT delivery modes.
13	0h RW	**Polarity field (POL):** This specifies the polarity of each interrupt input. When cleared, the signal is active high. When set, the signal is active low.
12	0h RO/V	**Delivery Status (DS):** This field contains the current status of the delivery of this interrupt. When set, an interrupt is pending and not yet delivered. When cleared, there is no activity for this entry
11	0h RW	**Destination Mode (DSM):** This field is used by the local APIC to determine whether it is the destination of the message.
10:8	0h RW	**Delivery Mode (DLM):** This field specifies how the APICs listed in the destination field should act on reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are: Val Name Notes 000 Fixed 001 Lowest Priority 010 SMI Not supported (check with 13.2.3 for details). 011 Reserved 100 NMI Not supported (check with 13.2.3 for details). 101 INIT Not supported (check with 13.2.3 for details). 110 Reserved 111 ExtINT
7:0	00h RW	**Vector field (VCT):** This field contains the interrupt vector for this interrupt. Values range between 10h and FEh.

23.1.5 Redirection Table Entry 2 (RTE2) - Offset 14h

Offset 14h - 15h

Type	Size	Offset	Default
MMIO	64 bit	FEC00000h + 14h	0000000000010000h

Bit Range	Default & Access	Field Name (ID): Description
63:56	00h RW	**Destination ID (DID):** Destination ID of the local APIC
55:48	00h RW	**Extended Destination ID (EDID):** Extended destination ID of the local APIC.
47:17	0h RO	**Reserved**
16	1h RW	**Mask field (MSK):** When set, interrupts are not delivered nor held pending. When cleared, and edge or level on this interrupt results in the delivery of the interrupt.
15	0h RW	**Trigger Mode (TM):** When cleared, the interrupt is edge sensitive. When set, the interrupt is level sensitive.
14	0h RO/V	**Remote IRR (RIRR):** This is used for level triggered interrupts - its meaning is undefined for edge triggered interrupts. This bit is set when IOxAPIC sends the level interrupt message to the CPU. This bit is cleared when an EOI message is received that matches the VCT field. This bit is never set for SMI, NMI, INIT, or ExtINT delivery modes.
13	0h RW	**Polarity field (POL):** This specifies the polarity of each interrupt input. When cleared, the signal is active high. When set, the signal is active low.
12	0h RO/V	**Delivery Status (DS):** This field contains the current status of the delivery of this interrupt. When set, an interrupt is pending and not yet delivered. When cleared, there is no activity for this entry
11	0h RW	**Destination Mode (DSM):** This field is used by the local APIC to determine whether it is the destination of the message.
10:8	0h RW	**Delivery Mode (DLM):** This field specifies how the APICs listed in the destination field should act on reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are: Val Name Notes 000 Fixed 001 Lowest Priority 010 SMI Not supported (check with 13.2.3 for details). 011 Reserved 100 NMI Not supported (check with 13.2.3 for details). 101 INIT Not supported (check with 13.2.3 for details). 110 Reserved 111 ExtINT
7:0	00h RW	**Vector field (VCT):** This field contains the interrupt vector for this interrupt. Values range between 10h and FEh.

23.1.6 Redirection Table Entry 3 (RTE3) - Offset 16h

Offset 16h - 17h

Type	Size	Offset	Default
MMIO	64 bit	FEC00000h + 16h	0000000000010000h

Bit Range	Default & Access	Field Name (ID): Description
63:56	00h RW	**Destination ID (DID):** Destination ID of the local APIC
55:48	00h RW	**Extended Destination ID (EDID):** Extended destination ID of the local APIC.
47:17	0h RO	**Reserved**
16	1h RW	**Mask field (MSK):** When set, interrupts are not delivered nor held pending. When cleared, and edge or level on this interrupt results in the delivery of the interrupt.
15	0h RW	**Trigger Mode (TM):** When cleared, the interrupt is edge sensitive. When set, the interrupt is level sensitive.
14	0h RO/V	**Remote IRR (RIRR):** This is used for level triggered interrupts - its meaning is undefined for edge triggered interrupts. This bit is set when IOxAPIC sends the level interrupt message to the CPU. This bit is cleared when an EOI message is received that matches the VCT field. This bit is never set for SMI, NMI, INIT, or ExtINT delivery modes.
13	0h RW	**Polarity field (POL):** This specifies the polarity of each interrupt input. When cleared, the signal is active high. When set, the signal is active low.
12	0h RO/V	**Delivery Status (DS):** This field contains the current status of the delivery of this interrupt. When set, an interrupt is pending and not yet delivered. When cleared, there is no activity for this entry
11	0h RW	**Destination Mode (DSM):** This field is used by the local APIC to determine whether it is the destination of the message.
10:8	0h RW	**Delivery Mode (DLM):** This field specifies how the APICs listed in the destination field should act on reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are: Val Name Notes 000 Fixed 001 Lowest Priority 010 SMI Not supported (check with 13.2.3 for details). 011 Reserved 100 NMI Not supported (check with 13.2.3 for details). 101 INIT Not supported (check with 13.2.3 for details). 110 Reserved 111 ExtINT
7:0	00h RW	**Vector field (VCT):** This field contains the interrupt vector for this interrupt. Values range between 10h and FEh.

23.1.7 Redirection Table Entry 4 (RTE4) - Offset 18h

Offset 18h - 19h

Type	Size	Offset	Default
MMIO	64 bit	FEC00000h + 18h	0000000000010000h

Bit Range	Default & Access	Field Name (ID): Description
63:56	00h RW	**Destination ID (DID):** Destination ID of the local APIC
55:48	00h RW	**Extended Destination ID (EDID):** Extended destination ID of the local APIC.
47:17	0h RO	**Reserved**
16	1h RW	**Mask field (MSK):** When set, interrupts are not delivered nor held pending. When cleared, and edge or level on this interrupt results in the delivery of the interrupt.
15	0h RW	**Trigger Mode (TM):** When cleared, the interrupt is edge sensitive. When set, the interrupt is level sensitive.
14	0h RO/V	**Remote IRR (RIRR):** This is used for level triggered interrupts - its meaning is undefined for edge triggered interrupts. This bit is set when IOxAPIC sends the level interrupt message to the CPU. This bit is cleared when an EOI message is received that matches the VCT field. This bit is never set for SMI, NMI, INIT, or ExtINT delivery modes.
13	0h RW	**Polarity field (POL):** This specifies the polarity of each interrupt input. When cleared, the signal is active high. When set, the signal is active low.
12	0h RO/V	**Delivery Status (DS):** This field contains the current status of the delivery of this interrupt. When set, an interrupt is pending and not yet delivered. When cleared, there is no activity for this entry
11	0h RW	**Destination Mode (DSM):** This field is used by the local APIC to determine whether it is the destination of the message.
10:8	0h RW	**Delivery Mode (DLM):** This field specifies how the APICs listed in the destination field should act on reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are: Val Name Notes 000 Fixed 001 Lowest Priority 010 SMI Not supported (check with 13.2.3 for details). 011 Reserved 100 NMI Not supported (check with 13.2.3 for details). 101 INIT Not supported (check with 13.2.3 for details). 110 Reserved 111 ExtINT
7:0	00h RW	**Vector field (VCT):** This field contains the interrupt vector for this interrupt. Values range between 10h and FEh.

23.1.8 Redirection Table Entry 5 (RTE5) - Offset 1Ah

Offset 1Ah - 1Bh

Type	Size	Offset	Default
MMIO	64 bit	FEC00000h + 1Ah	0000000000010000h

Bit Range	Default & Access	Field Name (ID): Description
63:56	00h RW	**Destination ID (DID):** Destination ID of the local APIC
55:48	00h RW	**Extended Destination ID (EDID):** Extended destination ID of the local APIC.
47:17	0h RO	**Reserved**
16	1h RW	**Mask field (MSK):** When set, interrupts are not delivered nor held pending. When cleared, and edge or level on this interrupt results in the delivery of the interrupt.
15	0h RW	**Trigger Mode (TM):** When cleared, the interrupt is edge sensitive. When set, the interrupt is level sensitive.
14	0h RO/V	**Remote IRR (RIRR):** This is used for level triggered interrupts - its meaning is undefined for edge triggered interrupts. This bit is set when IOxAPIC sends the level interrupt message to the CPU. This bit is cleared when an EOI message is received that matches the VCT field. This bit is never set for SMI, NMI, INIT, or ExtINT delivery modes.
13	0h RW	**Polarity field (POL):** This specifies the polarity of each interrupt input. When cleared, the signal is active high. When set, the signal is active low.
12	0h RO/V	**Delivery Status (DS):** This field contains the current status of the delivery of this interrupt. When set, an interrupt is pending and not yet delivered. When cleared, there is no activity for this entry
11	0h RW	**Destination Mode (DSM):** This field is used by the local APIC to determine whether it is the destination of the message.
10:8	0h RW	**Delivery Mode (DLM):** This field specifies how the APICs listed in the destination field should act on reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are: Val Name Notes 000 Fixed 001 Lowest Priority 010 SMI Not supported (check with 13.2.3 for details). 011 Reserved 100 NMI Not supported (check with 13.2.3 for details). 101 INIT Not supported (check with 13.2.3 for details). 110 Reserved 111 ExtINT
7:0	00h RW	**Vector field (VCT):** This field contains the interrupt vector for this interrupt. Values range between 10h and FEh.

23.1.9 Redirection Table Entry 6 (RTE6) - Offset 1Ch

Offset 1Ch - 1Dh

Type	Size	Offset	Default
MMIO	64 bit	FEC00000h + 1Ch	0000000000010000h

Bit Range	Default & Access	Field Name (ID): Description
63:56	00h RW	**Destination ID (DID):** Destination ID of the local APIC
55:48	00h RW	**Extended Destination ID (EDID):** Extended destination ID of the local APIC.
47:17	0h RO	**Reserved**
16	1h RW	**Mask field (MSK):** When set, interrupts are not delivered nor held pending. When cleared, and edge or level on this interrupt results in the delivery of the interrupt.
15	0h RW	**Trigger Mode (TM):** When cleared, the interrupt is edge sensitive. When set, the interrupt is level sensitive.
14	0h RO/V	**Remote IRR (RIRR):** This is used for level triggered interrupts - its meaning is undefined for edge triggered interrupts. This bit is set when IOxAPIC sends the level interrupt message to the CPU. This bit is cleared when an EOI message is received that matches the VCT field. This bit is never set for SMI, NMI, INIT, or ExtINT delivery modes.
13	0h RW	**Polarity field (POL):** This specifies the polarity of each interrupt input. When cleared, the signal is active high. When set, the signal is active low.
12	0h RO/V	**Delivery Status (DS):** This field contains the current status of the delivery of this interrupt. When set, an interrupt is pending and not yet delivered. When cleared, there is no activity for this entry
11	0h RW	**Destination Mode (DSM):** This field is used by the local APIC to determine whether it is the destination of the message.
10:8	0h RW	**Delivery Mode (DLM):** This field specifies how the APICs listed in the destination field should act on reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are: Val Name Notes 000 Fixed 001 Lowest Priority 010 SMI Not supported (check with 13.2.3 for details). 011 Reserved 100 NMI Not supported (check with 13.2.3 for details). 101 INIT Not supported (check with 13.2.3 for details). 110 Reserved 111 ExtINT
7:0	00h RW	**Vector field (VCT):** This field contains the interrupt vector for this interrupt. Values range between 10h and FEh.

23.1.10 Redirection Table Entry 7 (RTE7) - Offset 1Eh

Offset 1Eh - 1Fh

Type	Size	Offset	Default
MMIO	64 bit	FEC00000h + 1Eh	0000000000010000h

Bit Range	Default & Access	Field Name (ID): Description
63:56	00h RW	**Destination ID (DID):** Destination ID of the local APIC
55:48	00h RW	**Extended Destination ID (EDID):** Extended destination ID of the local APIC.
47:17	0h RO	**Reserved**
16	1h RW	**Mask field (MSK):** When set, interrupts are not delivered nor held pending. When cleared, and edge or level on this interrupt results in the delivery of the interrupt.
15	0h RW	**Trigger Mode (TM):** When cleared, the interrupt is edge sensitive. When set, the interrupt is level sensitive.
14	0h RO/V	**Remote IRR (RIRR):** This is used for level triggered interrupts - its meaning is undefined for edge triggered interrupts. This bit is set when IOxAPIC sends the level interrupt message to the CPU. This bit is cleared when an EOI message is received that matches the VCT field. This bit is never set for SMI, NMI, INIT, or ExtINT delivery modes.
13	0h RW	**Polarity field (POL):** This specifies the polarity of each interrupt input. When cleared, the signal is active high. When set, the signal is active low.
12	0h RO/V	**Delivery Status (DS):** This field contains the current status of the delivery of this interrupt. When set, an interrupt is pending and not yet delivered. When cleared, there is no activity for this entry
11	0h RW	**Destination Mode (DSM):** This field is used by the local APIC to determine whether it is the destination of the message.
10:8	0h RW	**Delivery Mode (DLM):** This field specifies how the APICs listed in the destination field should act on reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are: Val Name Notes 000 Fixed 001 Lowest Priority 010 SMI Not supported (check with 13.2.3 for details). 011 Reserved 100 NMI Not supported (check with 13.2.3 for details). 101 INIT Not supported (check with 13.2.3 for details). 110 Reserved 111 ExtINT
7:0	00h RW	**Vector field (VCT):** This field contains the interrupt vector for this interrupt. Values range between 10h and FEh.

23.1.11 Redirection Table Entry 8 (RTE8) - Offset 20h

Offset 20h - 21h

Type	Size	Offset	Default
MMIO	64 bit	FEC00000h + 20h	0000000000010000h

Bit Range	Default & Access	Field Name (ID): Description
63:56	00h RW	**Destination ID (DID):** Destination ID of the local APIC
55:48	00h RW	**Extended Destination ID (EDID):** Extended destination ID of the local APIC.
47:17	0h RO	**Reserved**
16	1h RW	**Mask field (MSK):** When set, interrupts are not delivered nor held pending. When cleared, and edge or level on this interrupt results in the delivery of the interrupt.
15	0h RW	**Trigger Mode (TM):** When cleared, the interrupt is edge sensitive. When set, the interrupt is level sensitive.
14	0h RO/V	**Remote IRR (RIRR):** This is used for level triggered interrupts - its meaning is undefined for edge triggered interrupts. This bit is set when IOxAPIC sends the level interrupt message to the CPU. This bit is cleared when an EOI message is received that matches the VCT field. This bit is never set for SMI, NMI, INIT, or ExtINT delivery modes.
13	0h RW	**Polarity field (POL):** This specifies the polarity of each interrupt input. When cleared, the signal is active high. When set, the signal is active low.
12	0h RO/V	**Delivery Status (DS):** This field contains the current status of the delivery of this interrupt. When set, an interrupt is pending and not yet delivered. When cleared, there is no activity for this entry
11	0h RW	**Destination Mode (DSM):** This field is used by the local APIC to determine whether it is the destination of the message.
10:8	0h RW	**Delivery Mode (DLM):** This field specifies how the APICs listed in the destination field should act on reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are: Val Name Notes 000 Fixed 001 Lowest Priority 010 SMI Not supported (check with 13.2.3 for details). 011 Reserved 100 NMI Not supported (check with 13.2.3 for details). 101 INIT Not supported (check with 13.2.3 for details). 110 Reserved 111 ExtINT
7:0	00h RW	**Vector field (VCT):** This field contains the interrupt vector for this interrupt. Values range between 10h and FEh.

23.1.12 Redirection Table Entry 9 (RTE9) - Offset 22h

Offset 22h - 23h

Type	Size	Offset	Default

Bit Range	Default & Access	Field Name (ID): Description
63:56	00h RW	**Destination ID (DID):** Destination ID of the local APIC
55:48	00h RW	**Extended Destination ID (EDID):** Extended destination ID of the local APIC.
47:17	0h RO	**Reserved**
16	1h RW	**Mask field (MSK):** When set, interrupts are not delivered nor held pending. When cleared, and edge or level on this interrupt results in the delivery of the interrupt.
15	0h RW	**Trigger Mode (TM):** When cleared, the interrupt is edge sensitive. When set, the interrupt is level sensitive.
14	0h RO/V	**Remote IRR (RIRR):** This is used for level triggered interrupts - its meaning is undefined for edge triggered interrupts. This bit is set when IOxAPIC sends the level interrupt message to the CPU. This bit is cleared when an EOI message is received that matches the VCT field. This bit is never set for SMI, NMI, INIT, or ExtINT delivery modes.
13	0h RW	**Polarity field (POL):** This specifies the polarity of each interrupt input. When cleared, the signal is active high. When set, the signal is active low.
12	0h RO/V	**Delivery Status (DS):** This field contains the current status of the delivery of this interrupt. When set, an interrupt is pending and not yet delivered. When cleared, there is no activity for this entry
11	0h RW	**Destination Mode (DSM):** This field is used by the local APIC to determine whether it is the destination of the message.
10:8	0h RW	**Delivery Mode (DLM):** This field specifies how the APICs listed in the destination field should act on reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are: Val Name Notes 000 Fixed 001 Lowest Priority 010 SMI Not supported (check with 13.2.3 for details). 011 Reserved 100 NMI Not supported (check with 13.2.3 for details). 101 INIT Not supported (check with 13.2.3 for details). 110 Reserved 111 ExtINT
7:0	00h RW	**Vector field (VCT):** This field contains the interrupt vector for this interrupt. Values range between 10h and FEh.

23.1.24 Redirection Table Entry 21 (RTE21) - Offset 3Ah

Offset 3Ah - 3Bh

Type	Size	Offset	Default
MMIO	64 bit	FEC00000h + 96h	0000000000010000h

Bit Range	Default & Access	Field Name (ID): Description
63:56	00h RW	**Destination ID (DID):** Destination ID of the local APIC
55:48	00h RW	**Extended Destination ID (EDID):** Extended destination ID of the local APIC.
47:17	0h RO	**Reserved**
16	1h RW	**Mask field (MSK):** When set, interrupts are not delivered nor held pending. When cleared, and edge or level on this interrupt results in the delivery of the interrupt.
15	0h RW	**Trigger Mode (TM):** When cleared, the interrupt is edge sensitive. When set, the interrupt is level sensitive.
14	0h RO/V	**Remote IRR (RIRR):** This is used for level triggered interrupts - its meaning is undefined for edge triggered interrupts. This bit is set when IOxAPIC sends the level interrupt message to the CPU. This bit is cleared when an EOI message is received that matches the VCT field. This bit is never set for SMI, NMI, INIT, or ExtINT delivery modes.
13	0h RW	**Polarity field (POL):** This specifies the polarity of each interrupt input. When cleared, the signal is active high. When set, the signal is active low.
12	0h RO/V	**Delivery Status (DS):** This field contains the current status of the delivery of this interrupt. When set, an interrupt is pending and not yet delivered. When cleared, there is no activity for this entry
11	0h RW	**Destination Mode (DSM):** This field is used by the local APIC to determine whether it is the destination of the message.
10:8	0h RW	**Delivery Mode (DLM):** This field specifies how the APICs listed in the destination field should act on reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are: Val Name Notes 000 Fixed 001 Lowest Priority 010 SMI Not supported (check with 13.2.3 for details). 011 Reserved 100 NMI Not supported (check with 13.2.3 for details). 101 INIT Not supported (check with 13.2.3 for details). 110 Reserved 111 ExtINT
7:0	00h RW	**Vector field (VCT):** This field contains the interrupt vector for this interrupt. Values range between 10h and FEh.

23.1.71 Redirection Table Entry 68 (RTE68) - Offset 98h

Offset 98h - 99h

Type	Size	Offset	Default
MMIO	64 bit	FEC00000h + 98h	0000000000010000h

7:0	00h RW	**Vector field (VCT):** This field contains the interrupt vector for this interrupt. Values range between 10h and FEh.

23.1.82 Redirection Table Entry 79 (RTE79) - Offset AEh

Offset AEh - AFh

Type	Size	Offset	Default
MMIO	64 bit	FEC00000h + AEh	0000000000010000h

Bit Range	Default & Access	Field Name (ID): Description
63:56	00h RW	**Destination ID (DID):** Destination ID of the local APIC
55:48	00h RW	**Extended Destination ID (EDID):** Extended destination ID of the local APIC.
47:17	0h RO	**Reserved**
16	1h RW	**Mask field (MSK):** When set, interrupts are not delivered nor held pending. When cleared, and edge or level on this interrupt results in the delivery of the interrupt.
15	0h RW	**Trigger Mode (TM):** When cleared, the interrupt is edge sensitive. When set, the interrupt is level sensitive.
14	0h RO/V	**Remote IRR (RIRR):** This is used for level triggered interrupts - its meaning is undefined for edge triggered interrupts. This bit is set when IOxAPIC sends the level interrupt message to the CPU. This bit is cleared when an EOI message is received that matches the VCT field. This bit is never set for SMI, NMI, INIT, or ExtINT delivery modes.
13	0h RW	**Polarity field (POL):** This specifies the polarity of each interrupt input. When cleared, the signal is active high. When set, the signal is active low.
12	0h RO/V	**Delivery Status (DS):** This field contains the current status of the delivery of this interrupt. When set, an interrupt is pending and not yet delivered. When cleared, there is no activity for this entry
11	0h RW	**Destination Mode (DSM):** This field is used by the local APIC to determine whether it is the destination of the message.
10:8	0h RW	**Delivery Mode (DLM):** This field specifies how the APICs listed in the destination field should act on reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are: Val Name Notes 000 Fixed 001 Lowest Priority 010 SMI Not supported (check with 13.2.3 for details). 011 Reserved 100 NMI Not supported (check with 13.2.3 for details). 101 INIT Not supported (check with 13.2.3 for details). 110 Reserved 111 ExtINT
7:0	00h RW	**Vector field (VCT):** This field contains the interrupt vector for this interrupt. Values range between 10h and FEh.

