This register will be used for D0i3 SW flow. This will be mapped to a different MMIO address from the other IPC registers. (MMIO and OCP address value are yet to be done) The description below also includes the type of access expected for the ISH FW for each configuration bit:
1. The Restore Required (RR) bit (bit [3]) should be RW for the ISH FW which can determine when to set and/or clear these bits depending on when the ISH FW determines whether restore is required although for ISH restore is never required since the power is never lost.
2. The D0i3 (i3) bit (bit [2]) should be RO for ISH FW as it needs to be written only by host SW. The ISH FW can determine to go to a low power state based on this bit.
3. The Interrupt Required (IR) bit (bit [1]) can be RO register for ISH FW and ISH FW can send an interrupt to Host by writing to the ish2host IPC doorbell register when this bit is set by SW.
4. The Command in Progress (CIP) register bit (bit [0]) is HW set and need to be cleared by ISH FW.
A simple edge detects logic can be used for the setting of this bit in HW. The CIP register bit will be tied to a RTE entry in the IOAPIC as an interrupt source. Hence ISH FW will get an interrupt when the In addition to the registers, the IOSF2OCP Bridge should be parameterized for the following:
1. The device idle capability parameter (ENABLE_PCI_IDLE_CAP) needs to be connected to a soft strap for ISH with a value of 1.
2. The STRAP for the MMIO address (strap_d0i3_offset) of D0i3 register (IPC offset address: h6D0) and the d0i3 valid (strap_d0i3_valid) bit needs should be appropriately tied.
3. The PCE register is made RO register by setting the appropriate parameter (Bridge top level strap: set_device_pg_config_type[5:0] is set to all 0s). This registers reset and clock domain will be in the OCP domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 2000h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4	0h RO	**Interrupt Request Capable (IRC):** Set to 1 by HW if it is capable of generating an interrupt on command completion, else 0. For ISH this bit will be tied to 0.
3	1h RW/1C	**Restore Required (RR):** When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**D0I3:** SW sets this bit to 1 to move the IP into the D0i3 state. Writing this bit to 0 will return the IP to the fully active D0 state (D0i0).
1	0h RW	**Interrupt Required (IR):** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this on each write to this register.
0	0h RO/V	**Command In Progress (CIP):** HW sets this bit on a 1->0 or 0->1 transition of bit [2]. While set, the other bits in this register are not valid and it is illegal for SW to write to any bit in this register. When clear all the other bits in the register are valid and SW may write to any bit.

5.2.106 Clock Gating And Soft Reset (CGSR) - Offset 2004h

This register is used to Clock gate or soft reset an IP by Host/Remote Host. Also register field of this register can be used for device idle status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 2004h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Idle Indication To Host (IDLE):** IP IDLE indication.
30:17	0h RO	**Reserved**
16	0h RW	**Clock Gate Enable (CG):** Setting this field to 1 clock gates the IP.
15:1	0h RO	**Reserved**
0	0h RW	**Soft Reset (SR):** Setting this bit to 1 resets the IP.

6 Inter-Integrated Circuit (I2C) Interface

6.1 I2C Configuration Registers Summary

This registers of the Intel® PSE Inter-Integrated Circuit I2C devices. This contains multiple Intel® PSE Inter-Integrated Circuit, I2C controller devices:

- Intel® PSE I2C Controller #0 - Bus: 0, Device: 27, Function: 0
- Intel® PSE I2C Controller #1 - Bus: 0, Device: 27, Function: 1
- Intel® PSE I2C Controller #2 - Bus: 0, Device: 27, Function: 2
- Intel® PSE I2C Controller #3 - Bus: 0, Device: 27, Function: 3
- Intel® PSE I2C Controller #4 - Bus: 0, Device: 27, Function: 4
- Intel® PSE I2C Controller #5 - Bus: 0, Device: 27, Function: 5
- Intel® PSE I2C Controller #6 - Bus: 0, Device: 27, Function: 6

DID Values:

Intel® PSE I2C Controller #0 - D27: F0 - 4BB9h

Intel® PSE I2C Controller #1 - D27: F1 - 4BBAh

Intel® PSE I2C Controller #2 - D27: F2 - 4BBBh

Intel® PSE I2C Controller #3 - D27: F3 - 4BBCh

Intel® PSE I2C Controller #4 - D27: F4 - 4BBDh

Intel® PSE I2C Controller #5 - D27: F5 - 4BBEh

Intel® PSE I2C Controller #6 - D27: F6 - 4BBFh

Table 6-1. Summary of Bus: 0, Device: 27, Function: 0 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	Device ID And Vendor ID Register (DEVVENDID) - Offset 0h	4BB90000h
4h	4	Status And Command (STATUSCOMMAND) - Offset 4h	00100000h
8h	4	Revision ID And Class Code (REVCLASSCODE) - Offset 8h	00000000h
Ch	4	Cache Line Latency Header And BIST (CLLATHEADERBIST) - Offset Ch	00000000h
10h	4	Base Address Register (BAR) - Offset 10h	00000000h
14h	4	Base Address Register High (BAR_HIGH) - Offset 14h	00000000h
18h	4	Base Address Register1 (BAR1) - Offset 18h	00000000h
1Ch	4	Base Address Register1 High (BAR1_HIGH) - Offset 1Ch	00000000h

Table 6-1. Summary of Bus: 0, Device: 27, Function: 0 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
2Ch	4	Subsystem Vendor and Subsystem ID (SUBSYSTEMID) - Offset 2Ch	00000000h
30h	4	Expansion ROM Base Address (EXPANSION_ROM_BASEADDR) - Offset 30h	00000000h
34h	4	Capabilities Pointer (CAPABILITYPTR) - Offset 34h	00000080h
3Ch	4	Interrupt Register (INTERRUPTREG) - Offset 3Ch	00000100h
80h	4	Power Management Capability ID (POWERCAPID) - Offset 80h	48030001h
84h	4	Power Management Control And Status Register (PMECTRLSTATUS) - Offset 84h	00000008h
90h	4	PCI Device Idle Vendor Capability Register (PCIDEVIDLE_CAP_RECORD) - Offset 90h	F0140009h
94h	4	Vendor Specific Extended Capability Register (DEVID_VEND_SPECIFIC_REG) - Offset 94h	01400010h
98h	4	Software LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG) - Offset 98h	00000000h
9Ch	4	Device Idle Pointer Register (DEVICE_IDLE_POINTER_REG) - Offset 9Ch	00000000h
A0h	4	D0i3 and Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG) - Offset A0h	00000800h
B0h	4	General Purpose Read Write Register1 (GEN_PCI_REGRW1) - Offset B0h	00000000h
C0h	4	General Purpose Input Register (GEN_INPUT_REG) - Offset C0h	00000000h
D0h	4	MSI Capability Register (MSI_CAP_REG) - Offset D0h	01800005h
D4h	4	MSI Message Low Address (MSI_ADDR_LOW) - Offset D4h	00000000h
D8h	4	MSI Message High Address (MSI_ADDR_HIGH) - Offset D8h	00000000h
DCh	4	MSI Message Data (MSI_MSG_DATA) - Offset DCh	00000000h
E0h	4	MSI Mask Register (MSI_MASK) - Offset E0h	00000000h
E4h	4	MSI Pending Register (MSI_PENDING) - Offset E4h	00000000h
F8h	4	Manufacturers ID (MANID) - Offset F8h	00000000h

6.1.1 Device ID And Vendor ID Register (DEVVENDID) - Offset 0h

Device ID and Vendor ID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 0h	4BB90000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	4BB9h RO/P	**Device ID Field (DEVICEID):** Device ID identifies the particular PCI device
15:0	0000h RO	**Vendor ID Field (VENDORID):** Vendor ID is a unique ID provided by the PCI SIG which identifies the manufacturer of the device

6.1.2 Status And Command (STATUSCOMMAND) - Offset 4h

Status and Command

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 4h	00100000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C	**Detected Parity Error (DPE):** Detected Parity Error
30	0h RW/1C	**Signaled System Error (SSE):** Signaled System Error
29	0h RW/1C	**RMA Field (RMA):** Received Master Abort
28	0h RW/1C	**RTA Field (RTA):** Received Target Abort
27:25	0h RO	**Reserved**
24	0h RW/1C	**Master Data Parity Error (MDPE):** Master Data Parity Error
23:21	0h RO	**Reserved**
20	1h RO	**Cap List Field (CAPLIST):** Capabilities List: Indicates that the controller contains a capabilities pointer list
19	0h RO	**Interrupt Status Field (INTR_STATUS):** Interrupt Status: This bit reflects state of interrupt in the device
18:11	0h RO	**Reserved**
10	0h RW	**Interrupt Disable Field (INTR_DISABLE):** Interrupt Disable
9	0h RO	**Reserved**
8	0h RW	**SERR Enable Field (SERR_ENABLE):** SERR Enable Not implemented
7	0h RO	**Reserved**
6	0h RW	**Parity Error Response Enable (PERE):** Parity Error Response Enable

Bit Range	Default & Access	Field Name (ID): Description
5:3	0h RO	**Reserved**
2	0h RW	**BME Field (BME):** Bus Master Enable
1	0h RW	**MSE Field (MSE):** Memory Space Enable
0	0h RO	**Reserved**

6.1.3 Revision ID And Class Code (REVCLASSCODE) - Offset 8h

Revision ID and Class Code

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	**Revision ID Field (CLASS_CODES):** Class Code register is read-only and is used to identify the generic function of the device and in some cases a specific register-level programming interface
7:0	00h RO/P	**Class Code Field (RID):** Revision ID identifies the revision of particular PCI device

6.1.4 Cache Line Latency Header And BIST (CLLATHEADERBIST) - Offset Ch

Cache Line size as RW with def 0 Latency Timer, RW with def 0 Header Type with Type 0 configuration header and Reserved BIST Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	0h RO	**Multifunction Device Field (MULFNDEV):** Multi-Function Device

Bit Range	Default & Access	Field Name (ID): Description
22:16	00h RO	**Header Type Field (HEADERTYPE):** Header Type: Implements Type 0 Configuration header
15:8	00h RO	**Latency Timer Field (LATTIMER):** Latency Timer:. This register is implemented as R/W with default as 0
7:0	00h RW/P	**Cache Line Size Field (CACHELINE_SIZE):** Cache Line Size

6.1.5 Base Address Register (BAR) - Offset 10h

Base Address Register Low [31:2] type [2:1] in 32bit or 64bit address range and memory space indicator [0]

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR):** Base Address Register Low Base address of the AXI fabric memory space. Taken from Strap values as ones
11:4	00h RO	**Size Field (SIZEINDICATOR):** Size Indicator RO Always returns 0 The size of this register depends on the size of the memory space
3	0h RO	**Prefetchable Field (PREFETCHABLE):** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**Type Field (TYPE0):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE):** Memory Space Indicator: 0 indicates this BAR is present in the memory space

6.1.6 Base Address Register High (BAR_HIGH) - Offset 14h

Base Address Register High enabled if [2:1] of BAR_HIGH is 10

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR_HIGH):** Base Address High - MSB

6.1.7 Base Address Register1 (BAR1) - Offset 18h

Base Address Register1 accesses to PCI configuration space and is always 4K type in [2:1] and memory space indicator in [0]

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR1):** Base Address1 This field is present if BAR1 is enabled through private configuration space
11:4	00h RO	**Size Field (SIZEINDICATOR1):** Always is 0 as minimum size is 4K
3	0h RO	**Prefetchable Field (PREFETCHABLE1):** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**Type Field (TYPE1):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE1):** Memory Space Indicator: 0 Indicates this BAR is present in the memory space

6.1.8 Base Address Register1 High (BAR1_HIGH) - Offset 1Ch

Base Address Register1 High enabled only if [2:1] of BAR1_HIGH register is 10

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR1_HIGH):** Base Address: Base address of the AXI fabric memory space. Taken from Strap values as ones

6.1.9 Subsystem Vendor and Subsystem ID (SUBSYSTEMID) - Offset 2Ch

SVID Register along with SID Register is to distinguish subsystem from another

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O/P	**Subsystem ID Field (SUBSYSTEMID):** Subsystem ID: This register is implemented for any function that can be instantiated more than once in a given system
15:0	0000h RW/O/P	**Subsystem Vendor Field (SUBSYSTEMVENDORID):** Subsystem Vendor ID: This register must be implemented for any function that can be instantiated more than once in a given system

6.1.10 Expansion ROM Base Address (EXPANSION_ROM_BASEADDR) - Offset 30h

Expansion ROM Base Address Register is a RO indicates support for expansion ROMs

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Expansion Rom Base Address Field (EXPANSION_ROM_BASE):** Expansion ROM Base Address: Value of all zeros indicates no support for Expansion ROM

6.1.11 Capabilities Pointer (CAPABILITYPTR) - Offset 34h

Capabilities Pointer Register indicates what the next capability is

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 34h	00000080h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	80h RO	**Capabilities Pointer Field (CAPPTR_POWER):** Capabilities Pointer: Indicates what the next capability is

6.1.12 Interrupt Register (INTERRUPTREG) - Offset 3Ch

Interrupt Line Register is not use in Bridge directly. Interrupt Pin Register reflects the IPIN value in private configuration space. MIN_GNT register indicating the requirements of latency timers and MAX_LAT register for max latency

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 3Ch	00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Max Latency Field (MAX_LAT):** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	00h RO	**Min GNT Field (MIN_GNT):** Value of 0 indicates device has no major requirements for the settings of latency timers // Re-Check Desc Padma
15:12	0h RO	**Reserved**
11:8	1h RO	**Interrupt Pin Field (INTPIN):** Interrupt Pin: Value in this register is reflected from the IPIN value in the private configuration space
7:0	00h RW/P	**Interrupt Line Field (INTLINE):** Interrupt Line: It is used to communicate to software the interrupt line to which the interrupt pin is connected

6.1.13 Power Management Capability ID (POWERCAPID) - Offset 80h

Power Management Capability ID Register points to next capability structure and Power Management Capability with Power Management Capabilities Register for PME support and version

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 80h	48030001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	09h RO	**PME Support Field (PMESUPPORT):** This 5-bit field indicates the power states in which the function can assert the PME#
26:19	0h RO	**Reserved**
18:16	3h RO	**Version Field (VERSION):** Indicates support for Revision 1.2 of the PCI Power Management Specification
15:8	00h RO	**Next Cap Field (NXTCAP):** Next Capability: Points to the next capability structure
7:0	01h RO	**Power Capability ID Field (POWER_CAP):** Power Management Capability: Indicates this is power management capability

6.1.14 Power Management Control And Status Register (PMECTRLSTATUS) - Offset 84h

Power Management Control and Status Register to set and read PME Status, PME Enable, No Soft reset and Power State

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 84h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW/1C/P	**PME Status Field (PMESTATUS):** PME Status
14:9	0h RO	**Reserved**
8	0h RW/P	**PME Enable Field (PMEENABLE):** PME Enable
7:4	0h RO	**Reserved**
3	1h RO	**No Soft Reset Field (NO_SOFT_RESET):** This bit indicates that devices transitioning from D3hot to D0 because of Power State commands do not perform an internal reset
2	0h RO	**Reserved**
1:0	0h RW	**Power State Field (POWERSTATE):** Power State: This field is used both to determine the current Power State and to set a new Power State

6.1.15 PCI Device Idle Vendor Capability Register (PCIDEVIDLE_CAP_RECORD) - Offset 90h

PCI Device Vendor Specific Capability Register defines Vendor Specific Capability ID, Revision Length, Next Capability and CAPID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 90h	F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**Vendor Cap Field (VEND_CAP):** Vendor Specific Capability ID
27:24	0h RO	**Revision ID Field (REVID):** Revision ID of capability structure
23:16	14h RO	**Cap Length Field (CAP_LENGTH):** Vendor Specific Capability Length
15:8	00h RO	**Next Capability Field (NEXT_CAP):** Next Capability
7:0	09h RO	**Capability ID Field (CAPID):** Capability ID

6.1.16 Vendor Specific Extended Capability Register (DEVID_VEND_SPECIFIC_REG) - Offset 94h

Extended Vendor Capability Register for VSEC Length, Revision and ID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 94h	01400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	014h RO	**Vendor Specific ID Field (VSEC_LENGTH):** Vendor Specific Extended Capability Length
19:16	0h RO	**Vendor Specific Revision Field (VSEC_REV):** Vendor Specific Extended Capability Revision
15:0	0010h RO	**Vendor Specific Length Field (VSECID):** Vendor Specific Extended Capability ID

6.1.17 Software LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG) - Offset 98h

Software Location Pointer in MMIO space as an offset specified by BAR

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RO	**SW LTR Dword Offset Field (SW_LAT_DWORD_OFFSET):** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**SW LTR Bar Number Field (SW_LAT_BAR_NUM):** Indicates that the SW LTR update MMIO location is always at BAR0
0	0h RO	**SW LTR Valid Field (SW_LAT_VALID):** This value is reflected from the SW LTR valid strap at the top level

6.1.18 Device Idle Pointer Register (DEVICE_IDLE_POINTER_REG) - Offset 9Ch

Device Idle Pointer Register giving details on Device MMIO Offset Location, BAR NUM and D0i3 Valid Strap

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RO	**D0i3 Dword Offset Field (DWORD_OFFSET):** Contains the location pointer to the SW LTR register in MMIO space as an offset from the specified BAR
3:1	0h RO	**BAR NUM Field (BAR_NUM):** BAR Num: Indicates that the D0i3 MMIO location is always at BAR0
0	0h RO	**D0i3 Valid Field (VALID):** Valid: This value is reflected from the D0i3 valid strap at the top level

6.1.19 D0i3 and Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG) - Offset A0h

D0idle_Max_Power_On_Latency Register set at boot and power control enable register to enable communication with the PGCB block below the Bridge

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + A0h	00000800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21	0h RW/P	**HAE:** Hardware Autonomous Enable
20	0h RO	**Reserved**
19	0h RW/P	**Sleep Enable Field (SLEEP_EN):** Sleep Enable
18	0h RW/P	**D3 Hen Field (D3HEN):** DEVIDLE Enable (DEVIDLEN): If '1' then the function will power gate when idle and the DevIdle register (DevIdleC[2] = '1') is set
17	0h RW/P	**Device Idle En Field (DEVIDLEN):** PMCRE: PMC Request Enable
16	0h RW/P	**PMC Request Enable Field (PMCRE):** D3-Hot Enable (D3HEN): If '1' then function will power gate when idle and the PMCSR[1:0] register in the function ='11' (D3)
15:13	0h RO	**Reserved**
12:10	2h RW/O/P	**Power Latency Scale Field (POW_LAT_SCALE):** Power On Latency Scale
9:0	000h RW/O/P	**Power Latency Value Field (POW_LAT_VALUE):** Power On Latency Value

6.1.20 General Purpose Read Write Register1 (GEN_PCI_REGRW1) - Offset B0h

General Purpose PCI Read Write Register1

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Read Write Field (GEN_PCI_REG_RW1):** General Purpose PCI Register: This register value is brought out as GEN_PCI_REG_RW1

6.1.21 General Purpose Input Register (GEN_INPUT_REG) - Offset C0h

General Purpose Input Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**General Purpose Input Field (GEN_REG_INPUT_RW):** General Purpose Input Register: This register value reflects the value of GEN_REG_INPUT_RW

6.1.22 MSI Capability Register (MSI_CAP_REG) - Offset D0h

MSI Capability Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + D0h	01800005h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	1h RO	**Per Vector Masking Capability Field (PER_VECTOR_MSK_CAP):** Per Vector Masking Capability
23	1h RO	**MSI Capability Field (MSI_CAP_64B):** 64 bit message address capability
22:20	0h RW	**Multi Message En Field (MUL_MSG_EN):** Multiple Message Enable
19:17	0h RO	**Multi Message Cap Field (MUL_MSG_CAP):** Multiple Message Capable

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**MSI Enable Field (MSG_MSI_ENABLE):** MSI Enable
15:8	00h RO	**Next Pointer Field (MSG_NXT_PTR):** Next Capability Pointer
7:0	05h RO	**MSI Capability Field (MSG_CAP_ID):** MSI Capability ID

6.1.23 MSI Message Low Address (MSI_ADDR_LOW) - Offset D4h

MSI Message Low Address

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description

6.2.1 IC_CON - Offset 0h

I2C Control Register - I2C Control Register. This register can be written only when the DW_apb_i2c is disabled, which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. Read/Write Access:
- If configuration parameter I2C_DYNAMIC_TAR_UPDATE=1, bit 4 is read only.
- If configuration parameter IC_RX_FULL_HLD_BUS_EN =0, bit 9 is read only.
- If configuration parameter IC_STOP_DET_IF_MASTER_ACTIVE =0, bit 10 is read only.
- If configuration parameter IC_BUS_CLEAR_FEATURE=0, bit 11 is read only.
- If configuration parameter IC_OPTIONAL_SAR=0, bit 16 is read only.
- If configuration parameter IC_SMBUS=0, bit 17 is read only.
- If configuration parameter IC_SMBUS_ARP=0, bits 18 and 19 are read only.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 0h	00000067h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved**
10	0h RW	**STOP_DET_IF_MASTER_ACTIVE:** In Master mode: - 1'b1: issues the STOP_DET interrupt only when master is active. - 1'b0: issues the STOP_DET irrespective of whether master is active or not.
9	0h RW	**RX_FIFO_FULL_HLD_CTRL:** This bit controls whether DW_apb_i2c should hold the bus when the Rx FIFO is physically full to its RX_BUFFER_DEPTH, as described in the IC_RX_FULL_HLD_BUS_EN parameter.
8	0h RW	**TX_EMPTY_CTRL:** This bit controls the generation of the TX_EMPTY interrupt, as described in the IC_RAW_INTR_STAT register.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**STOP_DET_IFADDRESSED:** In slave mode: - 1'b1: issues the STOP_DET interrupt only when it is addressed. - 0'b0: issues the STOP_DET irrespective of whether it's addressed or not. ***Note***: During a general call address, this slave does not issue the STOP_DET interrupt if STOP_DET_IF_ADDRESSED = 1'b1, even if the slave responds to the general call address by generating ACK. The STOP_DET interrupt is generated only when the transmitted address matches the slave address (SAR).
6	1h RW	**IC_SLAVE_DISABLE:** This bit controls whether I2C has its slave disabled, which means once the present signal is applied, then this bit takes on the value of the configuration parameter IC_SLAVE_DISABLE. You have the choice of having the slave enabled or disabled after reset is applied, which means software does not have to configure the slave. By default, the slave is always enabled (in reset state as well). If you need to disable it after reset, set this bit to 1. If this bit is set (slave is disabled), DW_apb_i2c functions only as a master and does not perform any action that requires a slave. ***Note***: Software should ensure that if this bit is written with 0, then bit 0 should also be written with a 0.
5	1h RW	**IC_RESTART_EN:** Determines whether RESTART conditions may be sent when acting as a master. Some older slaves do not support handling RESTART conditions; however, RESTART conditions are used in several DW_apb_i2c operations. When RESTART is disabled, the master is prohibited from performing the following functions: - Sending a START BYTE - Performing any high-speed mode operation - High-speed mode operation - Performing direction changes in combined format mode - Performing a read operation with a 10-bit address By replacing RESTART condition followed by a STOP and a subsequent START condition, split operations are broken down into multiple DW_apb_i2c transfers. If the above operations are performed, it will result in setting bit 6 (TX_ABRT) of the IC_RAW_INTR_STAT register. .
4	0h RO/V	**IC_10BITADDR_MASTER_RD_ONLY:** If the I2C_DYNAMIC_TAR_UPDATE configuration parameter is set to 'No' (0), this bit is named IC_10BITADDR_MASTER and controls whether the DW_apb_i2c starts its transfers in 7 or 10-bit addressing mode when acting as a master. If I2C_DYNAMIC_TAR_UPDATE is set to 'Yes' (1), the function of this bit is handled by bit 12 of IC_TAR register, and becomes a read-only copy called IC_10BITADDR_MASTER_rd_only. - 0: 7-bit addressing - 1: 10-bit addressing
3	0h RW	**IC_10BITADDR_SLAVE:** When acting as a slave, this bit controls whether the DW_apb_i2c responds to 7- or 10-bit addresses. - 0: 7-bit addressing. The DW_apb_i2c ignores transactions that involve 10-bit addressing; for 7-bit addressing, only the lower 7 bits of the IC_SAR register are compared. - 1: 10-bit addressing. The DW_apb_i2c responds to only 10-bit addressing transfers that match the full 10 bits of the IC_SAR register.
2:1	3h RW	**SPEED:** These bits control at which speed the DW_apb_i2c operates; its setting is relevant only if one is operating the DW_apb_i2c in master mode. Hardware protects against illegal values being programmed by software. These bits must be programmed appropriately for slave mode also, as it is used to capture correct value of spike filter as per the speed mode. This register should be programmed only with a value in the range of 1 to IC_MAX_SPEED_MODE; otherwise, hardware updates this register with the value of IC_MAX_SPEED_MODE. 1: standard mode (100 kbit/s) 2: fast mode (<=400 kbit/s) or fast mode plus (<=1000Kbit/s) 3: high speed mode (3.4 Mbit/s) ***Note***: This field is not applicable when IC_ULTRA_FAST_MODE=1
0	1h RW	**MASTER_MODE:** This bit controls whether the DW_apb_i2c master is enabled. ***Note***: Software should ensure that if this bit is written with '1' then bit 6 should also be written with a '1'.

6.2.2 IC_TAR - Offset 4h

I2C Target Address Register - I2C Target Address Register If the configuration parameter I2C_DYNAMIC_TAR_UPDATE is set to 'No' (0), this register is 12 bits wide, and bits 31:12 are reserved. This register can be written to only when IC_ENABLE[0] is set to 0. However, if I2C_DYNAMIC_TAR_UPDATE = 1, then the register becomes 13 bits wide. In this case, writes to IC_TAR succeed when one of the following conditions is true: - DW_apb_i2c is NOT enabled (IC_ENABLE[0] is set to 0); or - DW_apb_i2c is enabled (IC_ENABLE[0]=1); AND DW_apb_i2c is NOT engaged in any Master (tx, rx) operation (IC_STATUS[5]=0); AND DW_apb_i2c is enabled to operate in Master mode (IC_CON[0]=1); AND there are NO entries in the TX FIFO (IC_STATUS[2]=1) You can change the TAR address dynamically without losing the bus, only if the following conditions are met. - DW_apb_i2c is enabled (IC_ENABLE[0]=1); AND IC_EMPTYFIFO_HOLD_MASTER_EN configuration parameter is set to 1; AND DW_apb_i2c is enabled to operate in Master mode (IC_CON[0]=1); AND there are NO entries in the Tx FIFO and the master is in HOLD state (IC_INTR_STAT[13]=1). **Note**: If the software or application is aware that the DW_apb_i2c is not using the TAR address for the pending commands in the Tx FIFO, then it is possible to update the TAR address even while the Tx FIFO has entries (IC_STATUS[2]= 0). - It is not necessary to perform any write to this register if DW_apb_i2c is enabled as an I2C slave only.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4h	00000055h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	**Reserved**
12	0h RW	**IC_10BITADDR_MASTER:** This bit controls whether the DW_apb_i2c starts its transfers in 7- or 10-bit addressing mode when acting as a master. - 0: 7-bit addressing - 1: 10-bit addressing
11	0h RW	**SPECIAL:** This bit indicates whether software performs a Device-ID or General Call or START BYTE command. - 0: ignore bit 10 GC_OR_START and use IC_TAR normally - 1: perform special I2C command as specified in Device_ID or GC_OR_START bit
10	0h RW	**GC_OR_START:** If bit 11 (SPECIAL) is set to 1 and bit 13(Device-ID) is set to 0, then this bit indicates whether a General Call or START byte command is to be performed by the DW_apb_i2c. - 0: General Call Address - after issuing a General Call, only writes may be performed. Attempting to issue a read command results in setting bit 6 (TX_ABRT) of the IC_RAW_INTR_STAT register. The DW_apb_i2c remains in General Call mode until the SPECIAL bit value (bit 11) is cleared. - 1: START BYTE
9:0	055h RW	**IC_TAR:** This is the target address for any master transaction. When transmitting a General Call, these bits are ignored. To generate a START BYTE, the CPU needs to write only once into these bits. If the IC_TAR and IC_SAR are the same, loopback exists but the FIFOs are shared between master and slave, so full loopback is not feasible. Only one direction loopback mode is supported (simplex), not duplex. A master cannot transmit to itself; it can transmit to only a slave.

6.2.3 IC_SAR - Offset 8h

I2C Slave Address Register - I2C Slave Address Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8h	00000055h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:0	055h RW	**IC_SAR:** The IC_SAR holds the slave address when the I2C is operating as a slave. For 7-bit addressing, only IC_SAR[6:0] is used. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. ***Note***: The default values cannot be any of the reserved address locations: that is, 0x00 to 0x07, or 0x78 to 0x7f. The correct operation of the device is not guaranteed if you program the IC_SAR or IC_TAR to a reserved value.

6.2.4 IC_HS_MADDR - Offset Ch

I2C High Speed Master Mode Code Address Register - I2C High Speed Master Mode Code Address Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + Ch	00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2:0	1h RW	**IC_HS_MAR:** This bit field holds the value of the I2C HS mode master code. HS-mode master codes are reserved 8-bit codes (00001xxx) that are not used for slave addressing or other purposes. Each master has its unique master code; up to eight high-speed mode masters can be present on the same I2C bus system. Valid values are from 0 to 7. This register goes away and becomes read-only returning 0's if the IC_MAX_SPEED_MODE configuration parameter is set to either Standard (1) or Fast (2). This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect.

6.2.5 IC_DATA_CMD - Offset 10h

I2C Rx/Tx Data Buffer and Command Register - I2C Rx/Tx Data Buffer and Command Register; this is the register the CPU writes to when filling the TX FIFO and the CPU reads from when retrieving bytes from RX FIFO. The size of the register changes as follows: Write: - 11 bits when IC_EMPTYFIFO_HOLD_MASTER_EN=1 - 9 bits when IC_EMPTYFIFO_HOLD_MASTER_EN=0 Read: - 12 bits when IC_FIRST_DATA_BYTE_STATUS = 1 - 8 bits when IC_FIRST_DATA_BYTE_STATUS = 0
Note: In order for the DW_apb_i2c to continue acknowledging reads, a read command should be written for every byte that is to be received; otherwise the DW_apb_i2c will stop acknowledging.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RO/V	**FIRST_DATA_BYTE:** Indicates the first data byte received after the address phase for receive transfer in Master receiver or Slave receiver mode. ***Note***: In case of APB_DATA_WIDTH=8, 1. The user has to perform two APB Reads to IC_DATA_CMD in order to get status on 11 bit. 2. In order to read the 11 bit, the user has to perform the first data byte read [7:0] (offset 0x10) and then perform the second read[15:8](offset 0x11) in order to know the status of 11 bit (whether the data received in previous read is a first data byte or not). 3. The 11th bit is an optional read field, user can ignore 2nd byte read [15:8] (offset 0x11) if not interested in FIRST_DATA_BYTE status.
10	0h WO	**RESTART:** This bit controls whether a RESTART is issued before the byte is sent or received. This bit is available only if IC_EMPTYFIFO_HOLD_MASTER_EN is configured to 1. 1 - If IC_RESTART_EN is 1, a RESTART is issued before the data is sent/received (according to the value of CMD), regardless of whether or not the transfer direction is changing from the previous command; if IC_RESTART_EN is 0, a STOP followed by a START is issued instead. 0 - If IC_RESTART_EN is 1, a RESTART is issued only if the transfer direction is changing from the previous command; if IC_RESTART_EN is 0, a STOP followed by a START is issued instead.
9	0h WO	**STOP:** This bit controls whether a STOP is issued after the byte is sent or received. This bit is available only if IC_EMPTYFIFO_HOLD_MASTER_EN is configured to 1. - 1 - STOP is issued after this byte, regardless of whether or not the Tx FIFO is empty. If the Tx FIFO is not empty, the master immediately tries to start a new transfer by issuing a START and arbitrating for the bus. - 0 - STOP is not issued after this byte, regardless of whether or not the Tx FIFO is empty. If the Tx FIFO is not empty, the master continues the current transfer by sending/receiving data bytes according to the value of the CMD bit. If the Tx FIFO is empty, the master holds the SCL line low and stalls the bus until a new command is available in the Tx FIFO.
8	0h WO	**CMD:** This bit controls whether a read or a write is performed. This bit does not control the direction when the DW_apb_i2c acts as a slave. It controls only the direction when it acts as a master. When a command is entered in the TX FIFO, this bit distinguishes the write and read commands. In slave-receiver mode, this bit is a "don't care" because writes to this register are not required. In slave-transmitter mode, a "0" indicates that the data in IC_DATA_CMD is to be transmitted. When programming this bit, you should remember the following: attempting to perform a read operation after a General Call command has been sent results in a TX_ABRT interrupt (bit 6 of the IC_RAW_INTR_STAT register), unless bit 11 (SPECIAL) in the IC_TAR register has been cleared. If a "1" is written to this bit after receiving a RD_REQ interrupt, then a TX_ABRT interrupt occurs.
7:0	00h RW/V	**DAT:** This register contains the data to be transmitted or received on the I2C bus. If you are writing to this register and want to perform a read, bits 7:0 (DAT) are ignored by the DW_apb_i2c. However, when you read this register, these bits return the value of data received on the DW_apb_i2c interface.

6.2.6 IC_SS_SCL_HCNT - Offset 14h

Standard Speed I2C Clock SCL High Count Register - Standard Speed I2C Clock SCL High Count Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14h	000001E8h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	01E8h RW	**IC_SS_SCL_HCNT:** This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock high-period count for standard speed. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. The minimum valid value is 6; hardware prevents values less than this being written, and if attempted results in 6 being set. For designs with APB_DATA_WIDTH = 8, the order of programming is important to ensure the correct operation of the DW_apb_i2c. The lower byte must be programmed first. Then the upper byte is programmed. When the configuration parameter IC_HC_COUNT_VALUES is set to 1, this register is read only. ***Note***: This register must not be programmed to a value higher than 65525, because DW_apb_i2c uses a 16-bit counter to flag an I2C bus idle condition when this counter reaches a value of IC_SS_SCL_HCNT + 10.

6.2.7 IC_SS_SCL_LCNT - Offset 18h

Standard Speed I2C Clock SCL Low Count Register - Standard Speed I2C Clock SCL Low Count Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 18h	000001F3h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	01F3h RW	**IC_SS_SCL_LCNT:** This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock low period count for standard speed. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. The minimum valid value is 8; hardware prevents values less than this being written, and if attempted, results in 8 being set. For designs with APB_DATA_WIDTH = 8, the order of programming is important to ensure the correct operation of DW_apb_i2c. The lower byte must be programmed first, and then the upper byte is programmed. When the configuration parameter IC_HC_COUNT_VALUES is set to 1, this register is read only.

6.2.8 IC_FS_SCL_HCNT - Offset 1Ch

Fast Mode or Fast Mode Plus I2C Clock SCL High Count Register - Fast Mode or Fast Mode Plus I2C Clock SCL High Count Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1Ch	00000071h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0071h RW	**IC_FS_SCL_HCNT:** This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock high-period count for fast mode or fast mode plus. It is used in high-speed mode to send the Master Code and START BYTE or General CALL. This register goes away and becomes read-only returning 0s if IC_MAX_SPEED_MODE = standard. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. The minimum valid value is 6; hardware prevents values less than this being written, and if attempted results in 6 being set. For designs with APB_DATA_WIDTH == 8 the order of programming is important to ensure the correct operation of the DW_apb_i2c. The lower byte must be programmed first. Then the upper byte is programmed.

6.2.9 IC_FS_SCL_LCNT - Offset 20h

Fast Mode or Fast Mode Plus I2C Clock SCL Low Count Register - Fast Mode or Fast Mode Plus I2C Clock SCL Low Count Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 20h	0000007Ch

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	007Ch RW	**IC_FS_SCL_LCNT:** This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock low period count for fast speed. It is used in high-speed mode to send the Master Code and START BYTE or General CALL. This register goes away and becomes read-only returning 0s if IC_MAX_SPEED_MODE = standard. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. The minimum valid value is 8; hardware prevents values less than this being written, and if attempted results in 8 being set. For designs with APB_DATA_WIDTH = 8 the order of programming is important to ensure the correct operation of the DW_apb_i2c. The lower byte must be programmed first. Then the upper byte is programmed. If the value is less than 8 then the count value gets changed to 8. When the configuration parameter IC_HC_COUNT_VALUES is set to 1, this register is read only.

6.2.10 IC_HS_SCL_HCNT - Offset 24h

High Speed I2C Clock SCL High Count Register - High Speed I2C Clock SCL High Count Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 24h	00000029h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0029h RW	**IC_HS_SCL_HCNT:** This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock high period count for high speed.The SCL High time depends on the loading of the bus. For 100pF loading, the SCL High time is 60ns; for 400pF loading, the SCL High time is 120ns. This register goes away and becomes read-only returning 0s if IC_MAX_SPEED_MODE != high. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. The minimum valid value is 6; hardware prevents values less than this being written, and if attempted results in 6 being set. For designs with APB_DATA_WIDTH = 8 the order of programming is important to ensure the correct operation of the DW_apb_i2c. The lower byte must be programmed first. Then the upper byte is programmed.

6.2.11 IC_HS_SCL_LCNT - Offset 28h

High Speed I2C Clock SCL Low Count Register - High Speed I2C Clock SCL Low Count Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 28h	00000032h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0032h RW	**IC_HS_SCL_LCNT:** This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock low period count for high speed. The SCL low time depends on the loading of the bus. For 100pF loading, the SCL low time is 160ns; for 400pF loading, the SCL low time is 320ns. This register goes away and becomes read-only returning 0s if IC_MAX_SPEED_MODE != high. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. The minimum valid value is 8; hardware prevents values less than this being written, and if attempted results in 8 being set. For designs with APB_DATA_WIDTH == 8 the order of programming is important to ensure the correct operation of the DW_apb_i2c. The lower byte must be programmed first. Then the upper byte is programmed. If the value is less than 8 then the count value gets changed to 8.

6.2.12 IC_INTR_STAT - Offset 2Ch

I2C Interrupt Status Register - I2C Interrupt Status Register Each bit in this register has a corresponding mask bit in the IC_INTR_MASK register. These bits are cleared by reading the matching interrupt clear register. The unmasked raw versions of these bits are available in the IC_RAW_INTR_STAT register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13	0h RO/V	**R_MASTER_ON_HOLD:** See IC_RAW_INTR_STAT for a detailed description of R_MASTER_ON_HOLD bit.
12	0h RO/V	**R_RESTART_DET:** See IC_RAW_INTR_STAT for a detailed description of R_RESTART_DET bit.
11	0h RO/V	**R_GEN_CALL:** See IC_RAW_INTR_STAT for a detailed description of R_GEN_CALL bit.
10	0h RO/V	**R_START_DET:** See IC_RAW_INTR_STAT for a detailed description of R_START_DET bit.
9	0h RO/V	**R_STOP_DET:** See IC_RAW_INTR_STAT for a detailed description of R_STOP_DET bit.
8	0h RO/V	**R_ACTIVITY:** See IC_RAW_INTR_STAT for a detailed description of R_ACTIVITY bit.
7	0h RO/V	**R_RX_DONE:** See IC_RAW_INTR_STAT for a detailed description of R_RX_DONE bit.
6	0h RO/V	**R_TX_ABRT:** See IC_RAW_INTR_STAT for a detailed description of R_TX_ABRT bit.
5	0h RO/V	**R_RD_REQ:** See IC_RAW_INTR_STAT for a detailed description of R_RD_REQ bit.
4	0h RO/V	**R_TX_EMPTY:** See IC_RAW_INTR_STAT for a detailed description of R_TX_EMPTY bit.
3	0h RO/V	**R_TX_OVER:** See IC_RAW_INTR_STAT for a detailed description of R_TX_OVER bit.
2	0h RO/V	**R_RX_FULL:** See IC_RAW_INTR_STAT for a detailed description of R_RX_FULL bit.
1	0h RO/V	**R_RX_OVER:** See IC_RAW_INTR_STAT for a detailed description of R_RX_OVER bit.
0	0h RO/V	**R_RX_UNDER:** See IC_RAW_INTR_STAT for a detailed description of R_RX_UNDER bit.

6.2.13 IC_INTR_MASK - Offset 30h

I2C Interrupt Mask Register - I2C Interrupt Mask Register. These bits mask their corresponding interrupt status bits. This register is active low; a value of 0 masks the interrupt, whereas a value of 1 unmasks the interrupt.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 30h	000008FFh

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13	0h RW	**M_MASTER_ON_HOLD:** This bit masks the R_MASTER_ON_HOLD interrupt in IC_INTR_STAT register.
12	0h RW	**M_RESTART_DET:** This bit masks the R_RESTART_DET interrupt in IC_INTR_STAT register.
11	1h RW	**M_GEN_CALL:** This bit masks the R_GEN_CALL interrupt in IC_INTR_STAT register.
10	0h RW	**M_START_DET:** This bit masks the R_START_DET interrupt in IC_INTR_STAT register.
9	0h RW	**M_STOP_DET:** This bit masks the R_STOP_DET interrupt in IC_INTR_STAT register.
8	0h RW	**M_ACTIVITY:** This bit masks the R_ACTIVITY interrupt in IC_INTR_STAT register.
7	1h RW	**M_RX_DONE:** This bit masks the R_RX_DONE interrupt in IC_INTR_STAT register.
6	1h RW	**M_TX_ABRT:** This bit masks the R_TX_ABRT interrupt in IC_INTR_STAT register.
5	1h RW	**M_RD_REQ:** This bit masks the R_RD_REQ interrupt in IC_INTR_STAT register.
4	1h RW	**M_TX_EMPTY:** This bit masks the R_TX_EMPTY interrupt in IC_INTR_STAT register.
3	1h RW	**M_TX_OVER:** This bit masks the R_TX_OVER interrupt in IC_INTR_STAT register.
2	1h RW	**M_RX_FULL:** This bit masks the R_RX_FULL interrupt in IC_INTR_STAT register.
1	1h RW	**M_RX_OVER:** This bit masks the R_RX_OVER interrupt in IC_INTR_STAT register.
0	1h RW	**M_RX_UNDER:** This bit masks the R_RX_UNDER interrupt in IC_INTR_STAT register.

6.2.14 IC_RAW_INTR_STAT - Offset 34h

I2C Raw Interrupt Status Register - I2C Raw Interrupt Status Register Unlike the IC_INTR_STAT register, these bits are not masked so they always show the true status of the DW_apb_i2c.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 34h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13	0h RO/V	**MASTER_ON_HOLD:** Indicates whether master is holding the bus and TX FIFO is empty. Enabled only when I2C_DYNAMIC_TAR_UPDATE=1 and IC_EMPTYFIFO_HOLD_MASTER_EN=1.
12	0h RO/V	**RESTART_DET:** Indicates whether a RESTART condition has occurred on the I2C interface when DW_apb_i2c is operating in Slave mode and the slave is being addressed. Enabled only when IC_SLV_RESTART_DET_EN=1. ***Note***: However, in high-speed mode or during a START BYTE transfer, the RESTART comes before the address field as per the I2C protocol. In this case, the slave is not the addressed slave when the RESTART is issued, therefore DW_apb_i2c does not generate the RESTART_DET interrupt.
11	0h RO/V	**GEN_CALL:** Set only when a General Call address is received and it is acknowledged. It stays set until it is cleared either by disabling DW_apb_i2c or when the CPU reads bit 0 of the IC_CLR_GEN_CALL register. DW_apb_i2c stores the received data in the Rx buffer.
10	0h RO/V	**START_DET:** Indicates whether a START or RESTART condition has occurred on the I2C interface regardless of whether DW_apb_i2c is operating in slave or master mode.
9	0h RO/V	**STOP_DET:** Indicates whether a STOP condition has occurred on the I2C interface regardless of whether DW_apb_i2c is operating in slave or master mode. In Slave Mode: - If IC_CON[7]=1'b1 (STOP_DET_IFADDRESSED), the STOP_DET interrupt will be issued only if slave is addressed. ***Note***: During a general call address, this slave does not issue a STOP_DET interrupt if STOP_DET_IF_ADDRESSED=1'b1, even if the slave responds to the general call address by generating ACK. The STOP_DET interrupt is generated only when the transmitted address matches the slave address (SAR). - If IC_CON[7]=1'b0 (STOP_DET_IFADDRESSED), the STOP_DET interrupt is issued irrespective of whether it is being addressed. In Master Mode: - If IC_CON[10]=1'b1 (STOP_DET_IF_MASTER_ACTIVE),the STOP_DET interrupt will be issued only if Master is active. - If IC_CON[10]=1'b0 (STOP_DET_IFADDRESSED),the STOP_DET interrupt will be issued irrespective of whether master is active or not.
8	0h RO/V	**ACTIVITY:** This bit captures DW_apb_i2c activity and stays set until it is cleared. There are four ways to clear it: - Disabling the DW_apb_i2c - Reading the IC_CLR_ACTIVITY register - Reading the IC_CLR_INTR register - System reset Once this bit is set, it stays set unless one of the four methods is used to clear it. Even if the DW_apb_i2c module is idle, this bit remains set until cleared, indicating that there was activity on the bus.
7	0h RO/V	**RX_DONE:** When the DW_apb_i2c is acting as a slave-transmitter, this bit is set to 1 if the master does not acknowledge a transmitted byte. This occurs on the last byte of the transmission, indicating that the transmission is done.
6	0h RO/V	**TX_ABRT:** This bit indicates if DW_apb_i2c, as an I2C transmitter, is unable to complete the intended actions on the contents of the transmit FIFO. This situation can occur both as an I2C master or an I2C slave, and is referred to as a 'transmit abort'. When this bit is set to 1, the IC_TX_ABRT_SOURCE register indicates the reason why the transmit abort takes places. ***Note***: The DW_apb_i2c flushes/resets/empties only the TX_FIFO whenever there is a transmit abort caused by any of the events tracked by the IC_TX_ABRT_SOURCE register. The Tx FIFO remains in this flushed state until the register IC_CLR_TX_ABRT is read. Once this read is performed, the Tx FIFO is then ready to accept more data bytes from the APB interface. RX FIFO flush because of TX_ABRT is controlled by the coreConsultant parameter IC_AVOID_RX_FIFO_FLUSH_ON_TX_ABRT.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RO/V	**RD_REQ:** This bit is set to 1 when DW_apb_i2c is acting as a slave and another I2C master is attempting to read data from DW_apb_i2c. The DW_apb_i2c holds the I2C bus in a wait state (SCL=0) until this interrupt is serviced, which means that the slave has been addressed by a remote master that is asking for data to be transferred. The processor must respond to this interrupt and then write the requested data to the IC_DATA_CMD register. This bit is set to 0 just after the processor reads the IC_CLR_RD_REQ register.
4	0h RO/V	**TX_EMPTY:** The behavior of the TX_EMPTY interrupt status differs based on the TX_EMPTY_CTRL selection in the IC_CON register. - When TX_EMPTY_CTRL = 0: This bit is set to 1 when the transmit buffer is at or below the threshold value set in the IC_TX_TL register. - When TX_EMPTY_CTRL = 1: This bit is set to 1 when the transmit buffer is at or below the threshold value set in the IC_TX_TL register and the transmission of the address/data from the internal shift register for the most recently popped command is completed. It is automatically cleared by hardware when the buffer level goes above the threshold. When IC_ENABLE[0] is set to 0, the TX FIFO is flushed and held in reset. There the TX FIFO looks like it has no data within it, so this bit is set to 1, provided there is activity in the master or slave state machines. When there is no longer any activity, then with ic_en=0, this bit is set to 0.
3	0h RO/V	**TX_OVER:** Set during transmit if the transmit buffer is filled to IC_TX_BUFFER_DEPTH and the processor attempts to issue another I2C command by writing to the IC_DATA_CMD register. When the module is disabled, this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared.
2	0h RO/V	**RX_FULL:** Set when the receive buffer reaches or goes above the RX_TL threshold in the IC_RX_TL register. It is automatically cleared by hardware when buffer level goes below the threshold. If the module is disabled (IC_ENABLE[0]=0), the RX FIFO is flushed and held in reset; therefore the RX FIFO is not full. So this bit is cleared once the IC_ENABLE bit 0 is programmed with a 0, regardless of the activity that continues.
1	0h RO/V	**RX_OVER:** Set if the receive buffer is completely filled to IC_RX_BUFFER_DEPTH and an additional byte is received from an external I2C device. The DW_apb_i2c acknowledges this, but any data bytes received after the FIFO is full are lost. If the module is disabled (IC_ENABLE[0]=0), this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared. ***Note***: If the configuration parameter IC_RX_FULL_HLD_BUS_EN is enabled and bit 9 of the IC_CON register (RX_FIFO_FULL_HLD_CTRL) is programmed to HIGH, then the RX_OVER interrupt never occurs, because the Rx FIFO never overflows.
0	0h RO/V	**RX_UNDER:** Set if the processor attempts to read the receive buffer when it is empty by reading from the IC_DATA_CMD register. If the module is disabled (IC_ENABLE[0]=0), this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared.

6.2.15 IC_RX_TL - Offset 38h

I2C Receive FIFO Threshold Register - I2C Receive FIFO Threshold Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 38h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**RX_TL:** Receive FIFO Threshold Level. Controls the level of entries (or above) that triggers the RX_FULL interrupt (bit 2 in IC_RAW_INTR_STAT register). The valid range is 0-255, with the additional restriction that hardware does not allow this value to be set to a value larger than the depth of the buffer. If an attempt is made to do that, the actual value set will be the maximum depth of the buffer. A value of 0 sets the threshold for 1 entry, and a value of 255 sets the threshold for 256 entries.

6.2.16 IC_TX_TL - Offset 3Ch

I2C Transmit FIFO Threshold Register - I2C Transmit FIFO Threshold Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 3Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**TX_TL:** Transmit FIFO Threshold Level. Controls the level of entries (or below) that trigger the TX_EMPTY interrupt (bit 4 in IC_RAW_INTR_STAT register). The valid range is 0-255, with the additional restriction that it may not be set to value larger than the depth of the buffer. If an attempt is made to do that, the actual value set will be the maximum depth of the buffer. A value of 0 sets the threshold for 0 entries, and a value of 255 sets the threshold for 255 entries.

6.2.17 IC_CLR_INTR - Offset 40h

Clear Combined and Individual Interrupt Register - Clear Combined and Individual Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 40h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_INTR:** Read this register to clear the combined interrupt, all individual interrupts, and the IC_TX_ABRT_SOURCE register. This bit does not clear hardware clearable interrupts but software clearable interrupts. Refer to Bit 9 of the IC_TX_ABRT_SOURCE register for an exception to clearing IC_TX_ABRT_SOURCE.

6.2.18 IC_CLR_RX_UNDER - Offset 44h

Clear RX_UNDER Interrupt Register - Clear RX_UNDER Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 44h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RX_UNDER:** Read this register to clear the RX_UNDER interrupt (bit 0) of the IC_RAW_INTR_STAT register.

6.2.19 IC_CLR_RX_OVER - Offset 48h

Clear RX_OVER Interrupt Register - Clear RX_OVER Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 48h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RX_OVER:** Read this register to clear the RX_OVER interrupt (bit 1) of the IC_RAW_INTR_STAT register.

6.2.20 IC_CLR_TX_OVER - Offset 4Ch

Clear TX_OVER Interrupt Register - Clear TX_OVER Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_TX_OVER:** Read this register to clear the TX_OVER interrupt (bit 3) of the IC_RAW_INTR_STAT register.

6.2.21 IC_CLR_RD_REQ - Offset 50h

Clear RD_REQ Interrupt Register - Clear RD_REQ Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 50h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RD_REQ:** Read this register to clear the RD_REQ interrupt (bit 5) of the IC_RAW_INTR_STAT register.

6.2.22 IC_CLR_TX_ABRT - Offset 54h

Clear TX_ABRT Interrupt Register - Clear TX_ABRT Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 54h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_TX_ABRT:** Read this register to clear the TX_ABRT interrupt (bit 6) of the IC_RAW_INTR_STAT register, and the IC_TX_ABRT_SOURCE register. This also releases the TX FIFO from the flushed/reset state, allowing more writes to the TX FIFO. Refer to Bit 9 of the IC_TX_ABRT_SOURCE register for an exception to clearing IC_TX_ABRT_SOURCE.

6.2.23 IC_CLR_RX_DONE - Offset 58h

Clear RX_DONE Interrupt Register - Clear RX_DONE Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 58h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RX_DONE:** Read this register to clear the RX_DONE interrupt (bit 7) of the IC_RAW_INTR_STAT register.

6.2.24 IC_CLR_ACTIVITY - Offset 5Ch

Clear ACTIVITY Interrupt Register - Clear ACTIVITY Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_ACTIVITY:** Reading this register clears the ACTIVITY interrupt if the I2C is not active anymore. If the I2C module is still active on the bus, the ACTIVITY interrupt bit continues to be set. It is automatically cleared by hardware if the module is disabled and if there is no further activity on the bus. The value read from this register to get status of the ACTIVITY interrupt (bit 8) of the IC_RAW_INTR_STAT register.

6.2.25 IC_CLR_STOP_DET - Offset 60h

Clear STOP_DET Interrupt Register - Clear STOP_DET Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 60h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_STOP_DET:** Read this register to clear the STOP_DET interrupt (bit 9) of the IC_RAW_INTR_STAT register.

6.2.26 IC_CLR_START_DET - Offset 64h

Clear START_DET Interrupt Register - Clear START_DET Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 64h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_START_DET:** Read this register to clear the START_DET interrupt (bit 10) of the IC_RAW_INTR_STAT register.

6.2.27 IC_CLR_GEN_CALL - Offset 68h

Clear GEN_CALL Interrupt Register - Clear GEN_CALL Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 68h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_GEN_CALL:** Read this register to clear the GEN_CALL interrupt (bit 11) of IC_RAW_INTR_STAT register.

6.2.28 IC_ENABLE - Offset 6Ch

I2C ENABLE Register - I2C Enable Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**TX_CMD_BLOCK:** In Master mode: - 1'b1: Blocks the transmission of data on I2C bus even if Tx FIFO has data to transmit. - 1'b0: The transmission of data starts on I2C bus automatically, as soon as the first data is available in the Tx FIFO. ***Note***: To block the execution of Master commands, set the TX_CMD_BLOCK bit only when Tx FIFO is empty (IC_STATUS[2]==1) and Master is in Idle state (IC_STATUS[5] == 0). Any further commands put in the Tx FIFO are not executed until TX_CMD_BLOCK bit is unset.
1	0h RW	**ABORT:** When set, the controller initiates the transfer abort. - 0: ABORT not initiated or ABORT done - 1: ABORT operation in progress The software can abort the I2C transfer in master mode by setting this bit. The software can set this bit only when ENABLE is already set; otherwise, the controller ignores any write to ABORT bit. The software cannot clear the ABORT bit once set. In response to an ABORT, the controller issues a STOP and flushes the Tx FIFO after completing the current transfer, then sets the TX_ABORT interrupt after the abort operation. The ABORT bit is cleared automatically after the abort operation.
0	0h RW	**ENABLE:** Controls whether the DW_apb_i2c is enabled. - 0: Disables DW_apb_i2c (TX and RX FIFOs are held in an erased state) - 1: Enables DW_apb_i2c Software can disable DW_apb_i2c while it is active. However, it is important that care be taken to ensure that DW_apb_i2c is disabled properly. A recommended procedure is described in "Disabling DW_apb_i2c". When DW_apb_i2c is disabled, the following occurs: - The TX FIFO and RX FIFO get flushed. - Status bits in the IC_INTR_STAT register are still active until DW_apb_i2c goes into IDLE state. If the module is transmitting, it stops as well as deletes the contents of the transmit buffer after the current transfer is complete. If the module is receiving, the DW_apb_i2c stops the current transfer at the end of the current byte and does not acknowledge the transfer. In systems with asynchronous pclk and ic_clk when IC_CLK_TYPE parameter set to asynchronous (1), there is a two ic_clk delay when enabling or disabling the DW_apb_i2c.

6.2.29 IC_STATUS - Offset 70h

I2C STATUS Register - I2C Status Register This is a read-only register used to indicate the current transfer status and FIFO status. The status register may be read at any time. None of the bits in this register request an interrupt. When the I2C is disabled by writing 0 in bit 0 of the IC_ENABLE register: - Bits 1 and 2 are set to 1 - Bits 3 and 10 are set to 0 When the master or slave state machines goes to idle and ic_en=0: - Bits 5 and 6 are set to 0

Type	Size	Offset	Default
MMIO	32 bit	BAR + 70h	00000006h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved**
10	0h RO/V	**SLV_HOLD_RX_FIFO_FULL:** This bit indicates the BUS Hold in Slave mode due to Rx FIFO is Full and an additional byte has been received (This kind of Bus hold is applicable if IC_RX_FULL_HLD_BUS_EN is set to 1).
9	0h RO/V	**SLV_HOLD_TX_FIFO_EMPTY:** This bit indicates the BUS Hold in Slave mode for the Read request when the Tx FIFO is empty. The Bus is in hold until the Tx FIFO has data to Transmit for the read request.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RO/V	**MST_HOLD_RX_FIFO_FULL:** This bit indicates the BUS Hold in Master mode due to Rx FIFO is Full and additional byte has been received (This kind of Bus hold is applicable if IC_RX_FULL_HLD_BUS_EN is set to 1).
7	0h RO/V	**MST_HOLD_TX_FIFO_EMPTY:** If the IC_EMPTYFIFO_HOLD_MASTER_EN parameter is set to 1, the DW_apb_i2c master stalls the write transfer when Tx FIFO is empty, and the last byte does not have the Stop bit set. This bit indicates the BUS hold when the master holds the bus because of the Tx FIFO being empty, and the previous transferred command does not have the Stop bit set. (This kind of Bus hold is applicable if IC_EMPTYFIFO_HOLD_MASTER_EN is set to 1).
6	0h RO/V	**SLV_ACTIVITY:** Slave FSM Activity Status. When the Slave Finite State Machine (FSM) is not in the IDLE state, this bit is set. - 0: Slave FSM is in IDLE state so the Slave part of DW_apb_i2c is not Active - 1: Slave FSM is not in IDLE state so the Slave part of DW_apb_i2c is Active
5	0h RO/V	**MST_ACTIVITY:** Master FSM Activity Status. When the Master Finite State Machine (FSM) is not in the IDLE state, this bit is set. - 0: Master FSM is in IDLE state so the Master part of DW_apb_i2c is not Active - 1: Master FSM is not in IDLE state so the Master part of DW_apb_i2c is Active **Note**: IC_STATUS[0]-that is, ACTIVITY bit-is the OR of SLV_ACTIVITY and MST_ACTIVITY bits.
4	0h RO/V	**RFF:** Receive FIFO Completely Full. When the receive FIFO is completely full, this bit is set. When the receive FIFO contains one or more empty locations, this bit is cleared. - 0: Receive FIFO is not full - 1: Receive FIFO is full
3	0h RO/V	**RFNE:** Receive FIFO Not Empty. This bit is set when the receive FIFO contains one or more entries; it is cleared when the receive FIFO is empty. - 0: Receive FIFO is empty - 1: Receive FIFO is not empty
2	1h RO/V	**TFE:** Transmit FIFO Completely Empty. When the transmit FIFO is completely empty, this bit is set. When it contains one or more valid entries, this bit is cleared. This bit field does not request an interrupt. - 0: Transmit FIFO is not empty - 1: Transmit FIFO is empty
1	1h RO/V	**TFNF:** Transmit FIFO Not Full. Set when the transmit FIFO contains one or more empty locations, and is cleared when the FIFO is full. - 0: Transmit FIFO is full - 1: Transmit FIFO is not full
0	0h RO/V	**ACTIVITY:** I2C Activity Status.

6.2.30 IC_TXFLR - Offset 74h

I2C Transmit FIFO Level Register - I2C Transmit FIFO Level Register This register contains the number of valid data entries in the transmit FIFO buffer. It is cleared whenever: - The I2C is disabled - There is a transmit abort - that is, TX_ABRT bit is set in the IC_RAW_INTR_STAT register - The slave bulk transmit mode is aborted. The register increments whenever data is placed into the transmit FIFO and decrements when data is taken from the transmit FIFO.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 74h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:0	00h RO/V	**TXFLR:** Transmit FIFO Level. Contains the number of valid data entries in the transmit FIFO.

6.2.31 IC_RXFLR - Offset 78h

I2C Receive FIFO Level Register - I2C Receive FIFO Level Register This register contains the number of valid data entries in the receive FIFO buffer. It is cleared whenever: - The I2C is disabled - Whenever there is a transmit abort caused by any of the events tracked in IC_TX_ABRT_SOURCE. The register increments whenever data is placed into the receive FIFO and decrements when data is taken from the receive FIFO.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 78h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:0	00h RO/V	**RXFLR:** Receive FIFO Level. Contains the number of valid data entries in the receive FIFO.

6.2.32 IC_SDA_HOLD - Offset 7Ch

I2C SDA Hold Time Length Register - I2C SDA Hold Time Length Register The bits [15:0] of this register are used to control the hold time of SDA during transmit in both slave and master mode (after SCL goes from HIGH to LOW). The bits [23:16] of this register are used to extend the SDA transition (if any) whenever SCL is HIGH in the receiver in either master or slave mode. Writes to this register succeed only when IC_ENABLE[0]=0. The values in this register are in units of ic_clk period. The value programmed in IC_SDA_TX_HOLD must be greater than the minimum hold time in each mode one cycle in master mode, seven cycles in slave mode for the value to be implemented. The programmed SDA hold time during transmit (IC_SDA_TX_HOLD) cannot exceed at any time the duration of the low part of scl. Therefore the programmed value cannot be larger than N_SCL_LOW-2, where N_SCL_LOW is the duration of the low part of the scl period measured in ic_clk cycles.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7Ch	00000005h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:16	00h RW	**IC_SDA_RX_HOLD:** Sets the required SDA hold time in units of ic_clk period, when DW_apb_i2c acts as a receiver.
15:0	0005h RW	**IC_SDA_TX_HOLD:** Sets the required SDA hold time in units of ic_clk period, when DW_apb_i2c acts as a transmitter.

6.2.33 IC_TX_ABRT_SOURCE - Offset 80h

I2C Transmit Abort Source Register - I2C Transmit Abort Source Register This register has 32 bits that indicate the source of the TX_ABRT bit. Except for Bit 9, this register is cleared whenever the IC_CLR_TX_ABRT register or the IC_CLR_INTR register is read. To clear Bit 9, the source of the ABRT_SBYTE_NORSTRT must be fixed first; RESTART must be enabled (IC_CON[5]=1), the SPECIAL bit must be cleared (IC_TAR[11]), or the GC_OR_START bit must be cleared (IC_TAR[10]). Once the source of the ABRT_SBYTE_NORSTRT is fixed, then this bit can be cleared in the same manner as other bits in this register. If the source of the ABRT_SBYTE_NORSTRT is not fixed before attempting to clear this bit, Bit 9 clears for one cycle and is then re-asserted.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 80h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	000h RO/V	**TX_FLUSH_CNT:** This field indicates the number of Tx FIFO Data Commands which are flushed due to TX_ABRT interrupt. It is cleared whenever I2C is disabled. Role of DW_apb_i2c: Master-Transmitter or Slave-Transmitter
22:17	0h RO	**Reserved**
16	0h RO/V	**ABRT_USER_ABRT:** This is a master-mode-only bit. Master has detected the transfer abort (IC_ENABLE[1]) Role of DW_apb_i2c: Master-Transmitter
15	0h RO/V	**ABRT_SLVRD_INTX:** 1: When the processor side responds to a slave mode request for data to be transmitted to a remote master and user writes a 1 in CMD (bit 8) of IC_DATA_CMD register. Role of DW_apb_i2c: Slave-Transmitter
14	0h RO/V	**ABRT_SLV_ARBLOST:** This field indicates that a Slave has lost the bus while transmitting data to a remote master. IC_TX_ABRT_SOURCE[12] is set at the same time. ***Note***: Even though the slave never 'owns' the bus, something could go wrong on the bus. This is a fail safe check. For instance, during a data transmission at the low-to-high transition of SCL, if what is on the data bus is not what is supposed to be transmitted, then DW_apb_i2c no longer own the bus. Role of DW_apb_i2c: Slave-Transmitter
13	0h RO/V	**ABRT_SLVFLUSH_TXFIFO:** This field specifies that the Slave has received a read command and some data exists in the TX FIFO, so the slave issues a TX_ABRT interrupt to flush old data in TX FIFO. Role of DW_apb_i2c: Slave-Transmitter

Bit Range	Default & Access	Field Name (ID): Description
12	0h RO/V	**ARB_LOST:** This field specifies that the Master has lost arbitration, or if IC_TX_ABRT_SOURCE[14] is also set, then the slave transmitter has lost arbitration. Role of DW_apb_i2c: Master-Transmitter or Slave-Transmitter
11	0h RO/V	**ABRT_MASTER_DIS:** This field indicates that the User tries to initiate a Master operation with the Master mode disabled. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver
10	0h RO/V	**ABRT_10B_RD_NORSTRT:** This field indicates that the restart is disabled (IC_RESTART_EN bit (IC_CON[5]) =0) and the master sends a read command in 10-bit addressing mode. Role of DW_apb_i2c: Master-Receiver
9	0h RO/V	**ABRT_SBYTE_NORSTRT:** To clear Bit 9, the source of the ABRT_SBYTE_NORSTRT must be fixed first; restart must be enabled (IC_CON[5]=1), the SPECIAL bit must be cleared (IC_TAR[11]), or the GC_OR_START bit must be cleared (IC_TAR[10]). Once the source of the ABRT_SBYTE_NORSTRT is fixed, then this bit can be cleared in the same manner as other bits in this register. If the source of the ABRT_SBYTE_NORSTRT is not fixed before attempting to clear this bit, bit 9 clears for one cycle and then gets reasserted. When this field is set to 1, the restart is disabled (IC_RESTART_EN bit (IC_CON[5]) =0) and the user is trying to send a START Byte. Role of DW_apb_i2c: Master
8	0h RO/V	**ABRT_HS_NORSTRT:** This field indicates that the restart is disabled (IC_RESTART_EN bit (IC_CON[5]) =0) and the user is trying to use the master to transfer data in High Speed mode. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver
7	0h RO/V	**ABRT_SBYTE_ACKDET:** This field indicates that the Master has sent a START Byte and the START Byte was acknowledged (wrong behavior). Role of DW_apb_i2c: Master
6	0h RO/V	**ABRT_HS_ACKDET:** This field indicates that the Master is in High Speed mode and the High Speed Master code was acknowledged (wrong behavior). Role of DW_apb_i2c: Master
5	0h RO/V	**ABRT_GCALL_READ:** This field indicates that DW_apb_i2c in the master mode has sent a General Call but the user programmed the byte following the General Call to be a read from the bus (IC_DATA_CMD[9] is set to 1). Role of DW_apb_i2c: Master-Transmitter
4	0h RO/V	**ABRT_GCALL_NOACK:** This field indicates that DW_apb_i2c in master mode has sent a General Call and no slave on the bus acknowledged the General Call. Role of DW_apb_i2c: Master-Transmitter
3	0h RO/V	**ABRT_TXDATA_NOACK:** This field indicates the master-mode only bit. When the master receives an acknowledgment for the address, but when it sends data byte(s) following the address, it did not receive an acknowledge from the remote slave(s). Role of DW_apb_i2c: Master-Transmitter
2	0h RO/V	**ABRT_10ADDR2_NOACK:** This field indicates that the Master is in 10-bit address mode and that the second address byte of the 10-bit address was not acknowledged by any slave. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver
1	0h RO/V	**ABRT_10ADDR1_NOACK:** This field indicates that the Master is in 10-bit address mode and the first 10-bit address byte was not acknowledged by any slave. Reset value: 0x0 Role of DW_apb_i2c: Master-Transmitter or Master-Receiver
0	0h RO/V	**ABRT_7B_ADDR_NOACK:** This field indicates that the Master is in 7-bit addressing mode and the address sent was not acknowledged by any slave. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver

6.2.34 IC_DMA_CR - Offset 88h

DMA Control Register - DMA Control Register This register is only valid when DW_apb_i2c is configured with a set of DMA Controller interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist and writing to the register's address has no effect and reading from this register address will return zero. The register is used to enable the DMA Controller interface operation. There is a separate bit for transmit and receive. This can be programmed regardless of the state of IC_ENABLE.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 88h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1	0h RW	**TDMAE:** Transmit DMA Enable. This bit enables/disables the transmit FIFO DMA channel.
0	0h RW	**RDMAE:** Receive DMA Enable. This bit enables/disables the receive FIFO DMA channel.

6.2.35 IC_DMA_TDLR - Offset 8Ch

DMA Transmit Data Level Register - DMA Transmit Data Level Register This register is only valid when the DW_apb_i2c is configured with a set of DMA interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist; writing to its address has no effect; reading from its address returns zero.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:0	00h RW	**DMATDL:** Transmit Data Level. This bit field controls the level at which a DMA request is made by the transmit logic. It is equal to the watermark level; that is, the dma_tx_req signal is generated when the number of valid data entries in the transmit FIFO is equal to or below this field value, and TDMAE = 1.

6.2.36 IC_DMA_RDLR - Offset 90h

DMA Transmit Data Level Register - I2C Receive Data Level Register This register is only valid when DW_apb_i2c is configured with a set of DMA interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist; writing to its address has no effect; reading from its address returns zero.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 90h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:0	00h RW	**DMARDL:** Receive Data Level. This bit field controls the level at which a DMA request is made by the receive logic. The watermark level = DMARDL+1; that is, dma_rx_req is generated when the number of valid data entries in the receive FIFO is equal to or more than this field value + 1, and RDMAE =1. For instance, when DMARDL is 0, then dma_rx_req is asserted when 1 or more data entries are present in the receive FIFO.

6.2.37 IC_SDA_SETUP - Offset 94h

I2C SDA Setup Register - I2C SDA Setup Register This register controls the amount of time delay (in terms of number of ic_clk clock periods) introduced in the rising edge of SCL - relative to SDA changing - when DW_apb_i2c services a read request in a slave-transmitter operation. The relevant I2C requirement is tSU:DAT (note 4) as detailed in the I2C Bus Specification. This register must be programmed with a value equal to or greater than 2. Writes to this register succeed only when IC_ENABLE[0] = 0.
Note: The length of setup time is calculated using [(IC_SDA_SETUP - 1) * (ic_clk_period)], so if the user requires 10 ic_clk periods of setup time, they should program a value of 11. The IC_SDA_SETUP register is only used by the DW_apb_i2c when operating as a slave transmitter.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 94h	00000002h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	02h RW	**SDA_SETUP:** SDA Setup. It is recommended that if the required delay is 1000ns, then for an ic_clk frequency of 10 MHz, IC_SDA_SETUP should be programmed to a value of 11. IC_SDA_SETUP must be programmed with a minimum value of 2.

6.2.38 IC_ACK_GENERAL_CALL - Offset 98h

I2C ACK General Call Register - I2C ACK General Call Register The register controls whether DW_apb_i2c responds with a ACK or NACK when it receives an I2C General Call address. This register is applicable only when the DW_apb_i2c is in slave mode.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**ACK_GEN_CALL:** ACK General Call. When set to 1, DW_apb_i2c responds with a ACK (by asserting ic_data_oe) when it receives a General Call. Otherwise, DW_apb_i2c responds with a NACK (by negating ic_data_oe).

6.2.39 IC_ENABLE_STATUS - Offset 9Ch

I2C Enable Status Register - I2C Enable Status Register The register is used to report the DW_apb_i2c hardware status when the IC_ENABLE[0] register is set from 1 to 0; that is, when DW_apb_i2c is disabled. If IC_ENABLE[0] has been set to 1, bits 2:1 are forced to 0, and bit 0 is forced to 1. If IC_ENABLE[0] has been set to 0, bits 2:1 is only been valid as soon as bit 0 is read as '0'.
Note: When IC_ENABLE[0] has been set to 0, a delay occurs for bit 0 to be read as 0 because disabling the DW_apb_i2c depends on I2C bus activities.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RO/V	**SLV_RX_DATA_LOST:** Slave Received Data Lost. This bit indicates if a Slave-Receiver operation has been aborted with at least one data byte received from an I2C transfer due to the setting bit 0 of IC_ENABLE from 1 to 0. When read as 1, DW_apb_i2c is deemed to have been actively engaged in an aborted I2C transfer (with matching address) and the data phase of the I2C transfer has been entered, even though a data byte has been responded with a NACK. ***Note***: If the remote I2C master terminates the transfer with a STOP condition before the DW_apb_i2c has a chance to NACK a transfer, and IC_ENABLE[0] has been set to 0, then this bit is also set to 1. When read as 0, DW_apb_i2c is deemed to have been disabled without being actively involved in the data phase of a Slave-Receiver transfer. ***Note***: The CPU can safely read this bit when IC_EN (bit 0) is read as 0.
1	0h RO/V	**SLV_DISABLED_WHILE_BUSY:** Slave Disabled While Busy (Transmit, Receive). This bit indicates if a potential or active Slave operation has been aborted due to the setting bit 0 of the IC_ENABLE register from 1 to 0. This bit is set when the CPU writes a 0 to the IC_ENABLE register while: (a) DW_apb_i2c is receiving the address byte of the Slave-Transmitter operation from a remote master; OR, (b) address and data bytes of the Slave-Receiver operation from a remote master. When read as 1, DW_apb_i2c is deemed to have forced a NACK during any part of an I2C transfer, irrespective of whether the I2C address matches the slave address set in DW_apb_i2c (IC_SAR register) OR if the transfer is completed before IC_ENABLE is set to 0 but has not taken effect. ***Note***: If the remote I2C master terminates the transfer with a STOP condition before the DW_apb_i2c has a chance to NACK a transfer, and IC_ENABLE[0] has been set to 0, then this bit will also be set to 1. When read as 0, DW_apb_i2c is deemed to have been disabled when there is master activity, or when the I2C bus is idle. ***Note***: The CPU can safely read this bit when IC_EN (bit 0) is read as 0.
0	0h RO/V	**IC_EN:** ic_en Status. This bit always reflects the value driven on the output port ic_en. - When read as 1, DW_apb_i2c is deemed to be in an enabled state. - When read as 0, DW_apb_i2c is deemed completely inactive. ***Note***: The CPU can safely read this bit anytime. When this bit is read as 0, the CPU can safely read SLV_RX_DATA_LOST (bit 2) and SLV_DISABLED_WHILE_BUSY (bit 1).

6.2.40 IC_FS_SPKLEN - Offset A0h

I2C SS, FS or FM+ spike suppression limit - I2C SS, FS or FM+ spike suppression limit. This register is used to store the duration, measured in ic_clk cycles, of the longest spike that is filtered out by the spike suppression logic w hen the component is operating in SS, FS or FM+ modes. The relevant I2C requirement is tSP as detailed in the I2C Bus Specification. This register must be programmed with a minimum value of 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + A0h	00000005h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	05h RW	**IC_FS_SPKLEN:** This register must be set before any I2C bus transaction can take place to ensure stable operation. This register sets the duration, measured in ic_clk cycles, of the longest spike in the SCL or SDA lines that will be filtered out by the spike suppression logic. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. The minimum valid value is 1; hardware prevents values less than this being written, and if attempted results in 1 being set.

6.2.41 IC_HS_SPKLEN - Offset A4h

I2C HS spike suppression limit register - I2C HS spike suppression limit register This register is used to store the duration, measured in ic_clk cycles, of the longest spike that is filtered out by the spike suppression logic when the component is operating in HS modes. The relevant I2C requirement is tSP as detailed in the I2C Bus Specification. This register must be programmed with a minimum value of 1 and is implemented only if the component is configured to support HS mode; that is, if the IC_MAX_SPEED_MODE parameter is set to 3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + A4h	00000002h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	02h RW	**IC_HS_SPKLEN:** This register must be set before any I2C bus transaction can take place to ensure stable operation. This register sets the duration, measured in ic_clk cycles, of the longest spike in the SCL or SDA lines that will be filtered out by the spike suppression logic. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. The minimum valid value is 1; hardware prevents values less than this being written, and if attempted results in 1 being set.

6.2.42 IC_CLR_RESTART_DET - Offset A8h

Clear RESTART_DET Interrupt Register - Clear RESTART_DET Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + A8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RESTART_DET:** Read this register to clear the RESTART_DET interrupt (bit 12) of IC_RAW_INTR_STAT register.

6.2.43 IC_COMP_PARAM_1 - Offset F4h

Component Parameter Register 1 - Component Parameter Register 1
Note: This is a constant read-only register that contains encoded information about the component's parameter settings. The reset value depends on coreConsultant parameter(s).

Type	Size	Offset	Default
MMIO	32 bit	BAR + F4h	003F3FEEh

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:16	3Fh RO/V	**TX_BUFFER_DEPTH:** The value of this register is derived from the IC_TX_BUFFER_DEPTH coreConsultant parameter. - 0x00 = Reserved - 0x01 = 2 - 0x02 = 3 -0xFF = 256
15:8	3Fh RO/V	**RX_BUFFER_DEPTH:** The value of this register is derived from the IC_RX_BUFFER_DEPTH coreConsultant parameter. - 0x00: Reserved - 0x01: 2 - 0x02: 3 - 0xFF: 256
7	1h RO/V	**ADD_ENCODED_PARAMS:** The value of this register is derived from the IC_ADD_ENCODED_PARAMS coreConsultant parameter. Reading 1 in this bit means that the capability of reading these encoded parameters via software has been included. Otherwise, the entire register is 0 regardless of the setting of any other parameters that are encoded in the bits.
6	1h RO/V	**HAS_DMA:** The value of this register is derived from the IC_HAS_DMA coreConsultant parameter.
5	1h RO/V	**INTR_IO:** The value of this register is derived from the IC_INTR_IO coreConsultant parameter.
4	0h RO/V	**HC_COUNT_VALUES:** The value of this register is derived from the IC_HC_COUNT VALUES coreConsultant parameter.
3:2	3h RO/V	**MAX_SPEED_MODE:** The value of this register is derived from the IC_MAX_SPEED_MODE coreConsultant parameter. - 0x0: Reserved - 0x1: Standard - 0x2: Fast - 0x3: High
1:0	2h RO/V	**APB_DATA_WIDTH:** The value of this register is derived from the APB_DATA_WIDTH coreConsultant parameter.

6.2.44 IC_COMP_VERSION - Offset F8h

I2C Component Version Register - I2C Component Version Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + F8h	3230322Ah

Bit Range	Default & Access	Field Name (ID): Description
31:0	3230322Ah RO/V	**IC_COMP_VERSION**

6.2.45 IC_COMP_TYPE - Offset FCh

I2C Component Type Register - I2C Component Type Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + FCh	44570140h

Bit Range	Default & Access	Field Name (ID): Description
31:0	44570140h RO/V	**IC_COMP_TYPE:** Design ware Component Type number = 0x44_57_01_40. This assigned unique hex value is constant and is derived from the two ASCII letters 'DW' followed by a 16-bit unsigned number.

6.2.46 D0i3 Control (D0I3C) - Offset 1000h

This register will be used for D0i3 SW flow. This will be mapped to a different MMIO address from the other IPC registers. (MMIO and OCP address value are yet to be done). The description below also includes the type of access expected for the ISH FW for each configuration bit:
1. The Restore Required (RR) bit (bit [3]) should be RW for the ISH FW which can determine when to set and/or clear these bits depending on when the ISH FW determines whether restore is required although for ISH restore is never required since the power is never lost.
2. The D0i3 (i3) bit (bit [2]) should be RO for ISH FW as it needs to be written only by host SW. The ISH FW can determine to go to a low power state based on this bit.
3. The Interrupt Required (IR) bit (bit [1]) can be RO register for ISH FW and ISH FW can send an interrupt to Host by writing to the ish2host IPC doorbell register when this bit is set by SW.
4. The Command in Progress (CIP) register bit (bit [0]) is HW set and need to be cleared by ISH FW.
A simple edge detects logic can be used for the setting of this bit in HW. The CIP register bit will be tied to a RTE entry in the IOAPIC as an interrupt source. Hence ISH FW will get an interrupt when the In addition to the registers, the IOSF2OCP Bridge should be parameterized for the following:
1. The device idle capability parameter (ENABLE_PCI_IDLE_CAP) needs to be connected to a soft strap for ISH with a value of 1.
2. The STRAP for the MMIO address (strap_d0i3_offset) of D0i3 register (IPC offset address: h6D0) and the d0i3 valid (strap_d0i3_valid) bit needs should be appropriately

tied.
3. The PCE register is made RO register by setting the appropriate parameter (Bridge top level strap: set_device_pg_config_type[5:0] is set to all 0s). This registers reset and clock domain will be in the OCP domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1000h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4	0h RO	**Interrupt Request Capable (IRC):** Set to 1 by HW if it is capable of generating an interrupt on command completion, else 0. For ISH this bit will be tied to 0.
3	1h RW/1C	**Restore Required (RR):** When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up.
2	0h RW	**D0I3:** SW sets this bit to 1 to move the IP into the D0i3 state. Writing this bit to 0 will return the IP to the fully active D0 state (D0i0).
1	0h RW	**Interrupt Required (IR):** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this on each write to this register.
0	0h RO/V	**Command In Progress (CIP):** HW sets this bit on a 1->0 or 0->1 transition of bit [2]. While set, the other bits in this register are not valid and it is illegal for SW to write to any bit in this register. When clear all the other bits in the register are valid and SW may write to any bit.

6.2.47 Clock Gating And Soft Reset (CGSR) - Offset 1004h

This register is used to Clock gate or soft reset an IP by Host/Remote Host. Also register field of this register can be used for device idle status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1004h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Idle Indication To Host (IDLE):** IP IDLE indication.
30:17	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**Clock Gate Enable (CG):** Setting this field to 1 clock gates the IP.
15:1	0h RO	**Reserved**
0	0h RW	**Soft Reset (SR):** Setting this bit to 1 resets the IP.

7 Controller Area Network (CAN) Interface

7.1 CAN Configuration Registers Summary

This registers in Bus: 0, Device 24, Function 1 and 2.

DID Values:

- Intel® PSE CAN Controller #0:- D24: F1 - 4BC1h
- Intel® PSE CAN Controller #1:- D24: F2 - 4BC2h

Table 7-1. Summary of Bus: 0, Device: 24, Function: 1 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value

2Ch	4	Subsystem Vendor and Subsystem ID (SUBSYSTEMID) - Offset 2Ch	00000000h
30h	4	Expansion ROM Base Address (EXPANSION_ROM_BASEADDR) - Offset 30h	00000000h
34h	4	Capabilities Pointer (CAPABILITYPTR) - Offset 34h	00000080h
3Ch	4	Interrupt Register (INTERRUPTREG) - Offset 3Ch	00000100h
80h	4	Power Management Capability ID (POWERCAPID) - Offset 80h	48030001h
84h	4	Power Management Control And Status Register (PMECTRLSTATUS) - Offset 84h	00000008h
90h	4	PCI Device Idle Vendor Capability Register (PCIDEVIDLE_CAP_RECORD) - Offset 90h	F0140009h
94h	4	Vendor Specific Extended Capability Register (DEVID_VEND_SPECIFIC_REG) - Offset 94h	01400010h
98h	4	Software LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG) - Offset 98h	00000000h
9Ch	4	Device Idle Pointer Register (DEVICE_IDLE_POINTER_REG) - Offset 9Ch	00000000h
A0h	4	D0i3 and Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG) - Offset A0h	00000800h
B0h	4	General Purpose Read Write Register1 (GEN_PCI_REGRW1) - Offset B0h	00000000h

Table 7-1. Summary of Bus: 0, Device: 24, Function: 1 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
C0h	4	General Purpose Input Register (GEN_INPUT_REG) - Offset C0h	00000000h
D0h	4	MSI Capability Register (MSI_CAP_REG) - Offset D0h	01800005h
D4h	4	MSI Message Low Address (MSI_ADDR_LOW) - Offset D4h	00000000h
D8h	4	MSI Message High Address (MSI_ADDR_HIGH) - Offset D8h	00000000h
DCh	4	MSI Message Data (MSI_MSG_DATA) - Offset DCh	00000000h
E0h	4	MSI Mask Register (MSI_MASK) - Offset E0h	00000000h
E4h	4	MSI Pending Register (MSI_PENDING) - Offset E4h	00000000h
F8h	4	Manufacturers ID (MANID) - Offset F8h	00000000h

7.1.1 Device ID And Vendor ID Register (DEVVENDID) - Offset 0h

Device ID and Vendor ID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:24, F:1] + 0h	4BC10000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	4BC1h RO/P	**Device ID Field (DEVICEID):** Device ID identifies the particular PCI device
15:0	0000h RO	**Vendor ID Field (VENDORID):** Vendor ID is a unique ID provided by the PCI SIG which identifies the manufacturer of the device

7.1.2 Status And Command (STATUSCOMMAND) - Offset 4h

Status and Command

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:24, F:1] + 4h	00100000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C	**Detected Parity Error (DPE):** Detected Parity Error
30	0h RW/1C	**Signaled System Error (SSE):** Signaled System Error
29	0h RW/1C	**RMA Field (RMA):** Received Master Abort
28	0h RW/1C	**RTA Field (RTA):** Received Target Abort

Bit Range	Default & Access	Field Name (ID): Description
27:25	0h RO	**Reserved**
24	0h RW/1C	**Master Data Parity Error (MDPE):** Master Data Parity Error
23:21	0h RO	**Reserved**
20	1h RO	**Cap List Field (CAPLIST):** Capabilities List: Indicates that the controller contains a capabilities pointer list
19	0h RO	**Interrupt Status Field (INTR_STATUS):** Interrupt Status: This bit reflects state of interrupt in the device
18:11	0h RO	**Reserved**
10	0h RW	**Interrupt Disable Field (INTR_DISABLE):** Interrupt Disable
9	0h RO	**Reserved**
8	0h RW	**SERR Enable Field (SERR_ENABLE):** SERR Enable Not implemented
7	0h RO	**Reserved**
6	0h RW	**Parity Error Response Enable (PERE):** Parity Error Response Enable
5:3	0h RO	**Reserved**
2	0h RW	**BME Field (BME):** Bus Master Enable
1	0h RW	**MSE Field (MSE):** Memory Space Enable
0	0h RO	**Reserved**

7.1.3 Revision ID And Class Code (REVCLASSCODE) - Offset 8h

Revision ID and Class Code

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:24, F:1] + 8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	**Revision ID Field (CLASS_CODES):** Class Code register is read-only and is used to identify the generic function of the device and in some cases a specific register-level programming interface
7:0	00h RO/P	**Class Code Field (RID):** Revision ID identifies the revision of particular PCI device

7.1.4 Cache Line Latency Header And BIST (CLLATHEADERBIST) - Offset Ch

Cache Line size as RW with def 0 Latency Timer, RW with def 0 Header Type with Type 0 configuration header and Reserved BIST Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:24, F:1] + Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	0h RO	**Multifunction Device Field (MULFNDEV):** Multi-Function Device
22:16	00h RO	**Header Type Field (HEADERTYPE):** Header Type: Implements Type 0 Configuration header
15:8	00h RO	**Latency Timer Field (LATTIMER):** Latency Timer:. This register is implemented as R/W with default as 0
7:0	00h RW/P	**Cache Line Size Field (CACHELINE_SIZE):** Cache Line Size

7.1.5 Base Address Register (BAR) - Offset 10h

Base Address Register Low [31:2] type [2:1] in 32bit or 64bit address range and memory space indicator [0]

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:24, F:1] + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR):** Base Address Register Low Base address of the AXI fabric memory space. Taken from Strap values as ones
11:4	00h RO	**Size Field (SIZEINDICATOR):** Size Indicator RO Always returns 0 The size of this register depends on the size of the memory space
3	0h RO	**Prefetchable Field (PREFETCHABLE):** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**Type Field (TYPE0):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE):** Memory Space Indicator: 0 indicates this BAR is present in the memory space

7.1.6 Base Address Register High (BAR_HIGH) - Offset 14h

Base Address Register High enabled if [2:1] of BAR_HIGH is 10

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:24, F:1] + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR_HIGH):** Base Address High - MSB

7.1.7 Base Address Register1 (BAR1) - Offset 18h

Base Address Register1 accesses to PCI configuration space and is always 4K type in [2:1] and memory space indicator in [0]

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:24, F:1] + 18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR1):** Base Address1 This field is present if BAR1 is enabled through private configuration space
11:4	00h RO	**Size Field (SIZEINDICATOR1):** Always is 0 as minimum size is 4K
3	0h RO	**Prefetchable Field (PREFETCHABLE1):** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**Type Field (TYPE1):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE1):** Memory Space Indicator: 0 Indicates this BAR is present in the memory space

7.1.8 Base Address Register1 High (BAR1_HIGH) - Offset 1Ch

Base Address Register1 High enabled only if [2:1] of BAR1_HIGH register is 10

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:24, F:1] + 1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR1_HIGH):** Base Address: Base address of the AXI fabric memory space. Taken from Strap values as ones

7.1.9 Subsystem Vendor and Subsystem ID (SUBSYSTEMID) - Offset 2Ch

SVID Register along with SID Register is to distinguish subsystem from another

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:24, F:1] + 2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O/P	**Subsystem ID Field (SUBSYSTEMID):** Subsystem ID: This register is implemented for any function that can be instantiated more than once in a given system
15:0	0000h RW/O/P	**Subsystem Vendor Field (SUBSYSTEMVENDORID):** Subsystem Vendor ID: This register must be implemented for any function that can be instantiated more than once in a given system

7.1.10 Expansion ROM Base Address (EXPANSION_ROM_BASEADDR) - Offset 30h

Expansion ROM Base Address Register is a RO indicates support for expansion ROMs

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:24, F:1] + 30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Expansion Rom Base Address Field (EXPANSION_ROM_BASE):** Expansion ROM Base Address: Value of all zeros indicates no support for Expansion ROM

7.1.11 Capabilities Pointer (CAPABILITYPTR) - Offset 34h

Capabilities Pointer Register indicates what the next capability is

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:24, F:1] + 34h	00000080h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	80h RO	**Capabilities Pointer Field (CAPPTR_POWER):** Capabilities Pointer: Indicates what the next capability is

7.1.12 Interrupt Register (INTERRUPTREG) - Offset 3Ch

Interrupt Line Register is not use in Bridge directly. Interrupt Pin Register reflects the IPIN value in private configuration space. MIN_GNT register indicating the requirements of latency timers and MAX_LAT register for max latency

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:24, F:1] + 3Ch	00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Max Latency Field (MAX_LAT):** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	00h RO	**Min GNT Field (MIN_GNT):** Value of 0 indicates device has no major requirements for the settings of latency timers // Re-Check Desc Padma
15:12	0h RO	**Reserved**
11:8	1h RO	**Interrupt Pin Field (INTPIN):** Interrupt Pin: Value in this register is reflected from the IPIN value in the private configuration space
7:0	00h RW/P	**Interrupt Line Field (INTLINE):** Interrupt Line: It is used to communicate to software the interrupt line to which the interrupt pin is connected

7.1.13 Power Management Capability ID (POWERCAPID) - Offset 80h

Power Management Capability ID Register points to next capability structure and Power Management Capability with Power Management Capabilities Register for PME support and version

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:24, F:1] + 80h	48030001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	09h RO	**PME Support Field (PMESUPPORT):** This 5-bit field indicates the power states in which the function can assert the PME#
26:19	0h RO	**Reserved**
18:16	3h RO	**Version Field (VERSION):** Indicates support for Revision 1.2 of the PCI Power Management Specification
15:8	00h RO	**Next Cap Field (NXTCAP):** Next Capability: Points to the next capability structure
7:0	01h RO	**Power Capability ID Field (POWER_CAP):** Power Management Capability: Indicates this is power management capability

7.1.14 Power Management Control And Status Register (PMECTRLSTATUS) - Offset 84h

Power Management Control and Status Register to set and read PME Status, PME Enable, No Soft reset and Power State

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:24, F:1] + 84h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW/1C/P	**PME Status Field (PMESTATUS):** PME Status
14:9	0h RO	**Reserved**
8	0h RW/P	**PME Enable Field (PMEENABLE):** PME Enable
7:4	0h RO	**Reserved**
3	1h RO	**No Soft Reset Field (NO_SOFT_RESET):** This bit indicates that devices transitioning from D3hot to D0 because of Power State commands do not perform an internal reset
2	0h RO	**Reserved**
1:0	0h RW	**Power State Field (POWERSTATE):** Power State: This field is used both to determine the current Power State and to set a new Power State

7.1.15 PCI Device Idle Vendor Capability Register (PCIDEVIDLE_CAP_RECORD) - Offset 90h

PCI Device Vendor Specific Capability Register defines Vendor Specific Capability ID, Revision Length, Next Capability and CAPID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:24, F:1] + 90h	F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**Vendor Cap Field (VEND_CAP):** Vendor Specific Capability ID
27:24	0h RO	**Revision ID Field (REVID):** Revision ID of capability structure
23:16	14h RO	**Cap Length Field (CAP_LENGTH):** Vendor Specific Capability Length
15:8	00h RO	**Next Capability Field (NEXT_CAP):** Next Capability
7:0	09h RO	**Capability ID Field (CAPID):** Capability ID

7.1.16 Vendor Specific Extended Capability Register (DEVID_VEND_SPECIFIC_REG) - Offset 94h

Extended Vendor Capability Register for VSEC Length, Revision and ID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:24, F:1] + 94h	01400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	014h RO	**Vendor Specific ID Field (VSEC_LENGTH):** Vendor Specific Extended Capability Length
19:16	0h RO	**Vendor Specific Revision Field (VSEC_REV):** Vendor Specific Extended Capability Revision
15:0	0010h RO	**Vendor Specific Length Field (VSECID):** Vendor Specific Extended Capability ID

7.1.17 Software LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG) - Offset 98h

Software Location Pointer in MMIO space as an offset specified by BAR

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:24, F:1] + 98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RO	**SW LTR Dword Offset Field (SW_LAT_DWORD_OFFSET):** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**SW LTR Bar Number Field (SW_LAT_BAR_NUM):** Indicates that the SW LTR update MMIO location is always at BAR0
0	0h RO	**SW LTR Valid Field (SW_LAT_VALID):** This value is reflected from the SW LTR valid strap at the top level

7.1.18 Device Idle Pointer Register (DEVICE_IDLE_POINTER_REG) - Offset 9Ch

Device Idle Pointer Register giving details on Device MMIO Offset Location, BAR NUM and D0i3 Valid Strap

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:24, F:1] + 9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RO	**D0i3 Dword Offset Field (DWORD_OFFSET):** Contains the location pointer to the SW LTR register in MMIO space as an offset from the specified BAR
3:1	0h RO	**BAR NUM Field (BAR_NUM):** BAR Num: Indicates that the D0i3 MMIO location is always at BAR0
0	0h RO	**D0i3 Valid Field (VALID):** Valid: This value is reflected from the D0i3 valid strap at the top level

7.1.19 D0i3 and Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG) - Offset A0h

D0idle_Max_Power_On_Latency Register set at boot and power control enable register to enable communication with the PGCB block below the Bridge

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:24, F:1] + A0h	00000800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21	0h RW/P	**HAE:** Hardware Autonomous Enable
20	0h RO	**Reserved**
19	0h RW/P	**Sleep Enable Field (SLEEP_EN):** Sleep Enable
18	0h RW/P	**D3 Hen Field (D3HEN):** DEVIDLE Enable (DEVIDLEN): If '1' then the function will power gate when idle and the DevIdle register (DevIdleC[2] = '1') is set
17	0h RW/P	**Device Idle En Field (DEVIDLEN):** PMCRE: PMC Request Enable
16	0h RW/P	**PMC Request Enable Field (PMCRE):** D3-Hot Enable (D3HEN): If '1' then function will power gate when idle and the PMCSR[1:0] register in the function ='11' (D3)
15:13	0h RO	**Reserved**
12:10	2h RW/O/P	**Power Latency Scale Field (POW_LAT_SCALE):** Power On Latency Scale
9:0	000h RW/O/P	**Power Latency Value Field (POW_LAT_VALUE):** Power On Latency Value

7.1.20 General Purpose Read Write Register1 (GEN_PCI_REGRW1) - Offset B0h

General Purpose PCI Read Write Register1

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:24, F:1] + B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Read Write Field (GEN_PCI_REG_RW1):** General Purpose PCI Register: This register value is brought out as GEN_PCI_REG_RW1

7.1.21 General Purpose Input Register (GEN_INPUT_REG) - Offset C0h

General Purpose Input Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:24, F:1] + C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**General Purpose Input Field (GEN_REG_INPUT_RW):** General Purpose Input Register: This register value reflects the value of GEN_REG_INPUT_RW

7.1.22 MSI Capability Register (MSI_CAP_REG) - Offset D0h

MSI Capability Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:24, F:1] + D0h	01800005h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	1h RO	**Per Vector Masking Capability Field (PER_VECTOR_MSK_CAP):** Per Vector Masking Capability
23	1h RO	**MSI Capability Field (MSI_CAP_64B):** 64 bit message address capability
22:20	0h RW	**Multi Message En Field (MUL_MSG_EN):** Multiple Message Enable
19:17	0h RO	**Multi Message Cap Field (MUL_MSG_CAP):** Multiple Message Capable
16	0h RW	**MSI Enable Field (MSG_MSI_ENABLE):** MSI Enable
15:8	00h RO	**Next Pointer Field (MSG_NXT_PTR):** Next Capability Pointer
7:0	05h RO	**MSI Capability Field (MSG_CAP_ID):** MSI Capability ID

7.1.23 MSI Message Low Address (MSI_ADDR_LOW) - Offset D4h

MSI Message Low Address

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:24, F:1] + D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RW	**MSI Message Low Address Field (MSI_ADDR_LOW):** MSI Message Low Address
1:0	0h RO	**Reserved**

7.1.24 MSI Message High Address (MSI_ADDR_HIGH) - Offset D8h

MSI Message High Address

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:24, F:1] + D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSI Message High Address Field (MSI_ADDR_HIGH):** MSI Message High Address

7.1.25 MSI Message Data (MSI_MSG_DATA) - Offset DCh

MSI Message Data

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:24, F:1] + DCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0000h RW	**MSI Message Data Field (MSI_MSG_DATA):** MSI Message Data

7.1.26 MSI Mask Register (MSI_MASK) - Offset E0h

MSI Mask bits

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:24, F:1] + E0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSI Mask Field (MSI_MASK):** MSI Mask bits

7.1.27 MSI Pending Register (MSI_PENDING) - Offset E4h

MSI Pending bits

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:24, F:1] + E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**MSI Pending Field (MSI_PENDING):** MSI Pending bits

7.1.28 Manufacturers ID (MANID) - Offset F8h

Manufacturers ID Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:24, F:1] + F8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/P	**Manufacturers ID Field (MANID):** Manufacturer ID: Default value comes from straps

7.2 CAN MMIO Registers Summary

Table 7-2. Summary of Bus: 0, Device: 24, Function: 1 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	Core Release Register (CREL)	32150323h
4h	4	Endian Register (ENDN)	87654321h
8h	4	Customer Register (CUST)	00000000h
Ch	4	Fast Bit Timing and Prescaler Register (DBTP)	00000A33h
10h	4	Test Register (TEST)	00000000h
14h	4	RAM Watchdog (RWD)	00000000h
18h	4	CC Control Register (CCCR)	00000001h
1Ch	4	Bit Timing and Prescaler Register (BTP)	06000A03h
20h	4	Timestamp Counter Configuration (TSCC)	00000000h
24h	4	Timestamp Counter Value (TSCV)	00000000h
28h	4	Timeout Counter Configuration (TOCC)	FFFF0000h
2Ch	4	Timeout Counter Value (TOCV)	0000FFFFh
40h	4	Error Counter Register (ECR)	00000000h
44h	4	Protocol Status Register (PSR)	00000707h
48h	4	Transmitter Delay Compensation Register (TDCR)	00000000h
50h	4	Interrupt Register (IR)	00000000h

Table 7-2. Summary of Bus: 0, Device: 24, Function: 1 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
54h	4	Interrupt Enable (IE)	00000000h
58h	4	Interrupt Line Select (ILS)	00000000h
5Ch	4	Interrupt Line Enable (ILE)	00000000h
80h	4	Global Filter Configuration (GFC)	00000000h
84h	4	Standard ID Filter Configuration (SIDFC)	00000000h
88h	4	Extended ID Filter Configuration (XIDFC)	00000000h
90h	4	Extended ID AND Mask (XIDAM)	1FFFFFFFh
94h	4	High Priority Message Status (HPMS)	00000000h
98h	4	New Data 1 (NDAT1)	00000000h
9Ch	4	New Data 2 (NDAT2)	00000000h
A0h	4	RX FIFO 0 Configuration (RXF0C)	00000000h
A4h	4	RX FIFO 0 Status (RXF0S)	00000000h
A8h	4	RX FIFO 0 Acknowledge (RXF0A)	00000000h
ACh	4	RX Buffer Configuration (RXBC)	00000000h
B0h	4	RX FIFO 1 Configuration (RXF1C)	00000000h
B4h	4	RX FIFO 1 Status (RXF1S)	00000000h
B8h	4	RX FIFO 1 Acknowledge (RXF1A)	00000000h
BCh	4	Rx Buffer / FIFO Element Size Configuration (RXESC)	00000000h
C0h	4	TX Buffer Configuration (TXBC)	00000000h
C4h	4	TX FIFO/Queue Status (TXFQS)	00000000h
C8h	4	TX Buffer Element Size Configuration (TXESC)	00000000h
CCh	4	TX Buffer Request Pending (TXBRP)	00000000h
D0h	4	TX Buffer Add Request (TXBAR)	00000000h
D4h	4	TX Buffer Cancellation Request (TXBCR)	00000000h
D8h	4	TX Buffer Transmission Occured (TXBTO)	00000000h

7.2.3 Customer Register (CUST) - Offset 8h

Address 0x08 is reserved for an optional 32 bit customer-specific register. The Customer Register is intended to hold customer-specific configuration, control, and status bits.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Customer Register Field (CUST_FIELD):** Customer specific register field

7.2.4 Fast Bit Timing and Prescaler Register (DBTP) - Offset Ch

This register is only writable if bits CCCR.CCE and CCCR.INIT are set. The CAN bit time may be programed in the range of 4 to 25 time quanta. The CAN time quantum may be programmed in the range of 1 to 32 m_ttcan_cclk periods. tq = (FBRP + 1) m_ttcan_cclk period. FTSEG1 is the sum of Prop_Seg and Phase_Seg1. FTSEG2 is Phase_Seg2. Therefore the length of the bit time is (programmed values) [FTSEG1 + FTSEG2 + 3] tq or (functional values) [Sync_Seg + Prop_Seg + Phase_Seg1 + Phase_Seg2] tq. The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

Note: With a CAN clock (m_ttcan_cclk) of 8 MHz, the reset value of 0x00000A33 configures the M_TTCAN for a fast bit rate of 500 kBit/s.

Note: The bit rate configured for the CAN FD data phase via FBTP must be higher or equal to the bit rate configured for the arbitration phase via BTP.

Type	Size	Offset	Default
MMIO	32 bit	BAR + Ch	00000A33h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	0h RW/L	**Transceiver Delay Compensation (TDC):** 0= Transceiver Delay Compensation disabled 1= Transceiver Delay Compensation enabled

7.2.5 Test Register (TEST) - Offset 10h

Write access to the Test Register has to be enabled by setting bit CCCR.TEST to. All Test Register functions are set to their reset values when bit CCCR.TEST is reset. Loop Back Mode and software control of pin can*_tx_o are hardware test modes. Programming of TX not equal to h0 may disturb the message transfer on the CAN bus.

7.2.6 RAM Watchdog (RWD) - Offset 14h

The RAM Watchdog monitors the READY output of the Message RAM (m_ttcan_aeim_ready). A Message RAM access via the M_TTCANs Generic Master Interface (m_ttcan_aeim_sel active) starts the Message RAM Watchdog Counter with the value configured by RWD.WDC. The counter is reloaded with RWD.WDC when the Message RAM signals successful completion by activating its READY output. In case there is no response from the Message RAM until the counter has counted down to zero, the counter stops and interrupt flag IR.WDI is set. The RAM Watchdog Counter is clocked by the Host clock (m_ttcan_hclk).

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14h	00000000h

7	0h RW/V/L	**Test Mode Enable (TEST):** 0= Normal operation, register TEST holds reset values 1= Test Mode, write access to register TEST enabled This field may be written to b1 only when CCCR.INIT==1 AND CCCR.CCE==1, but may be cleared to 0 at any time
6	0h RW/L	**Disable Automatic Retransmission (DAR):** 0= Automatic retransmission of messages not transmitted successfully enabled 1= Automatic retransmission disabled
5	0h RW/V/L	**Bus Monitoring Mode (MON):** Bit MON can only be set by the Host when both CCE and INIT are set to 1. The bit can be reset by the Host at any time. 0= Bus Monitoring Mode is disabled 1= Bus Monitoring Mode is enabled This field may be written to b1 only when CCCR.INIT==1 AND CCCR.CCE==1, but may be cleared to 0 at any time
4	0h RW	**Clock Stop Request (CSR):** 0= No clock stop is requested 1= Clock stop requested. When clock stop is requested, first INIT and then CSA will be set after all pending transfer requests have been completed and the CAN bus reached idle.
3	0h RO	**Clock Stop Acknowledge (CSA):** 0= No clock stop acknowledged 1= M_TTCAN may be set in power down by stopping m_ttcan_hclk and m_ttcan_cclk
2	0h RW/V/L	**Restricted Operation Mode (ASM):** Bit ASM can only be set by the Host when both CCE and INIT are set to 1. The bit can be reset by the Host at any time. 0= Normal CAN operation 1= Restricted Operation Mode active This field may be written to b1 only when CCCR.INIT==1 AND CCCR.CCE==1, but may be cleared to 0 at any time
1	0h RW/L	**Configuration Change Enable (CCE):** 0= The CPU has no write access to the protected configuration registers 1= The CPU has write access to the protected configuration registers (while CCCR.INIT = 1)
0	1h RW	**INIT:** 0= Normal Operation 1= Initialization is started

7.2.8 Bit Timing and Prescaler Register (BTP) - Offset 1Ch

This register is only writable if bits CCCR.CCE and CCCR.INIT are set. The CAN bit time may be programed in the range of 4 to 81 time quanta. The CAN time quantum may be programmed in the range of 1 to 1024 m_ttcan_cclk periods. tq = (BRP + 1) m_ttcan_cclk period. TSEG1 is the sum of Prop_Seg and Phase_Seg1. TSEG2 is Phase_Seg2. Therefore the length of the bit time is (programmed values) [TSEG1 + TSEG2 + 3] tq or (functional values) [Sync_Seg + Prop_Seg + Phase_Seg1 + Phase_Seg2] tq. The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1Ch	06000A03h

Bit Range	Default & Access	Field Name (ID): Description
31:25	03h RW/L	**Nominal (Re) Synchronization Jump Width (NSJW):** 0x00-0x7F Valid values are 0 to 127. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.
24:16	000h RW/L	**Nominal Bit Rate Prescaler (BRP):** 0x000-0x1FF. The value by which the oscillator frequency is divided for generating the bit time quanta. The bit time is built up from a multiple of this quanta. Valid values for the Baud Rate Prescaler are 0 to 1023. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used. ***Note***: With a CAN clock (m_ttcan_cclk) of 8 MHz, the reset value of 0x00000A33 configures the M_TTCAN for a bit rate of 500 kBit/s.
15	0h RO	**Reserved**
14:8	0Ah RW/L	**Time segment before sample point (TSEG1):** 0x01-0xFF. Valid values are 1 to 63. The actual interpretation by the hardware of this value is such that one more than the programmed value is used.
7	0h RO	**Reserved**
6:0	03h RW/L	**Time segment after sample point (TSEG2):** 0x0-0x7F. Valid values are 0 to 127. The actual interpretation by the hardware of this value is such that one more than the programmed value is used.

7.2.9 Timestamp Counter Configuration (TSCC) - Offset 20h

Type	Size	Offset	Default
MMIO	32 bit	BAR + 20h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19:16	0h RW/L	**Timestamp Counter Prescaler (TCP):** 0x0-0xF. Configures the timestamp and timeout counters time unit in multiples of CAN bit times [1...16]. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.
15:2	0h RO	**Reserved**
1:0	0h RW/L	**Timestamp Select (TSS):** 00= Timestamp counter value always 0x0000 01= Timestamp counter value incremented according to TCP 10= External timestamp counter value used 11= Same as 00

7.2.10 Timestamp Counter Value (TSCV) - Offset 24h

Type	Size	Offset	Default
MMIO	32 bit	BAR + 24h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0000h RW/1C	**Timestamp Counter (TSC):** The internal/external Timestamp Counter value is captured on start of frame (both Rx and Tx). When TSCC.TSS = 01, the Timestamp Counter is incremented in multiples of CAN bit times [116] depending on the configuration of TSCC.TCP. Awr ap around sets interrupt flag IR.TSW. Write access resets the counter to zero. When TSCC.TSS = 10, TSC reflects the external Timestamp Counter value. A write access has no impact. ***Note***: A wrap around is a change of the Timestamp Counter value from non-zero to zero not caused by write access to TSCV.

7.2.11 Timeout Counter Configuration (TOCC) - Offset 28h

Type	Size	Offset	Default
MMIO	32 bit	BAR + 28h	FFFF0000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	FFFFh RW/L	**Timeout Period (TOP):** Start value of the Timeout Counter (down-counter). Configures the Timeout Period.
15:3	0h RO	**Reserved**
2:1	0h RW/L	**Timeout Select (TOS):** When operating in Continuous mode, a write to TOCV presets the counter to the value configured by TOCC.TOP and continues down-counting. When the Timeout Counter is controlled by one of the FIFOs, an empty FIFO presets the counter to the value configured by TOCC.TOP. Down-counting is started when the first FIFO element is stored. 00= Continuous operation 01= Timeout controlled by Tx Event FIFO 10= Timeout controlled by Rx FIFO 0 11= Timeout controlled by Rx FIFO 1
0	0h RW/L	**Enable Timeout Counter (ETOC):** 0= Timeout Counter disabled 1= Timeout Counter enabled

7.2.12 Timeout Counter Value (TOCV) - Offset 2Ch

Type	Size	Offset	Default
MMIO	32 bit	BAR + 2Ch	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	FFFFh RW/1C	**Timeout Counter (TOC):** The Timeout Counter is decremented in multiples of CAN bit times [116] depending on the configuration of TSCC.TCP. When decremented to zero, interrupt flag IR.TOO is set and the Timeout Counter is stopped. Start and reset/restart conditions are configured via TOCC.TOS.

7.2.13 Error Counter Register (ECR) - Offset 40h

Note: When CCCR.ASM is set, the CAN protocol controller does not increment TEC and REC when a CAN protocol error is detected, but CEL is still incremented. This enables monitoring of collisions between CAN frames and ASC frames.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 40h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:16	00h RO/C	**CAN Error Logging (CEL):** The counter is incremented each time when a CAN protocol error causes the Transmit Error Counter or the Receive Error Counter to be incremented. It is reset by read access to CEL. The counter stops at 0xFF; the next increment of TEC or REC sets interrupt flag IR.ELO.
15	0h RO	**Receive Error Passive (RP):** 0= The Receive Error Counter is below the error passive level of 128 1= The Receive Error Counter has reached the error passive level of 128
14:8	00h RO	**Receive Error Counter (REC):** Actual state of the Receive Error Counter, values between 0 and 127
7:0	00h RO	**Transmit Error Counter (TEC):** Actual state of the Transmit Error Counter, values between 0 and 255

7.2.14 Protocol Status Register (PSR) - Offset 44h

Note: When a frame in CAN FD format has reached the data phase with BRS flag set, the next CAN event (error or valid frame) will be shown in FLEC instead of LEC. An error in a fixed stuff bit of a CAN FD CRC sequence will be shown as a Form Error, not Stuff Error.

Note: The Bus_Off recovery sequence cannot be shortened by setting or resetting CCCR.INIT. If the device goes Bus_Off, it will set CCCR.INIT of its own accord, stopping all bus activities. Once CCCR.INIT has been cleared by the CPU, the device will then wait for 129 occurrences of Bus Idle (129 * 11 consecutive recessive bits) before resuming normal operation. At the end of the Bus_Off recovery sequence, the Error Management Counters will be reset. During the waiting time after the resetting of CCCR.INIT, each time a sequence of 11 recessive bits has been monitored, a Bit0Error

code is written to PSR.LEC, enabling the CPU to readily check up whether the CAN bus is stuck at dominant or continuously disturbed and to monitor the Bus_Off recovery sequence. ECR.REC is used to count these sequences.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 44h	00000707h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:16	00h RO	**Transmitter Delay Compensation Value (TDCV):** 0x00-0x7F Position of the secondary sample point, defined by the sum of the measured delay from m_ttcan_tx to m_ttcan_rx and TDCR.TDCO. The SSP position is, in the data phase, the number of mtq between the start of the transmitted bit and the secondary sample point Valid values are 0 to 127 mtq
15	0h RO	**Reserved**
14	0h RO/C	**Protocol Exception Event (PXE):** 0= No protocol exception event occurred since last read access 1= Protocol exception event occurred
13	0h RO/C	**Received a CAN FD Message (RFDF):** This bit is set independent of acceptance filtering. 0= Since this bit was reset by the CPU, no CAN FD message has been received 1= Message in CAN FD format with EDL flag set has been received
12	0h RO/C	**BRS flag of last received CAN FD Message (RBRS):** This bit is set together with REDL, independent of acceptance filtering. 0= Last received CAN FD message did not have its BRS flag set 1= Last received CAN FD message had its BRS flag set
11	0h RO/C	**ESI flag of last received CAN FD Message (RESI):** This bit is set together with REDL, independent of acceptance filtering. 0= Last received CAN FD message did not have its ESI flag set 1= Last received CAN FD message had its ESI flag set
10:8	7h RO/V	**Fast Last Error Code (FLEC):** Type of last error that occurred in the data phase of a CAN FD format frame with its BRS flag set. Coding is the same as for LEC. This field will be cleared to zero when a CAN FD format frame with its BRS flag set has been transferred (reception or transmission) without error.
7	0h RO	**Bus_Off Status (B0):** 0= The M_TTCAN is not Bus_Off 1= The M_TTCAN is in Bus_Off state
6	0h RO	**Warning Status (EW):** 0= Both error counters are below the Error_Warning limit of 96 1= At least one of error counters has reached the Error_Warning limit of 96

Bit Range	Default & Access	Field Name (ID): Description
5	0h RO	**Error Passive (EP):** 0= The M_TTCAN is in the Error_Active state. It normally takes part in bus communication and sends an active error flag when an error has been detected 1= The M_TTCAN is in the Error_Passive state
4:3	0h RO	**ACT:** Monitors the modules CAN communication state. 00= Synchronizing - node is synchronizing on CAN communication 01= Idle - node is neither receiver nor transmitter 10= Receiver - node is operating as receiver 11= Transmitter - node is operating as transmitter
2:0	7h RO/V	**Last Error Code (LEC):** The LEC indicates the type of the last error to occur on the CAN bus. This field will be cleared to 0 when a message has been transferred (reception or transmission) without error. 0= No Error: No error occurred since LEC has been reset by successful reception or transmission. 1= Stuff Error: More than 5 equal bits in a sequence have occurred in a part of a received message where this is not allowed. 2= Form Error: A fixed format part of a received frame has the wrong format. 3= AckError: The message transmitted by the M_TTCAN was not acknowledged by another node. 4= Bit1Error: During the transmission of a message (with the exception of the arbitration field), the device wanted to send a recessive level (bit of logical value 1), but the monitored bus value was dominant. 5= Bit0Error: During the transmission of a message (or acknowledge bit, or active error flag, or overload flag), the device wanted to send a dominant level (data or identifier bit logical value 0), but the monitored bus value was recessive. During Bus_Off recovery this status is set each time a sequence of 11 recessive bits has been monitored. This enables the CPU to monitor the proceeding of the Bus_Off recovery sequence (indicating the bus is not stuck at dominant or continuously disturbed). 6= CRCError: The CRC check sum of a received message was incorrect. The CRC of an incoming message does not match with the CRC calculated from the received data. 7= NoChange: Any read access to the Protocol Status Register re-initializes the LEC to 7. When the LEC shows the value 7, no CAN bus event was detected since the last CPU read access to the Protocol Status Register.

7.2.15 Transmitter Delay Compensation Register (TDCR) - Offset 48h

Type	Size	Offset	Default
MMIO	32 bit	BAR + 48h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	**Reserved**
14:8	00h RW	**Transmitter Delay Compensation Offset (TDCO):** 0x00-0x7F Offset value defining the distance between the measured delay from m_ttcan_tx to m_ttcan_rx and the secondary sample point. Valid values are 0 to 127 mtq.
7	0h RO	**Reserved**
6:0	00h RW	**Transmitter Delay Compensation Filter Window Length (TDCF):** 0x00-0x7F Defines the minimum value for the SSP position, dominant edges on m_ttcan_rx that would result in an earlier SSP position are ignored for transmitter delay measure

7.2.16 Interrupt Register (IR) - Offset 50h

The flags are set when one of the listed conditions is detected (edge-sensitive). The flags remain set until the Host clears them. A flag is cleared by writing a 1 to the corresponding bit position. Writing a 0 has no effect. Ahard reset will clear the register. The configuration of IE controls whether an interrupt is generated. The configuration of ILS controls on which interrupt line an interrupt is signaled.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 50h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29	0h RW/1C	**Access to Reserved Address (ARA):** 0 = No access to reserved address occurred 1 = Access to reserved address occurred
28	0h RW/1C	**Protocol Error in Data Phase (Data Bit Time is used) (PED):** 0= No Protocol Error in data phase 1= Protocol error in data phase detected (PSR.DLEC != 0,7)
27	0h RW/1C	**Protocol Error in Arbitration Phase (Nominal Bit Time is used) (PEA):** 0= No Arbitration Error in data phase 1= Arbitration error in data phase detected (PSR.DLEC != 0,7)
26	0h RW/1C	**Watchdog Interrupt (WDI):** 0= No Message RAM Watchdog event occurred 1= Message RAM Watchdog event due to missing READY
25	0h RW/1C	**Bus_Off Status (BO):** 0= Bus_Off status unchanged 1= Bus_Off status changed
24	0h RW/1C	**Warning Status (EW):** 0= Error_Warning status unchanged 1= Error_Warning status changed

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW/1C	**Error Passive (EP):** 0= Error_Warning status unchanged 1= Error_Warning status changed
22	0h RW/1C	**Error Logging Overflow (ELO):** 0= CAN Error Logging Counter did not overflow 1= Overflow of CAN Error Logging Counter occurred
21	0h RW/1C	**Bit Error Uncorrected (BEU):** Message RAM bit error detected, uncorrected. Controlled by input signal m_ttcan_aeim_berr[1] generated by an optional external parity / ECC logic attached to the Message RAM. An uncorrected Message RAM bit error sets CCCR.INIT to 1. This is done to avoid transmission of corrupted data. 0= No bit error detected when reading from Message RAM 1= Bit error detected, uncorrected (e.g. parity logic)
20	0h RW/1C	**Bit Error Corrected (BEC):** Message RAM bit error detected and corrected. Controlled by input signal m_ttcan_aeim_berr[0] generated by an optional external parity / ECC logic attached to the Message RAM. 0= No bit error detected when reading from Message RAM 1= Bit error detected and corrected (e.g. ECC)
19	0h RW/1C	**Message Stored to Dedicated RX Buffer (DRX):** The flag is set whenever a received message has been stored into a dedicated Rx Buffer. 0= No Rx Buffer updated 1= At least one received message stored into a Rx Buffer
18	0h RW/1C	**Timeout Occurred (TOO):** 0= No timeout 1= Timeout reached
17	0h RW/1C	**Message RAM Access Failure (MRAF):** The flag is set, when the Rx Handler * has not completed acceptance filtering or storage of an accepted message until the arbitration field of the following message has been received. In this case acceptance filtering or message storage is aborted and the Rx Handler starts processing of the following message. * was not able to write a message to the Message RAM. In this case message storage is aborted. In both cases the FIFO put index is not updated resp. the New Data flag for a dedicated Rx Buffer is not set, a partly stored message is overwritten when the next message is stored to this location. The flag is also set when the Tx Handler was not able to read a message from the Message RAM in time. In this case message transmission is aborted. In case of a Tx Handler access failure the M_TTCAN is switched into Restricted Operation Mode. To leave Restricted Operation Mode, the Host CPU has to reset CCCR.ASM. 0= No Message RAM access failure occurred 1= Message RAM access failure occurred
16	0h RW/1C	**Timestamp Wraparound (TSW):** 0= No timestamp counter wrap-around 1= Timestamp counter wrapped around
15	0h RW/1C	**TX Event FIFO Element Lost (TEFL):** 0= No Tx Event FIFO element lost 1= Tx Event FIFO element lost, also set after write attempt to Tx Event FIFO of size zero
14	0h RW/1C	**TX Event FIFO Full (TEFF):** 0= Tx Event FIFO not full 1= Tx Event FIFO full

Bit Range	Default & Access	Field Name (ID): Description
13	0h RW/1C	**TX Event FIFO Watermark Reached (TEFW):** 0= Tx Event FIFO fill level below watermark 1= Tx Event FIFO fill level reached watermark
12	0h RW/1C	**TX Event FIFO New Entry (TEFN):** 0= Tx Event FIFO unchanged 1= Tx Handler wrote Tx Event FIFO element
11	0h RW/1C	**TX FIFO Empty (TFE):** 0= Tx FIFO non-empty 1= Tx FIFO empty
10	0h RW/1C	**Transmission Cancellation Finished (TCF):** 0= No transmission cancellation finished 1= Transmission cancellation finished
9	0h RW/1C	**Transmission Completed (TC):** 0= No transmission completed 1= Transmission completed
8	0h RW/1C	**High Priority Message (HPM):** 0= No high priority message received 1= High priority message received
7	0h RW/1C	**RX FIFO 1 Message Lost (RF1L):** 0= No Rx FIFO 1 message lost 1= Rx FIFO 1 message lost, also set after write attempt to Rx FIFO 1 of size zero
6	0h RW/1C	**RX FIFO 1 Full (RF1F):** 0= Rx FIFO 1 not full 1= Rx FIFO 1 full
5	0h RW/1C	**RX FIFO 1 Watermark Reached (RF1W):** 0= Rx FIFO 1 fill level below watermark 1= Rx FIFO 1 fill level reached watermark
4	0h RW/1C	**RX FIFO 1 New Message (RF1N):** 0= No new message written to Rx FIFO 1 1= New message written to Rx FIFO 1
3	0h RW/1C	**RX FIFO 0 Message Lost (RF0L):** 0= No Rx FIFO 0 message lost 1= Rx FIFO 0 message lost, also set after write attempt to Rx FIFO 0 of size zero
2	0h RW/1C	**RX FIFO 0 Full (RF0F):** 0= Rx FIFO 0 not full 1= Rx FIFO 0 full
1	0h RW/1C	**RX FIFO 0 Watermark Reached (RF0W):** 0= Rx FIFO 0 fill level below watermark 1= Rx FIFO 0 fill level reached watermark
0	0h RW/1C	**RX FIFO 0 New Message (RF0N):** 0= No new message written to Rx FIFO 0 1= New message written to Rx FIFO 0

7.2.17 Interrupt Enable (IE) - Offset 54h

The settings in the Interrupt Enable register determine which status changes in the Interrupt Register will be signaled on an interrupt line.

0= Interrupt disabled

1= Interrupt enabled

Type	Size	Offset	Default
MMIO	32 bit	BAR + 54h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29	0h RW	**Access to Reserved Address Enable (ARAE):** 0 = No access to reserved address Disabled 1 = Access to reserved address Enabled

7.2.19 Interrupt Line Enable (ILE) - Offset 5Ch

Each of the two interrupt lines to the CPU can be enabled / disabled separately by programming bits EINT0 and EINT1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1	0h RW	**Enable Interrupt Line 1 (EINT1):** 0= Interrupt line m_ttcan_int1 disabled 1= Interrupt line m_ttcan_int1 enabled
0	0h RW	**Enable Interrupt Line 0 (EINT0):** 0= Interrupt line m_ttcan_int0 disabled 1= Interrupt line m_ttcan_int0 enabled

7.2.20 Global Filter Configuration (GFC) - Offset 80h

Global settings for Message ID filtering. The Global Filter Configuration controls the filter path for standard and extended messages.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 80h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:4	0h RW/L	**Accept Non-matching Frames Standard (ANFS):** Defines how received messages with 11-bit IDs that do not match any element of the filter list are treated. 00= Accept in Rx FIFO 0 01= Accept in Rx FIFO 1 10= Reject 11= Reject
3:2	0h RW/L	**Accept Non-matching Frames Extended (ANFE):** Defines how received messages with 29-bit IDs that do not match any element of the filter list are treated. 00= Accept in Rx FIFO 0 01= Accept in Rx FIFO 1 10= Reject 11= Reject
1	0h RW/L	**Reject Remote Frames Standard (RRFS):** 0= Filter remote frames with 11-bit standard IDs 1= Reject all remote frames with 11-bit standard IDs
0	0h RW/L	**Reject Remote Frames Extended (RRFE):** 0= Filter remote frames with 29-bit extended IDs 1= Reject all remote frames with 29-bit extended IDs

7.2.21 Standard ID Filter Configuration (SIDFC) - Offset 84h

Settings for 11-bit standard Message ID filtering. The Standard ID Filter Configuration controls the

filter path for standard messages.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 84h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:16	00h RW/L	**List Size Standard (LSS):** 0= No standard Message ID filter 1-128= Number of standard Message ID filter elements >128= Values greater than 128 are interpreted as 128
15:2	0000h RW/L	**Filter List Standard Start Address (FLSSA):** Start address of standard Message ID filter list (32-bit word address)
1:0	0h RO	**Reserved**

7.2.22 Extended ID Filter Configuration (XIDFC) - Offset 88h

Settings for 29-bit extended Message ID filtering. The Extended ID Filter Configuration controls the filter path for standard messages.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 88h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:16	00h RW/L	**List Size Extended (LSE):** 0= No extended Message ID filter 1-64= Number of extended Message ID filter elements >64= Values greater than 64 are interpreted as 64
15:2	0000h RW/L	**Filter List Extended Start Address (FLESA):** Start address of extended Message ID filter list (32-bit word address).
1:0	0h RO	**Reserved**

7.2.23 Extended ID AND Mask (XIDAM) - Offset 90h

Type	Size	Offset	Default
MMIO	32 bit	BAR + 90h	1FFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:0	1FFFFFFFh RW/L	**Extended ID Mask (EIDM):** For acceptance filtering of extended frames the Extended ID AND Mask is ANDed with the Message ID of a received frame. Intended for masking of 29-bit IDs in SAE J1939. With the reset value of all bits set to one the mask is not active.

7.2.24 High Priority Message Status (HPMS) - Offset 94h

This register is updated every time a Message ID filter element configured to generate a priority event matches. This can be used to monitor the status of incoming high priority messages and to enable fast access to these messages.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 94h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RO	**Filter List (FLST):** Indicates the filter list of the matching filter element. 0= Standard Filter List 1= Extended Filter List
14:8	00h RO	**Filter Index (FIDX):** Index of matching filter element. Range is 0 to SIDFC.LSS - 1 resp. XIDFC.LSE - 1.
7:6	0h RO	**Message Storage Indicator (MSI):** 00= No FIFO selected 01= FIFO message lost 10= Message stored in FIFO 0 11= Message stored in FIFO 1
5:0	00h RO	**Buffer Index (BIDX):** Index of Rx FIFO element to which the message was stored. Only valid when MSI[1] = 1.

7.2.25 New Data 1 (NDAT1) - Offset 98h

Type	Size	Offset	Default
MMIO	32 bit	BAR + 98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/1C	**New Data (ND):** The register holds the New Data flags of Rx Buffers 0 to 31. The flags are set when the respective Rx Buffer has been updated from a received frame. The flags remain set until the Host clears them. Aflag is cleared by writing a 1 to the corresponding bit position. Writing a 0 has no effect. A hard reset will clear the register. 0= Rx Buffer not updated 1= Rx Buffer updated from new message

7.2.26 New Data 2 (NDAT2) - Offset 9Ch

Type	Size	Offset	Default
MMIO	32 bit	BAR + 9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/1C	**New Data (ND):** The register holds the New Data flags of Rx Buffers 32 to 63. The flags are set when the respective Rx Buffer has been updated from a received frame. The flags remain set until the Host clears them. Aflag is cleared by writing a 1 to the corresponding bit position. Writing a 0 has no effect. A hard reset will clear the register. 0= Rx Buffer not updated 1= Rx Buffer updated from new message

7.2.27 RX FIFO 0 Configuration (RXF0C) - Offset A0h

Type	Size	Offset	Default
MMIO	32 bit	BAR + A0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**FIFO 0 Operation Mode (F0OM):** FIFO 0 can be operated in blocking or in overwrite mode. 0= FIFO 0 blocking mode 1= FIFO 0 overwrite mode
30:24	00h RW/L	**RX FIFO 0 Watermark (F0WM):** 0= Watermark interrupt disabled 1-64= Level for Rx FIFO 0 watermark interrupt (IR.RF0W) >64= Watermark interrupt disabled
23	0h RO	**Reserved**
22:16	00h RW/L	**RX FIFO 0 Size (F0S):** 0= No Rx FIFO 0 1-64= Number of Rx FIFO 0 elements >64= Values greater than 64 are interpreted as 64 The Rx FIFO 0 elements are indexed from 0 to F0S-1
15:2	0000h RW/L	**RX FIFO 0 Start Address (F0SA):** Start address of Rx FIFO 0 in Message RAM (32-bit word address).
1:0	0h RO	**Reserved**

7.2.28 RX FIFO 0 Status (RXF0S) - Offset A4h

Type	Size	Offset	Default
MMIO	32 bit	BAR + A4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved**
25	0h RO	**RX FIFO 0 Message Lost (RF0L):** This bit is a copy of interrupt flag IR.RF0L. When IR.RF0L is reset, this bit is also reset. 0= No Rx FIFO 0 message lost 1= Rx FIFO 0 message lost, also set after write attempt to Rx FIFO 0 of size zero ***Note***: Overwriting the oldest message when RXF0C.F0OM = 1 will not set this flag.
24	0h RO	**RX FIFO 0 Full (F0F):** 0= Rx FIFO 0 not full 1= Rx FIFO 0 full
23:22	0h RO	**Reserved**
21:16	00h RO	**RX FIFO 0 Put Index (F0PI):** Rx FIFO 0 write index pointer, range 0 to 63.
15:14	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
13:8	00h RO	**RX FIFO 0 Get Index (F0GI):** Rx FIFO 0 read index pointer, range 0 to 63.
7	0h RO	**Reserved**
6:0	00h RO	**RX FIFO 0 Fill Level (F0FL):** Number of elements stored in Rx FIFO 0, range 0 to 64.

7.2.29 RX FIFO 0 Acknowledge (RXF0A) - Offset A8h

Type	Size	Offset	Default
MMIO	32 bit	BAR + A8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:0	00h RW	**RX FIFO 0 Acknowledge Index (F0AI):** After the Host has read a message or a sequence of messages from Rx FIFO 0 it has to write the buffer index of the last element read from Rx FIFO 0 to F0AI. This will set the Rx FIFO 0 Get Index RXF0S.F0GI to F0AI + 1 and update the FIFO 0 Fill Level RXF0S.F0FL.

7.2.30 RX Buffer Configuration (RXBC) - Offset ACh

Type	Size	Offset	Default
MMIO	32 bit	BAR + ACh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:2	0000h RW/L	**RX Buffer Start Address (RBSA):** Configures the start address of the Rx Buffers section in the Message RAM (32-bit word address). Also used to reference debug messages A,B,C.
1:0	0h RO	**Reserved**

7.2.31 RX FIFO 1 Configuration (RXF1C) - Offset B0h

Type	Size	Offset	Default
MMIO	32 bit	BAR + B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**FIFO 1 Operation Mode (F1OM):** FIFO 1 can be operated in blocking or in overwrite mode. 0= FIFO 1 blocking mode 1= FIFO 1 overwrite mode
30:24	00h RW/L	**RX FIFO 1 Watermark (F1WM):** 0= Watermark interrupt disabled 1-64= Level for Rx FIFO 1 watermark interrupt (IR.RF1W) >64= Watermark interrupt disabled
23	0h RO	**Reserved**
22:16	00h RW/L	**RX FIFO 1 Size (F1S):** 0= No Rx FIFO 1 1-64= Number of Rx FIFO 1 elements >64= Values greater than 64 are interpreted as 64 The Rx FIFO 1 elements are indexed from 0 to F1S-1
15:2	0000h RW/L	**RX FIFO 1 Start Address (F1SA):** Start address of Rx FIFO 1 in Message RAM (32-bit word address).
1:0	0h RO	**Reserved**

7.2.32 RX FIFO 1 Status (RXF1S) - Offset B4h

Type	Size	Offset	Default
MMIO	32 bit	BAR + B4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved**
25	0h RO	**RX FIFO 1 Message Lost (RF1L):** This bit is a copy of interrupt flag IR.RF1L. When IR.RF1L is reset, this bit is also reset. 0= No Rx FIFO 1 message lost 1= Rx FIFO 1 message lost, also set after write attempt to Rx FIFO 1 of size zero ***Note***: Overwriting the oldest message when RXF1C.F1OM = 1 will not set this flag.
24	0h RO	**RX FIFO 1 Full (F1F):** 0= Rx FIFO 1 not full 1= Rx FIFO 1 full
23:22	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
21:16	00h RO	**RX FIFO 1 Put Index (F1PI):** Rx FIFO 1 writes index pointer, range 0 to 63.
15:14	0h RO	**Reserved**
13:8	00h RO	**RX FIFO 1 Get Index (F1GI):** Rx FIFO 1 read index pointer, range 0 to 63.
7	0h RO	**Reserved**
6:0	00h RO	**RX FIFO 1 Fill Level (F1FL):** Number of elements stored in Rx FIFO 1, range 0 to 64.

7.2.33 RX FIFO 1 Acknowledge (RXF1A) - Offset B8h

Type	Size	Offset	Default
MMIO	32 bit	BAR + B8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:0	00h RW	**RX FIFO 1 Acknowledge Index (F1AI):** After the Host has read a message or a sequence of messages from Rx FIFO 1 it has to write the buffer index of the last element read from Rx FIFO 1 to F1AI. This will set the Rx FIFO 1 Get Index RXF1S.F1GI to F1AI + 1 and update the FIFO 1 Fill Level RXF1S.F1FL.

7.2.34 Rx Buffer / FIFO Element Size Configuration (RXESC) - Offset BCh

Configures the number of data bytes belonging to an Rx Buffer / Rx FIFO element. Data field sizes >8 bytes are intended for CAN FD operation only.

Note: In case the data field size of an accepted CAN frame exceeds the data field size configured for the matching Rx Buffer or Rx FIFO, only the number of bytes as configured by RXESC are stored to the Rx Buffer resp. Rx FIFO element. The rest of the frames data field is

ignored.

Type	Size	Offset	Default
MMIO	32 bit	BAR + BCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved**

7.2.35 TX Buffer Configuration (TXBC) - Offset C0h

Note: Be aware that the sum of TFQS and NDTB may be not greater than 32. There is no check for erroneous configurations. The Tx Buffers section in the Message RAM starts with the dedicated Tx Buffers.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30	0h RW/L	**TX FIFO/Queue Mode (TFQM):** 0= Tx FIFO operation 1= Tx Queue operation
29:24	00h RW/L	**Transmit FIFO/Queue Size (TFQS):** 0= No Tx FIFO/Queue 1-32= Number of Tx Buffers used for Tx FIFO/Queue >32= Values greater than 32 are interpreted as 32
23:22	0h RO	**Reserved**
21:16	00h RW/L	**Number of Dedicated Transmit Buffers (NDTB):** 0= No Dedicated Tx Buffers 1-32= Number of Dedicated Tx Buffers >32= Values greater than 32 are interpreted as 32
15:2	0000h RW/L	**TX Buffers Start Address (TBSA):** Start address of Tx Buffers section in Message RAM.
1:0	0h RO	**Reserved**

7.2.36 TX FIFO/Queue Status (TXFQS) - Offset C4h

The Tx FIFO/Queue status is related to the pending Tx requests listed in register TXBRP. Therefore the effect of Add/Cancellation requests may be delayed due to a running Tx scan (TXBRP not yet updated).

Note: In case of mixed configurations where dedicated Tx Buffers are combined with a Tx FIFO or a Tx Queue, the Put and Get Indices indicate the number of the Tx Buffer starting with the first dedicated Tx Buffers.

Example: For a configuration of 12 dedicated Tx Buffers and a Tx FIFO of 20 Buffers a Put Index of 15 points to the fourth buffer of the Tx FIFO.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21	0h RO	**TX FIFO/Queue Full (TFQF):** 0= Tx FIFO/Queue not full 1= Tx FIFO/Queue full
20:16	00h RO	**TX FIFO/Queue Put Index (TFQPI):** Tx FIFO/Queue write index pointer, range 0 to 31.
15:13	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
12:8	00h RO	**TX FIFO Get Index (TFGI):** Tx FIFO read index pointer, range 0 to 31. Read as zero when Tx Queue operation is configured (TXBC.TFQM = 1).
7:6	0h RO	**Reserved**
5:0	00h RO	**TX FIFO Free Level (TFFL):** Number of consecutive free Tx FIFO elements starting from TFGI, range 0 to 32. Read as zero when Tx Queue operation is configured (TXBC.TFQM = 1)

7.2.37 TX Buffer Element Size Configuration (TXESC) - Offset C8h

Configures the number of data bytes belonging to a Tx Buffer element. Data field sizes > 8 bytes are

intended for CAN FD operation only.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2:0	0h RW/L	**TX Buffer Data Field Size (TBDS):** 000= 8 byte data field 001= 12 byte data field 010= 16 byte data field 011= 20 byte data field 100= 24 byte data field 101= 32 byte data field 110= 48 byte data field 111= 64 byte data field ***Note***: In case the data length code DLC of a Tx Buffer element is configured to a value higher than the Tx Buffer data field size TXESC.TBDS, the bytes not defined by the Tx Buffer are transmitted as 0xCC (padding bytes).

7.2.38 TX Buffer Request Pending (TXBRP) - Offset CCh

Type	Size	Offset	Default
MMIO	32 bit	BAR + CCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Transmission Request Pending (TRP):** Each Tx Buffer has its own Transmission Request Pending bit. The bits are set via register TXBAR. The bits are reset after a requested transmission has completed or has been canceled via register TXBCR. TXBRP bits are set only for those Tx Buffers configured via TXBC. After a TXBRP bit has been set, a Tx scan is started to check for the pending Tx request with the highest priority (Tx Buffer with lowest Message ID). A cancellation request resets the corresponding transmission request pending bit of register TXBRP. In case a transmission has already been started when a cancellation is requested, this is done at the end of the transmission, regardless whether the transmission was successful or not. The cancellation request bits are reset directly after the corresponding TXBRP bit has been reset. After a cancellation has been requested, a finished cancellation is signaled via TXBCF after successful transmission together with the corresponding TXBTO bit when the transmission has not yet been started at the point of cancellation when the transmission has been aborted due to lost arbitration when an error occurred during frame transmission. In DAR mode all transmissions are automatically canceled if they are not successful. The corresponding TXBCF bit is set for all unsuccessful transmissions. 0= No transmission request pending 1= Transmission request pending ***Note***: TXBRP bits which are set while a Tx scan is in progress are not considered during this particular Tx scan. In case a cancellation is requested for such a Tx Buffer, this Add Request is canceled immediately, the corresponding TXBRP bit is reset.

7.2.39 TX Buffer Add Request (TXBAR) - Offset D0h

Type	Size	Offset	Default
MMIO	32 bit	BAR + D0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Add Request (AR):** Each Tx Buffer has its own Add Request bit. Writing a 1 will set the corresponding Add Request bit; writing a 0 has no impact. This enables the Host to set transmission requests for multiple Tx Buffers with one write to TXBAR. TXBAR bits are set only for those Tx Buffers configured via TXBC. When no Tx scan is running, the bits are reset immediately, else the bits remain set until the Tx scan process has completed. 0= No transmission request added 1= Transmission requested added ***Note***: If an add request is applied for a Tx Buffer with pending transmission request (corresponding TXBRP bit already set), this add request is ignored.

7.2.40 TX Buffer Cancellation Request (TXBCR) - Offset D4h

Type	Size	Offset	Default
MMIO	32 bit	BAR + D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Cancellation Request (CR):** Each Tx Buffer has its own Cancellation Request bit. Writing a 1 will set the corresponding Cancellation Request bit; writing a 0 has no impact. This enables the Host to set cancellation requests for multiple Tx Buffers with one write to TXBCR. TXBCR bits are set only for those Tx Buffers configured via TXBC. The bits remain set until the corresponding bit of TXBRP is reset. 0= No cancellation pending 1= Cancellation pending

7.2.41 TX Buffer Transmission Occurred (TXBTO) - Offset D8h

Type	Size	Offset	Default
MMIO	32 bit	BAR + D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Transmission Occurred (TO):** Each Tx Buffer has its own Transmission Occurred bit. The bits are set when the corresponding TXBRP bit is cleared after a successful transmission. The bits are reset when a new transmission is requested by writing a 1 to the corresponding bit of register TXBAR. 0= No transmission occurred 1= Transmission occurred

7.2.42 TX Buffer Cancellation Finished (TXBCF) - Offset DCh

Type	Size	Offset	Default
MMIO	32 bit	BAR + DCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Cancellation Finished (CF):** Each Tx Buffer has its own Cancellation Finished bit. The bits are set when the corresponding TXBRP bit is cleared after a cancellation was requested via TXBCR. In case the corresponding TXBRP bit was not set at the point of cancellation, CF is set immediately. The bits are reset when a new transmission is requested by writing a 1 to the corresponding bit of register TXBAR. 0= No transmit buffer cancellation 1= Transmit buffer cancellation finished

7.2.43 TX Buffer Transmission Interrupt Enable (TXBTIE) - Offset E0h

Type	Size	Offset	Default
MMIO	32 bit	BAR + E0h	00000000h

7.2.52 TUR Configuration (TURCF) - Offset 110h

The length of the NTU is given by: NTU = CAN Clock Period X NC/DC NC is an 18-bit value. It's high part, NCH[17:16] is hard wired to 0b01. Therefore the range of NC is 0x10000...0x1FFFF. The value configured by NCL is the initial value for TURNA.NAV[15:0]. DC is set to 0x1000 by hardware reset and it may not be written to 0x0000. Level 1: NC >= 4 X DC and NTU = CAN bit time Level 0,2: NC >= 8 X DC The actual value of TUR may be changed by the clock drift compensation function of TTCAN Level 0 and Level 2 in order to adjust the nodes local view of the NTU to the time masters view of the NTU. DC will not be changed by the automatic drift compensation, TURNA.NAV may be adjusted around NC in the range of the Synchronization Deviation Limit given by TTOCF.LDSDL. NC and DC should be programmed to the largest suitable values in order to allow the best computational accuracy for the drift compensation process.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 110h	10000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/P	**Enable Local Time (ELT):** b0: Local time is stopped, default b1: Local time is enabled ***Note*: Local time is started by setting ELT. It remains active until ELT is reset or until the next hardware reset. TURCF.DC is locked when TURCF.ELT = b1. If ELT is written to b0, the readable value will stay at b1 until the new value has been synchronized into the CAN clock domain. During this time write access to the other bits of the register remains locked.**

7.2.59 TT Operation Status (TTOST) - Offset 12Ch

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12Ch	00000080h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Schedule Phase Lock (SPL):** The Bit is valid only when external synchronization is enabled (TTOCN.ESCN = b1). In this case it signals that the difference between cycle time configured by TTGTP.CTP and the cycle time at the rising edge at pin m_ttcan_evt is less or equal 9 NTU. b0: Phase outside range b1: Phase inside range
30	0h RO	**Wait for External Clock Synchronization (WECS):** b0: No external clock synchronization pending b1: Node waits for external clock synchronization to take effect. The bit is reset at the start of the next basic cycle.
29	0h RO	**Application Watchdog Event (AWE):** The application watchdog is served by reading TTOST. When the watchdog is not served in time, bit AWE is set, all TTCAN communication is stopped, and the M_TTCAN is set into Bus Monitoring Mode. b0: Application Watchdog served in time b1: Failed to serve Application Watchdog in time
28	0h RO	**Wait for Event (WFE):** b0: No Gap announced, reset by a reference message with Next_is_Gap = b0 b1: Reference message with Next_is_Gap = b1 received
27	0h RO	**Gap Started Indicator (GSI):** b0: No Gap in schedule, reset by each reference message and for all time slaves b1: Gap time after Basic Cycle has started
26:24	0h RO	**Time Master Priority (TMP):** 0x0-7: Priority of actual Time Master
23	0h RO	**Gap Finished Indicator (GFI):** Set when the CPU writes TTOCN.FGP, or by a time mark interrupt if TMG = b1, or via input pin m_ttcan_evt if TTOCN.GCS = b1. Not set by Ref_Trigger_Gap or when Gap is finished by another node sending a reference message. b0: Reset at the end of each reference message b1: Gap finished by M_TTCAN
22	0h RO	**Wait for Global Time Discontinuity (WGTD):** b0: No global time preset pending b1: Node waits for the global time preset to take effect. The bit is reset when the node has transmitted a reference message with Disc_Bit = b1 or after it received a reference message.
21:16	0h RO	**Reserved**
15:8	00h RO	**Reference Trigger Offset (RTO):** The Reference Trigger Offset value is a signed integer with a range from -127 (0x81) to 127 (0x7F). There is no notification when the lower limit of -127 is reached. In case the M_TTCAN becomes Time Master (MS[1:0] = b11), the reset of RTO is delayed due to synchronization between Host and CAN clock domain. For time slaves the value configured by TTOCF.IRTO is read. 0x00-FF: Actual Reference Trigger offset value
7	1h RO	**Quality of Clock Speed (QCS):** Only relevant in TTCAN Level 0 and Level 2, otherwise fixed to b1. b0: Local clock speed not synchronized to Time Master clock speed b1: Synchronization Deviation <= SDL
6	0h RO	**Quality of Global Time Phase (QGTP):** Only relevant in TTCAN Level 0 and Level 2, otherwise fixed to b0. b0: Global time not valid b1: Global time in phase with Time Master

Bit Range	Default & Access	Field Name (ID): Description
5:4	0h RO	**Synchronization State (SYS):** b00: Out of Synchronization b01: Synchronizing to TTCAN communication b10: Schedule suspended by Gap (In_Gap) b11: Synchronized to schedule (In_Schedule)
3:2	0h RO	**Master State (MS):** b00: Master_Off, no master properties relevant b01: Operating as Time Slave b10: Operating as Backup Time Master b11: Operating as current Time Master
1:0	0h RO	**Error Level (EL):** b00: Severity 0 - No Error b01: Severity 1 - Warning b10: Severity 2 - Error b11: Severity 3 - Severe Error

7.2.60 TUR Numerator Actual (TURNA) - Offset 130h

There is no drift compensation in TTCAN Level 1 (NAV = NC). In TTCAN Level 0 and Level 2, the drift between the nodes local clock and the time masters local clock is calculated. The drift is compensated when the Synchronization Deviation (difference between NC and the calculated NAV) is not more than 2(TTOCF.LDSDL + 5). With TTOCF.LDSDL 7, this results in a maximum range for NAV of (NC - 0x1000) NAV (NC + 0x1000).