23.1.83 Redirection Table Entry 80 (RTE80) - Offset B0h

Offset B0h - B1h

Type	Size	Offset	Default
MMIO	64 bit	FEC00000h + B0h	0000000000010000h

Bit Range	Default & Access	Field Name (ID): Description
63:56	00h RW	**Destination ID (DID):** Destination ID of the local APIC
55:48	00h RW	**Extended Destination ID (EDID):** Extended destination ID of the local APIC.
47:17	0h RO	**Reserved**
16	1h RW	**Mask field (MSK):** When set, interrupts are not delivered nor held pending. When cleared, and edge or level on this interrupt results in the delivery of the interrupt.

7:0	00h RW	**Vector field (VCT):** This field contains the interrupt vector for this interrupt. Values range between 10h and FEh.

23.2 APIC Registers Summary

Table 23-2. Summary of APIC Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
FEC00000h	4	Index Register (IDX)	00000000h
FEC00010h	4	Window Register (WDW)	00000000h
FEC00040h	4	EOI Register (EOI)	00000000h

23.2.1 Index Register (IDX) - Offset FEC00000h

This 8-bit register selects which indirect register appears in the window register to be manipulated by software. Software will program this register to select the desired APIC internal register.

Type	Size	Offset	Default
MMIO	32 bit	FEC00000h + FEC00000h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Index Register (IDX):** Index Register for APIC.

23.2.2 Window Register (WDW) - Offset FEC00010h

This 32-bit register specifies the data to be read or written to the register pointed to by the IDX register. This register can be accessed only in DW quantities.

Type	Size	Offset	Default
MMIO	32 bit	FEC00000h + FEC00010h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**Window Register (WDW):** Window Register for APIC.

23.2.3 EOI Register (EOI) - Offset FEC00040h

When a write is issued to this register, the IOxAPIC will check the lower 8 bits written to this register, and compare it with the vector field for each entry in the I/O Redirection Table. When a match is found, RTE.RIRR for that entry will be cleared. If multiple entries have the same vector, each of those entries will have RTE.RIRR cleared. Only bits 7:0 are used. Bits 31:8 are ignored.

Type	Size	Offset	Default
MMIO	32 bit	FEC00000h + FEC00040h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h WO	**EOI Register (EOI):** EOI Register field.

24 High Precision Event Timer (HPET)

24.1 HPET Memory Mapped Registers Summary

The timer registers are memory mapped directly (rather than indexed) to allow the CPU to access each register without having to use an index register. This ensures accesses are safe for multi-threaded environments. The timer register space is 1024 bytes. The registers are generally aligned on 64-bit boundaries to simplify implementation with IA64 processors. In the PCH, there are 4 possible memory address ranges beginning at 1) FED0_0000h, 2) FED0_1000h, 3) FED0_2000h, 4) FED0_3000h. The choice of address range should be selected by assigning the High Performance Event Timer Configuration (HPTC) register fields in the configuration space of the Primary to Sideband Bridge. All registers are implemented in the Primary power well, and all bits are reset by PLTRST#. Reads to reserved registers or bits will return a value of 0.
Behavioral Rules:
1. Software can read or write the various bytes in these registers using 32-bit or 64-bit accesses. Software must not attempt to read or write across register boundaries. For example, a 32-bit access should be to offset x0h, x4h, x8h, or xCh. 32-bit accesses should not be to 01h, 02h, 03h, 05h, 06h, 07h, 09h, 0Ah, 0Bh, 0Dh, 0Eh, or 0Fh. Any accesses to these offsets will result in an unexpected behavior, and may result in a master abort. However, these accesses should not result in system hangs. 64-bit accesses can only be to x0h and must not cross 64-bit boundaries.
2. Software should not write to read-only registers.
3. Software should not expect any particular or consistent value when reading reserved registers or bits.

Table 24-1. Summary of HPET Memory Mapped Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
FED00000h	8	General Capabilities and ID Register (GEN_CAP_ID)	027BC86B8086A701h
FED00010h	8	General Config Register (GEN_CFG)	0000000000000000h
FED00020h	8	General Interrupt Status Register (GEN_INT_STS)	0000000000000000h
FED000F0h	8	Main Counter Value (MAIN_CNTR)	0000000000000000h
FED00100h	8	Timer 0 Config and Capabilities (TMR0_CNF_CAP)	00F0000000008030h
FED00108h	8	Timer 0 Comparator Value (TMR0_CMP_VAL)	FFFFFFFFFFFFFFFFh

24.1.1 General Capabilities and ID Register (GEN_CAP_ID) - Offset FED00000h

Software can read the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 000h or 004h. 64-bit accesses may only be done to 000h. Writes to this register will have no effect.

Type	Size	Offset	Default
MMIO	64 bit	HPET Base + FED00000h	027BC86B8086A701h

Bit Range	Default & Access	Field Name (ID): Description
63:32	027BC86Bh RO/V	**Main Counter Tick Period (COUNTER_CLK_PER_CAP):** This read-only field indicates the period at which the counter increments in femtoseconds (10^-15 seconds). The PCH HPET timers use a 24 MHz clock, which has a period of 41,666,667 femtoseconds. Therefore this register will always return 027BC86Bh when read. Change by input strap value. If gpcom_strap_xtal_sel=0, then default value will equal to CNTR_CLK_PER_CAP_DEF. If gpcom_strap_xtal_sel=1, then default value will equal to CNTR_CLK_PER_CAP_DEF_CLK1.
31:16	8086h RO	**Vendor ID (VENDOR_ID_CAP):** These bits will return 8086h when read to reflect Intel as the vendor.
15	1h RO	**Legacy Rout Capable (LEG_RT_CAP):** This bit will always be 1 when read, indicating support for the Legacy Interrupt Rout.
14	0h RO	**Reserved**
13	1h RO	**Counter Size (COUNT_SIZE_CAP):** This bit will return 1 when read to indicate support for 64-bit counters allowing 64 or 32-bit mode operation.
12:8	07h RO	**Number of Timers (NUM_TIM_CAP):** This value in this field will be 07h to indicate support for 8 timers in the timer block.
7:0	01h RO	**Revision ID (REV_ID):** The value in this field will be 01h to indicate for revision 1.0 of the HPET specification.

24.1.2 General Configuration Register (GEN_CFG) - Offset FED00010h

Software can read the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 010h or 014h. 64-bit accesses may only be done to 010h.

Type	Size	Offset	Default
MMIO	64 bit	HPET Base + FED00010h	0000000000000000h

Bit Range	Default & Access	Field Name (ID): Description
63:2	0h RO	**Reserved**
1	0h RW	**Legacy Rout (LEG_RT_CNF):** If the LEG_RT_CNF bit is set, then the interrupts will be routed as follows: Timer 0 will be routed to IRQ0 in 8259 or IRQ2 in the I/O APIC Timer 1 will be routed to IRQ8 in 8259 or IRQ8 in the I/O APIC Timer 2-7 will be routed as per the routing in that timers Configuration register. If the LEG_RT_CNF bit is set, the individual routing bits for timers 0 and 1 (APIC or FSB) will have no impact. Otherwise, if the LEG_RT_CNF bit is not set, the individual routing bits for each of the timers are used. This bit will default to 0. BIOS can set it to 1 to enable the legacy routing, or 0 to disable the legacy routing. When changing other bits in this register, this bit should be left unchanged. Otherwise, a spurious interrupt may occur.
0	0h RW	**Overall Enable (ENABLE_CNF):** This bit must be set to enable any of the timers to generate interrupts. If this bit is 0, then the main counter will halt (will not increment) and no interrupts will be caused by any of these timers. For level-triggered interrupts, if an interrupt is pending when the ENABLE_CNF bit is changed from 1 to 0, the interrupt status indications (in the various Txx_INT_STS bits) will not be cleared. Software must write to the Txx_INT_STS bits to clear the interrupts. Intel Specific: This bit will default to 0. BIOS can set it to 1 or 0.

24.1.3 General Interrupt Status Register (GEN_INT_STS) - Offset FED00020h

Software can read the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 020h or 024h. 64-bit accesses may only be done to 020h.

Type	Size	Offset	Default
MMIO	64 bit	HPET Base + FED00020h	0000000000000000h

Bit Range	Default & Access	Field Name (ID): Description
63:8	0h RO	**Reserved**
7	0h RW/1C	**Timer 7 Interrupt Active (T07_INT_STS):** The functionality of this bit depends on whether the edge or level-triggered mode is used for this timer: If set to edge triggered mode this bit will always read as 0 and writes will have no effect. If set to level-triggered mode: This bit will be set by hardware if the corresponding timer interrupt is active. Once the bit is set, it can be cleared by software writing a 1 to the same bit position. Writes of 0 to this bit will have no effect. For example if the bit is already set, a write of 0 will not clear the bit. This bit defaults to 0.
6	0h RW/1C	**Timer 6 Interrupt Active (T06_INT_STS):** The functionality of this bit depends on whether the edge or level-triggered mode is used for this timer: If set to edge triggered mode this bit will always read as 0 and writes will have no effect. If set to level-triggered mode: This bit will be set by hardware if the corresponding timer interrupt is active. Once the bit is set, it can be cleared by software writing a 1 to the same bit position. Writes of 0 to this bit will have no effect. For example if the bit is already set, a write of 0 will not clear the bit. This bit defaults to 0.
5	0h RW/1C	**Timer 5 Interrupt Active (T05_INT_STS):** The functionality of this bit depends on whether the edge or level-triggered mode is used for this timer: If set to edge triggered mode this bit will always read as 0 and writes will have no effect. If set to level-triggered mode: This bit will be set by hardware if the corresponding timer interrupt is active. Once the bit is set, it can be cleared by software writing a 1 to the same bit position. Writes of 0 to this bit will have no effect. For example if the bit is already set, a write of 0 will not clear the bit. This bit defaults to 0.
4	0h RW/1C	**Timer 4 Interrupt Active (T04_INT_STS):** The functionality of this bit depends on whether the edge or level-triggered mode is used for this timer: If set to edge triggered mode this bit will always read as 0 and writes will have no effect. If set to level-triggered mode: This bit will be set by hardware if the corresponding timer interrupt is active. Once the bit is set, it can be cleared by software writing a 1 to the same bit position. Writes of 0 to this bit will have no effect. For example if the bit is already set, a write of 0 will not clear the bit. This bit defaults to 0.
3	0h RW/1C	**Timer 3 Interrupt Active (T03_INT_STS):** The functionality of this bit depends on whether the edge or level-triggered mode is used for this timer: If set to edge triggered mode this bit will always read as 0 and writes will have no effect. If set to level-triggered mode: This bit will be set by hardware if the corresponding timer interrupt is active. Once the bit is set, it can be cleared by software writing a 1 to the same bit position. Writes of 0 to this bit will have no effect. For example if the bit is already set, a write of 0 will not clear the bit. This bit defaults to 0.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW/1C	**Timer 2 Interrupt Active (T02_INT_STS):** The functionality of this bit depends on whether the edge or level-triggered mode is used for this timer: If set to edge triggered mode this bit will always read as 0 and writes will have no effect. If set to level-triggered mode: This bit will be set by hardware if the corresponding timer interrupt is active. Once the bit is set, it can be cleared by software writing a 1 to the same bit position. Writes of 0 to this bit will have no effect. For example if the bit is already set, a write of 0 will not clear the bit. This bit defaults to 0.
1	0h RW/1C	**Timer 1 Interrupt Active (T01_INT_STS):** The functionality of this bit depends on whether the edge or level-triggered mode is used for this timer: If set to edge triggered mode this bit will always read as 0 and writes will have no effect. If set to level-triggered mode: This bit will be set by hardware if the corresponding timer interrupt is active. Once the bit is set, it can be cleared by software writing a 1 to the same bit position. Writes of 0 to this bit will have no effect. For example if the bit is already set, a write of 0 will not clear the bit. This bit defaults to 0.
0	0h RW/1C	**Timer 0 Interrupt Active (T00_INT_STS):** The functionality of this bit depends on whether the edge or level-triggered mode is used for this timer: If set to edge triggered mode this bit will always read as 0 and writes will have no effect. If set to level-triggered mode: This bit will be set by hardware if the corresponding timer interrupt is active. Once the bit is set, it can be cleared by software writing a 1 to the same bit position. Writes of 0 to this bit will have no effect. For example if the bit is already set, a write of 0 will not clear the bit. This bit defaults to 0.

24.1.4 Main Counter Value (MAIN_CNTR) - Offset FED000F0h

Software can read the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 0F0h or 0F4h. 64-bit accesses may only be done to 0F0h. Writes to this register should only be done while the counter is halted. Reads to this register return the current value of the main counter. If 32-bit software attempts to read a 64-bit counter, it should first halt the counter. Since this will delay the interrupts for all of the timers, this should be done only if the consequences are understood. It is strongly recommended that 32-bit software only operate the timer in 32-bit mode. Reads to this register are monotonic. No two consecutive reads will return the same value. The second of two reads will always return a larger value (unless the timer has rolled over to 0)

Type	Size	Offset	Default
MMIO	64 bit	HPET Base + FED000F0h	0000000000000000h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0000000000000000h RW/V	**Counter Value (COUNTER_VAL):** Reads return the current value of the counter. Writes load the new value to the counter.

24.1.5 Timer 0 Configuration and Capabilities (TMR0_CNF_CAP) - Offset FED00100h

Software can read or write the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 1x0h or 1x4h. 64-bit accesses may only be done to 1x0h.

Type	Size	Offset	Default
MMIO	64 bit	HPET Base + FED00100h	00F0000000008030h

Bit Range	Default & Access	Field Name (ID): Description
63:32	00F00000h RO	**Timer 0 Interrupt Rout (TIMER0_INT_ROUT_CAP):** This 32-bit read-only field indicates to which interrupts in the 8259 or I/O (x) APIC this timers interrupt can be routed to. This is used in conjunction with the TIMERn_INT_ROUT_CNF field. Writes to this field will have no effect. Note: If interrupt is handled via 8259, only interrupts 0-15 are applicable and valid. Each bit in this field corresponds to a particular interrupt. For example, if this timers interrupt can be mapped to interrupts 16, 18, 20, 22, or 24, then bits 16, 18, 20, 22, and 24 in this field will be set to 1. All other bits will be 0. Timer 0,1: Bits 20, 21, 22, and 23 in this field will have a value of 1. All other bits will be 0. Timer 2: Bits 11, 20, 21, 22, and 23 in this field will have a value of 1. All other bits will be 0. If IRQ 11 is used, software should ensure IRQ 11 is not shared with any other devices to guarantee the proper operation of this timer. Timer 3: Bits 12, 20, 21, 22, and 23 in this field will have a value of 1. All other bits will be 0. If IRQ 12 is used, software should ensure IRQ 12 is not shared with any other devices to guarantee the proper operation of this timer. Timer 4-7: This field is always 0 as interrupts from these timers can only be delivered via direct FSB interrupt messages.
31:16	0h RO	**Reserved**
15	1h RO	**FSB Interrupt Delivery Capability (TIMER0_FSB_INT_DEL_CAP):** This bit is always read as 1, since the Intel PCH HPET implementation supports the direct FSB interrupt delivery.
14	0h RW	**Timer 0 FSB Interrupt Delivery Enable (TIMER0_FSB_EN_CNF):** When set, this will force the interrupts for Timer n to be delivered directly as FSB messages, rather than using the 8259 or I/O (x) APIC. In this case, the TIMERn_INT_ROUTE_CNF field in this register will be ignored and the TIMERn_FSB_ROUT register will be used instead. Timer 0, 1, 2, 3: This bit is a read/write bit. Timer 4, 5, 6, 7: This bit is always Read-Only 1 as interrupt from these timers can only be delivered via direct FSB interrupt messages.

Bit Range	Default & Access	Field Name (ID): Description
13:9	00h RW	**Interrupt Route (TIMER0_INT_ROUT_CNF):** This 5-bit field indicates the routing for the interrupt to the 8259 or I/O APIC. A maximum of 32 interrupts are supported. Software writes to this field to select which interrupt in the 8259 or I/O (x)APIC will be used for this timers interrupt. The default value for this register is 00h. If the Legacy Rout bit is set, then Timers 0 and 1 will have a different routing, and this bit field has no effect for those two timers. If the TIMERn_FSB_EN_CNF bit is set, then the interrupt will be delivered directly to the FSB, and this bit field has no effect. If interrupt is handled via 8259, only interrupts 0-15 are applicable and valid. Software must not program any value other than 0-15 in this field. Software must ensure that the value is valid for a particular timer as indicated by the TIMERn_INT_ROUTE_CAP field for that timer. The PCH logic does not check the validity of the value written. For Timers 4-7, this field is always Read-Only 0 as interrupts from these timers can only be delivered via direct FSB interrupt messages.
8	0h RW	**Timer 0 32-bit Mode (TIMER0_32_MODE_CNF):** Software can set this bit to force a 64-bit timer to behave as a 32-bit timer. This is typically needed if the software is not willing to halt the main counter to read or write a particular timer, and the software not capable of do an atomic 64-bit read to the timer. When TIMER0_32MODE_CNF is set to '1', the hardware counter will essentially be doing 32-bit operation on comparator match and rollovers. I.e. the upper 32-bit of the Timer 0 Comparator Value register is ignored. The upper 32-bit of the main counter is not involved in any roll over from lower 32-bit of the main counter and becomes all zero's. For timer 0, this bit will be read/write and default to 0. For timers 1-7, this bit will always read as 0 and writes will have no effect (since these seven timers are 32-bits).
7	0h RO	**Reserved**
6	0h WO	**Timer 0 Value Set (TIMER0_VAL_SET_CNF):** Software uses this bit only for timers that have been set to periodic mode. By writing this bit to a 1, the software is then allowed to directly set the timers accumulator. Software does NOT have to write this bit back to 0 (it automatically clears). This bit will return 0 when read. Software should not write a 1 to this bit position if the timer is set to non-periodic mode. Writes will only have an effect for Timer 0 if it is set to periodic mode. Writes will have no effect for Timers 1-7 as they do not support the periodic mode.
5	1h RO	**Timer 0 Size (TIMER0_SIZE_CAP):** Read-only Indicator of the timers size capability. 1: 64-bits 0: 32-bits. The value is 1 (64-bits) for timer 0, and 0 (32-bits) for timers 1-7.
4	1h RO	**Periodic Interrupt Capable (TIMER0_PER_INT_CAP):** If this read-only bit is 1, then the hardware supports a periodic mode for this timers interrupt. The value is 1 (periodic supported) for timer 0, and 0 (not supported) for timers 1-7.
3	0h RW	**Timer 0 Type (TIMER0_TYPE_CNF):** Setting this bit to 1 enables the timer to generate a periodic interrupt if it is capable of doing so. If the TIMERn_PER_INT_CAP bit is 0, then this bit will always return 0 when read and writes will have no impact. For timer 0, this bit will be read/write, with default of 0. For timers 1-7, this bit will be read-only, with a fixed value of 0.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Timer 0 Interrupt Enable (TIMER0_INT_ENB_CNF):** This bit must be set to 1 to enable timer n to cause an interrupt when it times out. If this bit is 0, the timer can still count and generate appropriate status bits, but will not cause an interrupt. Default value is 0.
1	0h RW	**Timer Interrupt Type (TIMER0_INT_TYPE_CNF):** Determines whether an edge or level interrupt will be used for this timer (when enabled). 0: Edge-triggered. If another interrupt occurs, another edge will be generated. 1: Level-triggered. The interrupt will be held active until it is cleared by writing to the bit in the General Interrupt Status Register. If another interrupt occurs before the interrupt is cleared, the interrupt will remain active. The default value is 0, edge-triggered. The interrupt type for any timer should be set before that timer generates any interrupts. If the interrupt type is changed dynamically, there will be some delay before the new type takes effect. That delay is not specified. Timer 0-3: This bit is a read/write bit as both edge and level triggered modes are supported. Timer 4-7: This bit is always Read-Only 0 as only edge-triggered mode is supported.
0	0h RO	**Reserved**

24.1.6 Timer 0 Comparator Value (TMR0_CMP_VAL) - Offset FED00108h

Timer 0 Comparator Value Register

Type	Size	Offset	Default
MMIO	64 bit	HPET Base + FED00108h	FFFFFFFFFFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
63:0	FFFFFFFFF FFFFFFFh RW/V	**Timer 0 Comparator Value (TMR0_CMP_VAL):** If the timer is configured to non-periodic mode, when the main counter equals the value last written to this register, the corresponding interrupt can be generated (if so enabled). The value in this register does not change based on the interrupt being generated. If the timer is configured to periodic mode (supported only for Timer 0), when the main counter equals the value last written to this register, the corresponding interrupt can be generated (if so enabled). When this time out occurs, the value in this register is increased by the value last written to the register. For example, in periodic mode if the value written to the register is 0000123h: 1. An interrupt will be generated when the main counter reaches 00000123h. 2. The value in this register will then be adjusted by the hardware to 00000246h. 3. Another interrupt will be generated when the main counter reaches 00000246h. 4. The value in this register will then be adjusted by the hardware to 00000369h As each periodic interrupt occurs, the value in this register will increment. When the incremented value is greater than the maximum value possible for this register (FFFFFFFFh for a 32-bit timer or FFFFFFFFFFFFFFFFh for a 64-bit timer), the value will wrap around through 0. For example, if the current value in a 32-bit timer is FFFF0000h and the last value written to this register is 20000, then after the next interrupt the value will change to 00010000h. The default value for each timer is all 1s for the bits that are implemented. For example, a 32-bit timer will have a default value of 00000000FFFFFFFFh. A 64-bit timer will have a default value of FFFFFFFFFFFFFFFFh. Software can read or write the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 1x8h or 1xCh. 64-bit accesses may only be done to 1x8h. Comparator value. Timer 0 is 64-bits wide. Timers 1-7 are 32-bits wide.