Type	Size	Offset	Default
MMIO	32 bit	BAR + 130h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17:0	00000h RO	**Numerator Actual Value (NAV):** <= 0x0EFFF: Illegal value 0x0F000-20FFF: Actual numerator value >= 0x21000: Illegal value

7.2.61 TT Local and Global Time (TTLGT) - Offset 134h

Type	Size	Offset	Default
MMIO	32 bit	BAR + 134h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	**Global Time (GT):** Non-fractional part of the sum of the nodes local time and its local offset. 0x0000-FFFF: Global time value of TTCAN network
15:0	0000h RO	**Local Time (LT):** Non-fractional part of local time, incremented once each local NTU. 0x0000-FFFF: Local time value of TTCAN node

7.2.62 TT Cycle Time & Count (TTCTC) - Offset 138h

Type	Size	Offset	Default
MMIO	32 bit	BAR + 138h	003F0000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21:16	3Fh RO	**Cycle Count (CC):** 0x00-3F Number of actual Basic Cycle in the System Matrix
15:0	0000h RO	**Cycle Time (CT):** Non-fractional part of the difference of the node's local time and Ref_Mark. 0x0000-FFFF Cycle time value of TTCAN Basic Cycle

7.2.63 TT Capture Time (TTCPT) - Offset 13Ch

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	**Stop Watch Value (SWV):** On a rising/falling edge (as configured via TTOCN.SWP) at the Stop Watch Trigger pin m_ttcan_swt, when TTOCN.SWS is not equal to b0 and TTIR.SWE is b0, the actual time value as selected by TTOCN.SWS (cycle, local, global) is copied to SWV and TTIR.SWE will be set to b1. Capturing of the next stop watch value is enabled by resetting TTIR.SWE. 0x0000-FFFF: Captured Stop Watch value
15:6	0h RO	**Reserved**
5:0	00h RO	**Cycle Count Value (CCV):** Cycle count value captured together with SWV. 0x00-3F: Captured cycle count value

7.2.64 TT Cycle Sync Mark (TTCSM) - Offset 140h

Type	Size	Offset	Default
MMIO	32 bit	BAR + 140h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0000h RO	**Cycle Sync Mark (CSM):** The Cycle Sync Mark is measured in cycle time. It is updated when the reference message becomes valid and retains its value until the next reference message becomes valid. 0x0000-FFFF Captured cycle time

7.2.65 Message RAM Size (MSG_RAM_SIZE) - Offset 500h

Type	Size	Offset	Default
MMIO	32 bit	BAR + 500h	00004600h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00004600h RO	**Size Bytes (SIZE_B):** Read only value of the size in bytes of the Message RAM of this dby_can instance @@jstokes3, need to set the default value where this RDL is instantiated

7.2.66 CTL - Offset 504h

Type	Size	Offset	Default
MMIO	32 bit	BAR + 504h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**M_TTCAN Disable Error Data Modification on Read (CAN_DIS_MORD):** Set to 1 to prevent reads to ECR.CEL and PSR.LEC from resetting the CAN error data in the register.

7.2.67 Interrupt Control (INT_CTL) - Offset 508h

Type	Size	Offset	Default
MMIO	32 bit	BAR + 508h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1	0h RW	**PUNIT Interrupt Enable (PUNIT_INT_EN):** Enables the dby_can PUNIT interrupt output int_punit_o. Software is expected to set PUNIT_INT_EN or PRIMARY_INT_EN to b1, but not both.
0	0h RW	**Primary Interrupt Enable (PRIMARY_INT_EN):** Enables the primary interrupt output int_o. Software is expected to set PUNIT_INT_EN or PRIMARY_INT_EN to b1, but not both.

7.2.68 Interrupt Status (INT_STAT) - Offset 50Ch

Type	Size	Offset	Default
MMIO	32 bit	BAR + 50Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RO	**Other CAN Parity Error Interrupt (OTHER_CAN_PERR_INT):** Parity error interrupt for the other CAN instance.
2	0h RO	**Other Controller Interrupt Status (OTHER_CAN_CONT_INT):** If asserted then the other instance of the M_TTCAN controller has its interrupt asserted.
1	0h RO	**This CAN Parity Error Interrupt (THIS_CAN_PERR_INT):** Parity error interrupt for this CAN instance.
0	0h RO	**This CAN Controller Interrupt Status (THIS_CAN_CONT_INT):** If asserted then this instance of the M_TTCAN controller has its interrupt asserted.

7.2.69 MSGRAM Address Conflict Status (MSGRAM_ADDR_CONFLICT_STAT) - Offset 510h

Type	Size	Offset	Default
MMIO	32 bit	BAR + 510h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	**Reserved**
16	0h RO	**Address Conflict Occurred (ADDR_CONFLICT_OCCURED):** A flag to indicate that an address conflict has occurred. This can be used to help the debug of the CAN device driver. Note that this does not cause an interrupt.
15	0h RO	**Reserved**
14:0	0000h RO	**M_TTCAN Address Conflict Offset (CAN_ADDR_CONFLICT_OFFSET):** The M_TTCAN address that the conflict between an AHB access to the MSGRAM simultaneous to an M_TTCAN access to MSGRAM.

7.2.70 TTCAN TIMESTAMP CONTROL REGISTER (TIMESTAMP_CTL) - Offset 514h

Type	Size	Offset	Default
MMIO	32 bit	BAR + 514h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RO	**Remote Cross Timestamp Valid (RXTSV):**
2	0h RO	**Local Cross Timestamp Valid (LXTSV):**
1	0h RW	**Capture Remote Cross Timestamp (RXTSC):**
0	0h RW	**Capture Local Cross Timestamp (LXTSC):**

7.2.71 TTCAN LOCAL TIMESTAMP HIGH (LOCALTIMESTAMP_HIGH) - Offset 518h

Type	Size	Offset	Default
MMIO	32 bit	BAR + 518h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Local Timestamp High (LTH):**

7.2.72 TTCAN LOCAL TIMESTAMP LOW (LOCALTIMESTAMP_LOW) - Offset 51Ch

Type	Size	Offset	Default
MMIO	32 bit	BAR + 51Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Local Timestamp Low (LTL):**

7.2.73 CAN Parity Error Control and Status (PAR_CTL_STAT) - Offset 600h

Control and Status of Parity Check Functionality

Type	Size	Offset	Default
MMIO	32 bit	BAR + 600h	00000003h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2	0h RW/1C/P	**Parity Error Occurred (PERR_OCCURED):** Sticky register which asserts when a parity error has been detected on a read from the message RAM. A write of b1 clears this field to b0. If they are enabled, the int_o and int_punit_o interrupt outputs may assert when this field is set to 1. The interrupts will clear when this field is cleared. This register field can only be reset on a powergoodrst_n.
1	1h RO	**Parity Initialisation In Progress (PARITY_INIT_IN_PROG):** Immediately on coming out of a reset (hresetn asserted) the message RAM will be parity initialised with writes of b0. While this is taking place, this field will read as 1. While this PARITY_INIT_IN_PROG is 1, reads to the message RAM will be stalled until completion of parity initialisation.
0	1h RW	**Parity Enable (PARITY_EN):** 1 - Parity bit generation, checking, error reporting and error injection are enabled for dby_can. 0 - All parity functionality is disabled for dby_can. The value of this field can only be updated by software when PARITY_INIT_IN_PROG == 0.

7.2.74 Parity Error Offset (PAR_ERR_OFFSET) - Offset 604h

Stores the message RAM offset at which a parity error occurred in dby_can message RAM space

Type	Size	Offset	Default
MMIO	32 bit	BAR + 604h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17	0h RO/P	**Parity Error In Upper 16 bits (PAR_ERR_UPP):** Indicates a that a parity error was detected in the upper 16 bits of the word at this offset. This register field can only be reset on a powergoodrst_n.
16	0h RO/P	**Parity Error In Lower 16 bits (PAR_ERR_LOW):** Indicates a that a parity error was detected in the lower 16 bits of the word at this offset. This register field can only be reset on a powergoodrst_n.
15	0h RO	**Reserved**
14:0	0000h RO/P	**Parity Error Offset (PAR_ERR_OFFSET):** Captures the message RAM offset at which a parity error occurred. A new offset can only be captured when PERR_OCCURED is b0. This offset is relative to 0x0 in dby_can memory space. This register field can only be reset on a powergoodrst_n.

7.2.75 Parity Error Injection Control and Status (PAR_EINJ_CTL_STAT) - Offset 608h

Control and status for parity error injection to the dby_can message RAM.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 608h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2	0h RO	**One Time Parity Error Injection Occurred (EINJ_ONE_TIME_ERR_OCCURED):** Asserts when a parity error is injected and EINJ_MODE = 0 (one time error injection). Cleared when EINJ_EN is set to b1 Once the one time parity error is injected, EINJ_EN deasserts. The intention then is that EINJ_ONE_TIME_ERR_OCCURED is the record that an error was injected.
1	0h RW	**Parity Error Injection Mode (EINJ_MODE):** b1: Continuous error injection. All writes to the message RAM are corrupted based on the value of EINJ_MASK b0: One time error injection. Only the first write to the address defined in EINJ_OFFSET is corrupted. After which EINJ_EN is cleared to b0 and EINJ_ONE_TIME_ERR_OCCURED is set to b1.
0	0h RW/AC	**Error Injection Enable (EINJ_EN):** 1 - Parity error injection is enabled 0 - Parity error injection is disabled. Once the one time parity error is injected, EINJ_EN deasserts.

7.2.76 Parity Error Injection Offset (PAR_EINJ_OFFSET) - Offset 60Ch

Parity error injection offset in dby_can message RAM

Type	Size	Offset	Default
MMIO	32 bit	BAR + 60Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	**Reserved**
14:0	0000h RW	**Error Injection Offset (EINJ_OFFSET):** Offset at which an error will be injected, if enabled. This offset is relative to 0x0 in dby_can memory space.

7.2.77 Parity Error Injection Data Mask (PAR_EINJ_DATA_MASK) - Offset 610h

Parity error injection data mask for dby_can

Type	Size	Offset	Default
MMIO	32 bit	BAR + 610h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Error Injection Data Mask (EINJ_DATA_MASK):** This field is XOR'd with the incoming write data in order to flip data bit/bits with respect to the value the parity bit was calculated for

7.2.78 Parity Error Injection Parity Mask (PAR_EINJ_PARITY_MASK) - Offset 614h

Parity error injection data mask for dby_can

Type	Size	Offset	Default
MMIO	32 bit	BAR + 614h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RW	**Error Injection Parity Mask (EINJ_PARITY_MASK):** This field is XOR'd with the parity bits in order to flip data bit/bits with respect to the value the parity bit was calculated for

7.2.79 D0i3 Control (D0I3C) - Offset 8000h

This register will be used for D0i3 SW flow. This will be mapped to a different MMIO address from the other IPC registers. (MMIO and OCP address value are yet to be done) The description below also includes the type of access expected for the ISH FW for each configuration bit:
1. The Restore Required (RR) bit (bit [3]) should be RW for the ISH FW which can determine when to set and/or clear these bits depending on when the ISH FW determines whether restore is required although for ISH restore is never required since the power is never lost.
2. The D0i3 (i3) bit (bit [2]) should be RO for ISH FW as it needs to be written only by host SW. The ISH FW can determine to go to a low power state based on this bit.
3. The Interrupt Required (IR) bit (bit [1]) can be RO register for ISH FW and ISH FW can send an interrupt to Host by writing to the ish2host IPC doorbell register when this bit is set by SW.
4. The Command in Progress (CIP) register bit (bit [0]) is HW set and need to be cleared by ISH FW.
A simple edge detects logic can be used for the setting of this bit in HW. The CIP register bit will be tied to a RTE entry in the IOAPIC as an interrupt source. Hence ISH FW will get an interrupt when the In addition to the registers, the IOSF2OCP Bridge should be parameterized for the following:
1. The device idle capability parameter (ENABLE_PCI_IDLE_CAP) needs to be connected to a soft strap for ISH with a value of 1.
2. The STRAP for the MMIO address (strap_d0i3_offset) of D0i3 register (IPC offset address: h6D0) and the d0i3 valid (strap_d0i3_valid) bit needs should be appropriately tied.
3. The PCE register is made RO register by setting the appropriate parameter (Bridge top level strap: set_device_pg_config_type[5:0] is set to all 0s). This registers reset and clock domain will be in the OCP domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8000h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4	0h RO	**Interrupt Request Capable (IRC):** Set to 1 by HW if it is capable of generating an interrupt on command completion, else 0. For ISH this bit will be tied to 0.
3	1h RW/1C	**Restore Required (RR):** When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up.
2	0h RW	**D0I3:** SW sets this bit to 1 to move the IP into the D0i3 state. Writing this bit to 0 will return the IP to the fully active D0 state (D0i0).
1	0h RW	**Interrupt Required (IR):** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this on each write to this register.
0	0h RO/V	**Command In Progress (CIP):** HW sets this bit on a 1->0 or 0->1 transition of bit [2]. While set, the other bits in this register are not valid and it is illegal for SW to write to any bit in this register. When clear all the other bits in the register are valid and SW may write to any bit.

7.2.80 Clock Gating And Soft Reset (CGSR) - Offset 8004h

This register is used to Clock gate or soft reset an IP by Host/Remote Host. Also register field of this register can be used for device idle status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8004h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Idle Indication To Host (IDLE):** IP IDLE indication.
30:17	0h RO	**Reserved**
16	0h RW	**Clock Gate Enable (CG):** Setting this field to 1 clock gates the IP.
15:1	0h RO	**Reserved**
0	0h RW	**Soft Reset (SR):** Setting this bit to 1 resets the IP.

8 Quadrature Encoder Pulse (QEP) Interface

8.1 QEP Configuration Registers Summary

This chapter documents the registers of the Intel® PSE Quadrature Encoder Peripheral, QEP devices. This contains multiple Intel® PSE Quadrature Encoder Peripheral, QEP Controller devices:

- Intel® PSE QEP Controller #0 - Bus: 0, Device: 24, Function: 3
- Intel® PSE QEP Controller #1 - Bus: 0, Device: 24, Function: 4
- Intel® PSE QEP Controller #2 - Bus: 0, Device: 24, Function: 5
- Intel® PSE QEP Controller #3 - Bus: 0, Device: 24, Function: 6

DID Values:

Intel® PSE QEP Controller #0- D24: F3 - 4BC3h

Intel® PSE QEP Controller #1- D24: F4 - 4B81h

Intel® PSE QEP Controller #2- D24: F5 - 4B82h

Intel® PSE QEP Controller #3- D24: F6 - 4B83h

Table 8-1. Summary of Bus: 0, Device: 24, Function: 3 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	Device ID And Vendor ID Register (DEVVENDID) - Offset 0h	4BC30000h
4h	4	Status And Command (STATUSCOMMAND) - Offset 4h	00100000h
8h	4	Revision ID And Class Code (REVCLASSCODE) - Offset 8h	00000000h
Ch	4	Cache Line Latency Header And BIST (CLLATHEADERBIST) - Offset Ch	00000000h
10h	4	Base Address Register (BAR) - Offset 10h	00000000h
14h	4	Base Address Register High (BAR_HIGH) - Offset 14h	00000000h
18h	4	Base Address Register1 (BAR1) - Offset 18h	00000000h
1Ch	4	Base Address Register1 High (BAR1_HIGH) - Offset 1Ch	00000000h
2Ch	4	Subsystem Vendor and Subsystem ID (SUBSYSTEMID) - Offset 2Ch	00000000h
30h	4	Expansion ROM Base Address (EXPANSION_ROM_BASEADDR) - Offset 30h	00000000h
34h	4	Capabilities Pointer (CAPABILITYPTR) - Offset 34h	00000080h
3Ch	4	Interrupt Register (INTERRUPTREG) - Offset 3Ch	00000100h
80h	4	Power Management Capability ID (POWERCAPID) - Offset 80h	48030001h

Table 8-1. Summary of Bus: 0, Device: 24, Function: 3 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
84h	4	Power Management Control And Status Register (PMECTRLSTATUS) - Offset 84h	00000008h
90h	4	PCI Device Idle Vendor Capability Register (PCIDEVIDLE_CAP_RECORD) - Offset 90h	F0140009h
94h	4	Vendor Specific Extended Capability Register (DEVID_VEND_SPECIFIC_REG) - Offset 94h	01400010h
98h	4	Software LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG) - Offset 98h	00000000h
9Ch	4	Device Idle Pointer Register (DEVICE_IDLE_POINTER_REG) - Offset 9Ch	00000000h
A0h	4	D0i3 and Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG) - Offset A0h	00000800h
B0h	4	General Purpose Read Write Register1 (GEN_PCI_REGRW1) - Offset B0h	00000000h
C0h	4	General Purpose Input Register (GEN_INPUT_REG) - Offset C0h	00000000h
D0h	4	MSI Capability Register (MSI_CAP_REG) - Offset D0h	01800005h
D4h	4	MSI Message Low Address (MSI_ADDR_LOW) - Offset D4h	00000000h
D8h	4	MSI Message High Address (MSI_ADDR_HIGH) - Offset D8h	00000000h
DCh	4	MSI Message Data (MSI_MSG_DATA) - Offset DCh	00000000h
E0h	4	MSI Mask Register (MSI_MASK) - Offset E0h	00000000h
E4h	4	MSI Pending Register (MSI_PENDING) - Offset E4h	00000000h
F8h	4	Manufacturers ID (MANID) - Offset F8h	00000000h

8.1.1 Device ID And Vendor ID Register (DEVVENDID) - Offset 0h

Device ID and Vendor ID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 0h	4BC30000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	4BC3h RO/P	**Device Id Field (DEVICEID):** Device ID identifies the particular PCI device
15:0	0000h RO	**Vendor ID Field (VENDORID):** Vendor ID is a unique ID provided by the PCI SIG which identifies the manufacturer of the device

8.1.2 Status And Command (STATUSCOMMAND) - Offset 4h

Status and Command

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 4h	00100000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C	**Detected Parity Error (DPE):** Detected Parity Error
30	0h RW/1C	**Signaled System Error (SSE):** Signaled System Error
29	0h RW/1C	**RMA Field (RMA):** Received Master Abort
28	0h RW/1C	**RTA Field (RTA):** Received Target Abort
27:25	0h RO	**Reserved**
24	0h RW/1C	**Master Data Parity Error (MDPE):** Master Data Parity Error
23:21	0h RO	**Reserved**
20	1h RO	**Cap List Field (CAPLIST):** Capabilities List: Indicates that the controller contains a capabilities pointer list
19	0h RO	**Interrupt Status Field (INTR_STATUS):** Interrupt Status: This bit reflects state of interrupt in the device
18:11	0h RO	**Reserved**
10	0h RW	**Interrupt Disable Field (INTR_DISABLE):** Interrupt Disable
9	0h RO	**Reserved**
8	0h RW	**SERR Enable Field (SERR_ENABLE):** SERR Enable Not implemented
7	0h RO	**Reserved**
6	0h RW	**Parity Error Response Enable (PERE):** Parity Error Response Enable
5:3	0h RO	**Reserved**
2	0h RW	**BME Field (BME):** Bus Master Enable
1	0h RW	**MSE Field (MSE):** Memory Space Enable
0	0h RO	**Reserved**

8.1.3 Revision ID And Class Code (REVCLASSCODE) - Offset 8h

Revision ID and Class Code

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	**Revision ID Field (CLASS_CODES):** Class Code register is read-only and is used to identify the generic function of the device and in some cases a specific register-level programming interface
7:0	00h RO/P	**Class Code Field (RID):** Revision ID identifies the revision of particular PCI device

8.1.4 Cache Line Latency Header And BIST (CLLATHEADERBIST) - Offset Ch

Cache Line size as RW with def 0 Latency Timer, RW with def 0 Header Type with Type 0 configuration header and Reserved BIST Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	0h RO	**Multifunction Device Field (MULFNDEV):** Multi-Function Device
22:16	00h RO	**Header Type Field (HEADERTYPE):** Header Type: Implements Type 0 Configuration header
15:8	00h RO	**Latency Timer Field (LATTIMER):** Latency Timer:. This register is implemented as R/W with default as 0
7:0	00h RW/P	**Cache Line Size Field (CACHELINE_SIZE):** Cache Line Size

8.1.5 Base Address Register (BAR) - Offset 10h

Base Address Register Low [31:2] type [2:1] in 32bit or 64bit address range and memory space indicator [0]

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR):** Base Address Register Low Base address of the AXI fabric memory space. Taken from Strap values as ones
11:4	00h RO	**Size Field (SIZEINDICATOR):** Size Indicator RO Always returns 0 The size of this register depends on the size of the memory space
3	0h RO	**Prefetchable Field (PREFETCHABLE):** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**Type Field (TYPE0):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE):** Memory Space Indicator: 0 indicates this BAR is present in the memory space

8.1.6 Base Address Register High (BAR_HIGH) - Offset 14h

Base Address Register High enabled if [2:1] of BAR_HIGH is 10

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR_HIGH):** Base Address High - MSB

8.1.7 Base Address Register1 (BAR1) - Offset 18h

Base Address Register1 accesses to PCI configuration space and is always 4K type in [2:1] and memory space indicator in [0]

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR1):** Base Address1 This field is present if BAR1 is enabled through private configuration space
11:4	00h RO	**Size Field (SIZEINDICATOR1):** Always is 0 as minimum size is 4K

Bit Range	Default & Access	Field Name (ID): Description
3	0h RO	**Prefetchable Field (PREFETCHABLE1):** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**Type Field (TYPE1):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE1):** Memory Space Indicator: 0 Indicates this BAR is present in the memory space

8.1.8 Base Address Register1 High (BAR1_HIGH) - Offset 1Ch

Base Address Register1 High enabled only if [2:1] of BAR1_HIGH register is 10

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR1_HIGH):** Base Address: Base address of the AXI fabric memory space. Taken from Strap values as ones

8.1.9 Subsystem Vendor and Subsystem ID (SUBSYSTEMID) - Offset 2Ch

SVID Register along with SID Register is to distinguish subsystem from another

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O/P	**Subsystem ID Field (SUBSYSTEMID):** Subsystem ID: This register is implemented for any function that can be instantiated more than once in a given system
15:0	0000h RW/O/P	**Subsystem Vendor Field (SUBSYSTEMVENDORID):** Subsystem Vendor ID: This register must be implemented for any function that can be instantiated more than once in a given system

8.1.10 Expansion ROM Base Address (EXPANSION_ROM_BASEADDR) - Offset 30h

Expansion ROM Base Address Register is a RO indicates support for expansion ROMs

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Expansion Rom Base Address Field (EXPANSION_ROM_BASE):** Expansion ROM Base Address: Value of all zeros indicates no support for Expansion ROM

8.1.11 Capabilities Pointer (CAPABILITYPTR) - Offset 34h

Capabilities Pointer Register indicates what the next capability is

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 34h	00000080h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	80h RO	**Capabilities Pointer Field (CAPPTR_POWER):** Capabilities Pointer: Indicates what the next capability is

8.1.12 Interrupt Register (INTERRUPTREG) - Offset 3Ch

Interrupt Line Register is not use in Bridge directly. Interrupt Pin Register reflects the IPIN value in private configuration space. MIN_GNT register indicating the requirements of latency timers and MAX_LAT register for max latency

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 3Ch	00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Max Latency Field (MAX_LAT):** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	00h RO	**Min GNT Field (MIN_GNT):** Value of 0 indicates device has no major requirements for the settings of latency timers // Re-Check Desc Padma

Bit Range	Default & Access	Field Name (ID): Description
15:12	0h RO	**Reserved**
11:8	1h RO	**Interrupt Pin Field (INTPIN):** Interrupt Pin: Value in this register is reflected from the IPIN value in the private configuration space
7:0	00h RW/P	**Interrupt Line Field (INTLINE):** Interrupt Line: It is used to communicate to software the interrupt line to which the interrupt pin is connected

8.1.13 Power Management Capability ID (POWERCAPID) - Offset 80h

Power Management Capability ID Register points to next capability structure and Power Management Capability with Power Management Capabilities Register for PME support and version

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 80h	48030001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	09h RO	**PME Support Field (PMESUPPORT):** This 5-bit field indicates the power states in which the function can assert the PME#
26:19	0h RO	**Reserved**
18:16	3h RO	**Version Field (VERSION):** Indicates support for Revision 1.2 of the PCI Power Management Specification
15:8	00h RO	**Next Cap Field (NXTCAP):** Next Capability: Points to the next capability structure
7:0	01h RO	**Power Capability ID Field (POWER_CAP):** Power Management Capability: Indicates this is power management capability

8.1.14 Power Management Control And Status Register (PMECTRLSTATUS) - Offset 84h

Power Management Control and Status Register to set and read PME Status, PME Enable, No Soft reset and Power State

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 84h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW/1C/P	**PME Status Field (PMESTATUS):** PME Status
14:9	0h RO	**Reserved**
8	0h RW/P	**PME Enable Field (PMEENABLE):** PME Enable
7:4	0h RO	**Reserved**
3	1h RO	**No Soft Reset Field (NO_SOFT_RESET):** This bit indicates that devices transitioning from D3hot to D0 because of Power State commands do not perform an internal reset
2	0h RO	**Reserved**
1:0	0h RW	**Power State Field (POWERSTATE):** Power State: This field is used both to determine the current Power State and to set a new Power State

8.1.15 PCI Device Idle Vendor Capability Register (PCIDEVIDLE_CAP_RECORD) - Offset 90h

PCI Device Vendor Specific Capability Register defines Vendor Specific Capability ID, Revision Length, Next Capability and CAPID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 90h	F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**Vendor Cap Field (VEND_CAP):** Vendor Specific Capability ID
27:24	0h RO	**Revision ID Field (REVID):** Revision ID of capability structure
23:16	14h RO	**Cap Length Field (CAP_LENGTH):** Vendor Specific Capability Length
15:8	00h RO	**Next Capability Field (NEXT_CAP):** Next Capability
7:0	09h RO	**Capability ID Field (CAPID):** Capability ID

8.1.16 Vendor Specific Extended Capability Register (DEVID_VEND_SPECIFIC_REG) - Offset 94h

Extended Vendor Capability Register for VSEC Length, Revision and ID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 94h	01400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	014h RO	**Vendor Specific ID Field (VSEC_LENGTH):** Vendor Specific Extended Capability Length
19:16	0h RO	**Vendor Specific Revision Field (VSEC_REV):** Vendor Specific Extended Capability Revision
15:0	0010h RO	**Vendor Specific Length Field (VSECID):** Vendor Specific Extended Capability ID

8.1.17 Software LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG) - Offset 98h

Software Location Pointer in MMIO space as an offset specified by BAR

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RO	**SW LTR Dword Offset Field (SW_LAT_DWORD_OFFSET):** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**SW LTR Bar Number Field (SW_LAT_BAR_NUM):** Indicates that the SW LTR update MMIO location is always at BAR0
0	0h RO	**SW LTR Valid Field (SW_LAT_VALID):** This value is reflected from the SW LTR valid strap at the top level

8.1.18 Device Idle Pointer Register (DEVICE_IDLE_POINTER_REG) - Offset 9Ch

Device Idle Pointer Register giving details on Device MMIO Offset Location, BAR NUM and D0i3 Valid Strap

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RO	**D0i3 Dword Offset Field (DWORD_OFFSET):** Contains the location pointer to the SW LTR register in MMIO space as an offset from the specified BAR
3:1	0h RO	**BAR NUM Field (BAR_NUM):** BAR Num: Indicates that the D0i3 MMIO location is always at BAR0
0	0h RO	**D0i3 Valid Field (VALID):** Valid: This value is reflected from the D0i3 valid strap at the top level

8.1.19 D0i3 and Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG) - Offset A0h

D0idle_Max_Power_On_Latency Register set at boot and power control enable register to enable communication with the PGCB block below the Bridge

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + A0h	00000800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21	0h RW/P	**HAE:** Hardware Autonomous Enable
20	0h RO	**Reserved**
19	0h RW/P	**Sleep Enable Field (SLEEP_EN):** Sleep Enable
18	0h RW/P	**D3 Hen Field (D3HEN):** DEVIDLE Enable (DEVIDLEN): If '1' then the function will power gate when idle and the DevIdle register (DevIdleC[2] = '1') is set
17	0h RW/P	**Device Idle En Field (DEVIDLEN):** PMCRE: PMC Request Enable
16	0h RW/P	**PMC Request Enable Field (PMCRE):** D3-Hot Enable (D3HEN): If '1' then function will power gate when idle and the PMCSR[1:0] register in the function ='11' (D3)
15:13	0h RO	**Reserved**
12:10	2h RW/O/P	**Power Latency Scale Field (POW_LAT_SCALE):** Power On Latency Scale
9:0	000h RW/O/P	**Power Latency Value Field (POW_LAT_VALUE):** Power On Latency Value

8.1.20 General Purpose Read Write Register1 (GEN_PCI_REGRW1) - Offset B0h

General Purpose PCI Read Write Register1

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Read Write Field (GEN_PCI_REG_RW1):** General Purpose PCI Register: This register value is brought out as GEN_PCI_REG_RW1

8.1.21 General Purpose Input Register (GEN_INPUT_REG) - Offset C0h

General Purpose Input Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**General Purpose Input Field (GEN_REG_INPUT_RW):** General Purpose Input Register: This register value reflects the value of GEN_REG_INPUT_RW

8.1.22 MSI Capability Register (MSI_CAP_REG) - Offset D0h

MSI Capability Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + D0h	01800005h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	1h RO	**Per Vector Masking Capability Field (PER_VECTOR_MSK_CAP):** Per Vector Masking Capability
23	1h RO	**MSI Capability Field (MSI_CAP_64B):** 64 bit message address capability
22:20	0h RW	**Multi Message En Field (MUL_MSG_EN):** Multiple Message Enable
19:17	0h RO	**Multi Message Cap Field (MUL_MSG_CAP):** Multiple Message Capable

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**MSI Enable Field (MSG_MSI_ENABLE):** MSI Enable
15:8	00h RO	**Next Pointer Field (MSG_NXT_PTR):** Next Capability Pointer
7:0	05h RO	**MSI Capability Field (MSG_CAP_ID):** MSI Capability ID

8.1.23 MSI Message Low Address (MSI_ADDR_LOW) - Offset D4h

MSI Message Low Address

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RW	**MSI Message Low Address Field (MSI_ADDR_LOW):** MSI Message Low Address
1:0	0h RO	**Reserved**

8.1.24 MSI Message High Address (MSI_ADDR_HIGH) - Offset D8h

MSI Message High Address

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSI Message High Address Field (MSI_ADDR_HIGH):** MSI Message High Address

8.1.25 MSI Message Data (MSI_MSG_DATA) - Offset DCh

MSI Message Data

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + DCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0000h RW	**MSI Message Data Field (MSI_MSG_DATA):** MSI Message Data

8.1.26 MSI Mask Register (MSI_MASK) - Offset E0h

MSI Mask bits

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + E0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSI Mask Field (MSI_MASK):** MSI Mask bits

8.1.27 MSI Pending Register (MSI_PENDING) - Offset E4h

MSI Pending bits

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**MSI Pending Field (MSI_PENDING):** MSI Pending bits

8.1.28 Manufacturers ID (MANID) - Offset F8h

Manufacturers ID Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + F8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/P	**Manufacturers ID Field (MANID):** Manufacturer ID: Default value comes from straps

8.2 QEP MMIO Registers Summary

Table 8-2. Summary of Bus: 0, Device: 24, Function: 3 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	QEPCON	0000001Ch
4h	4	QEPFLT	00000000h
8h	4	QEPCOUNT	00000000h
Ch	4	QEPMAX	FFFFFFFFh
10h	4	QEPWDT	00000000h
14h	4	QEPCAPDIV	00000000h
18h	4	QEPCNTR	00000000h
1Ch	4	QEPCAPBUF	00000000h
20h	4	QEPINT_STAT	00000000h
24h	4	QEPINT_MASK	00000000h
1000h	4	D0i3 Control (D0I3C)	00000008h
1004h	4	Clock Gating And Soft Reset (CGSR)	00000000h

8.2.1 QEPCON - Offset 0h

QEP Control Register. This register controls the QEP operation and provides status flags for the state of the QEP module

Type	Size	Offset	Default
MMIO	32 bit	BAR + 0h	0000001Ch

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RO/V	**FIFO_EMPTY:** Capture FIFO Empty Status Flag. Set when the FIFO is empty
14:12	0h RW/L	**FIFO_THRE:** Capture FIFO Threshold. It contains the number of valid data entries in the FIFO: NUM_DATA_ENTRIES = FIFO_THRE + 1 It is write able by the processor only when the peripheral is disabled. **Locked by:** QEPCON.EN
11	0h RW/L	**CAP_MODE:** Capture Block Mode. It selects the PhaseA event which triggers the FIFO to store the current QEPCNTR value 0 = Single edge 1 = Both edges It is write able by the processor only when the peripheral is disabled. **Locked by:** QEPCON.EN

Bit Range	Default & Access	Field Name (ID): Description
10:9	0h RW/L	**INDX_GATING:** Index Gating Select. It selects the state of PhaseA and PhaseB signals at which the index pulse will be gated 00 = PhaseA low and PhaseB low 01 = PhaseA low and PhaseB high 10 = PhaseA high and PhaseB low 11 = PhaseA high and PhaseB high It is write able by the processor only when the peripheral is disabled. **Locked by:** QEPCON.EN
8	0h RW/L	**COUNT_RST_MODE:** Position Counter Reset Mode 0 = Position counter reset on index event 1 = Position counter reset on maximum position It is write able by the processor only when the peripheral is disabled. **Locked by:** QEPCON.EN
7	0h RO	**Reserved**
6	0h RW/L	**OP_MODE:** Operating Mode 0 = Quadrature Encoder Peripheral (QEP) 1 = Capture Compare (CC) It is write able by the processor only when the peripheral is disabled. **Locked by:** QEPCON.EN
5	0h RW/L	**SWPAB:** Phase A and Phase B Input Swap Select 0 = Phase A and Phase B inputs are not swapped 1 = Phase A and Phase B inputs are swapped It is write able by the processor only when the peripheral is disabled. **Locked by:** QEPCON.EN
4	1h RW/L	**EDGE_INDX:** Edge selection of the Index input signal 0 = Falling edge 1 = Rising edge It is write able by the processor only when the peripheral is disabled. **Locked by:** QEPCON.EN
3	1h RW/L	**EDGE_B:** Edge selection of the PhaseB input signal 0 = Falling edge 1 = Rising edge It is write able by the processor only when the peripheral is disabled. **Locked by:** QEPCON.EN

Bit Range	Default & Access	Field Name (ID): Description
2	1h RW/L	**EDGE_A:** Edge selection of the PhaseA input signal 0 = Falling edge 1 = Rising edge It is writeable by the processor only when the peripheral is disabled. **Locked by:** QEPCON.EN
1	0h RW/L	**FLT_EN:** Noise Filters Enable 0 = Filters disabled 1 = Filters enabled It is writeable by the processor only when the peripheral is disabled. **Locked by:** QEPCON.EN
0	0h RW	**EN:** QEP/CC Enable 0 = QEP/CC disabled 1 = QEP/CC enabled

8.2.2 QEPFLT - Offset 4h

QEP Noise Filter Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved**
20:0	000000h RW/L	**MAX_COUNT:** Noise Filter Maximum Count. It selects the maximum glitch width to remove in terms of peripheral clock cycles: PCLK_CYCLES = MAX_COUNT + 2 It is write able by the processor only when the peripheral is disabled. **Locked by:** QEPCON.EN

8.2.3 QEPCOUNT - Offset 8h

QEP Position Counter Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**POS_COUNT:** Position Count Value. It stores the count value currently reached by the position counter. Disabling the peripheral will automatically clear its content.

8.2.4 QEPMAX - Offset Ch

QEP Maximum Position Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + Ch	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW/L	**MAX_COUNT:** Maximum Position Count. It defines the operating range for the position counter. It is write able by the processor only when the peripheral is disabled. **Locked by:** QEPCON.EN

8.2.5 QEPWDT - Offset 10h

QEP Watchdog Timer Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/L	**TOP:** Watchdog Timer Timeout Period. When the WDT reaches this value, a dedicated interrupt is generated to flag a stall event. It is writeable by the processor only when the peripheral is disabled. **Locked by:** QEPCON.EN

8.2.6 QEPCAPDIV - Offset 14h

QEP Capture Divider Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2:0	0h RW/L	**CLK_DIV:** Clock Divider Value. It allows the clock to be divided as follows: 000 = clock divided by 1 001 = clock divided by 2 010 = clock divided by 4 011 = clock divided by 8 100 = clock divided by 16 101 = clock divided by 32 110 = clock divided by 64 111 = clock divided by 128 It is write able by the processor only when the peripheral is disabled. **Locked by:** QEPCON.EN

8.2.7 QEPCNTR - Offset 18h

QEP Capture Counter Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**CAP_COUNT:** Capture Count Value. It stores the count value currently reached by the free-running capture counter. Disabling the peripheral will automatically clear its content.

8.2.8 QEPCAPBUF - Offset 1Ch

QEP Capture Data Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**DATA:** This is the register the processor reads from when retrieving bytes from FIFO

8.2.9 QEPINT_STAT - Offset 20h

QEP Raw Interrupt Status Register. Each bit in this register has a corresponding mask bit in the QEPINT_MASK register. These bits are cleared by writing '1' to the matching interrupt register field.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 20h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5	0h RW/1C/V	**FIFOCRIT/QEP_PH_ERR_INTR** : In Capture mode, Capture Function Event FIFO Critical Interrupt. The number of entries in the Capture FIFO has reached the configured threshold level. In Encoder mode, this bit is set when phase error has occurred on the QEP inputs.
4	0h RW/1C/V	**FIFOENTRY:** Capture Function Event FIFO Entry Interrupt. An entry has been added to the 'Capture' FIFO.
3	0h RW/1C/V	**QEPDIR:** QEP Function Change Of Direction Detected Interrupt. The Quadrature Decoder has detected that the attached motor (or user dial device) has changed direction.
2	0h RW/1C/V	**QEPRST_UP:** QEPCOUNT Reset detect with forward count direction Interrupt; The QEPCOUNT can be reset by one of 2 configurable methods: Index Input detect event or comparator match event
1	0h RW/1C/V	**QEPRST_DOWN:** QEPCOUNT Reset detect with reverse count direction Interrupt; The QEPCOUNT can be reset by one of 2 configurable methods: Index Input detect event or comparator match event
0	0h RW/1C/V	**WDT:** Watchdog Timeout Interrupt. The Watchdog Timer value has reached the watchdog comparator value.

8.2.10 QEPINT_MASK - Offset 24h

QEP Interrupt Mask Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 24h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5	0h RW	**FIFOCRIT:** This bit masks the FIFOCRIT interrupt bit from the QEPINT_STAT register
4	0h RW	**FIFOENTRY:** This bit masks the FIFOENTRY interrupt bit from the QEPINT_STAT register
3	0h RW	**QEPDIR:** This bit masks the QEPDIR interrupt bit from the QEPINT_STAT register

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**QEPRST_UP:** This bit masks the QEPRST_UP interrupt bit from the QEPINT_STAT register
1	0h RW	**QEPRST_DOWN:** This bit masks the QEPRST_DOWN interrupt bit from the QEPINT_STAT register
0	0h RW	**WDT:** This bit masks the WDT interrupt bit from the QEPINT_STAT register

8.2.11 D0i3 Control (D0I3C) - Offset 1000h

This register will be used for D0i3 SW flow. This will be mapped to a different MMIO address from the other IPC registers. (MMIO and OCP address value are yet to be done) The description below also includes the type of access expected for the ISH FW for each configuration bit:
1. The Restore Required (RR) bit(bit [3]) should be RW for the ISH FW which can determine when to set and/or clear these bits depending on when the ISH FW determines whether restore is required although for ISH restore is never required since the power is never lost.
2. The D0i3 (i3) bit(bit [2]) should be RO for ISH FW as it needs to be written only by host SW. The ISH FW can determine to go to a low power state based on this bit.
3. The Interrupt Required (IR) bit(bit [1]) can be RO register for ISH FW and ISH FW can send an interrupt to Host by writing to the ish2host IPC doorbell register when this bit is set by SW.
4. The Command in Progress (CIP) register bit (bit [0]) is HW set and need to be cleared by ISH FW.
A simple edge detects logic can be used for the setting of this bit in HW. The CIP register bit will be tied to a RTE entry in the IOAPIC as an interrupt source. Hence ISH FW will get an interrupt when the In addition to the registers, the IOSF2OCP Bridge should be parameterized for the following:
1. The device idle capability parameter (ENABLE_PCI_IDLE_CAP) needs to be connected to a soft strap for ISH with a value of 1.
2. The STRAP for the MMIO address (strap_d0i3_offset) of D0i3 register (IPC offset address: h6D0) and the d0i3 valid (strap_d0i3_valid) bit needs should be appropriately tied.
3. The PCE register is made RO register by setting the appropriate parameter (Bridge top level strap: set_device_pg_config_type[5:0] is set to all 0s). This registers reset and clock domain will be in the OCP domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1000h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4	0h RO	**Interrupt Request Capable (IRC):** Set to 1 by HW if it is capable of generating an interrupt on command completion, else 0. For ISH this bit will be tied to 0.
3	1h RW/1C	**Restore Required (RR):** When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up.
2	0h RW	**D0I3:** SW sets this bit to 1 to move the IP into the D0i3 state. Writing this bit to 0 will return the IP to the fully active D0 state (D0i0).
1	0h RW	**Interrupt Required (IR):** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this on each write to this register.
0	0h RO/V	**Command In Progress (CIP):** HW sets this bit on a 1->0 or 0->1 transition of bit [2]. While set, the other bits in this register are not valid and it is illegal for SW to write to any bit in this register. When clear all the other bits in the register are valid and SW may write to any bit.

8.2.12 Clock Gating And Soft Reset (CGSR) - Offset 1004h

This register is used to Clock gate or soft reset an IP by Host/Remote Host. Also register field of this register can be used for device idle status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1004h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Idle Indication To Host (IDLE):** IP IDLE indication.
30:17	0h RO	**Reserved**
16	0h RW	**Clock Gate Enable (CG):** Setting this field to 1 clock gates the IP.
15:1	0h RO	**Reserved**
0	0h RW	**Soft Reset (SR):** Setting this bit to 1 resets the IP.

9 Serial Peripheral Interface (SPI) Interface

9.1 SPI Configuration Registers Summary

This chapter documents the registers of the Intel® PSE devices. The processor contains multiple Intel® PSE SPI Controller devices:

- Intel® PSE SPI Controller #0 - Bus: 0, Device: 19, Function: 0
- Intel® PSE SPI Controller #1 - Bus: 0, Device: 19, Function: 1
- Intel® PSE SPI Controller #2 - Bus: 0, Device: 19, Function: 2
- Intel® PSE SPI Controller #3 - Bus: 0, Device: 19, Function: 3

DID Values:

- Intel® PSE SPI Controller #0 - D19: F0 - 4B84h
- Intel® PSE SPI Controller #1 - D19: F1 - 4B85h
- Intel® PSE SPI Controller #2 - D19: F2 - 4B86h
- Intel® PSE SPI Controller #3 - D19: F3 - 4B87h

Table 9-1. Summary of Bus: 0, Device: 19, Function: 0 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	Device ID And Vendor ID Register (DEVVENDID) - Offset 0h	4B840000h
4h	4	Status And Command (STATUSCOMMAND) - Offset 4h	00100000h
8h	4	Revision ID And Class Code (REVCLASSCODE) - Offset 8h	00000000h
Ch	4	Cache Line Latency Header And BIST (CLLATHEADERBIST) - Offset Ch	00000000h
10h	4	Base Address Register (BAR) - Offset 10h	00000000h
14h	4	Base Address Register High (BAR_HIGH) - Offset 14h	00000000h
18h	4	Base Address Register1 (BAR1) - Offset 18h	00000000h
1Ch	4	Base Address Register1 High (BAR1_HIGH) - Offset 1Ch	00000000h
2Ch	4	Subsystem Vendor and Subsystem ID (SUBSYSTEMID) - Offset 2Ch	00000000h
30h	4	Expansion ROM Base Address (EXPANSION_ROM_BASEADDR) - Offset 30h	00000000h
34h	4	Capabilities Pointer (CAPABILITYPTR) - Offset 34h	00000080h
3Ch	4	Interrupt Register (INTERRUPTREG) - Offset 3Ch	00000100h
80h	4	Power Management Capability ID (POWERCAPID) - Offset 80h	48030001h
84h	4	Power Management Control And Status Register (PMECTRLSTATUS) - Offset 84h	00000008h
90h	4	PCI Device Idle Vendor Capability Register (PCIDEVIDLE_CAP_RECORD) - Offset 90h	F0140009h

Table 9-1. Summary of Bus: 0, Device: 19, Function: 0 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
94h	4	Vendor Specific Extended Capability Register (DEVID_VEND_SPECIFIC_REG) - Offset 94h	01400010h
98h	4	Software LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG) - Offset 98h	00000000h
9Ch	4	Device Idle Pointer Register (DEVICE_IDLE_POINTER_REG) - Offset 9Ch	00000000h
A0h	4	D0i3 and Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG) - Offset A0h	00000800h
B0h	4	General Purpose Read Write Register1 (GEN_PCI_REGRW1) - Offset B0h	00000000h
C0h	4	General Purpose Input Register (GEN_INPUT_REG) - Offset C0h	00000000h
D0h	4	MSI Capability Register (MSI_CAP_REG) - Offset D0h	01800005h
D4h	4	MSI Message Low Address (MSI_ADDR_LOW) - Offset D4h	00000000h
D8h	4	MSI Message High Address (MSI_ADDR_HIGH) - Offset D8h	00000000h
DCh	4	MSI Message Data (MSI_MSG_DATA) - Offset DCh	00000000h
E0h	4	MSI Mask Register (MSI_MASK) - Offset E0h	00000000h
E4h	4	MSI Pending Register (MSI_PENDING) - Offset E4h	00000000h
F8h	4	Manufacturers ID (MANID) - Offset F8h	00000000h

9.1.1 Device ID And Vendor ID Register (DEVVENDID) - Offset 0h

Device ID and Vendor ID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 0h	4B840000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	4B84h RO/P	**Device ID Field (DEVICEID):** Device ID identifies the particular PCI device
15:0	0000h RO	**Vendor ID Field (VENDORID):** Vendor ID is a unique ID provided by the PCI SIG which identifies the manufacturer of the device

9.1.2 Status And Command (STATUSCOMMAND) - Offset 4h

Status and Command

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 4h	00100000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C	**Detected Parity Error (DPE):** Detected Parity Error
30	0h RW/1C	**Signaled System Error (SSE):** Signaled System Error
29	0h RW/1C	**RMA Field (RMA):** Received Master Abort
28	0h RW/1C	**RTA Field (RTA):** Received Target Abort
27:25	0h RO	**Reserved**
24	0h RW/1C	**Master Data Parity Error (MDPE):** Master Data Parity Error
23:21	0h RO	**Reserved**
20	1h RO	**Cap List Field (CAPLIST):** Capabilities List: Indicates that the controller contains a capabilities pointer list
19	0h RO	**Interrupt Status Field (INTR_STATUS):** Interrupt Status: This bit reflects state of interrupt in the device
18:11	0h RO	**Reserved**
10	0h RW	**Interrupt Disable Field (INTR_DISABLE):** Interrupt Disable
9	0h RO	**Reserved**
8	0h RW	**SERR Enable Field (SERR_ENABLE):** SERR Enable Not implemented
7	0h RO	**Reserved**
6	0h RW	**Parity Error Response Enable (PERE):** Parity Error Response Enable
5:3	0h RO	**Reserved**
2	0h RW	**BME Field (BME):** Bus Master Enable
1	0h RW	**MSE Field (MSE):** Memory Space Enable
0	0h RO	**Reserved**

9.1.3 Revision ID And Class Code (REVCLASSCODE) - Offset 8h

Revision ID and Class Code

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	**Revision ID Field (CLASS_CODES):** Class Code register is read-only and is used to identify the generic function of the device and in some cases a specific register-level programming interface
7:0	00h RO/P	**Class Code Field (RID):** Revision ID identifies the revision of particular PCI device

9.1.4 Cache Line Latency Header And BIST (CLLATHEADERBIST) - Offset Ch

Cache Line size as RW with def 0 Latency Timer, RW with def 0 Header Type with Type 0 configuration header and Reserved BIST Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	0h RO	**Multifunction Device Field (MULFNDEV):** Multi-Function Device
22:16	00h RO	**Header Type Field (HEADERTYPE):** Header Type: Implements Type 0 Configuration header
15:8	00h RO	**Latency Timer Field (LATTIMER):** Latency Timer:. This register is implemented as R/W with default as 0
7:0	00h RW/P	**Cache Line Size Field (CACHELINE_SIZE):** Cache Line Size

9.1.5 Base Address Register (BAR) - Offset 10h

Base Address Register Low [31:2] type [2:1] in 32bit or 64bit address range and memory space indicator [0]

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR):** Base Address Register Low Base address of the AXI fabric memory space. Taken from Strap values as ones
11:4	00h RO	**Size Field (SIZEINDICATOR):** Size Indicator RO Always returns 0 The size of this register depends on the size of the memory space
3	0h RO	**Prefetchable Field (PREFETCHABLE):** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**Type Field (TYPE0):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE):** Memory Space Indicator: 0 indicates this BAR is present in the memory space

9.1.6 Base Address Register High (BAR_HIGH) - Offset 14h

Base Address Register High enabled if [2:1] of BAR_HIGH is 10

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR_HIGH):** Base Address High - MSB

9.1.7 Base Address Register1 (BAR1) - Offset 18h

Base Address Register1 accesses to PCI configuration space and is always 4K type in [2:1] and memory space indicator in [0]

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR1):** Base Address1 This field is present if BAR1 is enabled through private configuration space
11:4	00h RO	**Size Field (SIZEINDICATOR1):** Always is 0 as minimum size is 4K

Bit Range	Default & Access	Field Name (ID): Description
3	0h RO	**Prefetchable Field (PREFETCHABLE1):** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**Type Field (TYPE1):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE1):** Memory Space Indicator: 0 Indicates this BAR is present in the memory space

9.1.8 Base Address Register1 High (BAR1_HIGH) - Offset 1Ch

Base Address Register1 High enabled only if [2:1] of BAR1_HIGH register is 10

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR1_HIGH):** Base Address: Base address of the AXI fabric memory space. Taken from Strap values as ones

9.1.9 Subsystem Vendor and Subsystem ID (SUBSYSTEMID) - Offset 2Ch

SVID Register along with SID Register is to distinguish subsystem from another

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O/P	**Subsystem ID Field (SUBSYSTEMID):** Subsystem ID: This register is implemented for any function that can be instantiated more than once in a given system
15:0	0000h RW/O/P	**Subsystem Vendor Field (SUBSYSTEMVENDORID):** Subsystem Vendor ID: This register must be implemented for any function that can be instantiated more than once in a given system

9.1.10 Expansion ROM Base Address (EXPANSION_ROM_BASEADDR) - Offset 30h

Expansion ROM Base Address Register is a RO indicates support for expansion ROMs

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Expansion Rom Base Address Field (EXPANSION_ROM_BASE):** Expansion ROM Base Address: Value of all zeros indicates no support for Expansion ROM

9.1.11 Capabilities Pointer (CAPABILITYPTR) - Offset 34h

Capabilities Pointer Register indicates what the next capability is

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 34h	00000080h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	80h RO	**Capabilities Pointer Field (CAPPTR_POWER):** Capabilities Pointer: Indicates what the next capability is

9.1.12 Interrupt Register (INTERRUPTREG) - Offset 3Ch

Interrupt Line Register is not use in Bridge directly. Interrupt Pin Register reflects the IPIN value in private configuration space. MIN_GNT register indicating the requirements of latency timers and MAX_LAT register for max latency

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 3Ch	00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Max Latency Field (MAX_LAT):** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	00h RO	**Min GNT Field (MIN_GNT):** Value of 0 indicates device has no major requirements for the settings of latency timers // Re-Check Desc Padma

Bit Range	Default & Access	Field Name (ID): Description
15:12	0h RO	**Reserved**
11:8	1h RO	**Interrupt Pin Field (INTPIN):** Interrupt Pin: Value in this register is reflected from the IPIN value in the private configuration space
7:0	00h RW/P	**Interrupt Line Field (INTLINE):** Interrupt Line: It is used to communicate to software the interrupt line to which the interrupt pin is connected

9.1.13 Power Management Capability ID (POWERCAPID) - Offset 80h

Power Management Capability ID Register points to next capability structure and Power Management Capability with Power Management Capabilities Register for PME support and version

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 80h	48030001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	09h RO	**PME Support Field (PMESUPPORT):** This 5-bit field indicates the power states in which the function can assert the PME#
26:19	0h RO	**Reserved**
18:16	3h RO	**Version Field (VERSION):** Indicates support for Revision 1.2 of the PCI Power Management Specification
15:8	00h RO	**Next Cap Field (NXTCAP):** Next Capability: Points to the next capability structure
7:0	01h RO	**Power Capability ID Field (POWER_CAP):** Power Management Capability: Indicates this is power management capability

9.1.14 Power Management Control And Status Register (PMECTRLSTATUS) - Offset 84h

Power Management Control and Status Register to set and read PME Status, PME Enable, No Soft reset and Power State

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 84h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW/1C/P	**PME Status Field (PMESTATUS):** PME Status
14:9	0h RO	**Reserved**
8	0h RW/P	**PME Enable Field (PMEENABLE):** PME Enable
7:4	0h RO	**Reserved**
3	1h RO	**No Soft Reset Field (NO_SOFT_RESET):** This bit indicates that devices transitioning from D3hot to D0 because of Power State commands do not perform an internal reset
2	0h RO	**Reserved**
1:0	0h RW	**Power State Field (POWERSTATE):** Power State: This field is used both to determine the current Power State and to set a new Power State

9.1.15 PCI Device Idle Vendor Capability Register (PCIDEVIDLE_CAP_RECORD) - Offset 90h

PCI Device Vendor Specific Capability Register defines Vendor Specific Capability ID, Revision Length, Next Capability and CAPID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 90h	F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**Vendor Cap Field (VEND_CAP):** Vendor Specific Capability ID
27:24	0h RO	**Revision ID Field (REVID):** Revision ID of capability structure
23:16	14h RO	**Cap Length Field (CAP_LENGTH):** Vendor Specific Capability Length
15:8	00h RO	**Next Capability Field (NEXT_CAP):** Next Capability
7:0	09h RO	**Capability ID Field (CAPID):** Capability ID

9.1.16 Vendor Specific Extended Capability Register (DEVID_VEND_SPECIFIC_REG) - Offset 94h

Extended Vendor Capability Register for VSEC Length, Revision and ID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 94h	01400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	014h RO	**Vendor Specific ID Field (VSEC_LENGTH):** Vendor Specific Extended Capability Length
19:16	0h RO	**Vendor Specific Revision Field (VSEC_REV):** Vendor Specific Extended Capability Revision
15:0	0010h RO	**Vendor Specific Length Field (VSECID):** Vendor Specific Extended Capability ID

9.1.17 Software LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG) - Offset 98h

Software Location Pointer in MMIO space as an offset specified by BAR

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RO	**SW LTR Dword Offset Field (SW_LAT_DWORD_OFFSET):** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**SW LTR Bar Number Field (SW_LAT_BAR_NUM):** Indicates that the SW LTR update MMIO location is always at BAR0
0	0h RO	**SW LTR Valid Field (SW_LAT_VALID):** This value is reflected from the SW LTR valid strap at the top level

9.1.18 Device Idle Pointer Register (DEVICE_IDLE_POINTER_REG) - Offset 9Ch

Device Idle Pointer Register giving details on Device MMIO Offset Location, BAR NUM and D0i3 Valid Strap

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RO	**D0i3 Dword Offset Field (DWORD_OFFSET):** Contains the location pointer to the SW LTR register in MMIO space as an offset from the specified BAR
3:1	0h RO	**BAR NUM Field (BAR_NUM):** BAR Num: Indicates that the D0i3 MMIO location is always at BAR0
0	0h RO	**D0i3 Valid Field (VALID):** Valid: This value is reflected from the D0i3 valid strap at the top level

9.1.19 D0i3 and Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG) - Offset A0h

D0idle_Max_Power_On_Latency Register set at boot and power control enable register to enable communication with the PGCB block below the Bridge

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + A0h	00000800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21	0h RW/P	**HAE:** Hardware Autonomous Enable
20	0h RO	**Reserved**
19	0h RW/P	**Sleep Enable Field (SLEEP_EN):** Sleep Enable
18	0h RW/P	**D3 Hen Field (D3HEN):** DEVIDLE Enable (DEVIDLEN): If '1' then the function will power gate when idle and the DevIdle register (DevIdleC[2] = '1') is set
17	0h RW/P	**Device Idle En Field (DEVIDLEN):** PMCRE: PMC Request Enable
16	0h RW/P	**PMC Request Enable Field (PMCRE):** D3-Hot Enable (D3HEN): If '1' then function will power gate when idle and the PMCSR[1:0] register in the function ='11' (D3)
15:13	0h RO	**Reserved**
12:10	2h RW/O/P	**Power Latency Scale Field (POW_LAT_SCALE):** Power On Latency Scale
9:0	000h RW/O/P	**Power Latency Value Field (POW_LAT_VALUE):** Power On Latency Value

9.1.20 General Purpose Read Write Register1 (GEN_PCI_REGRW1) - Offset B0h

General Purpose PCI Read Write Register1

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Read Write Field (GEN_PCI_REG_RW1):** General Purpose PCI Register: This register value is brought out as GEN_PCI_REG_RW1

9.1.21 General Purpose Input Register (GEN_INPUT_REG) - Offset C0h

General Purpose Input Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**General Purpose Input Field (GEN_REG_INPUT_RW):** General Purpose Input Register: This register value reflects the value of GEN_REG_INPUT_RW

9.1.22 MSI Capability Register (MSI_CAP_REG) - Offset D0h

MSI Capability Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + D0h	01800005h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	1h RO	**Per Vector Masking Capability Field (PER_VECTOR_MSK_CAP):** Per Vector Masking Capability
23	1h RO	**MSI Capability Field (MSI_CAP_64B):** 64 bit message address capability
22:20	0h RW	**Multi Message En Field (MUL_MSG_EN):** Multiple Message Enable
19:17	0h RO	**Multi Message Cap Field (MUL_MSG_CAP):** Multiple Message Capable

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**MSI Enable Field (MSG_MSI_ENABLE):** MSI Enable
15:8	00h RO	**Next Pointer Field (MSG_NXT_PTR):** Next Capability Pointer
7:0	05h RO	**MSI Capability Field (MSG_CAP_ID):** MSI Capability ID

9.1.23 MSI Message Low Address (MSI_ADDR_LOW) - Offset D4h

MSI Message Low Address

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RW	**MSI Message Low Address Field (MSI_ADDR_LOW):** MSI Message Low Address
1:0	0h RO	**Reserved**

9.1.24 MSI Message High Address (MSI_ADDR_HIGH) - Offset D8h

MSI Message High Address

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSI Message High Address Field (MSI_ADDR_HIGH):** MSI Message High Address

9.1.25 MSI Message Data (MSI_MSG_DATA) - Offset DCh

MSI Message Data

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + DCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0000h RW	**MSI Message Data Field (MSI_MSG_DATA):** MSI Message Data

9.1.26 MSI Mask Register (MSI_MASK) - Offset E0h

MSI Mask bits

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + E0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSI Mask Field (MSI_MASK):** MSI Mask bits

9.1.27 MSI Pending Register (MSI_PENDING) - Offset E4h

MSI Pending bits

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**MSI Pending Field (MSI_PENDING):** MSI Pending bits

9.1.28 Manufacturers ID (MANID) - Offset F8h

Manufacturers ID Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + F8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/P	**Manufacturers ID Field (MANID):** Manufacturer ID: Default value comes from straps

9.2 SPI MMIO Registers Summary

Table 9-2. Summary of Bus: 0, Device: 19, Function: 0 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	CTRLR0	01000007h

1004h	4	Clock Gating And Soft Reset (CGSR)	00000000h

9.2.1 CTRLR0 - Offset 0h

Control Register 0 - This register controls the serial data transfer. It is impossible to write to this register when the DW_apb_ssi is enabled. The DW_apb_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: SSI_CTRLR0_RST

Type	Size	Offset	Default
MMIO	32 bit	BAR + 0h	01000007h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	1h RW	**SSTE:** Slave Select Toggle Enable. When operating in SPI mode with clock phase (SCPH) set to 0, this register controls the behavior of the slave select line (ss_*_n) between data frames. If this register field is set to 1 the ss_*_n line will toggle between consecutive data frames, with the serial clock (sclk) being held to its default value while ss_*_n is high; if this register field is set to 0 the ss_*_n will stay low and sclk will run continuously for the duration of the transfer. ***Note***: This register is only valid when SSI_SCPH0_SSTOGGLE is set to 1.
23	0h RO	**Reserved**
22:21	0h RO/V	**SPI_FRF:** SPI Frame Format: Selects data frame format for Transmitting/Receiving the data Bits only valid when SSI_SPI_MODE is either set to "Dual" or "Quad" or "Octal" mode. When SSI_SPI_MODE is configured for "Dual Mode", 10/11 combination is reserved. When SSI_SPI_MODE is configured for "Quad Mode", 11 combination is reserved.
20:16	00h RO/V	**DFS_32:** Data Frame Size in 32-bit transfer size mode. Used to select the data frame size in 32-bit transfer mode. These bits are only valid when SSI_MAX_XFER_SIZE is configured to 32. When the data frame size is programmed to be less than 32 bits, the receive data are automatically right-justified by the receive logic, with the upper bits of the receive FIFO zero-padded. You are responsible for making sure that transmit data is right-justified before writing into the transmit FIFO. The transmit logic ignores the upper unused bits when transmitting the data. ***Note***: When SSI_SPI_MODE is either set to “Dual” or “Quad” or “Octal” mode and SPI_FRF is not set to 2'b00. - DFS value should be multiple of 2 if SPI_FRF = 0x01, - DFS value should be multiple of 4 if SPI_FRF = 0x10, - DFS value should be multiple of 8 if SPI_FRF = 0x11.
15:12	0h RW	**CFS:** Control Frame Size. Selects the length of the control word for the Microwire frame format.
11	0h RW	**SRL:** Shift Register Loop. Used for testing purposes only. When internally active, connects the transmit shift register output to the receive shift register input. Can be used in both serial-slave and serial-master modes. When the DW_apb_ssi is configured as a slave in loopback mode, the ss_in_n and ssi_clk signals must be provided by an external source. In this mode, the slave cannot generate these signals because there is nothing to which to loop back
10	0h RO	**Reserved**
9:8	0h RW	**TMOD:** Transfer Mode. Selects the mode of transfer for serial communication. This field does not affect the transfer duplicity. Only indicates whether the receive or transmit data are valid. In transmit-only mode, data received from the external device is not valid and is not stored in the receive FIFO memory; it is overwritten on the next transfer. In receive-only mode, transmitted data are not valid. After the first write to the transmit FIFO, the same word is retransmitted for the duration of the transfer. In transmit-and-receive mode, both transmit and receive data are valid. The transfer continues until the transmit FIFO is empty. Data received from the external device are stored into the receive FIFO memory, where it can be accessed by the host processor. In eeprom-read mode, receive data is not valid while control data is being transmitted. When all control data is sent to the EEPROM, receive data becomes valid and transmit data becomes invalid. All data in the transmit FIFO is considered control data in this mode. This transfer mode is only valid when the DW_apb_ssi is configured as master device. 00 - Transmit & Receive 01 - Transmit Only 10 - Receive Only 11 - EEPROM Read When SSI_SPI_MODE is either set to “Dual” or “Quad” or "Octal" mode and SPI_FRF is not set to 2'b00. There are only two valid combinations: 10 - Read 01 - Write

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**SCPOL:** Serial Clock Polarity. Valid when the frame format (FRF) is set to Motorola SPI. Used to select the polarity of the inactive serial clock, which is held inactive when the DW_apb_ssi master is not actively transferring data on the serial bus.
6	0h RW	**SCPH:** Serial Clock Phase. Valid when the frame format (FRF) is set to Motorola SPI. The serial clock phase selects the relationship of the serial clock with the slave select signal. When SCPH = 0, data are captured on the first edge of the serial clock. When SCPH = 1, the serial clock starts toggling one cycle after the slave select line is activated, and data are captured on the second edge of the serial clock.
5:4	0h RW	**FRF:** Frame Format. Selects which serial protocol transfers the data.
3:0	7h RW	**DFS:** Data Frame Size. This register field is only valid when SSI_MAX_XFER_SIZE is configured to 16. If SSI_MAX_XFER_SIZE is configured to 32, then writing to this field will not have any effect. Selects the data frame length. When the data frame size is programmed to be less than 16 bits, the receive data are automatically right-justified by the receive logic, with the upper bits of the receive FIFO zero-padded. You must right-justify transmit data before writing into the transmit FIFO. The transmit logic ignores the upper unused bits when transmitting the data ***Note***: When SSI_SPI_MODE is either set to "Dual" or "Quad" or "Octal" mode and SPI_FRF is not set to 2'b00. - DFS value should be multiple of 2 if SPI_FRF = 01, - DFS value should be multiple of 4 if SPI_FRF = 10, - DFS value should be multiple of 8 if SPI_FRF = 11.

9.2.2 CTRLR1 - Offset 4h

Control Register 1 - This register exists only when the DW_apb_ssi is configured as a master device. When the DW_apb_ssi is configured as a serial slave, writing to this location has no effect; reading from this location returns 0. Control register 1 controls the end of serial transfers when in receive-only mode. It is impossible to write to this register when the DW_apb_ssi is enabled. The DW_apb_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0000h RW	**NDF:** Number of Data Frames. When TMOD = 10 or TMOD = 11 , this register field sets the number of data frames to be continuously received by the DW_apb_ssi. The DW_apb_ssi continues to receive serial data until the number of data frames received is equal to this register value plus 1, which enables you to receive up to 64 KB of data in a continuous transfer. When the DW_apb_ssi is configured as a serial slave, the transfer continues for as long as the slave is selected. Therefore, this register serves no purpose and is not present when the DW_apb_ssi is configured as a serial slave.

9.2.3 SSIENR - Offset 8h

SSI Enable Register - This register enables and disables the DW_apb_ssi. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**SSI_EN:** SSI Enable. Enables and disables all DW_apb_ssi operations. When disabled, all serial transfers are halted immediately. Transmit and receive FIFO buffers are cleared when the device is disabled. It is impossible to program some of the DW_apb_ssi control registers when enabled. When disabled, the ssi_sleep output is set (after delay) to inform the system that it is safe to remove the ssi_clk, thus saving power consumption in the system.

9.2.4 MWCR - Offset Ch

Microwire Control Register - This register controls the direction of the data word for the half-duplex Microwire serial protocol. It is impossible to write to this register when the DW_apb_ssi is enabled. The DW_apb_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	BAR + Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2	0h RW	**MHS:** Microwire Handshaking. Relevant only when the DW_apb_ssi is configured as a serial-master device. When configured as a serial slave, this bit field has no functionality. Used to enable and disable the busy/ready handshaking interface for the Microwire protocol. When enabled, the DW_apb_ssi checks for a ready status from the target slave, after the transfer of the last data/control bit, before clearing the BUSY status in the SR register.
1	0h RW	**MDD:** Microwire Control. Defines the direction of the data word when the Microwire serial protocol is used. When this bit is set to 0, the data word is received by the DW_apb_ssi MacroCell from the external serial device. When this bit is set to 1, the data word is transmitted from the DW_apb_ssi MacroCell to the external serial device.
0	0h RW	**MWMOD:** Microwire Transfer Mode. Defines whether the Microwire transfer is sequential or non-sequential. When sequential mode is used, only one control word is needed to transmit or receive a block of data words. When non-sequential mode is used, there must be a control word for each data word that is transmitted or received.

9.2.5 SER - Offset 10h

Slave Enable Register - This register is valid only when the DW_apb_ssi is configured as a master device. When the DW_apb_ssi is configured as a serial slave, writing to this location has no effect; reading from this location returns 0. The register enables the individual slave select output lines from the DW_apb_ssi master. Up to 16 slave-select output pins are available on the DW_apb_ssi master. Register bits can be set or cleared when SSI_EN=0. If SSI_EN=1, then register bits can be set (to delay the slave select assertion while TX FIFO is getting filled) but cannot be cleared. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RW	**SER:** Slave Select Enable Flag. Each bit in this register corresponds to a slave select line (ss_x_n) from the DW_apb_ssi master. When a bit in this register is set (1), the corresponding slave select line from the master is activated when a serial transfer begins. It should be noted that setting or clearing bits in this register have no effect on the corresponding slave select outputs until a transfer is started. Before beginning a transfer, you should enable the bit in this register that corresponds to the slave device with which the master wants to communicate. When not operating in broadcast mode, only one bit in this field should be set.

9.2.6 BAUDR - Offset 14h

Baud Rate Select - This register is valid only when the DW_apb_ssi is configured as a master device. When the DW_apb_ssi is configured as a serial slave, writing to this location has no effect; reading from this location returns 0. The register derives the frequency of the serial clock that regulates the data transfer. The 16-bit field in this register defines the ssi_clk divider value. It is impossible to write to this register when the DW_apb_ssi is enabled. The DW_apb_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0000h RW	**SCKDV:** SSI Clock Divider. The LSB for this field is always set to 0 and is unaffected by a write operation, which ensures an even value is held in this register. If the value is 0, the serial output clock (sclk_out) is disabled. The frequency of the sclk_out is derived from the following equation: Fsclk_out = Fssi_clk/SCKDV where SCKDV is any even value between 2 and 65534. For example, for Fssi_clk = 3.6864MHz and SCKDV =2 Fsclk_out = 3.6864/2 = 1.8432MHz

9.2.7 TXFTLR - Offset 18h

Transmit FIFO Threshold Level - This register controls the threshold value for the transmit FIFO memory. The DW_apb_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	BAR + 18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:0	00h RW	**TFT:** Transmit FIFO Threshold. Controls the level of entries (or below) at which the transmit FIFO controller triggers an interrupt. The FIFO depth is configurable in the range 2-256; this register is sized to the number of address bits needed to access the FIFO. If you attempt to set this value greater than or equal to the depth of the FIFO, this field is not written and retains its current value. When the number of transmit FIFO entries is less than or equal to this value, the transmit FIFO empty interrupt is triggered.

9.2.8 RXFTLR - Offset 1Ch

Receive FIFO Threshold Level - This register controls the threshold value for the receive FIFO memory. The DW_apb_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:0	00h RW	**RFT:** Receive FIFO Threshold. Controls the level of entries (or above) at which the receive FIFO controller triggers an interrupt. The FIFO depth is configurable in the range 2-256. This register is sized to the number of address bits needed to access the FIFO. If you attempt to set this value greater than the depth of the FIFO, this field is not written and retains its current value. When the number of receive FIFO entries is greater than or equal to this value + 1, the receive FIFO full interrupt is triggered.

9.2.9 TXFLR - Offset 20h

Transmit FIFO Level Register - This register contains the number of valid data entries in the transmit FIFO memory. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	BAR + 20h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:0	00h RO/V	**TXTFL:** Transmit FIFO Level. Contains the number of valid data entries in the transmit FIFO.

9.2.10 RXFLR - Offset 24h

Receive FIFO Level Register - This register contains the number of valid data entries in the receive FIFO memory. This register can be ready at any time. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	BAR + 24h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:0	00h RO/V	**RXTFL:** Receive FIFO Level. Contains the number of valid data entries in the receive FIFO.

9.2.11 SR - Offset 28h

Status Register - This is a read-only register used to indicate the current transfer status, FIFO status, and any transmission/reception errors that may have occurred. The status register may be read at any time. None of the bits in this register request an interrupt. Reset Value: 0x6

Type	Size	Offset	Default
MMIO	32 bit	BAR + 28h	00000006h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6	0h RO/V	**DCOL:** Data Collision Error. Relevant only when the DW_apb_ssi is configured as a master device. This bit will be set if ss_in_n input is asserted by other master, when the DW_apb_ssi master is in the middle of the transfer. This informs the processor that the last data transfer was halted before completion. This bit is cleared when read.
5	0h RO	**Reserved**
4	0h RO/V	**RFF:** Receive FIFO Full. When the receive FIFO is completely full, this bit is set. When the receive FIFO contains one or more empty locations, this bit is cleared.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RO/V	**RFNE:** Receive FIFO Not Empty. Set when the receive FIFO contains one or more entries and is cleared when the receive FIFO is empty. This bit can be polled by software to completely empty the receive FIFO.
2	1h RO/V	**TFE:** Transmit FIFO Empty. When the transmit FIFO is completely empty, this bit is set. When the transmit FIFO contains one or more valid entries, this bit is cleared. This bit field does not request an interrupt.
1	1h RO/V	**TFNF:** Transmit FIFO Not Full. Set when the transmit FIFO contains one or more empty locations, and is cleared when the FIFO is full.
0	0h RO/V	**BUSY:** SSI Busy Flag. When set, indicates that a serial transfer is in progress; when cleared indicates that the DW_apb_ssi is idle or disabled.

9.2.12 IMR - Offset 2Ch

Interrupt Mask Register - This read/write reigster masks or enables all interrupts generated by the DW_apb_ssi. When the DW_apb_ssi is configured as a slave device, the MSTIM bit field is not present. This changes the reset value from 0x3F for serial-master configurations to 0x1F for serial-slave configurations. Reset Value: (SSI_IS_MASTER == 1) ? 0x3F : 0x1F

Type	Size	Offset	Default
MMIO	32 bit	BAR + 2Ch	0000003Fh

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5	1h RW	**MSTIM:** Multi-Master Contention Interrupt Mask. This bit field is not present if the DW_apb_ssi is configured as a serial-slave device.
4	1h RW	**RXFIM:** Receive FIFO Full Interrupt Mask
3	1h RW	**RXOIM:** Receive FIFO Overflow Interrupt Mask
2	1h RW	**RXUIM:** Receive FIFO Underflow Interrupt Mask
1	1h RW	**TXOIM:** Transmit FIFO Overflow Interrupt Mask
0	1h RW	**TXEIM:** Transmit FIFO Empty Interrupt Mask

9.2.13 ISR - Offset 30h

Interrupt Status Register - This register reports the status of the DW_apb_ssi interrupts after they have been masked. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	BAR + 30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5	0h RO/V	**MSTIS:** Multi-Master Contention Interrupt Status. This bit field is not present if the DW_apb_ssi is configured as a serial-slave device.
4	0h RO/V	**RXFIS:** Receive FIFO Full Interrupt Status
3	0h RO/V	**RXOIS:** Receive FIFO Overflow Interrupt Status
2	0h RO/V	**RXUIS:** Receive FIFO Underflow Interrupt Status
1	0h RO/V	**TXOIS:** Transmit FIFO Overflow Interrupt Status
0	0h RO/V	**TXEIS:** Transmit FIFO Empty Interrupt Status

9.2.14 RISR - Offset 34h

Raw Interrupt Status Register - This read-only register reports the status of the DW_apb_ssi interrupts prior to masking. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	BAR + 34h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5	0h RO/V	**MSTIR:** Multi-Master Contention Raw Interrupt Status. This bit field is not present if the DW_apb_ssi is configured as a serial-slave device.
4	0h RO/V	**RXFIR:** Receive FIFO Full Raw Interrupt Status
3	0h RO/V	**RXOIR:** Receive FIFO Overflow Raw Interrupt Status
2	0h RO/V	**RXUIR:** Receive FIFO Underflow Raw Interrupt Status
1	0h RO/V	**TXOIR:** Transmit FIFO Overflow Raw Interrupt Status
0	0h RO/V	**TXEIR:** Transmit FIFO Empty Raw Interrupt Status

9.2.15 TXOICR - Offset 38h

Transmit FIFO Overflow Interrupt Clear Register. Register - Transmit FIFO Overflow Interrupt Clear Register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	BAR + 38h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TXOICR:** Clear Transmit FIFO Overflow Interrupt. This register reflects the status of the interrupt. A read from this register clears the ssi_txo_intr interrupt; writing has no effect.

9.2.16 RXOICR - Offset 3Ch

Receive FIFO Overflow Interrupt Clear Register - Receive FIFO Overflow Interrupt Clear Register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	BAR + 3Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**RXOICR:** Clear Receive FIFO Overflow Interrupt. This register reflects the status of the interrupt. A read from this register clears the ssi_rxo_intr interrupt; writing has no effect.

9.2.17 RXUICR - Offset 40h

Receive FIFO Underflow Interrupt Clear Register - Receive FIFO Underflow Interrupt Clear Register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	BAR + 40h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**RXUICR:** Clear Receive FIFO Underflow Interrupt. This register reflects the status of the interrupt. A read from this register clears the ssi_rxu_intr interrupt; writing has no effect.

9.2.18 MSTICR - Offset 44h

Multi-Master Interrupt Clear Register - Multi-Master Interrupt Clear Register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	BAR + 44h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**MSTICR:** Clear Multi-Master Contention Interrupt. This register reflects the status of the interrupt. A read from this register clears the ssi_mst_intr interrupt; writing has no effect.

9.2.19 ICR - Offset 48h

Interrupt Clear Register - Interrupt Clear Register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	BAR + 48h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**ICR:** Clear Interrupts. This register is set if any of the interrupts below are active. A read clears the ssi_txo_intr, ssi_rxu_intr, ssi_rxo_intr, and the ssi_mst_intr interrupts. Writing to this register has no effect.

9.2.20 DMACR - Offset 4Ch

DMA Control Register - This register is only valid when DW_apb_ssi is configured with a set of DMA Controller interface signals (SSI_HAS_DMA = 1). When DW_apb_ssi is not configured for DMA operation, this register will not exist and writing to the register's address will have no effect; reading from this register address will return zero. The register is used to enable the DMA Controller interface operation. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1	0h RW	**TDMAE:** Transmit DMA Enable. This bit enables/disables the transmit FIFO DMA channel.
0	0h RW	**RDMAE:** Receive DMA Enable. This bit enables/disables the receive FIFO DMA channel

9.2.21 DMATDLR - Offset 50h

DMA Transmit Data Level - This register is only valid when the DW_apb_ssi is configured with a set of DMA interface signals (SSI_HAS_DMA = 1). When DW_apb_ssi is not configured for DMA operation, this register will not exist and writing to its address will have no effect; reading from its address will return zero. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	BAR + 50h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:0	00h RW	**DMATDL:** Transmit Data Level. This bit field controls the level at which a DMA request is made by the transmit logic. It is equal to the watermark level; that is, the dma_tx_req signal is generated when the number of valid data entries in the transmit FIFO is equal to or below this field value, and TDMAE = 1.

9.2.22 DMARDLR - Offset 54h

DMA Receive Data Level - This register is only valid when DW_apb_ssi is configured with a set of DMA interface signals (SSI_HAS_DMA = 1). When DW_apb_ssi is not configured for DMA operation, this register will not exist and writing to its address will have no effect; reading from its address will return zero. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	BAR + 54h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:0	00h RW	**DMARDL:** Receive Data Level. This bit field controls the level at which a DMA request is made by the receive logic. The watermark level = DMARDL+1; that is, dma_rx_req is generated when the number of valid data entries in the receive FIFO is equal to or above this field value + 1, and RDMAE=1.

9.2.23 IDR - Offset 58h

Identification Register - This register contains the peripherals identification code, which is written into the register at configuration time using coreConsultant. Reset Value: SSI_ID

Type	Size	Offset	Default
MMIO	32 bit	BAR + 58h	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RO/V	**IDCODE:** Identification code. The register contains the peripheral's identification code, which is written into the register at configuration time using CoreConsultant.

9.2.24 SSI_VERSION_ID - Offset 5Ch

coreKit version ID Register - This read-only register stores the specific DW_apb_ssi component version. Reset Value: SSI_VERSION_ID

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5Ch	3430322Ah

Bit Range	Default & Access	Field Name (ID): Description
31:0	3430322Ah RO/V	**SSI_COMP_VERSION:** Contains the hex representation of the Synopsys component version. Consists of ASCII value for each number in the version, followed by *. For example 32_30_31_2A represents the version 2.01*.

9.2.25 DR0 - Offset 60h

Data Register x - The DW_apb_ssi data register is a 16/32-bit (depending on SSI_MAX_XFER_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI_MAX_XFER_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI_EN = 1. FIFOs are reset when SSI_EN = 0.
NOTE: The DR registers in the DW_apb_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW_apb_ssi are not addressable. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	BAR + 60h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0000h RW/V	**DR:** Data Register. When writing to this register, you must right-justify the data. Read data are automatically right-justified. If SSI_MAX_XFER_SIZE configuration parameter is set to 32, all 32 bits are valid. Otherwise, only 16 bits ([15:0]) of the register are valid. Read = Receive FIFO buffer Write = Transmit FIFO buffer.

9.2.26 DR1 - Offset 64h

Data Register x - The DW_apb_ssi data register is a 16/32-bit (depending on SSI_MAX_XFER_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI_MAX_XFER_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI_EN = 1. FIFOs are reset when SSI_EN = 0.
NOTE: The DR registers in the DW_apb_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. 9.2.32 DR7 - Offset 7Ch

Data Register x - The DW_apb_ssi data register is a 16/32-bit (depending on SSI_MAX_XFER_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI_MAX_XFER_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI_EN = 1. FIFOs are reset when SSI_EN = 0.
NOTE: The DR registers in the DW_apb_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW_apb_ssi are not addressable. Reset Value: 0x0

9.2.61 RX_SAMPLE_DLY - Offset F0h

RX Sample Delay Register - This register is only valid when the DW_apb_ssi is configured with rxd sample delay logic (SSI_HAS_RX_SAMPLE_DELAY==1). When the DW_apb_ssi is not configured with rxd sample delay logic, this register will not exist and writing to its address location will have no effect; reading from its address will return zero. This register control the number of ssi_clk cycles that are delayed (from the default sample time) before the actual sample of the rxd input occurs. It is impossible to write to this register when the DW_apb_ssi is enabled. The DW_apb_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	BAR + F0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**RSD:** Rxd Sample Delay. This register is used to delay the sample of the rxd input port. Each value represents a single ssi_clk delay on the sample of rxd. ***Note***: If this register is programmed with a value that exceeds the depth of the internal shift registers (SSI_RX_DLY_SR_DEPTH) zero delay will be applied to the rxd sample.

9.2.62 RSVD - Offset FCh

Reserved

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**Reserved**

9.2.63 D0i3 Control (D0I3C) - Offset 1000h

This register will be used for D0i3 SW flow. This will be mapped to a different MMIO address from the other IPC registers. (MMIO and OCP address value are yet to be done) The description below also includes the type of access expected for the ISH FW for each configuration bit:
1. The Restore Required (RR) bit (bit [3]) should be RW for the ISH FW which can determine when to set and/or clear these bits depending on when the ISH FW determines whether restore is required although for ISH restore is never required since the power is never lost.
2. The D0i3 (i3) bit (bit [2]) should be RO for ISH FW as it needs to be written only by host SW. The ISH FW can determine to go to a low power state based on this bit.
3. The Interrupt Required (IR) bit (bit [1]) can be RO register for ISH FW and ISH FW can send an interrupt to Host by writing to the ish2host IPC doorbell register when this bit is set by SW.
4. The Command in Progress (CIP) register bit (bit [0]) is HW set and need to be cleared by ISH FW.
A simple edge detects logic can be used for the setting of this bit in HW. The CIP register bit will be tied to a RTE entry in the IOAPIC as an interrupt source. Hence ISH FW will get an interrupt when the In addition to the registers, the IOSF2OCP Bridge should be parameterized for the following:
1. The device idle capability parameter (ENABLE_PCI_IDLE_CAP) needs to be connected to a soft strap for ISH with a value of 1.
2. The STRAP for the MMIO address (strap_d0i3_offset) of D0i3 register (IPC offset address: h6D0) and the d0i3 valid (strap_d0i3_valid) bit needs should be appropriately tied.
3. The PCE register is made RO register by setting the appropriate parameter (Bridge top level strap: set_device_pg_config_type[5:0] is set to all 0s). This registers reset and clock domain will be in the OCP domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1000h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4	0h RO	**Interrupt Request Capable (IRC):** Set to 1 by HW if it is capable of generating an interrupt on command completion, else 0. For ISH this bit will be tied to 0.
3	1h RW/1C	**Restore Required (RR):** When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up.
2	0h RW	**D0I3:** SW sets this bit to 1 to move the IP into the D0i3 state. Writing this bit to 0 will return the IP to the fully active D0 state (D0i0).
1	0h RW	**Interrupt Required (IR):** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this on each write to this register.
0	0h RO/V	**Command In Progress (CIP):** HW sets this bit on a 1->0 or 0->1 transition of bit [2]. While set, the other bits in this register are not valid and it is illegal for SW to write to any bit in this register. When clear all the other bits in the register are valid and SW may write to any bit.

9.2.64 Clock Gating And Soft Reset (CGSR) - Offset 1004h

This register is used to Clock gate or soft reset an IP by Host/Remote Host. Also register field of this register can be used for device idle status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1004h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Idle Indication To Host (IDLE):** IP IDLE indication.
30:17	0h RO	**Reserved**
16	0h RW	**Clock Gate Enable (CG):** Setting this field to 1 clock gates the IP.
15:1	0h RO	**Reserved**
0	0h RW	**Soft Reset (SR):** Setting this bit to 1 resets the IP.

10 General Purpose Input/Output (GPIO) Interface

10.1 GPIO Configuration Registers Summary

This chapter documents the registers in Bus: 0, Device 19, Function 4 and 5.

DID Values:

- Intel® PSE: GPIO Controller #0:- D19: F4 - 4B88h
- Intel® PSE: GPIO Controller #1:- D19: F5 - 4B89h

24	0h RW/1C	**Master Data Parity Error (MDPE):** Master Data Parity Error
23:21	0h RO	**Reserved**
20	1h RO	**Cap List Field (CAPLIST):** Capabilities List: Indicates that the controller contains a capabilities pointer list
19	0h RO	**Interrupt Status Field (INTR_STATUS):** Interrupt Status: This bit reflects state of interrupt in the device
18:11	0h RO	**Reserved**
10	0h RW	**Interrupt Disable Field (INTR_DISABLE):** Interrupt Disable
9	0h RO	**Reserved**
8	0h RW	**SERR Enable Field (SERR_ENABLE):** SERR Enable Not implemented
7	0h RO	**Reserved**
6	0h RW	**Parity Error Response Enable (PERE):** Parity Error Response Enable
5:3	0h RO	**Reserved**
2	0h RW	**BME Field (BME):** Bus Master Enable
1	0h RW	**MSE Field (MSE):** Memory Space Enable
0	0h RO	**Reserved**

10.1.3 Revision ID And Class Code (REVCLASSCODE) - Offset 8h

Revision ID and Class Code

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	**Revision ID Field (CLASS_CODES):** Class Code register is read-only and is used to identify the generic function of the device and in some cases a specific register-level programming interface
7:0	00h RO/P	**Class Code Field (RID):** Revision ID identifies the revision of particular PCI device

10.1.4 Cache Line Latency Header And BIST (CLLATHEADERBIST) - Offset Ch

Cache Line size as RW with def 0 Latency Timer, RW with def 0 Header Type with Type 0 configuration header and Reserved BIST Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	0h RO	**Multifunction Device Field (MULFNDEV):** Multi-Function Device
22:16	00h RO	**Header Type Field (HEADERTYPE):** Header Type: Implements Type 0 Configuration header
15:8	00h RO	**Latency Timer Field (LATTIMER):** Latency Timer:. This register is implemented as R/W with default as 0
7:0	00h RW/P	**Cache Line Size Field (CACHELINE_SIZE):** Cache Line Size

10.1.5 Base Address Register (BAR) - Offset 10h

Base Address Register Low [31:2] type [2:1] in 32bit or 64bit address range and memory space indicator [0]

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR):** Base Address Register Low Base address of the AXI fabric memory space. Taken from Strap values as ones
11:4	00h RO	**Size Field (SIZEINDICATOR):** Size Indicator RO Always returns 0 The size of this register depends on the size of the memory space
3	0h RO	**Prefetchable Field (PREFETCHABLE):** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**Type Field (TYPE0):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE):** Memory Space Indicator: 0 indicates this BAR is present in the memory space

10.1.6 Base Address Register High (BAR_HIGH) - Offset 14h

Base Address Register High enabled if [2:1] of BAR_HIGH is 10

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR_HIGH):** Base Address High - MSB

10.1.7 Base Address Register1 (BAR1) - Offset 18h

Base Address Register1 accesses to PCI configuration space and is always 4K type in [2:1] and memory space indicator in [0]

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR1):** Base Address1 This field is present if BAR1 is enabled through private configuration space
11:4	00h RO	**Size Field (SIZEINDICATOR1):** Always is 0 as minimum size is 4K
3	0h RO	**Prefetchable Field (PREFETCHABLE1):** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**Type Field (TYPE1):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE1):** Memory Space Indicator: 0 Indicates this BAR is present in the memory space

10.1.8 Base Address Register1 High (BAR1_HIGH) - Offset 1Ch

Base Address Register1 High enabled only if [2:1] of BAR1_HIGH register is 10

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR1_HIGH):** Base Address: Base address of the AXI fabric memory space. Taken from Strap values as ones

10.1.9 Subsystem Vendor and Subsystem ID (SUBSYSTEMID) - Offset 2Ch

SVID Register along with SID Register is to distinguish subsystem from another

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O/P	**Subsystem ID Field (SUBSYSTEMID):** Subsystem ID: This register is implemented for any function that can be instantiated more than once in a given system
15:0	0000h RW/O/P	**Subsystem Vendor Field (SUBSYSTEMVENDORID):** Subsystem Vendor ID: This register must be implemented for any function that can be instantiated more than once in a given system

10.1.10 Expansion ROM Base Address (EXPANSION_ROM_BASEADDR) - Offset 30h

Expansion ROM Base Address Register is a RO indicates support for expansion ROMs

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Expansion Rom Base Address Field (EXPANSION_ROM_BASE):** Expansion ROM Base Address: Value of all zeros indicates no support for Expansion ROM

10.1.11 Capabilities Pointer (CAPABILITYPTR) - Offset 34h

Capabilities Pointer Register indicates what the next capability is

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 34h	00000080h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	80h RO	**Capabilities Pointer Field (CAPPTR_POWER):** Capabilities Pointer: Indicates what the next capability is

10.1.12 Interrupt Register (INTERRUPTREG) - Offset 3Ch

Interrupt Line Register is not use in Bridge directly. Interrupt Pin Register reflects the IPIN value in private configuration space. MIN_GNT register indicating the requirements of latency timers and MAX_LAT register for max latency

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 3Ch	00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Max Latency Field (MAX_LAT):** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	00h RO	**Min GNT Field (MIN_GNT):** Value of 0 indicates device has no major requirements for the settings of latency timers // Re-Check Desc Padma
15:12	0h RO	**Reserved**
11:8	1h RO	**Interrupt Pin Field (INTPIN):** Interrupt Pin: Value in this register is reflected from the IPIN value in the private configuration space
7:0	00h RW/P	**Interrupt Line Field (INTLINE):** Interrupt Line: It is used to communicate to software the interrupt line to which the interrupt pin is connected

10.1.13 Power Management Capability ID (POWERCAPID) - Offset 80h

Power Management Capability ID Register points to next capability structure and Power Management Capability with Power Management Capabilities Register for PME support and version

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 80h	48030001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	09h RO	**PME Support Field (PMESUPPORT):** This 5-bit field indicates the power states in which the function can assert the PME#
26:19	0h RO	**Reserved**
18:16	3h RO	**Version Field (VERSION):** Indicates support for Revision 1.2 of the PCI Power Management Specification
15:8	00h RO	**Next Cap Field (NXTCAP):** Next Capability: Points to the next capability structure
7:0	01h RO	**Power Capability ID Field (POWER_CAP):** Power Management Capability: Indicates this is power management capability

10.1.14 Power Management Control And Status Register (PMECTRLSTATUS) - Offset 84h

Power Management Control and Status Register to set and read PME Status, PME Enable, No Soft reset and Power State

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 84h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW/1C/P	**PME Status Field (PMESTATUS):** PME Status
14:9	0h RO	**Reserved**
8	0h RW/P	**PME Enable Field (PMEENABLE):** PME Enable
7:4	0h RO	**Reserved**
3	1h RO	**No Soft Reset Field (NO_SOFT_RESET):** This bit indicates that devices transitioning from D3hot to D0 because of Power State commands do not perform an internal reset
2	0h RO	**Reserved**
1:0	0h RW	**Power State Field (POWERSTATE):** Power State: This field is used both to determine the current Power State and to set a new Power State

10.1.15 PCI Device Idle Vendor Capability Register (PCIDEVIDLE_CAP_RECORD) - Offset 90h

PCI Device Vendor Specific Capability Register defines Vendor Specific Capability ID, Revision Length, Next Capability and CAPID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 90h	F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**Vendor Cap Field (VEND_CAP):** Vendor Specific Capability ID
27:24	0h RO	**Revision ID Field (REVID):** Revision ID of capability structure
23:16	14h RO	**Cap Length Field (CAP_LENGTH):** Vendor Specific Capability Length
15:8	00h RO	**Next Capability Field (NEXT_CAP):** Next Capability
7:0	09h RO	**Capability ID Field (CAPID):** Capability ID

10.1.16 Vendor Specific Extended Capability Register (DEVID_VEND_SPECIFIC_REG) - Offset 94h

Extended Vendor Capability Register for VSEC Length, Revision and ID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 94h	01400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	014h RO	**Vendor Specific ID Field (VSEC_LENGTH):** Vendor Specific Extended Capability Length
19:16	0h RO	**Vendor Specific Revision Field (VSEC_REV):** Vendor Specific Extended Capability Revision
15:0	0010h RO	**Vendor Specific Length Field (VSECID):** Vendor Specific Extended Capability ID

10.1.17 Software LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG) - Offset 98h

Software Location Pointer in MMIO space as an offset specified by BAR

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RO	**SW LTR Dword Offset Field (SW_LAT_DWORD_OFFSET):** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**SW LTR Bar Number Field (SW_LAT_BAR_NUM):** Indicates that the SW LTR update MMIO location is always at BAR0
0	0h RO	**SW LTR Valid Field (SW_LAT_VALID):** This value is reflected from the SW LTR valid strap at the top level

10.1.18 Device Idle Pointer Register (DEVICE_IDLE_POINTER_REG) - Offset 9Ch

Device Idle Pointer Register giving details on Device MMIO Offset Location, BAR NUM and D0i3 Valid Strap

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RO	**D0i3 Dword Offset Field (DWORD_OFFSET):** Contains the location pointer to the SW LTR register in MMIO space as an offset from the specified BAR
3:1	0h RO	**BAR NUM Field (BAR_NUM):** BAR Num: Indicates that the D0i3 MMIO location is always at BAR0
0	0h RO	**D0i3 Valid Field (VALID):** Valid: This value is reflected from the D0i3 valid strap at the top level

10.1.19 D0i3 and Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG) - Offset A0h

D0idle_Max_Power_On_Latency Register set at boot and power control enable register to enable communication with the PGCB block below the Bridge

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + A0h	00000800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21	0h RW/P	**HAE:** Hardware Autonomous Enable
20	0h RO	**Reserved**
19	0h RW/P	**Sleep Enable Field (SLEEP_EN):** Sleep Enable
18	0h RW/P	**D3 Hen Field (D3HEN):** DEVIDLE Enable (DEVIDLEN): If '1' then the function will power gate when idle and the DevIdle register (DevIdleC[2] = '1') is set
17	0h RW/P	**Device Idle En Field (DEVIDLEN):** PMCRE: PMC Request Enable
16	0h RW/P	**PMC Request Enable Field (PMCRE):** D3-Hot Enable (D3HEN): If '1' then function will power gate when idle and the PMCSR[1:0] register in the function ='11' (D3)
15:13	0h RO	**Reserved**
12:10	2h RW/O/P	**Power Latency Scale Field (POW_LAT_SCALE):** Power On Latency Scale
9:0	000h RW/O/P	**Power Latency Value Field (POW_LAT_VALUE):** Power On Latency Value

10.1.20 General Purpose Read Write Register1 (GEN_PCI_REGRW1) - Offset B0h

General Purpose PCI Read Write Register1

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Read Write Field (GEN_PCI_REG_RW1):** General Purpose PCI Register: This register value is brought out as GEN_PCI_REG_RW1

10.1.21 General Purpose Input Register (GEN_INPUT_REG) - Offset C0h

General Purpose Input Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**General Purpose Input Field (GEN_REG_INPUT_RW):** General Purpose Input Register: This register value reflects the value of GEN_REG_INPUT_RW

10.1.22 MSI Capability Register (MSI_CAP_REG) - Offset D0h

MSI Capability Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + D0h	01800005h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	1h RO	**Per Vector Masking Capability Field (PER_VECTOR_MSK_CAP):** Per Vector Masking Capability
23	1h RO	**MSI Capability Field (MSI_CAP_64B):** 64 bit message address capability
22:20	0h RW	**Multi Message En Field (MUL_MSG_EN):** Multiple Message Enable
19:17	0h RO	**Multi Message Cap Field (MUL_MSG_CAP):** Multiple Message Capable
16	0h RW	**MSI Enable Field (MSG_MSI_ENABLE):** MSI Enable
15:8	00h RO	**Next Pointer Field (MSG_NXT_PTR):** Next Capability Pointer
7:0	05h RO	**MSI Capability Field (MSG_CAP_ID):** MSI Capability ID

10.1.23 MSI Message Low Address (MSI_ADDR_LOW) - Offset D4h

MSI Message Low Address

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RW	**MSI Message Low Address Field (MSI_ADDR_LOW):** MSI Message Low Address
1:0	0h RO	**Reserved**

10.1.24 MSI Message High Address (MSI_ADDR_HIGH) - Offset D8h

MSI Message High Address

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSI Message High Address Field (MSI_ADDR_HIGH):** MSI Message High Address

10.1.25 MSI Message Data (MSI_MSG_DATA) - Offset DCh

MSI Message Data

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + DCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0000h RW	**MSI Message Data Field (MSI_MSG_DATA):** MSI Message Data

10.1.26 MSI Mask Register (MSI_MASK) - Offset E0h

MSI Mask bits

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + E0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSI Mask Field (MSI_MASK):** MSI Mask bits

10.1.27 MSI Pending Register (MSI_PENDING) - Offset E4h

MSI Pending bits

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**MSI Pending Field (MSI_PENDING):** MSI Pending bits

10.1.28 Manufacturers ID (MANID) - Offset F8h

Manufacturers ID Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + F8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/P	**Manufacturers ID Field (MANID):** Manufacturer ID: Default value comes from straps

10.2 GPIO MMIO Registers Summary

Table 10-2. Summary of Bus: 0, Device: 19, Function: 4 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	GPIO Pin DirectionLock (GCCR)	00000000h
4h	4	GPIO Pin Level (GPLR0)	00000000h
8h	4	GPIO Pin Level (GPLR1)	00000000h
1Ch	4	GPIO Pin Direction (GPDR0)	00000000h
20h	4	GPIO Pin Direction (GPDR1)	00000000h
34h	4	GPIO Pin Output Set (GPSR0)	00000000h
38h	4	GPIO Pin Output Set (GPSR1)	00000000h
4Ch	4	GPIO Pin Output Clear (GPCR0)	00000000h
50h	4	GPIO Pin Output Clear (GPCR1)	00000000h
64h	4	GPIO Rising Edge Detect Enable (GRER0)	00000000h
68h	4	GPIO Rising Edge Detect Enable (GRER1)	00000000h
7Ch	4	GPIO Falling Edge Detect Enable (GFER0)	00000000h
80h	4	GPIO Falling Edge Detect Enable (GFER1)	00000000h
94h	4	GPIO Glitch Filter Bypass (GFBR0)	00000000h
98h	4	GPIO Glitch Filter Bypass (GFBR1)	00000000h
ACh	4	GPIO Interrupt Mask (GIMR0)	00000000h

Table 10-2. Summary of Bus: 0, Device: 19, Function: 4 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
B0h	4	GPIO Interrupt Mask (GIMR1)	00000000h
C4h	4	GPIO Interrupt Source (GISR0)	00000000h
C8h	4	GPIO Interrupt Source (GISR1)	00000000h
100h	4	GPIO Wake Mask (GWMR0)	00000000h
104h	4	GPIO Wake Mask (GWMR1)	00000000h
118h	4	GPIO Wake Source (GWSR0)	00000000h
11Ch	4	GPIO Wake Source (GWSR1)	00000000h
130h	4	GPIO Secure Input (GSEC)	00000000h
1000h	4	REG TGPIOCTL0 (TGPIO0_CTL_REG)	00002000h
1004h	4	REG TGPIOCOMPV0_31_0 (TGPIO0_COMPV_31_0)	00000000h
1008h	4	REG TGPIOCOMPV0_63_32 (TGPIO0_COMPV_63_32)	00000000h
100Ch	4	REG TGPIOPIV0_31_0 (TGPIO0_PIV_31_0)	00000000h
1010h	4	REG TGPIOPIV0_63:32 (TGPIO0_PIV_63_32)	00000000h
1014h	4	REG TGPIOTCV0_31_0 (TGPIO0_TCV_31_0)	00000000h
1018h	4	REG TGPIOTCV0_63_32 (TGPIO0_TCV_63_32)	00000000h
101Ch	4	REG TGPIOECCV0_31_0 (TGPIO0_ECCV_31_0)	00000000h
1020h	4	REG TGPIOECCV0_63_32 (TGPIO0_ECCV_63_32)	00000000h
1024h	4	REG TGPIOEC0_31_0 (TGPIO0_EC_31_0)	00000000h
1028h	4	REG TGPIOEC0_63_32 (TGPIO0_EC_63_32)	00000000h
102Ch	4	REG TGPIOMATCHMASK0_31_0 (TGPIO0_MATCH_MASK_31_0)	00000000h
1030h	4	REG TGPIOMATCHMASK0_63_32 (TGPIO0_MATCH_MASK_63_32)	00000000h
1040h	4	REG TGPIOCTL1 (TGPIO1_CTL_REG)	00002000h
1044h	4	REG TGPIOCOMPV1_31_0 (TGPIO1_COMPV_31_0)	00000000h
1048h	4	REG TGPIOCOMPV1_63_32 (TGPIO1_COMPV_63_32)	00000000h
104Ch	4	REG TGPIOPIV1_31_0 (TGPIO1_PIV_31_0)	00000000h
1050h	4	REG TGPIOPIV1_63:32 (TGPIO1_PIV_63_32)	00000000h
1054h	4	REG TGPIOTCV1_31_0 (TGPIO1_TCV_31_0)	00000000h
1058h	4	REG TGPIOTCV1_63_32 (TGPIO1_TCV_63_32)	00000000h
105Ch	4	REG TGPIOECCV1_31_0 (TGPIO1_ECCV_31_0)	00000000h
1060h	4	REG TGPIOECCV1_63_32 (TGPIO1_ECCV_63_32)	00000000h
1064h	4	REG TGPIOEC1_31_0 (TGPIO1_EC_31_0)	00000000h
1068h	4	REG TGPIOEC1_63_32 (TGPIO1_EC_63_32)	00000000h
106Ch	4	REG TGPIOMATCHMASK1_31_0 (TGPIO1_MATCH_MASK_31_0)	00000000h
1070h	4	REG TGPIOMATCHMASK1_63_32 (TGPIO1_MATCH_MASK_63_32)	00000000h
1080h	4	REG TGPIOCTL2 (TGPIO2_CTL_REG)	00002000h
1084h	4	REG TGPIOCOMPV2_31_0 (TGPIO2_COMPV_31_0)	00000000h
1088h	4	REG TGPIOCOMPV2_63_32 (TGPIO2_COMPV_63_32)	00000000h
108Ch	4	REG TGPIOPIV2_31_0 (TGPIO2_PIV_31_0)	00000000h
1090h	4	REG TGPIOPIV2_63:32 (TGPIO2_PIV_63_32)	00000000h

Table 10-2. Summary of Bus: 0, Device: 19, Function: 4 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
1094h	4	REG TGPIOTCV2_31_0 (TGPIO2_TCV_31_0)	00000000h

10.2.1 GPIO Pin DirectionLock (GCCR) - Offset 0h

Register to lock GPIO Pin direction.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**GPDR_LOCK:** This bit locks the GPDR register from being modified and is a write once bit which is cleared on a powergood assertion. This field is valid both when GPIO is input or output. 0 = GPDR is Unlocked 1 = GPDR is Locked.

10.2.2 GPIO Pin Level (GPLR0) - Offset 4h

Register for reading current value of GPIO pin. Valid when GPIO direction set as input.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**GPLR0:** Check the state of each of the GPIO pins by reading the GPIO Pin Level register (GPLR). Each bit in the GPLR corresponds to one pin in the GPIO. GPLR0 31 to 0 correspond to GPIO 31 to 0. Use the GPLRx read-only registers to determine the current value of a particular pin (only available during GPIO input mode). For reserved bits, reads return zero.

10.2.3 GPIO Pin Level (GPLR1) - Offset 8h

Register for reading current value of GPIO pin. Valid when GPIO direction set as input.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**GPLR1:** Check the state of each of the GPIO pins by reading the GPIO Pin Level register (GPLR). Each bit in the GPLR corresponds to one pin in the GPIO. GPLR0 31 to 0 correspond to GPIO 31 to 0. Use the GPLRx read-only registers to determine the current value of a particular pin (only available during GPIO input mode). For reserved bits, reads return zero.

10.2.4 GPIO Pin Direction (GPDR0) - Offset 1Ch

Register to set GPIO direction.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GPDR0:** Setting whether a pin is an input or output is controlled by programming the GPIO pin direction registers (GPDR0-5). The GPDR registers contain one direction control bit for each of the 192 GPIO pins. If a direction bit is programmed to 1, the GPIO is an output. If it is programmed to 0, it is an input. A reset clears all bits in the GPDR0-5 registers and configures all GPIO pins as inputs.

10.2.5 GPIO Pin Direction (GPDR1) - Offset 20h

Register to set GPIO direction.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 20h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GPDR1:** Setting whether a pin is an input or output is controlled by programming the GPIO pin direction registers (GPDR0-5). The GPDR registers contain one direction control bit for each of the 192 GPIO pins. If a direction bit is programmed to 1, the GPIO is an output. If it is programmed to 0, it is an input. A reset clears all bits in the GPDR0-5 registers and configures all GPIO pins as inputs.

10.2.6 GPIO Pin Output Set (GPSR0) - Offset 34h

Register to assert GPIO output pin, valid for output pins.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 34h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h WO	**GPSR0:** When a GPIO is configured as an output, the state of the pin is controlled by writing to either the GPIO Pin Output Set registers (GPSR0-5) or the GPIO Pin Output Clear registers (GPCR0-5). An output pin is set by setting to its corresponding bit within the GPSR. To clear an output pin, set the corresponding GPCR bit. Writing 0 to any of the GPSR or GPCR bits has no effect on the state of the pin. Writing 1 to a GPSR or GPCR bit corresponding to a pin that is configured as an input is effective only after the pin is configured as an output. When a GPIO pin is reconfigured as an output, the most recent write to GPSR or GPCR determines the pins output state. The GPIO Pin-Output Set registers (GPSR0-5) and GPIO Pin-Output Clear registers (GPCR0-5) are write-only registers. Reads return unpredictable values. GPSR and GPCR arent actually registers they toggle the Set and Reset pins of a D-Flip-Flop. The reason for this implementation was to prevent the need for read-modify-writes from SW to toggle an external pin.

10.2.7 GPIO Pin Output Set (GPSR1) - Offset 38h

Register to assert GPIO output pin, valid for output pins.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 38h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h WO	**GPSR1:** When a GPIO is configured as an output, the state of the pin is controlled by writing to either the GPIO Pin Output Set registers (GPSR0-5) or the GPIO Pin Output Clear registers (GPCR0-5). An output pin is set by setting to its corresponding bit within the GPSR. To clear an output pin, set the corresponding GPCR bit. Writing 0 to any of the GPSR or GPCR bits has no effect on the state of the pin. Writing 1 to a GPSR or GPCR bit corresponding to a pin that is configured as an input is effective only after the pin is configured as an output. When a GPIO pin is reconfigured as an output, the most recent write to GPSR or GPCR determines the pins output state. The GPIO Pin-Output Set registers (GPSR0-5) and GPIO Pin-Output Clear registers (GPCR0-5) are write-only registers. Reads return unpredictable values. GPSR and GPCR arent actually registers they toggle the Set and Reset pins of a D-Flip-Flop. The reason for this implementation was to prevent the need for read-modify-writes from SW to toggle an external pin.

10.2.8 GPIO Pin Output Clear (GPCR0) - Offset 4Ch

Register to deassert GPIO output pin, valid for output pins.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h WO	**GPCR0:** When a GPIO is configured as an output, the state of the pin is controlled by writing to either the GPIO Pin Output Set registers (GPSR0-5) or the GPIO Pin Output Clear registers (GPCR0-5). An output pin is set by setting to its corresponding bit within the GPSR. To clear an output pin, set the corresponding GPCR bit. Writing 0 to any of the GPSR or GPCR bits has no effect on the state of the pin. Writing 1 to a GPSR or GPCR bit corresponding to a pin that is configured as an input is effective only after the pin is configured as an output. When a GPIO pin is reconfigured as an output, the most recent write to GPSR or GPCR determines the pins output state. The GPIO Pin-Output Set registers (GPSR0-5) and GPIO Pin-Output Clear registers (GPCR0-5) are write-only registers. Reads return unpredictable values. GPSR and GPCR arent actually registers they toggle the Set and Reset pins of a D-Flip-Flop. The reason for this implementation was to prevent the need for read-modify-writes from SW to toggle an external pin.

10.2.9 GPIO Pin Output Clear (GPCR1) - Offset 50h

Register to deassert GPIO output pin, valid for output pins.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 50h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h WO	**GPCR1:** When a GPIO is configured as an output, the state of the pin is controlled by writing to either the GPIO Pin Output Set registers (GPSR0-5) or the GPIO Pin Output Clear registers (GPCR0-5). An output pin is set by setting to its corresponding bit within the GPSR. To clear an output pin, set the corresponding GPCR bit. Writing 0 to any of the GPSR or GPCR bits has no effect on the state of the pin. Writing 1 to a GPSR or GPCR bit corresponding to a pin that is configured as an input is effective only after the pin is configured as an output. When a GPIO pin is reconfigured as an output, the most recent write to GPSR or GPCR determines the pins output state. The GPIO Pin-Output Set registers (GPSR0-5) and GPIO Pin-Output Clear registers (GPCR0-5) are write-only registers. Reads return unpredictable values. GPSR and GPCR arent actually registers they toggle the Set and Reset pins of a D-Flip-Flop. The reason for this implementation was to prevent the need for read-modify-writes from SW to toggle an external pin.

10.2.10 GPIO Rising Edge Detect Enable (GRER0) - Offset 64h

Register to enable rising edge detect for GPIO Input pin.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 64h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GRER0:** Each GPIO can also be programmed to detect rising-edge or falling-edge transition on a pin. When an edge is detected that matches the type of edge programmed for the pin, a status bit is set. The GPIO Rising-Edge Detect Enable register (GRERx) and Falling Edge Detect Enable register (GFERx) select the type of transition on a GPIO pin that causes an interrupt or wake to be propogated. For a given GPIO pin, if its corresponding GRER bit is set, an interrupt or wake source bit is set when the pin transitions from logic level zero to logic level one. Likewise, GFER sets the corresponding interrupt or wake source bit when a transition from logic level one to logic level zero occurs on the pin. When the corresponding bits are set in both registers, either a falling- or a rising-edge transition causes will cause the Interrupt or Wake Source registers to be set if they are unmasked. For the interrupt or wake source bits to be set it first has to be unmasked through the Interrupt Mask or Wake Mask register. Minimum pulse-width timing requirements exist to guarantee that an edge or level transition is detected.

10.2.11 GPIO Rising Edge Detect Enable (GRER1) - Offset 68h

Register to enable rising edge detect for GPIO Input pin.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 68h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GRER1:** Each GPIO can also be programmed to detect rising-edge or falling-edge transition on a pin. When an edge is detected that matches the type of edge programmed for the pin, a status bit is set. The GPIO Rising-Edge Detect Enable register (GRERx) and Falling Edge Detect Enable register (GFERx) select the type of transition on a GPIO pin that causes an interrupt or wake to be propogated. For a given GPIO pin, if its corresponding GRER bit is set, an interrupt or wake source bit is set when the pin transitions from logic level zero to logic level one. Likewise, GFER sets the corresponding interrupt or wake source bit when a transition from logic level one to logic level zero occurs on the pin. When the corresponding bits are set in both registers, either a falling- or a rising-edge transition causes will cause the Interrupt or Wake Source registers to be set if they are unmasked. For the interrupt or wake source bits to be set it first has to be unmasked through the Interrupt Mask or Wake Mask register. Minimum pulse-width timing requirements exist to guarantee that an edge or level transition is detected.

10.2.12 GPIO Falling Edge Detect Enable (GFER0) - Offset 7Ch

Register to enable falling edge detect for GPIO Input pin.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GFER0:** Each GPIO can also be programmed to detect rising-edge or falling-edge transition on a pin. When an edge is detected that matches the type of edge programmed for the pin, a status bit is set. The GPIO Rising-Edge Detect Enable register (GRERx) and Falling Edge Detect Enable register (GFERx) select the type of transition on a GPIO pin that causes an interrupt or wake to be propogated. For a given GPIO pin, if its corresponding GRER bit is set, an interrupt or wake source bit is set when the pin transitions from logic level zero to logic level one. Likewise, GFER sets the corresponding interrupt or wake source bit when a transition from logic level one to logic level zero occurs on the pin. When the corresponding bits are set in both registers, either a falling- or a rising-edge transition causes will cause the Interrupt or Wake Source registers to be set if they are unmasked. For the interrupt or wake source bits to be set it first has to be unmasked through the Interrupt Mask or Wake Mask register. Minimum pulse-width timing requirements exist to guarantee that an edge or level transition is detected.

10.2.13 GPIO Falling Edge Detect Enable (GFER1) - Offset 80h

Register to enable falling edge detect for GPIO Input pin.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 80h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GFER1:** Each GPIO can also be programmed to detect rising-edge or falling-edge transition on a pin. When an edge is detected that matches the type of edge programmed for the pin, a status bit is set. The GPIO Rising-Edge Detect Enable register (GRERx) and Falling Edge Detect Enable register (GFERx) select the type of transition on a GPIO pin that causes an interrupt or wake to be propogated. For a given GPIO pin, if its corresponding GRER bit is set, an interrupt or wake source bit is set when the pin transitions from logic level zero to logic level one. Likewise, GFER sets the corresponding interrupt or wake source bit when a transition from logic level one to logic level zero occurs on the pin. When the corresponding bits are set in both registers, either a falling- or a rising-edge transition causes will cause the Interrupt or Wake Source registers to be set if they are unmasked. For the interrupt or wake source bits to be set it first has to be unmasked through the Interrupt Mask or Wake Mask register. Minimum pulse-width timing requirements exist to guarantee that an edge or level transition is detected.

10.2.14 GPIO Glitch Filter Bypass (GFBR0) - Offset 94h

Register to bypass Glitch filter for input pin.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 94h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GFBR0:** The GPIO Glitch Filter Bypass registers (GFBR0-5) contain a total of 192 bits that correspond to the 192 GPIO pins. When in general purpose mode, all GPIO pins go through the glitch filter logic by default. The glitch filter allows input signals that are stable for a certain number of clock cycles to propagate to the GPIO edge detection logic. Each GPIO pin can be individually configured to bypass this glitch filter.

10.2.15 GPIO Glitch Filter Bypass (GFBR1) - Offset 98h

Register to bypass Glitch filter for input pin.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GFBR1:** The GPIO Glitch Filter Bypass registers (GFBR0-5) contain a total of 192 bits that correspond to the 192 GPIO pins. When in general purpose mode, all GPIO pins go through the glitch filter logic by default. The glitch filter allows input signals that are stable for a certain number of clock cycles to propagate to the GPIO edge detection logic. Each GPIO pin can be individually configured to bypass this glitch filter.

10.2.16 GPIO Interrupt Mask (GIMR0) - Offset ACh

Register to mask interrupts for GPIO input pins.

Type	Size	Offset	Default
MMIO	32 bit	BAR + ACh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GIMR0:** The GPIO Interrupt Mask, Interrupt Source, Wake Mask, and Wake Source registers are new registers for Tangier and are used to differentiate wakes and interrupts. These registers control if a GPIO pin is wake or interrupt enabled and the source registers contain information on which pin initiated the wake or interrupt.

10.2.17 GPIO Interrupt Mask (GIMR1) - Offset B0h

Register to mask interrupts for GPIO input pins.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GIMR1:** The GPIO Interrupt Mask, Interrupt Source, Wake Mask, and Wake Source registers are new registers for Tangier and are used to differentiate wakes and interrupts. These registers control if a GPIO pin is wake or interrupt enabled and the source registers contain information on which pin initiated the wake or interrupt.

10.2.18 GPIO Interrupt Source (GISR0) - Offset C4h

Register for interrupts status of GPIO input pins.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/1C	**GISR0:** The GPIO Interrupt Mask, Interrupt Source, Wake Mask, and Wake Source registers are new registers for Tangier and are used to differentiate wakes and interrupts. These registers control if a GPIO pin is wake or interrupt enabled and the source registers contain information on which pin initiated the wake or interrupt.

10.2.19 GPIO Interrupt Source (GISR1) - Offset C8h

Register for interrupts status of GPIO input pins.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/1C	**GISR1:** The GPIO Interrupt Mask, Interrupt Source, Wake Mask, and Wake Source registers are new registers for Tangier and are used to differentiate wakes and interrupts. These registers control if a GPIO pin is wake or interrupt enabled and the source registers contain information on which pin initiated the wake or interrupt.

10.2.20 GPIO Wake Mask (GWMR0) - Offset 100h

Register to mask wake from GPIO input pin.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 100h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GWMR0:** The GPIO Interrupt Mask, Interrupt Source, Wake Mask, and Wake Source registers are new registers for Tangier and are used to differentiate wakes and interrupts. These registers control if a GPIO pin is wake or interrupt enabled and the source registers contain information on which pin initiated the wake or interrupt.

10.2.21 GPIO Wake Mask (GWMR1) - Offset 104h

Register to mask wake from GPIO input pin.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 104h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GWMR1:** The GPIO Interrupt Mask, Interrupt Source, Wake Mask, and Wake Source registers are new registers for Tangier and are used to differentiate wakes and interrupts. These registers control if a GPIO pin is wake or interrupt enabled and the source registers contain information on which pin initiated the wake or interrupt.

10.2.22 GPIO Wake Source (GWSR0) - Offset 118h

Register for indicating wake source from GPIO input pin.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 118h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/1C	**GWSR0:** The GPIO Interrupt Mask, Interrupt Source, Wake Mask, and Wake Source registers are new registers for Tangier and are used to differentiate wakes and interrupts. These registers control if a GPIO pin is wake or interrupt enabled and the source registers contain information on which pin initiated the wake or interrupt.

10.2.23 GPIO Wake Source (GWSR1) - Offset 11Ch

Register for indicating wake source from GPIO input pin.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/1C	**GWSR1:** The GPIO Interrupt Mask, Interrupt Source, Wake Mask, and Wake Source registers are new registers for Tangier and are used to differentiate wakes and interrupts. These registers control if a GPIO pin is wake or interrupt enabled and the source registers contain information on which pin initiated the wake or interrupt.

10.2.24 GPIO Secure Input (GSEC) - Offset 130h

UNUSED FOR ISH.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 130h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GSEC:** 1 = Hide Pin Level Status Updates to GPLR and Mask Pin Interrupts to IO-APIC 0 = Unhidden.

10.2.25 REG TGPIOCTL0 (TGPIO0_CTL_REG) - Offset 1000h

TGPIO Control Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1000h	00002000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24:17	00h RW	**Periodic Sequence Length (TGPIO0_CTL_PRDC_SEQ_LEN_O):** 8'b0 = continues infinitely, Any other value defines the length of sequence.
16	0h RW	**EC Counter (TGPIO0_CTL_EC_CTR_O):** Applicable only when the GPIO is configured as an output. 1 b0 EC not used 1 b1 EC increments from whatever initial value was programmed every clock cycle. .
15:14	0h RW	**Input Event Control (TGPIO0_CTL_IN_EVNT_CTL_O):** This is applicable only when the GPIO is configured as an Input. 2 b00 An input transition will cause the EC to increment, Time Stamp to be captured in TCV and interrupt to be signaled if enabled. 2 b01 An input transition causes the EC to be incremented only. The EC value could be fed back by connecting the Output Event Counter to the Input Event counter pins. An interrupt could be signaled when a match occurs with the programmed value in the COMPV. 2 b10 - reserved 2 b11 - reserved .
13	1h RW	**Freeze Input Timestamp (TGPIO0_FREEZE_IN_TS_O):** When set the an input time stamp is captured and not cleared until the corresponding raw interrupt status bit is cleared.
12:10	0h RO	**Reserved**
9	0h RW	**Input Counter Select (TGPIO0_CTL_IN_CTR_SEL_O):** 0 Select Input Time Stamp Counter 1 Select Input Event Counter
8:5	0h RW	**Pulse Width Stretch (TGPIO0_CTL_PW_STRETCH_O):** Default - 2 clk cycles Range - 2 to 17 clk cycles
4	0h RW	**Periodic Mode (PM) (TGPIO0_CTL_PM_O):** 0 Periodic mode is disabled 1 Periodic mode is enabled
3:2	0h RW	**Event Polarity (EP) (TGPIO0_CTL_EP_O):** 00 Rising edge 01 Falling edge 10 Toggle edge 11 Reserved
1	0h RW	**Direction (DIR) (TGPIO0_CTL_DIR_O):** 0 Output 1 Input.
0	0h RW	**Enable (EN) (TGPIO0_CTL_EN_O):** 0 Timed GPIO is disabled 1 Timed GPIO is enabled

10.2.26 REG TGPIOCOMPV0_31_0 (TGPIO0_COMPV_31_0) - Offset 1004h

Comparator Value 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1004h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO0_COMPV_REG_31_0:** If periodic mode is not enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. The value in this register does not change. If periodic mode is enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. When this occurs, the value in this register is increased by the value in the Periodic Interval register.

10.2.27 REG TGPIOCOMPV0_63_32 (TGPIO0_COMPV_63_32) - Offset 1008h

Comparator Value 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1008h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO0_COMPV_REG_63_32:** If periodic mode is not enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. The value in this register does not change. If periodic mode is enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. When this occurs, the value in this register is increased by the value in the Periodic Interval register.

10.2.28 REG TGPIOPIV0_31_0 (TGPIO0_PIV_31_0) - Offset 100Ch

Periodic Interval Value 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 100Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TGPIO0_PIV_REG_31_0:** The value in this register is written by SW to set the interval for the periodic Timed GPIO event.

10.2.29 REG TGPIOPIV0_63:32 (TGPIO0_PIV_63_32) - Offset 1010h

Periodic Interval Value 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1010h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TGPIO0_PIV_REG_63_32:** The value in this register is written by SW to set the interval for the periodic Timed GPIO event.

10.2.30 REG TGPIOTCV0_31_0 (TGPIO0_TCV_31_0) - Offset 1014h

Timestamp Capture Value 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1014h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO0_TCV_REG_31_0:** When Timed GPIO event triggers, HW captures the current ART time into this register.

10.2.31 REG TGPIOTCV0_63_32 (TGPIO0_TCV_63_32) - Offset 1018h

Timestamp Capture Value 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1018h	00000000h

Comparator Mask Register 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1130h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TGPIO4_MATCH_MSK_REG_63_32:** When a bit in this register is set then the corresponding match function between the corresponding COMPV and input Timer Value are ignored and a match is forced.

10.2.90 REG TGPIOCTL5 (TGPIO5_CTL_REG) - Offset 1140h

TGPIO Control Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1140h	00002000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24:17	00h RW	**Periodic Sequence Length (TGPIO5_CTL_PRDC_SEQ_LEN_O):** 8'b0 = continues infinitely, Any other value defines the length of sequence.
16	0h RW	**EC Counter (TGPIO5_CTL_EC_CTR_O):** Applicable only when the GPIO is configured as an output. 1 b0 EC not used 1 b1 EC increments from whatever initial value was programmed every clock cycle.
15:14	0h RW	**Input Event Control (TGPIO5_CTL_IN_EVNT_CTL_O):** This is applicable only when the GPIO is configured as an Input. 2 b00 An input transition will cause the EC to increment, Time Stamp to be captured in TCV and interrupt to be signaled if enabled. 2 b01 An input transition causes the EC to be incremented only. The EC value could be fed back by connecting the Output Event Counter to the Input Event counter pins. An interrupt could be signaled when a match occurs with the programmed value in the COMPV. 2 b10 - reserved 2 b11 reserved.
13	1h RW	**Freeze Input Timestamp (TGPIO5_FREEZE_IN_TS_O):** When set the an input time stamp is captured and not cleared until the corresponding raw interrupt status bit is cleared.
12:10	0h RO	**Reserved**
9	0h RW	**Input Counter Select (TGPIO5_CTL_IN_CTR_SEL_O):** 0 Select Input Time Stamp Counter 1 Select Input Event Counter.
8:5	0h RW	**Pulse Width Stretch (TGPIO5_CTL_PW_STRETCH_O):** Default - 2 clk cycles Range - 2 to 17 clk cycles.
4	0h RW	**Periodic Mode (PM) (TGPIO5_CTL_PM_O):** 0 Periodic mode is disabled 1 Periodic mode is enabled.
3:2	0h RW	**Event Polarity (EP) (TGPIO5_CTL_EP_O):** 00 Rising edge 01 Falling edge 10 Toggle edge 11 Reserved.
1	0h RW	**Direction (DIR) (TGPIO5_CTL_DIR_O):** 0 Output 1 Input.
0	0h RW	**Enable (EN) (TGPIO5_CTL_EN_O):** 0 Timed GPIO is disabled 1 Timed GPIO is enabled.

10.2.91 REG TGPIOCOMPV5_31_0 (TGPIO5_COMPV_31_0) - Offset 1144h

Comparator Value 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1144h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO5_COMPV_REG_31_0:** If periodic mode is not enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. The value in this register does not change. If periodic mode is enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. When this occurs, the value in this register is increased by the value in the Periodic Interval register. .

10.2.92 REG TGPIOCOMPV5_63_32 (TGPIO5_COMPV_63_32) - Offset 1148h

Comparator Value 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1148h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO5_COMPV_REG_63_32:** If periodic mode is not enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. The value in this register does not change. If periodic mode is enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. When this occurs, the value in this register is increased by the value in the Periodic Interval register. .

10.2.93 REG TGPIOPIV5_31_0 (TGPIO5_PIV_31_0) - Offset 114Ch

Periodic Interval Value 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 114Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TGPIO5_PIV_REG_31_0:** The value in this register is written by SW to set the interval for the periodic Timed GPIO event.

10.2.94 REG TGPIOPIV5_63:32 (TGPIO5_PIV_63_32) - Offset 1150h

Periodic Interval Value 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1150h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TGPIO5_PIV_REG_63_32:** The value in this register is written by SW to set the interval for the periodic Timed GPIO event.

10.2.95 REG TGPIOTCV5_31_0 (TGPIO5_TCV_31_0) - Offset 1154h

Timestamp Capture Value 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1154h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO5_TCV_REG_31_0:** When Timed GPIO event triggers, HW captures the current ART time into this register.

10.2.96 REG TGPIOTCV5_63_32 (TGPIO5_TCV_63_32) - Offset 1158h

Timestamp Capture Value 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1158h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO5_TCV_REG_63_32:** When Timed GPIO event triggers, HW captures the current ART time into this register.

10.2.97 REG TGPIOECCV5_31_0 (TGPIO5_ECCV_31_0) - Offset 115Ch

Event Counter Capture Value 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 115Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO5_ECCV_REG_31_0:** The value in this register must be the Timed GPIO event count associated with the time captured in the Time Capture Value register.

10.2.98 REG TGPIOECCV5_63_32 (TGPIO5_ECCV_63_32) - Offset 1160h

Event Counter Capture Value 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1160h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO5_ECCV_REG_63_32:** The value in this register must be the Timed GPIO event count associated with the time captured in the Time Capture Value register.

10.2.99 REG TGPIOEC5_31_0 (TGPIO5_EC_31_0) - Offset 1164h

Event Counter Value 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1164h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO5_EC_REG_31_0:** When Timed GPIO is configured as input, event counter will increment by 1 for every input event triggered. When Timed GPIO is configured as output, event counter will increment by 1 for every output event generated.

10.2.100 REG TGPIOEC5_63_32 (TGPIO5_EC_63_32) - Offset 1168h

Event Counter Value 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1168h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO5_EC_REG_63_32:** When Timed GPIO is configured as input, event counter will increment by 1 for every input event triggered. When Timed GPIO is configured as output, event counter will increment by 1 for every output event generated.

10.2.101 REG TGPIOMATCHMASK5_31_0 (TGPIO5_MATCH_MASK_31_0) - Offset 116Ch

Comparator Mask Register 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 116Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TGPIO5_MATCH_MSK_REG_31_0:** When a bit in this register is set then the corresponding match function between the corresponding COMPV and input Timer Value are ignored and a match is forced.

10.2.102 REG TGPIOMATCHMASK5_63_32 (TGPIO5_MATCH_MASK_63_32) - Offset 1170h

Comparator Mask Register 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1170h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TGPIO5_MATCH_MSK_REG_63_32:** When a bit in this register is set then the corresponding match function between the corresponding COMPV and input Timer Value are ignored and a match is forced.

10.2.103 REG TGPIOCTL6 (TGPIO6_CTL_REG) - Offset 1180h

TGPIO Control Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1180h	00002000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24:17	00h RW	**Periodic Sequence Length (TGPIO6_CTL_PRDC_SEQ_LEN_O):** 8'b0 = continues infinitely, Any other value defines the length of sequence.
16	0h RW	**EC Counter (TGPIO6_CTL_EC_CTR_O):** Applicable only when the GPIO is configured as an output. 1 b0 EC not used 1 b1 EC increments from whatever initial value was programmed every clock cycle.
15:14	0h RW	**Input Event Control (TGPIO6_CTL_IN_EVNT_CTL_O):** This is applicable only when the GPIO is configured as an Input. 2 b00 An input transition will cause the EC to increment, Time Stamp to be captured in TCV and interrupt to be signaled if enabled. 2 b01 An input transition causes the EC to be incremented only. The EC value could be fed back by connecting the Output Event Counter to the Input Event counter pins. An interrupt could be signaled when a match occurs with the programmed value in the COMPV. 2 b10 - reserved 2 b11 reserved.
13	1h RW	**Freeze Input Timestamp (TGPIO6_FREEZE_IN_TS_O):** When set the an input time stamp is captured and not cleared until the corresponding raw interrupt status bit is cleared.
12:10	0h RO	**Reserved**
9	0h RW	**Input Counter Select (TGPIO6_CTL_IN_CTR_SEL_O):** 0 Select Input Time Stamp Counter 1 Select Input Event Counter.
8:5	0h RW	**Pulse Width Stretch (TGPIO6_CTL_PW_STRETCH_O):** Default - 2 clk cycles Range - 2 to 17 clk cycles.
4	0h RW	**Periodic Mode (PM) (TGPIO6_CTL_PM_O):** 0 Periodic mode is disabled 1 Periodic mode is enabled.
3:2	0h RW	**Event Polarity (EP) (TGPIO6_CTL_EP_O):** 00 Rising edge 01 Falling edge 10 Toggle edge 11 Reserved.
1	0h RW	**Direction (DIR) (TGPIO6_CTL_DIR_O):** 0 Output 1 Input.
0	0h RW	**Enable (EN) (TGPIO6_CTL_EN_O):** 0 Timed GPIO is disabled 1 Timed GPIO is enabled.

10.2.104 REG TGPIOCOMPV6_31_0 (TGPIO6_COMPV_31_0) - Offset 1184h

Comparator Value 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1184h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO6_COMPV_REG_31_0:** If periodic mode is not enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. The value in this register does not change. If periodic mode is enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. When this occurs, the value in this register is increased by the value in the Periodic Interval register. .

10.2.105 REG TGPIOCOMPV6_63_32 (TGPIO6_COMPV_63_32) - Offset 1188h

Comparator Value 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1188h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO6_COMPV_REG_63_32:** If periodic mode is not enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. The value in this register does not change. If periodic mode is enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. When this occurs, the value in this register is increased by the value in the Periodic Interval register. .

10.2.106 REG TGPIOPIV6_31_0 (TGPIO6_PIV_31_0) - Offset 118Ch

Periodic Interval Value 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 118Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TGPIO6_PIV_REG_31_0:** The value in this register is written by SW to set the interval for the periodic Timed GPIO event.

10.2.107 REG TGPIOPIV6_63:32 (TGPIO6_PIV_63_32) - Offset 1190h

Periodic Interval Value 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1190h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TGPIO6_PIV_REG_63_32:** The value in this register is written by SW to set the interval for the periodic Timed GPIO event.

10.2.108 REG TGPIOTCV6_31_0 (TGPIO6_TCV_31_0) - Offset 1194h

Timestamp Capture Value 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1194h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO6_TCV_REG_31_0:** When Timed GPIO event triggers, HW captures the current ART time into this register.

10.2.109 REG TGPIOTCV6_63_32 (TGPIO6_TCV_63_32) - Offset 1198h

Timestamp Capture Value 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1198h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO6_TCV_REG_63_32:** When Timed GPIO event triggers, HW captures the current ART time into this register.

10.2.110 REG TGPIOECCV6_31_0 (TGPIO6_ECCV_31_0) - Offset 119Ch

Event Counter Capture Value 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 119Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO6_ECCV_REG_31_0:** The value in this register must be the Timed GPIO event count associated with the time captured in the Time Capture Value register.

10.2.111 REG TGPIOECCV6_63_32 (TGPIO6_ECCV_63_32) - Offset 11A0h

Event Counter Capture Value 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11A0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO6_ECCV_REG_63_32:** The value in this register must be the Timed GPIO event count associated with the time captured in the Time Capture Value register.

10.2.112 REG TGPIOEC6_31_0 (TGPIO6_EC_31_0) - Offset 11A4h

Event Counter Value 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11A4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO6_EC_REG_31_0:** When Timed GPIO is configured as input, event counter will increment by 1 for every input event triggered. When Timed GPIO is configured as output, event counter will increment by 1 for every output event generated.

10.2.113 REG TGPIOEC6_63_32 (TGPIO6_EC_63_32) - Offset 11A8h

Event Counter Value 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11A8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO6_EC_REG_63_32:** When Timed GPIO is configured as input, event counter will increment by 1 for every input event triggered. When Timed GPIO is configured as output, event counter will increment by 1 for every output event generated.

10.2.114 REG TGPIOMATCHMASK6_31_0 (TGPIO6_MATCH_MASK_31_0) - Offset 11ACh

Comparator Mask Register 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11ACh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TGPIO6_MATCH_MSK_REG_31_0:** When a bit in this register is set then the corresponding match function between the corresponding COMPV and input Timer Value are ignored and a match is forced.

10.2.115 REG TGPIOMATCHMASK6_63_32 (TGPIO6_MATCH_MASK_63_32) - Offset 11B0h

Comparator Mask Register 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TGPIO6_MATCH_MSK_REG_63_32:** When a bit in this register is set then the corresponding match function between the corresponding COMPV and input Timer Value are ignored and a match is forced.

10.2.116 REG TGPIOCTL7 (TGPIO7_CTL_REG) - Offset 11C0h

TGPIO Control Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11C0h	00002000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24:17	00h RW	**Periodic Sequence Length (TGPIO7_CTL_PRDC_SEQ_LEN_O):** 8'b0 = continues infinitely, Any other value defines the length of sequence.

Timestamp Capture Value 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1358h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO13_TCV_REG_63_32:** When Timed GPIO event triggers, HW captures the current ART time into this register.

10.2.201 REG TGPIOECCV13_31_0 (TGPIO13_ECCV_31_0) - Offset 135Ch

Event Counter Capture Value 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 135Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO13_ECCV_REG_31_0:** The value in this register must be the Timed GPIO event count associated with the time captured in the Time Capture Value register.

10.2.202 REG TGPIOECCV13_63_32 (TGPIO13_ECCV_63_32) - Offset 1360h

Event Counter Capture Value 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1360h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO13_ECCV_REG_63_32:** The value in this register must be the Timed GPIO event count associated with the time captured in the Time Capture Value register.

10.2.203 REG TGPIOEC13_31_0 (TGPIO13_EC_31_0) - Offset 1364h

Event Counter Value 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1364h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO13_EC_REG_31_0:** When Timed GPIO is configured as input, event counter will increment by 1 for every input event triggered. When Timed GPIO is configured as output, event counter will increment by 1 for every output event generated.

10.2.204 REG TGPIOEC13_63_32 (TGPIO13_EC_63_32) - Offset 1368h

Event Counter Value 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1368h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO13_EC_REG_63_32:** When Timed GPIO is configured as input, event counter will increment by 1 for every input event triggered. When Timed GPIO is configured as output, event counter will increment by 1 for every output event generated.

10.2.205 REG TGPIOMATCHMASK13_31_0 (TGPIO13_MATCH_MASK_31_0) - Offset 136Ch

Comparator Mask Register 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 136Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TGPIO13_MATCH_MSK_REG_31_0:** When a bit in this register is set then the corresponding match function between the corresponding COMPV and input Timer Value are ignored and a match is forced.

10.2.206 REG TGPIOMATCHMASK13_63_32 (TGPIO13_MATCH_MASK_63_32) - Offset 1370h

Comparator Mask Register 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1370h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TGPIO13_MATCH_MSK_REG_63_32:** When a bit in this register is set then the corresponding match function between the corresponding COMPV and input Timer Value are ignored and a match is forced.

10.2.207 REG TGPIOCTL14 (TGPIO14_CTL_REG) - Offset 1380h

TGPIO Control Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1380h	00002000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24:17	00h RW	**Periodic Sequence Length (TGPIO14_CTL_PRDC_SEQ_LEN_O):** 8'b0 = continues infinitely, Any other value defines the length of sequence.
16	0h RW	**EC Counter (TGPIO14_CTL_EC_CTR_O):** Applicable only when the GPIO is configured as an output. 1 b0 EC not used 1 b1 EC increments from whatever initial value was programmed every clock cycle.
15:14	0h RW	**Input Event Control (TGPIO14_CTL_IN_EVNT_CTL_O):** This is applicable only when the GPIO is configured as an Input. 2 b00 An input transition will cause the EC to increment, Time Stamp to be captured in TCV and interrupt to be signaled if enabled. 2 b01 An input transition causes the EC to be incremented only. The EC value could be fed back by connecting the Output Event Counter to the Input Event counter pins. An interrupt could be signaled when a match occurs with the programmed value in the COMPV. 2 b10 - reserved 2 b11 reserved.
13	1h RW	**Freeze Input Timestamp (TGPIO14_FREEZE_IN_TS_O):** When set the an input time stamp is captured and not cleared until the corresponding raw interrupt status bit is cleared.
12:10	0h RO	**Reserved**
9	0h RW	**Input Counter Select (TGPIO14_CTL_IN_CTR_SEL_O):** 0 Select Input Time Stamp Counter 1 Select Input Event Counter.
8:5	0h RW	**Pulse Width Stretch (TGPIO14_CTL_PW_STRETCH_O):** Default - 2 clk cycles Range - 2 to 17 clk cycles.
4	0h RW	**Periodic Mode (PM) (TGPIO14_CTL_PM_O):** 0 Periodic mode is disabled 1 Periodic mode is enabled.
3:2	0h RW	**Event Polarity (EP) (TGPIO14_CTL_EP_O):** 00 Rising edge 01 Falling edge 10 Toggle edge 11 Reserved.
1	0h RW	**Direction (DIR) (TGPIO14_CTL_DIR_O):** 0 Output 1 Input.
0	0h RW	**Enable (EN) (TGPIO14_CTL_EN_O):** 0 Timed GPIO is disabled 1 Timed GPIO is enabled.

10.2.208 REG TGPIOCOMPV14_31_0 (TGPIO14_COMPV_31_0) - Offset 1384h

Comparator Value 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1384h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO14_COMPV_REG_31_0:** If periodic mode is not enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. The value in this register does not change. If periodic mode is enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. When this occurs, the value in this register is increased by the value in the Periodic Interval register. .

10.2.209 REG TGPIOCOMPV14_63_32 (TGPIO14_COMPV_63_32) - Offset 1388h

Comparator Value 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1388h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO14_COMPV_REG_63_32:** If periodic mode is not enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. The value in this register does not change. If periodic mode is enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. When this occurs, the value in this register is increased by the value in the Periodic Interval register. .

10.2.210 REG TGPIOPIV14_31_0 (TGPIO14_PIV_31_0) - Offset 138Ch

Periodic Interval Value 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 138Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TGPIO14_PIV_REG_31_0:** The value in this register is written by SW to set the interval for the periodic Timed GPIO event.

10.2.211 REG TGPIOPIV14_63:32 (TGPIO14_PIV_63_32) - Offset 1390h

Periodic Interval Value 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1390h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TGPIO14_PIV_REG_63_32:** The value in this register is written by SW to set the interval for the periodic Timed GPIO event.

10.2.212 REG TGPIOTCV14_31_0 (TGPIO14_TCV_31_0) - Offset 1394h

Timestamp Capture Value 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1394h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO14_TCV_REG_31_0:** When Timed GPIO event triggers, HW captures the current ART time into this register.

10.2.213 REG TGPIOTCV14_63_32 (TGPIO14_TCV_63_32) - Offset 1398h

Timestamp Capture Value 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1398h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO14_TCV_REG_63_32:** When Timed GPIO event triggers, HW captures the current ART time into this register.

10.2.214 REG TGPIOECCV14_31_0 (TGPIO14_ECCV_31_0) - Offset 139Ch

Event Counter Capture Value 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 139Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO14_ECCV_REG_31_0:** The value in this register must be the Timed GPIO event count associated with the time captured in the Time Capture Value register.

10.2.215 REG TGPIOECCV14_63_32 (TGPIO14_ECCV_63_32) - Offset 13A0h

Event Counter Capture Value 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13A0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO14_ECCV_REG_63_32:** The value in this register must be the Timed GPIO event count associated with the time captured in the Time Capture Value register.

10.2.216 REG TGPIOEC14_31_0 (TGPIO14_EC_31_0) - Offset 13A4h

Event Counter Value 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13A4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO14_EC_REG_31_0:** When Timed GPIO is configured as input, event counter will increment by 1 for every input event triggered. When Timed GPIO is configured as output, event counter will increment by 1 for every output event generated.

10.2.217 REG TGPIOEC14_63_32 (TGPIO14_EC_63_32) - Offset 13A8h

Event Counter Value 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13A8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO14_EC_REG_63_32:** When Timed GPIO is configured as input, event counter will increment by 1 for every input event triggered. When Timed GPIO is configured as output, event counter will increment by 1 for every output event generated.

10.2.218 REG TGPIOMATCHMASK14_31_0 (TGPIO14_MATCH_MASK_31_0) - Offset 13ACh

Comparator Mask Register 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13ACh	00000000h

Bit Range	Default & Access	Field Name (ID): Description

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO19_COMPV_REG_31_0:** If periodic mode is not enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. The value in this register does not change. If periodic mode is enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. When this occurs, the value in this register is increased by the value in the Periodic Interval register. .

10.2.274 REG TGPIOCOMPV19_63_32 (TGPIO19_COMPV_63_32) - Offset 14C8h

Comparator Value 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14C8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO19_COMPV_REG_63_32:** If periodic mode is not enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. The value in this register does not change. If periodic mode is enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. When this occurs, the value in this register is increased by the value in the Periodic Interval register. .

10.2.275 REG TGPIOPIV19_31_0 (TGPIO19_PIV_31_0) - Offset 14CCh

Periodic Interval Value 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14CCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TGPIO19_PIV_REG_31_0:** The value in this register is written by SW to set the interval for the periodic Timed GPIO event.

10.2.276 REG TGPIOPIV19_63:32 (TGPIO19_PIV_63_32) - Offset 14D0h

Periodic Interval Value 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14D0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TGPIO19_PIV_REG_63_32:** The value in this register is written by SW to set the interval for the periodic Timed GPIO event.

10.2.277 REG TGPIOTCV19_31_0 (TGPIO19_TCV_31_0) - Offset 14D4h

Timestamp Capture Value 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO19_TCV_REG_31_0:** When Timed GPIO event triggers, HW captures the current ART time into this register.

10.2.278 REG TGPIOTCV19_63_32 (TGPIO19_TCV_63_32) - Offset 14D8h

Timestamp Capture Value 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO19_TCV_REG_63_32:** When Timed GPIO event triggers, HW captures the current ART time into this register.

10.2.279 REG TGPIOECCV19_31_0 (TGPIO19_ECCV_31_0) - Offset 14DCh

Event Counter Capture Value 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14DCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO19_ECCV_REG_31_0:** The value in this register must be the Timed GPIO event count associated with the time captured in the Time Capture Value register.

10.2.280 REG TGPIOECCV19_63_32 (TGPIO19_ECCV_63_32) - Offset 14E0h

Event Counter Capture Value 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14E0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO19_ECCV_REG_63_32:** The value in this register must be the Timed GPIO event count associated with the time captured in the Time Capture Value register.

10.2.281 REG TGPIOEC19_31_0 (TGPIO19_EC_31_0) - Offset 14E4h

Event Counter Value 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO19_EC_REG_31_0:** When Timed GPIO is configured as input, event counter will increment by 1 for every input event triggered. When Timed GPIO is configured as output, event counter will increment by 1 for every output event generated.

10.2.282 REG TGPIOEC19_63_32 (TGPIO19_EC_63_32) - Offset 14E8h

Event Counter Value 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14E8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO19_EC_REG_63_32:** When Timed GPIO is configured as input, event counter will increment by 1 for every input event triggered. When Timed GPIO is configured as output, event counter will increment by 1 for every output event generated.

10.2.283 REG TGPIOMATCHMASK19_31_0 (TGPIO19_MATCH_MASK_31_0) - Offset 14ECh

Comparator Mask Register 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14ECh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TGPIO19_MATCH_MSK_REG_31_0:** When a bit in this register is set then the corresponding match function between the corresponding COMPV and input Timer Value are ignored and a match is forced.

10.2.284 REG TGPIOMATCHMASK19_63_32 (TGPIO19_MATCH_MASK_63_32) - Offset 14F0h

Comparator Mask Register 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14F0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TGPIO19_MATCH_MSK_REG_63_32:** When a bit in this register is set then the corresponding match function between the corresponding COMPV and input Timer Value are ignored and a match is forced.

10.2.285 REG TGPIOINTRCTL (TGPIO_INTR_CTL_REG) - Offset 1500h

Interrupt Control Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1500h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**Disable Interrupt Coalescing (TGPIO_INTR_COALESCE_DISABLE):** When set will prevent coalescing of interrupts. The default is to enable interrupt coalescing.