25 Interrupt

25.1 Interrupt Registers Summary

Table 25-1. Summary of Interrupt Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
20h	1	Master Initialization Command Word 1 (MICW1)	11h
21h	1	Master Initialization Command Word 2 (MICW2)	00h
A0h	1	Slave Initialization Command Word 1 (SICW1)	11h
A1h	1	Slave Initialization Command Word 2 (SICW2)	00h
4D0h	1	Master Edge/Level Control (ELCR1)	00h
4D1h	1	Slave Edge/Level Control (ELCR2)	00h

25.1.1 Master Initialization Command Word 1 (MICW1) - Offset 20h

A write to Initialization Command Word 1 starts the interrupt controller initialization sequence, during which the following occurs:

1. The Interrupt Mask register is cleared.
2. IRQ7 input is assigned priority 7.
3. The slave mode address is set to 7.
4. Special Mask Mode is cleared and Status Read is set to IRR.

Once this write occurs, the controller expects writes to ICW2, ICW3, and ICW4 to complete the initialization sequence.

Type	Size	Offset	Default
IO	8 bit	20h	11h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h WO	**ICW/OCW select (ICW_OCW_SLT1):** These bits are MCS-85 specific, and not needed. Should be programmed to 000.
4	1h WO	**ICW/OCW select (ICW_OCW_SLT2):** This bit must be a 1 to select ICW1 and enable the ICW2, ICW3, and ICW4 sequence.
3	0h WO	**Edge/Level Bank Select (LTIM):** Disabled. Replaced by the edge/level triggered control registers (ELCR).

Bit Range	Default & Access	Field Name (ID): Description
2	0h WO	**ADI IGNORED (ADI):** Ignored for PCH. Should be programmed to 0.
1	0h WO	**Single or Cascade (SNGL):** Must be programmed to a 0 to indicate two controllers operating in cascade mode.
0	1h WO	**ICW4 Write Required (IC4):** This bit must be programmed to a 1 to indicate that ICW4 needs to be programmed.

25.1.2 Master Initialization Command Word 2 (MICW2) - Offset 21h

ICW2 is used to initialize the interrupt controller with the five most significant bits of the interrupt vector address. The value programmed for bits[7:3] is used by the CPU to define the base address in the interrupt vector table for the interrupt routines associated with each IRQ on the controller. Typical ISA ICW2 values are 08h for the master controller and 70h for the slave controller.

Type	Size	Offset	Default
IO	8 bit	21h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:3	00h WO	**Interrupt Vector Base Address (IVBA):** Bits [7:3] define the base address in the interrupt vector table for the interrupt routines associated with each interrupt request level input.
2:0	0h WO	**Interrupt Request Level (IRL):** When writing ICW2, these bits should all be 0. During an interrupt acknowledge cycle, these bits are programmed by the interrupt controller with the interrupt to be serviced. This is combined with bits [7:3] to form the interrupt vector driven onto the data bus during the second INTA# cycle. The code is a three bit binary code: Code Master Interrupt Slave Interrupt 000 IRQ0 IRQ8 001 IRQ1 IRQ9 010 IRQ2 IRQ10 011 IRQ3 IRQ11 100 IRQ4 IRQ12 101 IRQ5 IRQ13 110 IRQ6 IRQ14 111 IRQ7 IRQ15

25.1.3 Slave Initialization Command Word 1 (SICW1) - Offset A0h

A write to Initialization Command Word 1 starts the interrupt controller initialization sequence, during which the following occurs:

1. The Interrupt Mask register is cleared.
2. IRQ7 input is assigned priority 7.
3. The slave mode address is set to 7.
4. Special Mask Mode is cleared and Status Read is set to IRR.

Once this write occurs, the controller expects writes to ICW2, ICW3, and ICW4 to complete the initialization sequence.

Type	Size	Offset	Default
IO	8 bit	A0h	11h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h WO	**ICW/OCW select (ICW_OCW_SLT1):** These bits are MCS-85 specific, and not needed. Should be programmed to 000.
4	1h WO	**ICW/OCW select (ICW_OCW_SLT2):** This bit must be a 1 to select ICW1 and enable the ICW2, ICW3, and ICW4 sequence.
3	0h WO	**Edge/Level Bank Select (LTIM):** Disabled. Replaced by the edge/level triggered control registers (ELCR).
2	0h WO	**ADI IGNORED (ADI):** Ignored for PCH. Should be programmed to 0.
1	0h WO	**Single or Cascade (SNGL):** Must be programmed to a 0 to indicate two controllers operating in cascade mode.
0	1h WO	**ICW4 Write Required (IC4):** This bit must be programmed to a 1 to indicate that ICW4 needs to be programmed.

25.1.4 Slave Initialization Command Word 2 (SICW2) - Offset A1h

ICW2 is used to initialize the interrupt controller with the five most significant bits of the interrupt vector address. The value programmed for bits[7:3] is used by the CPU to define the base address in the interrupt vector table for the interrupt routines associated with each IRQ on the controller. Typical ISA ICW2 values are 08h for the master controller and 70h for the slave controller.

Type	Size	Offset	Default
IO	8 bit	A1h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:3	00h WO	**Interrupt Vector Base Address (IVBA):** Bits [7:3] define the base address in the interrupt vector table for the interrupt routines associated with each interrupt request level input.
2:0	0h WO	**Interrupt Request Level (IRL):** When writing ICW2, these bits should all be 0. During an interrupt acknowledge cycle, these bits are programmed by the interrupt controller with the interrupt to be serviced. This is combined with bits [7:3] to form the interrupt vector driven onto the data bus during the second INTA# cycle. The code is a three bit binary code: Code Master Interrupt Slave Interrupt 000 IRQ0 IRQ8 001 IRQ1 IRQ9 010 IRQ2 IRQ10 011 IRQ3 IRQ11 100 IRQ4 IRQ12 101 IRQ5 IRQ13 110 IRQ6 IRQ14 111 IRQ7 IRQ15

25.1.5 Master Edge/Level Control (ELCR1) - Offset 4D0h

Master Edge/Level Control Register.

Type	Size	Offset	Default
IO	8 bit	4D0h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:3	00h RW	**Edge Level Control (ELC_7_3):** In edge mode, (bit cleared), the interrupt is recognized by a low to high transition. In level mode (bit set), the interrupt is recognized by a high level.
2:0	0h RO	**Reserved**

25.1.6 Slave Edge/Level Control (ELCR2) - Offset 4D1h

Slave Edge/Level Control Register.

Type	Size	Offset	Default
IO	8 bit	4D1h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RW	**Edge Level Control (ELC_15_14):** In edge mode, (bit cleared), the interrupt is recognized by a low to high transition. In level mode (bit set), the interrupt is recognized by a high level. Bit 7 applies to IRQ15, and bit 6 to IRQ14.
5	0h RW	**Edge Level Control (ELC_13):** In edge mode, (bit cleared), the interrupt is recognized by a low to high transition. In level mode (bit set), the interrupt is recognized by a high level. This bit applies to IRQ13.
4:1	0h RW	**Edge Level Control (ELC_12_9):** In edge mode, (bit cleared), the interrupt is recognized by a low to high transition. In level mode (bit set), the interrupt is recognized by a high level. Bit 4 applies to IRQ12, bit 3 to IRQ11, bit 2 to IRQ10, and bit 1 to IRQ9.
0	0h RO	**Reserved**

26 Real Time Clock (RTC)

26.1 RTC Indexed Registers Summary

The RTC contains two sets of indexed registers that are accessed using the two separate Index and Target registers (70h/71h or 72h/73h), as shown in the following table:

RTC (Standard) RAM Bank

Index Name
00h Seconds
01h Seconds Alarm
02h Minutes
03h Minutes Alarm
04h Hours
05h Hours Alarm
06h Day of Week
07h Day of Month
08h Month
09h Year
0Ah Register A
0Bh Register Band
0Ch Register D
0Dh Register D
0Bh-7Fh 114 Bytes of User RAM

Table 26-1. Summary of RTC Indexed Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	1	Seconds Value (SEC)	00h
1h	1	Seconds Alarm (SEC_ALARM)	00h
2h	1	Minutes Value (MINUTES)	00h
3h	1	Minutes Alarm (MINUTES_ALARM)	00h
4h	1	Hours Value (HOURS)	00h
5h	1	Hours Alarm (HOURS_ALARM)	00h
6h	1	Day Of Week (DAY_OF_WEEK)	00h
7h	1	Day Of Month (DAY_OF_MONTH)	00h
8h	1	Month Value (MONTH)	00h
9h	1	Year Value (YEAR)	00h
Ah	1	Register A (REGISTER_A)	70h
Bh	1	Register B General Configuration (REGISTER_B)	80h
Ch	1	Register C Flag Register (REGISTER_C)	00h
Dh	1	Register D Flag Register (REGISTER_D)	80h
Eh	1	114 Bytes Of Lower User RAM (REGISTER_E)	00h
80h	1	128 Bytes Of Upper User RAM (REGISTER_80)	00h

26.1.1 Seconds Value (SEC) - Offset 0h

RTC Index: 00h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current time Second

Type	Size	Offset	Default
IO	8 bit	0h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW/V	**Seconds Value (SEC):** Time Seconds. The time in seconds can be represented in either BCD or Binary format depending on the value in RegB.Data Mode.

26.1.2 Seconds Alarm (SEC_ALARM) - Offset 1h

RTC Index: 01h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores Seconds Alarm

Type	Size	Offset	Default
IO	8 bit	1h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW	**Seconds Alarm (SEC_ALARM):** Seconds field of the Alarm.

26.1.3 Minutes Value (MINUTES) - Offset 2h

RTC Index: 02h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current time Minutes

Type	Size	Offset	Default
IO	8 bit	2h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW/V	**Minutes Value (MINUTES):** Time Minutes. The time in minutes can be represented in either BCD or Binary format depending on the value in RegB.Data Mode.

26.1.4 Minutes Alarm (MINUTES_ALARM) - Offset 3h

RTC Index: 03h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores Alarm Minutes

Type	Size	Offset	Default
IO	8 bit	3h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW	**Minutes Alarm (MINUTES_ALARM):** Minutes field of the Alarm.

26.1.5 Hours Value (HOURS) - Offset 4h

RTC Index: 04h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current time Hours

Type	Size	Offset	Default
IO	8 bit	4h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW/V	**Hours Value (HOURS):** Time Hours. The time in hours can be represented in either BCD or Binary format depending on the value in RegB.Data Mode. It can also be represented in either 12-hour mode or 24-hour mode depending on the value in RegB.Hour Format.

26.1.6 Hours Alarm (HOURS_ALARM) - Offset 5h

RTC Index: 05h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores Alarm Hours

Type	Size	Offset	Default
IO	8 bit	5h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW	**Hours Alarm (HOURS_ALARM):** Hours field of the Alarm.

26.1.7 Day Of Week (DAY_OF_WEEK) - Offset 6h

RTC Index: 06h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current Day of Week

Type	Size	Offset	Default
IO	8 bit	6h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW/V	**Day of Week (DAY_OF_WEEK):** This field indicates current Day of Week. 1-Sunday 2-Monday 3-Tuesday 4-Wednesday 5-Thursday 6-Friday 7-Saturday. The value is the same regardless of the Data Mode.

26.1.8 Day Of Month (DAY_OF_MONTH) - Offset 7h

RTC Index: 07h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current Day of Month

Type	Size	Offset	Default
IO	8 bit	7h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW/V	**Day of Month (DAY_OF_MONTH):** This field indicates current Day of Month. The day of month can be represented in either BCD or Binary format depending on the value in RegB.Data Mode.

26.1.9 Month Value (MONTH) - Offset 8h

RTC Index: 08h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current Month

Type	Size	Offset	Default
IO	8 bit	8h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW/V	**Month Value (MONTH):** This field indicates current Month. The month can be represented in either BCD or Binary format depending on the value in RegB.Data Mode.

26.1.10 Year Value (YEAR) - Offset 9h

RTC Index: 09h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current Year

Type	Size	Offset	Default
IO	8 bit	9h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW/V	**Year Value (YEAR):** This field indicates current Year. The year can be represented in either BCD or Binary format depending on the value in RegB.Data Mode.

26.1.11 Register A (REGISTER_A) - Offset Ah

RTC Index: 0Ah
Default Value: 0UUUUUUU
Lockable: No Power
Attribute: Read/Write
Size: 8-bit
Well: RTC

This register is used for general configuration of the RTC functions. None of the bits are affected by RSMRST# or any other reset signal.

Type	Size	Offset	Default
IO	8 bit	Ah	70h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO/V	**UPDATE IN PROGRESS (UIP):** This bit may be monitored as a status flag. When asserted as a 1, the update is soon to occur or is in progress. If 0, the update cycle will not start for at least 488 s. The time, calendar, and alarm information in RAM is always available when the UIP bit is 0. The ICH provides the ability to generate SMI# based on either the 0-to-1 or 1-to-0 transition of this bit. This can be useful for work-around and debug in silicon.
6:4	7h RW	**Division Chain Select (DV_2_0):** These three bits control the divider chain for the oscillator, and are not affected by RSMRST# or any other reset signal. DV(2) corresponds to bit 6. DV2 DV1 DV0 Function 0 1 0 Normal Operation 1 1 X Divider Reset 1 0 1 Bypass 15 stages (test mode only) 1 0 0 Bypass 10 stages (test mode only) 0 1 1 Bypass 5 stages (test mode only) 0 0 1 Invalid 0 0 0 Invalid
3:0	0h RW	**Rate Select (RS_3_0):** Selects one of 13 taps of the 15 stage divider chain. The selected tap can generate a periodic interrupt if the PIE bit is set in Register B. Otherwise this tap will set the PF flag of Register C. If the periodic interrupt is not to be used, these bits should all be set to zero. RS3 corresponds to bit 3. RS3 RS2 RS1 RS0 Periodic Rate 0 0 0 0 Interrupt never toggles 0 0 0 1 3.90625 ms 0 0 1 0 7.8125 ms 0 0 1 1 122.070 s 0 1 0 0 244.141 s 0 1 0 1 488.281 s 0 1 1 0 976.5625 s 0 1 1 1 1.953125 ms 1 0 0 0 3.90625 ms 1 0 0 1 7.8125 ms 1 0 1 0 15.625 ms 1 0 1 1 31.25 ms 1 1 0 0 62.5 ms 1 1 0 1 125 ms 1 1 1 0 250 ms 1 1 1 1 500 ms

26.1.12 Register B General Configuration (REGISTER_B) - Offset Bh

RTC Index: 0Bh
Default Value: 10000UUU
Lockable: No

Attribute: Read/Write
Size: 8-bit
Power Well: RTC

Type	Size	Offset	Default
IO	8 bit	Bh	80h

Bit Range	Default & Access	Field Name (ID): Description
7	1h RW	**Update Cycle Inhibit (RTC_SET):** Enables/Inhibits the update cycles. When SET is 0, update cycle occurs normally once each second. If set to one, a current update cycle will abort and subsequent update cycles will not occur until SET is returned to zero. When set is one, the BIOS may initialize time and calendar bytes safely. This bit is not affected by RSMRST# nor any other reset signal. Note: Software must ensure this bit is at least transitioned from '1' to '0' once whenever the RTC coin battery is inserted. This is to ensure that the internal RTC time updates occur properly.
6	0h RW	**Periodic Interrupt Enable (PIE):** If set to 1, the Periodic Interrupt Enable (PIE) bit allows an interrupt to occur with a time base set with the RS bits of register A. This bit is cleared by RSMRST#, but not on any other reset.
5	0h RW	**Alarm Interrupt Enable (AIE):** If set to one, the Alarm Interrupt Enable (AIE) bit allows an interrupt to occur when the AF is one as set from an alarm match from the update cycle. An alarm can occur once a second, one an hour, once a day, or once a month. This bit is cleared by RTEST# assertion, but not on any other reset.
4	0h RW	**Update-ended Interrupt Enable: (UIE):** If set to one, the Update-ended Interrupt Enable (UIE) bit allows an interrupt to occur when the update cycle ends. This bit is cleared by RSMRST#, but not on any other reset.
3	0h RW	**Square Wave Enable (SQWE):** The Square Wave Enable bit serves no function in this device, yet is left in this register bank to provide compatibility with the Motorola 146818B. There is not SQW pin on this device. This bit is cleared by RSMRST#, but not on any other reset.
2	0h RW	**Data Mode (DM):** The Data Mode (DM) bit specifies either binary or BCD data representation. A one denotes binary, and zero denotes BCD. This bit is not affected by RSMRST# nor any other reset signal.
1	0h RW	**Hour Format (HOURFORM):** This bit indicates the hour byte format. If one, twenty-four hour mode is selected. If zero, twelve-hour mode is selected. In twelve hour mode, the seventh bit represents AM as zero and PM as one. This bit is not affected by RSMRST# nor any other reset signal.
0	0h RW	**Daylight Savings Enable (DSE):** The Daylight Savings Enable bit triggers two special hour updates per year when set to one. One is on the first Sunday in April, where time increments from 1:59:59 AM to 3:00:00 AM. The other is the last Sunday in October when the time first reaches 1:59:59 AM, it is changed to 1:00:00 AM. The time must increment normally for at least two update cycles (seconds) previous to these conditions for the time change to occur properly. These special update conditions do not occur when the DSE bit is set to zero. The days for the hour adjustment are those specified in United States federal law as of 1987, which is different than previous years. This bit is not affected by RSMRST# nor any other reset signal. If BUC.DSO bit is set, the DSE bit continues to be a R/W bit, but Daylight Saving is disabled regardless of the DSE bit.

26.1.13 Register C Flag Register (REGISTER_C) - Offset Ch

RTC Index: 0Ch
Default Value: 00000000
Lockable: No

Attribute: Read-Only (Writes have no effect).
Size: 8-bit
Power Well: RTC

Type	Size	Offset	Default
IO	8 bit	Ch	00h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO/V	**Interrupt Request Flag (IRQF):** Interrupt Request Flag = PF * PIE + AF * AIE + UF * UFE. This also causes the RTC Interrupt to be asserted. This bit is cleared upon RSMRST# or a read of Register C.
6	0h RO/V	**Periodic Interrupt Flag (PF):** Periodic interrupt Flag will be one when the tap as specified by the RS bits of register A is one. If no taps are specified, this flag bit will remain at zero. This bit is cleared upon RSMRST# or a read of Register C.
5	0h RO/V	**Alarm Flag (AF):** Alarm Flag will be high after all Alarm values match the current time. This bit is cleared upon RTEST# or a read of Register C.
4	0h RO/V	**Update-ended Flag (UF):** Updated-ended flag will be high immediately following an update cycle for each second. The bit is cleared upon RSMRST# or a read of Register C.
3:0	0h RO	**Reserved**

26.1.14 Register D Flag Register (REGISTER_D) - Offset Dh

RTC Index: 0Dh
Default Value: 10UUUUUU
Lockable: No Power

Attribute: Read/Write
Size: 8-bit
Well: RTC

Type	Size	Offset	Default
IO	8 bit	Dh	80h

Bit Range	Default & Access	Field Name (ID): Description
7	1h RO	**Valid RAM and Time Bit (VRT):** This bit is hard-wired to 1 in the RTC power well. This bit should always be written as a 0 for write cycle, however it will return a 1 for read cycles.
6	0h RO	**Reserved**
5:0	00h RW	**Date Alarm (DATE_ALARM):** These bits store the date of month alarm value. If set to 000000, then a don't care state is assumed. The host must configure the dates alarm for these bits to do anything, yet they can be written at any time. If the date alarm is not enabled, these bits will return zeros to mimic the functionality of the Motorola 146818B. These bits are not affected by any reset assertion.

26.1.15 114 Bytes Of Lower User RAM (REGISTER_E) - Offset Eh

Remaining 114 Bytes of Lower User RAM. Each byte in this bank shares the same description as shown below. RAM default values are undetermined and the last written value will be retained until RTC power is removed.

Type	Size	Offset	Default
MMIO	8 bit	+ Eh	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW	**Lower User RAM (LOWER_USER_RAM):** RTC RAM lower unused range.

26.1.16 128 Bytes Of Upper User RAM (REGISTER_80) - Offset 80h

128 Bytes of Upper User RAM. Each byte in this bank shares the same description as shown below. RAM default values are undetermined and the last written value will be retained until RTC power is removed.

Type	Size	Offset	Default
IO	8 bit	80h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW	**Upper User RAM (UPPER_USER_RAM):** RTC RAM upper unused range.

26.2 RTC I/O Index Registers Summary

RTC I/O Index Registers Port - 70h and 71h.