10.2.286 REG TGPIORIS (TGPIO_INTR_RIS_REG) - Offset 1504h

Raw Interrupt Status Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1504h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved**
25	0h RO	**TGPIO_RIS_TMT_NESC_WRAP_GLOBAL:** Set when the TMT GLOBAL nanosecond counter wraps which is about every 1s.
24	0h RO	**TGPIO_RIS_TMT_NESC_WRAP_WORKING:** Set when the TMT WORKING nanosecond counter wraps which is about every 1s.
23	0h RO	**TGPIO_RIS_TMT_NESC_WRAP_TSG:** Set when the TMT TSG nanosecond counter wraps which is about every 1s.
22	0h RO	**Time Adjust Complete TADJ_TMT_GLOBAL_CMPLT (TGPIO_RIS_TADJ_TMT_GLOBAL_CMPLT):** 0-No Interrupt 1-Interrupt.
21	0h RO	**Time Adjust Complete TADJ_TMT_WORKING_CMPLT (TGPIO_RIS_TADJ_TMT_WORKING_CMPLT):** 0-No Interrupt 1-Interrupt.
20	0h RO	**Time Adjust Complete TADJ_TMT_TSG_CMPLT (TGPIO_RIS_TADJ_TMT_TSG_CMPLT):** 0-No Interrupt 1-Interrupt.
19:0	00000h RO	**Event Interrupt (TGPIO_RIS_EVENT_INTR):** 0-No Interrupt 1-Interrupt Pending.

10.2.287 REG TGPIOMSC (TGPIO_INTR_MSC_REG) - Offset 1508h

Interrupt Mask Control Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1508h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved**
25	0h RW	**TGPIO_MSC_TMT_NESC_WRAP_GLOBAL_EN:** 0-Interrupt Disabled 1-Interrupt Enabled.
24	0h RW	**TGPIO_MSC_TMT_NESC_WRAP_WORKING_EN:** 0-Interrupt Disabled 1-Interrupt Enabled.
23	0h RW	**TGPIO_MSC_TMT_NESC_WRAP_TSG_EN:** 0-Interrupt Disabled 1-Interrupt Enabled.
22	0h RW	**Time Adjust Complete Enable TADJ_TMT_GLOBAL_EN (TGPIO_MSC_TADJ_TMT_GLOBAL_EN):** 0-Interrupt Disabled 1-Interrupt Enabled.
21	0h RW	**Time Adjust Complete Enable TADJ_TMT_WORKING_EN (TGPIO_MSC_TADJ_TMT_WORKING_EN):** 0-Interrupt Disabled 1-Interrupt Enabled.
20	0h RW	**Time Adjust Complete Enable TADJ_TMT_TSG_EN (TGPIO_MSC_TADJ_TMT_TSG_EN):** 0-Interrupt Disabled 1-Interrupt Enabled.
19:0	00000h RW	**Event Interrupt (TGPIO_MSC_EVENT_INTR):** 0-Interrupt Disabled 1-Interrupt Enabled.

10.2.288 REG TGPIOMIS (TGPIO_INTR_MIS_REG) - Offset 150Ch

Masked Interrupt Status Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 150Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved**
25	0h RO	**TGPIO_MIS_TMT_NESC_WRAP_GLOBAL:** 0- No Interrupt 1-Interrupt.
24	0h RO	**TGPIO_MIS_TMT_NESC_WRAP_WORKING:** 0- No Interrupt 1-Interrupt.
23	0h RO	**TGPIO_MIS_TMT_NESC_WRAP_TSG:** 0- No Interrupt 1-Interrupt.
22	0h RO	**Time Adjust Complete TADJ_TMT_GLOBAL_CMPLT (TGPIO_MIS_TADJ_TMT_GLOBAL):** 0- No Interrupt 1-Interrupt.

Bit Range	Default & Access	Field Name (ID): Description
21	0h RO	**Time Adjust Complete TADJ_TMT_WORKING_CMPLT (TGPIO_MIS_TADJ_TMT_WORKING):** 0- No Interrupt 1-Interrupt.
20	0h RO	**Time Adjust Complete TADJ_TMT_TSG_CMPLT (TGPIO_MIS_TADJ_TMT_TSG):** 0- No Interrupt 1-Interrupt.
19:0	00000h RO	**Event Interrupt (TGPIO_MIS_EVENT_INTR):** 1-No Interrupt 2-Interrupt Pending.

10.2.289 REG TGPIOICR (TGPIO_INTR_ICR_REG) - Offset 1510h

Interrupt Clear Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1510h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved**
25	0h WO	**TGPIO_ICR_TMT_NESC_WRAP_GLOBAL:** 0 No change 1-Clear Interrupt Request.
24	0h WO	**TGPIO_ICR_TMT_NESC_WRAP_WORKING:** 0 No change 1-Clear Interrupt Request.
23	0h WO	**TGPIO_ICR_TMT_NESC_WRAP_TSG:** 0 No change 1-Clear Interrupt Request.
22	0h WO	**Clear Time Adjust Complete CLR_TADJ_TMT_GLOBAL_CMPLT (TGPIO_ICR_CLR_TADJ_TMT_GLOBAL):** 0 No change 1-Clear Interrupt Request.
21	0h WO	**Clear Time Adjust Complete CLR_TADJ_TMT_WORKING_CMPLT (TGPIO_ICR_CLR_TADJ_TMT_WORKING):** 0 No change 1-Clear Interrupt Request.
20	0h WO	**Clear Time Adjust Complete CLR_TADJ_TMT_TSG_CMPLT (TGPIO_ICR_CLR_TADJ_TMT_TSG):** 0 No change 1-Clear Interrupt Request.
19:0	00000h WO	**Clear Event Interrupt [19:0] (TGPIO_ICR_CLR_EVENT_INTR):** 0 No change 1-Clear Interrupt Request.

10.2.290 REG TGPIO_CLK_SEL_REG (TGPIO_CLK_SEL_REG) - Offset 1514h

Timed GPIO Clock Select Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1514h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19:0	00000h RW	**Clock Select (TGPIO_CLK_SEL_REG):** Timed GPIO clock select register.

10.2.291 REG TGPIO_CLK_SEL_REG (TGPIO_XTAL_CG_REG) - Offset 1518h

Timed GPIO XTAL Clock Gate Enable Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1518h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**TGPIO_XTL_CG_REG:** This clock needs to be gated before writing to the clk_sel register.

10.2.292 Reg TGPIO_PTP_CG_REG (TGPIO_PTP_CG_REG) - Offset 151Ch

Timed GPIO PTP Clock Gate Enable Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 151Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**TGPIO_PPT_CG_REG:** This clock needs to be gated before writing to the clk_sel register.

10.2.293 REG TGPIO_TS_SEL_0_REG (TGPIO_TS_SEL_0_REG) - Offset 1520h

TGPIO Input Timestamp Select Register 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1520h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Timestamp Select 0 (TGPIO_TS_SEL_0_REG):** TGPIO input timestamp select register 0.

10.2.294 REG TGPIO_TS_SEL_1_REG (TGPIO_TS_SEL_1_REG) - Offset 1524h

TGPIO Input Timestamp Select Register 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1524h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Timestamp Select 1 (TGPIO_TS_SEL_1_REG):** TGPIO input timestamp select register 1.

10.2.295 REG TMT_CLK_SEL_REG (TGPIO_TMT_CLK_SEL_REG) - Offset 1528h

TMT Clock Select Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1528h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2:0	0h RW	**TMT Clock Select (TGPIO_TMT_CLK_SEL_REG):** TMT clock select register.

10.2.296 REG TGPIO_TSC_CTL_REG (TGPIO_CTS_ENABLE_REG) - Offset 1530h

TGPIO Cross Timestamp Control Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1530h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:4	0h RW	**TMT CTS En 2 (TMT_CTS_ENABLE_REG_2):** TMT Cross Time Stamp Control [2].
3:2	0h RW	**TMT CTS En 1 (TMT_CTS_ENABLE_REG_1):** TMT Cross Time Stamp Control [1].
1:0	0h RW	**TMT CTS En 0 (TMT_CTS_ENABLE_REG_0):** TMT Cross Time Stamp Control [0].

10.2.297 REG TGPIO_TSC_STATUS_REG (TGPIO_CTS_VALID_REG) - Offset 1534h

TGPIO Cross Timestamp Status Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1534h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:4	0h RO	**TMT CTS STATUS 2 (TMT_CTS_VALID_REG_2):** TMT Cross Time Stamp Status [2].
3:2	0h RO	**TMT CTS STATUS 1 (TMT_CTS_VALID_REG_1):** TMT Cross Time Stamp Status [1].
1:0	0h RO	**TMT CTS STATUS 0 (TMT_CTS_VALID_REG_0):** TMT Cross Time Stamp Status [0].

10.2.298 REG TMTCTL_TSG (TMT_CTL_TSG_REG) - Offset 1600h

TMT Control Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1600h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**TMT ENABLE (TGPIO_TMT_CTRL_TSG_REG):** Enables incrementing TMT when set Should be cleared before initializing TMT.

10.2.299 REG TMTR_TSG (TMTR_TSG_REG) - Offset 1604h

TMT Timestamp Residue Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1604h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO_TMT_TMTR_TSG_REG:** TMT residue value defined with a resolution of 2^-32ns.

10.2.300 REG TMTL_TSG (TMTL_TSG_REG) - Offset 1608h

TMT Timestamp Low Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1608h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:0	00000000h RW/V	**TGPIO_TMT_TMTL_TSG_REG:** Lower Half of the TMT defined in ns..

10.2.301 REG TMTH_TSG (TMTH_TSG_REG) - Offset 160Ch

TMT Timestamp High Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 160Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO_TMT_TMTH_TSG_REG:** Upper Half of the TMT defined in ns.

10.2.302 REG TIMINCA_TSG (TMT_TIMINCA_TSG_REG) - Offset 1610h

TMT Time Increment Adjust Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1610h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**TGPIO_TMT_TSG_TIMINCA_ISIGN:** Increment Sign 0 Each 5ns cycle add to the TMT Timer a value of 5ns + Incvalue*2^-32ns 1 Each 5ns cycle add to the TMT Timer a value of 5ns IncValue*2^-32ns.
30:0	00000000h RW	**TGPIO_TMT_TSG_TIMINCA_INC_VALUE:** Increment Value to be added or subtracted from 5ns clock cycle.

10.2.303 REG TIMADJ_TSG (TMT_TIMADJ_TSG_REG) - Offset 1614h

TMT Time Offset Adjust Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1614h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**TGPIO_TMT_TSG_TIMADJ_SIGN:** 0 = positive 1 = Negative.
30	0h RW	**Zero Bit (TGPIO_TMT_TSG_TIMADJ_ZERO_BIT):** Zero bit.
29:0	00000000h RW	**TGPIO_TMT_TSG_TIMADJ_TADJUS:** Time Adjust Value.

10.2.304 REG LXTS_TMT_HIGH_TSG (TMT_LXTS_SNAPSHOT_TSG_REG_1) - Offset 1618h

TMT Local Cross Timestamp Snapshot Register 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1618h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_TMTH_TSG_REG:** TMTH captured when a local cross time stamp capture is enabled.

10.2.305 REG LXTS_TMT_LOW_TSG (TMT_LXTS_SNAPSHOT_TSG_REG_0) - Offset 161Ch

TMT Local Cross Timestamp Snapshot Register 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 161Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_TMTL_TSG_REG:** TMTL captured when a local cross time stamp capture is enabled.

10.2.306 REG LXTS_ART_HIGH_TSG (TMT_ART_SNAPSHOT_TSG_REG_1) - Offset 1620h

TMT Local Cross Timestamp ART Snapshot Register 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1620h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_ART_HIGH_TSG_REG:** ART bits [63:0] captured when a local cross time stamp capture is enabled.

10.2.307 REG LXTS_ART_LOW_TSG (TMT_ART_SNAPSHOT_TSG_REG_0) - Offset 1624h

TMT Local Cross Timestamp ART Snapshot Register 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1624h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_ART_LOW_TSG_REG:** ART bits [31:0]captured when a local cross time stamp capture is enabled.

10.2.308 REG RXTS_TMT_HIGH_TSG (TMT_RXTS_SNAPSHOT_TSG_REG_1) - Offset 1628h

TMT Remote Cross Timestamp Snapshot Register 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1628h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_RXTS_TMTH_TSG_REG:** TMTH captured when a remote time stamp capture is enabled.

10.2.309 REG RXTS_TMT_LOW_TSG (TMT_RXTS_SNAPSHOT_TSG_REG_0) - Offset 162Ch

TMT Remote Cross Timestamp Snapshot Register 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 162Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_RXTS_TMTL_TSG_REG:** TMTL captured when a remote time stamp capture is enabled.

10.2.310 REG TMTCTL_GLOBAL (TMT_CTL_GLOBAL_REG) - Offset 1640h

TMT Control Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1640h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**TMT ENABLE (TGPIO_TMT_CTRL_GLOBAL_REG):** Enables incrementing TMT when set Should be cleared before initializing TMT.

10.2.311 REG TMTR_GLOBAL (TMTR_GLOBAL_REG) - Offset 1644h

TMT Timestamp Residue Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1644h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO_TMT_TMTR_GLOBAL_REG:** TMT residue value defined with a resolution of 2^-32ns.

10.2.312 REG TMTL_GLOBAL (TMTL_GLOBAL_REG) - Offset 1648h

TMT Timestamp Low Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1648h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:0	00000000h RW/V	**TGPIO_TMT_TMTL_GLOBAL_REG:** Lower Half of the TMT defined in ns..

10.2.313 REG TMTH_GLOBAL (TMTH_GLOBAL_REG) - Offset 164Ch

TMT Timestamp High Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 164Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO_TMT_TMTH_GLOBAL_REG:** Upper Half of the TMT defined in ns.

10.2.314 REG TIMINCA_GLOBAL (TMT_TIMINCA_GLOBAL_REG) - Offset 1650h

TMT Time Increment Adjust Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1650h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**TGPIO_TMT_GLOBAL_TIMINCA_ISIGN:** Increment Sign 0 Each 5ns cycle add to the TMT Timer a value of 5ns + Incvalue*2^-32ns 1 Each 5ns cycle add to the TMT Timer a value of 5ns IncValue*2^-32ns.
30:0	00000000h RW	**TGPIO_TMT_GLOBAL_TIMINCA_INC_VALUE:** Increment Value to be added or subtracted from 5ns clock cycle.

10.2.315 REG TIMADJ_GLOBAL (TMT_TIMADJ_GLOBAL_REG) - Offset 1654h

TMT Time Offset Adjust register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1654h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**TGPIO_TMT_GLOBAL_TIMADJ_SIGN:** 0 = positive 1 = Negative.
30	0h RW	**Zero Bit (TGPIO_TMT_GLOBAL_TIMADJ_ZERO_BIT):** Zero bit.
29:0	00000000h RW	**TGPIO_TMT_GLOBAL_TIMADJ_TADJUS:** Time Adjust Value.

10.2.316 REG LXTS_TMT_LOW_GLOBAL (TMT_LXTS_SNAPSHOT_GLOBAL_REG_0) - Offset 1658h

TMT Local Cross Timestamp Snapshot Register 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1658h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_TMTL_GLOBAL_REG:** TMTL captured when a local cross time stamp capture is enabled.

10.2.317 REG LXTS_TMT_HIGH_GLOBAL (TMT_LXTS_SNAPSHOT_GLOBAL_REG_1) - Offset 165Ch

TMT Local Cross Timestamp Snapshot Register 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 165Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_TMTH_GLOBAL_REG:** TMTH captured when a local cross time stamp capture is enabled.

10.2.318 REG LXTS_ART_LOW_GLOBAL (TMT_ART_SNAPSHOT_GLOBAL_REG_0) - Offset 1660h

TMT Local Cross Timestamp ART Snapshot Register 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1660h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_ART_LOW_GLOBAL_REG:** ART bits [31:0]captured when a local cross time stamp capture is enabled.

10.2.319 REG LXTS_ART_HIGH_GLOBAL (TMT_ART_SNAPSHOT_GLOBAL_REG_1) - Offset 1664h

TMT lOcal Cross Timestamp ART Snapshot Register 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1664h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_ART_HIGH_GLOBAL_REG:** ART bits [63:0] captured when a local cross time stamp capture is enabled.

10.2.320 REG RXTS_TMT_LOW_GLOBAL (TMT_RXTS_SNAPSHOT_GLOBAL_REG_0) - Offset 1668h

TMT Remote Cross Timestamp Snapshot Register 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1668h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_RXTS_TMTL_GLOBAL_REG:** TMTL captured when a remote time stamp capture is enabled.

10.2.321 REG RXTS_TMT_HIGH_GLOBAL (TMT_RXTS_SNAPSHOT_GLOBAL_REG_1) - Offset 166Ch

TMT Remote Cross Timestamp Snapshot Register 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 166Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_RXTS_TMTH_GLOBAL_REG:** TMTH captured when a remote time stamp capture is enabled.

10.2.322 REG TMTCTL_WORKING (TMT_CTL_WORKING_REG) - Offset 1680h

TMT Control Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1680h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**TMT ENABLE (TGPIO_TMT_CTRL_WORKING_REG):** Enables incrementing TMT when set Should be cleared before initializing TMT.

10.2.323 REG TMTR_WORKING (TMTR_WORKING_REG) - Offset 1684h

TMT Timestamp Residue Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1684h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO_TMT_TMTR_WORKING_REG:** TMT residue value defined with a resolution of 2^-32ns.

10.2.324 REG TMTL_WORKING (TMTL_WORKING_REG) - Offset 1688h

TMT Timestamp Low Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1688h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:0	00000000h RW/V	**TGPIO_TMT_TMTL_WORKING_REG:** Lower Half of the TMT defined in ns..

10.2.325 REG TMTH_WORKING (TMTH_WORKING_REG) - Offset 168Ch

TMT Timestamp High Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 168Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO_TMT_TMTH_WORKING_REG:** Upper Half of the TMT defined in ns.

10.2.326 REG TIMINCA_WORKING (TMT_TIMINCA_WORKING_REG) - Offset 1690h

TMT Time Increment Adjust Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1690h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**TGPIO_TMT_WORKING_TIMINCA_ISIGN:** Increment Sign 0 Each 5ns cycle add to the TMT Timer a value of 5ns + Incvalue*2^-32ns 1 Each 5ns cycle add to the TMT Timer a value of 5ns IncValue*2^-32ns.
30:0	00000000h RW	**TGPIO_TMT_WORKING_TIMINCA_INC_VALUE:** Increment Value to be added or subtracted from 5ns clock cycle.

10.2.327 REG TIMADJ_WORKING (TMT_TIMADJ_WORKING_REG) - Offset 1694h

TMT Time Offset Adjust register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1694h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**TGPIO_TMT_WORKING_TIMADJ_SIGN:** 0 = positive 1 = Negative.
30	0h RW	**Zero Bit (TGPIO_TMT_WORKING_TIMADJ_ZERO_BIT):** Zero bit.
29:0	00000000h RW	**TGPIO_TMT_WORKING_TIMADJ_TADJUS:** Time Adjust Value.

10.2.328 REG LXTS_TMT_LOW_WORKING (TMT_LXTS_SNAPSHOT_WORKING_REG_0) - Offset 1698h

TMT Local Cross Timestamp Snapshot Register 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1698h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_TMTL_WORKING_REG:** TMTL captured when a local cross time stamp capture is enabled.

10.2.329 REG LXTS_TMT_HIGH_WORKING (TMT_LXTS_SNAPSHOT_WORKING_REG_1) - Offset 169Ch

TMT Local Cross Timestamp Snapshot Register 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 169Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_TMTH_WORKING_REG:** TMTH captured when a local cross time stamp capture is enabled.

10.2.330 REG LXTS_ART_LOW_WORKING (TMT_ART_SNAPSHOT_WORKING_REG_0) - Offset 16A0h

TMT Local Cross Timestamp ART Snapshot Register 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 16A0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_ART_LOW_WORKING_REG:** ART bits [31:0]captured when a local cross time stamp capture is enabled.

10.2.331 REG LXTS_ART_HIGH_WORKING (TMT_ART_SNAPSHOT_WORKING_REG_1) - Offset 16A4h

TMT Local Cross Timestamp ART Snapshot Register 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 16A4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_ART_HIGH_WORKING_REG:** ART bits [63:0] captured when a local cross time stamp capture is enabled.

10.2.332 REG RXTS_TMT_LOW_WORKING (TMT_RXTS_SNAPSHOT_WORKING_REG_0) - Offset 16A8h

TMT Remote Cross Timestamp Snapshot Register 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 16A8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_RXTS_TMTL_WORKING_REG:** TMTL captured when a remote time stamp capture is enabled.

10.2.333 REG RXTS_TMT_HIGH_WORKING (TMT_RXTS_SNAPSHOT_WORKING_REG_1) - Offset 16ACh

TMT Remote Cross Timestamp Snapshot Register 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 16ACh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_RXTS_TMTH_WORKING_REG:** TMTH captured when a remote time stamp capture is enabled.

10.2.334 D0i3 Control (D0I3C) - Offset 2000h

This register is will be used for D0i3 SW flow. This will be mapped to a different MMIO address from the other IPC registers. (MMIO and OCP address value are yet to be done) The description below also includes the type of access expected for the ISH FW for each configuration bit:
1. The Restore Required (RR) bit (bit [3]) should be RW for the ISH FW which can determine when to set and/or clear these bits depending on when the ISH FW determines whether restore is required although for ISH restore is never required since the power is never lost.
2. The D0i3 (i3) bit (bit [2]) should be RO for ISH FW as it needs to be written only by host SW. The ISH FW can determine to go to a low power state based on this bit.
3. The Interrupt Required (IR) bit (bit [1]) can be RO register for ISH FW and ISH FW can send an interrupt to Host by writing to the ish2host IPC doorbell register when this bit is set by SW.
4. The Command in Progress (CIP) register bit (bit [0]) is HW set and need to be cleared by ISH FW.
A simple edge detect logic can be used for the setting of this bit in HW. The CIP register bit will be tied to a RTE entry in the IOAPIC as an interrupt source. Hence ISH FW will get an interrupt when the In addition to the registers, the IOSF2OCP Bridge should be parameterized for the following:
1. The device idle capability parameter (ENABLE_PCI_IDLE_CAP) need to be connected to a soft strap for ISH with a value of 1.
2. The STRAP for the MMIO address (strap_d0i3_offset) of D0i3 register (IPC offset address: h6D0) and the d0i3 valid (strap_d0i3_valid) bit needs should be appropriately tied.
3. The PCE register is made RO register by setting the appropriate parameter (Bridge top level strap: set_device_pg_config_type[5:0] is set to all 0s). This registers reset and clock domain will be in the OCP domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 2000h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4	0h RO	**Interrupt Request Capable (IRC):** Set to 1 by HW if it is capable of generating an interrupt on command completion, else 0. For ISH this bit will be tied to 0.
3	1h RW/1C	**Restore Required (RR):** When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**D0I3:** SW sets this bit to 1 to move the IP into the D0i3 state. Writing this bit to 0 will return the IP to the fully active D0 state (D0i0).
1	0h RW	**Interrupt Required (IR):** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this on each write to this register.
0	0h RO/V	**Command In Progress (CIP):** HW sets this bit on a 1->0 or 0->1 transition of bit [2]. While set, the other bits in this register are not valid and it is illegal for SW to write to any bit in this register. When clear all the other bits in the register are valid and SW may write to any bit.

10.2.335 Clock Gating And Soft Reset (CGSR) - Offset 2004h

This register is used to Clock Gate or Soft Reset an IP by Host/Remote Host. Also register field of this register can be used for device idle status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 2004h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Idle Indication To Host (IDLE):** IP IDLE indication.
30:17	0h RO	**Reserved**
16	0h RW	**Clock Gate Enable (CG):** Setting this field to 1 clock gates the IP.
15:1	0h RO	**Reserved**
0	0h RW	**Soft Reset (SR):** Setting this bit to 1 resets the IP.

11 Universal Asynchronous Receiver-Transmitter (UART) Interface

11.1 UART Configuration Registers Summary

This chapter documents the registers of the Intel® PSE devices. This contains multiple Intel® PSE UART Controller devices:

- Intel® PSE UART Controller #0 - Bus: 0, Device: 17, Function: 0
- Intel® PSE UART Controller #1 - Bus: 0, Device: 17, Function: 1
- Intel® PSE UART Controller #2 - Bus: 0, Device: 17, Function: 2
- Intel® PSE UART Controller #3 - Bus: 0, Device: 17, Function: 3
- Intel® PSE UART Controller #4 - Bus: 0, Device: 17, Function: 4
- Intel® PSE UART Controller #5 - Bus: 0, Device: 17, Function: 5

DID Values:

- Intel® PSE UART Controller #0:- D17: F0 - 4B96h
- Intel® PSE UART Controller #1:- D17: F1 - 4B97h
- Intel® PSE UART Controller #2:- D17: F2 - 4B98h
- Intel® PSE UART Controller #3:- D17: F3 - 4B99h
- Intel® PSE UART Controller #4:- D17: F4 - 4B9Ah
- Intel® PSE UART Controller #5:- D17: F5 - 4B9Bh

Table 11-1. Summary of Bus: 0, Device: 17, Function: 0 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	Device ID And Vendor ID Register (DEVVENDID) - Offset 0h	4B960000h
4h	4	Status And Command (STATUSCOMMAND) - Offset 4h	00100000h
8h	4	Revision ID And Class Code (REVCLASSCODE) - Offset 8h	00000000h
Ch	4	Cache Line Latency Header And BIST (CLLATHEADERBIST) - Offset Ch	00000000h
10h	4	Base Address Register (BAR) - Offset 10h	00000000h
14h	4	Base Address Register High (BAR_HIGH) - Offset 14h	00000000h
18h	4	Base Address Register1 (BAR1) - Offset 18h	00000000h
1Ch	4	Base Address Register1 High (BAR1_HIGH) - Offset 1Ch	00000000h
2Ch	4	Subsystem Vendor and Subsystem ID (SUBSYSTEMID) - Offset 2Ch	00000000h
30h	4	Expansion ROM Base Address (EXPANSION_ROM_BASEADDR) - Offset 30h	00000000h

Table 11-1. Summary of Bus: 0, Device: 17, Function: 0 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
34h	4	Capabilities Pointer (CAPABILITYPTR) - Offset 34h	00000080h
3Ch	4	Interrupt Register (INTERRUPTREG) - Offset 3Ch	00000100h
80h	4	Power Management Capability ID (POWERCAPID) - Offset 80h	48030001h
84h	4	Power Management Control And Status Register (PMECTRLSTATUS) - Offset 84h	00000008h
90h	4	PCI Device Idle Vendor Capability Register (PCIDEVIDLE_CAP_RECORD) - Offset 90h	F0140009h
94h	4	Vendor Specific Extended Capability Register (DEVID_VEND_SPECIFIC_REG) - Offset 94h	01400010h
98h	4	Software LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG) - Offset 98h	00000000h
9Ch	4	Device Idle Pointer Register (DEVICE_IDLE_POINTER_REG) - Offset 9Ch	00000000h
A0h	4	D0i3 and Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG) - Offset A0h	00000800h
B0h	4	General Purpose Read Write Register1 (GEN_PCI_REGRW1) - Offset B0h	00000000h
C0h	4	General Purpose Input Register (GEN_INPUT_REG) - Offset C0h	00000000h
D0h	4	MSI Capability Register (MSI_CAP_REG) - Offset D0h	01800005h
D4h	4	MSI Message Low Address (MSI_ADDR_LOW) - Offset D4h	00000000h
D8h	4	MSI Message High Address (MSI_ADDR_HIGH) - Offset D8h	00000000h
DCh	4	MSI Message Data (MSI_MSG_DATA) - Offset DCh	00000000h
E0h	4	MSI Mask Register (MSI_MASK) - Offset E0h	00000000h
E4h	4	MSI Pending Register (MSI_PENDING) - Offset E4h	00000000h
F8h	4	Manufacturers ID (MANID) - Offset F8h	00000000h

11.1.1 Device ID And Vendor ID Register (DEVVENDID) - Offset 0h

Device ID and Vendor ID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 0h	4B960000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	4B96h RO/P	**Device ID Field (DEVICEID):** Device ID identifies the particular PCI device
15:0	0000h RO	**Vendor ID Field (VENDORID):** Vendor ID is a unique ID provided by the PCI SIG which identifies the manufacturer of the device

11.1.2 Status And Command (STATUSCOMMAND) - Offset 4h

Status and Command

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 4h	00100000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C	**Detected Parity Error (DPE):** Detected Parity Error
30	0h RW/1C	**Signaled System Error (SSE):** Signaled System Error
29	0h RW/1C	**RMA Field (RMA):** Received Master Abort
28	0h RW/1C	**RTA Field (RTA):** Received Target Abort
27:25	0h RO	**Reserved**
24	0h RW/1C	**Master Data Parity Error (MDPE):** Master Data Parity Error
23:21	0h RO	**Reserved**
20	1h RO	**Cap List Field (CAPLIST):** Capabilities List: Indicates that the controller contains a capabilities pointer list
19	0h RO	**Interrupt Status Field (INTR_STATUS):** Interrupt Status: This bit reflects state of interrupt in the device
18:11	0h RO	**Reserved**
10	0h RW	**Interrupt Disable Field (INTR_DISABLE):** Interrupt Disable
9	0h RO	**Reserved**
8	0h RW	**SERR Enable Field (SERR_ENABLE):** SERR Enable Not implemented
7	0h RO	**Reserved**
6	0h RW	**Parity Error Response Enable (PERE):** Parity Error Response Enable
5:3	0h RO	**Reserved**
2	0h RW	**BME Field (BME):** Bus Master Enable
1	0h RW	**MSE Field (MSE):** Memory Space Enable
0	0h RO	**Reserved**

11.1.3 Revision ID And Class Code (REVCLASSCODE) - Offset 8h

Revision ID and Class Code

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	**Revision ID Field (CLASS_CODES):** Class Code register is read-only and is used to identify the generic function of the device and in some cases a specific register-level programming interface
7:0	00h RO/P	**Class Code Field (RID):** Revision ID identifies the revision of particular PCI device

11.1.4 Cache Line Latency Header And BIST (CLLATHEADERBIST) - Offset Ch

Cache Line size as RW with def 0 Latency Timer, RW with def 0 Header Type with Type 0 configuration header and Reserved BIST Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	0h RO	**Multifunction Device Field (MULFNDEV):** Multi-Function Device
22:16	00h RO	**Header Type Field (HEADERTYPE):** Header Type: Implements Type 0 Configuration header
15:8	00h RO	**Latency Timer Field (LATTIMER):** Latency Timer:. This register is implemented as R/W with default as 0
7:0	00h RW/P	**Cache Line Size Field (CACHELINE_SIZE):** Cache Line Size

11.1.5 Base Address Register (BAR) - Offset 10h

Base Address Register Low [31:2] type [2:1] in 32bit or 64bit address range and memory space indicator [0]

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR):** Base Address Register Low Base address of the AXI fabric memory space. Taken from Strap values as ones
11:4	00h RO	**Size Field (SIZEINDICATOR):** Size Indicator RO Always returns 0 The size of this register depends on the size of the memory space
3	0h RO	**Prefetchable Field (PREFETCHABLE):** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**Type Field (TYPE0):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE):** Memory Space Indicator: 0 indicates this BAR is present in the memory space

11.1.6 Base Address Register High (BAR_HIGH) - Offset 14h

Base Address Register High enabled if [2:1] of BAR_HIGH is 10

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR_HIGH):** Base Address High - MSB

11.1.7 Base Address Register1 (BAR1) - Offset 18h

Base Address Register1 accesses to PCI configuration space and is always 4K type in [2:1] and memory space indicator in [0]

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR1):** Base Address1 This field is present if BAR1 is enabled through private configuration space
11:4	00h RO	**Size Field (SIZEINDICATOR1):** Always is 0 as minimum size is 4K

Bit Range	Default & Access	Field Name (ID): Description
3	0h RO	**Prefetchable Field (PREFETCHABLE1):** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**Type Field (TYPE1):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE1):** Memory Space Indicator: 0 Indicates this BAR is present in the memory space

11.1.8 Base Address Register1 High (BAR1_HIGH) - Offset 1Ch

Base Address Register1 High enabled only if [2:1] of BAR1_HIGH register is 10

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR1_HIGH):** Base Address: Base address of the AXI fabric memory space. Taken from Strap values as ones

11.1.9 Subsystem Vendor and Subsystem ID (SUBSYSTEMID) - Offset 2Ch

SVID Register along with SID Register is to distinguish subsystem from another

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O/P	**Subsystem ID Field (SUBSYSTEMID):** Subsystem ID: This register is implemented for any function that can be instantiated more than once in a given system
15:0	0000h RW/O/P	**Subsystem Vendor Field (SUBSYSTEMVENDORID):** Subsystem Vendor ID: This register must be implemented for any function that can be instantiated more than once in a given system

11.1.10 Expansion ROM Base Address (EXPANSION_ROM_BASEADDR) - Offset 30h

Expansion ROM Base Address Register is a RO indicates support for expansion ROMs

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Expansion Rom Base Address Field (EXPANSION_ROM_BASE):** Expansion ROM Base Address: Value of all zeros indicates no support for Expansion ROM

11.1.11 Capabilities Pointer (CAPABILITYPTR) - Offset 34h

Capabilities Pointer Register indicates what the next capability is

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 34h	00000080h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	80h RO	**Capabilities Pointer Field (CAPPTR_POWER):** Capabilities Pointer: Indicates what the next capability is

11.1.12 Interrupt Register (INTERRUPTREG) - Offset 3Ch

Interrupt Line Register is not use in Bridge directly. Interrupt Pin Register reflects the IPIN value in private configuration space. MIN_GNT register indicating the requirements of latency timers and MAX_LAT register for max latency

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 3Ch	00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Max Latency Field (MAX_LAT):** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	00h RO	**Min GNT Field (MIN_GNT):** Value of 0 indicates device has no major requirements for the settings of latency timers // Re-Check Desc Padma

Bit Range	Default & Access	Field Name (ID): Description
15:12	0h RO	**Reserved**
11:8	1h RO	**Interrupt Pin Field (INTPIN):** Interrupt Pin: Value in this register is reflected from the IPIN value in the private configuration space
7:0	00h RW/P	**Interrupt Line Field (INTLINE):** Interrupt Line: It is used to communicate to software the interrupt line to which the interrupt pin is connected

11.1.13 Power Management Capability ID (POWERCAPID) - Offset 80h

Power Management Capability ID Register points to next capability structure and Power Management Capability with Power Management Capabilities Register for PME support and version

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 80h	48030001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	09h RO	**PME Support Field (PMESUPPORT):** This 5-bit field indicates the power states in which the function can assert the PME#
26:19	0h RO	**Reserved**
18:16	3h RO	**Version Field (VERSION):** Indicates support for Revision 1.2 of the PCI Power Management Specification
15:8	00h RO	**Next Cap Field (NXTCAP):** Next Capability: Points to the next capability structure
7:0	01h RO	**Power Capability ID Field (POWER_CAP):** Power Management Capability: Indicates this is power management capability

11.1.14 Power Management Control And Status Register (PMECTRLSTATUS) - Offset 84h

Power Management Control and Status Register to set and read PME Status, PME Enable, No Soft reset and Power State

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 84h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW/1C/P	**PME Status Field (PMESTATUS):** PME Status
14:9	0h RO	**Reserved**
8	0h RW/P	**PME Enable Field (PMEENABLE):** PME Enable
7:4	0h RO	**Reserved**
3	1h RO	**No Soft Reset Field (NO_SOFT_RESET):** This bit indicates that devices transitioning from D3hot to D0 because of Power State commands do not perform an internal reset
2	0h RO	**Reserved**
1:0	0h RW	**Power State Field (POWERSTATE):** Power State: This field is used both to determine the current Power State and to set a new Power State

11.1.15 PCI Device Idle Vendor Capability Register (PCIDEVIDLE_CAP_RECORD) - Offset 90h

PCI Device Vendor Specific Capability Register defines Vendor Specific Capability ID, Revision Length, Next Capability and CAPID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 90h	F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**Vendor Cap Field (VEND_CAP):** Vendor Specific Capability ID
27:24	0h RO	**Revision ID Field (REVID):** Revision ID of capability structure
23:16	14h RO	**Cap Length Field (CAP_LENGTH):** Vendor Specific Capability Length
15:8	00h RO	**Next Capability Field (NEXT_CAP):** Next Capability
7:0	09h RO	**Capability ID Field (CAPID):** Capability ID

11.1.16 Vendor Specific Extended Capability Register (DEVID_VEND_SPECIFIC_REG) - Offset 94h

Extended Vendor Capability Register for VSEC Length, Revision and ID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 94h	01400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	014h RO	**Vendor Specific ID Field (VSEC_LENGTH):** Vendor Specific Extended Capability Length
19:16	0h RO	**Vendor Specific Revision Field (VSEC_REV):** Vendor Specific Extended Capability Revision
15:0	0010h RO	**Vendor Specific Length Field (VSECID):** Vendor Specific Extended Capability ID

11.1.17 Software LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG) - Offset 98h

Software Location Pointer in MMIO space as an offset specified by BAR

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RO	**SW LTR Dword Offset Field (SW_LAT_DWORD_OFFSET):** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**SW LTR Bar Number Field (SW_LAT_BAR_NUM):** Indicates that the SW LTR update MMIO location is always at BAR0
0	0h RO	**SW LTR Valid Field (SW_LAT_VALID):** This value is reflected from the SW LTR valid strap at the top level

11.1.18 Device Idle Pointer Register (DEVICE_IDLE_POINTER_REG) - Offset 9Ch

Device Idle Pointer Register giving details on Device MMIO Offset Location, BAR NUM and D0i3 Valid Strap

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RO	**D0i3 Dword Offset Field (DWORD_OFFSET):** Contains the location pointer to the SW LTR register in MMIO space as an offset from the specified BAR
3:1	0h RO	**BAR NUM Field (BAR_NUM):** BAR Num: Indicates that the D0i3 MMIO location is always at BAR0
0	0h RO	**D0i3 Valid Field (VALID):** Valid: This value is reflected from the D0i3 valid strap at the top level

11.1.19 D0i3 and Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG) - Offset A0h

D0idle_Max_Power_On_Latency Register set at boot and power control enable register to enable communication with the PGCB block below the Bridge

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + A0h	00000800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21	0h RW/P	**HAE:** Hardware Autonomous Enable
20	0h RO	**Reserved**
19	0h RW/P	**Sleep Enable Field (SLEEP_EN):** Sleep Enable
18	0h RW/P	**D3 Hen Field (D3HEN):** DEVIDLE Enable (DEVIDLEN): If '1' then the function will power gate when idle and the DevIdle register (DevIdleC[2] = '1') is set
17	0h RW/P	**Device Idle En Field (DEVIDLEN):** PMCRE: PMC Request Enable
16	0h RW/P	**PMC Request Enable Field (PMCRE):** D3-Hot Enable (D3HEN): If '1' then function will power gate when idle and the PMCSR[1:0] register in the function ='11' (D3)
15:13	0h RO	**Reserved**
12:10	2h RW/O/P	**Power Latency Scale Field (POW_LAT_SCALE):** Power On Latency Scale
9:0	000h RW/O/P	**Power Latency Value Field (POW_LAT_VALUE):** Power On Latency Value

11.1.20 General Purpose Read Write Register1 (GEN_PCI_REGRW1) - Offset B0h

General Purpose PCI Read Write Register1

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Read Write Field (GEN_PCI_REG_RW1):** General Purpose PCI Register: This register value is brought out as GEN_PCI_REG_RW1

11.1.21 General Purpose Input Register (GEN_INPUT_REG) - Offset C0h

General Purpose Input Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**General Purpose Input Field (GEN_REG_INPUT_RW):** General Purpose Input Register: This register value reflects the value of GEN_REG_INPUT_RW

11.1.22 MSI Capability Register (MSI_CAP_REG) - Offset D0h

MSI Capability Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + D0h	01800005h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	1h RO	**Per Vector Masking Capability Field (PER_VECTOR_MSK_CAP):** Per Vector Masking Capability
23	1h RO	**MSI Capability Field (MSI_CAP_64B):** 64 bit message address capability
22:20	0h RW	**Multi Message En Field (MUL_MSG_EN):** Multiple Message Enable
19:17	0h RO	**Multi Message Cap Field (MUL_MSG_CAP):** Multiple Message Capable

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**MSI Enable Field (MSG_MSI_ENABLE):** MSI Enable
15:8	00h RO	**Next Pointer Field (MSG_NXT_PTR):** Next Capability Pointer
7:0	05h RO	**MSI Capability Field (MSG_CAP_ID):** MSI Capability ID

11.1.23 MSI Message Low Address (MSI_ADDR_LOW) - Offset D4h

MSI Message Low Address

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RW	**MSI Message Low Address Field (MSI_ADDR_LOW):** MSI Message Low Address
1:0	0h RO	**Reserved**

11.1.24 MSI Message High Address (MSI_ADDR_HIGH) - Offset D8h

MSI Message High Address

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSI Message High Address Field (MSI_ADDR_HIGH):** MSI Message High Address

11.1.25 MSI Message Data (MSI_MSG_DATA) - Offset DCh

MSI Message Data

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + DCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0000h RW	**MSI Message Data Field (MSI_MSG_DATA):** MSI Message Data

11.1.26 MSI Mask Register (MSI_MASK) - Offset E0h

MSI Mask bits

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + E0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSI Mask Field (MSI_MASK):** MSI Mask bits

11.1.27 MSI Pending Register (MSI_PENDING) - Offset E4h

MSI Pending bits

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**MSI Pending Field (MSI_PENDING):** MSI Pending bits

11.1.28 Manufacturers ID (MANID) - Offset F8h

Manufacturers ID Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + F8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/P	**Manufacturers ID Field (MANID):** Manufacturer ID: Default value comes from straps

11.2 UART MMIO Registers Summary

Table 11-2. Summary of Bus: 0, Device: 17, Function: 0 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	RBR	00000000h
4h	4	IER	00000000h
8h	4	IIR	00000001h
Ch	4	LCR	00000000h
10h	4	MCR	00000000h
14h	4	LSR	00000060h
18h	4	MSR	00000000h
1Ch	4	SCR	00000000h
70h	4	FAR	00000000h
7Ch	4	USR	00000006h
80h	4	TFL	00000000h
84h	4	RFL	00000000h
A4h	4	HTX	00000000h
A8h	4	DMASA	00000000h
ACh	4	TCR	00000006h
B0h	4	DE_EN	00000000h
B4h	4	RE_EN	00000000h
B8h	4	DET	00000000h
BCh	4	TAT	00000000h
C0h	4	DLF	00000000h
C4h	4	RAR	00000000h

CCh	4	LCR_EXT	00000000h
F4h	4	CPR	00043532h
F8h	4	UCV	3430322Ah
FCh	4	CTR	44570110h
1000h	4	D0i3 Control (D0I3C)	00000008h
1004h	4	Clock Gating And Soft Reset (CGSR)	00000000h

11.2.1 RBR - Offset 0h

Receive Buffer Register - Receive Buffer Register. This register can be accessed only when the DLAB bit (LCR[7]) is cleared.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved**
8:0	000h RO/V	**RBR:** Receive Buffer Register. This register contains the data byte received on the serial input port (sin) in UART mode or the serial infrared input (sir_in) in infrared mode. The data in this register is valid only if the Data Ready (DR) bit in the Line status Register (LSR) is set. If in non-FIFO mode (FIFO_MODE == NONE) or FIFOs are disabled (FCR[0] set to 0), the data in the RBR must be read before the next data arrives, otherwise it will be overwritten, resulting in an over-run error. If in FIFO mode (FIFO_MODE!= NONE) and FIFOs are enabled (FCR[0] set to 1), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO will be preserved but any incoming data will be lost and an over-run error occurs. ***Note***: When UART_9BIT_DATA_EN=0, this field width is 8. When UART_9BIT_DATA_EN=1, this field width is 9.

11.2.2 IER - Offset 4h

Interrupt Enable Register - Interrupt Enable Register. This register can be accessed only when the DLAB bit (LCR[7]) is cleared.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7	0h RW	**PTIME:** Programmable THRE Interrupt Mode Enable. Writeable only when THRE_MODE_USER == Enabled, always readable. This is used to enable/disable the generation of THRE Interrupt.
6:5	0h RO	**Reserved**
4	0h RO/V	**ELCOLR:** Interrupt Enable Register: ELCOLR, this bit controls the method for clearing the status in the LSR register. This is applicable only for Overrun Error, Parity Error, Framing Error, and Break Interrupt status bits. 0 = LSR status bits are cleared either on reading Rx FIFO (RBR Read) or On reading LSR register. 1 = LSR status bits are cleared only on reading LSR register. Writeable only when LSR_STATUS_CLEAR == Enabled, always readable.
3	0h RW	**EDSSI:** Enable Modem Status Interrupt. This is used to enable/disable the generation of Modem Status Interrupt. This is the fourth highest priority interrupt.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**ELSI:** Enable Receiver Line Status Interrupt. This is used to enable/disable the generation of Receiver Line Status Interrupt. This is the highest priority interrupt.
1	0h RW	**ETBEI:** Enable Transmit Holding Register Empty Interrupt. This is used to enable/disable the generation of Transmitter Holding Register Empty Interrupt. This is the third highest priority interrupt.
0	0h RW	**ERBFI:** Enable Received Data Available Interrupt. This is used to enable/disable the generation of Received Data Available Interrupt and the Character Timeout Interrupt (if in FIFO mode and FIFO's enabled). These are the second highest priority interrupts.

11.2.3 FIFO Control (FCR)—Offset 8h

Note that the register can also be used as the Interrupt Identification Register (IIR) when it is read from.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8h	00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:6	0h WO	**RCVR:** This is used to select the trigger level in the receiver FIFO at which the Received Data Available Interrupt is generated. The following trigger levels are supported: 00 = 1 character in the FIFO 01 = FIFO ¼ full 10 = FIFO ½ full 11 = FIFO 2 less than full
5:4	0h WO	**TET:** This is used to select the empty threshold level at which the THRE Interrupts are generated when the mode is active. The following trigger levels are supported: 00 = FIFO empty 01 = 2 characters in the FIFO 10 = FIFO ¼ full 11 = FIFO ½ full
3	0h RO	**Reserved**
2	0h WO	**XFIFOR:** This resets the control portion of the transmit FIFO and treats the FIFO as empty. ***Note:*** This bit is 'self-clearing'. It is not necessary to clear this bit
1	0h WO	**RFIFOR:** This resets the control portion of the receive FIFO and treats the FIFO as empty. ***Note:*** that this bit is 'self-clearing'. It is not necessary to clear this bit.
0	1h WO	**FIFOE:** This is used to indicate whether the FIFOs are enabled or disabled. 00 = disabled 11 = enabled

11.2.4 LCR - Offset Ch

Line Control Register - Line Control Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7	0h RW	**DLAB:** Divisor Latch Access Bit. If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. This bit is used to enable reading and writing of the Divisor Latch register (DLL and DLH/LPDLL and LPDLH) to set the baud rate of the UART. This bit must be cleared after initial baud rate setup in order to access other registers.
6	0h RW	**BC:** Break Control Bit. This is used to cause a break condition to be transmitted to the receiving device. If set to one the serial output is forced to the spacing (logic 0) state. When not in Loopback Mode, as determined by MCR[4], the sout line is forced low until the Break bit is cleared. If SIR_MODE == Enabled and active (MCR[6] set to one) the sir_out_n line is continuously pulsed. When in Loopback Mode, the break condition is internally looped back to the receiver and the sir_out_n line is forced low.
5	0h RW	**SP:** Stick Parity. If UART_16550_COMPATIBLE = NO, then writeable only when UART is not busy (USR[0] is 0); otherwise always writable and always readable. This bit is used to force parity value. When PEN, EPS and Stick Parity are set to 1, the parity bit is transmitted and checked as logic 0. If PEN and Stick Parity are set to 1 and EPS is a logic 0, then parity bit is transmitted and checked as a logic 1. If this bit is set to 0, Stick Parity is disabled.
4	0h RW	**EPS:** Even Parity Select. If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. This is used to select between even and odd parity, when parity is enabled (PEN set to one). If set to one, an even number of logic '1's is transmitted or checked. If set to zero, an odd number of logic '1's is transmitted or checked.
3	0h RW	**PEN:** Parity Enable . If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. This bit is used to enable and disable parity generation and detection in transmitted and received serial character respectively.
2	0h RW	**STOP:** Number of stop bits. If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. This is used to select the number of stop bits per character that the peripheral will transmit and receive. If set to zero, one stop bit is transmitted in the serial data. If set to one and the data bits are set to 5 (LCR[1:0] set to zero) one and a half stop bits is transmitted. Otherwise, two stop bits are transmitted. Note that regardless of the number of stop bits selected the receiver will only check the first stop bit. ***Note***: The STOP bit duration implemented by DW_apb_uart may appear longer due to idle time inserted between characters for some configurations and baud clock divisor values in the transmit direction.
1:0	0h RW	**DLS:** Data Length Select (or CLS as used in legacy). If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. When DLS_E in LCR_EXT is set to 0, this register is used to select the number of data bits per character that the peripheral will transmit and receive.

11.2.5 MCR - Offset 10h

Modem Control Register - Modem Control Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6	0h RO/V	**SIRE:** SIR Mode Enable. Writeable only when SIR_MODE == Enabled, always readable. This is used to enable/ disable the IrDA SIR Mode features. ***Note***: To enable SIR mode, write the appropriate value to the MCR register before writing to the LCR register.
5	0h RW	**AFCE:** Auto Flow Control Enable. Writeable only when AFCE_MODE == Enabled, always readable. When FIFOs are enabled and the Auto Flow Control Enable (AFCE) bit is set, Auto Flow Control features are enabled.
4	0h RW	**LOOPBACK:** LoopBack Bit. This is used to put the UART into a diagnostic mode for test purposes. If operating in UART mode (SIR_MODE != Enabled OR NOT active, MCR[6] set to zero), data on the sout line is held high, while serial data output is looped back to the sin line, internally. In this mode all the interrupts are fully functional. Also, in loopback mode, the modem control inputs (dsr_n, cts_n, ri_n, dcd_n) are disconnected and the modem control outputs (dtr_n, rts_n, out1_n, out2_n) are looped back to the inputs, internally. If operating in infrared mode (SIR_MODE == Enabled AND active, MCR[6] set to one), data on the sir_out_n line is held low, while serial data output is inverted and looped back to the sir_in line.
3	0h RW	**OUT2:** OUT2. This is used to directly control the user-designated Output2 (out2_n) output. The value written to this location is inverted and driven out on out2_n. Note that in Loopback mode (MCR[4] set to one), the out2_n output is held inactive high while the value of this location is internally looped back to an input.
2	0h RW	**OUT1:** OUT1. This is used to directly control the user-designated Output1 (out1_n) output. The value written to this location is inverted and driven out on out1_n. Note that in Loopback mode (MCR[4] set to one), the out1_n output is held inactive high while the value of this location is internally looped back to an input.
1	0h RW	**RTS:** Request to Send. This is used to directly control the Request to Send (rts_n) output. The Request To Send (rts_n) output is used to inform the modem or data set that the UART is ready to exchange data. When Auto RTS Flow Control is not enabled (MCR[5] set to zero), the rts_n signal is set low by programming MCR[1] (RTS) to a high. In Auto Flow Control, AFCE_MODE == Enabled and active (MCR[5] set to one) and FIFO's enable (FCR[0] set to one), the rts_n output is controlled in the same way, but is also gated with the receiver FIFO threshold trigger (rts_n is inactive high when above the threshold). The rts_n signal will be de-asserted when MCR[1] is set low. Note that in Loopback mode (MCR[4] set to one), the rts_n output is held inactive high while the value of this location is internally looped back to an input.
0	0h RW	**DTR:** Data Terminal Ready. This is used to directly control the Data Terminal Ready (dtr_n) output. The value written to this location is inverted and driven out on dtr_n. The Data Terminal Ready output is used to inform the modem or data set that the UART is ready to establish communications. Note that in Loopback mode (MCR[4] set to one), the dtr_n output is held inactive high while the value of this location is internally looped back to an input.

11.2.6 LSR - Offset 14h

Line Status Register - Line Status Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14h	00000060h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved**
8	0h RO/V	**ADDR_RCVD:** Address Received Bit. If 9Bit data mode (LCR_EXT[0]=1) is enabled, this bit is used to indicate the 9th bit of the receive data is set to 1. This bit can also be used to indicate whether the incoming character is address or data. - 1 = Indicates the character is address. - 0 = Indicates the character is data. In the FIFO mode, since the 9th bit is associated with a character received, it is revealed when the character with the 9th bit set to 1 is at the top of the FIFO. Reading the LSR clears the 9BIT. ***Note***: User needs to ensure that interrupt gets cleared (reading LSR register) before the next address byte arrives. If there is a delay in clearing the interrupt, then Software will not be able to distinguish between multiple address related interrupt.
7	0h RO/V	**RFE:** Receiver FIFO Error bit. This bit is only relevant when FIFO_MODE != NONE AND FIFO's are enabled (FCR[0] set to one). This is used to indicate if there is at least one parity error, framing error, or break indication in the FIFO. This bit is cleared when the LSR is read and the character with the error is at the top of the receiver FIFO and there are no subsequent errors in the FIFO.
6	1h RO/V	**TEMT:** Transmitter Empty bit. If in FIFO mode (FIFO_MODE != NONE) and FIFO's enabled (FCR[0] set to one), this bit is set whenever the Transmitter Shift Register and the FIFO are both empty. If in the non-FIFO mode or FIFO's are disabled, this bit is set whenever the Transmitter Holding Register and the Transmitter Shift Register are both empty.
5	1h RO/V	**THRE:** Transmit Holding Register Empty bit. If THRE_MODE_USER = Disabled or THRE mode is disabled (IER[7] set to zero) and regardless of FIFO's being implemented/enabled or not, this bit indicates that the THR or TX FIFO is empty. This bit is set whenever data is transferred from the THR or TX FIFO to the transmitter shift register and no new data has been written to the THR or TX FIFO. This also causes a THRE Interrupt to occur, if the THRE Interrupt is enabled. If THRE_MODE_USER == Enabled AND FIFO_MODE != NONE and both modes are active (IER[7] set to one and FCR[0] set to one respectively), the functionality is switched to indicate the transmitter FIFO is full, and no longer controls THRE interrupts, which are then controlled by the FCR[5:4] threshold setting.
4	0h RO/V	**BI:** Break Interrupt bit. This is used to indicate the detection of a break sequence on the serial input data. If in UART mode it is set whenever the serial input, sin, is held in a logic '0' state for longer than the sum of start time + data bits + parity + stop bits. If in infrared mode it is set whenever the serial input, sir_in, is continuously pulsed to logic '0' for longer than the sum of start time + data bits + parity + stop bits. A break condition on serial input causes one and only one character, consisting of all zeros, to be received by the UART. In the FIFO mode, the character associated with the break condition is carried through the FIFO and is revealed when the character is at the top of the FIFO. Reading the LSR clears the BI bit (if LSR_STATUS_CLEAR==1) Or Reading the LSR or RBR clears the BI bit (if LSR_STATUS_CLEAR==0). In the non-FIFO mode, the BI indication occurs immediately and persists until the LSR is read. ***Note***: If a FIFO is full when a break condition is received, a FIFO overrun occurs. The break condition and all the information associated with it-parity and framing errors-is discarded; any information that a break character was received is lost.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RO/V	**FE:** Framing Error bit. This is used to indicate the occurrence of a framing error in the receiver. A framing error occurs when the receiver does not detect a valid STOP bit in the received data. In the FIFO mode, since the framing error is associated with a character received, it is revealed when the character with the framing error is at the top of the FIFO. When a framing error occurs the UART will try resynchronize. It does this by assuming that the error was due to the start bit of the next character and then continues receiving the other bit i.e. data, and/or parity and stop. It should be noted that the Framing Error (FE) bit (LSR[3]) will be set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]). This happens because the break character implicitly generates a framing error by holding the sin input to logic 0 for longer than the duration of a character. Reading the LSR clears the FE bit (if LSR_STATUS_CLEAR==1) Or Reading the LSR or RBR clears the FE bit (if LSR_STATUS_CLEAR==0).
2	0h RO/V	**PE:** Parity Error bit. This is used to indicate the occurrence of a parity error in the receiver if the Parity Enable (PEN) bit (LCR[3]) is set. In the FIFO mode, since the parity error is associated with a character received, it is revealed when the character with the parity error arrives at the top of the FIFO. It should be noted that the Parity Error (PE) bit (LSR[2]) will be set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]). In this situation, the Parity Error bit is set if parity generation and detection is enabled (LCR[3]=1) and the parity is set to odd (LCR[4]=0). Reading the LSR clears the PE bit (if LSR_STATUS_CLEAR==1) Or Reading the LSR or RBR clears the PE bit (if LSR_STATUS_CLEAR==0).
1	0h RO/V	**OE:** Overrun error bit. This is used to indicate the occurrence of an overrun error. This occurs if a new data character was received before the previous data was read. In the non-FIFO mode, the OE bit is set when a new character arrives in the receiver before the previous character was read from the RBR. When this happens, the data in the RBR is overwritten. In the FIFO mode, an overrun error occurs when the FIFO is full and a new character arrives at the receiver. The data in the FIFO is retained and the data in the receive shift register is lost. Reading the LSR clears the OE bit (if LSR_STATUS_CLEAR==1) Or Reading the LSR or RBR clears the OE bit (if LSR_STATUS_CLEAR==0).
0	0h RO/V	**DR:** Data Ready bit. This is used to indicate that the receiver contains at least one character in the RBR or the receiver FIFO. This bit is cleared when the RBR is read in the non-FIFO mode, or when the receiver FIFO is empty, in the FIFO mode.

11.2.7 MSR - Offset 18h

Modem Status Register - Whenever bits 0, 1, 2 or 3 are set to logic one, to indicate a change on the modem control inputs, a modem status interrupt will be generated if enabled via the IER regardless of when the change occurred. The bits (bits 0, 1, 3) can be set after a reset-even though their respective modem signals are inactive-because the synchronized version of the modem signals have a reset value of 0 and change to value 1 after reset. To prevent unwanted interrupts due to this change, a read of the MSR register can be performed after reset.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7	0h RO/V	**DCD:** Data Carrier Detect. This is used to indicate the current state of the modem control line dcd_n. That is this bit is the complement dcd_n. When the Data Carrier Detect input (dcd_n) is asserted it is an indication that the carrier has been detected by the modem or data set. In Loopback Mode (MCR[4] set to one), DCD is the same as MCR[3] (Out2).
6	0h RO/V	**RI:** Ring Indicator. This is used to indicate the current state of the modem control line ri_n. That is this bit is the complement ri_n. When the Ring Indicator input (ri_n) is asserted it is an indication that a telephone ringing signal has been received by the modem or data set. In Loopback Mode (MCR[4] set to one), RI is the same as MCR[2] (Out1).
5	0h RO/V	**DSR:** Data Set Ready. This is used to indicate the current state of the modem control line dsr_n. That is this bit is the complement dsr_n. When the Data Set Ready input (dsr_n) is asserted it is an indication that the modem or data set is ready to establish communications with the DW_apb_uart. In Loopback Mode (MCR[4] set to one), DSR is the same as MCR[0] (DTR).
4	0h RO/V	**CTS:** Clear to Send. This is used to indicate the current state of the modem control line cts_n. That is, this bit is the complement cts_n. When the Clear to Send input (cts_n) is asserted it is an indication that the modem or data set is ready to exchange data with the DW_apb_uart. In Loopback Mode (MCR[4] set to one), CTS is the same as MCR[1] (RTS).
3	0h RO/V	**DDCD:** Delta Data Carrier Detect. This is used to indicate that the modem control line dcd_n has changed since the last time the MSR was read. Reading the MSR clears the DDCD bit. In Loopback Mode (MCR[4] set to one), DDCD reflects changes on MCR[3] (Out2). Note, if the DDCD bit is not set and the dcd_n signal is asserted (low) and a reset occurs (software or otherwise), then the DDCD bit will get set when the reset is removed if the dcd_n signal remains asserted.
2	0h RO/V	**TERI:** Trailing Edge of Ring Indicator. This is used to indicate that a change on the input ri_n (from an active low, to an inactive high state) has occurred since the last time the MSR was read. Reading the MSR clears the TERI bit. In Loopback Mode (MCR[4] set to one), TERI reflects when MCR[2] (Out1) has changed state from a high to a low.
1	0h RO/V	**DDSR:** Delta Data Set Ready. This is used to indicate that the modem control line dsr_n has changed since the last time the MSR was read. Reading the MSR clears the DDSR bit. In Loopback Mode (MCR[4] set to one), DDSR reflects changes on MCR[0] (DTR). Note, if the DDSR bit is not set and the dsr_n signal is asserted (low) and a reset occurs (software or otherwise), then the DDSR bit will get set when the reset is removed if the dsr_n signal remains asserted.
0	0h RO/V	**DCTS:** Delta Clear to Send. This is used to indicate that the modem control line cts_n has changed since the last time the MSR was read. Reading the MSR clears the DCTS bit. In Loopback Mode (MCR[4] set to one), DCTS reflects changes on MCR[1] (RTS). Note, if the DCTS bit is not set and the cts_n signal is asserted (low) and a reset occurs (software or otherwise), then the DCTS bit will get set when the reset is removed if the cts_n signal remains asserted.

11.2.8 SCR - Offset 1Ch

Scratchpad Register - Scratchpad Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**SCR:** This register is for programmers to use as a temporary storage space. It has no defined purpose in the DW_apb_uart.

11.2.9 FAR - Offset 70h

FIFO Access Register - FIFO Access Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 70h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**FAR:** Writes will have no effect when FIFO_ACCESS == No, always readable. This register is used to enable a FIFO access mode for testing, so that the receive FIFO can be written by the master and the transmit FIFO can be read by the master when FIFO's are implemented and enabled. When FIFOs are not implemented or not enabled it allows the RBR to be written by the master and the THR to be read by the master. Note, that when the FIFO access mode is enabled/disabled, the control portion of the receive FIFO and transmit FIFO is reset and the FIFO's are treated as empty.

11.2.10 USR - Offset 7Ch

UART Status register - UART Status register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7Ch	00000006h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4	0h RO/V	**RFF:** Receive FIFO Full. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the receive FIFO is completely full. That is: This bit is cleared when the RX FIFO is no longer full.
3	0h RO/V	**RFNE:** Receive FIFO Not Empty. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the receive FIFO contains one or more entries. This bit is cleared when the RX FIFO is empty.
2	1h RO/V	**TFE:** Transmit FIFO Empty. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the transmit FIFO is completely empty. This bit is cleared when the TX FIFO is no longer empty.
1	1h RO/V	**TFNF:** Transmit FIFO Not Full. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the transmit FIFO is not full. This bit is cleared when the TX FIFO is full.
0	0h RO	**Reserved**

11.2.11 TFL - Offset 80h

Transmit FIFO Level - TFL register is valid only when the DW_apb_uart is configured to have additional FIFO status registers implemented (FIFO_STAT = YES). If status registers are not implemented, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 80h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:0	00h RO/V	**TFL:** Transmit FIFO Level. This indicates the number of data entries in the transmit FIFO.

11.2.12 RFL - Offset 84h

Receive FIFO Level - RFL register is valid only when the DW_apb_uart is configured to have additional FIFO status registers implemented (FIFO_STAT = YES). If status registers are not implemented, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 84h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:0	00h RO/V	**RFL:** Receive FIFO Level. This indicates the number of data entries in the receive FIFO.

11.2.13 HTX - Offset A4h

Halt TX - Halt TX

Type	Size	Offset	Default
MMIO	32 bit	BAR + A4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**HTX:** Halt TX. Writes will have no effect when FIFO_MODE == NONE, always readable. This register is used to halt transmissions for testing, so that the transmit FIFO can be filled by the master when FIFO's are implemented and enabled. Note, if FIFO's are implemented and not enabled the setting of the halt TX register will have no effect on operation.

11.2.14 DMASA - Offset A8h

DMA Software Acknowledge Register - DMA Software Acknowledge Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + A8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h WO	**DMASA:** DMA Software Acknowledge. Writes will have no effect when DMA_EXTRA == No. This register is used to perform DMA software acknowledge if a transfer needs to be terminated due to an error condition. For example, if the DMA disables the channel, then the DW_apb_uart should clear its request. This will cause the TX request, TX single, RX request and RX single signals to de-assert. Note that this bit is 'self-clearing' and it is not necessary to clear this bit.

11.2.15 TCR - Offset ACh

Transceiver Control Register - This register is used to enable or disable RS485 mode and also control the polarity values for Driven enable (de) and Receiver Enable (re) signals. This register is only valid when the DW_apb_uart is configured to have RS485

interface implemented (UART_RS485_INTERFACE_EN = ENABLED). If RS485 interface is not implemented, this register does not exist and reading from this register address returns zero.

Type	Size	Offset	Default
MMIO	32 bit	BAR + ACh	00000006h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4:3	0h RW	**XFER_MODE:** Transfer Mode. - 0: In this mode, transmit and receive can happen simultaneously. The user can enable DE_EN, RE_EN at any point of time. Turn around timing as programmed in the TAT register is not applicable in this mode. - 1: In this mode, DE and RE are mutually exclusive. Either DE or RE only one of them is expected to be enabled through programming. Hardware will consider the Turn Around timings which are programmed in the TAT register while switching from RE to DE or DE to RE. For transmission Hardware will wait if it is in middle of receiving any transfer, before it starts transmitting. - 2: In this mode, DE and RE are mutually exclusive. Once DE_EN/RE_EN is programed - by default 're' will be enabled and DW_apb_uart controller will be ready to receive. If the user programs the TX FIFO with the data then DW_apb_uart, after ensuring no receive is in progress, disable 're' and enable 'de' signal. Once the TX FIFO becomes empty, 're' signal gets enabled and 'de' signal will be disabled. In this mode of operation hardware will consider the Turn Around timings which are programmed in the TAT register while switching from RE to DE or DE to RE. In this mode, 'de' and 're' signals are strictly complementary to each other.
2	1h RW	**DE_POL:** Driver Enable Polarity. - 1: DE signal is active high - 0: DE signal is active low
1	1h RW	**RE_POL:** Receiver Enable Polarity. - 1: RE signal is active high - 0: RE signal is active low
0	0h RW	**RS485_EN:** RS485 Transfer Enable. - 0 : In this mode, the transfers are still in the RS232 mode. All other fields in this register are reserved and register DE_EN/RE_EN/TAT are also reserved. - 1 : In this mode, the transfers will happen in RS485 mode. All other fields of this register are applicable.

11.2.16 DE_EN - Offset B0h

Driver Output Enable Register - The Driver Output Enable Register (DE_EN) is used to control the assertion and de-assertion of the DE signal. This register is only valid when the DW_apb_uart is configured to have RS485 interface implemented (UART_RS485_INTERFACE_EN = ENABLED). If RS485 interface is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**DE_ENABLE:** DE Enable control. The 'DE Enable' register bit is used to control assertion and de-assertion of 'de' signal. - 0: De-assert 'de' signal - 1: Assert 'de' signal

11.2.17 RE_EN - Offset B4h

Receiver Output Enable Register - The Receiver Output Enable Register (RE_EN) is used to control the assertion and de-assertion of the RE signal. This register is only valid when the DW_apb_uart is configured to have RS485 interface implemented (UART_RS485_INTERFACE_EN = ENABLED). If the RS485 interface is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**RE_ENABLE:** RE Enable control. The 'RE Enable' register bit is used to control assertion and de-assertion of 're' signal. - 0: De-assert 're' signal - 1: Assert 're' signal

11.2.18 DET - Offset B8h

Driver Output Enable Timing Register - The Driver Output Enable Timing Register (DET) is used to control the DE assertion and de-assertion timings of 'de' signal. This register is only valid when the DW_apb_uart is configured to have RS485 interface implemented (UART_RS485_INTERFACE = ENABLED). If RS485 interface is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:16	00h RW	**DE_DE_ASSERTION_TIME:** Driver Enable de-assertion time. This field controls the amount of time (in terms of number of serial clock periods) between the end of stop bit on the sout to the falling edge of Driver output enable signal.
15:8	0h RO	**Reserved**
7:0	00h RW	**DE_ASSERTION_TIME:** Driver Enable assertion time. This field controls the amount of time (in terms of number of serial clock periods) between the assertion of rising edge of Driver output enable signal to serial transmit enable. Any data in transmit buffer, will start on serial output (sout) after the transmit enable.

11.2.19 TAT - Offset BCh

TurnAround Timing Register - The TurnAround Timing Register (TAT) is used to hold the turnaround time between switching of 're' and 'de' signals. This register is only valid when the DW_apb_uart is configured to have the RS485 interface implemented (UART_RS485_INTERFACE_EN = ENABLED). If RS485 interface is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	BAR + BCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**RE_TO_DE:** Receiver Enable to Driver Enable TurnAround time. Turnaround time (in terms of serial clock) for RE De-assertion to DE assertion. ***Note***: If the DE assertion time in the DET register is 0, then the actual value is the programmed value + 3. - If the DE assertion time in the DET register is 1, then the actual value is the programmed value + 2. - If the DE assertion time in the DET register is greater than 1, then the actual value is the programmed value + 1.
15:0	0000h RW	**DE_TO_RE:** Driver Enable to Receiver Enable TurnAround time. Turnaround time (in terms of serial clock) for DE De-assertion to RE assertion. ***Note***: The actual time is the programmed value + 1.

11.2.20 DLF - Offset C0h

Divisor Latch Fraction Register - This register is only valid when the DW_apb_uart is configured to have Fractional Baud rate Divisor implemented (FRACTIONAL_BAUD_DIVISOR_EN = ENABLED). If Fractional Baud rate divisor is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3:0	0h RW	**DLF:** Fractional part of divisor. The fractional value is added to integer value set by DLH, DLL. Fractional value is determined by (Divisor Fraction value)/(2^DLF_SIZE).

11.2.21 RAR - Offset C4h

Receive Address Register - Receive Address Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + C4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**RAR:** This is an address matching register during receive mode. If the 9-th bit is set in the incoming character then the remaining 8-bits will be checked against this register value. If the match happens then sub-sequent characters with 9-th bit set to 0 will be treated as data byte until the next address byte is received. ***Note***: This register is applicable only when 'ADDR_MATCH'(LCR_EXT[1] and 'DLS_E' (LCR_EXT[0]) bits are set to 1. - If UART_16550_COMPATIBLE is configured to 0, then RAR should be programmed only when UART is not busy. - If UART_16550_COMPATIBLE is configured to 0, then RAR can be programmed at any point of the time. However, user must not change this register value when any receive is in progress.

11.2.22 TAR - Offset C8h

Transmit Address Register - Transmit Address Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + C8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**TAR:** This is an address matching register during transmit mode. If DLS_E (LCR_EXT[0]) bit is enabled, then DW_apb_uart will send the 9-bit character with 9-th bit set to 1 and remaining 8-bit address will be sent from this register provided 'SEND_ADDR' (LCR_EXT[2]) bit is set to 1. ***Note***: This register is used only to send the address. The normal data should be sent by programming THR register. - Once the address is started to send on the DW_apb_uart serial lane, then 'SEND_ADDR' bit will be auto-cleared by the hardware.

11.2.23 LCR_EXT - Offset CCh

Line Extended Control Register - Line Extended Control Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + CCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW/V	**TRANSMIT_MODE:** Transmit mode control bit. This bit is used to control the type of transmit mode during 9-bit data transfers. - 1: In this mode of operation, Transmit Holding Register (THR) and Shadow Transmit Holding Register (STHR) are 9-bit wide. The user needs to ensure that the THR/STHR register is written correctly for address/data. Address: 9th bit is set to 1, Data : 9th bit is set to 0. ***Note***: Transmit address register (TAR) is not applicable in this mode of operation. - 0: In this mode of operation, Transmit Holding Register (THR) and Shadow Transmit Holding register (STHR) are 8-bit wide. The user needs to program the address into Transmit Address Register (TAR) and data into the THR/STHR register. SEND_ADDR bit is used as a control knob to indicate the DW_apb_uart on when to send the address.
2	0h RW/V	**SEND_ADDR:** Send address control bit. This bit is used as a control knob for the user to determine when to send the address during transmit mode. - 1 = 9-bit character will be transmitted with 9-th bit set to 1 and the remaining 8-bits will match to what is being programmed in 'Transmit Address Register'. - 0 = 9-bit character will be transmitted with 9-th bit set to 0 and the remaining 8-bits will be taken from the TXFIFO which is programmed through 8-bit wide THR/STHR register. ***Note***: 1. This bit is auto-cleared by the hardware, after sending out the address character. User is not expected to program this bit to 0. - 2. This field is applicable only when DLS_E bit is set to 1 and TRANSMIT_MODE is set to 0.
1	0h RW/V	**ADDR_MATCH:** Address Match Mode.This bit is used to enable the address match feature during receive. - 1 = Address match mode; DW_apb_uart will wait until the incoming character with 9-th bit set to 1. And further checks to see if the address matches with what is programmed in 'Receive Address Match Register'. If match is found, then sub-sequent characters will be treated as valid data and DW_apb_uart starts receiving data. - 0 = Normal mode; DW_apb_uart will start to receive the data and 9-bit character will be formed and written into the receive RXFIFO. User is responsible to read the data and differentiate b/n address and data. ***Note***: This field is applicable only when DLS_E is set to 1.
0	0h RW/V	**DLS_E:** Extension for DLS. This bit is used to enable 9-bit data for transmit and receive transfers.

11.2.24 CPR - Offset F4h

Component Parameter Register - Component Parameter Register.This register is valid only when UART_ADD_ENCODED_PARAMS = 1. If the UART_ADD_ENCODED_PARAMS parameter is not set, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + F4h	00043532h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:16	04h RO/V	**FIFO_MODE:** Encoding of FIFO_MODE configuration parameter value.
15:14	0h RO	**Reserved**
13	1h RO/V	**DMA_EXTRA:** Encoding of DMA_EXTRA configuration parameter value.
12	1h RO/V	**UART_ADD_ENCODED_PARAMS:** Encoding of UART_ADD_ENCODED_PARAMS configuration parameter value.
11	0h RO/V	**SHADOW:** Encoding of SHADOW configuration parameter value.
10	1h RO/V	**FIFO_STAT:** Encoding of FIFO_STAT configuration parameter value.
9	0h RO/V	**FIFO_ACCESS:** Encoding of FIFO_ACCESS configuration parameter value.
8	1h RO/V	**ADDITIONAL_FEAT:** Encoding of ADDITIONAL_FEATURES configuration parameter value.
7	0h RO/V	**SIR_LP_MODE:** Encoding of SIR_LP_MODE configuration parameter value.
6	0h RO/V	**SIR_MODE:** Encoding of SIR_MODE configuration parameter value.
5	1h RO/V	**THRE_MODE:** Encoding of THRE_MODE configuration parameter value.
4	1h RO/V	**AFCE_MODE:** Encoding of AFCE_MODE configuration parameter value.
3:2	0h RO	**Reserved**
1:0	2h RO/V	**APB_DATA_WIDTH:** Encoding of APB_DATA_WIDTH configuration parameter value.