Table 26-2. Summary of RTC I/O Index Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
70h	1	RTC Index Register (INDEX)	00h
71h	1	RTC Target Register (TARGET)	00h

26.2.1 RTC Index Register (INDEX) - Offset 70h

This 8-bit register selects which indirect register appears in the target register to be manipulated by software. Software will program this register to select the desired RTC indexed register.

Type	Size	Offset	Default
MMIO	8 bit	FD00000h + 70h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW	**Index Register (INDEX):** Index Register for RTC

26.2.2 RTC Target Register (TARGET) - Offset 71h

This 32-bit register specifies the data to be read or written to the register pointed to by the INDEX register.

Type	Size	Offset	Default
MMIO	8 bit	FD00000h + 71h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW/V	**RTC Target Register (TARGET):** RTC Target Register for RTC

26.3 RTC PCR Registers Summary

These registers are within the PCH Private Configuration Space which is accessible through the PCH Sideband Interface. They can be accessed via (SBREG_BAR + PortID + Register Offset).

Table 26-3. Summary of RTC PCR Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
3400h	4	RTC Configuration (RC)	00000000h
3414h	4	Backed Up Control (BUC)	00000000h
3F04h	4	RTC Update In Progress SMI Control (UIPSMI)	00000000h

26.3.1 RTC Configuration (RC) — Offset 3400h

All bits in this register are in the Primary Well and cleared by host_side_rst_b.

Type	Size	Offset	Default
MMIO	32 bit	FDC30000h + 3400h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	None

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1L	**BIOS Interface Lock-Down (BILD):** When set, prevents RTC version of TS (BUC.TS) from being changed. This bit can only be written from 0 to 1 once. This BILD bit has different function compared to SPI and eSPI version but BIOS should set all the corresponding bits after reset in order to lock down the BIOS interface correctly.
30:7	0h RO	**Reserved**
6	0h RW	**RTC High Power Mode HW Disable (HPM_HW_DIS):** When set to 1 the internal VRM that generates the RTC Well supply voltage in SUS mode is disabled when SLP_S0# is asserted to '0'. (via irtcdswen pin to RTC EBB). When 0, HW control of the RTC internal VRM is disabled.
5	0h RW	**RTC High Power Mode SW Disable (HPM_SW_DIS):** When set to 1 the internal VRM that generates the rtc well supply voltage in SUS mode is disabled (via irtcdswen pin to RTC EBB). When 0 the internal VRM powers the rtc well when RSMRST# is '1'. (default)
4	0h RW/1L	**Partial Range Lock in Upper 128 Bytes (UL):** When set, bytes 38h-3Fh in the upper 128 byte bank of RTC RAM are locked and cannot be accessed. Writes will be dropped and reads will not return any guaranteed data. Bit reset on system reset.
3	0h RW/1L	**Partial Range Lock in Lower 128 Bytes (LL):** When set, bytes 38h-3Fh in the lower 128 byte bank of RTC RAM are locked and cannot be accessed. Writes will be dropped and reads will not return any guaranteed data. Bit reset on system reset.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Upper 128 Byte Enable (UE):** When set, the upper 128 byte bank of RTC RAM can be accessed.
1:0	0h RO	**Reserved**

26.3.2 Backed Up Control (BUC) — Offset 3414h

All bits in this register are in the RTC well and only cleared by RTEST.

Type	Size	Offset	Default
MMIO	32 bit	FDC30000h + 3414h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	None

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4	0h RW	**Daylight Savings Override (SDO):** When this bit is a '1', the DSE bit in the RTC Register B bit(0) is a RW bit but has no effect where daylight savings is hard-disabled internally. When this bit is a '0', the DSE bit in the RTC register B bit(0) is a RW bit that is configurable by software to enable the daylight savings. System BIOS shall configure this bit accordingly during the boot process before RTC time is initialized.
3:1	0h RO	**Reserved**
0	0h RW/L	**Top Swap (TS):** This should be set by BIOS when the corresponding TS bit in the eSPI controller is set in order to properly restore the state of that field after reset since they are not preserved in an RTC well bit in those devices. *If PCH is strapped for Top-Swap (GNT(3)# is low at rising edge of PWROK), then this bit cannot be cleared by software. The strap jumper should be removed and the system rebooted. **Locked by:** RC.BILD

26.3.3 RTC Update In Progress SMI Control (UIPSMI) — Offset 3F04h

This register exists in the Core Well.

Type	Size	Offset	Default
MMIO	32 bit	FDC30000h + 3F04h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	None

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17	0h RW/1C/V	**RTC UIP Low-to-High (UIP_L2H):** This sticky status bit is set whenever the RTC Update-In-Progress signal transitions from low to high (i.e., at the start of an update).
16	0h RW/1C/V	**RTC UIP High-to-Low (UIP_H2L):** This sticky status bit is set whenever the RTC Update-In-Progress signal transitions from high to low (i.e., at the start of an update).
15:2	0h RO	**Reserved**
1	0h RW	**RTC UIP Low-to-High SMI Enable (UIP_L2H_SMI_EN):** When this bit is set, a '1' in bit 17 will assert the internal SMI signal to the Power Management SMI logic.
0	0h RW	**RTC UIP High-to-Low SMI Enable (UIP_H2L_SMI_EN):** When this BIOS is set, a '1' in bit 16 will assert the internal SMI signal to the Power Management SMI logic.

27 System Management Bus TCO

27.1 SMBus TCO I/O Registers Summary

The TCO I/O registers reside in a 32-byte range that starts from the IO Base Address described in the TCOBAR register in the SMBus PCI Configuration space.

Table 27-1. Summary of SMBus TCO I/O Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	2	TCO_RLD Register (TRLD)	0004h
2h	1	TCO_DAT_IN Register (TDI)	00h
3h	1	TCO_DAT_OUT Register (TDO)	00h
4h	2	TCO1_STS Register (TSTS1)	0000h
6h	2	TCO2_STS Register (TSTS2)	0000h
8h	2	TCO1_CNT Register (TCTL1)	0000h
Ah	2	TCO2_CNT Register (TCTL2)	0008h
Ch	2	TCO Message Registers (TMSG)	0000h
Eh	1	TCO_WDSTATUS Register (TWDS)	00h
10h	1	LEGACY_ELIM Register (LE)	03h
12h	2	TCO_TMR Register (TTMR)	0004h

27.1.1 TCO_RLD Register (TRLD) - Offset 0h

TCO_RLD Register

Type	Size	Offset	Default
IO	16 bit	SMBus TCO + 0h	0004h

Bit Range	Default & Access	Field Name (ID): Description
15:10	0h RO	**Reserved**
9:0	004h RW	**TCORLD:** Reading this register will return the current count of the TCO timer. Writing any value to this register will reload the timer to prevent the timeout.

27.1.2 TCO_DAT_IN Register (TDI) - Offset 2h

TCO_DAT_IN Register

Type	Size	Offset	Default
IO	8 bit	SMBus TCO + 2h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW	**TDI:** Data Register for passing commands from the OS to the SMI handler. Writes to this register will cause an SMI and set the OS_TCO_SMI bit in the TCO_STS register.

27.1.3 TCO_DAT_OUT Register (TDO) - Offset 3h

TCO_DAT_OUT Register

Type	Size	Offset	Default
IO	8 bit	SMBus TCO + 3h	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW	**TDO:** Data Register for passing commands from the SMI handler to the OS. Writes to this register will set the TCO_INT_STS bit in the TCO_STS register. It also causes an interrupt, as selected by the TCO_IRQ_SEL bits.

27.1.4 TCO1_STS Register (TSTS1) - Offset 4h

Unless otherwise indicated, these bits are sticky and are cleared by writing a 1 to the corresponding bit position.

Type	Size	Offset	Default
IO	16 bit	SMBus TCO + 4h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	**Reserved**
13	0h RO	**TCO Slave Select (TCO_SLVSEL):** This register bit indicates the value of TCO Slave Select Soft Strap.
12	0h RW/1C	**CPUSERR_STS:** This bit is set to 1 if the CPU complex sends a DMI special cycle message indicating that it wants to cause an SERR#. The software must read the MCH to find out why it wanted the SERR#. Software must write a 1 back to this bit to clear it.
11	0h RO	**Reserved**
10	0h RW/1C	**CPUSMI_STS:** This bit is set to 1 if the CPU complex sends a DMI special cycle message indicating that it wants to cause an SMI. The software must read the CPU to find out why it wanted the SMI. Software must write a 1 back to this bit to clear it.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW/1C	**CPUSCI_STS:** This bit is set to 1 if the CPU complex sends a DMI special cycle message indicating that it wants to cause an SCI. The software must read the CPU to find out why it wanted the SCI. Software must write a 1 back to this bit to clear it.
8	0h RW/1C	**BIOSWR_STS:** Intel PCH sets this bit to 1 and generates and SMI# to indicate an illegal attempt to write to the BIOS. (The BIOS write could be either to FirmwareHUB (FWH) or SPI Flash). This occurs when either: a) The WP bit (10.1.7.4 bit 0) is changed from 0 to 1 and the LE bit (10.1.7.4 bit 1) is also set, or b) any write is attempted to the BIOS and the WP bit is also set. Note: On write cycles attempted to the 4MB lower alias to the BIOS space, the BIOSWR_STS bit will not be set.
7	0h RW/1C	**NEWCENTURY_STS:** This bit will be set when the year rolls over from 1999 to 2000. If the bit is already 1, it will remain 1. This bit can be cleared either by software writing a 1 back to the bit position, or by RTEST# going active. When this bit is set, an SMI# will be generated. However, this will not be a wake event (i.e. if the system is in a sleeping state when the NEWCENTURY_STS bit is set, the system will not wake up). Note: This bit 7 is not valid when the RTC battery is first put in (or if the RTC battery does not provide sufficient power when the system is unplugged). Software can determine that the RTC well was not maintained by checking the RTC_PWR_STS bit (GEN_PMCON_3 register in the Power Management Controller, D31:F2:A4, bit 2) or by other means (such as doing a checksum on the RTC RAM array). If the RTC well is determined to not have been maintained, the BIOS should set the time to a legal value and then clear the NEWCENTURY_STS bit. Note: This bit may take up to 3 RTCCLKs for the bit to be cleared when a 1 is written to the bit to clear it. After writing a 1 to the NEWCENTURY_STS bit, software should also not exit the SMI handler until after the bit has been cleared. This is to make sure the SMI is not re-entered. BIOS Assumption: When booting, the BIOS checks the NEWCENTURY_STS bit. If set, the BIOS should increment the value in the RTC RAM register associated with the century. The BIOS should then clear the NEWCENTURY_STS bit. This scenario would occur if the system was asleep when the century rolls over. If the system is in an S0 state (not sleeping) and the SMI# occurs with the NEWCENTURY_STS bit sets, the SMI handler should increment the value in the RTC RAM register and clear the NEWCENTURY_STS bit.
6:4	0h RO	**Reserved**
3	0h RW/1C	**TIMEOUT:** Bit set to 1 by Intel PCH to indicate that the SMI was caused by TCO timer reaching 0. Note: The SMI handler should clear this bit to prevent an immediate re-entry to the SMI handler.
2	0h RW/1C	**TCO_INT_STS:** Bit set to 1 when SMI handler caused the interrupt by writing to the TCO_DAT_OUT register.
1	0h RW/1C	**OS_TCO_SMI:** Bit set to 1 when OS code caused an SMI# by writing to the TCO_DAT_IN register.
0	0h RO/V	**NMI2SMI_STS:** The Intel PCH sets read-only this bit when an SMI# occurs because an event occurred that would otherwise have caused an NMI. The NMI2SMI_STS bit should not be sticky bit. It should be a simple OR gate to indicate that one of the NMI sources has caused the SMI#. Each of the NMI sources already has its own sticky bit feeding the OR gate. Writes to this bit have no effect.

27.1.5 TCO2_STS Register (TSTS2) - Offset 6h

TCO2_STS Register

Type	Size	Offset	Default
IO	16 bit	SMBus TCO + 6h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:5	0h RO	**Reserved**
4	0h RW/1C	**SMLINK_SLAVE_SMI_STS:** Intel PCH will set this bit to 1 when it receives the SMI message (encoding 08h in the command type) on the SMLinks Slave Interface. Software clears the bit by writing a 1 to this bit position. This bit is in the resume well. It is reset by RSMRST#, but not by the PCI Reset associated with exit from S3-S5 states. This allows the software (presumably BIOS) to get the interrupt, see this new bit set, and decidedly go into the pre-determined (by local policy) sleep state. The advantage here is that race conditions are eliminated if the bit is only meant for power-down instead of potentially being meant for power-up or power-down depending on the current state (like the real power button).
3	0h RO	**Reserved**
2	0h RO/V	**NRSTRAP_STS:** This bit reflects the state of the No_Reboot strap that is sampled on PWROK rise.
1	0h RW/1C	**SECOND_TO_STS:** Intel PCH sets this bit to 1 to indicate that the TIMEOUT bit had been (or is currently) set and a second timeout occurred before the TCO_RLD register was written. If this bit is set and the NO_REBOOT configuration bit is 0, then the Intel PCH will reboot the system after the second timeout. The reboot is done by asserting PLTRST#. This bit is only cleared by writing a 1 to this bit or by a RSMRST#.
0	0h RW/1C	**INTRD_DET:** Intruder Detect. Bit set to 1 by the Intel PCH to indicate that an intrusion was detected. This is latched. This bit is cleared by writing a 1 to this bit or by RTEST#. This bit is backed in the RTC Well. Note: This bit has a recovery time. After writing a 1 to this bit position (to clear it), the bit may be read back as a 1 for up 65 microseconds before it is read as a 0. Software must be aware of this recovery time when reading this bit after clearing it. Note: If the INTRUDER# signal is active when the software attempts to clear the INTRD_DET bit, the bit will remain as a 1, and the SMI# will be generated again immediately. The SMI handler can clear the INTRD_SEL bits to avoid further SMIs. However, if the INTRUDER# signals goes inactive and then active again, there will not be further SMIs (because the INTRD_SEL bits would select that no SMI# be generated). If the INTRUDER# signal goes inactive some point after the INTRD_DET bit is written as a 1, then the INTRD_DET signal will go to a 0 when INTRUDER# input signal goes inactive. Note that this is slightly different from a classic sticky bit, since most sticky bits would remain active indefinitely when the signal goes active and would immediately go inactive when a 1 is written to the bit.

27.1.6 TCO1_CNT Register (TCTL1) - Offset 8h

TCO1_CNT Register

Type	Size	Offset	Default
IO	16 bit	SMBus TCO + 8h	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	**Reserved**
12	0h RW	**TCO_LOCK:** When set to 1, this bit prevents writes from changing the TCO_EN bit (in offset 30h of Power Management I/O space). Once this bit is set to 1, it can not be cleared by software writing a 0 to this bit location. A core-well reset is required to change this bit from 1 to 0. This bit defaults to 0.
11	0h RW	**TCO_TMR_HALT:** 1 = The TCO timer will halt. It will not count, and thus cannot reach a value that would cause an SMI# or to cause the SECOND_TO_STS bit to be set. This will also prevent rebooting 0 = The TCO timer is enabled to count. This is the default
10	0h RO	**Reserved**
9	0h RW	**NMI2SMI_EN:** Setting this bit 1 forces all NMIs to instead cause an SMI#, and will be reported in the TCO1_STS register. NMI2SMI_EN bit is set AND the NMI_EN# bit is set to 0, the NMI# will be routed to cause an SMI#. No NMI will be caused. However, if the GBL_SMI_EN bit is not set, then no SMI# will be generated, either. If NMI2SMI_EN is set but the NMI_EN# bit is set to 1, then no NMI or SMI# will be generated. The following table shows the possible combinations: NMI_EN#, GBL_SMI_EN 00 No SMI# based on NMI events (since no SMI# at all because SMI_EN = 0) 01 SMI# will be caused based on NMI events 10 No SMI# at all because SMI_EN is 0 11 No SMI# based on NMI events because NMI_EN#=1
8	0h RW	**NMI_NOW:** Writing a 1 to this bit causes an NMI. This allows the BIOS or SMI handler to force entry to the NMI handler. The NMI handler is expected to clear this bit. Another NMI will not be generated until the bit is cleared by writing a 1 back to the same bit position.
7:1	0h RO	**Reserved**
0	0h RW	**NR_MSUS:** This bit reflects the No Reboot pin strap state. It is sampled high on PWROK. This bit may be set or cleared by software if the strap is sampled low but may not override the strap when it indicates No Reboot. When set, the TCO timer will count down and generate the SMI# on the first timeout, but will not reboot on the second timeout.

27.1.7 TCO2_CNT Register (TCTL2) - Offset Ah

TCO2_CNT Register

Type	Size	Offset	Default
IO	16 bit	SMBus TCO + Ah	0008h

Bit Range	Default & Access	Field Name (ID): Description
15:6	0h RO	**Reserved**
5:4	0h RW	**OS_POLICY:** OS-based software writes to these bits to select the policy that the BIOS will use after the platform resets due to the WDT. The following convention is recommended for the BIOS and OS: 00 Boot normally 01 Shut down 10 Do Not Load OS. Hold in pre-boot state and use LAN to determine next step 11 Reserved Implementation note: These are just scratched pad bits. They should not be reset when the TCO logic resets the platform due to Watchdog Timer.
3	1h RW	**SMB_ALERT_DISABLE:** Disables GP/SMBALERT# as an alert source for the heartbeats and the SMBus slave. At reset (RSMRST# pin assertion only), this bit is set and the muxed GP/SMBALERT# are disabled.
2:1	0h RW	**INTRD_SEL:** Selects the action to take if the INTRUDER# signal goes active. 11 Reserved 01 Interrupt (as selected by TCO_INT_SEL) 10 SMI# 00 INTRUDER# does not cause SMI# or interrupt
0	0h RO	**Reserved**

27.1.8 TCO Message Registers (TMSG) - Offset Ch

TCOBASE+0Ch (MSG1) TCOBASE+0Dh (MSG2)

BIOS can write into these registers to indicate its boot progress. The external micro-controller can read these registers to monitor the boot progress.

Type	Size	Offset	Default
IO	16 bit	SMBus TCO + Ch	0000h

Bit Range	Default & Access	Field Name (ID): Description
15:8	00h RW	**TCO Message2 (MSG2):** TCO Message2
7:0	00h RW	**TCO Message1 (MSG1):** TCO Message1

27.1.9 TCO_WDSTATUS Register (TWDS) - Offset Eh

TCO_WDSTATUS Register

Type	Size	Offset	Default
IO	8 bit	SMBus TCO + Eh	00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW	**TCO_WDSTATUS Register (TWDS):** The BIOS or system management software can write into this register to indicate more details on the boot progress. The register will rest to 00h based on a RSMRST# (but not PCI Reset). The external microcontroller can read this register to monitor boot progress.

27.1.10 LEGACY_ELIM Register (LE) - Offset 10h

LEGACY_ELIM Register

Type	Size	Offset	Default
IO	8 bit	SMBus TCO + 10h	03h

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	**Reserved**
1	1h RW	**IRQ12_CAUSE:** When software sets the bit to 1, IRQ12 will be high (asserted). When software sets the bit to 0, IRQ12 will be low (not asserted). Default for this bit is 1.
0	1h RW	**IRQ1_CAUSE:** When software sets the bit to 1, IRQ1 will be high (asserted). When software sets the bit to 0, IRQ1 will be low (not asserted). Default for this bit is 1.

27.1.11 TCO_TMR Register (TTMR) - Offset 12h

TCO_TMR Register

Type	Size	Offset	Default
IO	16 bit	SMBus TCO + 12h	0004h

Bit Range	Default & Access	Field Name (ID): Description
15:10	0h RO	**Reserved**
9:0	004h RW	**TCOTMR:** Value that is loaded into the timer each time the TCO_RLD register is written. Values of 0000h or 0001h will be ignored and should not be attempted. The timer is clocked at approximately 0.6 seconds, and thus allows timeouts ranging from 1.2 seconds to 613.8 seconds. Note: The timer has an error of +/- 1 tick (0.6s).

28 FIA Configuration

28.1 FIA Configuration Registers Summary

Table 28-1. Summary of FIA Configuration Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	Common Control (CC)	00000000h
100h	4	PCIe Device Reference Clock Request Enable 1 (PDRCRE1)	00000000h
108h	4	PCIe Device Reference Clock Request Mapping 1 (PDRCRM1)	040C2040h
10Ch	4	PCIe Device Reference Clock Request Mapping 2 (PDRCRM2)	09207185h
110h	4	PCIe Device Reference Clock Request Mapping 3 (PDRCRM3)	00000000h
114h	4	PCIe Device Reference Clock Request Mapping 4 (PDRCRM4)	00000000h
118h	4	PCIe Device Reference Clock Request Mapping 5 (PDRCRM5)	00000000h
11Ch	4	PCIe Device Reference Clock Request Mapping 6 (PDRCRM6)	00000000h
120h	4	PCIe Device Reference Clock Request Mapping 7 (PDRCRM7)	00000000h
124h	4	PCIe Device Reference Clock Request Mapping 8 (PDRCRM8)	00000000h
300h	4	Lane Owner Status 1 (LOS1)	00000000h
304h	4	Lane Owner Status 2 (LOS2)	00000000h
308h	4	Lane Owner Status 3 (LOS3)	00000000h
30Ch	4	Lane Owner Status 4 (LOS4)	00000000h
310h	4	Lane Owner Status 5 (LOS5)	00000000h

28.1.1 Common Control (CC) - Offset 0h

Common Control

Type	Size	Offset	Default
MMIO	32 bit	FDCF0000h + 0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V/L	**Secured Register Lock (SRL):** Secured Register Lock (SRL): When this bit is set, all the secured registers listed down below, including the SRL bit itself, will be locked and will be Read-Only. The lock is only cleared by the reset. Software is expected to program all the registers listed down below then only set this bit to '1'. The following fields are locked by CC.SRL: *DRCRM* *DRCRE* Note: During VNN removal exit flow when register context is restored, this bit shall only be restored after *DRCRM* and *DRCRE* registers are restored. **Locked by:** CC.SRL
30:18	0h RO	**Reserved**
17	0h RO	**Partition/Trunk Oscillator Clock Gating Enable (PTOCGE):** Partition/Trunk Oscillator Clock Gating Enable (PTOCGE): Reserved.
16	0h RW	**Oscillator/Side Clock Dynamic Clock Gating Enable (OSCDCGE):** Oscillator/Side Clock Dynamic Clock Gating Enable (OSCDCGE): When set, the oscillator and Side clock will be dynamically clock gated locally when the conditions to clock gate are met. When clear, the oscillator and Side clock will never be dynamically clock gated. If FC1.CDCGDIS is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. Register Attribute: Static
15	0h RW	**Side Clock Partition/Trunk Clock Gating Enable (SCPTCGE):** Side Clock Partition/Trunk Clock Gating Enable (SCPTCGE): When set, the Side Clock will be clock gated at the partition/trunk level when the conditions to clock gate are met. When clear, the Side Clock will never be clock gated at the partition/trunk level. If FC1.CDCGDIS is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. Register Attribute: Static
14:2	0h RO	**Reserved**
1:0	0h RW	**IOSF Sideband ISM Idle Counter (SBIC):** IOSF Sideband ISM Idle Counter (SBIC): This register provides configuration flexibility to govern when the IOSF sideband ISM transitions to IDLE_REQ state with respect to sideband interface idle. 00b: IOSF sideband ISM will transition to IDLE_REQ after 16 clocks of idle on sideband interface. 01b: IOSF sideband ISM will transition to IDLE_REQ after 31 clocks of idle on sideband interface. 10b: IOSF sideband ISM will transition to IDLE_REQ after 64 clocks of idle on sideband interface. 11b: IOSF sideband ISM will never transition to IDLE_REQ on sideband interface. Register Attribute: Dynamic

28.1.2 PCIe Device Reference Clock Request Enable 1 (PDRCRE1) - Offset 100h

PCIe Device Reference Clock Request Enable 1

Type	Size	Offset	Default
MMIO	32 bit	FDCF0000h + 100h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Express Port 31 CLKREQ Mapping Enable (P31CKRQME):** Express Port 31 CLKREQ Mapping Enable (P31CKRQME): Reserved.
30	0h RO	**Express Port 30 CLKREQ Mapping Enable (P30CKRQME):** Express Port 30 CLKREQ Mapping Enable (P30CKRQME): Reserved.
29	0h RO	**Express Port 29 CLKREQ Mapping Enable (P29CKRQME):** Express Port 29 CLKREQ Mapping Enable (P29CKRQME): Reserved.
28	0h RO	**Express Port 28 CLKREQ Mapping Enable (P28CKRQME):** Express Port 28 CLKREQ Mapping Enable (P28CKRQME): Reserved.
27	0h RO	**Express Port 27 CLKREQ Mapping Enable (P27CKRQME):** Express Port 27 CLKREQ Mapping Enable (P27CKRQME): Reserved.
26	0h RO	**Express Port 26 CLKREQ Mapping Enable (P26CKRQME):** Express Port 26 CLKREQ Mapping Enable (P26CKRQME): Reserved.

21	0h RO	**Express Port 21 CLKREQ Mapping Enable (P21CKRQME):** Express Port 21 CLKREQ Mapping Enable (P21CKRQME): Reserved.
20	0h RO	**Express Port 20 CLKREQ Mapping Enable (P20CKRQME):** Express Port 20 CLKREQ Mapping Enable (P20CKRQME): Reserved.
19	0h RO	**Express Port 19 CLKREQ Mapping Enable (P19CKRQME):** Express Port 19 CLKREQ Mapping Enable (P19CKRQME): Reserved.
18	0h RO	**Express Port 18 CLKREQ Mapping Enable (P18CKRQME):** Express Port 18 CLKREQ Mapping Enable (P18CKRQME): Reserved.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**Express Port 17 CLKREQ Mapping Enable (P17CKRQME):** Express Port 17 CLKREQ Mapping Enable (P17CKRQME): Reserved.
16	0h RO	**Express Port 16 CLKREQ Mapping Enable (P16CKRQME):** Express Port 16 CLKREQ Mapping Enable (P16CKRQME): Reserved.
15	0h RO	**Express Port 15 CLKREQ Mapping Enable (P15CKRQME):** Express Port 15 CLKREQ Mapping Enable (P15CKRQME): Reserved.
14	0h RO	**Express Port 14 CLKREQ Mapping Enable (P14CKRQME):** Express Port 14 CLKREQ Mapping Enable (P14CKRQME): Reserved.
13	0h RO	**Express Port 13 CLKREQ Mapping Enable (P13CKRQME):** Express Port 13 CLKREQ Mapping Enable (P13CKRQME): Reserved.
12	0h RO	**Express Port 12 CLKREQ Mapping Enable (P12CKRQME):** Express Port 12 CLKREQ Mapping Enable (P12CKRQME): Reserved.
11	0h RO	**Express Port 11 CLKREQ Mapping Enable (P11CKRQME):** Express Port 11 CLKREQ Mapping Enable (P11CKRQME): Reserved.
10	0h RO	**Express Port 10 CLKREQ Mapping Enable (P10CKRQME):** Express Port 10 CLKREQ Mapping Enable (P10CKRQME): Reserved.
9	0h RW/L	**Express Port 9 CLKREQ Mapping Enable (P9CKRQME):** Express Port 9 CLKREQ Mapping Enable (P9CKRQME): Similar to register PDRCRE1.P1CKRQME but this register is for Express Port 9. **Locked by:** CC.SRL
8	0h RW/L	**Express Port 8 CLKREQ Mapping Enable (P8CKRQME):** Express Port 8 CLKREQ Mapping Enable (P8CKRQME): Similar to register PDRCRE1.P1CKRQME but this register is for Express Port 8. **Locked by:** CC.SRL
7	0h RW/L	**Express Port 7 CLKREQ Mapping Enable (P7CKRQME):** Express Port 7 CLKREQ Mapping Enable (P7CKRQME): Similar to register PDRCRE1.P1CKRQME but this register is for Express Port 7. **Locked by:** CC.SRL
6	0h RW/L	**Express Port 6 CLKREQ Mapping Enable (P6CKRQME):** Express Port 6 CLKREQ Mapping Enable (P6CKRQME): Similar to register PDRCRE1.P1CKRQME but this register is for Express Port 6. **Locked by:** CC.SRL
5	0h RW/L	**Express Port 5 CLKREQ Mapping Enable (P5CKRQME):** Express Port 5 CLKREQ Mapping Enable (P5CKRQME): Similar to register PDRCRE1.P1CKRQME but this register is for Express Port 5. **Locked by:** CC.SRL
4	0h RW/L	**Express Port 4 CLKREQ Mapping Enable (P4CKRQME):** Express Port 4 CLKREQ Mapping Enable (P4CKRQME): Similar to register PDRCRE1.P1CKRQME but this register is for Express Port 4. **Locked by:** CC.SRL

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/L	**Express Port 3 CLKREQ Mapping Enable (P3CKRQME):** Express Port 3 CLKREQ Mapping Enable (P3CKRQME): Similar to register PDRCRE1.P1CKRQME but this register is for Express Port 3. **Locked by:** CC.SRL
2	0h RW/L	**Express Port 2 CLKREQ Mapping Enable (P2CKRQME):** Express Port 2 CLKREQ Mapping Enable (P2CKRQME): Similar to register PDRCRE1.P0CKRQME but this register is for Express Port 2. **Locked by:** CC.SRL
1	0h RW/L	**Express Port 1 CLKREQ Mapping Enable (P1CKRQME):** Express Port 1 CLKREQ Mapping Enable (P1CKRQME): The mapping of Express Port 1 to the corresponding CLKREQ# pin is configured by this field. '1' means this Express Port has the CLKREQ pin presence and the corresponding register for Express Port 1, i.e. PDRMCRM*.P1CKRQM will indicates which CLKREQ# pin the Express Port is mapped to, '0' means not presence and will be masked to a de-asserted state. This register bit is Read-Only when the CC.SRL bit is set. **Locked by:** CC.SRL
0	0h RW/L	**Express Port 0 CLKREQ Mapping Enable (P0CKRQME):** Express Port 0 CLKREQ Mapping Enable (P0CKRQME): The mapping of Express Port 0 to the corresponding CLKREQ# pin is configured by this field. '1' means this Express Port has the CLKREQ pin presence and the corresponding register for Express Port 0, i.e. PDRMCRM*.P1CKRQM will indicates which CLKREQ# pin the Express Port is mapped to, '0' means not presence and will be masked to a de-asserted state. This register bit is Read-Only when the CC.SRL bit is set. **Locked by:** CC.SRL

28.1.3 PCIe Device Reference Clock Request Mapping 1 (PDRCRM1) - Offset 108h

PCIe Device Reference Clock Request Mapping 1

Type	Size	Offset	Default
MMIO	32 bit	FDCF0000h + 108h	040C2040h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:24	04h RW/L	**Express Port 4 CLKREQ Mapping (P4CKRQM):** Express Port 4 CLKREQ Mapping (P4CKRQM): Similar to register DRCRM1.P1CKRQM but this register is for Express Port 4. **Locked by:** CC.SRL
23	0h RO	**Reserved**
22:18	03h RW/L	**Express Port 3 CLKREQ Mapping (P3CKRQM):** Express Port 3 CLKREQ Mapping (P3CKRQM): Similar to register DRCRM1.P1CKRQM but this register is for Express Port 3. **Locked by:** CC.SRL

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**Reserved**
16:12	02h RW/L	**Express Port 2 CLKREQ Mapping (P2CKRQM):** Express Port 2 CLKREQ Mapping (P2CKRQM): Similar to register DRCRM1.P0CKRQM but this register is for Express Port 2. **Locked by:** CC.SRL
11	0h RO	**Reserved**
10:6	01h RW/L	**Express Port 1 CLKREQ Mapping (P1CKRQM):** Express Port 1 CLKREQ Mapping (P1CKRQM): The mapping of PCH Express Port 1 to the corresponding CLKREQ# pin is configured by this field. This register is only valid if the corresponding register for Express Port 1, i.e. PDRCRE*.P1CKRQME=1. '00h': Express Port 1 maps to CLKREQ0# pin '01h': Express Port 1 maps to CLKREQ1# pin : : '1Dh': Express Port 1 maps to CLKREQ29# pin '1Eh': Express Port 1 maps to CLKREQ30# pin '1Fh': Express Port 1 maps to CLKREQ31# pin Software must never map multiple PCH Express Ports and CPU Express Ports using PDRCRM* and CPDRCRM* registers to the same CLKREQ# pin. The hardware behavior is undefined if this ever happens. This field must be configured prior to enabling any power management features. For SoC with less than 32 CLKREQ# supported for PCIe, configuring this field to map to any unsupported CLKREQ# pins may result in undefined hardware behavior. This register bit is Read-Only when the CC.SRL bit is set. Register Attribute: Static **Locked by:** CC.SRL
5	0h RO	**Reserved**
4:0	00h RW/L	**Express Port 0 CLKREQ Mapping (P0CKRQM):** Express Port 0 CLKREQ Mapping (P0CKRQM): The mapping of PCH Express Port 0 to the corresponding CLKREQ# pin is configured by this field. This register is only valid if the corresponding register for Express Port 0, i.e. PDRCRE*.P0CKRQME=1. '00h': Express Port 0 maps to CLKREQ0# pin '01h': Express Port 0 maps to CLKREQ1# pin : : '1Dh': Express Port 0 maps to CLKREQ29# pin '1Eh': Express Port 0 maps to CLKREQ30# pin '1Fh': Express Port 0 maps to CLKREQ31# pin Software must never map multiple PCH Express Ports and CPU Express Ports using PDRCRM* and CPDRCRM* registers to the same CLKREQ# pin. The hardware behavior is undefined if this ever happens. This field must be configured prior to enabling any power management features. For SoC with less than 32 CLKREQ# supported for PCIe, configuring this field to map to any unsupported CLKREQ# pins may result in undefined hardware behavior. This register bit is Read-Only when the CC.SRL bit is set. Register Attribute: Static **Locked by:** CC.SRL

28.1.4 PCIe Device Reference Clock Request Mapping 2 (PDRCRM2) - Offset 10Ch

PCIe Device Reference Clock Request Mapping 2

Type	Size	Offset	Default

4:0	00h RO	**Express Port 35 CLKREQ Mapping (P35CKRQM):** Express Port 35 CLKREQ Mapping (P35CKRQM): Reserved.

28.1.11 Lane Owner Status 1 (LOS1) - Offset 300h

Lane Owner Status 1

Type	Size	Offset	Default
MMIO	32 bit	FDCF0000h + 300h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO/V	**Lane 7 Owner (L7O):** Lane 7 Owner (L7O): Similar to register LOS1.L0O but this register is for PHY Lane 7.
27:24	0h RO/V	**Lane 6 Owner (L6O):** Lane 6 Owner (L6O): Similar to register LOS1.L0O but this register is for PHY Lane 6.
23:20	0h RO/V	**Lane 5 Owner (L5O):** Lane 5 Owner (L5O): Similar to register LOS1.L0O but this register is for PHY Lane 5.

Bit Range	Default & Access	Field Name (ID): Description
19:16	0h RO/V	**Lane 4 Owner (L4O):** Lane 4 Owner (L4O): Similar to register LOS1.L0O but this register is for PHY Lane 4.
15:12	0h RO/V	**Lane 3 Owner (L3O):** Lane 3 Owner (L3O): Similar to register LOS1.L0O but this register is for PHY Lane 3.
11:8	0h RO/V	**Lane 2 Owner (L2O):** Lane 2 Owner (L2O): Similar to register LOS1.L0O but this register is for PHY Lane 2.
7:4	0h RO/V	**Lane 1 Owner (L1O):** Lane 1 Owner (L1O): This register indicates the lane owner for PHY Lane 1. 0h: PCIe/DMI 1h: USB3 2h: SATA 3h: GbE 4h: Reserved 5h: Reserved 6h: Reserved 7h: Reserved 8h: Display Port/PCIe4th 9h: Thunderbolt/PCIe3rd Ah: HTI Bh: TSN GbE Ch: PCIe2nd Dh-Eh: Reserved Fh: No Owner (If statically assigned to 'No Owner' then PHY power state is PS2-Reset. If dynamically assigned to 'No Owner' then PHY power state is USB3 Idle state, i.e. PS3) Implementation Note: This register has no hardware functional use for FIA.
3:0	0h RO/V	**Lane 0 Owner (L0O):** Lane 0 Owner (L0O): This register indicates the lane owner for PHY Lane 0. 0h: PCIe/DMI 1h: USB3 2h: SATA 3h: GbE 4h: Reserved 5h: Reserved 6h: Reserved 7h: Reserved 8h: Display Port/PCIe4th 9h: Thunderbolt/PCIe3rd Ah: HTI Bh: TSN GbE Ch: PCIe2nd Dh-Eh: Reserved Fh: No Owner (If statically assigned to 'No Owner' then PHY power state is PS2-Reset. If dynamically assigned to 'No Owner' then PHY power state is USB3 Idle state, i.e. PS3) Implementation Note: This register has no hardware functional use for FIA.

28.1.12 Lane Owner Status 2 (LOS2) - Offset 304h

Lane Owner Status 2

Type	Size	Offset	Default
MMIO	32 bit	FDCF0000h + 304h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Lane 15 Owner (L15O):** Lane 15 Owner (L15O): Reserved.
27:24	0h RO	**Lane 14 Owner (L14O):** Lane 14 Owner (L14O): Reserved.
23:20	0h RO	**Lane 13 Owner (L13O):** Lane 13 Owner (L13O): Reserved.
19:16	0h RO	**Lane 12 Owner (L12O):** Lane 12 Owner (L12O): Reserved.
15:12	0h RO/V	**Lane 11 Owner (L11O):** Lane 11 Owner (L11O): Similar to register LOS1.L0O but this register is for PHY Lane 11.
11:8	0h RO/V	**Lane 10 Owner (L10O):** Lane 10 Owner (L10O): Similar to register LOS1.L0O but this register is for PHY Lane 10.
7:4	0h RO/V	**Lane 9 Owner (L9O):** Lane 9 Owner (L9O): Similar to register LOS1.L0O but this register is for PHY Lane 9.
3:0	0h RO/V	**Lane 8 Owner (L8O):** Lane 8 Owner (L8O): Similar to register LOS1.L0O but this register is for PHY Lane 8.

28.1.13 Lane Owner Status 3 (LOS3) - Offset 308h

Lane Owner Status 3

Type	Size	Offset	Default
MMIO	32 bit	FDCF0000h + 308h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Lane 23 Owner (L23O):** Lane 23 Owner (L23O): Reserved.
27:24	0h RO	**Lane 22 Owner (L22O):** Lane 22 Owner (L22O): Reserved.
23:20	0h RO	**Lane 21 Owner (L21O):** Lane 21 Owner (L21O): Reserved.
19:16	0h RO	**Lane 20 Owner (L20O):** Lane 20 Owner (L20O): Reserved.
15:12	0h RO	**Lane 19 Owner (L19O):** Lane 19 Owner (L19O): Reserved.
11:8	0h RO	**Lane 18 Owner (L18O):** Lane 18 Owner (L18O): Reserved.
7:4	0h RO	**Lane 17 Owner (L17O):** Lane 17 Owner (L17O): Reserved.
3:0	0h RO	**Lane 16 Owner (L16O):** Lane 16 Owner (L16O): Reserved.

28.1.14 Lane Owner Status 4 (LOS4) - Offset 30Ch

Lane Owner Status 4

Type	Size	Offset	Default
MMIO	32 bit	FDCF0000h + 30Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Lane 31 Owner (L31O):** Lane 31 Owner (L31O): Reserved.
27:24	0h RO	**Lane 30 Owner (L30O):** Lane 30 Owner (L30O): Reserved.
23:20	0h RO	**Lane 29 Owner (L29O):** Lane 29 Owner (L29O): Reserved.
19:16	0h RO	**Lane 28 Owner (L28O):** Lane 28 Owner (L28O): Reserved.

Bit Range	Default & Access	Field Name (ID): Description
15:12	0h RO	**Lane 27 Owner (L27O):** Lane 27 Owner (L27O): Reserved.
11:8	0h RO	**Lane 26 Owner (L26O):** Lane 26 Owner (L26O): Reserved.
7:4	0h RO	**Lane 25 Owner (L25O):** Lane 25 Owner (L25O): Reserved.
3:0	0h RO	**Lane 24 Owner (L24O):** Lane 24 Owner (L24O): Reserved.

28.1.15 Lane Owner Status 5 (LOS5) - Offset 310h

Lane Owner Status 5

Type	Size	Offset	Default
MMIO	32 bit	FDCF0000h + 310h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Lane 39 Owner (L39O):** Lane 39 Owner (L39O): Reserved.
27:24	0h RO	**Lane 38 Owner (L38O):** Lane 38 Owner (L38O): Reserved.
23:20	0h RO	**Lane 37 Owner (L37O):** Lane 37 Owner (L37O): Reserved.
19:16	0h RO	**Lane 36 Owner (L36O):** Lane 36 Owner (L36O): Reserved.
15:12	0h RO	**Lane 35 Owner (L35O):** Lane 35 Owner (L35O): Reserved.
11:8	0h RO	**Lane 34 Owner (L34O):** Lane 34 Owner (L34O): Reserved.
7:4	0h RO	**Lane 33 Owner (L33O):** Lane 33 Owner (L33O): Reserved.
3:0	0h RO	**Lane 32 Owner (L32O):** Lane 32 Owner (L32O): Reserved.

29 On Package DMI (OPDMI)

This chapter documents OPDMI Registers.

29.1 OPDMI Registers Summary

These registers are within the PCH Private Configuration Space which is accessible through the PCH Sideband Interface. They can be accessed via (SBREG_BAR + PortID + Register Offset).