11.2.25 UCV - Offset F8h

UART Component Version - UCV register is valid only when the DW_apb_uart is configured to have additional features implemented (ADDITIONAL_FEATURES = YES). If additional features are not implemented, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + F8h	3430322Ah

Bit Range	Default & Access	Field Name (ID): Description
31:0	3430322Ah RO/V	**UART_COMPONENT_VERSION:** ASCII value for each number in the version, followed by *. For example 32_30_31_2A represents the version 2.01*

11.2.26 CTR - Offset FCh

Component Type Register - CTR is register is valid only when the DW_apb_uart is configured to have additional features implemented (ADDITIONAL_FEATURES = YES). If additional features are not implemented, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + FCh	44570110h

Bit Range	Default & Access	Field Name (ID): Description
31:0	44570110h RO/V	**PERIPHERAL_ID:** This register contains the peripherals identification code.

11.2.27 D0i3 Control (D0I3C) - Offset 1000h

This register will be used for D0i3 SW flow. This will be mapped to a different MMIO address from the other IPC registers. (MMIO and OCP address value are yet to be done) The description below also includes the type of access expected for the ISH FW for each configuration bit:
1. The Restore Required (RR) bit (bit [3]) should be RW for the ISH FW which can determine when to set and/or clear these bits depending on when the ISH FW determines whether restore is required although for ISH restore is never required since the power is never lost.
2. The D0i3 (i3) bit (bit [2]) should be RO for ISH FW as it needs to be written only by host SW. The ISH FW can determine to go to a low power state based on this bit.
3. The Interrupt Required (IR) bit (bit [1]) can be RO register for ISH FW and ISH FW can send an interrupt to Host by writing to the ish2host IPC doorbell register when this bit is set by SW.
4. The Command in Progress (CIP) register bit (bit [0]) is HW set and need to be cleared by ISH FW.
A simple edge detects logic can be used for the setting of this bit in HW. The CIP register bit will be tied to a RTE entry in the IOAPIC as an interrupt source. Hence ISH FW will get an interrupt when the addition to the registers; the IOSF2OCP Bridge should be parameterized for the following:
1. The device idle capability parameter (ENABLE_PCI_IDLE_CAP) needs to be connected to a soft strap for ISH with a value of 1.
2. The STRAP for the MMIO address (strap_d0i3_offset) of D0i3 register (IPC offset address: h6D0) and the d0i3 valid (strap_d0i3_valid) bit needs should be appropriately tied.
3. The PCE register is made RO register by setting the appropriate parameter (Bridge top level strap: set_device_pg_config_type[5:0] is set to all 0s). This registers reset and clock domain will be in the OCP domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1000h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4	0h RO	**Interrupt Request Capable (IRC):** Set to 1 by HW if it is capable of generating an interrupt on command completion, else 0. For ISH this bit will be tied to 0.
3	1h RW/1C	**Restore Required (RR):** When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up.
2	0h RW	**D0I3:** SW sets this bit to 1 to move the IP into the D0i3 state. Writing this bit to 0 will return the IP to the fully active D0 state (D0i0).
1	0h RW	**Interrupt Required (IR):** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this on each write to this register.
0	0h RO/V	**Command In Progress (CIP):** HW sets this bit on a 1->0 or 0->1 transition of bit [2]. While set, the other bits in this register are not valid and it is illegal for SW to write to any bit in this register. When clear all the other bits in the register are valid and SW may write to any bit.

11.2.28 Clock Gating And Soft Reset (CGSR) - Offset 1004h

This register is used to Clock gate or soft reset an IP by Host/Remote Host. Also register field of this register can be used for device idle status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1004h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Idle Indication To Host (IDLE):** IP IDLE indication.
30:17	0h RO	**Reserved**
16	0h RW	**Clock Gate Enable (CG):** Setting this field to 1 clock gates the IP.
15:1	0h RO	**Reserved**
0	0h RW	**Soft Reset (SR):** Setting this bit to 1 resets the IP.

12 Inter-IC Sound (I2S) Interface

12.1 I2S Configuration Registers Summary

This chapter documents the registers in Bus: 0, Device 17, Function 6 and 7.

DID Values:

- Intel® PSE I2S Controller #0:- D17: F6 - 4B9Ch
- Intel® PSE I2S Controller #1:- D17: F7 - 4B9Dh

Table 12-1. Summary of Bus: 0, Device: 17, Function: 6 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	Device ID And Vendor ID Register (DEVVENDID) - Offset 0h	4B9C0000h
4h	4	Status And Command (STATUSCOMMAND) - Offset 4h	00100000h
8h	4	Revision ID And Class Code (REVCLASSCODE) - Offset 8h	00000000h
Ch	4	Cache Line Latency Header And BIST (CLLATHEADERBIST) - Offset Ch	00000000h
10h	4	Base Address Register (BAR) - Offset 10h	00000000h
14h	4	Base Address Register High (BAR_HIGH) - Offset 14h	00000000h
18h	4	Base Address Register1 (BAR1) - Offset 18h	00000000h
1Ch	4	Base Address Register1 High (BAR1_HIGH) - Offset 1Ch	00000000h
2Ch	4	Subsystem Vendor and Subsystem ID (SUBSYSTEMID) - Offset 2Ch	00000000h
30h	4	Expansion ROM Base Address (EXPANSION_ROM_BASEADDR) - Offset 30h	00000000h
34h	4	Capabilities Pointer (CAPABILITYPTR) - Offset 34h	00000080h
3Ch	4	Interrupt Register (INTERRUPTREG) - Offset 3Ch	00000100h
80h	4	Power Management Capability ID (POWERCAPID) - Offset 80h	48030001h
84h	4	Power Management Control And Status Register (PMECTRLSTATUS) - Offset 84h	00000008h
90h	4	PCI Device Idle Vendor Capability Register (PCIDEVIDLE_CAP_RECORD) - Offset 90h	F0140009h
94h	4	Vendor Specific Extended Capability Register (DEVID_VEND_SPECIFIC_REG) - Offset 94h	01400010h
98h	4	Software LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG) - Offset 98h	00000000h
9Ch	4	Device Idle Pointer Register (DEVICE_IDLE_POINTER_REG) - Offset 9Ch	00000000h
A0h	4	D0i3 and Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG) - Offset A0h	00000800h
B0h	4	General Purpose Read Write Register1 (GEN_PCI_REGRW1) - Offset B0h	00000000h
C0h	4	General Purpose Input Register (GEN_INPUT_REG) - Offset C0h	00000000h
D0h	4	MSI Capability Register (MSI_CAP_REG) - Offset D0h	01800005h

Table 12-1. Summary of Bus: 0, Device: 17, Function: 6 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
D4h	4	MSI Message Low Address (MSI_ADDR_LOW) - Offset D4h	00000000h
D8h	4	MSI Message High Address (MSI_ADDR_HIGH) - Offset D8h	00000000h
DCh	4	MSI Message Data (MSI_MSG_DATA) - Offset DCh	00000000h
E0h	4	MSI Mask Register (MSI_MASK) - Offset E0h	00000000h
E4h	4	MSI Pending Register (MSI_PENDING) - Offset E4h	00000000h
F8h	4	Manufacturers ID (MANID) - Offset F8h	00000000h

12.1.1 Device ID And Vendor ID Register (DEVVENDID) - Offset 0h

Device ID and Vendor ID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 0h	4B9C0000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	4B9Ch RO/P	**Device ID Field (DEVICEID):** Device ID identifies the particular PCI device
15:0	0000h RO	**Vendor ID Field (VENDORID):** Vendor ID is a unique ID provided by the PCI SIG which identifies the manufacturer of the device

12.1.2 Status And Command (STATUSCOMMAND) - Offset 4h

Status and Command

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 4h	00100000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C	**Detected Parity Error (DPE):** Detected Parity Error
30	0h RW/1C	**Signaled System Error (SSE):** Signaled System Error
29	0h RW/1C	**RMA Field (RMA):** Received Master Abort
28	0h RW/1C	**RTA Field (RTA):** Received Target Abort
27:25	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW/1C	**Master Data Parity Error (MDPE):** Master Data Parity Error
23:21	0h RO	**Reserved**
20	1h RO	**Cap List Field (CAPLIST):** Capabilities List: Indicates that the controller contains a capabilities pointer list
19	0h RO	**Interrupt Status Field (INTR_STATUS):** Interrupt Status: This bit reflects state of interrupt in the device
18:11	0h RO	**Reserved**
10	0h RW	**Interrupt Disable Field (INTR_DISABLE):** Interrupt Disable
9	0h RO	**Reserved**
8	0h RW	**SERR Enable Field (SERR_ENABLE):** SERR Enable Not implemented
7	0h RO	**Reserved**
6	0h RW	**Parity Error Response Enable (PERE):** Parity Error Response Enable
5:3	0h RO	**Reserved**
2	0h RW	**BME Field (BME):** Bus Master Enable
1	0h RW	**MSE Field (MSE):** Memory Space Enable
0	0h RO	**Reserved**

12.1.3 Revision ID And Class Code (REVCLASSCODE) - Offset 8h

Revision ID and Class Code

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	**Revision ID Field (CLASS_CODES):** Class Code register is read-only and is used to identify the generic function of the device and in some cases a specific register-level programming interface
7:0	00h RO/P	**Class Code Field (RID):** Revision ID identifies the revision of particular PCI device

12.1.4 Cache Line Latency Header And BIST (CLLATHEADERBIST) - Offset Ch

Cache Line size as RW with def 0 Latency Timer, RW with def 0 Header Type with Type 0 configuration header and Reserved BIST Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	0h RO	**Multifunction Device Field (MULFNDEV):** Multi-Function Device
22:16	00h RO	**Header Type Field (HEADERTYPE):** Header Type: Implements Type 0 Configuration header
15:8	00h RO	**Latency Timer Field (LATTIMER):** Latency Timer:. This register is implemented as R/W with default as 0
7:0	00h RW/P	**Cache Line Size Field (CACHELINE_SIZE):** Cache Line Size

12.1.5 Base Address Register (BAR) - Offset 10h

Base Address Register Low [31:2] type [2:1] in 32bit or 64bit address range and memory space indicator [0]

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR):** Base Address Register Low Base address of the AXI fabric memory space. Taken from Strap values as ones
11:4	00h RO	**Size Field (SIZEINDICATOR):** Size Indicator RO Always returns 0 The size of this register depends on the size of the memory space
3	0h RO	**Prefetchable Field (PREFETCHABLE):** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**Type Field (TYPE0):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE):** Memory Space Indicator: 0 indicates this BAR is present in the memory space

12.1.6 Base Address Register High (BAR_HIGH) - Offset 14h

Base Address Register High enabled if [2:1] of BAR_HIGH is 10

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR_HIGH):** Base Address High - MSB

12.1.7 Base Address Register1 (BAR1) - Offset 18h

Base Address Register1 accesses to PCI configuration space and is always 4K type in [2:1] and memory space indicator in [0]

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR1):** Base Address1 This field is present if BAR1 is enabled through private configuration space
11:4	00h RO	**Size Field (SIZEINDICATOR1):** Always is 0 as minimum size is 4K
3	0h RO	**Prefetchable Field (PREFETCHABLE1):** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**Type Field (TYPE1):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE1):** Memory Space Indicator: 0 Indicates this BAR is present in the memory space

12.1.8 Base Address Register1 High (BAR1_HIGH) - Offset 1Ch

Base Address Register1 High enabled only if [2:1] of BAR1_HIGH register is 10

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR1_HIGH):** Base Address: Base address of the AXI fabric memory space. Taken from Strap values as ones

12.1.9 Subsystem Vendor and Subsystem ID (SUBSYSTEMID) - Offset 2Ch

SVID Register along with SID Register is to distinguish subsystem from another

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O/P	**Subsystem ID Field (SUBSYSTEMID):** Subsystem ID: This register is implemented for any function that can be instantiated more than once in a given system
15:0	0000h RW/O/P	**Subsystem Vendor Field (SUBSYSTEMVENDORID):** Subsystem Vendor ID: This register must be implemented for any function that can be instantiated more than once in a given system

12.1.10 Expansion ROM Base Address (EXPANSION_ROM_BASEADDR) - Offset 30h

Expansion ROM Base Address Register is a RO indicates support for expansion ROMs

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Expansion Rom Base Address Field (EXPANSION_ROM_BASE):** Expansion ROM Base Address: Value of all zeros indicates no support for Expansion ROM

12.1.11 Capabilities Pointer (CAPABILITYPTR) - Offset 34h

Capabilities Pointer Register indicates what the next capability is

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 34h	00000080h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	80h RO	**Capabilities Pointer Field (CAPPTR_POWER):** Capabilities Pointer: Indicates what the next capability is

12.1.12 Interrupt Register (INTERRUPTREG) - Offset 3Ch

Interrupt Line Register is not use in Bridge directly. Interrupt Pin Register reflects the IPIN value in private configuration space. MIN_GNT register indicating the requirements of latency timers and MAX_LAT register for max latency

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 3Ch	00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Max Latency Field (MAX_LAT):** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	00h RO	**Min GNT Field (MIN_GNT):** Value of 0 indicates device has no major requirements for the settings of latency timers // Re-Check Desc Padma
15:12	0h RO	**Reserved**
11:8	1h RO	**Interrupt Pin Field (INTPIN):** Interrupt Pin: Value in this register is reflected from the IPIN value in the private configuration space
7:0	00h RW/P	**Interrupt Line Field (INTLINE):** Interrupt Line: It is used to communicate to software the interrupt line to which the interrupt pin is connected

12.1.13 Power Management Capability ID (POWERCAPID) - Offset 80h

Power Management Capability ID Register points to next capability structure and Power Management Capability with Power Management Capabilities Register for PME support and version

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 80h	48030001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	09h RO	**PME Support Field (PMESUPPORT):** This 5-bit field indicates the power states in which the function can assert the PME#
26:19	0h RO	**Reserved**
18:16	3h RO	**Version Field (VERSION):** Indicates support for Revision 1.2 of the PCI Power Management Specification
15:8	00h RO	**Next Cap Field (NXTCAP):** Next Capability: Points to the next capability structure
7:0	01h RO	**Power Capability ID Field (POWER_CAP):** Power Management Capability: Indicates this is power management capability

12.1.14 Power Management Control And Status Register (PMECTRLSTATUS) - Offset 84h

Power Management Control and Status Register to set and read PME Status, PME Enable, No Soft reset and Power State

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 84h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW/1C/P	**PME Status Field (PMESTATUS):** PME Status
14:9	0h RO	**Reserved**
8	0h RW/P	**PME Enable Field (PMEENABLE):** PME Enable
7:4	0h RO	**Reserved**
3	1h RO	**No Soft Reset Field (NO_SOFT_RESET):** This bit indicates that devices transitioning from D3hot to D0 because of Power State commands do not perform an internal reset
2	0h RO	**Reserved**
1:0	0h RW	**Power State Field (POWERSTATE):** Power State: This field is used both to determine the current Power State and to set a new Power State

12.1.15 PCI Device Idle Vendor Capability Register (PCIDEVIDLE_CAP_RECORD) - Offset 90h

PCI Device Vendor Specific Capability Register defines Vendor Specific Capability ID, Revision Length, Next Capability and CAPID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 90h	F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**Vendor Cap Field (VEND_CAP):** Vendor Specific Capability ID
27:24	0h RO	**Revision ID Field (REVID):** Revision ID of capability structure
23:16	14h RO	**Cap Length Field (CAP_LENGTH):** Vendor Specific Capability Length
15:8	00h RO	**Next Capability Field (NEXT_CAP):** Next Capability
7:0	09h RO	**Capability ID Field (CAPID):** Capability ID

12.1.16 Vendor Specific Extended Capability Register (DEVID_VEND_SPECIFIC_REG) - Offset 94h

Extended Vendor Capability Register for VSEC Length, Revision and ID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 94h	01400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	014h RO	**Vendor Specific ID Field (VSEC_LENGTH):** Vendor Specific Extended Capability Length
19:16	0h RO	**Vendor Specific Revision Field (VSEC_REV):** Vendor Specific Extended Capability Revision
15:0	0010h RO	**Vendor Specific Length Field (VSECID):** Vendor Specific Extended Capability ID

12.1.17 Software LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG) - Offset 98h

Software Location Pointer in MMIO space as an offset specified by BAR

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RO	**SW LTR Dword Offset Field (SW_LAT_DWORD_OFFSET):** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**SW LTR Bar Number Field (SW_LAT_BAR_NUM):** Indicates that the SW LTR update MMIO location is always at BAR0
0	0h RO	**SW LTR Valid Field (SW_LAT_VALID):** This value is reflected from the SW LTR valid strap at the top level

12.1.18 Device Idle Pointer Register (DEVICE_IDLE_POINTER_REG) - Offset 9Ch

Device Idle Pointer Register giving details on Device MMIO Offset Location, BAR NUM and D0i3 Valid Strap

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RO	**D0i3 Dword Offset Field (DWORD_OFFSET):** Contains the location pointer to the SW LTR register in MMIO space as an offset from the specified BAR
3:1	0h RO	**BAR NUM Field (BAR_NUM):** BAR Num: Indicates that the D0i3 MMIO location is always at BAR0
0	0h RO	**D0i3 Valid Field (VALID):** Valid: This value is reflected from the D0i3 valid strap at the top level

12.1.19 D0i3 and Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG) - Offset A0h

D0idle_Max_Power_On_Latency Register set at boot and power control enable register to enable communication with the PGCB block below the Bridge

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + A0h	00000800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21	0h RW/P	**HAE:** Hardware Autonomous Enable
20	0h RO	**Reserved**
19	0h RW/P	**Sleep Enable Field (SLEEP_EN):** Sleep Enable
18	0h RW/P	**D3 Hen Field (D3HEN):** DEVIDLE Enable (DEVIDLEN): If '1' then the function will power gate when idle and the DevIdle register (DevIdleC[2] = '1') is set
17	0h RW/P	**Device Idle En Field (DEVIDLEN):** PMCRE: PMC Request Enable
16	0h RW/P	**PMC Request Enable Field (PMCRE):** D3-Hot Enable (D3HEN): If '1' then function will power gate when idle and the PMCSR[1:0] register in the function ='11' (D3)
15:13	0h RO	**Reserved**
12:10	2h RW/O/P	**Power Latency Scale Field (POW_LAT_SCALE):** Power On Latency Scale
9:0	000h RW/O/P	**Power Latency Value Field (POW_LAT_VALUE):** Power On Latency Value

12.1.20 General Purpose Read Write Register1 (GEN_PCI_REGRW1) - Offset B0h

General Purpose PCI Read Write Register1

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Read Write Field (GEN_PCI_REG_RW1):** General Purpose PCI Register: This register value is brought out as GEN_PCI_REG_RW1

12.1.21 General Purpose Input Register (GEN_INPUT_REG) - Offset C0h

General Purpose Input Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**General Purpose Input Field (GEN_REG_INPUT_RW):** General Purpose Input Register: This register value reflects the value of GEN_REG_INPUT_RW

12.1.22 MSI Capability Register (MSI_CAP_REG) - Offset D0h

MSI Capability Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + D0h	01800005h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	1h RO	**Per Vector Masking Capability Field (PER_VECTOR_MSK_CAP):** Per Vector Masking Capability
23	1h RO	**MSI Capability Field (MSI_CAP_64B):** 64 bit message address capability
22:20	0h RW	**Multi Message En Field (MUL_MSG_EN):** Multiple Message Enable
19:17	0h RO	**Multi Message Cap Field (MUL_MSG_CAP):** Multiple Message Capable
16	0h RW	**MSI Enable Field (MSG_MSI_ENABLE):** MSI Enable
15:8	00h RO	**Next Pointer Field (MSG_NXT_PTR):** Next Capability Pointer
7:0	05h RO	**MSI Capability Field (MSG_CAP_ID):** MSI Capability ID

12.1.23 MSI Message Low Address (MSI_ADDR_LOW) - Offset D4h

MSI Message Low Address

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RW	**MSI Message Low Address Field (MSI_ADDR_LOW):** MSI Message Low Address
1:0	0h RO	**Reserved**

12.1.24 MSI Message High Address (MSI_ADDR_HIGH) - Offset D8h

MSI Message High Address

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSI Message High Address Field (MSI_ADDR_HIGH):** MSI Message High Address

12.1.25 MSI Message Data (MSI_MSG_DATA) - Offset DCh

MSI Message Data

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + DCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0000h RW	**MSI Message Data Field (MSI_MSG_DATA):** MSI Message Data

12.1.26 MSI Mask Register (MSI_MASK) - Offset E0h

MSI Mask bits

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + E0h	00000000h

12.1.28 Manufacturers ID (MANID) - Offset F8h

Manufacturers ID Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + F8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/P	**Manufacturers ID Field (MANID):** Manufacturer ID: Default value comes from straps

12.2 I2S MMIO Registers Summary

Table 12-2. Summary of Bus: 0, Device: 17, Function: 6 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	I2S-SC Control (I2S_CTRL)	000001B8h
4h	4	I2S Full Duplex Mode Receiver Control (I2S_CTRL_FDR)	00000010h
8h	4	Transceiver Sample Resolution (I2S_SRES)	00000000h
Ch	4	Full Duplex Mode Receive Samples Resolution (I2S_SRES_FDR)	00000000h
10h	4	Transceiver Sample Rate (I2S_SRATE)	00000000h
14h	4	I2S-SC Status Flags (I2S_STAT)	0003000Ch
18h	4	FIFO Using Level(Read Only) (FIFO_LEVEL)	00000000h
1Ch	4	FIFO Almost Empty Level (FIFO_AEMPTY)	00000000h
20h	4	FIFO Almost Full Level (FIFO_AFULL)	0000001Fh
24h	4	Full Duplex Mode Receiver FIFO Using Level(Read Only) (FIFO_LEVEL_FDR)	00000000h
28h	4	Full Duplex Mode Receiver FIFO Almost Empty Level (FIFO_AEMPTY_FDR)	00000000h
2Ch	4	Full Duplex Mode Receiver FIFO Almost Full Level (FIFO_AFULL_FDR)	0000001Fh
30h	4	Time Division Multiplexing Control (TDM_CTRL)	FFFF0000h
34h	4	Time Division Multiplexing Full Duplex Mode Channels Direction (TDM_FD_DIR)	0000FFFFh

Table 12-2. Summary of Bus: 0, Device: 17, Function: 6 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
40h	4	TX/RX FIFo (FIFO)	00000000h
1000h	4	D0i3 Control (D0I3C)	00000008h
1004h	4	Clock Gating And Soft Reset (CGSR)	00000000h

12.2.1 I2S-SC Control (I2S_CTRL) - Offset 0h

I2S-SC Control Register After end of reset bit sfr_rst triggers to 1 and bit FIFO_rst triggers to 1. Therefore register value after end of reset is 000001B8.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 0h	000001B8h

FIFO

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Full-Duplex Mode Receiver Samples Resolution (FULL_DUPLEX):** Full-duplex mode enable bit. If HIGH transmitter and receiver data units work simultaneously, otherwise only transmitter or receiver is enable in dependent to dir_cfg bit (I2S_CTRL[1]).
30	0h RW	**FIFO Almost Full Mask Register (FIFO_AFULL_MASK):** Bit masking interrupt request generation after FIFO becomes almost full. When LOW, masks generation of interrupt request. When full-duplex mode is active, this bit is a mask only for transmitter FIFO empty condition.
29	0h RW	**FIFO Full Mask Register (FIFO_FULL_MASK):** Bit masking interrupt request generation after FIFO becomes full. When LOW, masks generation of interrupt request. When full-duplex mode is active, this bit is a mask only for transmitter FIFO empty condition.
28	0h RW	**FIFO Almost Empty Mask Register (FIFO_AEMPTY_MASK):** Bit masking interrupt request generation after FIFO becomes almost empty. When LOW, masks generation of interrupt request. When full-duplex mode is active, this bit is a mask only for transmitter FIFO empty condition. Sampled on the rising edge of the clock.
27	0h RW	**FIFO Empty Mask Register (FIFO_EMPTY_MASK):** Bit masking interrupt request generation after FIFO becomes empty. When LOW, masks generation of interrupt request. When full-duplex mode is active, this bit is a mask only for transmitter FIFO empty condition. Sampled on the rising edge of the clock.
26	0h RW	**I2s Mask Register (I2S_MASK):** Bit masking interrupt request generation after underrun/overrun condition occurrence in I2S-SC transceiver. When LOW, masks generation of interrupt request. When full-duplex mode is active, this bit is a mask only for underrun event interrupt. Sampled on the rising edge of the clock.
25	0h RW	**Interrupt Mask Register (INTREQ_MASK):** Bit masking all interrupt requests. When LOW all interrupts are masked, when HIGH interrupts use individual masks. Sampled on the rising edge of the clock.
24	0h RW	**Transceiver Clock Enable. (I2S_STB):** Transceiver clock enable. When LOW the clk_i2s clock is enabled, else clock is disabled. Sampled on the rising edge of the clock.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**Audio Data Sample Alignment At Host Data Bus. (HOST_DATA_ALIGN):** Audio data sample alignment at host data bus. When LOW the audio sample data is aligned to the LSB at the host data bus. When HIGH the audio sample data is aligned to the MSB at host data bus.Sampled on the rising edge of the clock.
22	0h RW	**Audio Data Sample Arrangement In Audio Data Slot (DATA_ORDER):** Bit masking interrupt request generation after FIFO becomes almost empty. When LOW, masks generation of interrupt request. When full-duplex mode is active, this bit is a mask only for transmitter FIFO empty condition.
21	0h RW	**Audio Sample Alignment In Audio Data Time Slot (DATA_ALIGN):** Bit masking interrupt request generation after FIFO becomes empty. When LOW, masks generation of interrupt request. When full-duplex mode is active, this bit is a mask only for transmitter FIFO empty condition.
20:16	00h RW	**Audio Data Delay After WS Signal (DATA_WS_DEL):** Bit masking interrupt request generation after underrun/overrun condition occurrence in I2S-SC transceiver. When LOW, masks generation of interrupt request. When full-duplex mode is active, this bit is a mask only for underrun event interrupt.
15	0h RW	**The Word Select Signal Polarity Selection. (WS_POLAR):** Bit masking all interrupt requests. When LOW all interrupts are masked, when HIGH interrupts use individual masks.
14	0h RW	**The Continuous Serial Clock Active Edge. (SCK_POLAR):** Transceiver clock enable. When LOW the clk_i2s clock is enabled, else clock is disabled.
13	0h RW	**Mono/Stereo Audio Mode Selection (AUDIO_MODE):** Audio data sample alignment at host data bus. When LOW the audio sample data is aligned to the LSB at the host data bus. When HIGH the audio sample data is aligned to the MSB at host data bus.
12	0h RW	**Active Audio Channel In Mono Mode (MONO_MODE):** Active audio channel in mono mode. When LOW left audio channel is active. When HIGH right audio channel is active.
11:8	1h RW	**Word Select Signal (WS) Format. (WS_MODE):** Word select signal (WS) format. TDM mode is not active: Only bit 8 is relevant. If it is set to LOW (even value of ws_mode) WS signal have DSP audio interface specification format. If it is set to HIGH (odd value of ws_mode) WS signal have standard I2S audio interface specification format. TDM mode is active: When field equals 0 WS signal has DSP audio interface specification format, otherwise (ws_mode field equals the value from range 1 &CHN_NO-1) WS.
7:5	5h RW	**Audio Channel Time Slot Width (CHN_WIDTH):** Audio channel time slot width in I2S master or DSP/TDM master and slave modes. 0 8 SCK cycles per audio channel 1 12 SCK cycles per audio channel 2 16 SCK cycles per audio channel 3 18 SCK cycles per audio channel 4 20 SCK cycles per audio channel 5 24 SCK cycles per audio channel 6 28 SCK cycles per audio channel 7 32 SCK cycles per audio channel.
4	1h RW	**FIFO Reset (FIFO_RST):** FIFO reset. When LOW, FIFO pointer is reset to zero. Threshold levels for FIFO are unchanged. This bit is automatically set to HIGH after one clock cycle. In full-duplex mode this bit resets only transmitter FIFO.
3	1h RW	**SFR Block Synchronous Reset (SFR_RST):** SFR block synchronous reset. When LOW, all bits in SFR registers are reset to default values. This bit is automatically set to HIGH after one clock cycle.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Configuration Bit For Transceiver Synchronizing Unit (MS_CFG):** Configuration bit for transceiver synchronizing unit: 1 Master 0 Slave.
1	0h RW	**Direction Of Transmission (DIR_CFG):** 1 Transmitter 0 Receiver.
0	0h RW	**Enable Bit For I2S Transceiver (I2S_EN):** 1 enables transceiver 0 disables transceiver, causes synchronous reset signal, configuration SFR bits are unchanged.

12.2.2 I2S Full Duplex Mode Receiver Control (I2S_CTRL_FDR) - Offset 4h

I2S Full Duplex Mode Receiver Control Register After end of reset bit FIFO_rst triggers to 1. Therefore register value after end of reset is 00000010.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4h	00000010h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30	0h RW	**Full Duplex Almost FIFO Full Mask Register (RFIFO_AFULL_MASK):** Bit masking interrupt request generation after full-duplex mode receive FIFO becomes almost full. When LOW, masks generation of interrupt request.
29	0h RW	**Full Duplex FIFO Full Mask Register (RFIFO_FULL_MASK):** Bit masking interrupt request generation after full-duplex mode receive FIFO becomes full. When LOW, masks generation of interrupt request.
28	0h RW	**Full Duplex Almost FIFO Empty Mask Register (RFIFO_AEMPTY_MASK):** Bit masking interrupt request generation after full-duplex mode receive FIFO becomes almost empty. When LOW, masks generation of interrupt request.
27	0h RW	**Full Duplex FIFO Empty Mask Register (RFIFO_EMPTY_MASK):** Bit masking interrupt request generation after full-duplex mode receive FIFO becomes empty. When LOW, masks generation of interrupt request.
26	0h RW	**Full Duplex I2s_mask Register (RI2S_MASK):** Bit masking interrupt request generation after overrun condition occurrence in I2S-SC full-duplex mode receiver. When LOW, masks generation of interrupt request.
25:5	0h RO	**Reserved**
4	1h RW	**Full-Duplex Mode Receiver FIFO Reset. (FIFO_RST):** Full-duplex mode receiver FIFO reset. Active only in full-duplex mode. When '0', RFIFO pointer is reset to zero. Threshold levels for RFIFO are unchanged. The bit is automatically set to '1' after one clock cycle.
3:0	0h RO	**Reserved**

12.2.3 Transceiver Sample Resolution (I2S_SRES) - Offset 8h

Transceiver Sample Resolution.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4:0	00h RW	**Samples Resolution. (RESOLUTION):** Samples resolution. When full-duplex mode is active, this value specifies resolution only for transmitted samples. Sampled on the rising edge of the clock. It simply should be assigned the value equal to the number of valid bits minus one, for example, 00000B sample resolution = 1 bit 11111B sample resolution = 32 bits.

12.2.4 Full Duplex Mode Receive Samples Resolution (I2S_SRES_FDR) - Offset Ch

Full Duplex Mode Receive Samples Resolution.

Type	Size	Offset	Default
MMIO	32 bit	BAR + Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4:0	00h RW	**I2s_sres Register - Samples Resolution (RESOLUTION):** Full-duplex mode receives samples resolution. When half-duplex mode is active this value is ignored. It simply should be assigned the value equal to the number of valid bits minus one, for example, 00000B sample resolution = 1 bit 11111B sample resolution = 32 bits.

12.2.5 Transceiver Sample Rate (I2S_SRATE) - Offset 10h

Transceiver Sample Rate.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19:0	00000h RW	**SAMPLE_RATE:** In general value of sample rate is the quotient of CLK frequency and I2S rate [bit/s]. The value of sample rate is the higher the CLK frequency is greater than I2S rate.

12.2.6 I2S-SC Status Flags (I2S_STAT) - Offset 14h

I2S-SC Status Flags Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14h	0003000Ch

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19	0h RW	**Receive FIFO Almost Full Flag In Full-Duplex Mode (RFIFO_AFULL):** Receive FIFO almost full flag in full-duplex mode. Active HIGH. This flag is set to HIGH when RX FIFO becomes almost full (rising edge of almost full condition).
18	0h RW	**Receive FIFO Full Flag In Full-Duplex Mode (RFIFO_FULL):** Receive FIFO full flag in full-duplex mode. Active HIGH. This flag is set to HIGH when RX FIFO is full.
17	1h RW	**Receive FIFO Almost Empty Flag In Full-Duplex Mode (RFIFO_AEMPTY):** Receive FIFO almost empty flag in full-duplex mode. Active HIGH. This flag is set to HIGH when RX FIFO becomes almost empty (rising edge of almost empty condition).
16	1h RW	**Receive FIFO Empty Flag In Full-Duplex Mode (RFIFO_EMPTY):** Receive FIFO empty flag in full-duplex mode. Active HIGH. This flag is set to HIGH when RX FIFO is empty.
15:6	0h RO	**Reserved**
5	0h RW	**FIFO Almost Full Flag (FIFO_AFULL):** FIFO almost full flag. Active HIGH. This flag is set to HIGH when FIFO becomes almost full (rising edge of almost full condition). When full-duplex mode is active, this bit is a flag only for transmitter FIFO almost full condition.
4	0h RW	**FIFO Full Flag (FIFO_FULL):** FIFO full flag. Active HIGH. This flag is set to HIGH when FIFO is full. When full-duplex mode is active, this bit is a flag only for transmitter FIFO full condition.
3	1h RW	**FIFO Almost Empty Flag (FIFO_AEMPTY):** FIFO almost empty flag. Active HIGH. This flag is set to HIGH when FIFO becomes almost empty (rising edge of almost empty condition). When full-duplex mode is active, this bit is a flag only for transmitter FIFO almost empty condition.
2	1h RW	**FIFO Empty Flag (FIFO_EMPTY):** FIFO empty flag. Active HIGH. This flag is set to HIGH when FIFO is empty. When full-duplex mode is active, this bit is a flag only for transmitter FIFO empty condition.
1	0h RW	**RDATA_OVRERR:** Indicates data overrun error for transceiver in receiver mode, active HIGH. Sampled and updated on the rising edge of the clock. Writing LOW value to this bit resets the transceiver and the FIFO. The transceiver configuration is preserved.
0	0h RW	**Full Duplex Mode Samples Resolution Register (TDATA_UNDERR):** Indicates data underrun event, active HIGH. This flag is set to HIGH when TX underrun arises (rising edge of underrun condition).

12.2.7 FIFO Using Level (Read Only) (FIFO_LEVEL) - Offset 18h

FIFO Using Level Register (read only).

Type	Size	Offset	Default
MMIO	32 bit	BAR + 18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:0	00h RO	**FIFO Level Register (FIFO_LEVEL):** Indicates FIFO level. Updated on the rising edge of the clock. When full-duplex mode is active, this register holds value of the transmitter FIFO level. When half-duplex mode is active, this register holds value of the transmitter or receiver FIFO level in dependent to the transmit/receive direction mode.

12.2.8 FIFO Almost Empty Level (FIFO_AEMPTY) - Offset 1Ch

FIFO Almost Empty Level.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4:0	00h RW	**FIFO Almost Empty Threshold Level (AEMPTY_THRESHOLD):** Determines threshold for almost empty flag in the FIFO. When full-duplex mode is active, this register specifies an almost empty level of the transmitter FIFO level.

12.2.9 FIFO Almost Full Level (FIFO_AFULL) - Offset 20h

FIFO Almost Full Level.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 20h	0000001Fh

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4:0	1Fh RW	**FIFO Aempty Threshold Level (AFULL_THRESHOLD):** Determines threshold for almost full flag in the FIFO. When full-duplex mode is active, this register specifies an almost full level of the transmitter FIFO level.

12.2.10 Full Duplex Mode Receiver FIFO Using Level (Read Only) (FIFO_LEVEL_FDR) - Offset 24h

Full Duplex Mode Receiver FIFO Using Level Register (read only).

Type	Size	Offset	Default
MMIO	32 bit	BAR + 24h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:0	00h RO	**Full Duplex FIFO Level (RX_FIFO_LEVEL):** Full-duplex mode receives FIFO level.

12.2.11 Full Duplex Mode Receiver FIFO Almost Empty Level (FIFO_AEMPTY_FDR) - Offset 28h

Full Duplex Mode Receiver FIFO Almost Empty Level.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 28h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4:0	00h RW	**Full Duplex FIFO Almost Empty Level (AEMPTY_THRESHOLD):** Determines almost empty level in the receive FIFO in full-duplex mode.

12.2.12 Full Duplex Mode Receiver FIFO Almost Full Level (FIFO_AFULL_FDR) - Offset 2Ch

Full Duplex Mode Receiver FIFO Almost Full Level.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 2Ch	0000001Fh

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4:0	1Fh RW	**Full Duplex FIFO Almost Full Level (AFULL_THRESHOLD):** Determines almost full level in the receive FIFO in full-duplex mode.

12.2.13 Time Division Multiplexing Control (TDM_CTRL) - Offset 30h

Time Division Multiplexing Control Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 30h	FFFF0000h

Bit Range	Default & Access	Field Name (ID): Description
31	1h RW	**TDM Channel Enable 15 (CH15_EN):** TDM interface channel 15 activating bit. When HIGH 15th time slot sample is transmitted and/or received depending on transceiver mode.
30	1h RW	**TDM Channel Enable 14 (CH14_EN):** TDM interface channel 14 activating bit. When HIGH 14th time slot sample is transmitted and/or received depending on transceiver mode.
29	1h RW	**TDM Channel Enable 13 (CH13_EN):** TDM interface channel 13 activating bit. When HIGH 13th time slot sample is transmitted and/or received depending on transceiver mode.
28	1h RW	**TDM Channel Enable 12 (CH12_EN):** TDM interface channel 12 activating bit. When HIGH 12th time slot sample is transmitted and/or received depending on transceiver mode.
27	1h RW	**TDM Channel Enable 11 (CH11_EN):** TDM interface channel 11 activating bit. When HIGH 11th time slot sample is transmitted and/or received depending on transceiver mode.
26	1h RW	**TDM Channel Enable 10 (CH10_EN):** TDM interface channel 10 activating bit. When HIGH 10th time slot sample is transmitted and/or received depending on transceiver mode.
25	1h RW	**TDM Channel Enable 9 (CH9_EN):** TDM interface channel 9 activating bit. When HIGH 9th time slot sample is transmitted and/or received depending on transceiver mode.
24	1h RW	**TDM Channel Enable 8 (CH8_EN):** TDM interface channel 8 activating bit. When HIGH 8th time slot sample is transmitted and/or received depending on transceiver mode.
23	1h RW	**TDM Channel Enable 7 (CH7_EN):** TDM interface channel 7 activating bit. When HIGH 7th time slot sample is transmitted and/or received depending on transceiver mode.
22	1h RW	**TDM Channel Enable 6 (CH6_EN):** TDM interface channel 6 activating bit. When HIGH 6th time slot sample is transmitted and/or received depending on transceiver mode.
21	1h RW	**TDM Channel Enable 5 (CH5_EN):** TDM interface channel 5 activating bit. When HIGH 5th time slot sample is transmitted and/or received depending on transceiver mode.
20	1h RW	**TDM Channel Enable 4 (CH4_EN):** TDM interface channel 4 activating bit. When HIGH 4th time slot sample is transmitted and/or received depending on transceiver mode.
19	1h RW	**TDM Channel Enable 3 (CH3_EN):** TDM interface channel 3 activating bit. When HIGH 3rd time slot sample is transmitted and/or received depending on transceiver mode.
18	1h RW	**TDM Channel Enable 2 (CH2_EN):** TDM interface channel 2 activating bit. When HIGH 2nd time slot sample is transmitted and/or received depending on transceiver mode.

Bit Range	Default & Access	Field Name (ID): Description
17	1h RW	**TDM Channel Enable 1 (CH1_EN):** TDM interface channel 1 activating bit. When HIGH 1st time slot sample is transmitted and/or received depending on transceiver mode.
16	1h RW	**TDM Channel Enable 0 (CH0_EN):** TDM interface channel 0 activating bit. When HIGH zero time slot sample is transmitted and/or received depending on transceiver mode.
15:5	0h RO	**Reserved**
4:1	0h RW	**TDM Register For Number Of Channels Per Frame (CHN_NO):** Number of supported audio channels in TDM compatible interface mode. Written value equals channels number minus 1.
0	0h RW	**Time Division Multiplexing Audio Interface Enable (TDM_EN):** Time Division Multiplexing audio interfaces enable. When HIGH audio interface works in TDM compatible mode determined by this register value. When LOW audio interface works in standard stereo I2S mode.

12.2.14 Time Division MultSDIiplexing Full Duplex Mode Channels Direction (TDM_FD_DIR) - Offset 34h

Time Division Multiplexing Full Duplex Mode Channels Direction Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 34h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Full Duplex Rx Channel Enable 15 (CH15_RXEN):** TDM interface channel 15 receives enable bit. Active only in full-duplex mode. When HIGH and ch15_en bit in TDM_CTRL register is HIGH audio sample is received from SDI line at 15 time slot.
30	0h RW	**Full Duplex Rx Channel Enable 14 (CH14_RXEN):** TDM interface channel 14 receives enable bit. Active only in full-duplex mode. When HIGH and ch14_en bit in TDM_CTRL register is HIGH audio sample is received from SDI line at 14 time slot.
29	0h RW	**Full Duplex Rx Channel Enable 13 (CH13_RXEN):** TDM interface channel 13 receives enable bit. Active only in full-duplex mode. When HIGH and ch13_en bit in TDM_CTRL register is HIGH audio sample is received from SDI line at 13 time slot.
28	0h RW	**Full Duplex Rx Channel Enable 12 (CH12_RXEN):** TDM interface channel 12 receives enable bit. Active only in full-duplex mode. When HIGH and ch12_en bit in TDM_CTRL register is HIGH audio sample is received from SDO line at 12 time slot.
27	0h RW	**Full Duplex Rx Channel Enable 11 (CH11_RXEN):** TDM interface channel 11 receives enable bit. Active only in full-duplex mode. When HIGH and ch11_en bit in TDM_CTRL register is HIGH audio sample is received from SDI line at 11 time slot.
26	0h RW	**Full Duplex Rx Channel Enable 10 (CH10_RXEN):** TDM interface channel 10 receives enable bit. Active only in full-duplex mode. When HIGH and ch10_en bit in TDM_CTRL register is HIGH audio sample is received from SDI line at 10 time slot.

Bit Range	Default & Access	Field Name (ID): Description
25	0h RW	**Full Duplex Rx Channel Enable 9 (CH9_RXEN):** TDM interface channel 9 receives enable bit. Active only in full-duplex mode. When HIGH and ch9_en bit in TDM_CTRL register is HIGH audio sample is received from SDI line at 9 time slot.
24	0h RW	**Full Duplex Rx Channel Enable 8 (CH8_RXEN):** TDM interface channel 8 receives enable bit. Active only in full-duplex mode. When HIGH and ch8_en bit in TDM_CTRL register is HIGH audio sample is received from SDI line at 8 time slot.
23	0h RW	**Full Duplex Rx Channel Enable 7 (CH7_RXEN):** TDM interface channel 7 receives enable bit. Active only in full-duplex mode. When HIGH and ch7_en bit in TDM_CTRL register is HIGH audio sample is received from SDI line at 7 time slot.
22	0h RW	**Full Duplex Rx Channel Enable 6 (CH6_RXEN):** TDM interface channel 6 receives enable bit. Active only in full-duplex mode. When HIGH and ch6_en bit in TDM_CTRL register is HIGH audio sample is received from SDI line at 6 time slot.
21	0h RW	**Full Duplex Rx Channel Enable 5 (CH5_RXEN):** TDM interface channel 5 receives enable bit. Active only in full-duplex mode. When HIGH and ch5_en bit in TDM_CTRL register is HIGH audio sample is received from SDI line at 5 time slot.
20	0h RW	**Full Duplex Rx Channel Enable 4 (CH4_RXEN):** TDM interface channel 4 receives enable bit. Active only in full-duplex mode. When HIGH and ch4_en bit in TDM_CTRL register is HIGH audio sample is received from SDI line at 4 time slot.
19	0h RW	**Full Duplex Rx Channel Enable 3 (CH3_RXEN):** TDM interface channel 3 receives enable bit. Active only in full-duplex mode. When HIGH and ch3_en bit in TDM_CTRL register is HIGH audio sample is received from SDI line at 3 time slot.
18	0h RW	**Full Duplex Rx Channel Enable 2 (CH2_RXEN):** TDM interface channel 2 receives enable bit. Active only in full-duplex mode. When HIGH and ch2_en bit in TDM_CTRL register is HIGH audio sample is received from SDI line at 2 time slot.
17	0h RW	**Full Duplex Rx Channel Enable 1 (CH1_RXEN):** TDM interface channel 1 receives enable bit. Active only in full-duplex mode. When HIGH and ch1_en bit in TDM_CTRL register is HIGH audio sample is received from SDI line at 1 time slot.
16	0h RW	**Full Duplex Tx Channel Enable 0 (CH0_TXEN):** TDM interface channel 0 receives enable bit. Active only in full-duplex mode. When HIGH and ch0_en bit in TDM_CTRL register is HIGH audio sample is received from SDI line at 0 time slot.
15	1h RW	**Full Duplex Tx Channel Enable 15 (CH15_TXEN):** TDM interface channel 15 transmit enable bit. Active only in full-duplex mode. When HIGH and ch15_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 15 time slot through SDO line.
14	1h RW	**Full Duplex Tx Channel Enable 14 (CH14_TXEN):** TDM interface channel 14 transmit enable bit. Active only in full-duplex mode. When HIGH and ch14_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 14 time slot through SDO line.
13	1h RW	**Full Duplex Tx Channel Enable 13 (CH13_TXEN):** TDM interface channel 13 transmit enable bit. Active only in full-duplex mode. When HIGH and ch13_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 13 time slot through SDO line.
12	1h RW	**Full Duplex Tx Channel Enable 12 (CH12_TXEN):** TDM interface channel 12 transmit enable bit. Active only in full-duplex mode. When HIGH and ch12_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 12 time slot through SDO line.

Bit Range	Default & Access	Field Name (ID): Description
11	1h RW	**Full Duplex Tx Channel Enable 11 (CH11_TXEN):** TDM interface channel 11 transmit enable bit. Active only in full-duplex mode. When HIGH and ch11_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 11 time slot through SDO line.
10	1h RW	**Full Duplex Tx Channel Enable 10 (CH10_TXEN):** TDM interface channel 10 transmit enable bit. Active only in full-duplex mode. When HIGH and ch10_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 10 time slot through SDO line.
9	1h RW	**Full Duplex Tx Channel Enable 9 (CH9_TXEN):** TDM interface channel 9 transmit enable bit. Active only in full-duplex mode. When HIGH and ch9_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 9 time slot through SDO line.
8	1h RW	**Full Duplex Tx Channel Enable 8 (CH8_TXEN):** TDM interface channel 8 transmit enable bit. Active only in full-duplex mode. When HIGH and ch8_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 8th time slot through SDO line.
7	1h RW	**Full Duplex Tx Channel Enable 7 (CH7_TXEN):** TDM interface channel 7 transmit enable bit. Active only in full-duplex mode. When HIGH and ch7_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 7 time slot through SDO line.
6	1h RW	**Full Duplex Tx Channel Enable 6 (CH6_TXEN):** TDM interface channel 6 transmit enable bit. Active only in full-duplex mode. When HIGH and ch6_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 6 time slot through SDO line.
5	1h RW	**Full Duplex Tx Channel Enable 5 (CH5_TXEN):** TDM interface channel 5 transmit enable bit. Active only in full-duplex mode. When HIGH and ch5_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 5 time slot through SDO line.
4	1h RW	**Full Duplex Tx Channel Enable 4 (CH4_TXEN):** TDM interface channel 4 transmit enable bit. Active only in full-duplex mode. When HIGH and ch4_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 4 time slot through SDO line.
3	1h RW	**Full Duplex Tx Channel Enable 3 (CH3_TXEN):** TDM interface channel 3 transmit enable bit. Active only in full-duplex mode. When HIGH and ch3_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 3 time slot through SDO line.
2	1h RW	**Full Duplex Tx Channel Enable 2 (CH2_TXEN):** TDM interface channel 2 transmit enable bit. Active only in full-duplex mode. When HIGH and ch2_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 2 time slot through SDO line.
1	1h RW	**Full Duplex Tx Channel Enable 1 (CH1_TXEN):** TDM interface channel 1 transmit enable bit. Active only in full-duplex mode. When HIGH and ch1_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 1 time slot through SDO line.
0	1h RW	**Full Duplex Rx Channel Enable 0 (CH0_RXEN):** TDM interface channel 0 transmit enable bit. Active only in full-duplex mode. When HIGH and ch0_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 0 time slot through SDO line.

12.2.15 TX/RX FIFO (FIFO) - Offset 40h

TX/RX FIFO.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 40h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SFR:** Registers for TX and RX FIFO.

12.2.16 D0i3 Control (D0I3C) - Offset 1000h

This register will be used for D0i3 SW flow. This will be mapped to a different MMIO address from the other IPC registers. (MMIO and OCP address value are yet to be done). The description below also includes the type of access expected for the ISH FW for each configuration bit:
1. The Restore Required (RR) bit (bit [3]) should be RW for the ISH FW which can determine when to set and/or clear these bits depending on when the ISH FW determines whether restore is required although for ISH restore is never required since the power is never lost.
2. The D0i3 (i3) bit (bit [2]) should be RO for ISH FW as it needs to be written only by host SW. The ISH FW can determine to go to a low power state based on this bit.
3. The Interrupt Required (IR) bit (bit [1]) can be RO register for ISH FW and ISH FW can send an interrupt to Host by writing to the ish2host IPC doorbell register when this bit is set by SW.
4. The Command in Progress (CIP) register bit (bit [0]) is HW set and need to be cleared by ISH FW (Write 1 to clear).
A simple edge detects logic can be used for the setting of this bit in HW. The CIP register bit will be tied to a RTE entry in the IOAPIC as an interrupt source. Hence ISH FW will get an interrupt; In addition to the registers, the IOSF2OCP Bridge should be parameterized for the following:
1. The device idle capability parameter (ENABLE_PCI_IDLE_CAP) needs to be connected to a soft strap for ISH with a value of 1.
2. The STRAP for the MMIO address (strap_d0i3_offset) of D0i3 register (IPC offset address: h6D0) and the d0i3 valid (strap_d0i3_valid) bit needs should be appropriately tied.
3. The PCE register is made RO register by setting the appropriate parameter (Bridge top level strap: set_device_pg_config_type[5:0] is set to all 0s). This registers reset and clock domain will be in the OCP domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1000h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4	0h RO	**Interrupt Request Capable (IRC):** Set to 1 by HW if it is capable of generating an interrupt on command completion, else 0. For ISH this bit will be tied to 0.
3	1h RW/1C	**Restore Required (RR):** When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up.
2	0h RW	**D0I3:** SW sets this bit to 1 to move the IP into the D0i3 state. Writing this bit to 0 will return the IP to the fully active D0 state (D0i0).
1	0h RW	**Interrupt Required (IR):** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this on each write to this register.
0	0h RO/V	**Command In Progress (CIP):** HW sets this bit on a 1->0 or 0->1 transition of bit [2]. While set, the other bits in this register are not valid and it is illegal for SW to write to any bit in this register. When clear all the other bits in the register are valid and SW may write to any bit.

12.2.17 Clock Gating And Soft Reset (CGSR) - Offset 1004h

This register is used to Clock gate or soft reset an IP by Host/Remote Host. Also register field of this register can be used for device idle status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1004h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Idle Indication To Host (IDLE):** IP IDLE indication.
30:17	0h RO	**Reserved**
16	0h RW	**Clock Gate Enable (CG):** Setting this field to 1 clock gates the IP.
15:1	0h RO	**Reserved**
0	0h RW	**Soft Reset (SR):** Setting this bit to 1 resets the IP.

13 SBEP Interface

This chapter documents the SBEP Host registers.

13.1 SBEP Registers Summary

Table 13-1. Summary of SBEP Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	Attribute Reg (DS_ATTRIBUTES)	00000000h
4h	4	Address Reg LO (DS_ADDRESS_LSB)	00000000h
8h	4	Address Reg HI (DS_ADDRESS_MSB)	00000000h
Ch	4	Extended Header (SAIRS) (DS_SAI)	00000000h
10h	4	Received Data (DS_DATA_IN)	00000000h
14h	4	Control And Status (DS_CONTROL_STATUS)	00000000h
18h	4	ISH Source Port ID (DS_SOURCEPORTID)	00000000h
20h	4	Completion Data (DS_CMP_DATA)	00000000h
24h	4	Completion SAI (DS_CMP_SAI)	00000000h
28h	4	Completion Status And Control (DS_CMP_STATUS)	00000000h
40h	4	Status Reg (US_STATUS)	00000000h
44h	4	Command Reg (US_COMMAND)	00000000h
48h	4	Target AddressLO (US_TARGET_LO)	00000000h
4Ch	4	Target AddressHI (US_TARGET_HIGH)	00000000h
50h	4	Target Out Data (US_TARGET_DATA)	00000000h
54h	4	Upstream Attribute (US_ATTRIBUTES)	00000000h
58h	4	Upstream Request SAIRS (US_SAIR)	80000000h
5Ch	4	Upstream Completion Data (US_CMP_DATA)	00000000h
60h	4	Upstream Completion Status And Control (US_CMP_STATUS_CONTROL)	00000000h
64h	4	Upstream Completion SAI (US_CMP_SAIR)	00000034h
68h	4	SAI_WIDTH Reg (SAI_WIDTH)	00000007h
6Ch	4	Side Clk Gate Enable (SIDE_CLK_GATE_EN)	00000000h
74h	4	Received Data (DS_DATA_IN_DW2)	00000000h
80h	4	DN Access Valid Enable (DS_ACCESS_VALID_EN)	00000000h
84h	4	Boot Prep Control (BOOT_PREP_CONTROL_REG)	00000000h

13.1.1 Attribute Reg (DS_ATTRIBUTES) — Offset 0h

Attribute Register. This register has only indirect write access from host and non-host agents.

Type	Size	Offset	Default
MMIO	32 bit	FDBE000h + 0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	R	R

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27:24	0h WO	**BYTE_ENABLE_OF_THE_DWORD:** Byte enables. First byte enables.
23:16	00h WO	**OPCODE_OF_MESSAGE:** Opcode of messages.
15:8	00h WO	**SOURCE_PORT_ID:** Source Port ID.
7:0	00h WO	**DESTINATION_PORT_ID:** Destination Port ID.

13.1.2 Address Reg LO (DS_ADDRESS_LSB) — Offset 4h

Downstream Address Register LO. This register has only indirect write access from host and non-host agents.

Type	Size	Offset	Default
MMIO	32 bit	FDBE000h + 4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	R	R

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h WO	**ADDRESS_LSB:** Address [31:0].

13.1.3 Address Reg HI (DS_ADDRESS_MSB) — Offset 8h

Downstream Address Register HI. This register has only indirect write access from host and non-host agents.

Type	Size	Offset	Default
MMIO	32 bit	FDBE000h + 8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	R	R

Bit Range	Default & Access	Field Name (ID): Description
31	0h WO	**Address Length (ADDRESS_LENGTH):** Indicates the length of the address field as follows: 0: 16-bit address 1: 48-bit address.
30:16	0h RO	**Reserved**
15:0	0000h WO	**ADDRESS_MSB:** Address [47:32].

13.1.4 Extended Header (SAIRS) (DS_SAI) — Offset Ch

Downstream Extended Header (SAIRS) Register. This register has only indirect write access from host and non-host agents.

Type	Size	Offset	Default
MMIO	32 bit	FDBE000h + Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	R	R

Bit Range	Default & Access	Field Name (ID): Description
31	0h WO	**VALID:** EH Present SAI preset- when 1, 23:0 bits are valid.
30:20	0h RO	**Reserved**
19:16	0h WO	**ROOT_SPACE:** Root Space field received in message.
15:0	0000h WO	**SAI:** SAI Security attribute indicator.

13.1.5 Received Data (DS_DATA_IN) — Offset 10h

Downstream Received Data Register DW2. This register has only indirect write access from host and non-host agents.

Type	Size	Offset	Default
MMIO	32 bit	FDBE000h + 10h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	R	R

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h WO	**DATA_RECEIVED:** Data received in message.

13.1.6 Control And Status (DS_CONTROL_STATUS) — Offset 14h

Downstream Control and Status Register.

Type	Size	Offset	Default
MMIO	32 bit	FDBE000h + 14h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	None	None

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**MSG_RX_STATUS:** Message received interrupt - Message received interrupt status register. Written by HW and cleared HW itself when MinuteIA writes to upstream completion control register indicating completion is available. When cleared interrupt going to MinuteIA goes low.
30	0h RW	**INTERRUPT_MASK:** Interrupt mask register for message received interrupt. When set to 1 interrupt is not generated to MinuteIA. Mask does not affect interrupt status bit.
29:2	0h RO	**Reserved**
1:0	0h RO	**TYPE_OF_TRANSACTION:** Type of transaction: indicates type of transaction received as follows: 2 b001: Posted message 2 b010: Non-posted message 2 b1011: Completion message

13.1.7 ISH Source Port ID (DS_SOURCEPORTID) — Offset 18h

Downstream Source Port ID.

Type	Size	Offset	Default
MMIO	32 bit	FDBE000h + 18h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
R	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO	**SOURCE_PORT_ID:** (Reset value is 0, straps will get loaded runtime) Source ID of ISH. Default value is coming from top level straps.

13.1.8 Completion Data (DS_CMP_DATA) — Offset 20h

Downstream Completion Data Register.

Type	Size	Offset	Default
MMIO	32 bit	FDBE000h + 20h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
R	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**COMPLETION_DATA:** Completion data received for upstream non-posted read.

13.1.9 Completion SAI (DS_CMP_SAI) — Offset 24h

Downstream Completion SAI Registers.

Type	Size	Offset	Default
MMIO	32 bit	FDBE000h + 24h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
R	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**COMPLETION_SAI:** Completion SAI received for upstream non-posted read.

13.1.10 Completion Status And Control (DS_CMP_STATUS) — Offset 28h

Downstream Completion Status and Control Register.

Type	Size	Offset	Default
MMIO	32 bit	FDBE000h + 28h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	None	None

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C	**COMPLETION_RECEIVED:** Completion received status register. Set by HW and cleared by FW by writing 1 to it.
30	0h RW	**INTERRUPT_MASK:** Interrupt mask register for completion received interrupt. When set to 1 interrupt is not generated to MinuteIA. Mask does not affect interrupt status bit.
29:9	0h RO	**Reserved**
8	0h RO	**DN_CMPL_EHPRESENT:** EH present for Downstream completion (ISH4 Only).
7:3	0h RO	**Reserved**
2:0	0h RO	**Completion Status (COMPLETION_STATUS):** 000: Successful Completion (SC) 001: Unsupported Request (UR)

13.1.11 Status Reg (US_STATUS) — Offset 40h

Upstream Status Register.

Type	Size	Offset	Default
MMIO	32 bit	FDBE000h + 40h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1	0h RW/1C	**Message Sent (MSG_SENT):** Upstream message sent interrupt status 1, Upstream message has been sent out. This is cleared FW by writing 1 to it.
0	0h RO	**SM Status (STATE_MACHINE_STATUS):** 1 = The Endpoint State Machine is busy. 0 = The Endpoint Status Machine is idle. This is OR of posted SM and NP SM busy signals.

13.1.12 Command Reg (US_COMMAND) — Offset 44h

Upstream Command Register.

Type	Size	Offset	Default
MMIO	32 bit	FDBE000h + 44h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**Interrupt Enable (ENABLE_INTERRUPT):** 1 = Cause an interrupt when the transaction completes.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Message Type (TYPE_OF_MSG):** 1 = Transaction will be Posted 0 = Transaction will be non-posted will be hardcoded to 0 indicating NP message. For posted message register (new) this field would be hardcoded to 1.
1	0h RW	**Transaction Command Type (TRANSACTION_TYPE):** 1 = Transaction will be a Read 0 = Transaction will be a Write. For posted message register (new) this bit will be hardcoded to 0 as reads cannot be P.
0	0h RW	**SEND_IOSF_SB_TRANSACTION:** MinuteIA writes a 1 to this bit to cause an IOSF SB Transaction. The type of transaction is determined by Bit 1 in this register. *This bit will always be read as 0 but FW can write it to 1 to start the upstream transaction. In that way it won't be readable as 1 after writing to.

13.1.13 Target Address LO (US_TARGET_LO) — Offset 48h

Target Address Register LO.

Type	Size	Offset	Default
MMIO	32 bit	FDBE000h + 48h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Address Low (ADDRESS_LOW):** Address of message. Offset within the Target s IOSF SB Port.

13.1.14 Target Address HI (US_TARGET_HIGH) — Offset 4Ch

Target Address Register HI.

Type	Size	Offset	Default
MMIO	32 bit	FDBE000h + 4Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	None	None

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Length (ADDRESS_LENGTH):** Indicates the length of the address field as follows: 0: 16-bit address 1: 48-bit address
30:16	0h RO	**Reserved**
15:0	0000h RW	**Address MSB (ADDRESS_HIGH):** MSB 16 address bits, valid only when bit 31 is set to 1.

13.1.15 Target Out Data (US_TARGET_DATA) — Offset 50h

Target Out Data Register.

Type	Size	Offset	Default
MMIO	32 bit	FDBE000h + 50h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DATA_SENT:** The MinuteIA writes the data value that will be sent on the next write IOSF SB Transaction.

13.1.16 Upstream Attribute (US_ATTRIBUTES) — Offset 54h

Upstream Attribute Register.

Type	Size	Offset	Default
MMIO	32 bit	FDBE000h + 54h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RW	**FID:** FID.
23:20	0h RW	**BAR:** BAR for upstream register access.
19:16	0h RW	**BYTE_ENABLE_FOR_THE_MSG:** Upstream byte enables. 19:16 FBE.
15:8	00h RW	**OPCODE:** Message Opcode. This Opcode will go as Opcode for upstream message.
7:0	00h RW	**DESTINATION_PORT_ID:** Destination ID of upstream message. For ex. If when the upstream message is targeted to PMC then.FW writes to this register with destination ID of PMC.

13.1.17 Upstream Request SAIRS (US_SAIR) — Offset 58h

Upstream Request SAIRS Register.

Type	Size	Offset	Default
MMIO	32 bit	FDBE000h + 58h	80000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	None	None

Bit Range	Default & Access	Field Name (ID): Description
31	1h RO	**EH Present (EH_PRESET):** Extended header present indication. When set to 1 indicates extended header is present. Currently tied to 1 in RTL as ISH supports only EH=1 transactions.
30:20	0h RO	**Reserved**
19:16	0h RW	**ROOT_SPACE:** Root space.

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	**Reserved**
10:8	0h RW	**TAG:** Tag.
7:0	00h RO	**SAI_OF_IOSF_SBEP:** ISH SAI to be inserted in all upstream messages with if EH_present bit is set to 1. Reset value is 0, straps will get loaded runtime.

13.1.18 Upstream Completion Data (US_CMP_DATA) — Offset 5Ch

Upstream Completion Data Register.

Type	Size	Offset	Default
MMIO	32 bit	FDBE000h + 5Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**COMPLETION_DATA:** Completion data to be used for upstream completion as a result of downstream read request. This field is valid only downstream when type of transfer register indicates non-posted type of transaction.

13.1.19 Upstream Completion Status And Control (US_CMP_STATUS_CONTROL) — Offset 60h

Upstream Completion Status and Control Register.

Type	Size	Offset	Default
MMIO	32 bit	FDBE000h + 60h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	None	None

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/AC	**IOSF_SB_COMPLETION:** Upstream completion for Downstream request. MinuteIA writes a 1 to this bit to indicate downstream message received is consumed. This internally causes an IOSF SB completion Transaction if original downstream request is non-posted. If original message is posted then upstream completion is not generated by HW. to it. This bit cleared by HW.
30:3	0h RO	**Reserved**
2:0	0h RW	**COMPLETION_STATUS:** Completion Status: 000: Successful Completion (SC) 001: Unsupported Request (UR)

13.1.20 Upstream Completion SAI (US_CMP_SAIR) — Offset 64h

Upstream Completion SAI Register.

Type	Size	Offset	Default
MMIO	32 bit	FDBE000h + 64h	00000034h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	34h RO	**SAI_STRAP_FOR_COMPLETION:** SAI for ISH which will be inserted in upstream completion. Reset value is 0, straps will get loaded runtime.

13.1.21 SAI_WIDTH Reg (SAI_WIDTH) — Offset 68h

Register for SAI_WIDTH.

Type	Size	Offset	Default
MMIO	32 bit	FDBE000h + 68h	00000007h

Register Level Access:

BIOS Access	SMM Access	OS Access
R	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3:0	7h RO	**SAI_WIDTH:** Specifies the SAI Width value.

13.1.22 Side Clk Gate Enable (SIDE_CLK_GATE_EN) — Offset 6Ch

Register for Side Clk Gate Enable.

Type	Size	Offset	Default
MMIO	32 bit	FDBE000h + 6Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1	0h RW	**Trunk Clk Gate (JTAG_FORCE_CLKREQ):** 0: Clk request enable 1: Clk is gated
0	0h RW	**Local Clk Gate (CG_CTRL_CLKGATEDEF):** 0: Clk is un-gated 1: Clk is gated

13.1.23 Received Data (DS_DATA_IN_DW2) — Offset 74h

Downstream Received Data Register DW2. This register has only indirect write access from host and non-host agents.

Type	Size	Offset	Default
MMIO	32 bit	FDBE000h + 74h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	R	R

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h WO	**Data Received (DATA_RECEIVED):** Data received in message. DW2.

13.1.24 DN Access Valid Enable (DS_ACCESS_VALID_EN) — Offset 80h

Downstream Access Valid Enable.

Type	Size	Offset	Default
MMIO	32 bit	FDBE000h + 80h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:1	00000000h RO	**DS_ACCESS_VALID_EN_RSVD:** Reserved
0	0h RW	**Access Valid Enable For DS (ACCESS_VALID_ENABLE):** Downstream messages PMC access valid Enable: This bit is set by ISH FW to enable SBEP HW to accept downstream cycles from PMC, Hammock Harbor ART agent, Audio, ISP, CSME, GPIO, DFX Trusted0 Red2, DFX Trusted1 Red4, DFX Trusted2 Orange and interrupt ISH upon such an event. Note that ISH HW chooses the SAI value corresponding to this agent. NOTE: If a BOOTPREP message is received, ISH FW is interrupted unconditionally, i.e. irrespective of this bit being 1 or 0.

13.1.25 Boot Prep Control (BOOT_PREP_CONTROL_REG) — Offset 84h

BOOT PREP CONTROL register. This register has only indirect write access from host and non-host agents.

Type	Size	Offset	Default
MMIO	32 bit	FDBE000h + 84h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
R	R	R

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h WO	**Boot Prep Received Status (BOOT_PREP_RECEIVED_STATUS):** This bit is set by SBEP HW upon the reception of Boot Prep message. ISH FW is required to clear this status bit by writing 0, upon issuing Boot Prep Ack message on the upstream path of SBEP HW. SBEP HW will clear this bit, upon auto Ack ing of Boot Prep due to timeout condition.

14 Intel® PSE ARM Registers

This chapter documents Intel® PSE IP for ARM registers. The following table shows the memory map of the registers.

Intel® PSE ARM Address Map						
Section	**Region**	**Sub Region**	**Sub Region Size (KB)**	**Start Address**	**End Address**	**Region Size (MB)**

14.1 I2C Interface Registers

There are eight I2C Interface registers:-

- I2C_0 Registers
- I2C_1 Registers

I2C Interface Registers	Address Offset	Table
I2C_0	40100000h - 401000FCh	Table 14-1
I2C_1	40102000h - 401020FCh	Table 14-2
I2C_2	40104000h - 401040FCh	Table 14-3
I2C_3	40106000h - 401060FCh	Table 14-4
I2C_4	40108000h - 401080FCh	Table 14-5
I2C_5	4010A000h - 4010A0FCh	Table 14-6
I2C_6	4010C000h - 4010C0FCh	Table 14-7
I2C_7	4010E000h - 4010E0FCh	Table 14-8

14.1.1 I2C_0 Registers Summary

Table 14-1. Summary of I2C_0 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
40100000h	4	IC_CON	00000067h

14.1.1.1 IC_CON — Offset 40100000h

I2C Control Register - I2C Control Register. This register can be written only when the DW_apb_i2c is disabled, which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. Read/Write Access: - If configuration parameter I2C_DYNAMIC_TAR_UPDATE=1, bit 4 is read only. - If configuration parameter IC_RX_FULL_HLD_BUS_EN =0, bit 9 is read only. - If configuration parameter IC_STOP_DET_IF_MASTER_ACTIVE =0, bit 10 is read only. - If configuration parameter IC_BUS_CLEAR_FEATURE=0, bit 11 is read only - If configuration parameter IC_OPTIONAL_SAR=0, bit 16 is read only - If configuration parameter IC_SMBUS=0, bit 17 is read only - If configuration parameter IC_SMBUS_ARP=0, bits 18 and 19 are read only.

Type	Size	Offset	Default
MMIO	32 bit	40100000h	00000067h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved**
10	0h RW	**STOP_DET_IF_MASTER_ACTIVE:** In Master mode: - 1'b1: issues the STOP_DET interrupt only when master is active. - 1'b0: issues the STOP_DET irrespective of whether master is active or not.
9	0h RW	**RX_FIFO_FULL_HLD_CTRL:** This bit controls whether DW_apb_i2c should hold the bus when the Rx FIFO is physically full to its RX_BUFFER_DEPTH, as described in the IC_RX_FULL_HLD_BUS_EN parameter.
8	0h RW	**TX_EMPTY_CTRL:** This bit controls the generation of the TX_EMPTY interrupt, as described in the IC_RAW_INTR_STAT register.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**STOP_DET_IFADDRESSED:** In slave mode: - 1'b1: issues the STOP_DET interrrupt only when it is addressed. - 0'b0: issues the STOP_DET irrespective of whether it's addressed or not. NOTE: During a general call address, this slave does not issue the STOP_DET interrupt if STOP_DET_IF_ADDRESSED = 1'b1, even if the slave responds to the general call address by generating ACK. The STOP_DET interrupt is generated only when the transmitted address matches the slave address (SAR).
6	1h RW	**IC_SLAVE_DISABLE:** This bit controls whether I2C has its slave disabled, which means once the presetn signal is applied, then this bit takes on the value of the configuration parameter IC_SLAVE_DISABLE. You have the choice of having the slave enabled or disabled after reset is applied, which means software does not have to configure the slave. By default, the slave is always enabled (in reset state as well). If you need to disable it after reset, set this bit to 1. If this bit is set (slave is disabled), DW_apb_i2c functions only as a master and does not perform any action that requires a slave. NOTE: Software should ensure that if this bit is written with 0, then bit 0 should also be written with a 0.
5	1h RW	**IC_RESTART_EN:** Determines whether RESTART conditions may be sent when acting as a master. Some older slaves do not support handling RESTART conditions; however, RESTART conditions are used in several DW_apb_i2c operations. When RESTART is disabled, the master is prohibited from performing the following functions: - Sending a START BYTE - Performing any high-speed mode operation - High-speed mode operation - Performing direction changes in combined format mode - Performing a read operation with a 10-bit address By replacing RESTART condition followed by a STOP and a subsequent START condition, split operations are broken down into multiple DW_apb_i2c transfers. If the above operations are performed, it will result in setting bit 6 (TX_ABRT) of the IC_RAW_INTR_STAT register. .
4	0h RO/V	**IC_10BITADDR_MASTER_RD_ONLY:** If the I2C_DYNAMIC_TAR_UPDATE configuration parameter is set to 'No' (0), this bit is named IC_10BITADDR_MASTER and controls whether the DW_apb_i2c starts its transfers in 7 or 10-bit addressing mode when acting as a master. If I2C_DYNAMIC_TAR_UPDATE is set to 'Yes' (1), the function of this bit is handled by bit 12 of IC_TAR register, and becomes a read-only copy called IC_10BITADDR_MASTER_rd_only. - 0: 7-bit addressing - 1: 10-bit addressing
3	0h RW	**IC_10BITADDR_SLAVE:** When acting as a slave, this bit controls whether the DW_apb_i2c responds to 7- or 10-bit addresses. - 0: 7-bit addressing. The DW_apb_i2c ignores transactions that involve 10-bit addressing; for 7-bit addressing, only the lower 7 bits of the IC_SAR register are compared. - 1: 10-bit addressing. The DW_apb_i2c responds to only 10-bit addressing transfers that match the full 10 bits of the IC_SAR register.
2:1	3h RW	**SPEED:** These bits control at which speed the DW_apb_i2c operates; its setting is relevant only if one is operating the DW_apb_i2c in master mode. Hardware protects against illegal values being programmed by software. These bits must be programmed appropriately for slave mode also, as it is used to capture correct value of spike filter as per the speed mode. This register should be programmed only with a value in the range of 1 to IC_MAX_SPEED_MODE; otherwise, hardware updates this register with the value of IC_MAX_SPEED_MODE. 1: standard mode (100 kbit/s) 2: fast mode (<=400 kbit/s) or fast mode plus (<=1000Kbit/s) 3: high speed mode (3.4 Mbit/s) Note: This field is not applicable when IC_ULTRA_FAST_MODE=1
0	1h RW	**MASTER_MODE:** This bit controls whether the DW_apb_i2c master is enabled. NOTE: Software should ensure that if this bit is written with '1' then bit 6 should also be written with a '1'.