Table 29-1. Summary of OPDMI Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
2014h	4	Virtual Channel 0 Resource Control (V0CTL)	80000000h
201Ah	2	Virtual Channel 0 Resource Status (V0STS)	0000h
2020h	4	Virtual Channel 1 Resource Control (V1CTL)	00000000h
2026h	2	Virtual Channel 1 Resource Status (V1STS)	0000h
2040h	4	ME Virtual Channel (VCm) Resource Control (VMCTL)	00000000h
2046h	2	ME Virtual Channel Resource Status (VMSTS)	0000h
2084h	4	Uncorrectable Error Status (UES)	00000000h
2088h	4	Uncorrectable Error Mask (UEM)	00000000h
208Ch	4	Uncorrectable Error Severity (UEV)	00000000h
2090h	4	Correctable Error Status (CES)	00000000h
2094h	4	Correctable Error Mask (CEM)	00002000h
20ACh	4	Root Error Command (REC)	00000000h
20B0h	4	Root Error Status (RES)	00000000h
20B4h	4	Error Source Identification (ESID)	00000000h
2234h	4	DMI Control Register (Common) (DMIC)	08000000h
223Ch	4	IOSF Primary Control And Status (Common) (IPCS_IOSFSBCS)	000C0000h
2608h	4	Target Link Speed (TLS)	00000002h
2618h	4	Link Configuration (LCFG)	00330031h
2730h	4	LPC Generic I/O Range 1 (LPCLGIR1)	00000000h
2734h	4	LPC Generic I/O Range 2 (LPCLGIR2)	00000000h
2738h	4	LPC Generic I/O Range 3 (LPCLGIR3)	00000000h
273Ch	4	LPC Generic I/O Range 4 (LPCLGIR4)	00000000h
2740h	4	LPC Generic Memory Range (LPCGMR)	00000000h
2744h	4	LPC BIOS Decode Enable (LPCBDE)	0000FFCFh
2748h	4	uCode Patch Region (UCPR)	00000001h
274Ch	4	General Control and Status (GCS)	00000000h
2750h	4	I/O Trap Register 1 - Lower DW (IOT1_LOW)	00000000h
2754h	4	I/O Trap Register 1 - Upper DW (IOT1_HIGH)	00000000h
2770h	4	LPC I/O Decode Ranges (LPCIOD)	00000000h
2774h	4	LPC I/O Enables (LPCIOE)	00000000h
2778h	4	TCO Base Address (TCOBASE)	00000001h
277Ch	4	General Purpose Memory Range 1 (GPMR1)	00000000h
2780h	4	General Purpose Memory Range 1 Destination ID (GPMR1DID)	00000000h
27ACh	4	PM Base Address (PMBASEA)	00000000h
27B0h	4	PM Base Control (PMBASEC)	00000000h
27B4h	4	ACPI Base Address (ACPIBA)	00000000h
27B8h	4	ACPI Base Destination ID (ACPIBDID)	00000000h

29.1.1 Virtual Channel 0 Resource Control (V0CTL) — Offset

2014h

Virtual Channel 0 Resource Control

Type	Size	Offset	Default
MMIO	32 bit	FD880000h + 2014h	80000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31	1h RO	**Virtual Channel Enable (EN):** Enables the VC when set. Disables the VC when cleared.
30:27	0h RO	**Reserved**
26:24	0h RO	**Virtual Channel Identifier (ID):** Indicates the ID to use for this virtual channel
23:16	0h RO	**Reserved**
15:10	00h RW/L	**Extended TC/VC Map (ETVM):** Defines the upper 8-bits of the VC0 16-bit TC/VC mapping registers. These registers use the PCI reserved TC[3] traffic class bit. This register is Read-Only if DMIC.SRL field is set. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
9:7	0h RO	**Reserved**
6:1	00h RW/L	**Transaction Class / Virtual Channel Map (TVM):** Indicates which transaction classes are mapped to this virtual channel. When a bit is set, this transaction class is mapped to the virtual channel. This register is Read-Only if DMIC.SRL field is set. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
0	0h RO	**Reserved**

29.1.2 Virtual Channel 0 Resource Status (V0STS) — Offset 201Ah

Virtual Channel 0 Resource Status

Type	Size	Offset	Default
MMIO	16 bit	FD880000h + 201Ah	0000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
15:2	0h RO	**Reserved**
1	0h RO/V	**VC Negotiation Pending (NP):** When set, indicates the virtual channel is still being negotiated with ingress ports.
0	0h RO	**Reserved**

29.1.3 Virtual Channel 1 Resource Control (V1CTL) — Offset 2020h

Virtual Channel 1 Resource Control

Type	Size	Offset	Default
MMIO	32 bit	FD880000h + 2020h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**Virtual Channel Enable (EN):** Enables the VC when set. Disables the VC when cleared. This register is Read-Only if the DMIC.SRL field is set. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
30:28	0h RO	**Reserved**
27:24	0h RW/L	**Virtual Channel Identifier (ID):** Indicates the ID to use for this virtual channel BIOS is required to program VCID[3] to 0 when operating at DMI2. This register is Read-Only if the DMIC.SRL field is set. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
23:16	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
15:10	00h RW/L	**Extended TC/VC Map (ETVM):** Defines the upper 8-bits of the VC1 16-bit TC/VC mapping registers These registers use the PCIe reserved TC[3] traffic class bit. This register is Read-Only if the DMIC.SRL field is set. If VC1 is not enabled, the register output sent to the users of this register is forced to 0. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
9:8	0h RO	**Reserved**
7:1	00h RW/L	**Transaction Class / Virtual Channel Map (TVM):** Indicates which transaction classes are mapped to this virtual channel. When a bit is set, this transaction class is mapped to the virtual channel. This register is Read-Only if the DMIC.SRL field is set. If VC1 is not enabled, the register output sent to the users of this register is forced to 0. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
0	0h RO	**Reserved**

29.1.4 Virtual Channel 1 Resource Status (V1STS) — Offset 2026h

Virtual Channel 1 Resource Status

Note: Bit definitions are the same as V0STS, offset 201Ah.

29.1.5 ME Virtual Channel (VCm) Resource Control (VMCTL) — Offset 2040h

ME Virtual Channel (VCm) Resource Control

Type	Size	Offset	Default
MMIO	32 bit	FD880000h + 2040h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**Virtual Channel Enable (EN):** Enables the VC when set. Disables the VC when cleared. This register is Read-Only if the DMIC.SRL field is set. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
30:28	0h RO	**Reserved**
27:24	0h RW/L	**Virtual Channel Identifier (ID):** Indicates the ID to use for this virtual channel BIOS is required to program VCID[3] to 0 when operating at DMI2. This register is Read-Only if the DMIC.SRL field is set. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
23:16	0h RO	**Reserved**
15:10	00h RW/L	**Extended TC/VC Map (ETVM):** Defines the upper 8-bits of the VCm 16-bit TC/VC mapping registers. These registers use the PCIe reserved TC[3] traffic class bit. This register is Read-Only if the DMIC.SRL field is set. If VCm is not enabled, the register output sent to the users of this register is forced to 0. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
9:8	0h RO	**Reserved**
7:1	00h RW/L	**Transaction Class / Virtual Channel Map (TVM):** Indicates which transaction classes are mapped to this virtual channel. When a bit is set, this transaction class is mapped to the virtual channel. This register is Read-Only if the DMIC.SRL field is set. If VCm is not enabled, the register output sent to the users of this register is forced to 0. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
0	0h RO	**Reserved**

29.1.6 ME Virtual Channel Resource Status (VMSTS) — Offset 2046h

ME Virtual Channel Resource Status

Note: Bit definitions are the same as V0STS, offset 201Ah.

29.1.7 Uncorrectable Error Status (UES) — Offset 2084h

Uncorrectable Error Status

Type	Size	Offset	Default
MMIO	32 bit	FD880000h + 2084h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved**
20	0h RW/1C/V/P	**Unsupported Request Error Status (URE):** Indicates an unsupported request was received.
19	0h RO	**ECRC Error Status (EE):** ECRC is not supported.
18	0h RW/1C/V/P	**Malformed TLP Status (MT):** Indicates a malformed TLP was received.
17	0h RW/1C/V/P	**Receiver Overflow Status (RO):** Indicates a receiver overflow occurred.
16	0h RO	**Unexpected Completion Status (UC):** Reserved
15	0h RW/1C/V/P	**Completer Abort Status (CA):** Indicates a completer abort was received.
14	0h RO	**Completion Timeout Status (CT):** Reserved
13	0h RO	**Flow Control Protocol Error Status (FCPE):** Not supported.
12	0h RW/1C/V/P	**Poisoned TLP Status (PT):** Indicates a poisoned TLP was received.
11:5	0h RO	**Reserved**
4	0h RW/1C/V/P	**Data Link Protocol Error Status (DLPE):** Indicates a data link protocol error occurred.
3:1	0h RO	**Reserved**
0	0h RO	**Training Error Status (TE):** Not supported.

29.1.8 Uncorrectable Error Mask (UEM) — Offset 2088h

Uncorrectable Error Mask

Type	Size	Offset	Default
MMIO	32 bit	FD880000h + 2088h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved**
20	0h RW/P	**Unsupported Request Error Mask (URE):** Mask for uncorrectable errors.
19	0h RO	**ECRC Error Mask (EE):** ECRC is not supported.
18	0h RW/P	**Malformed TLP Mask (MT):** Mask for malformed TLPs
17	0h RW/P	**Receiver Overflow Mask (RO):** Mask for receiver overflows.
16	0h RO	**Unexpected Completion Mask (UC):** Reserved
15	0h RW/P	**Completer Abort Mask (CM):** Mask for completer abort.
14	0h RO	**Completion Timeout Mask (CT):** Reserved
13	0h RO	**Flow Control Protocol Error Mask (FCPE):** Not supported.
12	0h RW/P	**Poisoned TLP Mask (PT):** Mask for poisoned TLPs.
11:5	0h RO	**Reserved**
4	0h RW/P	**Data Link Protocol Error Mask (DLPE):** Mask for data link protocol errors.
3:1	0h RO	**Reserved**
0	0h RO	**Training Error Mask (TE):** Not supported.

29.1.9 Uncorrectable Error Severity (UEV) — Offset 208Ch

Uncorrectable Error Severity

Type	Size	Offset	Default
MMIO	32 bit	FD880000h + 208Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved**
20	0h RW/P	**Unsupported Request Error Severity (URE):** Severity for unsupported request reception.
19	0h RO	**ECRC Error Severity (EE):** ECRC is not supported.
18	0h RW/P	**Malformed TLP Severity (MT):** Severity for malformed TLP reception.
17	0h RW/P	**Receiver Overflow Severity (RO):** Severity for receiver overflow occurrences.
16	0h RO	**Unexpected Completion Severity (UC):** Reserved
15	0h RW/P	**Completer Abort Severity (CA):** Severity for completer.
14	0h RO	**Completion Timeout Severity (CT):** Reserved
13	0h RO	**Flow Control Protocol Error Severity (FCPE):** Not supported.
12	0h RW/P	**Poisoned TLP Severity (PT):** Severity for poisoned TLP reception.
11:5	0h RO	**Reserved**
4	0h RW/P	**Data Link Protocol Error Severity (DLPE):** Severity for data link protocol errors.
3:1	0h RO	**Reserved**
0	0h RW/P	**Training Error Severity (TE):** TE not supported. This bit is RW for ease of implementation.

29.1.10 Correctable Error Status (CES) — Offset 2090h

Correctable Error Status

Type	Size	Offset	Default
MMIO	32 bit	FD880000h + 2090h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13	0h RW/1C/V/P	**Advisory Non-Fatal Error Status (ANFES):** When set, indicates that a Advisory Non-Fatal Error occurred.
12	0h RW/1C/V/P	**Replay Timer Timeout Status (RTT):** Indicates the replay timer timed out.
11:9	0h RO	**Reserved**
8	0h RW/1C/V/P	**Replay Number Rollover Status (RNR):** Indicates the replay number rolled over.
7	0h RW/1C/V/P	**Bad DLLP Status (BD):** Indicates a bad DLLP was received.
6	0h RW/1C/V/P	**Bad TLP Status (BT):** Indicates a bad TLP was received.
5:1	0h RO	**Reserved**
0	0h RW/1C/V/P	**Receiver Error Status (RE):** Indicates a receiver error occurred.

29.1.11 Correctable Error Mask (CEM) — Offset 2094h

Correctable Error Mask

Type	Size	Offset	Default
MMIO	32 bit	FD880000h + 2094h	00002000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13	1h RW/P	**Advisory Non-Fatal Error Mask (ANFEM):** When set, masks Advisory Non-Fatal errors from (a) signaling ERR_COR to the device control register and (b) updating the Uncorrectable Error Status register. This register is set by default to enable compatibility with software that does not comprehend Role-Based Error Reporting.
12	0h RW/P	**Replay Timer Timeout Mask (RTT):** Mask for replay timer timeout.
11:9	0h RO	**Reserved**
8	0h RW/P	**Replay Number Rollover Mask (RNR):** Mask for replay number rollover.
7	0h RW/P	**Bad DLLP Mask (BD):** Mask for bad DLLP reception.
6	0h RW/P	**Bad TLP Mask (BT):** Mask for bad TLP reception.
5:1	0h RO	**Reserved**
0	0h RW/P	**Receiver Error Mask (RE):** Mask for receiver errors.

29.1.12 Root Error Command (REC) — Offset 20ACh

Root Error Command

Type	Size	Offset	Default
MMIO	32 bit	FD880000h + 20ACh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**Drop Poisoned Downstream Packets (DPDP):** When set to a '1', if downstream packet on DMI is received with the EP bit set, this packet and all downstream packets with data received on DMI for any VC will have their Unsupported Transaction (UT) attribute set causing them to be forwarded to the fabric Error Handler. When cleared to a '0', downstream packets from DMI with the EP bit set are forwarded onto the downstream backbone normally. This register is Read-Only if DMIC.SRL field is set. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
30	0h RW	**Unsupported Transaction Policy Bit (UTPB):** When set to '1', the Unsupported Transactions detected on DMI will not set the UES.URE bit. This subsequently ensures that SERR will never be signaled in response to Unsupported Transactions regardless of UEV.URE. When set to '0', the Unsupported Transactions detected on DMI will set the UES.URE bit.
29:3	0h RO	**Reserved**
2	0h RO	**Fatal Error Reporting Enable (FERE):** When set, the root port will generate an interrupt when a fatal error is reported by the attached device. Not implemented by PCH.
1	0h RO	**Non-fatal Error Reporting Enable (NERE):** When set, the root port will generate an interrupt when a non-fatal error is reported by the attached device. Not implemented in PCH.
0	0h RO	**Correctable Error Reporting Enable (CERE):** When set, the root port will generate an interrupt when a correctable error is reported by the attached device. Not implemented in PCH.

29.1.13 Root Error Status (RES) — Offset 20B0h

Root Error Status

Type	Size	Offset	Default
MMIO	32 bit	FD880000h + 20B0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:27	00h RO	**Advanced Error Interrupt Message Number (AEMN):** There is only one error interrupt allocated.
26:4	0h RO	**Reserved**
3	0h RO	**Multiple ERR_FATAL/NONFATAL Recvieved (MENR):** Set when either a fatal or a non-fatal error is received and the ENR bit is already set. This is not supported in PCH.
2	0h RW/1C/V	**ERR_FATAL/NONFATAL Received (ENR):** Set when either a fatal or a non-fatal error message is received or an internal fatal error is detected (all internal uncorrectable errors are fatal).
1	0h RO	**Multiple ERR_COR Received (MCR):** Set when a correctable error message is received and the CR bit is already set. This is not supported in PCH
0	0h RW/1C/V	**ERR_COR Received (CR):** Set when a correctable error message is received or an internal correctable error is detected.

29.1.14 Error Source Identification (ESID) — Offset 20B4h

Error Source Identification

Type	Size	Offset	Default
MMIO	32 bit	FD880000h + 20B4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO/V	**ERR_FATAL/NONFATAL Source Identification (ENSID):** Loaded with the requester ID indicated in the received ERR_FATAL or ERR_NONFATAL message when RES.ENR is first set, or the internal requestor ID if an internally detected error.
15:0	0000h RO/V	**ERR_COR Source Identification (CSID):** Loaded with the requester ID indicated in the received ERR_COR message when RES.CR is first set, or the internal requester ID if an internally detected error.

29.1.15 DMI Control Register (Common) (DMIC) — Offset 2234h

DMI Control Register (Common)

Type	Size	Offset	Default
MMIO	32 bit	FD880000h + 2234h	08000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**Secured Register Lock (SRL):** When this bit is set, all the secured registers will be locked and will be Read-Only. The following fields are locked by DMIC.SRL: V0CTL.ETVM and V0CTL.TVM. V1CTL.ETVM and V1CTL.TVM. VMCTL.ETVM and VMCTL.TVM. REC.DPDP. LCTL.LD. DMIEIN.EPT. DMIC.TIOCTPD. DMIC.TXTPCE. DMIC.CPUSEL. DMIC.TXTPCRP. DMIHBP. DMI Source Decode Registers (except IO Trap). DMIDBG.ATE. DMIDBG.NEDLBE. DMIDBG.LBTE. DMICMMPC.START. PCE.SE. DMIEEPPES.PSSSGE. DMIEEPEG.PEG. DMPCHK. RXHALEP DMPCHK.MRSCDIS This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
30	0h RO	**Reserved**
29	0h RW/L	**Trusted I/O Context TLP Prefix Disable (TIOCTPD):** When set, disables the TIO Context TLP prefix support. On the transmit side, the TIO Context TLP prefix will not be forwarded to the other side of the link. On the receive side, the cycle with TIO Context TLP prefix will be handled as malformed. When clear, TIO Context TLP Prefix will be sent, subjected to DMIC.LTLPPDIS. This register is Read-Only if DMIC.SRL field is set. Register Attribute: Dynamic. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL

Bit Range	Default & Access	Field Name (ID): Description
28	0h RW/L	**Transmit TLP Prefix Caching Enable (TXTPCE):** When set, enables Transmit TLP Prefix Caching. This register is Read-Only if the DMIC.SRL field is set. Receive TLP Prefix Caching logic is not affected by this config bit. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
27	1h RW/L	**CPU Select (CPUSEL):** Indicates which CPU, DMI is paired with. '0': Compute Die '1': Reserved This register is expected to be programmed by PMC FW in between host_side_rst_b deassertion and host_prim_rst_b deassertion window. This register is Read-Only if DMIC.SRL field is set. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
26	0h RO/V	**Local TLP Prefix Disable (LTLPPDIS):** Disable Local TLP Prefix on transmit and receive path of the PCIe TLP formatter. '0': Enabled '1': Disabled The value of this field is defined by soft strap unless when DMIC.CPUSEL is '1'. When DMIC.CPUSEL is '1', this field will have a value of '1' also.
25:24	0h RW	**Offset Re-Calibration Enable (ORCE):** Enable offset re-calibration mechanism to cater for temperature variation during run-time. Offset re-calibration is triggered on entry to the following states: Polling.Active, Recovery.RcvrLock and Configuration.LinkwidthStart, qualified with the data rate configured in this field. '00b': Disable offset re-calibration. '01b': Enable offset re-calibration for Gen 2 and Gen 3 data rate only. '10b': Reserved. '11b': Enable offset re-calibration for all data rates. Note: This register is not applicable to OP-DMI. Register Attribute: Dynamic.
23	0h RW	**Offset Re-Calibration Request (ORCR):** When this bit is set followed by a link retrain, offset recalibration will be performed on entry to Recovery state. This bit cleared by hardware upon the completion of offset re-calibration in Recovery.RcvrLock state Note: When offset re-calibration request bit is set followed by a link retrain, hardware may truncate the received TLP/DLLP. Note: This register is not applicable to OP-DMI. Register Attribute: Static.
22:20	0h RW	**Flow Control Update Policy (FCP):** Indicates how long a flow control update should wait for transmit in the presence of TLPs to transmit. When the link is idle, a flow control update will occur immediately when it becomes available. Additionally, if a 2nd update becomes available, the flow control update will occur next, regardless of the clock count. Encodings are: Bits Encoding 101 Wait 128-160 link clocks before sending the update 100 Wait 96-128 link clocks before sending the update 011 Wait 64-96 link clocks before sending the update 010 Wait 32-64 link clocks before sending the update 000 Never wait, send flow control update immediately All values other than the ones specified will alias to '000'. Register Attribute: Static.

Bit Range	Default & Access	Field Name (ID): Description
19	0h RW	**Downstream Non-Posted Request Limit (DNPRL):** When set, limits the number of downstream non-posted request towards PSF to just one outstanding. Register Attribute: Static.
18	0h RW	**IOSF Transaction Credit Update Mode (ITCUM):** When set, the credit update to the IOSF Fabric will occur on the clock the command is transferred to the retry buffer, ahead of the data transfer. When cleared, the credit update will not occur until the end of the data transfer. This register can only be set to '1' in OP-DMI x8 or DMI x4 GEN3 configuration.
17	0h RO/V	**Transaction Layer Packet Fast Transmit Mode (TLPF):** When set, the DMI transmit block will transmit the packet header in the upstream command queue without waiting for the corresponding data to be available. When cleared, the TLP transfer will not occur until the upstream data queue has the entire data phase available.
16	0h RO/V	**DMI Credit Allocated Update Mode (CAM):** When set, the credit update to the DMI transmit block will occur when the command is granted on the IOSF downstream backbone, ahead of the data transfer. When cleared, the credit update will not occur until the last data phase o the IOSF transaction.
15:8	0h RO	**Reserved**
7:5	0h RW/L	**Transmit TLP Prefix Cache Replacement Policy (TXTPCRP):** Indicates the number of times a unique set of TLP Prefix attributes are sampled before the cache is replaced. '000' - 1 time '001' - 2 times ... '110' - 7 times '111' - 8 times This register is Read-Only if the DMIC.SRL field is set. This register should be programmed to the desired value before enabling DMIC.TXTPCE Register Attribute: Static This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
4	0h RW	**Partition/Trunk Oscillator Clock Gate Enable (PTOCGE):** When set, this bit allows the oscillator clock to be gated at the partition/trunk level when the conditions are met. When cleared, the oscillator clock gating at the partition/trunk level is disabled. Note: If Core Dynamic Clock Gating Disable fuse is '1', hardware will always see 0 as an output from this register. BIOS reading this register should always return the correct value. Register Attribute: Static
3	0h RW	**DMI Link CLKREQ Enable (DMILCLKREQEN):** When set, this bit enables DMI to de-assert the DMI link CLKREQ. When cleared, DMI link CLKREQ is not allowed to de-assert. Note: If Link Trunk Clock Gating Disable fuse is '1', hardware will always see 0 as an output from this register. BIOS reading this register should always return the correct value.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**DMI Backbone CLKREQ Enable (DMIBBCLKREQEN):** When set, this bit enables DMI to de-assert the IOSF Primary backbone CLKREQ. When cleared, DMI IOSF Primary backbone CLKREQ is not allowed to de-assert.
1	0h RW	**DMI Link Dynamic Clock Gate Enable (DMILCGEN):** When set, this bit enables dynamic clock gating on the DMI Link clock domain logic. When cleared, dynamic clock gating on the DMI Link clock domain is disabled. Note: If Link Dynamic Clock Gating Disable fuse is '1', hardware will always see 0 as an output from this register. BIOS reading this register should always return the correct value.
0	0h RW	**DMI Backbone Dynamic Clock Gate Enable (DMIBCGEN):** When set, this bit enables dynamic clock gating on the DMI Backbone clock domain logic. When cleared, dynamic clock gating on the DMI backbone clock domain is disabled. Note: If Core Dynamic Clock Gating Disable fuse is '1', hardware will always see 0 as an output from this register. BIOS reading this register should always return the correct value.

29.1.16 IOSF Primary Control And Status (Common) (IPCS_IOSFSBCS) — Offset 223Ch

IOSF Primary Control And Status (Common)

Type	Size	Offset	Default
MMIO	32 bit	FD880000h + 223Ch	000C0000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22	0h RW	**Side Clock Partition/Trunk Clock Gating Enable (SCPTCGE):** When set, the Side Clock will be clock gated at the partition/trunk level when the conditions to clock gate are met. When clear, the Side Clock will never be clock gated at the partition/trunk level. Note: If 'Core Dynamic Clock Gate Disable' fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. Register Attribute: Static.
21	0h RW	**Sideband Endpoint Oscillator/Side Dynamic Clock Gating Enable (SEOSCGE):** When set, the oscillator and Side clock used within the Sideband Endpoint will be dynamically gated when the condition permits. When cleared, the dynamic oscillator and Side clock gating mechanism is disabled. Note: If 'Core Dynamic Clock Gating Disable' fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. Register Attribute: Static.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**Reserved**
19:18	3h RW	**IOSF Sideband Interface Idle Counter (SIID):** This register provides configuration flexibility to govern when the trunk clock can be gated from the time the sideband interface is idle. 00: Wait for 32 idle clocks before allowing trunk clock gating. 01: Wait for 64 idle clocks before allowing trunk clock gating. 10: Wait for 128 idle clocks before allowing trunk clock gating. 11: Wait for 256 idle clocks before allowing trunk clock gating.
17:16	0h RW	**IOSF Sideband ISM Idle Counter (SBIC):** This register provides configuration flexibility to govern when the IOSF sideband ISM transitions to IDLE_REQ state with respect to sideband interface idle. 00: IOSF sideband ISM will transition to IDLE_REQ after 16 clocks of idle on sideband interface. 01: IOSF sideband ISM will transition to IDLE_REQ after 31 clocks of idle on sideband interface. 10: IOSF sideband ISM will transition to IDLE_REQ after 64 clocks of idle on sideband interface. 11: IOSF sideband ISM will never transition to IDLE_REQ on sideband interface. Note: Controller Power Gating will be blocked if this field is programmed to '11'
15	0h RO	**Reserved**
14:12	0h RW	**IOSF Primary ISM Idle Counter (PRIC):** This register provides configuration flexibility to govern when the IOSF primary ISM transitions to IDLE_REQ state with respect to primary interface idle. 000: IOSF primary ISM will transition to IDLE_REQ after 16 clocks of idle on primary interface. 001: IOSF primary ISM will transition to IDLE_REQ after 31 clocks of idle on primary interface. 010: IOSF primary ISM will transition to IDLE_REQ after 64 clocks of idle on primary interface. 011: IOSF primary ISM will transition to IDLE_REQ after 128 clocks of idle on primary interface. 100: IOSF primary ISM will transition to IDLE_REQ after 256 clocks of idle on primary interface. 101: IOSF primary ISM will transition to IDLE_REQ after 512 clocks of idle on primary interface. 110: IOSF primary ISM will transition to IDLE_REQ after 1024 clocks of idle on primary interface. 111: IOSF primary ISM will never transition to IDLE_REQ on primary interface. Note: Controller Power Gating will be blocked if this field is programmed to '111' Register Attribute: Dynamic.
11:0	0h RO	**Reserved**

29.1.17 Target Link Speed (TLS) — Offset 2608h

Target Link Speed

Type	Size	Offset	Default
MMIO	32 bit	FD880000h + 2608h	00000002h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3:0	2h RO/V	**Target Link Speed (TLS):** Specifies the Target link speed that should be used if speed change is supported. Bit | Description 0000 | SPEED0: 100 Mb/s per-lane 0001 | SPEED1: 1 Gb/s per-lane 0010 | SPEED2: 2 Gb/s per-lane 0011 | SPEED3: 4 GT/s per-lane 0100-1111 | Reserved Note: The default value of bit[1:0] is defined by soft strap. Bit[3:2] are hardwired to '00'. This field is Read-only (RO) in with TLS value defined by soft-strap. Only static speed configuration is supported.

29.1.18 Link Configuration (LCFG) — Offset 2618h

Link Configuration

Type	Size	Offset	Default
MMIO	32 bit	FD880000h + 2618h	00330031h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:28	0h RO/V	**OPI PHY Low Voltage Operation Soft Strap (OPIPLVOSS):** This field reflects the status of the OPI PHY Low Voltage Operation soft-strap.
27	0h RW	**Aging Mitigation Enable (AME):** When set, Aging Mitigation logic will be enabled each time IDLE_L1 state is entered. Note: This bit is expected to be set before Hardware-Autonomous IDLE_L1 Enable (LCTL.HAIE) is set.

Bit Range	Default & Access	Field Name (ID): Description
26	0h RW	**Loopback Operational Mode (LOM):** 0': LOOPBACK operates as defined in the OPI spec rev 0.8. It is considered a Link Down condition with an extended sideband handshake exit to RESET. '1': LOOPBACK operates as defined in the OPI 'LOOPBACK to ACTIVE' ECN to the 0.8 spec. It is considered a Link Up condition if entered from ACTIVE, and will return to ACTIVE on an extended sideband handshake if entered from ACTIVE.
25	0h RW/L	**Secure Register Lock (SRL):** When set, locks the following registers: OPI Error Injection Control (EIC) register. LCTL.FLME. LCTL.LTE. LCTL.DNELBE. LCFG.DFELBE. LCFG.NESLE. OPIHBPC. Once this bit is written to '1', it cannot be changed until a PLTRST# occurs. This register is Read-Only if LCFG.SRL field is set **Locked by:** LCFG.SRL
24	0h RW/L	**Digital Far-End Loopback Enable (DFELBE):** When set, the Link Layer loops back the Receive data from the RXFIFO to the TXFIFO. This register is Read-Only if LCFG.SRL field is set. Note: This bit is expected to be set when the link is in ACTIVE state and the interface is in Transmit Idle/ Transmit Quiet state. This register is Read-Only if LCFG.SRL field is set **Locked by:** LCFG.SRL
23	0h RW/L	**Near-End Sideband Loopback Enable (NESLE):** When set, the TXSB will be loopback to RXSB in the Link Layer. None of the other OPI pins are impacted by this bit except for TXSB and RXSB. This bit is expected to be set when running in ANELB (master) and AFELB (master). The intention is to supplement the PHY loopback since TXSB and RXSB do not have abutment for loopback. This register is Read-Only if LCFG.SRL field is set. This register is Read-Only if LCFG.SRL field is set **Locked by:** LCFG.SRL
22:20	3h RO/V	**Transmit Link Width (TXLW):** This field specifies the number of transmit lanes. Bit | Description 000 | 1 lane 001 | 2 lanes 010 | 4 lanes 011 | 8 lanes 100 | 12 lanes (not supported) 101 | 16 lanes (not supported) 110 | 32 lanes (not supported) 111 | Reserved Note: Not all the link width is supported in PCH. The value of this field is defined by soft strap.
19	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
18:16	3h RO/V	**Receive Link Width (RXLW):** This field specifies the number of receive lanes. Bit | Description 000 | 1 lane 001 | 2 lanes 010 | 4 lanes 011 | 8 lanes 100 | 12 lanes (not supported) 101 | 16 lanes (not supported) 110 | 32 lanes (not supported) 111 | Reserved Note: Not all the link width is supported in PCH. The value of this field is defined by soft strap.
15:12	0h RO	**Reserved**
11:10	0h RO	**ACTIVE State Link Reset Timer (ASLRT):** In any state other than SLEEP_L2.READY, LOOPBACK and DISABLED state, once the Secondary Bus Reset or Link Reset register is set, a timer will be kicked off. If the timer expires prior to the Sideband signal assertion on both sides of the link, acknowledging LINKRESET entry, the extended Sideband handshake is performed. Bit | Description 00 | 5 ms 01 | 10 ms 10 | 20 ms 11 | 30 ms This field is only used by the upstream component. The field is Read-only (RO) '0' in PCH. It is not applicable for PCH as the OPI downstream device.
9:8	0h RO	**Unsuccessful Speed Change Timer (USCT):** This is the timer value for the component to wait for the Ping LLP after a speed change. The timer starts from the time the LSM enters ACTIVE_L0 state with the Speed Change Flag set from SPEED state. Bit | Description 00 | Disabled 01 | 50 us 10 | 100 us 11 | 1 ms The field is Read-only (RO) '0' in PCH. It is not applicable for PCH as only static speed configuration is supported.
7	0h RO	**Reserved**
6:4	3h RW	**TLCP Grant Count (TLCPGC):** Sets the grant count for FCPs in the link arbiter. The counter is decremented each time a TLCP request is granted. In the absence of higher priority requests, the FCP requests will continue to be granted until the counter reaches 0. The counter is reset when all grant counters are 0 or, no requests are asserted.
3	0h RO	**Reserved**
2:0	1h RW	**TLP Grant Count (TLPGC):** Sets the grant count for TLP in the link arbiter. The counter is decremented each time a TLP request is granted. In the absence of higher priority requests, the TLP requests will continue to be granted until the counter reaches 0. The counter is reset when all grant counters are 0 or, no requests are asserted.

31:16	0h RO	**Reserved**
15	1h RO	**F8-FF Enable (EF8):** Enables decoding of 512K of the following BIOS range: Data space: FFF80000h FFFFFFFFh Feature space: FFB80000h FFBFFFFFh Register Attribute: Static.
14	1h RW/L	**F0-F8 Enable (EF0):** Enables decoding of 512K of the following BIOS range: Data space: FFF00000h FFF7FFFFh Feature space: FFB00000h FFB7FFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
13	1h RW/L	**E8-EF Enable (EE8):** Enables decoding of 512K of the following BIOS range: Data space: FFE80000h FFEFFFFFh Feature space: FFA80000h FFAFFFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
12	1h RW/L	**E0-E8 Enable (EE0):** Enables decoding of 512K of the following BIOS range: Data space: FFE00000h FFE7FFFFh Feature Space: FFA00000h FFA7FFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
11	1h RW/L	**D8-DF Enable (ED8):** Enables decoding of 512K of the following BIOS range: Data space: FFD80000h FFDFFFFFh Feature space: FF980000h FF9FFFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL

Bit Range	Default & Access	Field Name (ID): Description
10	1h RW/L	**D0-D7 Enable (ED0):** Enables decoding of 512K of the following BIOS range: Data space: FFD00000h FFD7FFFFh Feature space: FF900000h FF97FFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
9	1h RW/L	**C8-CF Enable (EC8):** Enables decoding of 512K of the following BIOS range: Data space: FFC80000h FFCFFFFFh Feature space: FF880000h FF8FFFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
8	1h RW/L	**C0-C7 Enable (EC0):** Enables decoding of 512K of the following BIOS range: Data space: FFC00000h FFC7FFFFh Feature space: FF800000h FF87FFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
7	1h RW/L	**Legacy F Segment Enable (LFE):** This enables the decoding of the legacy 64KB range at F0000h FFFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
6	1h RW/L	**Legacy E Segment Enable (LEE):** This enables the decoding of the legacy 64KB range at E0000h EFFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
5:4	0h RO	**Reserved**
3	1h RW/L	**70-7F Enable (E70):** Enables decoding of 1MB of the following BIOS range: Data space: FF700000h FF7FFFFFh Feature space: FF300000h FF3FFFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL

Bit Range	Default & Access	Field Name (ID): Description
2	1h RW/L	**60-6F Enable (E60):** Enables decoding of 1MB of the following BIOS range: Data space: FF600000h FF6FFFFFh Feature Space: FF200000h FF2FFFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
1	1h RW/L	**50-5F Enable (E50):** Enables decoding of 1MB of the following BIOS range: Data space: FF500000h FF5FFFFFh Feature Space: FF100000h FF1FFFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
0	1h RW/L	**40-4F Enable (E40):** Enables decoding of 1MB of the following BIOS range: Data space: FF400000h FF4FFFFFh Feature space: FF000000h FF0FFFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL

29.1.25 uCode Patch Region (UCPR) — Offset 2748h

uCode Patch Region

Type	Size	Offset	Default
MMIO	32 bit	FD880000h + 2748h	00000001h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	1h RW/L	**uCode Patch Region Enable (UPRE):** When set, enables memory access targeting the uCode patch region (0xFEF00000 to 0xFEFFFFFF) to be forwarded to SPI Flash. This register is Read-Only if the DMIC.SRL field is set. Note: This bit should never be set if the boot flash is on LPC. This bit can only be set if the boot flash is on SPI. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL

29.1.26 General Control and Status (GCS) — Offset 274Ch

General Control and Status

Type	Size	Offset	Default
MMIO	32 bit	FD880000h + 274Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/L	**RPR Destination ID (RPRDID):** This field specifies the PCIe port Destination ID that is the target of the I/O ranges specified in the RPR field. Only one PCIe root port at a time can be enabled for Port 8xh support. This field is only valid when GCS.RPR field is set. BIOS must program the bits which are not used to zeros. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
15:11	0h RO	**Reserved**
10	0h RW/V/L	**Boot BIOS Strap (BBS):** This field determines the destination of accesses to the BIOS memory range. Bits Description 0b: SPI 1b: LPC/eSPI When SPI or LPC/eSPI is selected, the range that is decoded is further qualified by other configuration bits described in the respective sections. The value in this field can be overwritten by software as long as the BIOS Interface Lock-Down (bit 0) and DMIC.SRL are not set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
9:1	0h RO	**Reserved**
0	0h RW/O	**BIOS Interface Lock-Down (BILD):** When set, prevents GCS.BBS from being changed. This bit can only be written from 0 to 1 once. Register Attribute: Static.

29.1.27 I/O Trap Register 1 - Lower DW (IOT1_LOW) — Offset 2750h

I/O Trap Register 1 - Lower DW

Type	Size	Offset	Default
MMIO	32 bit	FD880000h + 2750h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:18	00h RW	**Address[7:2] Mask (ADDRMASK):** A '1' in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for traps on address ranges up to 256 bytes in size. Register Attribute: Static.
17:16	0h RO	**Reserved**
15:2	0000h RW	**Address[15:2] DWord-aligned address (ADDR):** Address[15:2]: DWord-aligned address. Register Attribute: Static.
1	0h RO	**Reserved**
0	0h RW	**Trap Enable (TNSMIEN):** When this bit is set to '1', then the trapping logic specified in this register is enabled. Register Attribute: Static.

29.1.28 I/O Trap Register 1 - Upper DW (IOT1_HIGH) — Offset 2754h

I/O Trap Register 1 - Upper DW

Type	Size	Offset	Default
MMIO	32 bit	FD880000h + 2754h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17	0h RW	**Read/Write Mask (RWMASK):** When this bit is '1', the trapping logic will operate on both read and write cycles. When this bit is '0', the cycle must match the type specified in bit IOT1.RWB. Register Attribute: Static.
16	0h RW	**RW:** 1 = Read, 0 = Write - the value in this field does not matter if bit IOT1.RWM is set. Register Attribute: Static.
15:8	0h RO	**Reserved**
7:4	0h RW	**Byte Enable Mask (BEMASK):** A '1' in any bit position indicates that any value in the corresponding byte enable bit in a received cycle will be treated as a match. The corresponding bit in the Byte Enables field, below, is ignored. Register Attribute: Static.
3:0	0h RW	**Byte Enable (BE):** Active-high, DWord-aligned byte enables. Register Attribute: Static.

29.1.29 LPC I/O Decode Ranges (LPCIOD) — Offset 2770h

LPC I/O Decode Ranges

Type	Size	Offset	Default
MMIO	32 bit	FD880000h + 2770h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	**Reserved**
12	0h RW/L	**FDD Range (FDD):** The following table describes which range to decode for the FDD Port. Bits | Decode Range 0 | 3F0h 3F5h, 3F7h | (Primary) 1 | 370h 375h, 377h (Secondary) This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
11:10	0h RO	**Reserved**
9:8	0h RW/L	**LPT Range (LPT):** The following table describes which range to decode for the LPT Port. Bits | Decode Range 00 | 378h 37Fh and 778h 77Fh 01 | 278h 27Fh (port 279h is read only) and 678h 67Fh 10 | 3BCh 3BEh and 7BCh 7BEh 11 | Reserved. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
7	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
6:4	0h RW/L	**ComB Range (CB):** The following table describes which range to decode for the COMB Port. Bits | Decode Range 000 | 3F8h 3FFh (COM1) 001 | 2F8h 2FFh (COM2) 010 | 220h 227h 011 | 228h 22Fh 100 | 238h 23Fh 101 | 2E8h 2EFh | (COM 4) 110 | 338h 33Fh 111 | 3E8h 3EFh (COM 3) This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
3	0h RO	**Reserved**
2:0	0h RW/L	**ComA Range (CA):** The following table describes which range to decode for the COMA Port. Bits | Decode Range 000 | 3F8h 3FFh (COM1) 001 | 2F8h 2FFh (COM2) 010 | 220h 227h 011 | 228h 22Fh 100 | 238h 23Fh 101 | 2E8h 2EFh (COM 4) 110 | 338h 33Fh 111 | 3E8h 3EFh (COM 3) This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL

29.1.30 LPC I/O Enables (LPCIOE) — Offset 2774h

LPC I/O Enables

Type	Size	Offset	Default
MMIO	32 bit	FD880000h + 2774h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9	0h RW/L	**High Gameport Enable (HGE):** Enables decoding of the I/O locations 208h to 20Fh to LPC. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
8	0h RW/L	**Low Gameport Enable (LGE):** Enables decoding of the I/O locations 200h to 207h to LPC. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
7:4	0h RO	**Reserved**
3	0h RW/L	**Floppy Drive Enable (FDE):** Enables decoding of the FDD range to LPC. Range is selected by LIOD.FDE. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
2	0h RW/L	**Parallel Port Enable (PPE):** Enables decoding of the LPT range to LPC. Range is selected by LIOD.LPT. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
1	0h RW/L	**Com Port B Enable (CBE):** Enables decoding of the COMB range to LPC. Range is selected LIOD.CB. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
0	0h RW/L	**Com Port A Enable (CAE):** Enables decoding of the COMA range to LPC. Range is selected LIOD.CA. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL

29.1.31 TCO Base Address (TCOBASE) — Offset 2778h

TCO Base Address

Type	Size	Offset	Default
MMIO	32 bit	FD880000h + 2778h	00000001h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:5	000h RW/L	**TCO Base Address (TCOBA):** Provides the 32 bytes of I/O space for TCO logic, that can be map anywhere in the 64k I/O space on 32-byte boundaries. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
4:2	0h RO	**Reserved**
1	0h RW/L	**TCO Enable (TCOEN):** When set, decode of the I/O range specified by the TCO base address. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
0	1h RO	**Always 1 (A1IOS):** Always 1 to indicate I/O space.