14.1.1.2 IC_TAR — Offset 40100004h

I2C Target Address Register - I2C Target Address Register If the configuration parameter I2C_DYNAMIC_TAR_UPDATE is set to 'No' (0), this register is 12 bits wide, and bits 31:12 are reserved. This register can be written to only when IC_ENABLE[0] is

set to 0. However, if I2C_DYNAMIC_TAR_UPDATE = 1, then the register becomes 13 bits wide. In this case, writes to IC_TAR succeed when one of the following conditions are true: - DW_apb_i2c is NOT enabled (IC_ENABLE[0] is set to 0); or - DW_apb_i2c is enabled (IC_ENABLE[0]=1); AND DW_apb_i2c is NOT engaged in any Master (tx, rx) operation (IC_STATUS[5]=0); AND DW_apb_i2c is enabled to operate in Master mode (IC_CON[0]=1); AND there are NO entries in the TX FIFO (IC_STATUS[2]=1) You can change the TAR address dynamically without losing the bus, only if the following conditions are met. - DW_apb_i2c is enabled (IC_ENABLE[0]=1); AND IC_EMPTYFIFO_HOLD_MASTER_EN configuration parameter is set to 1; AND DW_apb_i2c is enabled to operate in Master mode (IC_CON[0]=1); AND there are NO entries in the Tx FIFO and the master is in HOLD state (IC_INTR_STAT[13]=1).

Note: If the software or application is aware that the DW_apb_i2c is not using the TAR address for the pending commands in the Tx FIFO, then it is possible to update the TAR address even while the Tx FIFO has entries (IC_STATUS[2]= 0). - It is not necessary to perform any write to this register if DW_apb_i2c is enabled as an I2C slave only.

Type	Size	Offset	Default
MMIO	32 bit	40100004h	00000055h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	**Reserved**
12	0h RW	**IC_10BITADDR_MASTER:** This bit controls whether the DW_apb_i2c starts its transfers in 7- or 10-bit addressing mode when acting as a master. - 0: 7-bit addressing - 1: 10-bit addressing
11	0h RW	**SPECIAL:** This bit indicates whether software performs a Device-ID or General Call or START BYTE command. - 0: ignore bit 10 GC_OR_START and use IC_TAR normally - 1: perform special I2C command as specified in Device_ID or GC_OR_START bit
10	0h RW	**GC_OR_START:** If bit 11 (SPECIAL) is set to 1 and bit 13(Device-ID) is set to 0, then this bit indicates whether a General Call or START byte command is to be performed by the DW_apb_i2c. - 0: General Call Address - after issuing a General Call, only writes may be performed. Attempting to issue a read command results in setting bit 6 (TX_ABRT) of the IC_RAW_INTR_STAT register. The DW_apb_i2c remains in General Call mode until the SPECIAL bit value (bit 11) is cleared. - 1: START BYTE
9:0	055h RW	**IC_TAR:** This is the target address for any master transaction. When transmitting a General Call, these bits are ignored. To generate a START BYTE, the CPU needs to write only once into these bits. If the IC_TAR and IC_SAR are the same, loopback exists but the FIFOs are shared between master and slave, so full loopback is not feasible. Only one direction loopback mode is supported (simplex), not duplex. A master cannot transmit to itself; it can transmit to only a slave.

14.1.1.3 IC_SAR — Offset 40100008h

I2C Slave Address Register - I2C Slave Address Register

Type	Size	Offset	Default
MMIO	32 bit	40100008h	00000055h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:0	055h RW	**IC_SAR:** The IC_SAR holds the slave address when the I2C is operating as a slave. For 7-bit addressing, only IC_SAR[6:0] is used. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. Note: The default values cannot be any of the reserved address locations: that is, 0x00 to 0x07, or 0x78 to 0x7f. The correct operation of the device is not guaranteed if you program the IC_SAR or IC_TAR to a reserved value.

14.1.1.4 IC_HS_MADDR — Offset 4010000Ch

I2C High Speed Master Mode Code Address Register - I2C High Speed Master Mode Code Address Register

Type	Size	Offset	Default
MMIO	32 bit	4010000Ch	00000001h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2:0	1h RW	**IC_HS_MAR:** This bit field holds the value of the I2C HS mode master code. HS-mode master codes are reserved 8-bit codes (00001xxx) that are not used for slave addressing or other purposes. Each master has its unique master code; up to eight high-speed mode masters can be present on the same I2C bus system. Valid values are from 0 to 7. This register goes away and becomes read-only returning 0's if the IC_MAX_SPEED_MODE configuration parameter is set to either Standard (1) or Fast (2). This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect.

14.1.1.5 IC_DATA_CMD — Offset 40100010h

I2C Rx/Tx Data Buffer and Command Register - I2C Rx/Tx Data Buffer and Command Register; this is the register the CPU writes to when filling the TX FIFO and the CPU reads from when retrieving bytes from RX FIFO. The size of the register changes as follows: Write: - 11 bits when IC_EMPTYFIFO_HOLD_MASTER_EN=1 - 9 bits when IC_EMPTYFIFO_HOLD_MASTER_EN=0 Read: - 12 bits when IC_FIRST_DATA_BYTE_STATUS = 1 - 8 bits when IC_FIRST_DATA_BYTE_STATUS = 0 Note: In order for the DW_apb_i2c to continue acknowledging reads, a read command should be written for every byte that is to be received; otherwise the DW_apb_i2c will stop acknowledging.

Type	Size	Offset	Default
MMIO	32 bit	40100010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RO/V	**FIRST_DATA_BYTE:** Indicates the first data byte received after the address phase for receive transfer in Master receiver or Slave receiver mode. NOTE: In case of APB_DATA_WIDTH=8, 1. The user has to perform two APB Reads to IC_DATA_CMD in order to get status on 11 bit. 2. Inorder to read the 11 bit, the user has to perform the first data byte read [7:0] (offset 0x10) and then perform the second read[15:8](offset 0x11) in order to know the status of 11 bit (whether the data received in previous read is a first data byte or not). 3. The 11th bit is an optional read field, user can ignore 2nd byte read [15:8] (offset 0x11) if not interested in FIRST_DATA_BYTE status.
10	0h WO	**RESTART:** This bit controls whether a RESTART is issued before the byte is sent or received. This bit is available only if IC_EMPTYFIFO_HOLD_MASTER_EN is configured to 1. 1 - If IC_RESTART_EN is 1, a RESTART is issued before the data is sent/received (according to the value of CMD), regardless of whether or not the transfer direction is changing from the previous command; if IC_RESTART_EN is 0, a STOP followed by a START is issued instead. 0 - If IC_RESTART_EN is 1, a RESTART is issued only if the transfer direction is changing from the previous command; if IC_RESTART_EN is 0, a STOP followed by a START is issued instead.

Bit Range	Default & Access	Field Name (ID): Description
9	0h WO	**STOP:** This bit controls whether a STOP is issued after the byte is sent or received. This bit is available only if IC_EMPTYFIFO_HOLD_MASTER_EN is configured to 1. - 1 - STOP is issued after this byte, regardless of whether or not the Tx FIFO is empty. If the Tx FIFO is not empty, the master immediately tries to start a new transfer by issuing a START and arbitrating for the bus. - 0 - STOP is not issued after this byte, regardless of whether or not the Tx FIFO is empty. If the Tx FIFO is not empty, the master continues the current transfer by sending/receiving data bytes according to the value of the CMD bit. If the Tx FIFO is empty, the master holds the SCL line low and stalls the bus until a new command is available in the Tx FIFO.
8	0h WO	**CMD:** This bit controls whether a read or a write is performed. This bit does not control the direction when the DW_apb_i2c acts as a slave. It controls only the direction when it acts as a master. When a command is entered in the TX FIFO, this bit distinguishes the write and read commands. In slave-receiver mode, this bit is a "don't care" because writes to this register are not required. In slave-transmitter mode, a "0" indicates that the data in IC_DATA_CMD is to be transmitted. When programming this bit, you should remember the following: attempting to perform a read operation after a General Call command has been sent results in a TX_ABRT interrupt (bit 6 of the IC_RAW_INTR_STAT register), unless bit 11 (SPECIAL) in the IC_TAR register has been cleared. If a "1" is written to this bit after receiving a RD_REQ interrupt, then a TX_ABRT interrupt occurs.
7:0	00h RW/V	**DAT:** This register contains the data to be transmitted or received on the I2C bus. If you are writing to this register and want to perform a read, bits 7:0 (DAT) are ignored by the DW_apb_i2c. However, when you read this register, these bits return the value of data received on the DW_apb_i2c interface.

14.1.1.6 IC_SS_SCL_HCNT — Offset 40100014h

Standard Speed I2C Clock SCL High Count Register - Standard Speed I2C Clock SCL High Count Register

Type	Size	Offset	Default
MMIO	32 bit	40100014h	000001E8h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	01E8h RW	**IC_SS_SCL_HCNT:** This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock high-period count for standard speed. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. The minimum valid value is 6; hardware prevents values less than this being written, and if attempted results in 6 being set. For designs with APB_DATA_WIDTH = 8, the order of programming is important to ensure the correct operation of the DW_apb_i2c. The lower byte must be programmed first. Then the upper byte is programmed. When the configuration parameter IC_HC_COUNT_VALUES is set to 1, this register is read only. NOTE: This register must not be programmed to a value higher than 65525, because DW_apb_i2c uses a 16-bit counter to flag an I2C bus idle condition when this counter reaches a value of IC_SS_SCL_HCNT + 10.

14.1.1.7 IC_SS_SCL_LCNT — Offset 40100018h

Standard Speed I2C Clock SCL Low Count Register - Standard Speed I2C Clock SCL Low Count Register

Then the upper byte is programmed. If the value is less than 8 then the count value gets changed to 8.

14.1.1.12 IC_INTR_STAT — Offset 4010002Ch

I2C Interrupt Status Register - I2C Interrupt Status Register Each bit in this register has a corresponding mask bit in the IC_INTR_MASK register. These bits are cleared by reading the matching interrupt clear register. The unmasked raw versions of these bits are available in the IC_RAW_INTR_STAT register.

Type	Size	Offset	Default
MMIO	32 bit	4010002Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13	0h RO/V	**R_MASTER_ON_HOLD:** See IC_RAW_INTR_STAT for a detailed description of R_MASTER_ON_HOLD bit.
12	0h RO/V	**R_RESTART_DET:** See IC_RAW_INTR_STAT for a detailed description of R_RESTART_DET bit.
11	0h RO/V	**R_GEN_CALL:** See IC_RAW_INTR_STAT for a detailed description of R_GEN_CALL bit.

Bit Range	Default & Access	Field Name (ID): Description
10	0h RO/V	**R_START_DET:** See IC_RAW_INTR_STAT for a detailed description of R_START_DET bit.
9	0h RO/V	**R_STOP_DET:** See IC_RAW_INTR_STAT for a detailed description of R_STOP_DET bit.
8	0h RO/V	**R_ACTIVITY:** See IC_RAW_INTR_STAT for a detailed description of R_ACTIVITY bit.
7	0h RO/V	**R_RX_DONE:** See IC_RAW_INTR_STAT for a detailed description of R_RX_DONE bit.
6	0h RO/V	**R_TX_ABRT:** See IC_RAW_INTR_STAT for a detailed description of R_TX_ABRT bit.
5	0h RO/V	**R_RD_REQ:** See IC_RAW_INTR_STAT for a detailed description of R_RD_REQ bit.
4	0h RO/V	**R_TX_EMPTY:** See IC_RAW_INTR_STAT for a detailed description of R_TX_EMPTY bit.
3	0h RO/V	**R_TX_OVER:** See IC_RAW_INTR_STAT for a detailed description of R_TX_OVER bit.
2	0h RO/V	**R_RX_FULL:** See IC_RAW_INTR_STAT for a detailed description of R_RX_FULL bit.
1	0h RO/V	**R_RX_OVER:** See IC_RAW_INTR_STAT for a detailed description of R_RX_OVER bit.
0	0h RO/V	**R_RX_UNDER:** See IC_RAW_INTR_STAT for a detailed description of R_RX_UNDER bit.

14.1.1.13 IC_INTR_MASK — Offset 40100030h

I2C Interrupt Mask Register - I2C Interrupt Mask Register. These bits mask their corresponding interrupt status bits. This register is active low; a value of 0 masks the interrupt, whereas a value of 1 unmasks the interrupt.

Type	Size	Offset	Default
MMIO	32 bit	40100030h	000008FFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13	0h RW	**M_MASTER_ON_HOLD:** This bit masks the R_MASTER_ON_HOLD interrupt in IC_INTR_STAT register.
12	0h RW	**M_RESTART_DET:** This bit masks the R_RESTART_DET interrupt in IC_INTR_STAT register.

Bit Range	Default & Access	Field Name (ID): Description
11	1h RW	**M_GEN_CALL:** This bit masks the R_GEN_CALL interrupt in IC_INTR_STAT register.
10	0h RW	**M_START_DET:** This bit masks the R_START_DET interrupt in IC_INTR_STAT register.
9	0h RW	**M_STOP_DET:** This bit masks the R_STOP_DET interrupt in IC_INTR_STAT register.
8	0h RW	**M_ACTIVITY:** This bit masks the R_ACTIVITY interrupt in IC_INTR_STAT register.
7	1h RW	**M_RX_DONE:** This bit masks the R_RX_DONE interrupt in IC_INTR_STAT register.
6	1h RW	**M_TX_ABRT:** This bit masks the R_TX_ABRT interrupt in IC_INTR_STAT register.
5	1h RW	**M_RD_REQ:** This bit masks the R_RD_REQ interrupt in IC_INTR_STAT register.
4	1h RW	**M_TX_EMPTY:** This bit masks the R_TX_EMPTY interrupt in IC_INTR_STAT register.
3	1h RW	**M_TX_OVER:** This bit masks the R_TX_OVER interrupt in IC_INTR_STAT register.
2	1h RW	**M_RX_FULL:** This bit masks the R_RX_FULL interrupt in IC_INTR_STAT register.
1	1h RW	**M_RX_OVER:** This bit masks the R_RX_OVER interrupt in IC_INTR_STAT register.
0	1h RW	**M_RX_UNDER:** This bit masks the R_RX_UNDER interrupt in IC_INTR_STAT register.

14.1.1.14 IC_RAW_INTR_STAT — Offset 40100034h

I2C Raw Interrupt Status Register - I2C Raw Interrupt Status Register Unlike the IC_INTR_STAT register, these bits are not masked so they always show the true status of the DW_apb_i2c.

Type	Size	Offset	Default
MMIO	32 bit	40100034h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13	0h RO/V	**MASTER_ON_HOLD:** Indicates whether master is holding the bus and TX FIFO is empty. Enabled only when I2C_DYNAMIC_TAR_UPDATE=1 and IC_EMPTYFIFO_HOLD_MASTER_EN=1.
12	0h RO/V	**RESTART_DET:** Indicates whether a RESTART condition has occurred on the I2C interface when DW_apb_i2c is operating in Slave mode and the slave is being addressed. Enabled only when IC_SLV_RESTART_DET_EN=1. Note: However, in high-speed mode or during a START BYTE transfer, the RESTART comes before the address field as per the I2C protocol. In this case, the slave is not the addressed slave when the RESTART is issued, therefore DW_apb_i2c does not generate the RESTART_DET interrupt.
11	0h RO/V	**GEN_CALL:** Set only when a General Call address is received and it is acknowledged. It stays set until it is cleared either by disabling DW_apb_i2c or when the CPU reads bit 0 of the IC_CLR_GEN_CALL register. DW_apb_i2c stores the received data in the Rx buffer.
10	0h RO/V	**START_DET:** Indicates whether a START or RESTART condition has occurred on the I2C interface regardless of whether DW_apb_i2c is operating in slave or master mode.
9	0h RO/V	**STOP_DET:** Indicates whether a STOP condition has occurred on the I2C interface regardless of whether DW_apb_i2c is operating in slave or master mode. In Slave Mode: - If IC_CON[7]=1'b1 (STOP_DET_IFADDRESSED), the STOP_DET interrupt will be issued only if slave is addressed. Note: During a general call address, this slave does not issue a STOP_DET interrupt if STOP_DET_IF_ADDRESSED=1'b1, even if the slave responds to the general call address by generating ACK. The STOP_DET interrupt is generated only when the transmitted address matches the slave address (SAR). - If IC_CON[7]=1'b0 (STOP_DET_IFADDRESSED), the STOP_DET interrupt is issued irrespective of whether it is being addressed. In Master Mode: - If IC_CON[10]=1'b1 (STOP_DET_IF_MASTER_ACTIVE),the STOP_DET interrupt will be issued only if Master is active. - If IC_CON[10]=1'b0 (STOP_DET_IFADDRESSED),the STOP_DET interrupt will be issued irrespective of whether master is active or not.
8	0h RO/V	**ACTIVITY:** This bit captures DW_apb_i2c activity and stays set until it is cleared. There are four ways to clear it: - Disabling the DW_apb_i2c - Reading the IC_CLR_ACTIVITY register - Reading the IC_CLR_INTR register - System reset Once this bit is set, it stays set unless one of the four methods is used to clear it. Even if the DW_apb_i2c module is idle, this bit remains set until cleared, indicating that there was activity on the bus.
7	0h RO/V	**RX_DONE:** When the DW_apb_i2c is acting as a slave-transmitter, this bit is set to 1 if the master does not acknowledge a transmitted byte. This occurs on the last byte of the transmission, indicating that the transmission is done.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RO/V	**TX_ABRT:** This bit indicates if DW_apb_i2c, as an I2C transmitter, is unable to complete the intended actions on the contents of the transmit FIFO. This situation can occur both as an I2C master or an I2C slave, and is referred to as a 'transmit abort'. When this bit is set to 1, the IC_TX_ABRT_SOURCE register indicates the reason why the transmit abort takes places. Note: The DW_apb_i2c flushes/resets/empties only the TX_FIFO whenever there is a transmit abort caused by any of the events tracked by the IC_TX_ABRT_SOURCE register. The Tx FIFO remains in this flushed state until the register IC_CLR_TX_ABRT is read. Once this read is performed, the Tx FIFO is then ready to accept more data bytes from the APB interface. RX FIFO flush because of TX_ABRT is controlled by the coreConsultant parameter IC_AVOID_RX_FIFO_FLUSH_ON_TX_ABRT.
5	0h RO/V	**RD_REQ:** This bit is set to 1 when DW_apb_i2c is acting as a slave and another I2C master is attempting to read data from DW_apb_i2c. The DW_apb_i2c holds the I2C bus in a wait state (SCL=0) until this interrupt is serviced, which means that the slave has been addressed by a remote master that is asking for data to be transferred. The processor must respond to this interrupt and then write the requested data to the IC_DATA_CMD register. This bit is set to 0 just after the processor reads the IC_CLR_RD_REQ register.
4	0h RO/V	**TX_EMPTY:** The behavior of the TX_EMPTY interrupt status differs based on the TX_EMPTY_CTRL selection in the IC_CON register. - When TX_EMPTY_CTRL = 0: This bit is set to 1 when the transmit buffer is at or below the threshold value set in the IC_TX_TL register. - When TX_EMPTY_CTRL = 1: This bit is set to 1 when the transmit buffer is at or below the threshold value set in the IC_TX_TL register and the transmission of the address/data from the internal shift register for the most recently popped command is completed. It is automatically cleared by hardware when the buffer level goes above the threshold. When IC_ENABLE[0] is set to 0, the TX FIFO is flushed and held in reset. There the TX FIFO looks like it has no data within it, so this bit is set to 1, provided there is activity in the master or slave state machines. When there is no longer any activity, then with ic_en=0, this bit is set to 0.
3	0h RO/V	**TX_OVER:** Set during transmit if the transmit buffer is filled to IC_TX_BUFFER_DEPTH and the processor attempts to issue another I2C command by writing to the IC_DATA_CMD register. When the module is disabled, this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared.
2	0h RO/V	**RX_FULL:** Set when the receive buffer reaches or goes above the RX_TL threshold in the IC_RX_TL register. It is automatically cleared by hardware when buffer level goes below the threshold. If the module is disabled (IC_ENABLE[0]=0), the RX FIFO is flushed and held in reset; therefore the RX FIFO is not full. So this bit is cleared once the IC_ENABLE bit 0 is programmed with a 0, regardless of the activity that continues.
1	0h RO/V	**RX_OVER:** Set if the receive buffer is completely filled to IC_RX_BUFFER_DEPTH and an additional byte is received from an external I2C device. The DW_apb_i2c acknowledges this, but any data bytes received after the FIFO is full are lost. If the module is disabled (IC_ENABLE[0]=0), this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared. Note: If the configuration parameter IC_RX_FULL_HLD_BUS_EN is enabled and bit 9 of the IC_CON register (RX_FIFO_FULL_HLD_CTRL) is programmed to HIGH, then the RX_OVER interrupt never occurs, because the Rx FIFO never overflows.
0	0h RO/V	**RX_UNDER:** Set if the processor attempts to read the receive buffer when it is empty by reading from the IC_DATA_CMD register. If the module is disabled (IC_ENABLE[0]=0), this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared.

14.1.1.15 IC_RX_TL — Offset 40100038h

I2C Receive FIFO Threshold Register - I2C Receive FIFO Threshold Register

Type	Size	Offset	Default
MMIO	32 bit	40100038h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**RX_TL:** Receive FIFO Threshold Level. Controls the level of entries (or above) that triggers the RX_FULL interrupt (bit 2 in IC_RAW_INTR_STAT register). The valid range is 0-255, with the additional restriction that hardware does not allow this value to be set to a value larger than the depth of the buffer. If an attempt is made to do that, the actual value set will be the maximum depth of the buffer. A value of 0 sets the threshold for 1 entry, and a value of 255 sets the threshold for 256 entries.

14.1.1.16 IC_TX_TL — Offset 4010003Ch

I2C Transmit FIFO Threshold Register - I2C Transmit FIFO Threshold Register

Type	Size	Offset	Default
MMIO	32 bit	4010003Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**TX_TL:** Transmit FIFO Threshold Level. Controls the level of entries (or below) that trigger the TX_EMPTY interrupt (bit 4 in IC_RAW_INTR_STAT register). The valid range is 0-255, with the additional restriction that it may not be set to value larger than the depth of the buffer. If an attempt is made to do that, the actual value set will be the maximum depth of the buffer. A value of 0 sets the threshold for 0 entries, and a value of 255 sets the threshold for 255 entries.

14.1.1.17 IC_CLR_INTR — Offset 40100040h

Clear Combined and Individual Interrupt Register - Clear Combined and Individual Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40100040h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_INTR:** Read this register to clear the combined interrupt, all individual interrupts, and the IC_TX_ABRT_SOURCE register. This bit does not clear hardware clearable interrupts but software clearable interrupts. Refer to Bit 9 of the IC_TX_ABRT_SOURCE register for an exception to clearing IC_TX_ABRT_SOURCE.

14.1.1.18 IC_CLR_RX_UNDER — Offset 40100044h

Clear RX_UNDER Interrupt Register - Clear RX_UNDER Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40100044h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RX_UNDER:** Read this register to clear the RX_UNDER interrupt (bit 0) of the IC_RAW_INTR_STAT register.

14.1.1.19 IC_CLR_RX_OVER — Offset 40100048h

Clear RX_OVER Interrupt Register - Clear RX_OVER Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40100048h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RX_OVER:** Read this register to clear the RX_OVER interrupt (bit 1) of the IC_RAW_INTR_STAT register.

14.1.1.20 IC_CLR_TX_OVER — Offset 4010004Ch

Clear TX_OVER Interrupt Register - Clear TX_OVER Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010004Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_TX_OVER:** Read this register to clear the TX_OVER interrupt (bit 3) of the IC_RAW_INTR_STAT register.

14.1.1.21 IC_CLR_RD_REQ — Offset 40100050h

Clear RD_REQ Interrupt Register - Clear RD_REQ Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40100050h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RD_REQ:** Read this register to clear the RD_REQ interrupt (bit 5) of the IC_RAW_INTR_STAT register.

14.1.1.22 IC_CLR_TX_ABRT — Offset 40100054h

Clear TX_ABRT Interrupt Register - Clear TX_ABRT Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40100054h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_TX_ABRT:** Read this register to clear the TX_ABRT interrupt (bit 6) of the IC_RAW_INTR_STAT register, and the IC_TX_ABRT_SOURCE register. This also releases the TX FIFO from the flushed/reset state, allowing more writes to the TX FIFO. Refer to Bit 9 of the IC_TX_ABRT_SOURCE register for an exception to clearing IC_TX_ABRT_SOURCE.

14.1.1.23 IC_CLR_RX_DONE — Offset 40100058h

Clear RX_DONE Interrupt Register - Clear RX_DONE Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40100058h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RX_DONE:** Read this register to clear the RX_DONE interrupt (bit 7) of the IC_RAW_INTR_STAT register.

14.1.1.24 IC_CLR_ACTIVITY — Offset 4010005Ch

Clear ACTIVITY Interrupt Register - Clear ACTIVITY Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010005Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_ACTIVITY:** Reading this register clears the ACTIVITY interrupt if the I2C is not active anymore. If the I2C module is still active on the bus, the ACTIVITY interrupt bit continues to be set. It is automatically cleared by hardware if the module is disabled and if there is no further activity on the bus. The value read from this register to get status of the ACTIVITY interrupt (bit 8) of the IC_RAW_INTR_STAT register.

14.1.1.25 IC_CLR_STOP_DET — Offset 40100060h

Clear STOP_DET Interrupt Register - Clear STOP_DET Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40100060h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_STOP_DET:** Read this register to clear the STOP_DET interrupt (bit 9) of the IC_RAW_INTR_STAT register.

14.1.1.26 IC_CLR_START_DET — Offset 40100064h

Clear START_DET Interrupt Register - Clear START_DET Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40100064h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_START_DET:** Read this register to clear the START_DET interrupt (bit 10) of the IC_RAW_INTR_STAT register.

14.1.1.27 IC_CLR_GEN_CALL — Offset 40100068h

Clear GEN_CALL Interrupt Register - Clear GEN_CALL Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40100068h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_GEN_CALL:** Read this register to clear the GEN_CALL interrupt (bit 11) of IC_RAW_INTR_STAT register.

14.1.1.28 IC_ENABLE — Offset 4010006Ch

I2C ENABLE Register - I2C Enable Register

Type	Size	Offset	Default
MMIO	32 bit	4010006Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**TX_CMD_BLOCK:** In Master mode: - 1'b1: Blocks the transmission of data on I2C bus even if Tx FIFO has data to transmit. - 1'b0: The transmission of data starts on I2C bus automatically, as soon as the first data is available in the Tx FIFO. Note: To block the execution of Master commands, set the TX_CMD_BLOCK bit only when Tx FIFO is empty (IC_STATUS[2]==1) and Master is in Idle state (IC_STATUS[5] == 0). Any further commands put in the Tx FIFO are not executed until TX_CMD_BLOCK bit is unset.
1	0h RW	**ABORT:** When set, the controller initiates the transfer abort. - 0: ABORT not initiated or ABORT done - 1: ABORT operation in progress The software can abort the I2C transfer in master mode by setting this bit. The software can set this bit only when ENABLE is already set; otherwise, the controller ignores any write to ABORT bit. The software cannot clear the ABORT bit once set. In response to an ABORT, the controller issues a STOP and flushes the Tx FIFO after completing the current transfer, then sets the TX_ABORT interrupt after the abort operation. The ABORT bit is cleared automatically after the abort operation.
0	0h RW	**ENABLE:** Controls whether the DW_apb_i2c is enabled. - 0: Disables DW_apb_i2c (TX and RX FIFOs are held in an erased state) - 1: Enables DW_apb_i2c Software can disable DW_apb_i2c while it is active. However, it is important that care be taken to ensure that DW_apb_i2c is disabled properly. A recommended procedure is described in "Disabling DW_apb_i2c". When DW_apb_i2c is disabled, the following occurs: - The TX FIFO and RX FIFO get flushed. - Status bits in the IC_INTR_STAT register are still active until DW_apb_i2c goes into IDLE state. If the module is transmitting, it stops as well as deletes the contents of the transmit buffer after the current transfer is complete. If the module is receiving, the DW_apb_i2c stops the current transfer at the end of the current byte and does not acknowledge the transfer. In systems with asynchronous pclk and ic_clk when IC_CLK_TYPE parameter set to asynchronous (1), there is a two ic_clk delay when enabling or disabling the DW_apb_i2c.

14.1.1.29 IC_STATUS — Offset 40100070h

I2C STATUS Register - I2C Status Register This is a read-only register used to indicate the current transfer status and FIFO status. The status register may be read at any time. None of the bits in this register request an interrupt. When the I2C is disabled by writing 0 in bit 0 of the IC_ENABLE register: - Bits 1 and 2 are set to 1 - Bits 3 and 10 are set to 0 When the master or slave state machines goes to idle and ic_en=0: - Bits 5 and 6 are set to 0

Type	Size	Offset	Default
MMIO	32 bit	40100070h	00000006h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved**
10	0h RO/V	**SLV_HOLD_RX_FIFO_FULL:** This bit indicates the BUS Hold in Slave mode due to Rx FIFO is Full and an additional byte has been received (This kind of Bus hold is applicable if IC_RX_FULL_HLD_BUS_EN is set to 1).
9	0h RO/V	**SLV_HOLD_TX_FIFO_EMPTY:** This bit indicates the BUS Hold in Slave mode for the Read request when the Tx FIFO is empty. The Bus is in hold until the Tx FIFO has data to Transmit for the read request.
8	0h RO/V	**MST_HOLD_RX_FIFO_FULL:** This bit indicates the BUS Hold in Master mode due to Rx FIFO is Full and additional byte has been received (This kind of Bus hold is applicable if IC_RX_FULL_HLD_BUS_EN is set to 1).
7	0h RO/V	**MST_HOLD_TX_FIFO_EMPTY:** If the IC_EMPTYFIFO_HOLD_MASTER_EN parameter is set to 1, the DW_apb_i2c master stalls the write transfer when Tx FIFO is empty, and the the last byte does not have the Stop bit set. This bit indicates the BUS hold when the master holds the bus because of the Tx FIFO being empty, and the the previous transferred command does not have the Stop bit set. (This kind of Bus hold is applicable if IC_EMPTYFIFO_HOLD_MASTER_EN is set to 1).
6	0h RO/V	**SLV_ACTIVITY:** Slave FSM Activity Status. When the Slave Finite State Machine (FSM) is not in the IDLE state, this bit is set. - 0: Slave FSM is in IDLE state so the Slave part of DW_apb_i2c is not Active - 1: Slave FSM is not in IDLE state so the Slave part of DW_apb_i2c is Active
5	0h RO/V	**MST_ACTIVITY:** Master FSM Activity Status. When the Master Finite State Machine (FSM) is not in the IDLE state, this bit is set. - 0: Master FSM is in IDLE state so the Master part of DW_apb_i2c is not Active - 1: Master FSM is not in IDLE state so the Master part of DW_apb_i2c is Active Note: IC_STATUS[0]-that is, ACTIVITY bit-is the OR of SLV_ACTIVITY and MST_ACTIVITY bits.
4	0h RO/V	**RFF:** Receive FIFO Completely Full. When the receive FIFO is completely full, this bit is set. When the receive FIFO contains one or more empty location, this bit is cleared. - 0: Receive FIFO is not full - 1: Receive FIFO is full
3	0h RO/V	**RFNE:** Receive FIFO Not Empty. This bit is set when the receive FIFO contains one or more entries; it is cleared when the receive FIFO is empty. - 0: Receive FIFO is empty - 1: Receive FIFO is not empty

Bit Range	Default & Access	Field Name (ID): Description
2	1h RO/V	**TFE:** Transmit FIFO Completely Empty. When the transmit FIFO is completely empty, this bit is set. When it contains one or more valid entries, this bit is cleared. This bit field does not request an interrupt. - 0: Transmit FIFO is not empty - 1: Transmit FIFO is empty
1	1h RO/V	**TFNF:** Transmit FIFO Not Full. Set when the transmit FIFO contains one or more empty locations, and is cleared when the FIFO is full. - 0: Transmit FIFO is full - 1: Transmit FIFO is not full
0	0h RO/V	**ACTIVITY:** I2C Activity Status.

14.1.1.30 IC_TXFLR — Offset 40100074h

I2C Transmit FIFO Level Register - I2C Transmit FIFO Level Register This register contains the number of valid data entries in the transmit FIFO buffer. It is cleared whenever: - The I2C is disabled - There is a transmit abort - that is, TX_ABRT bit is set in the IC_RAW_INTR_STAT register - The slave bulk transmit mode is aborted The register increments whenever data is placed into the transmit FIFO and decrements when data is taken from the transmit FIFO.

Type	Size	Offset	Default
MMIO	32 bit	40100074h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:0	00h RO/V	**TXFLR:** Transmit FIFO Level. Contains the number of valid data entries in the transmit FIFO.

14.1.1.31 IC_RXFLR — Offset 40100078h

I2C Receive FIFO Level Register - I2C Receive FIFO Level Register This register contains the number of valid data entries in the receive FIFO buffer. It is cleared whenever: - The I2C is disabled - Whenever there is a transmit abort caused by any of the events tracked in IC_TX_ABRT_SOURCE The register increments whenever data is placed into the receive FIFO and decrements when data is taken from the receive FIFO.

Type	Size	Offset	Default
MMIO	32 bit	40100078h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:0	00h RO/V	**RXFLR:** Receive FIFO Level. Contains the number of valid data entries in the receive FIFO.

14.1.1.32 IC_SDA_HOLD — Offset 4010007Ch

I2C SDA Hold Time Length Register - I2C SDA Hold Time Length Register The bits [15:0] of this register are used to control the hold time of SDA during transmit in both slave and master mode (after SCL goes from HIGH to LOW). The bits [23:16] of this register are used to extend the SDA transition (if any) whenever SCL is HIGH in the receiver in either master or slave mode. Writes to this register succeed only when IC_ENABLE[0]=0. The values in this register are in units of ic_clk period. The value programmed in IC_SDA_TX_HOLD must be greater than the minimum hold time in each mode one cycle in master mode, seven cycles in slave mode for the value to be implemented. The programmed SDA hold time during transmit (IC_SDA_TX_HOLD) cannot exceed at any time the duration of the low part of scl. Therefore the programmed value cannot be larger than N_SCL_LOW-2, where N_SCL_LOW is the duration of the low part of the scl period measured in ic_clk cycles.

Type	Size	Offset	Default
MMIO	32 bit	4010007Ch	00000005h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:16	00h RW	**IC_SDA_RX_HOLD:** Sets the required SDA hold time in units of ic_clk period, when DW_apb_i2c acts as a receiver.
15:0	0005h RW	**IC_SDA_TX_HOLD:** Sets the required SDA hold time in units of ic_clk period, when DW_apb_i2c acts as a transmitter.

14.1.1.33 IC_TX_ABRT_SOURCE — Offset 40100080h

I2C Transmit Abort Source Register - I2C Transmit Abort Source Register This register has 32 bits that indicate the source of the TX_ABRT bit. Except for Bit 9, this register is cleared whenever the IC_CLR_TX_ABRT register or the IC_CLR_INTR register is read. To clear Bit 9, the source of the ABRT_SBYTE_NORSTRT must be fixed first; RESTART must be enabled (IC_CON[5]=1), the SPECIAL bit must be cleared (IC_TAR[11]), or the GC_OR_START bit must be cleared (IC_TAR[10]). Once the source of the ABRT_SBYTE_NORSTRT is fixed, then this bit can be cleared in the same manner as other bits in this register. If the source of the ABRT_SBYTE_NORSTRT is not fixed before attempting to clear this bit, Bit 9 clears for one cycle and is then re-asserted.

Type	Size	Offset	Default
MMIO	32 bit	40100080h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:23	000h RO/V	**TX_FLUSH_CNT:** This field indicates the number of Tx FIFO Data Commands which are flushed due to TX_ABRT interrupt. It is cleared whenever I2C is disabled. Role of DW_apb_i2c: Master-Transmitter or Slave-Transmitter
22:17	0h RO	**Reserved**
16	0h RO/V	**ABRT_USER_ABRT:** This is a master-mode-only bit. Master has detected the transfer abort (IC_ENABLE[1]) Role of DW_apb_i2c: Master-Transmitter
15	0h RO/V	**ABRT_SLVRD_INTX:** 1: When the processor side responds to a slave mode request for data to be transmitted to a remote master and user writes a 1 in CMD (bit 8) of IC_DATA_CMD register. Role of DW_apb_i2c: Slave-Transmitter
14	0h RO/V	**ABRT_SLV_ARBLOST:** This field indicates that a Slave has lost the bus while transmitting data to a remote master. IC_TX_ABRT_SOURCE[12] is set at the same time. Note: Even though the slave never 'owns' the bus, something could go wrong on the bus. This is a fail safe check. For instance, during a data transmission at the low-to-high transition of SCL, if what is on the data bus is not what is supposed to be transmitted, then DW_apb_i2c no longer own the bus. Role of DW_apb_i2c: Slave-Transmitter
13	0h RO/V	**ABRT_SLVFLUSH_TXFIFO:** This field specifies that the Slave has received a read command and some data exists in the TX FIFO, so the slave issues a TX_ABRT interrupt to flush old data in TX FIFO. Role of DW_apb_i2c: Slave-Transmitter
12	0h RO/V	**ARB_LOST:** This field specifies that the Master has lost arbitration, or if IC_TX_ABRT_SOURCE[14] is also set, then the slave transmitter has lost arbitration. Role of DW_apb_i2c: Master-Transmitter or Slave-Transmitter
11	0h RO/V	**ABRT_MASTER_DIS:** This field indicates that the User tries to initiate a Master operation with the Master mode disabled. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver

Bit Range	Default & Access	Field Name (ID): Description
10	0h RO/V	**ABRT_10B_RD_NORSTRT:** This field indicates that the restart is disabled (IC_RESTART_EN bit (IC_CON[5]) =0) and the master sends a read command in 10-bit addressing mode. Role of DW_apb_i2c: Master-Receiver
9	0h RO/V	**ABRT_SBYTE_NORSTRT:** To clear Bit 9, the source of the ABRT_SBYTE_NORSTRT must be fixed first; restart must be enabled (IC_CON[5]=1), the SPECIAL bit must be cleared (IC_TAR[11]), or the GC_OR_START bit must be cleared (IC_TAR[10]). Once the source of the ABRT_SBYTE_NORSTRT is fixed, then this bit can be cleared in the same manner as other bits in this register. If the source of the ABRT_SBYTE_NORSTRT is not fixed before attempting to clear this bit, bit 9 clears for one cycle and then gets reasserted. When this field is set to 1, the restart is disabled (IC_RESTART_EN bit (IC_CON[5]) =0) and the user is trying to send a START Byte. Role of DW_apb_i2c: Master
8	0h RO/V	**ABRT_HS_NORSTRT:** This field indicates that the restart is disabled (IC_RESTART_EN bit (IC_CON[5]) =0) and the user is trying to use the master to transfer data in High Speed mode. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver
7	0h RO/V	**ABRT_SBYTE_ACKDET:** This field indicates that the Master has sent a START Byte and the START Byte was acknowledged (wrong behavior). Role of DW_apb_i2c: Master
6	0h RO/V	**ABRT_HS_ACKDET:** This field indicates that the Master is in High Speed mode and the High Speed Master code was acknowledged (wrong behavior). Role of DW_apb_i2c: Master
5	0h RO/V	**ABRT_GCALL_READ:** This field indicates that DW_apb_i2c in the master mode has sent a General Call but the user programmed the byte following the General Call to be a read from the bus (IC_DATA_CMD[9] is set to 1). Role of DW_apb_i2c: Master-Transmitter
4	0h RO/V	**ABRT_GCALL_NOACK:** This field indicates that DW_apb_i2c in master mode has sent a General Call and no slave on the bus acknowledged the General Call. Role of DW_apb_i2c: Master-Transmitter
3	0h RO/V	**ABRT_TXDATA_NOACK:** This field indicates the master-mode only bit. When the master receives an acknowledgement for the address, but when it sends data byte(s) following the address, it did not receive an acknowledge from the remote slave(s). Role of DW_apb_i2c: Master-Transmitter
2	0h RO/V	**ABRT_10ADDR2_NOACK:** This field indicates that the Master is in 10-bit address mode and that the second address byte of the 10-bit address was not acknowledged by any slave. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver
1	0h RO/V	**ABRT_10ADDR1_NOACK:** This field indicates that the Master is in 10-bit address mode and the first 10-bit address byte was not acknowledged by any slave. Reset value: 0x0 Role of DW_apb_i2c: Master-Transmitter or Master-Receiver
0	0h RO/V	**ABRT_7B_ADDR_NOACK:** This field indicates that the Master is in 7-bit addressing mode and the address sent was not acknowledged by any slave. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver

14.1.1.34 IC_DMA_CR — Offset 40100088h

DMA Control Register - DMA Control Register This register is only valid when DW_apb_i2c is configured with a set of DMA Controller interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist and writing to the register's address has no effect and reading from this register

address will return zero. The register is used to enable the DMA Controller interface operation. There is a separate bit for transmit and receive. This can be programmed regardless of the state of IC_ENABLE.

Type	Size	Offset	Default
MMIO	32 bit	40100088h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1	0h RW	**TDMAE:** Transmit DMA Enable. This bit enables/disables the transmit FIFO DMA channel.
0	0h RW	**RDMAE:** Receive DMA Enable. This bit enables/disables the receive FIFO DMA channel.

14.1.1.35 IC_DMA_TDLR — Offset 4010008Ch

DMA Transmit Data Level Register - DMA Transmit Data Level Register This register is only valid when the DW_apb_i2c is configured with a set of DMA interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist; writing to its address has no effect; reading from its address returns zero.

Type	Size	Offset	Default
MMIO	32 bit	4010008Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:0	00h RW	**DMATDL:** Transmit Data Level. This bit field controls the level at which a DMA request is made by the transmit logic. It is equal to the watermark level; that is, the dma_tx_req signal is generated when the number of valid data entries in the transmit FIFO is equal to or below this field value, and TDMAE = 1.

14.1.1.36 IC_DMA_RDLR — Offset 40100090h

DMA Transmit Data Level Register - I2C Receive Data Level Register This register is only valid when DW_apb_i2c is configured with a set of DMA interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist; writing to its address has no effect; reading from its address returns zero.

Type	Size	Offset	Default
MMIO	32 bit	40100090h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:0	00h RW	**DMARDL:** Receive Data Level. This bit field controls the level at which a DMA request is made by the receive logic. The watermark level = DMARDL+1; that is, dma_rx_req is generated when the number of valid data entries in the receive FIFO is equal to or more than this field value + 1, and RDMAE =1. For instance, when DMARDL is 0, then dma_rx_req is asserted when 1 or more data entries are present in the receive FIFO.

14.1.1.37 IC_SDA_SETUP — Offset 40100094h

I2C SDA Setup Register - I2C SDA Setup Register This register controls the amount of time delay (in terms of number of ic_clk clock periods) introduced in the rising edge of SCL - relative to SDA changing - when DW_apb_i2c services a read request in a slave-transmitter operation. The relevant I2C requirement is tSU:DAT as detailed in the I2C Bus Specification. This register must be programmed with a value equal to or greater than 2. Writes to this register succeed only when IC_ENABLE[0] = 0. Note: The length of setup time is calculated using [(IC_SDA_SETUP - 1) * (ic_clk_period)], so if the user requires 10 ic_clk periods of setup time, they should program a value of 11. The IC_SDA_SETUP register is only used by the DW_apb_i2c when operating as a slave transmitter.

Type	Size	Offset	Default
MMIO	32 bit	40100094h	00000002h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	02h RW	**SDA_SETUP:** SDA Setup. It is recommended that if the required delay is 1000ns, then for an ic_clk frequency of 10 MHz, IC_SDA_SETUP should be programmed to a value of 11. IC_SDA_SETUP must be programmed with a minimum value of 2.

14.1.1.38 IC_ACK_GENERAL_CALL — Offset 40100098h

I2C ACK General Call Register - I2C ACK General Call Register The register controls whether DW_apb_i2c responds with a ACK or NACK when it receives an I2C General Call address. This register is applicable only when the DW_apb_i2c is in slave mode.

Type	Size	Offset	Default
MMIO	32 bit	40100098h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**ACK_GEN_CALL:** ACK General Call. When set to 1, DW_apb_i2c responds with a ACK (by asserting ic_data_oe) when it receives a General Call. Otherwise, DW_apb_i2c responds with a NACK (by negating ic_data_oe).

14.1.1.39 IC_ENABLE_STATUS — Offset 4010009Ch

I2C Enable Status Register - I2C Enable Status Register The register is used to report the DW_apb_i2c hardware status when the IC_ENABLE[0] register is set from 1 to 0; that is, when DW_apb_i2c is disabled. If IC_ENABLE[0] has been set to 1, bits 2:1 are forced to 0, and bit 0 is forced to 1. If IC_ENABLE[0] has been set to 0, bits 2:1 is only be valid as soon as bit 0 is read as '0'. Note: When IC_ENABLE[0] has been set to 0, a delay occurs for bit 0 to be read as 0 because disabling the DW_apb_i2c depends on I2C bus activities.

Type	Size	Offset	Default
MMIO	32 bit	4010009Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2	0h RO/V	**SLV_RX_DATA_LOST:** Slave Received Data Lost. This bit indicates if a Slave-Receiver operation has been aborted with at least one data byte received from an I2C transfer due to the setting bit 0 of IC_ENABLE from 1 to 0. When read as 1, DW_apb_i2c is deemed to have been actively engaged in an aborted I2C transfer (with matching address) and the data phase of the I2C transfer has been entered, even though a data byte has been responded with a NACK. Note: If the remote I2C master terminates the transfer with a STOP condition before the DW_apb_i2c has a chance to NACK a transfer, and IC_ENABLE[0] has been set to 0, then this bit is also set to 1. When read as 0, DW_apb_i2c is deemed to have been disabled without being actively involved in the data phase of a Slave-Receiver transfer. Note: The CPU can safely read this bit when IC_EN (bit 0) is read as 0.
1	0h RO/V	**SLV_DISABLED_WHILE_BUSY:** Slave Disabled While Busy (Transmit, Receive). This bit indicates if a potential or active Slave operation has been aborted due to the setting bit 0 of the IC_ENABLE register from 1 to 0. This bit is set when the CPU writes a 0 to the IC_ENABLE register while: (a) DW_apb_i2c is receiving the address byte of the Slave-Transmitter operation from a remote master; OR, (b) address and data bytes of the Slave-Receiver operation from a remote master. When read as 1, DW_apb_i2c is deemed to have forced a NACK during any part of an I2C transfer, irrespective of whether the I2C address matches the slave address set in DW_apb_i2c (IC_SAR register) OR if the transfer is completed before IC_ENABLE is set to 0 but has not taken effect. Note: If the remote I2C master terminates the transfer with a STOP condition before the DW_apb_i2c has a chance to NACK a transfer, and IC_ENABLE[0] has been set to 0, then this bit will also be set to 1. When read as 0, DW_apb_i2c is deemed to have been disabled when there is master activity, or when the I2C bus is idle. Note: The CPU can safely read this bit when IC_EN (bit 0) is read as 0.
0	0h RO/V	**IC_EN:** ic_en Status. This bit always reflects the value driven on the output port ic_en. - When read as 1, DW_apb_i2c is deemed to be in an enabled state. - When read as 0, DW_apb_i2c is deemed completely inactive. Note: The CPU can safely read this bit anytime. When this bit is read as 0, the CPU can safely read SLV_RX_DATA_LOST (bit 2) and SLV_DISABLED_WHILE_BUSY (bit 1).

14.1.1.40 IC_FS_SPKLEN — Offset 401000A0h

I2C SS, FS or FM+ spike suppression limit - I2C SS, FS or FM+ spike suppression limit This register is used to store the duration, measured in ic_clk cycles, of the longest spike that is filtered out by the spike suppression logic w hen the component is operating in SS, FS or FM+ modes. This register must be programmed with a minimum value of 1.

Type	Size	Offset	Default
MMIO	32 bit	401000A0h	00000005h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	05h RW	**IC_FS_SPKLEN:** This register must be set before any I2C bus transaction can take place to ensure stable operation. This register sets the duration, measured in ic_clk cycles, of the longest spike in the SCL or SDA lines that will be filtered out by the spike suppression logic. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. The minimum valid value is 1; hardware prevents values less than this being written, and if attempted results in 1 being set.

14.1.1.41 IC_HS_SPKLEN — Offset 401000A4h

I2C HS spike suppression limit register - I2C HS spike suppression limit register This register is used to store the duration, measured in ic_clk cycles, of the longest spike that is filtered out by the spike suppression logic when the component is operating in HS modes. This register must be programmed with a minimum value of 1 and is implemented only if the component is configured to support HS mode; that is, if the IC_MAX_SPEED_MODE parameter is set to 3.

Type	Size	Offset	Default
MMIO	32 bit	401000A4h	00000002h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	02h RW	**IC_HS_SPKLEN:** This register must be set before any I2C bus transaction can take place to ensure stable operation. This register sets the duration, measured in ic_clk cycles, of the longest spike in the SCL or SDA lines that will be filtered out by the spike suppression logic. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. The minimum valid value is 1; hardware prevents values less than this being written, and if attempted results in 1 being set.

14.1.1.42 IC_CLR_RESTART_DET — Offset 401000A8h

Clear RESTART_DET Interrupt Register - Clear RESTART_DET Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	401000A8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RESTART_DET:** Read this register to clear the RESTART_DET interrupt (bit 12) of IC_RAW_INTR_STAT register.

14.1.1.43 IC_COMP_PARAM_1 — Offset 401000F4h

Component Parameter Register 1 - Component Parameter Register 1 Note This is a constant read-only register that contains encoded information about the component's parameter settings. The reset value depends on coreConsultant parameter(s).

Type	Size	Offset	Default
MMIO	32 bit	401000F4h	003F3FEEh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:16	3Fh RO/V	**TX_BUFFER_DEPTH:** The value of this register is derived from the IC_TX_BUFFER_DEPTH coreConsultant parameter. - 0x00 = Reserved - 0x01 = 2 - 0x02 = 3 - ... - 0xFF = 256
15:8	3Fh RO/V	**RX_BUFFER_DEPTH:** The value of this register is derived from the IC_RX_BUFFER_DEPTH coreConsultant parameter. - 0x00: Reserved - 0x01: 2 - 0x02: 3 - ... - 0xFF: 256
7	1h RO/V	**ADD_ENCODED_PARAMS:** The value of this register is derived from the IC_ADD_ENCODED_PARAMS coreConsultant parameter. Reading 1 in this bit means that the capability of reading these encoded parameters via software has been included. Otherwise, the entire register is 0 regardless of the setting of any other parameters that are encoded in the bits.

Bit Range	Default & Access	Field Name (ID): Description
6	1h RO/V	**HAS_DMA:** The value of this register is derived from the IC_HAS_DMA coreConsultant parameter.
5	1h RO/V	**INTR_IO:** The value of this register is derived from the IC_INTR_IO coreConsultant parameter.
4	0h RO/V	**HC_COUNT_VALUES:** The value of this register is derived from the IC_HC_COUNT VALUES coreConsultant parameter.
3:2	3h RO/V	**MAX_SPEED_MODE:** The value of this register is derived from the IC_MAX_SPEED_MODE coreConsultant parameter. - 0x0: Reserved - 0x1: Standard - 0x2: Fast - 0x3: High
1:0	2h RO/V	**APB_DATA_WIDTH:** The value of this register is derived from the APB_DATA_WIDTH coreConsultant parameter.

14.1.1.44 IC_COMP_VERSION — Offset 401000F8h

I2C Component Version Register - I2C Component Version Register

Type	Size	Offset	Default
MMIO	32 bit	401000F8h	3230322Ah

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	3230322Ah RO/V	**IC_COMP_VERSION:**

14.1.1.45 IC_COMP_TYPE — Offset 401000FCh

I2C Component Type Register - I2C Component Type Register

Type	Size	Offset	Default
MMIO	32 bit	401000FCh	44570140h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	44570140h RO/V	**IC_COMP_TYPE:** Designware Component Type number = 0x44_57_01_40. This assigned unique hex value is constant and is derived from the two ASCII letters 'DW' followed by a 16-bit unsigned number.

14.1.2 I2C_1 Registers Summary

Table 14-2. Summary of I2C_1 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
40102000h	4	IC_CON	00000067h

401020FCh	4	IC_COMP_TYPE	44570140h

14.1.2.1 IC_CON — Offset 40102000h

I2C Control Register - I2C Control Register. This register can be written only when the DW_apb_i2c is disabled, which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. Read/Write Access: - If configuration parameter I2C_DYNAMIC_TAR_UPDATE=1, bit 4 is read only. - If configuration parameter IC_RX_FULL_HLD_BUS_EN =0, bit 9 is read only. - If configuration parameter IC_STOP_DET_IF_MASTER_ACTIVE =0, bit 10 is read only. - If configuration parameter IC_BUS_CLEAR_FEATURE=0, bit 11 is read only - If configuration parameter IC_OPTIONAL_SAR=0, bit 16 is read only - If configuration parameter IC_SMBUS=0, bit 17 is read only - If configuration parameter IC_SMBUS_ARP=0, bits 18 and 19 are read only.

Type	Size	Offset	Default
MMIO	32 bit	40102000h	00000067h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved**
10	0h RW	**STOP_DET_IF_MASTER_ACTIVE:** In Master mode: - 1'b1: issues the STOP_DET interrupt only when master is active. - 1'b0: issues the STOP_DET irrespective of whether master is active or not.
9	0h RW	**RX_FIFO_FULL_HLD_CTRL:** This bit controls whether DW_apb_i2c should hold the bus when the Rx FIFO is physically full to its RX_BUFFER_DEPTH, as described in the IC_RX_FULL_HLD_BUS_EN parameter.
8	0h RW	**TX_EMPTY_CTRL:** This bit controls the generation of the TX_EMPTY interrupt, as described in the IC_RAW_INTR_STAT register.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**STOP_DET_IFADDRESSED:** In slave mode: - 1'b1: issues the STOP_DET interrrupt only when it is addressed. - 0'b0: issues the STOP_DET irrespective of whether it's addressed or not. NOTE: During a general call address, this slave does not issue the STOP_DET interrupt if STOP_DET_IF_ADDRESSED = 1'b1, even if the slave responds to the general call address by generating ACK. The STOP_DET interrupt is generated only when the transmitted address matches the slave address (SAR).
6	1h RW	**IC_SLAVE_DISABLE:** This bit controls whether I2C has its slave disabled, which means once the presetn signal is applied, then this bit takes on the value of the configuration parameter IC_SLAVE_DISABLE. You have the choice of having the slave enabled or disabled after reset is applied, which means software does not have to configure the slave. By default, the slave is always enabled (in reset state as well). If you need to disable it after reset, set this bit to 1. If this bit is set (slave is disabled), DW_apb_i2c functions only as a master and does not perform any action that requires a slave. NOTE: Software should ensure that if this bit is written with 0, then bit 0 should also be written with a 0.
5	1h RW	**IC_RESTART_EN:** Determines whether RESTART conditions may be sent when acting as a master. Some older slaves do not support handling RESTART conditions; however, RESTART conditions are used in several DW_apb_i2c operations. When RESTART is disabled, the master is prohibited from performing the following functions: - Sending a START BYTE - Performing any high-speed mode operation - High-speed mode operation - Performing direction changes in combined format mode - Performing a read operation with a 10-bit address By replacing RESTART condition followed by a STOP and a subsequent START condition, split operations are broken down into multiple DW_apb_i2c transfers. If the above operations are performed, it will result in setting bit 6 (TX_ABRT) of the IC_RAW_INTR_STAT register. .
4	0h RO/V	**IC_10BITADDR_MASTER_RD_ONLY:** If the I2C_DYNAMIC_TAR_UPDATE configuration parameter is set to 'No' (0), this bit is named IC_10BITADDR_MASTER and controls whether the DW_apb_i2c starts its transfers in 7 or 10-bit addressing mode when acting as a master. If I2C_DYNAMIC_TAR_UPDATE is set to 'Yes' (1), the function of this bit is handled by bit 12 of IC_TAR register, and becomes a read-only copy called IC_10BITADDR_MASTER_rd_only. - 0: 7-bit addressing - 1: 10-bit addressing
3	0h RW	**IC_10BITADDR_SLAVE:** When acting as a slave, this bit controls whether the DW_apb_i2c responds to 7- or 10-bit addresses. - 0: 7-bit addressing. The DW_apb_i2c ignores transactions that involve 10-bit addressing; for 7-bit addressing, only the lower 7 bits of the IC_SAR register are compared. - 1: 10-bit addressing. The DW_apb_i2c responds to only 10-bit addressing transfers that match the full 10 bits of the IC_SAR register.
2:1	3h RW	**SPEED:** These bits control at which speed the DW_apb_i2c operates; its setting is relevant only if one is operating the DW_apb_i2c in master mode. Hardware protects against illegal values being programmed by software. These bits must be programmed appropriately for slave mode also, as it is used to capture correct value of spike filter as per the speed mode. This register should be programmed only with a value in the range of 1 to IC_MAX_SPEED_MODE; otherwise, hardware updates this register with the value of IC_MAX_SPEED_MODE. 1: standard mode (100 kbit/s) 2: fast mode (<=400 kbit/s) or fast mode plus (<=1000Kbit/s) 3: high speed mode (3.4 Mbit/s) Note: This field is not applicable when IC_ULTRA_FAST_MODE=1
0	1h RW	**MASTER_MODE:** This bit controls whether the DW_apb_i2c master is enabled. NOTE: Software should ensure that if this bit is written with '1' then bit 6 should also be written with a '1'.

14.1.2.2 IC_TAR — Offset 40102004h

I2C Target Address Register - I2C Target Address Register If the configuration parameter I2C_DYNAMIC_TAR_UPDATE is set to 'No' (0), this register is 12 bits wide, and bits 31:12 are reserved. This register can be written to only when IC_ENABLE[0] is set to 0. However, if I2C_DYNAMIC_TAR_UPDATE = 1, then the register becomes 13

bits wide. In this case, writes to IC_TAR succeed when one of the following conditions are true: - DW_apb_i2c is NOT enabled (IC_ENABLE[0] is set to 0); or - DW_apb_i2c is enabled (IC_ENABLE[0]=1); AND DW_apb_i2c is NOT engaged in any Master (tx, rx) operation (IC_STATUS[5]=0); AND DW_apb_i2c is enabled to operate in Master mode (IC_CON[0]=1); AND there are NO entries in the TX FIFO (IC_STATUS[2]=1) You can change the TAR address dynamically without losing the bus, only if the following conditions are met. - DW_apb_i2c is enabled (IC_ENABLE[0]=1); AND IC_EMPTYFIFO_HOLD_MASTER_EN configuration parameter is set to 1; AND DW_apb_i2c is enabled to operate in Master mode (IC_CON[0]=1); AND there are NO entries in the Tx FIFO and the master is in HOLD state (IC_INTR_STAT[13]=1). Note: If the software or application is aware that the DW_apb_i2c is not using the TAR address for the pending commands in the Tx FIFO, then it is possible to update the TAR address even while the Tx FIFO has entries (IC_STATUS[2]= 0). - It is not necessary to perform any write to this register if DW_apb_i2c is enabled as an I2C slave only.

Type	Size	Offset	Default
MMIO	32 bit	40102004h	00000055h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	**Reserved**
12	0h RW	**IC_10BITADDR_MASTER:** This bit controls whether the DW_apb_i2c starts its transfers in 7- or 10-bit addressing mode when acting as a master. - 0: 7-bit addressing - 1: 10-bit addressing
11	0h RW	**SPECIAL:** This bit indicates whether software performs a Device-ID or General Call or START BYTE command. - 0: ignore bit 10 GC_OR_START and use IC_TAR normally - 1: perform special I2C command as specified in Device_ID or GC_OR_START bit
10	0h RW	**GC_OR_START:** If bit 11 (SPECIAL) is set to 1 and bit 13(Device-ID) is set to 0, then this bit indicates whether a General Call or START byte command is to be performed by the DW_apb_i2c. - 0: General Call Address - after issuing a General Call, only writes may be performed. Attempting to issue a read command results in setting bit 6 (TX_ABRT) of the IC_RAW_INTR_STAT register. The DW_apb_i2c remains in General Call mode until the SPECIAL bit value (bit 11) is cleared. - 1: START BYTE
9:0	055h RW	**IC_TAR:** This is the target address for any master transaction. When transmitting a General Call, these bits are ignored. To generate a START BYTE, the CPU needs to write only once into these bits. If the IC_TAR and IC_SAR are the same, loopback exists but the FIFOs are shared between master and slave, so full loopback is not feasible. Only one direction loopback mode is supported (simplex), not duplex. A master cannot transmit to itself; it can transmit to only a slave.

14.1.2.3 IC_SAR — Offset 40102008h

I2C Slave Address Register - I2C Slave Address Register

Type	Size	Offset	Default
MMIO	32 bit	40102008h	00000055h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:0	055h RW	**IC_SAR:** The IC_SAR holds the slave address when the I2C is operating as a slave. For 7-bit addressing, only IC_SAR[6:0] is used. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. Note: The default values cannot be any of the reserved address locations: that is, 0x00 to 0x07, or 0x78 to 0x7f. The correct operation of the device is not guaranteed if you program the IC_SAR or IC_TAR to a reserved value.

14.1.2.4 IC_HS_MADDR — Offset 4010200Ch

I2C High Speed Master Mode Code Address Register - I2C High Speed Master Mode Code Address Register

Type	Size	Offset	Default
MMIO	32 bit	4010200Ch	00000001h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2:0	1h RW	**IC_HS_MAR:** This bit field holds the value of the I2C HS mode master code. HS-mode master codes are reserved 8-bit codes (00001xxx) that are not used for slave addressing or other purposes. Each master has its unique master code; up to eight high-speed mode masters can be present on the same I2C bus system. Valid values are from 0 to 7. This register goes away and becomes read-only returning 0's if the IC_MAX_SPEED_MODE configuration parameter is set to either Standard (1) or Fast (2). This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect.

14.1.2.5 IC_DATA_CMD — Offset 40102010h

I2C Rx/Tx Data Buffer and Command Register - I2C Rx/Tx Data Buffer and Command Register; this is the register the CPU writes to when filling the TX FIFO and the CPU reads from when retrieving bytes from RX FIFO. The size of the register changes as follows: Write: - 11 bits when IC_EMPTYFIFO_HOLD_MASTER_EN=1 - 9 bits when IC_EMPTYFIFO_HOLD_MASTER_EN=0 Read: - 12 bits when IC_FIRST_DATA_BYTE_STATUS = 1 - 8 bits when IC_FIRST_DATA_BYTE_STATUS = 0 Note: In order for the DW_apb_i2c to continue acknowledging reads, a read command should be written for every byte that is to be received; otherwise the DW_apb_i2c will stop acknowledging.

Type	Size	Offset	Default
MMIO	32 bit	40102010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RO/V	**FIRST_DATA_BYTE:** Indicates the first data byte received after the address phase for receive transfer in Master receiver or Slave receiver mode. NOTE: In case of APB_DATA_WIDTH=8, 1. The user has to perform two APB Reads to IC_DATA_CMD in order to get status on 11 bit. 2. Inorder to read the 11 bit, the user has to perform the first data byte read [7:0] (offset 0x10) and then perform the second read[15:8](offset 0x11) in order to know the status of 11 bit (whether the data received in previous read is a first data byte or not). 3. The 11th bit is an optional read field, user can ignore 2nd byte read [15:8] (offset 0x11) if not interested in FIRST_DATA_BYTE status.
10	0h WO	**RESTART:** This bit controls whether a RESTART is issued before the byte is sent or received. This bit is available only if IC_EMPTYFIFO_HOLD_MASTER_EN is configured to 1. 1 - If IC_RESTART_EN is 1, a RESTART is issued before the data is sent/received (according to the value of CMD), regardless of whether or not the transfer direction is changing from the previous command; if IC_RESTART_EN is 0, a STOP followed by a START is issued instead. 0 - If IC_RESTART_EN is 1, a RESTART is issued only if the transfer direction is changing from the previous command; if IC_RESTART_EN is 0, a STOP followed by a START is issued instead.

Bit Range	Default & Access	Field Name (ID): Description
9	0h WO	**STOP:** This bit controls whether a STOP is issued after the byte is sent or received. This bit is available only if IC_EMPTYFIFO_HOLD_MASTER_EN is configured to 1. - 1 - STOP is issued after this byte, regardless of whether or not the Tx FIFO is empty. If the Tx FIFO is not empty, the master immediately tries to start a new transfer by issuing a START and arbitrating for the bus. - 0 - STOP is not issued after this byte, regardless of whether or not the Tx FIFO is empty. If the Tx FIFO is not empty, the master continues the current transfer by sending/receiving data bytes according to the value of the CMD bit. If the Tx FIFO is empty, the master holds the SCL line low and stalls the bus until a new command is available in the Tx FIFO.
8	0h WO	**CMD:** This bit controls whether a read or a write is performed. This bit does not control the direction when the DW_apb_i2c acts as a slave. It controls only the direction when it acts as a master. When a command is entered in the TX FIFO, this bit distinguishes the write and read commands. In slave-receiver mode, this bit is a "don't care" because writes to this register are not required. In slave-transmitter mode, a "0" indicates that the data in IC_DATA_CMD is to be transmitted. When programming this bit, you should remember the following: attempting to perform a read operation after a General Call command has been sent results in a TX_ABRT interrupt (bit 6 of the IC_RAW_INTR_STAT register), unless bit 11 (SPECIAL) in the IC_TAR register has been cleared. If a "1" is written to this bit after receiving a RD_REQ interrupt, then a TX_ABRT interrupt occurs.
7:0	00h RW/V	**DAT:** This register contains the data to be transmitted or received on the I2C bus. If you are writing to this register and want to perform a read, bits 7:0 (DAT) are ignored by the DW_apb_i2c. However, when you read this register, these bits return the value of data received on the DW_apb_i2c interface.

14.1.2.6 IC_SS_SCL_HCNT — Offset 40102014h

Standard Speed I2C Clock SCL High Count Register - Standard Speed I2C Clock SCL High Count Register

Type	Size	Offset	Default
MMIO	32 bit	40102014h	000001E8h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	01E8h RW	**IC_SS_SCL_HCNT:** This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock high-period count for standard speed. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. The minimum valid value is 6; hardware prevents values less than this being written, and if attempted results in 6 being set. For designs with APB_DATA_WIDTH = 8, the order of programming is important to ensure the correct operation of the DW_apb_i2c. The lower byte must be programmed first. Then the upper byte is programmed. When the configuration parameter IC_HC_COUNT_VALUES is set to 1, this register is read only. NOTE: This register must not be programmed to a value higher than 65525, because DW_apb_i2c uses a 16-bit counter to flag an I2C bus idle condition when this counter reaches a value of IC_SS_SCL_HCNT + 10.

14.1.2.7 IC_SS_SCL_LCNT — Offset 40102018h

Standard Speed I2C Clock SCL Low Count Register - Standard Speed I2C Clock SCL Low Count Register

Then the upper byte is programmed. If the value is less than 8 then the count value gets changed to 8.

14.1.2.12 IC_INTR_STAT — Offset 4010202Ch

I2C Interrupt Status Register - I2C Interrupt Status Register Each bit in this register has a corresponding mask bit in the IC_INTR_MASK register. These bits are cleared by reading the matching interrupt clear register. The unmasked raw versions of these bits are available in the IC_RAW_INTR_STAT register.

Type	Size	Offset	Default
MMIO	32 bit	4010202Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13	0h RO/V	**R_MASTER_ON_HOLD:** See IC_RAW_INTR_STAT for a detailed description of R_MASTER_ON_HOLD bit.
12	0h RO/V	**R_RESTART_DET:** See IC_RAW_INTR_STAT for a detailed description of R_RESTART_DET bit.
11	0h RO/V	**R_GEN_CALL:** See IC_RAW_INTR_STAT for a detailed description of R_GEN_CALL bit.

Bit Range	Default & Access	Field Name (ID): Description
10	0h RO/V	**R_START_DET:** See IC_RAW_INTR_STAT for a detailed description of R_START_DET bit.
9	0h RO/V	**R_STOP_DET:** See IC_RAW_INTR_STAT for a detailed description of R_STOP_DET bit.
8	0h RO/V	**R_ACTIVITY:** See IC_RAW_INTR_STAT for a detailed description of R_ACTIVITY bit.
7	0h RO/V	**R_RX_DONE:** See IC_RAW_INTR_STAT for a detailed description of R_RX_DONE bit.
6	0h RO/V	**R_TX_ABRT:** See IC_RAW_INTR_STAT for a detailed description of R_TX_ABRT bit.
5	0h RO/V	**R_RD_REQ:** See IC_RAW_INTR_STAT for a detailed description of R_RD_REQ bit.
4	0h RO/V	**R_TX_EMPTY:** See IC_RAW_INTR_STAT for a detailed description of R_TX_EMPTY bit.
3	0h RO/V	**R_TX_OVER:** See IC_RAW_INTR_STAT for a detailed description of R_TX_OVER bit.
2	0h RO/V	**R_RX_FULL:** See IC_RAW_INTR_STAT for a detailed description of R_RX_FULL bit.
1	0h RO/V	**R_RX_OVER:** See IC_RAW_INTR_STAT for a detailed description of R_RX_OVER bit.
0	0h RO/V	**R_RX_UNDER:** See IC_RAW_INTR_STAT for a detailed description of R_RX_UNDER bit.

14.1.2.13 IC_INTR_MASK — Offset 40102030h

I2C Interrupt Mask Register - I2C Interrupt Mask Register. These bits mask their corresponding interrupt status bits. This register is active low; a value of 0 masks the interrupt, whereas a value of 1 unmasks the interrupt.

Type	Size	Offset	Default
MMIO	32 bit	40102030h	000008FFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13	0h RW	**M_MASTER_ON_HOLD:** This bit masks the R_MASTER_ON_HOLD interrupt in IC_INTR_STAT register.
12	0h RW	**M_RESTART_DET:** This bit masks the R_RESTART_DET interrupt in IC_INTR_STAT register.

Bit Range	Default & Access	Field Name (ID): Description
11	1h RW	**M_GEN_CALL:** This bit masks the R_GEN_CALL interrupt in IC_INTR_STAT register.
10	0h RW	**M_START_DET:** This bit masks the R_START_DET interrupt in IC_INTR_STAT register.
9	0h RW	**M_STOP_DET:** This bit masks the R_STOP_DET interrupt in IC_INTR_STAT register.
8	0h RW	**M_ACTIVITY:** This bit masks the R_ACTIVITY interrupt in IC_INTR_STAT register.
7	1h RW	**M_RX_DONE:** This bit masks the R_RX_DONE interrupt in IC_INTR_STAT register.
6	1h RW	**M_TX_ABRT:** This bit masks the R_TX_ABRT interrupt in IC_INTR_STAT register.
5	1h RW	**M_RD_REQ:** This bit masks the R_RD_REQ interrupt in IC_INTR_STAT register.
4	1h RW	**M_TX_EMPTY:** This bit masks the R_TX_EMPTY interrupt in IC_INTR_STAT register.
3	1h RW	**M_TX_OVER:** This bit masks the R_TX_OVER interrupt in IC_INTR_STAT register.
2	1h RW	**M_RX_FULL:** This bit masks the R_RX_FULL interrupt in IC_INTR_STAT register.
1	1h RW	**M_RX_OVER:** This bit masks the R_RX_OVER interrupt in IC_INTR_STAT register.
0	1h RW	**M_RX_UNDER:** This bit masks the R_RX_UNDER interrupt in IC_INTR_STAT register.

14.1.2.14 IC_RAW_INTR_STAT — Offset 40102034h

I2C Raw Interrupt Status Register - I2C Raw Interrupt Status Register Unlike the IC_INTR_STAT register, these bits are not masked so they always show the true status of the DW_apb_i2c.