29.1.32 General Purpose Memory Range 1 (GPMR1) — Offset 277Ch

General Purpose Memory Range 1

Type	Size	Offset	Default
MMIO	32 bit	FD880000h + 277Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/L	**General Purpose Memory Range Limit 1 (GPMRL1):** This field specifies limit address bits[31:16] for the General Purpose Memory Range 1. Bits [15:0] are assumed to be 'FFFFh'. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
15:0	0000h RW/L	**General Purpose Memory Range Base 1 (GPMRB1):** This field specifies base address bits[31:16] for the General Purpose Memory Range 1. Bits [15:0] are assumed to be '0000h'. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL

29.1.33 General Purpose Memory Range 1 Destination ID (GPMR1DID) — Offset 2780h

General Purpose Memory Range 1 Destination ID

Type	Size	Offset	Default
MMIO	32 bit	FD880000h + 2780h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**General Purpose Memory Range 1 Decode Enable (GPMR1DE):** When enabled, memory cycles that falls within the GPMR1.GPMRL1 and GPMR1.GPMRB1 range inclusive will be forwarded using source decode to the destination ID specified in GPMR1DID.GPMR1DID field. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
30:0	00000000h RW/L	**General Purpose Memory Range 1 Destination ID (GPMR1DID):** The destination ID to be used to forward the cycle decoded to hit the General Purpose Memory Range 1. BIOS must program the bits which are not used to zeros. Hardware will ignore the unused bits. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL

29.1.34 PM Base Address (PMBASEA) — Offset 27ACh

PM Base Address

Type	Size	Offset	Default
MMIO	32 bit	FD880000h + 27ACh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/L	**PM Base Address Memory Range Limit (PMBAMRL):** This field specifies limit address bits[31:16] for the PM Base Address memory range. Bits [15:0] are assumed to be 'FFFFh'. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
15:0	0000h RW/L	**PM Base Address Memory Range Base (PMBAMRB):** This field specifies base address bits[31:16] for the PM Base Address memory range. Bits [15:0] are assumed to be '0000h'. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL

29.1.35 PM Base Control (PMBASEC) — Offset 27B0h

PM Base Control

Type	Size	Offset	Default
MMIO	32 bit	FD880000h + 27B0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**PM Base Address Memory Range Decode Enable (PMBAMRDE):** When enabled, memory cycles that falls within the PMBASEADDR.PMBAMRB and PMBASEADDR.PMBAMRL range inclusive will be forwarded using source decode to the destination ID specified in PMBASEC.PMBDID field. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
30:0	00000000h RW/L	**PM Base Destination ID (PMBDID):** The destination ID to be used to forward the cycle decoded to hit the PM Base Address range. BIOS must program the bits which are not used to zeros. Hardware will ignore the unused bits. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL

29.1.36 ACPI Base Address (ACPIBA) — Offset 27B4h

ACPI Base Address

Type	Size	Offset	Default
MMIO	32 bit	FD880000h + 27B4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:18	00h RW/L	**Address[7:2] Mask (ADDR72MASK):** A '1' in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
17:16	0h RO	**Reserved**
15:2	0000h RW/L	**Address[15:2] DWord-aligned address (ADDR):** Address[15:2]: DWord-aligned address. PCH does not provide decode down to the word or byte level. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL
1	0h RO	**Reserved**
0	0h RW/L	**ACPI I/O Base Address Decode Enable (ACPIBADE):** When this bit is set to '1', then the range specified in this register is enabled for decoding to the destination ID specified in ACPIBDID register. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL

29.1.37 ACPI Base Destination ID (ACPIBDID) — Offset 27B8h

ACPI Base Destination ID

Type	Size	Offset	Default
MMIO	32 bit	FD880000h + 27B8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/L	**ACPI Base Destination ID (ACPIBDID):** The destination ID to be used to forward the cycle decoded to hit the ACPI Base Address range. BIOS must program the bits which are not used to zeros. Hardware will ignore the unused bits. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set **Locked by:** DMIC.SRL

30 I/O Trap

30.1 I/O Trap Registers Summary

These registers are within the PCH Private Configuration Space which is accessible through the PCH Sideband Interface. They can be accessed via (SBREG_BAR + PortID + Register Offset).

Table 30-1. Summary of I/O Trap Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
1D00h	4	PSTH Control Register (PSTHCTL)	00000000h
1E00h	4	Trap Status Register (TRPSTS)	00000000h
1E10h	4	Trapped Cycle Register (TRPCYC1)	00000000h
1E18h	4	Trapped Write Data Register (TRPWRDATA1)	00000000h
1E80h	4	I/O Trap Registers 1 (IOTRP1_1)	00000000h
1E84h	4	I/O Trap Registers 1 (IOTRP1_2)	00000000h
1E88h	4	I/O Trap Registers 2 (IOTRP2_1)	00000000h
1E8Ch	4	I/O Trap Registers 2 (IOTRP2_2)	00000000h
1E90h	4	I/O Trap Registers 3 (IOTRP3_1)	00000000h
1E94h	4	I/O Trap Registers 3 (IOTRP3_2)	00000000h
1E98h	4	I/O Trap Registers 4 (IOTRP4_1)	00000000h
1E9Ch	4	I/O Trap Registers 4 (IOTRP4_2)	00000000h

30.1.1 PSTH Control Register (PSTHCTL) - Offset 1D00h

PSTH Control Register

Type	Size	Offset	Default
MMIO	32 bit	FD890000h + 1D00h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**PSTH IOSF Primary Trunk Clock Gating Enable (PSTHIOSFPTCGE):** When set, the IOSF Primary CLKREQ for PSTH will de-assert when the conditions to clock gate are met. When clear, the IOSF Primary CLKREQ for PSTH will never de-assert, preventing IOSF Primary trunk clock gating.
1	0h RW	**PSTH IOSF Sideband Trunk Clock Gating Enable (PSTHIOSFSTCGE):** When set, the IOSF Sideband CLKREQ for PSTH will de-assert when the conditions to clock gate are met. When clear, the IOSF Sideband CLKREQ for PSTH will never de-assert, preventing IOSF Sideband trunk clock gating.
0	0h RW	**PSTH Dynamic Clock Gating Enable (PSTHDCGE):** When set, the clocks used within the PSTH block will be dynamically gated when the condition permits. When cleared, the dynamic clock gating mechanism is disabled.

30.1.2 Trap Status Register (TRPSTS) - Offset 1E00h

Trap Status Register

Type	Size	Offset	Default
MMIO	32 bit	FD890000h + 1E00h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3:0	0h RW/1C/V	**Cycle Trap SMI# Status (SMISTAT):** These bits are set by hardware when the corresponding Cycle Trap register is enabled and a matching cycle is received (and trapped). These bits are OR'ed together to create a single status bit in the Power Management register space. Note that the SMI# and trapping must be enabled in order to set these bits. This is because, in order to do the cycle comparison, packets must be delayed by several clocks from the DMI pins to the internal receiver. This delay is only enabled when at least one of the trap ranges is enabled. These bits are set before the completion is generated for the trapped cycle, thereby guaranteeing that the processor can enter the SMI# handler when the instruction completes. Each status bit is cleared by writing a '1' to the corresponding bit location in this register.

30.1.3 Trapped Cycle Register (TRPCYC1) - Offset 1E10h

This register saves information about the I/O Cycle that was trapped and generated the SMI# for software to read.

Type	Size	Offset	Default
MMIO	32 bit	FD890000h + 1E10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RO/V	**TRPRWR:** 1 = Read, 0 = Write
23:20	0h RO	**Reserved**
19:16	0h RO/V	**Active-High Byte Enables (TRPBE):** This is the DWord-aligned byte enables associated with the trapped cycle. A 1 in any bit location indicates that the corresponding byte is enabled in the cycle.
15:2	0000h RO/V	**IO Address (TRPADDR):** This is the DWord-aligned address of the trapped cycle.
1:0	0h RO	**Reserved**

30.1.4 Trapped Write Data Register (TRPWRDATA1) - Offset 1E18h

This register saves the data from I/O write cycles that are trapped for software to read

Type	Size	Offset	Default
MMIO	32 bit	FD890000h + 1E18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TRPDATA:** DWord of I/O write data. This field is undefined after trapping a read cycle.

30.1.5 I/O Trap Registers 1 (IOTRP1_1) - Offset 1E80h

These registers are used to specify the set of I/O cycles to be trapped and to enable this functionality.

Type	Size	Offset	Default
MMIO	32 bit	FD890000h + 1E80h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:18	00h RW	**Address Mask (TRP1ADDRM):** A '1' in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for traps on address ranges up to 256 bytes in size.
17:16	0h RO	**Reserved**
15:2	0000h RW	**TRP1ADDR:** DWord-aligned address.
1	0h RO	**Reserved**
0	0h RW	**Trap and SMI Enable (TRP1EN):** When this bit is set to '1', then the trapping logic specified in this register is enabled.

30.1.6 I/O Trap Registers 1 (IOTRP1_2) - Offset 1E84h

These registers are used to specify the set of I/O cycles to be trapped and to enable this functionality.

Type	Size	Offset	Default
MMIO	32 bit	FD890000h + 1E84h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17	0h RW	**Read-Write Mask (TRP1RWM):** When this bit is '1', the trapping logic will operate on both read and write cycles. When this bit is '0', the cycle must match the type specified in bit 48.
16	0h RW	**TRP1RW:** 1 = Read, 0 = Write, the value in this field does not matter if bit 49 is set.
15:8	0h RO	**Reserved**
7:4	0h RW	**Byte Enable Mask (TRP1BEM):** A '1' in any bit position indicates that any value in the corresponding byte enable bit in a received cycle will be treated as a match. The corresponding bit in the Byte Enables field, below, is ignored.
3:0	0h RW	**Byte Enables (TRP1BE):** Active-high, DWord-aligned byte enables.

30.1.7 I/O Trap Registers 2 (IOTRP2_1) - Offset 1E88h

These registers are used to specify the set of I/O cycles to be trapped and to enable this functionality.

Type	Size	Offset	Default
MMIO	32 bit	FD890000h + 1E88h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:18	00h RW	**Address Mask (TRP2ADDRM):** A '1' in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for traps on address ranges up to 256 bytes in size.
17:16	0h RO	**Reserved**
15:2	0000h RW	**TRP2ADDR:** DWord-aligned address.
1	0h RO	**Reserved**
0	0h RW	**Trap and SMI Enable (TRP2EN):** When this bit is set to '1', then the trapping logic specified in this register is enabled.

30.1.8 I/O Trap Registers 2 (IOTRP2_2) - Offset 1E8Ch

These registers are used to specify the set of I/O cycles to be trapped and to enable this functionality.

Type	Size	Offset	Default
MMIO	32 bit	FD890000h + 1E8Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17	0h RW	**Read-Write Mask (TRP2RWM):** When this bit is '1', the trapping logic will operate on both read and write cycles. When this bit is '0', the cycle must match the type specified in bit 48.
16	0h RW	**TRP2RW:** 1 = Read, 0 = Write, the value in this field does not matter if bit 49 is set.
15:8	0h RO	**Reserved**
7:4	0h RW	**Byte Enable Mask (TRP2BEM):** A '1' in any bit position indicates that any value in the corresponding byte enable bit in a received cycle will be treated as a match. The corresponding bit in the Byte Enables field, below, is ignored.
3:0	0h RW	**Byte Enables (TRP2BE):** Active-high, DWord-aligned byte enables.

30.1.9 I/O Trap Registers 3 (IOTRP3_1) - Offset 1E90h

These registers are used to specify the set of I/O cycles to be trapped and to enable this functionality.

Type	Size	Offset	Default
MMIO	32 bit	FD890000h + 1E90h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:18	00h RW	**Address Mask (TRP3ADDRM):** A '1' in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for traps on address ranges up to 256 bytes in size.
17:16	0h RO	**Reserved**
15:2	0000h RW	**TRP3ADDR:** DWord-aligned address.
1	0h RO	**Reserved**
0	0h RW	**Trap and SMI Enable (TRP3EN):** When this bit is set to '1', then the trapping logic specified in this register is enabled.

30.1.10 I/O Trap Registers 3 (IOTRP3_2) - Offset 1E94h

These registers are used to specify the set of I/O cycles to be trapped and to enable this functionality.

Type	Size	Offset	Default
MMIO	32 bit	FD890000h + 1E94h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17	0h RW	**Read-Write Mask (TRP3RWM):** When this bit is '1', the trapping logic will operate on both read and write cycles. When this bit is '0', the cycle must match the type specified in bit 48.
16	0h RW	**TRP3RW:** 1 = Read, 0 = Write, the value in this field does not matter if bit 49 is set.

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved**
7:4	0h RW	**Byte Enable Mask (TRP3BEM):** A '1' in any bit position indicates that any value in the corresponding byte enable bit in a received cycle will be treated as a match. The corresponding bit in the Byte Enables field, below, is ignored.
3:0	0h RW	**Byte Enables (TRP3BE):** Active-high, DWord-aligned byte enables.

30.1.11 I/O Trap Registers 4 (IOTRP4_1) - Offset 1E98h

These registers are used to specify the set of I/O cycles to be trapped and to enable this functionality.

Type	Size	Offset	Default
MMIO	32 bit	FD890000h + 1E98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:18	00h RW	**Address Mask (TRP4ADDRM):** A '1' in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for traps on address ranges up to 256 bytes in size.
17:1	0h RO	**Reserved**
0	0h RW	**Trap and SMI Enable (TRP4EN):** When this bit is set to '1', then the trapping logic specified in this register is enabled.

30.1.12 I/O Trap Registers 4 (IOTRP4_2) - Offset 1E9Ch

These registers are used to specify the set of I/O cycles to be trapped and to enable this functionality.

Type	Size	Offset	Default
MMIO	32 bit	FD890000h + 1E9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17	0h RW	**Read-Write Mask (TRP4RWM):** When this bit is '1', the trapping logic will operate on both read and write cycles. When this bit is '0', the cycle must match the type specified in bit 48.
16	0h RW	**TRP4RW:** 1 = Read, 0 = Write, the value in this field does not matter if bit 49 is set.
15:8	0h RO	**Reserved**
7:4	0h RW	**Byte Enable Mask (TRP4BEM):** A '1' in any bit position indicates that any value in the corresponding byte enable bit in a received cycle will be treated as a match. The corresponding bit in the Byte Enables field, below, is ignored.
3:0	0h RW	**Byte Enables (TRP4BE):** Active-high, DWord-aligned byte enables.

31 ModPHY Configuration

31.1 ModPHY Configuration Registers Summary

Table 31-1. Summary of ModPHY Configuration Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
8188h	4	PLL_DWORD2 (PLL_DWORD2)	00000125h
818Ch	4	PLL_DWORD3 (PLL_DWORD3)	00000000h

31.1.1 PLL_DWORD2 (PLL_DWORD2) - Offset 8188h

This register configures the ModPHY PLL used for USB 3.1 and PCIe Gen 1 & 2.

Type	Size	Offset	Default
MMIO	32 bit	FDAB0000h + 8188h	00000125h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved**
25:24	0h RW	**i_sscstepsize_9_8:** RET Fractional value for one SSC frequency step. Effected by i_ssc_propagate_h
23:16	0h RW	**i_sscstepsize_7_0:** RET Fractional value for one SSC frequency step. Effected by i_ssc_propagate_h
15:11	0h RO	**Reserved**
10	0h RW	**i_sscen_h:** RET Enables SSC modulator. Used for dynamically controlling SSC modulator. SSC profile shuts off after reaching neutral point.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**i_feedfwrdcal_pause_h:** RET This bit is for dynamically turning on and off feed forward gain calibration, when i_feedfwrdcal_en_h is enabled to take care of dynamic feedfwrdgain calculation during SSC mode
8	1h RW	**i_feedfwrdcal_en_h:** RET Background feedfward gain calibration enable signal This is meant for PVT coverage. During PLL ramping this need to be disabled. It is taken care by dynamically changing i_feedfwrdcal_pause_h
7:0	25h RW	**i_feedfwrdgain_7_0:** RET Feedforwad gain for fractional mode/SSC mode PLL This setting is needed whenever PLL is configured in fractional mode or configured for SSC clock generation. use 34 as default @ 5.4GHz Effected by i_fbdiv_propagate_h

31.1.2 PLL_DWORD3 (PLL_DWORD3) - Offset 818Ch

This register configures the ModPHY PLL used for USB 3.1 and PCIe Gen 1 & 2.

Type	Size	Offset	Default
MMIO	32 bit	FDAB0000h + 818Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Reserved**
23:17	0h RO	**Reserved**
16	00h RO	**Reserved**
15:9	00h RO	**Reserved**
8	0h RW	**i_rampafc_sscen_h:** RET 0: Disables changing of AFC during SSC 1: Enables AFC changes during SSC to take care PLL ramping and SSC simultaneously This need to be high only for 2-3% SSC spread cases.
7:1	0h RO	**Reserved**
0	0h WO	**i_ssc_propagate_h:** RETCLR Propagate bit for LCPLL to capture SSC stepsize This bit is automatically cleared after sscstepsize settings captured. (HW Clear)

Bit	Description
31:22	**Reserved**
21:16	**SATA 6.0 GT/s** **TX Output -6.0dB Mode De-Emphasis Adjustment Setting (ow2tapgen3deemph6p0) - R/W** These bits can be used to adjust or fine-tune the amount by which the output is de- emphasized De-Emphasis = 20*Log([21:16]Decimal / 64) dB Where 111111b --> Min Level, 000001b --> Max Level, 000000 --> Reserved **Note**: Larger value generates a smaller De-Emphasis level.
15:14	**Reserved**
13:8	**PCIe* Gen2 and SATA 3.0 GT/s** **TX Output -6.0 dB Mode De-Emphasis Adjustment Setting (ow2tapgen2deemph6p0) - R/W** These bits can be used to adjust or fine-tune the amount by which the output is de- emphasized De-Emphasis = 20*Log([13:8]Decimal / 64) dB Where 111111b --> Min Level, 000001b --> Max Level, 000000 --> Reserved **Note**: Larger value generates a smaller De-Emphasis level.
7:6	**Reserved**
5:0	**SATA 1.5 GT/s** **TX Output -6.0 dB Mode De-Emphasis Adjustment Setting (ow2tapgen1deemph6p0) - R/W** These bits can be used to adjust or fine-tune the amount by which the output is de- emphasized. De-Emphasis = 20*Log([5:0]Decimal / 64) dB Where 111111b --> Min Level, 000001b --> Max Level, 000000 --> Reserved **Note**: Larger value generates a smaller De-Emphasis level

31.2.6 HSIO_TX_DWORD8 - High Speed I/O Transmit Control Register 8

Address: Refer to Table 33

BIOS Reference Code Platform Configuration PCH Policy Details:

PCIe* Gen1 Parameters

PchPcieHsioTxGen1DownscaleAmpEnable = 1 (Enable)

PchPcieHsioTxGen1DownscaleAmp = Bits[13:8]

PCIe* Gen2 Parameters

PchPcieHsioTxGen2DownscaleAmpEnable = 1 (Enable)

PchPcieHsioTxGen2DownscaleAmp = Bits[21:16]

PCIe* Gen3 Parameters

PchPcieHsioTxGen3DownscaleAmpEnable = 1 (Enable)

PchPcieHsioTxGen3DownscaleAmp = Bits[29:24]

SATA 1.5 GT/s Parameters

PchSataHsioTxGen1DownscaleAmpEnable = 1 (Enable)

PchSataHsioTxGen1DownscaleAmp = Bits[13:8]

SATA 3.0 GT/s Parameters

PchSataHsioTxGen2DownscaleAmpEnable = 1 (Enable)

PchSataHsioTxGen2DownscaleAmp = Bits[21:16]

SATA 6.0 GT/s Parameters

PchSataHsioTxGen3DownscaleAmpEnable = 1 (Enable)

PchSataHsioTxGen3DownscaleAmp = Bits[29:24]

USB 3.1 Gen1 Parameters

HsioTxDownscaleAmpEnable = 1 (Enable)

HsioTxDownscaleAmp = Bits[21:16]

Bit	Description
31:30	**Reserved**
29:24	**PCIe* Gen3 and SATA 6.0 GT/s** **TX Output Downscale Amplitude Adjustment (orate10margin) - R/W**p These bits can be used to adjust the transmitter driver strength and its output swing Amplitude = Full Swing Voltage Level * (Bits[29:24]decimal / 64) - Where 000000b/111111b --> Max Level, 000001b --> Min Level
23:22	**Reserved**
21:16	**PCIe* Gen2, SATA 3.0 GT/s, and USB 3.1 Gen1** **TX Output Downscale Amplitude Adjustment (orate01margin) - R/W** These bits can be used to adjust the transmitter driver strength and its output swing Amplitude = Full Swing Voltage Level * (Bits[21:16]decimal / 64) - Where 000000b/111111b --> Max Level, 000001b --> Min Level
15:14	**Reserved**
13:8	**PCIe* Gen1 and SATA 1.5 GT/s** **TX Output Downscale Amplitude Adjustment (orate00margin) - R/W** These bits can be used to adjust the transmitter driver strength and its output swing Amplitude = Full Swing Voltage Level * (Bits[13:8]decimal / 64) - Where 000000b/111111b --> Max Level, 000001b --> Min Level
7:0	**Reserved**

31.2.7 HSIO_TX_DWORD9 - High Speed I/O Transmit Control Register 9

Address: Refer to Table 33

BIOS Reference Code Platform Configuration PCH Policy Details:

USB 3.1 Gen2 Parameters

HsioTxRate2UniqTranEnable = 1 (Enable)

Rate2UniqTranScale = Bits[14:8]

Bit	Description
31:15	**Reserved**
14:8	**USB 3.1 Gen2** **TX Output Downscale Amplitude Adjustment (rate2UniqTranScale) - R/W** These bits can be used to adjust the transmitter driver strength and its output swing Amplitude = Full Swing Voltage Level * (Bits[14:8]decimal / 64) - Where 0000000b/1111111b --> Max Level, 0000001b --> Min Level
7:0	**Reserved**

31.2.8 HSIO_TX_DWORD19 - High Speed I/O Transmit Control Register 19

Address: Refer to Table 33

Bit Range	Description
31:2	**Reserved**
1	**TX ModPHY Register Initiate Calculation (o_calcinit) - R/W** 0 = Disable 1 = Initiate **Note**: Refer to Section 4.3.1 for additional details. This bit is only needed, when dynamically (manually) writing and adjusting any of the TX ModPHY Registers.
0	**Reserved**