Type	Size	Offset	Default
MMIO	32 bit	40102034h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13	0h RO/V	**MASTER_ON_HOLD:** Indicates whether master is holding the bus and TX FIFO is empty. Enabled only when I2C_DYNAMIC_TAR_UPDATE=1 and IC_EMPTYFIFO_HOLD_MASTER_EN=1.
12	0h RO/V	**RESTART_DET:** Indicates whether a RESTART condition has occurred on the I2C interface when DW_apb_i2c is operating in Slave mode and the slave is being addressed. Enabled only when IC_SLV_RESTART_DET_EN=1. Note: However, in high-speed mode or during a START BYTE transfer, the RESTART comes before the address field as per the I2C protocol. In this case, the slave is not the addressed slave when the RESTART is issued, therefore DW_apb_i2c does not generate the RESTART_DET interrupt.
11	0h RO/V	**GEN_CALL:** Set only when a General Call address is received and it is acknowledged. It stays set until it is cleared either by disabling DW_apb_i2c or when the CPU reads bit 0 of the IC_CLR_GEN_CALL register. DW_apb_i2c stores the received data in the Rx buffer.
10	0h RO/V	**START_DET:** Indicates whether a START or RESTART condition has occurred on the I2C interface regardless of whether DW_apb_i2c is operating in slave or master mode.
9	0h RO/V	**STOP_DET:** Indicates whether a STOP condition has occurred on the I2C interface regardless of whether DW_apb_i2c is operating in slave or master mode. In Slave Mode: - If IC_CON[7]=1'b1 (STOP_DET_IFADDRESSED), the STOP_DET interrupt will be issued only if slave is addressed. Note: During a general call address, this slave does not issue a STOP_DET interrupt if STOP_DET_IF_ADDRESSED=1'b1, even if the slave responds to the general call address by generating ACK. The STOP_DET interrupt is generated only when the transmitted address matches the slave address (SAR). - If IC_CON[7]=1'b0 (STOP_DET_IFADDRESSED), the STOP_DET interrupt is issued irrespective of whether it is being addressed. In Master Mode: - If IC_CON[10]=1'b1 (STOP_DET_IF_MASTER_ACTIVE),the STOP_DET interrupt will be issued only if Master is active. - If IC_CON[10]=1'b0 (STOP_DET_IFADDRESSED),the STOP_DET interrupt will be issued irrespective of whether master is active or not.
8	0h RO/V	**ACTIVITY:** This bit captures DW_apb_i2c activity and stays set until it is cleared. There are four ways to clear it: - Disabling the DW_apb_i2c - Reading the IC_CLR_ACTIVITY register - Reading the IC_CLR_INTR register - System reset Once this bit is set, it stays set unless one of the four methods is used to clear it. Even if the DW_apb_i2c module is idle, this bit remains set until cleared, indicating that there was activity on the bus.
7	0h RO/V	**RX_DONE:** When the DW_apb_i2c is acting as a slave-transmitter, this bit is set to 1 if the master does not acknowledge a transmitted byte. This occurs on the last byte of the transmission, indicating that the transmission is done.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RO/V	**TX_ABRT:** This bit indicates if DW_apb_i2c, as an I2C transmitter, is unable to complete the intended actions on the contents of the transmit FIFO. This situation can occur both as an I2C master or an I2C slave, and is referred to as a 'transmit abort'. When this bit is set to 1, the IC_TX_ABRT_SOURCE register indicates the reason why the transmit abort takes places. Note: The DW_apb_i2c flushes/resets/empties only the TX_FIFO whenever there is a transmit abort caused by any of the events tracked by the IC_TX_ABRT_SOURCE register. The Tx FIFO remains in this flushed state until the register IC_CLR_TX_ABRT is read. Once this read is performed, the Tx FIFO is then ready to accept more data bytes from the APB interface. RX FIFO flush because of TX_ABRT is controlled by the coreConsultant parameter IC_AVOID_RX_FIFO_FLUSH_ON_TX_ABRT.
5	0h RO/V	**RD_REQ:** This bit is set to 1 when DW_apb_i2c is acting as a slave and another I2C master is attempting to read data from DW_apb_i2c. The DW_apb_i2c holds the I2C bus in a wait state (SCL=0) until this interrupt is serviced, which means that the slave has been addressed by a remote master that is asking for data to be transferred. The processor must respond to this interrupt and then write the requested data to the IC_DATA_CMD register. This bit is set to 0 just after the processor reads the IC_CLR_RD_REQ register.
4	0h RO/V	**TX_EMPTY:** The behavior of the TX_EMPTY interrupt status differs based on the TX_EMPTY_CTRL selection in the IC_CON register. - When TX_EMPTY_CTRL = 0: This bit is set to 1 when the transmit buffer is at or below the threshold value set in the IC_TX_TL register. - When TX_EMPTY_CTRL = 1: This bit is set to 1 when the transmit buffer is at or below the threshold value set in the IC_TX_TL register and the transmission of the address/data from the internal shift register for the most recently popped command is completed. It is automatically cleared by hardware when the buffer level goes above the threshold. When IC_ENABLE[0] is set to 0, the TX FIFO is flushed and held in reset. There the TX FIFO looks like it has no data within it, so this bit is set to 1, provided there is activity in the master or slave state machines. When there is no longer any activity, then with ic_en=0, this bit is set to 0.
3	0h RO/V	**TX_OVER:** Set during transmit if the transmit buffer is filled to IC_TX_BUFFER_DEPTH and the processor attempts to issue another I2C command by writing to the IC_DATA_CMD register. When the module is disabled, this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared.
2	0h RO/V	**RX_FULL:** Set when the receive buffer reaches or goes above the RX_TL threshold in the IC_RX_TL register. It is automatically cleared by hardware when buffer level goes below the threshold. If the module is disabled (IC_ENABLE[0]=0), the RX FIFO is flushed and held in reset; therefore the RX FIFO is not full. So this bit is cleared once the IC_ENABLE bit 0 is programmed with a 0, regardless of the activity that continues.
1	0h RO/V	**RX_OVER:** Set if the receive buffer is completely filled to IC_RX_BUFFER_DEPTH and an additional byte is received from an external I2C device. The DW_apb_i2c acknowledges this, but any data bytes received after the FIFO is full are lost. If the module is disabled (IC_ENABLE[0]=0), this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared. Note: If the configuration parameter IC_RX_FULL_HLD_BUS_EN is enabled and bit 9 of the IC_CON register (RX_FIFO_FULL_HLD_CTRL) is programmed to HIGH, then the RX_OVER interrupt never occurs, because the Rx FIFO never overflows.
0	0h RO/V	**RX_UNDER:** Set if the processor attempts to read the receive buffer when it is empty by reading from the IC_DATA_CMD register. If the module is disabled (IC_ENABLE[0]=0), this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared.

14.1.2.15 IC_RX_TL — Offset 40102038h

I2C Receive FIFO Threshold Register - I2C Receive FIFO Threshold Register

Type	Size	Offset	Default
MMIO	32 bit	40102038h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**RX_TL:** Receive FIFO Threshold Level. Controls the level of entries (or above) that triggers the RX_FULL interrupt (bit 2 in IC_RAW_INTR_STAT register). The valid range is 0-255, with the additional restriction that hardware does not allow this value to be set to a value larger than the depth of the buffer. If an attempt is made to do that, the actual value set will be the maximum depth of the buffer. A value of 0 sets the threshold for 1 entry, and a value of 255 sets the threshold for 256 entries.

14.1.2.16 IC_TX_TL — Offset 4010203Ch

I2C Transmit FIFO Threshold Register - I2C Transmit FIFO Threshold Register

Type	Size	Offset	Default
MMIO	32 bit	4010203Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**TX_TL:** Transmit FIFO Threshold Level. Controls the level of entries (or below) that trigger the TX_EMPTY interrupt (bit 4 in IC_RAW_INTR_STAT register). The valid range is 0-255, with the additional restriction that it may not be set to value larger than the depth of the buffer. If an attempt is made to do that, the actual value set will be the maximum depth of the buffer. A value of 0 sets the threshold for 0 entries, and a value of 255 sets the threshold for 255 entries.

14.1.2.17 IC_CLR_INTR — Offset 40102040h

Clear Combined and Individual Interrupt Register - Clear Combined and Individual Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40102040h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_INTR:** Read this register to clear the combined interrupt, all individual interrupts, and the IC_TX_ABRT_SOURCE register. This bit does not clear hardware clearable interrupts but software clearable interrupts. Refer to Bit 9 of the IC_TX_ABRT_SOURCE register for an exception to clearing IC_TX_ABRT_SOURCE.

14.1.2.18 IC_CLR_RX_UNDER — Offset 40102044h

Clear RX_UNDER Interrupt Register - Clear RX_UNDER Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40102044h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RX_UNDER:** Read this register to clear the RX_UNDER interrupt (bit 0) of the IC_RAW_INTR_STAT register.

14.1.2.19 IC_CLR_RX_OVER — Offset 40102048h

Clear RX_OVER Interrupt Register - Clear RX_OVER Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40102048h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RX_OVER:** Read this register to clear the RX_OVER interrupt (bit 1) of the IC_RAW_INTR_STAT register.

14.1.2.20 IC_CLR_TX_OVER — Offset 4010204Ch

Clear TX_OVER Interrupt Register - Clear TX_OVER Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010204Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_TX_OVER:** Read this register to clear the TX_OVER interrupt (bit 3) of the IC_RAW_INTR_STAT register.

14.1.2.21 IC_CLR_RD_REQ — Offset 40102050h

Clear RD_REQ Interrupt Register - Clear RD_REQ Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40102050h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RD_REQ:** Read this register to clear the RD_REQ interrupt (bit 5) of the IC_RAW_INTR_STAT register.

14.1.2.22 IC_CLR_TX_ABRT — Offset 40102054h

Clear TX_ABRT Interrupt Register - Clear TX_ABRT Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40102054h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_TX_ABRT:** Read this register to clear the TX_ABRT interrupt (bit 6) of the IC_RAW_INTR_STAT register, and the IC_TX_ABRT_SOURCE register. This also releases the TX FIFO from the flushed/reset state, allowing more writes to the TX FIFO. Refer to Bit 9 of the IC_TX_ABRT_SOURCE register for an exception to clearing IC_TX_ABRT_SOURCE.

14.1.2.23 IC_CLR_RX_DONE — Offset 40102058h

Clear RX_DONE Interrupt Register - Clear RX_DONE Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40102058h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RX_DONE:** Read this register to clear the RX_DONE interrupt (bit 7) of the IC_RAW_INTR_STAT register.

14.1.2.24 IC_CLR_ACTIVITY — Offset 4010205Ch

Clear ACTIVITY Interrupt Register - Clear ACTIVITY Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010205Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_ACTIVITY:** Reading this register clears the ACTIVITY interrupt if the I2C is not active anymore. If the I2C module is still active on the bus, the ACTIVITY interrupt bit continues to be set. It is automatically cleared by hardware if the module is disabled and if there is no further activity on the bus. The value read from this register to get status of the ACTIVITY interrupt (bit 8) of the IC_RAW_INTR_STAT register.

14.1.2.25 IC_CLR_STOP_DET — Offset 40102060h

Clear STOP_DET Interrupt Register - Clear STOP_DET Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40102060h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_STOP_DET:** Read this register to clear the STOP_DET interrupt (bit 9) of the IC_RAW_INTR_STAT register.

14.1.2.26 IC_CLR_START_DET — Offset 40102064h

Clear START_DET Interrupt Register - Clear START_DET Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40102064h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_START_DET:** Read this register to clear the START_DET interrupt (bit 10) of the IC_RAW_INTR_STAT register.

14.1.2.27 IC_CLR_GEN_CALL — Offset 40102068h

Clear GEN_CALL Interrupt Register - Clear GEN_CALL Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40102068h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_GEN_CALL:** Read this register to clear the GEN_CALL interrupt (bit 11) of IC_RAW_INTR_STAT register.

14.1.2.28 IC_ENABLE — Offset 4010206Ch

I2C ENABLE Register - I2C Enable Register

Type	Size	Offset	Default
MMIO	32 bit	4010206Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**TX_CMD_BLOCK:** In Master mode: - 1'b1: Blocks the transmission of data on I2C bus even if Tx FIFO has data to transmit. - 1'b0: The transmission of data starts on I2C bus automatically, as soon as the first data is available in the Tx FIFO. Note: To block the execution of Master commands, set the TX_CMD_BLOCK bit only when Tx FIFO is empty (IC_STATUS[2]==1) and Master is in Idle state (IC_STATUS[5] == 0). Any further commands put in the Tx FIFO are not executed until TX_CMD_BLOCK bit is unset.
1	0h RW	**ABORT:** When set, the controller initiates the transfer abort. - 0: ABORT not initiated or ABORT done - 1: ABORT operation in progress The software can abort the I2C transfer in master mode by setting this bit. The software can set this bit only when ENABLE is already set; otherwise, the controller ignores any write to ABORT bit. The software cannot clear the ABORT bit once set. In response to an ABORT, the controller issues a STOP and flushes the Tx FIFO after completing the current transfer, then sets the TX_ABORT interrupt after the abort operation. The ABORT bit is cleared automatically after the abort operation.
0	0h RW	**ENABLE:** Controls whether the DW_apb_i2c is enabled. - 0: Disables DW_apb_i2c (TX and RX FIFOs are held in an erased state) - 1: Enables DW_apb_i2c Software can disable DW_apb_i2c while it is active. However, it is important that care be taken to ensure that DW_apb_i2c is disabled properly. A recommended procedure is described in "Disabling DW_apb_i2c". When DW_apb_i2c is disabled, the following occurs: - The TX FIFO and RX FIFO get flushed. - Status bits in the IC_INTR_STAT register are still active until DW_apb_i2c goes into IDLE state. If the module is transmitting, it stops as well as deletes the contents of the transmit buffer after the current transfer is complete. If the module is receiving, the DW_apb_i2c stops the current transfer at the end of the current byte and does not acknowledge the transfer. In systems with asynchronous pclk and ic_clk when IC_CLK_TYPE parameter set to asynchronous (1), there is a two ic_clk delay when enabling or disabling the DW_apb_i2c.

14.1.2.29 IC_STATUS — Offset 40102070h

I2C STATUS Register - I2C Status Register This is a read-only register used to indicate the current transfer status and FIFO status. The status register may be read at any time. None of the bits in this register request an interrupt. When the I2C is disabled by writing 0 in bit 0 of the IC_ENABLE register: - Bits 1 and 2 are set to 1 - Bits 3 and 10 are set to 0 When the master or slave state machines goes to idle and ic_en=0: - Bits 5 and 6 are set to 0

Type	Size	Offset	Default
MMIO	32 bit	40102070h	00000006h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved**
10	0h RO/V	**SLV_HOLD_RX_FIFO_FULL:** This bit indicates the BUS Hold in Slave mode due to Rx FIFO is Full and an additional byte has been received (This kind of Bus hold is applicable if IC_RX_FULL_HLD_BUS_EN is set to 1).
9	0h RO/V	**SLV_HOLD_TX_FIFO_EMPTY:** This bit indicates the BUS Hold in Slave mode for the Read request when the Tx FIFO is empty. The Bus is in hold until the Tx FIFO has data to Transmit for the read request.
8	0h RO/V	**MST_HOLD_RX_FIFO_FULL:** This bit indicates the BUS Hold in Master mode due to Rx FIFO is Full and additional byte has been received (This kind of Bus hold is applicable if IC_RX_FULL_HLD_BUS_EN is set to 1).
7	0h RO/V	**MST_HOLD_TX_FIFO_EMPTY:** If the IC_EMPTYFIFO_HOLD_MASTER_EN parameter is set to 1, the DW_apb_i2c master stalls the write transfer when Tx FIFO is empty, and the the last byte does not have the Stop bit set. This bit indicates the BUS hold when the master holds the bus because of the Tx FIFO being empty, and the the previous transferred command does not have the Stop bit set. (This kind of Bus hold is applicable if IC_EMPTYFIFO_HOLD_MASTER_EN is set to 1).
6	0h RO/V	**SLV_ACTIVITY:** Slave FSM Activity Status. When the Slave Finite State Machine (FSM) is not in the IDLE state, this bit is set. - 0: Slave FSM is in IDLE state so the Slave part of DW_apb_i2c is not Active - 1: Slave FSM is not in IDLE state so the Slave part of DW_apb_i2c is Active
5	0h RO/V	**MST_ACTIVITY:** Master FSM Activity Status. When the Master Finite State Machine (FSM) is not in the IDLE state, this bit is set. - 0: Master FSM is in IDLE state so the Master part of DW_apb_i2c is not Active - 1: Master FSM is not in IDLE state so the Master part of DW_apb_i2c is Active Note: IC_STATUS[0]-that is, ACTIVITY bit-is the OR of SLV_ACTIVITY and MST_ACTIVITY bits.
4	0h RO/V	**RFF:** Receive FIFO Completely Full. When the receive FIFO is completely full, this bit is set. When the receive FIFO contains one or more empty location, this bit is cleared. - 0: Receive FIFO is not full - 1: Receive FIFO is full
3	0h RO/V	**RFNE:** Receive FIFO Not Empty. This bit is set when the receive FIFO contains one or more entries; it is cleared when the receive FIFO is empty. - 0: Receive FIFO is empty - 1: Receive FIFO is not empty

Bit Range	Default & Access	Field Name (ID): Description
2	1h RO/V	**TFE:** Transmit FIFO Completely Empty. When the transmit FIFO is completely empty, this bit is set. When it contains one or more valid entries, this bit is cleared. This bit field does not request an interrupt. - 0: Transmit FIFO is not empty - 1: Transmit FIFO is empty
1	1h RO/V	**TFNF:** Transmit FIFO Not Full. Set when the transmit FIFO contains one or more empty locations, and is cleared when the FIFO is full. - 0: Transmit FIFO is full - 1: Transmit FIFO is not full
0	0h RO/V	**ACTIVITY:** I2C Activity Status.

14.1.2.30 IC_TXFLR — Offset 40102074h

I2C Transmit FIFO Level Register - I2C Transmit FIFO Level Register This register contains the number of valid data entries in the transmit FIFO buffer. It is cleared whenever: - The I2C is disabled - There is a transmit abort - that is, TX_ABRT bit is set in the IC_RAW_INTR_STAT register - The slave bulk transmit mode is aborted The register increments whenever data is placed into the transmit FIFO and decrements when data is taken from the transmit FIFO.

Type	Size	Offset	Default
MMIO	32 bit	40102074h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:0	00h RO/V	**TXFLR:** Transmit FIFO Level. Contains the number of valid data entries in the transmit FIFO.

14.1.2.31 IC_RXFLR — Offset 40102078h

I2C Receive FIFO Level Register - I2C Receive FIFO Level Register This register contains the number of valid data entries in the receive FIFO buffer. It is cleared whenever: - The I2C is disabled - Whenever there is a transmit abort caused by any of the events tracked in IC_TX_ABRT_SOURCE The register increments whenever data is placed into the receive FIFO and decrements when data is taken from the receive FIFO.

Type	Size	Offset	Default
MMIO	32 bit	40102078h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:0	00h RO/V	**RXFLR:** Receive FIFO Level. Contains the number of valid data entries in the receive FIFO.

14.1.2.32 IC_SDA_HOLD — Offset 4010207Ch

I2C SDA Hold Time Length Register - I2C SDA Hold Time Length Register The bits [15:0] of this register are used to control the hold time of SDA during transmit in both slave and master mode (after SCL goes from HIGH to LOW). The bits [23:16] of this register are used to extend the SDA transition (if any) whenever SCL is HIGH in the receiver in either master or slave mode. Writes to this register succeed only when IC_ENABLE[0]=0. The values in this register are in units of ic_clk period. The value programmed in IC_SDA_TX_HOLD must be greater than the minimum hold time in each mode one cycle in master mode, seven cycles in slave mode for the value to be implemented. The programmed SDA hold time during transmit (IC_SDA_TX_HOLD) cannot exceed at any time the duration of the low part of scl. Therefore the programmed value cannot be larger than N_SCL_LOW-2, where N_SCL_LOW is the duration of the low part of the scl period measured in ic_clk cycles.

Type	Size	Offset	Default
MMIO	32 bit	4010207Ch	00000005h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:16	00h RW	**IC_SDA_RX_HOLD:** Sets the required SDA hold time in units of ic_clk period, when DW_apb_i2c acts as a receiver.
15:0	0005h RW	**IC_SDA_TX_HOLD:** Sets the required SDA hold time in units of ic_clk period, when DW_apb_i2c acts as a transmitter.

14.1.2.33 IC_TX_ABRT_SOURCE — Offset 40102080h

I2C Transmit Abort Source Register - I2C Transmit Abort Source Register This register has 32 bits that indicate the source of the TX_ABRT bit. Except for Bit 9, this register is cleared whenever the IC_CLR_TX_ABRT register or the IC_CLR_INTR register is read. To clear Bit 9, the source of the ABRT_SBYTE_NORSTRT must be fixed first; RESTART must be enabled (IC_CON[5]=1), the SPECIAL bit must be cleared (IC_TAR[11]), or the GC_OR_START bit must be cleared (IC_TAR[10]). Once the source of the ABRT_SBYTE_NORSTRT is fixed, then this bit can be cleared in the same manner as other bits in this register. If the source of the ABRT_SBYTE_NORSTRT is not fixed before attempting to clear this bit, Bit 9 clears for one cycle and is then re-asserted.

Type	Size	Offset	Default
MMIO	32 bit	40102080h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:23	000h RO/V	**TX_FLUSH_CNT:** This field indicates the number of Tx FIFO Data Commands which are flushed due to TX_ABRT interrupt. It is cleared whenever I2C is disabled. Role of DW_apb_i2c: Master-Transmitter or Slave-Transmitter
22:17	0h RO	**Reserved**
16	0h RO/V	**ABRT_USER_ABRT:** This is a master-mode-only bit. Master has detected the transfer abort (IC_ENABLE[1]) Role of DW_apb_i2c: Master-Transmitter
15	0h RO/V	**ABRT_SLVRD_INTX:** 1: When the processor side responds to a slave mode request for data to be transmitted to a remote master and user writes a 1 in CMD (bit 8) of IC_DATA_CMD register. Role of DW_apb_i2c: Slave-Transmitter
14	0h RO/V	**ABRT_SLV_ARBLOST:** This field indicates that a Slave has lost the bus while transmitting data to a remote master. IC_TX_ABRT_SOURCE[12] is set at the same time. Note: Even though the slave never 'owns' the bus, something could go wrong on the bus. This is a fail safe check. For instance, during a data transmission at the low-to-high transition of SCL, if what is on the data bus is not what is supposed to be transmitted, then DW_apb_i2c no longer own the bus. Role of DW_apb_i2c: Slave-Transmitter
13	0h RO/V	**ABRT_SLVFLUSH_TXFIFO:** This field specifies that the Slave has received a read command and some data exists in the TX FIFO, so the slave issues a TX_ABRT interrupt to flush old data in TX FIFO. Role of DW_apb_i2c: Slave-Transmitter
12	0h RO/V	**ARB_LOST:** This field specifies that the Master has lost arbitration, or if IC_TX_ABRT_SOURCE[14] is also set, then the slave transmitter has lost arbitration. Role of DW_apb_i2c: Master-Transmitter or Slave-Transmitter
11	0h RO/V	**ABRT_MASTER_DIS:** This field indicates that the User tries to initiate a Master operation with the Master mode disabled. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver

Bit Range	Default & Access	Field Name (ID): Description
10	0h RO/V	**ABRT_10B_RD_NORSTRT:** This field indicates that the restart is disabled (IC_RESTART_EN bit (IC_CON[5]) =0) and the master sends a read command in 10-bit addressing mode. Role of DW_apb_i2c: Master-Receiver
9	0h RO/V	**ABRT_SBYTE_NORSTRT:** To clear Bit 9, the source of the ABRT_SBYTE_NORSTRT must be fixed first; restart must be enabled (IC_CON[5]=1), the SPECIAL bit must be cleared (IC_TAR[11]), or the GC_OR_START bit must be cleared (IC_TAR[10]). Once the source of the ABRT_SBYTE_NORSTRT is fixed, then this bit can be cleared in the same manner as other bits in this register. If the source of the ABRT_SBYTE_NORSTRT is not fixed before attempting to clear this bit, bit 9 clears for one cycle and then gets reasserted. When this field is set to 1, the restart is disabled (IC_RESTART_EN bit (IC_CON[5]) =0) and the user is trying to send a START Byte. Role of DW_apb_i2c: Master
8	0h RO/V	**ABRT_HS_NORSTRT:** This field indicates that the restart is disabled (IC_RESTART_EN bit (IC_CON[5]) =0) and the user is trying to use the master to transfer data in High Speed mode. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver
7	0h RO/V	**ABRT_SBYTE_ACKDET:** This field indicates that the Master has sent a START Byte and the START Byte was acknowledged (wrong behavior). Role of DW_apb_i2c: Master
6	0h RO/V	**ABRT_HS_ACKDET:** This field indicates that the Master is in High Speed mode and the High Speed Master code was acknowledged (wrong behavior). Role of DW_apb_i2c: Master
5	0h RO/V	**ABRT_GCALL_READ:** This field indicates that DW_apb_i2c in the master mode has sent a General Call but the user programmed the byte following the General Call to be a read from the bus (IC_DATA_CMD[9] is set to 1). Role of DW_apb_i2c: Master-Transmitter
4	0h RO/V	**ABRT_GCALL_NOACK:** This field indicates that DW_apb_i2c in master mode has sent a General Call and no slave on the bus acknowledged the General Call. Role of DW_apb_i2c: Master-Transmitter
3	0h RO/V	**ABRT_TXDATA_NOACK:** This field indicates the master-mode only bit. When the master receives an acknowledgement for the address, but when it sends data byte(s) following the address, it did not receive an acknowledge from the remote slave(s). Role of DW_apb_i2c: Master-Transmitter
2	0h RO/V	**ABRT_10ADDR2_NOACK:** This field indicates that the Master is in 10-bit address mode and that the second address byte of the 10-bit address was not acknowledged by any slave. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver
1	0h RO/V	**ABRT_10ADDR1_NOACK:** This field indicates that the Master is in 10-bit address mode and the first 10-bit address byte was not acknowledged by any slave. Reset value: 0x0 Role of DW_apb_i2c: Master-Transmitter or Master-Receiver
0	0h RO/V	**ABRT_7B_ADDR_NOACK:** This field indicates that the Master is in 7-bit addressing mode and the address sent was not acknowledged by any slave. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver

14.1.2.34 IC_DMA_CR — Offset 40102088h

DMA Control Register - DMA Control Register This register is only valid when DW_apb_i2c is configured with a set of DMA Controller interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist and writing to the register's address has no effect and reading from this register

address will return zero. The register is used to enable the DMA Controller interface operation. There is a separate bit for transmit and receive. This can be programmed regardless of the state of IC_ENABLE.

Type	Size	Offset	Default
MMIO	32 bit	40102088h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1	0h RW	**TDMAE:** Transmit DMA Enable. This bit enables/disables the transmit FIFO DMA channel.
0	0h RW	**RDMAE:** Receive DMA Enable. This bit enables/disables the receive FIFO DMA channel.

14.1.2.35 IC_DMA_TDLR — Offset 4010208Ch

DMA Transmit Data Level Register - DMA Transmit Data Level Register This register is only valid when the DW_apb_i2c is configured with a set of DMA interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist; writing to its address has no effect; reading from its address returns zero.

Type	Size	Offset	Default
MMIO	32 bit	4010208Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:0	00h RW	**DMATDL:** Transmit Data Level. This bit field controls the level at which a DMA request is made by the transmit logic. It is equal to the watermark level; that is, the dma_tx_req signal is generated when the number of valid data entries in the transmit FIFO is equal to or below this field value, and TDMAE = 1.

14.1.2.36 IC_DMA_RDLR — Offset 40102090h

DMA Transmit Data Level Register - I2C Receive Data Level Register This register is only valid when DW_apb_i2c is configured with a set of DMA interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist; writing to its address has no effect; reading from its address returns zero.

Type	Size	Offset	Default
MMIO	32 bit	40102090h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:0	00h RW	**DMARDL:** Receive Data Level. This bit field controls the level at which a DMA request is made by the receive logic. The watermark level = DMARDL+1; that is, dma_rx_req is generated when the number of valid data entries in the receive FIFO is equal to or more than this field value + 1, and RDMAE =1. For instance, when DMARDL is 0, then dma_rx_req is asserted when 1 or more data entries are present in the receive FIFO.

14.1.2.37 IC_SDA_SETUP — Offset 40102094h

I2C SDA Setup Register - I2C SDA Setup Register This register controls the amount of time delay (in terms of number of ic_clk clock periods) introduced in the rising edge of SCL - relative to SDA changing - when DW_apb_i2c services a read request in a slave-transmitter operation. The relevant I2C requirement is tSU:DAT as detailed in the I2C Bus Specification. This register must be programmed with a value equal to or greater than 2. Writes to this register succeed only when IC_ENABLE[0] = 0. Note: The length of setup time is calculated using [(IC_SDA_SETUP - 1) * (ic_clk_period)], so if the user requires 10 ic_clk periods of setup time, they should program a value of 11. The IC_SDA_SETUP register is only used by the DW_apb_i2c when operating as a slave transmitter.

Type	Size	Offset	Default
MMIO	32 bit	40102094h	00000002h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	02h RW	**SDA_SETUP:** SDA Setup. It is recommended that if the required delay is 1000ns, then for an ic_clk frequency of 10 MHz, IC_SDA_SETUP should be programmed to a value of 11. IC_SDA_SETUP must be programmed with a minimum value of 2.

14.1.2.38 IC_ACK_GENERAL_CALL — Offset 40102098h

I2C ACK General Call Register - I2C ACK General Call Register The register controls whether DW_apb_i2c responds with a ACK or NACK when it receives an I2C General Call address. This register is applicable only when the DW_apb_i2c is in slave mode.

Type	Size	Offset	Default
MMIO	32 bit	40102098h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**ACK_GEN_CALL:** ACK General Call. When set to 1, DW_apb_i2c responds with a ACK (by asserting ic_data_oe) when it receives a General Call. Otherwise, DW_apb_i2c responds with a NACK (by negating ic_data_oe).

14.1.2.39 IC_ENABLE_STATUS — Offset 4010209Ch

I2C Enable Status Register - I2C Enable Status Register The register is used to report the DW_apb_i2c hardware status when the IC_ENABLE[0] register is set from 1 to 0; that is, when DW_apb_i2c is disabled. If IC_ENABLE[0] has been set to 1, bits 2:1 are forced to 0, and bit 0 is forced to 1. If IC_ENABLE[0] has been set to 0, bits 2:1 is only be valid as soon as bit 0 is read as '0'. Note: When IC_ENABLE[0] has been set to 0, a delay occurs for bit 0 to be read as 0 because disabling the DW_apb_i2c depends on I2C bus activities.

Type	Size	Offset	Default
MMIO	32 bit	4010209Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2	0h RO/V	**SLV_RX_DATA_LOST:** Slave Received Data Lost. This bit indicates if a Slave-Receiver operation has been aborted with at least one data byte received from an I2C transfer due to the setting bit 0 of IC_ENABLE from 1 to 0. When read as 1, DW_apb_i2c is deemed to have been actively engaged in an aborted I2C transfer (with matching address) and the data phase of the I2C transfer has been entered, even though a data byte has been responded with a NACK. Note: If the remote I2C master terminates the transfer with a STOP condition before the DW_apb_i2c has a chance to NACK a transfer, and IC_ENABLE[0] has been set to 0, then this bit is also set to 1. When read as 0, DW_apb_i2c is deemed to have been disabled without being actively involved in the data phase of a Slave-Receiver transfer. Note: The CPU can safely read this bit when IC_EN (bit 0) is read as 0.
1	0h RO/V	**SLV_DISABLED_WHILE_BUSY:** Slave Disabled While Busy (Transmit, Receive). This bit indicates if a potential or active Slave operation has been aborted due to the setting bit 0 of the IC_ENABLE register from 1 to 0. This bit is set when the CPU writes a 0 to the IC_ENABLE register while: (a) DW_apb_i2c is receiving the address byte of the Slave-Transmitter operation from a remote master; OR, (b) address and data bytes of the Slave-Receiver operation from a remote master. When read as 1, DW_apb_i2c is deemed to have forced a NACK during any part of an I2C transfer, irrespective of whether the I2C address matches the slave address set in DW_apb_i2c (IC_SAR register) OR if the transfer is completed before IC_ENABLE is set to 0 but has not taken effect. Note: If the remote I2C master terminates the transfer with a STOP condition before the DW_apb_i2c has a chance to NACK a transfer, and IC_ENABLE[0] has been set to 0, then this bit will also be set to 1. When read as 0, DW_apb_i2c is deemed to have been disabled when there is master activity, or when the I2C bus is idle. Note: The CPU can safely read this bit when IC_EN (bit 0) is read as 0.
0	0h RO/V	**IC_EN:** ic_en Status. This bit always reflects the value driven on the output port ic_en. - When read as 1, DW_apb_i2c is deemed to be in an enabled state. - When read as 0, DW_apb_i2c is deemed completely inactive. Note: The CPU can safely read this bit anytime. When this bit is read as 0, the CPU can safely read SLV_RX_DATA_LOST (bit 2) and SLV_DISABLED_WHILE_BUSY (bit 1).

14.1.2.40 IC_FS_SPKLEN — Offset 401020A0h

I2C SS, FS or FM+ spike suppression limit - I2C SS, FS or FM+ spike suppression limit This register is used to store the duration, measured in ic_clk cycles, of the longest spike that is filtered out by the spike suppression logic w hen the component is operating in SS, FS or FM+ modes. This register must be programmed with a minimum value of 1.

Type	Size	Offset	Default
MMIO	32 bit	401020A0h	00000005h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	05h RW	**IC_FS_SPKLEN:** This register must be set before any I2C bus transaction can take place to ensure stable operation. This register sets the duration, measured in ic_clk cycles, of the longest spike in the SCL or SDA lines that will be filtered out by the spike suppression logic. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. The minimum valid value is 1; hardware prevents values less than this being written, and if attempted results in 1 being set.

14.1.2.41 IC_HS_SPKLEN — Offset 401020A4h

I2C HS spike suppression limit register - I2C HS spike suppression limit register This register is used to store the duration, measured in ic_clk cycles, of the longest spike that is filtered out by the spike suppression logic when the component is operating in HS modes. This register must be programmed with a minimum value of 1 and is implemented only if the component is configured to support HS mode; that is, if the IC_MAX_SPEED_MODE parameter is set to 3.

Type	Size	Offset	Default
MMIO	32 bit	401020A4h	00000002h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	02h RW	**IC_HS_SPKLEN:** This register must be set before any I2C bus transaction can take place to ensure stable operation. This register sets the duration, measured in ic_clk cycles, of the longest spike in the SCL or SDA lines that will be filtered out by the spike suppression logic. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. The minimum valid value is 1; hardware prevents values less than this being written, and if attempted results in 1 being set.

14.1.2.42 IC_CLR_RESTART_DET — Offset 401020A8h

Clear RESTART_DET Interrupt Register - Clear RESTART_DET Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	401020A8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RESTART_DET:** Read this register to clear the RESTART_DET interrupt (bit 12) of IC_RAW_INTR_STAT register.

14.1.2.43 IC_COMP_PARAM_1 — Offset 401020F4h

Component Parameter Register 1 - Component Parameter Register 1 Note This is a constant read-only register that contains encoded information about the component's parameter settings. The reset value depends on coreConsultant parameter(s).

Type	Size	Offset	Default
MMIO	32 bit	401020F4h	003F3FEEh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:16	3Fh RO/V	**TX_BUFFER_DEPTH:** The value of this register is derived from the IC_TX_BUFFER_DEPTH coreConsultant parameter. - 0x00 = Reserved - 0x01 = 2 - 0x02 = 3 - ... - 0xFF = 256
15:8	3Fh RO/V	**RX_BUFFER_DEPTH:** The value of this register is derived from the IC_RX_BUFFER_DEPTH coreConsultant parameter. - 0x00: Reserved - 0x01: 2 - 0x02: 3 - ... - 0xFF: 256
7	1h RO/V	**ADD_ENCODED_PARAMS:** The value of this register is derived from the IC_ADD_ENCODED_PARAMS coreConsultant parameter. Reading 1 in this bit means that the capability of reading these encoded parameters via software has been included. Otherwise, the entire register is 0 regardless of the setting of any other parameters that are encoded in the bits.

Bit Range	Default & Access	Field Name (ID): Description
6	1h RO/V	**HAS_DMA:** The value of this register is derived from the IC_HAS_DMA coreConsultant parameter.
5	1h RO/V	**INTR_IO:** The value of this register is derived from the IC_INTR_IO coreConsultant parameter.
4	0h RO/V	**HC_COUNT_VALUES:** The value of this register is derived from the IC_HC_COUNT VALUES coreConsultant parameter.
3:2	3h RO/V	**MAX_SPEED_MODE:** The value of this register is derived from the IC_MAX_SPEED_MODE coreConsultant parameter. - 0x0: Reserved - 0x1: Standard - 0x2: Fast - 0x3: High
1:0	2h RO/V	**APB_DATA_WIDTH:** The value of this register is derived from the APB_DATA_WIDTH coreConsultant parameter.

14.1.2.44 IC_COMP_VERSION — Offset 401020F8h

I2C Component Version Register - I2C Component Version Register

Type	Size	Offset	Default
MMIO	32 bit	401020F8h	3230322Ah

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	3230322Ah RO/V	**IC_COMP_VERSION:**

14.1.2.45 IC_COMP_TYPE — Offset 401020FCh

I2C Component Type Register - I2C Component Type Register

Type	Size	Offset	Default
MMIO	32 bit	401020FCh	44570140h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	44570140h RO/V	**IC_COMP_TYPE:** Designware Component Type number = 0x44_57_01_40. This assigned unique hex value is constant and is derived from the two ASCII letters 'DW' followed by a 16-bit unsigned number.

14.1.3 I2C_2 Registers Summary

Table 14-3. Summary of I2C_2 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
40104000h	4	IC_CON	00000067h

14.1.3.1 IC_CON — Offset 40104000h

I2C Control Register - I2C Control Register. This register can be written only when the DW_apb_i2c is disabled, which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. Read/Write Access: - If configuration parameter I2C_DYNAMIC_TAR_UPDATE=1, bit 4 is read only. - If configuration parameter IC_RX_FULL_HLD_BUS_EN =0, bit 9 is read only. - If configuration parameter IC_STOP_DET_IF_MASTER_ACTIVE =0, bit 10 is read only. - If configuration parameter IC_BUS_CLEAR_FEATURE=0, bit 11 is read only - If configuration parameter IC_OPTIONAL_SAR=0, bit 16 is read only - If configuration parameter IC_SMBUS=0, bit 17 is read only - If configuration parameter IC_SMBUS_ARP=0, bits 18 and 19 are read only.

Type	Size	Offset	Default
MMIO	32 bit	40104000h	00000067h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved**
10	0h RW	**STOP_DET_IF_MASTER_ACTIVE:** In Master mode: - 1'b1: issues the STOP_DET interrupt only when master is active. - 1'b0: issues the STOP_DET irrespective of whether master is active or not.
9	0h RW	**RX_FIFO_FULL_HLD_CTRL:** This bit controls whether DW_apb_i2c should hold the bus when the Rx FIFO is physically full to its RX_BUFFER_DEPTH, as described in the IC_RX_FULL_HLD_BUS_EN parameter.
8	0h RW	**TX_EMPTY_CTRL:** This bit controls the generation of the TX_EMPTY interrupt, as described in the IC_RAW_INTR_STAT register.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**STOP_DET_IFADDRESSED:** In slave mode: - 1'b1: issues the STOP_DET interrrupt only when it is addressed. - 0'b0: issues the STOP_DET irrespective of whether it's addressed or not. NOTE: During a general call address, this slave does not issue the STOP_DET interrupt if STOP_DET_IF_ADDRESSED = 1'b1, even if the slave responds to the general call address by generating ACK. The STOP_DET interrupt is generated only when the transmitted address matches the slave address (SAR).
6	1h RW	**IC_SLAVE_DISABLE:** This bit controls whether I2C has its slave disabled, which means once the presetn signal is applied, then this bit takes on the value of the configuration parameter IC_SLAVE_DISABLE. You have the choice of having the slave enabled or disabled after reset is applied, which means software does not have to configure the slave. By default, the slave is always enabled (in reset state as well). If you need to disable it after reset, set this bit to 1. If this bit is set (slave is disabled), DW_apb_i2c functions only as a master and does not perform any action that requires a slave. NOTE: Software should ensure that if this bit is written with 0, then bit 0 should also be written with a 0.
5	1h RW	**IC_RESTART_EN:** Determines whether RESTART conditions may be sent when acting as a master. Some older slaves do not support handling RESTART conditions; however, RESTART conditions are used in several DW_apb_i2c operations. When RESTART is disabled, the master is prohibited from performing the following functions: - Sending a START BYTE - Performing any high-speed mode operation - High-speed mode operation - Performing direction changes in combined format mode - Performing a read operation with a 10-bit address By replacing RESTART condition followed by a STOP and a subsequent START condition, split operations are broken down into multiple DW_apb_i2c transfers. If the above operations are performed, it will result in setting bit 6 (TX_ABRT) of the IC_RAW_INTR_STAT register. .
4	0h RO/V	**IC_10BITADDR_MASTER_RD_ONLY:** If the I2C_DYNAMIC_TAR_UPDATE configuration parameter is set to 'No' (0), this bit is named IC_10BITADDR_MASTER and controls whether the DW_apb_i2c starts its transfers in 7 or 10-bit addressing mode when acting as a master. If I2C_DYNAMIC_TAR_UPDATE is set to 'Yes' (1), the function of this bit is handled by bit 12 of IC_TAR register, and becomes a read-only copy called IC_10BITADDR_MASTER_rd_only. - 0: 7-bit addressing - 1: 10-bit addressing
3	0h RW	**IC_10BITADDR_SLAVE:** When acting as a slave, this bit controls whether the DW_apb_i2c responds to 7- or 10-bit addresses. - 0: 7-bit addressing. The DW_apb_i2c ignores transactions that involve 10-bit addressing; for 7-bit addressing, only the lower 7 bits of the IC_SAR register are compared. - 1: 10-bit addressing. The DW_apb_i2c responds to only 10-bit addressing transfers that match the full 10 bits of the IC_SAR register.
2:1	3h RW	**SPEED:** These bits control at which speed the DW_apb_i2c operates; its setting is relevant only if one is operating the DW_apb_i2c in master mode. Hardware protects against illegal values being programmed by software. These bits must be programmed appropriately for slave mode also, as it is used to capture correct value of spike filter as per the speed mode. This register should be programmed only with a value in the range of 1 to IC_MAX_SPEED_MODE; otherwise, hardware updates this register with the value of IC_MAX_SPEED_MODE. 1: standard mode (100 kbit/s) 2: fast mode (<=400 kbit/s) or fast mode plus (<=1000Kbit/s) 3: high speed mode (3.4 Mbit/s) Note: This field is not applicable when IC_ULTRA_FAST_MODE=1
0	1h RW	**MASTER_MODE:** This bit controls whether the DW_apb_i2c master is enabled. NOTE: Software should ensure that if this bit is written with '1' then bit 6 should also be written with a '1'.

14.1.3.2 IC_TAR — Offset 40104004h

I2C Target Address Register - I2C Target Address Register If the configuration parameter I2C_DYNAMIC_TAR_UPDATE is set to 'No' (0), this register is 12 bits wide, and bits 31:12 are reserved. This register can be written to only when IC_ENABLE[0] is set to 0. However, if I2C_DYNAMIC_TAR_UPDATE = 1, then the register becomes 13

bits wide. In this case, writes to IC_TAR succeed when one of the following conditions are true: - DW_apb_i2c is NOT enabled (IC_ENABLE[0] is set to 0); or - DW_apb_i2c is enabled (IC_ENABLE[0]=1); AND DW_apb_i2c is NOT engaged in any Master (tx, rx) operation (IC_STATUS[5]=0); AND DW_apb_i2c is enabled to operate in Master mode (IC_CON[0]=1); AND there are NO entries in the TX FIFO (IC_STATUS[2]=1) You can change the TAR address dynamically without losing the bus, only if the following conditions are met. - DW_apb_i2c is enabled (IC_ENABLE[0]=1); AND IC_EMPTYFIFO_HOLD_MASTER_EN configuration parameter is set to 1; AND DW_apb_i2c is enabled to operate in Master mode (IC_CON[0]=1); AND there are NO entries in the Tx FIFO and the master is in HOLD state (IC_INTR_STAT[13]=1). Note: If the software or application is aware that the DW_apb_i2c is not using the TAR address for the pending commands in the Tx FIFO, then it is possible to update the TAR address even while the Tx FIFO has entries (IC_STATUS[2]= 0). - It is not necessary to perform any write to this register if DW_apb_i2c is enabled as an I2C slave only.

Type	Size	Offset	Default
MMIO	32 bit	40104004h	00000055h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	**Reserved**
12	0h RW	**IC_10BITADDR_MASTER:** This bit controls whether the DW_apb_i2c starts its transfers in 7- or 10-bit addressing mode when acting as a master. - 0: 7-bit addressing - 1: 10-bit addressing
11	0h RW	**SPECIAL:** This bit indicates whether software performs a Device-ID or General Call or START BYTE command. - 0: ignore bit 10 GC_OR_START and use IC_TAR normally - 1: perform special I2C command as specified in Device_ID or GC_OR_START bit
10	0h RW	**GC_OR_START:** If bit 11 (SPECIAL) is set to 1 and bit 13(Device-ID) is set to 0, then this bit indicates whether a General Call or START byte command is to be performed by the DW_apb_i2c. - 0: General Call Address - after issuing a General Call, only writes may be performed. Attempting to issue a read command results in setting bit 6 (TX_ABRT) of the IC_RAW_INTR_STAT register. The DW_apb_i2c remains in General Call mode until the SPECIAL bit value (bit 11) is cleared. - 1: START BYTE
9:0	055h RW	**IC_TAR:** This is the target address for any master transaction. When transmitting a General Call, these bits are ignored. To generate a START BYTE, the CPU needs to write only once into these bits. If the IC_TAR and IC_SAR are the same, loopback exists but the FIFOs are shared between master and slave, so full loopback is not feasible. Only one direction loopback mode is supported (simplex), not duplex. A master cannot transmit to itself; it can transmit to only a slave.

14.1.3.3 IC_SAR — Offset 40104008h

I2C Slave Address Register - I2C Slave Address Register

Type	Size	Offset	Default
MMIO	32 bit	40104008h	00000055h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:0	055h RW	**IC_SAR:** The IC_SAR holds the slave address when the I2C is operating as a slave. For 7-bit addressing, only IC_SAR[6:0] is used. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. Note: The default values cannot be any of the reserved address locations: that is, 0x00 to 0x07, or 0x78 to 0x7f. The correct operation of the device is not guaranteed if you program the IC_SAR or IC_TAR to a reserved value.

14.1.3.4 IC_HS_MADDR — Offset 4010400Ch

I2C High Speed Master Mode Code Address Register - I2C High Speed Master Mode Code Address Register

Type	Size	Offset	Default
MMIO	32 bit	4010400Ch	00000001h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2:0	1h RW	**IC_HS_MAR:** This bit field holds the value of the I2C HS mode master code. HS-mode master codes are reserved 8-bit codes (00001xxx) that are not used for slave addressing or other purposes. Each master has its unique master code; up to eight high-speed mode masters can be present on the same I2C bus system. Valid values are from 0 to 7. This register goes away and becomes read-only returning 0's if the IC_MAX_SPEED_MODE configuration parameter is set to either Standard (1) or Fast (2). This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect.

14.1.3.5 IC_DATA_CMD — Offset 40104010h

I2C Rx/Tx Data Buffer and Command Register - I2C Rx/Tx Data Buffer and Command Register; this is the register the CPU writes to when filling the TX FIFO and the CPU reads from when retrieving bytes from RX FIFO. The size of the register changes as follows: Write: - 11 bits when IC_EMPTYFIFO_HOLD_MASTER_EN=1 - 9 bits when IC_EMPTYFIFO_HOLD_MASTER_EN=0 Read: - 12 bits when IC_FIRST_DATA_BYTE_STATUS = 1 - 8 bits when IC_FIRST_DATA_BYTE_STATUS = 0 Note: In order for the DW_apb_i2c to continue acknowledging reads, a read command should be written for every byte that is to be received; otherwise the DW_apb_i2c will stop acknowledging.

Type	Size	Offset	Default
MMIO	32 bit	40104010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RO/V	**FIRST_DATA_BYTE:** Indicates the first data byte received after the address phase for receive transfer in Master receiver or Slave receiver mode. NOTE: In case of APB_DATA_WIDTH=8, 1. The user has to perform two APB Reads to IC_DATA_CMD in order to get status on 11 bit. 2. Inorder to read the 11 bit, the user has to perform the first data byte read [7:0] (offset 0x10) and then perform the second read[15:8](offset 0x11) in order to know the status of 11 bit (whether the data received in previous read is a first data byte or not). 3. The 11th bit is an optional read field, user can ignore 2nd byte read [15:8] (offset 0x11) if not interested in FIRST_DATA_BYTE status.
10	0h WO	**RESTART:** This bit controls whether a RESTART is issued before the byte is sent or received. This bit is available only if IC_EMPTYFIFO_HOLD_MASTER_EN is configured to 1. 1 - If IC_RESTART_EN is 1, a RESTART is issued before the data is sent/received (according to the value of CMD), regardless of whether or not the transfer direction is changing from the previous command; if IC_RESTART_EN is 0, a STOP followed by a START is issued instead. 0 - If IC_RESTART_EN is 1, a RESTART is issued only if the transfer direction is changing from the previous command; if IC_RESTART_EN is 0, a STOP followed by a START is issued instead.

Bit Range	Default & Access	Field Name (ID): Description
9	0h WO	**STOP:** This bit controls whether a STOP is issued after the byte is sent or received. This bit is available only if IC_EMPTYFIFO_HOLD_MASTER_EN is configured to 1. - 1 - STOP is issued after this byte, regardless of whether or not the Tx FIFO is empty. If the Tx FIFO is not empty, the master immediately tries to start a new transfer by issuing a START and arbitrating for the bus. - 0 - STOP is not issued after this byte, regardless of whether or not the Tx FIFO is empty. If the Tx FIFO is not empty, the master continues the current transfer by sending/receiving data bytes according to the value of the CMD bit. If the Tx FIFO is empty, the master holds the SCL line low and stalls the bus until a new command is available in the Tx FIFO.
8	0h WO	**CMD:** This bit controls whether a read or a write is performed. This bit does not control the direction when the DW_apb_i2c acts as a slave. It controls only the direction when it acts as a master. When a command is entered in the TX FIFO, this bit distinguishes the write and read commands. In slave-receiver mode, this bit is a "don't care" because writes to this register are not required. In slave-transmitter mode, a "0" indicates that the data in IC_DATA_CMD is to be transmitted. When programming this bit, you should remember the following: attempting to perform a read operation after a General Call command has been sent results in a TX_ABRT interrupt (bit 6 of the IC_RAW_INTR_STAT register), unless bit 11 (SPECIAL) in the IC_TAR register has been cleared. If a "1" is written to this bit after receiving a RD_REQ interrupt, then a TX_ABRT interrupt occurs.
7:0	00h RW/V	**DAT:** This register contains the data to be transmitted or received on the I2C bus. If you are writing to this register and want to perform a read, bits 7:0 (DAT) are ignored by the DW_apb_i2c. However, when you read this register, these bits return the value of data received on the DW_apb_i2c interface.

14.1.3.6 IC_SS_SCL_HCNT — Offset 40104014h

Standard Speed I2C Clock SCL High Count Register - Standard Speed I2C Clock SCL High Count Register

Type	Size	Offset	Default
MMIO	32 bit	40104014h	000001E8h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	01E8h RW	**IC_SS_SCL_HCNT:** This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock high-period count for standard speed. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. The minimum valid value is 6; hardware prevents values less than this being written, and if attempted results in 6 being set. For designs with APB_DATA_WIDTH = 8, the order of programming is important to ensure the correct operation of the DW_apb_i2c. The lower byte must be programmed first. Then the upper byte is programmed. When the configuration parameter IC_HC_COUNT_VALUES is set to 1, this register is read only. NOTE: This register must not be programmed to a value higher than 65525, because DW_apb_i2c uses a 16-bit counter to flag an I2C bus idle condition when this counter reaches a value of IC_SS_SCL_HCNT + 10.

14.1.3.7 IC_SS_SCL_LCNT — Offset 40104018h

Standard Speed I2C Clock SCL Low Count Register - Standard Speed I2C Clock SCL Low Count Register

11	0h RO/V	**R_GEN_CALL:** See IC_RAW_INTR_STAT for a detailed description of R_GEN_CALL bit.

Bit Range	Default & Access	Field Name (ID): Description
10	0h RO/V	**R_START_DET:** See IC_RAW_INTR_STAT for a detailed description of R_START_DET bit.
9	0h RO/V	**R_STOP_DET:** See IC_RAW_INTR_STAT for a detailed description of R_STOP_DET bit.
8	0h RO/V	**R_ACTIVITY:** See IC_RAW_INTR_STAT for a detailed description of R_ACTIVITY bit.
7	0h RO/V	**R_RX_DONE:** See IC_RAW_INTR_STAT for a detailed description of R_RX_DONE bit.
6	0h RO/V	**R_TX_ABRT:** See IC_RAW_INTR_STAT for a detailed description of R_TX_ABRT bit.
5	0h RO/V	**R_RD_REQ:** See IC_RAW_INTR_STAT for a detailed description of R_RD_REQ bit.
4	0h RO/V	**R_TX_EMPTY:** See IC_RAW_INTR_STAT for a detailed description of R_TX_EMPTY bit.
3	0h RO/V	**R_TX_OVER:** See IC_RAW_INTR_STAT for a detailed description of R_TX_OVER bit.
2	0h RO/V	**R_RX_FULL:** See IC_RAW_INTR_STAT for a detailed description of R_RX_FULL bit.
1	0h RO/V	**R_RX_OVER:** See IC_RAW_INTR_STAT for a detailed description of R_RX_OVER bit.
0	0h RO/V	**R_RX_UNDER:** See IC_RAW_INTR_STAT for a detailed description of R_RX_UNDER bit.

14.1.3.13 IC_INTR_MASK — Offset 40104030h

I2C Interrupt Mask Register - I2C Interrupt Mask Register. These bits mask their corresponding interrupt status bits. This register is active low; a value of 0 masks the interrupt, whereas a value of 1 unmasks the interrupt.

Type	Size	Offset	Default
MMIO	32 bit	40104030h	000008FFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13	0h RW	**M_MASTER_ON_HOLD:** This bit masks the R_MASTER_ON_HOLD interrupt in IC_INTR_STAT register.
12	0h RW	**M_RESTART_DET:** This bit masks the R_RESTART_DET interrupt in IC_INTR_STAT register.

Bit Range	Default & Access	Field Name (ID): Description
11	1h RW	**M_GEN_CALL:** This bit masks the R_GEN_CALL interrupt in IC_INTR_STAT register.
10	0h RW	**M_START_DET:** This bit masks the R_START_DET interrupt in IC_INTR_STAT register.
9	0h RW	**M_STOP_DET:** This bit masks the R_STOP_DET interrupt in IC_INTR_STAT register.
8	0h RW	**M_ACTIVITY:** This bit masks the R_ACTIVITY interrupt in IC_INTR_STAT register.
7	1h RW	**M_RX_DONE:** This bit masks the R_RX_DONE interrupt in IC_INTR_STAT register.
6	1h RW	**M_TX_ABRT:** This bit masks the R_TX_ABRT interrupt in IC_INTR_STAT register.
5	1h RW	**M_RD_REQ:** This bit masks the R_RD_REQ interrupt in IC_INTR_STAT register.
4	1h RW	**M_TX_EMPTY:** This bit masks the R_TX_EMPTY interrupt in IC_INTR_STAT register.
3	1h RW	**M_TX_OVER:** This bit masks the R_TX_OVER interrupt in IC_INTR_STAT register.
2	1h RW	**M_RX_FULL:** This bit masks the R_RX_FULL interrupt in IC_INTR_STAT register.
1	1h RW	**M_RX_OVER:** This bit masks the R_RX_OVER interrupt in IC_INTR_STAT register.
0	1h RW	**M_RX_UNDER:** This bit masks the R_RX_UNDER interrupt in IC_INTR_STAT register.

14.1.3.14 IC_RAW_INTR_STAT — Offset 40104034h

I2C Raw Interrupt Status Register - I2C Raw Interrupt Status Register Unlike the IC_INTR_STAT register, these bits are not masked so they always show the true status of the DW_apb_i2c.

Type	Size	Offset	Default
MMIO	32 bit	40104034h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13	0h RO/V	**MASTER_ON_HOLD:** Indicates whether master is holding the bus and TX FIFO is empty. Enabled only when I2C_DYNAMIC_TAR_UPDATE=1 and IC_EMPTYFIFO_HOLD_MASTER_EN=1.
12	0h RO/V	**RESTART_DET:** Indicates whether a RESTART condition has occurred on the I2C interface when DW_apb_i2c is operating in Slave mode and the slave is being addressed. Enabled only when IC_SLV_RESTART_DET_EN=1. Note: However, in high-speed mode or during a START BYTE transfer, the RESTART comes before the address field as per the I2C protocol. In this case, the slave is not the addressed slave when the RESTART is issued, therefore DW_apb_i2c does not generate the RESTART_DET interrupt.
11	0h RO/V	**GEN_CALL:** Set only when a General Call address is received and it is acknowledged. It stays set until it is cleared either by disabling DW_apb_i2c or when the CPU reads bit 0 of the IC_CLR_GEN_CALL register. DW_apb_i2c stores the received data in the Rx buffer.
10	0h RO/V	**START_DET:** Indicates whether a START or RESTART condition has occurred on the I2C interface regardless of whether DW_apb_i2c is operating in slave or master mode.
9	0h RO/V	**STOP_DET:** Indicates whether a STOP condition has occurred on the I2C interface regardless of whether DW_apb_i2c is operating in slave or master mode. In Slave Mode: - If IC_CON[7]=1'b1 (STOP_DET_IFADDRESSED), the STOP_DET interrupt will be issued only if slave is addressed. Note: During a general call address, this slave does not issue a STOP_DET interrupt if STOP_DET_IF_ADDRESSED=1'b1, even if the slave responds to the general call address by generating ACK. The STOP_DET interrupt is generated only when the transmitted address matches the slave address (SAR). - If IC_CON[7]=1'b0 (STOP_DET_IFADDRESSED), the STOP_DET interrupt is issued irrespective of whether it is being addressed. In Master Mode: - If IC_CON[10]=1'b1 (STOP_DET_IF_MASTER_ACTIVE),the STOP_DET interrupt will be issued only if Master is active. - If IC_CON[10]=1'b0 (STOP_DET_IFADDRESSED),the STOP_DET interrupt will be issued irrespective of whether master is active or not.
8	0h RO/V	**ACTIVITY:** This bit captures DW_apb_i2c activity and stays set until it is cleared. There are four ways to clear it: - Disabling the DW_apb_i2c - Reading the IC_CLR_ACTIVITY register - Reading the IC_CLR_INTR register - System reset Once this bit is set, it stays set unless one of the four methods is used to clear it. Even if the DW_apb_i2c module is idle, this bit remains set until cleared, indicating that there was activity on the bus.
7	0h RO/V	**RX_DONE:** When the DW_apb_i2c is acting as a slave-transmitter, this bit is set to 1 if the master does not acknowledge a transmitted byte. This occurs on the last byte of the transmission, indicating that the transmission is done.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RO/V	**TX_ABRT:** This bit indicates if DW_apb_i2c, as an I2C transmitter, is unable to complete the intended actions on the contents of the transmit FIFO. This situation can occur both as an I2C master or an I2C slave, and is referred to as a 'transmit abort'. When this bit is set to 1, the IC_TX_ABRT_SOURCE register indicates the reason why the transmit abort takes places. Note: The DW_apb_i2c flushes/resets/empties only the TX_FIFO whenever there is a transmit abort caused by any of the events tracked by the IC_TX_ABRT_SOURCE register. The Tx FIFO remains in this flushed state until the register IC_CLR_TX_ABRT is read. Once this read is performed, the Tx FIFO is then ready to accept more data bytes from the APB interface. RX FIFO flush because of TX_ABRT is controlled by the coreConsultant parameter IC_AVOID_RX_FIFO_FLUSH_ON_TX_ABRT.
5	0h RO/V	**RD_REQ:** This bit is set to 1 when DW_apb_i2c is acting as a slave and another I2C master is attempting to read data from DW_apb_i2c. The DW_apb_i2c holds the I2C bus in a wait state (SCL=0) until this interrupt is serviced, which means that the slave has been addressed by a remote master that is asking for data to be transferred. The processor must respond to this interrupt and then write the requested data to the IC_DATA_CMD register. This bit is set to 0 just after the processor reads the IC_CLR_RD_REQ register.
4	0h RO/V	**TX_EMPTY:** The behavior of the TX_EMPTY interrupt status differs based on the TX_EMPTY_CTRL selection in the IC_CON register. - When TX_EMPTY_CTRL = 0: This bit is set to 1 when the transmit buffer is at or below the threshold value set in the IC_TX_TL register. - When TX_EMPTY_CTRL = 1: This bit is set to 1 when the transmit buffer is at or below the threshold value set in the IC_TX_TL register and the transmission of the address/data from the internal shift register for the most recently popped command is completed. It is automatically cleared by hardware when the buffer level goes above the threshold. When IC_ENABLE[0] is set to 0, the TX FIFO is flushed and held in reset. There the TX FIFO looks like it has no data within it, so this bit is set to 1, provided there is activity in the master or slave state machines. When there is no longer any activity, then with ic_en=0, this bit is set to 0.
3	0h RO/V	**TX_OVER:** Set during transmit if the transmit buffer is filled to IC_TX_BUFFER_DEPTH and the processor attempts to issue another I2C command by writing to the IC_DATA_CMD register. When the module is disabled, this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared.
2	0h RO/V	**RX_FULL:** Set when the receive buffer reaches or goes above the RX_TL threshold in the IC_RX_TL register. It is automatically cleared by hardware when buffer level goes below the threshold. If the module is disabled (IC_ENABLE[0]=0), the RX FIFO is flushed and held in reset; therefore the RX FIFO is not full. So this bit is cleared once the IC_ENABLE bit 0 is programmed with a 0, regardless of the activity that continues.
1	0h RO/V	**RX_OVER:** Set if the receive buffer is completely filled to IC_RX_BUFFER_DEPTH and an additional byte is received from an external I2C device. The DW_apb_i2c acknowledges this, but any data bytes received after the FIFO is full are lost. If the module is disabled (IC_ENABLE[0]=0), this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared. Note: If the configuration parameter IC_RX_FULL_HLD_BUS_EN is enabled and bit 9 of the IC_CON register (RX_FIFO_FULL_HLD_CTRL) is programmed to HIGH, then the RX_OVER interrupt never occurs, because the Rx FIFO never overflows.
0	0h RO/V	**RX_UNDER:** Set if the processor attempts to read the receive buffer when it is empty by reading from the IC_DATA_CMD register. If the module is disabled (IC_ENABLE[0]=0), this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared.

14.1.3.15 IC_RX_TL — Offset 40104038h

I2C Receive FIFO Threshold Register - I2C Receive FIFO Threshold Register

Type	Size	Offset	Default
MMIO	32 bit	40104038h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**RX_TL:** Receive FIFO Threshold Level. Controls the level of entries (or above) that triggers the RX_FULL interrupt (bit 2 in IC_RAW_INTR_STAT register). The valid range is 0-255, with the additional restriction that hardware does not allow this value to be set to a value larger than the depth of the buffer. If an attempt is made to do that, the actual value set will be the maximum depth of the buffer. A value of 0 sets the threshold for 1 entry, and a value of 255 sets the threshold for 256 entries.

14.1.3.16 IC_TX_TL — Offset 4010403Ch

I2C Transmit FIFO Threshold Register - I2C Transmit FIFO Threshold Register

Type	Size	Offset	Default
MMIO	32 bit	4010403Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**TX_TL:** Transmit FIFO Threshold Level. Controls the level of entries (or below) that trigger the TX_EMPTY interrupt (bit 4 in IC_RAW_INTR_STAT register). The valid range is 0-255, with the additional restriction that it may not be set to value larger than the depth of the buffer. If an attempt is made to do that, the actual value set will be the maximum depth of the buffer. A value of 0 sets the threshold for 0 entries, and a value of 255 sets the threshold for 255 entries.

14.1.3.17 IC_CLR_INTR — Offset 40104040h

Clear Combined and Individual Interrupt Register - Clear Combined and Individual Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40104040h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_INTR:** Read this register to clear the combined interrupt, all individual interrupts, and the IC_TX_ABRT_SOURCE register. This bit does not clear hardware clearable interrupts but software clearable interrupts. Refer to Bit 9 of the IC_TX_ABRT_SOURCE register for an exception to clearing IC_TX_ABRT_SOURCE.

14.1.3.18 IC_CLR_RX_UNDER — Offset 40104044h

Clear RX_UNDER Interrupt Register - Clear RX_UNDER Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40104044h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RX_UNDER:** Read this register to clear the RX_UNDER interrupt (bit 0) of the IC_RAW_INTR_STAT register.

14.1.3.19 IC_CLR_RX_OVER — Offset 40104048h

Clear RX_OVER Interrupt Register - Clear RX_OVER Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40104048h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RX_OVER:** Read this register to clear the RX_OVER interrupt (bit 1) of the IC_RAW_INTR_STAT register.

14.1.3.20 IC_CLR_TX_OVER — Offset 4010404Ch

Clear TX_OVER Interrupt Register - Clear TX_OVER Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010404Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_TX_OVER:** Read this register to clear the TX_OVER interrupt (bit 3) of the IC_RAW_INTR_STAT register.

14.1.3.21 IC_CLR_RD_REQ — Offset 40104050h

Clear RD_REQ Interrupt Register - Clear RD_REQ Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40104050h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RD_REQ:** Read this register to clear the RD_REQ interrupt (bit 5) of the IC_RAW_INTR_STAT register.

14.1.3.22 IC_CLR_TX_ABRT — Offset 40104054h

Clear TX_ABRT Interrupt Register - Clear TX_ABRT Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40104054h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_TX_ABRT:** Read this register to clear the TX_ABRT interrupt (bit 6) of the IC_RAW_INTR_STAT register, and the IC_TX_ABRT_SOURCE register. This also releases the TX FIFO from the flushed/reset state, allowing more writes to the TX FIFO. Refer to Bit 9 of the IC_TX_ABRT_SOURCE register for an exception to clearing IC_TX_ABRT_SOURCE.

14.1.3.23 IC_CLR_RX_DONE — Offset 40104058h

Clear RX_DONE Interrupt Register - Clear RX_DONE Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40104058h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RX_DONE:** Read this register to clear the RX_DONE interrupt (bit 7) of the IC_RAW_INTR_STAT register.

14.1.3.24 IC_CLR_ACTIVITY — Offset 4010405Ch

Clear ACTIVITY Interrupt Register - Clear ACTIVITY Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010405Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_ACTIVITY:** Reading this register clears the ACTIVITY interrupt if the I2C is not active anymore. If the I2C module is still active on the bus, the ACTIVITY interrupt bit continues to be set. It is automatically cleared by hardware if the module is disabled and if there is no further activity on the bus. The value read from this register to get status of the ACTIVITY interrupt (bit 8) of the IC_RAW_INTR_STAT register.

14.1.3.25 IC_CLR_STOP_DET — Offset 40104060h

Clear STOP_DET Interrupt Register - Clear STOP_DET Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40104060h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_STOP_DET:** Read this register to clear the STOP_DET interrupt (bit 9) of the IC_RAW_INTR_STAT register.

14.1.3.26 IC_CLR_START_DET — Offset 40104064h

Clear START_DET Interrupt Register - Clear START_DET Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40104064h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_START_DET:** Read this register to clear the START_DET interrupt (bit 10) of the IC_RAW_INTR_STAT register.

14.1.3.27 IC_CLR_GEN_CALL — Offset 40104068h

Clear GEN_CALL Interrupt Register - Clear GEN_CALL Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40104068h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_GEN_CALL:** Read this register to clear the GEN_CALL interrupt (bit 11) of IC_RAW_INTR_STAT register.

14.1.3.28 IC_ENABLE — Offset 4010406Ch

I2C ENABLE Register - I2C Enable Register

Type	Size	Offset	Default
MMIO	32 bit	4010406Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**TX_CMD_BLOCK:** In Master mode: - 1'b1: Blocks the transmission of data on I2C bus even if Tx FIFO has data to transmit. - 1'b0: The transmission of data starts on I2C bus automatically, as soon as the first data is available in the Tx FIFO. Note: To block the execution of Master commands, set the TX_CMD_BLOCK bit only when Tx FIFO is empty (IC_STATUS[2]==1) and Master is in Idle state (IC_STATUS[5] == 0). Any further commands put in the Tx FIFO are not executed until TX_CMD_BLOCK bit is unset.
1	0h RW	**ABORT:** When set, the controller initiates the transfer abort. - 0: ABORT not initiated or ABORT done - 1: ABORT operation in progress The software can abort the I2C transfer in master mode by setting this bit. The software can set this bit only when ENABLE is already set; otherwise, the controller ignores any write to ABORT bit. The software cannot clear the ABORT bit once set. In response to an ABORT, the controller issues a STOP and flushes the Tx FIFO after completing the current transfer, then sets the TX_ABORT interrupt after the abort operation. The ABORT bit is cleared automatically after the abort operation. For a detailed description on how to abort I2C transfers, refer to "Aborting I2C Transfers".
0	0h RW	**ENABLE:** Controls whether the DW_apb_i2c is enabled. - 0: Disables DW_apb_i2c (TX and RX FIFOs are held in an erased state) - 1: Enables DW_apb_i2c Software can disable DW_apb_i2c while it is active. However, it is important that care be taken to ensure that DW_apb_i2c is disabled properly. A recommended procedure is described in "Disabling DW_apb_i2c". When DW_apb_i2c is disabled, the following occurs: - The TX FIFO and RX FIFO get flushed. - Status bits in the IC_INTR_STAT register are still active until DW_apb_i2c goes into IDLE state. If the module is transmitting, it stops as well as deletes the contents of the transmit buffer after the current transfer is complete. If the module is receiving, the DW_apb_i2c stops the current transfer at the end of the current byte and does not acknowledge the transfer. In systems with asynchronous pclk and ic_clk when IC_CLK_TYPE parameter set to asynchronous (1), there is a two ic_clk delay when enabling or disabling the DW_apb_i2c.

14.1.3.29 IC_STATUS — Offset 40104070h

I2C STATUS Register - I2C Status Register This is a read-only register used to indicate the current transfer status and FIFO status. The status register may be read at any time. None of the bits in this register request an interrupt. When the I2C is disabled by writing 0 in bit 0 of the IC_ENABLE register: - Bits 1 and 2 are set to 1 - Bits 3 and 10 are set to 0 When the master or slave state machines goes to idle and ic_en=0: - Bits 5 and 6 are set to 0

Type	Size	Offset	Default
MMIO	32 bit	40104070h	00000006h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved**
10	0h RO/V	**SLV_HOLD_RX_FIFO_FULL:** This bit indicates the BUS Hold in Slave mode due to Rx FIFO is Full and an additional byte has been received (This kind of Bus hold is applicable if IC_RX_FULL_HLD_BUS_EN is set to 1).
9	0h RO/V	**SLV_HOLD_TX_FIFO_EMPTY:** This bit indicates the BUS Hold in Slave mode for the Read request when the Tx FIFO is empty. The Bus is in hold until the Tx FIFO has data to Transmit for the read request.
8	0h RO/V	**MST_HOLD_RX_FIFO_FULL:** This bit indicates the BUS Hold in Master mode due to Rx FIFO is Full and additional byte has been received (This kind of Bus hold is applicable if IC_RX_FULL_HLD_BUS_EN is set to 1).
7	0h RO/V	**MST_HOLD_TX_FIFO_EMPTY:** If the IC_EMPTYFIFO_HOLD_MASTER_EN parameter is set to 1, the DW_apb_i2c master stalls the write transfer when Tx FIFO is empty, and the the last byte does not have the Stop bit set. This bit indicates the BUS hold when the master holds the bus because of the Tx FIFO being empty, and the the previous transferred command does not have the Stop bit set. (This kind of Bus hold is applicable if IC_EMPTYFIFO_HOLD_MASTER_EN is set to 1).
6	0h RO/V	**SLV_ACTIVITY:** Slave FSM Activity Status. When the Slave Finite State Machine (FSM) is not in the IDLE state, this bit is set. - 0: Slave FSM is in IDLE state so the Slave part of DW_apb_i2c is not Active - 1: Slave FSM is not in IDLE state so the Slave part of DW_apb_i2c is Active
5	0h RO/V	**MST_ACTIVITY:** Master FSM Activity Status. When the Master Finite State Machine (FSM) is not in the IDLE state, this bit is set. - 0: Master FSM is in IDLE state so the Master part of DW_apb_i2c is not Active - 1: Master FSM is not in IDLE state so the Master part of DW_apb_i2c is Active Note: IC_STATUS[0]-that is, ACTIVITY bit-is the OR of SLV_ACTIVITY and MST_ACTIVITY bits.
4	0h RO/V	**RFF:** Receive FIFO Completely Full. When the receive FIFO is completely full, this bit is set. When the receive FIFO contains one or more empty location, this bit is cleared. - 0: Receive FIFO is not full - 1: Receive FIFO is full
3	0h RO/V	**RFNE:** Receive FIFO Not Empty. This bit is set when the receive FIFO contains one or more entries; it is cleared when the receive FIFO is empty. - 0: Receive FIFO is empty - 1: Receive FIFO is not empty

Bit Range	Default & Access	Field Name (ID): Description
2	1h RO/V	**TFE:** Transmit FIFO Completely Empty. When the transmit FIFO is completely empty, this bit is set. When it contains one or more valid entries, this bit is cleared. This bit field does not request an interrupt. - 0: Transmit FIFO is not empty - 1: Transmit FIFO is empty
1	1h RO/V	**TFNF:** Transmit FIFO Not Full. Set when the transmit FIFO contains one or more empty locations, and is cleared when the FIFO is full. - 0: Transmit FIFO is full - 1: Transmit FIFO is not full
0	0h RO/V	**ACTIVITY:** I2C Activity Status.

14.1.3.30 IC_TXFLR — Offset 40104074h

I2C Transmit FIFO Level Register - I2C Transmit FIFO Level Register This register contains the number of valid data entries in the transmit FIFO buffer. It is cleared whenever: - The I2C is disabled - There is a transmit abort - that is, TX_ABRT bit is set in the IC_RAW_INTR_STAT register - The slave bulk transmit mode is aborted The register increments whenever data is placed into the transmit FIFO and decrements when data is taken from the transmit FIFO.

Type	Size	Offset	Default
MMIO	32 bit	40104074h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:0	00h RO/V	**TXFLR:** Transmit FIFO Level. Contains the number of valid data entries in the transmit FIFO.

14.1.3.31 IC_RXFLR — Offset 40104078h

I2C Receive FIFO Level Register - I2C Receive FIFO Level Register This register contains the number of valid data entries in the receive FIFO buffer. It is cleared whenever: - The I2C is disabled - Whenever there is a transmit abort caused by any of the events tracked in IC_TX_ABRT_SOURCE The register increments whenever data is placed into the receive FIFO and decrements when data is taken from the receive FIFO.

Type	Size	Offset	Default
MMIO	32 bit	40104078h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:0	00h RO/V	**RXFLR:** Receive FIFO Level. Contains the number of valid data entries in the receive FIFO.

14.1.3.32 IC_SDA_HOLD — Offset 4010407Ch

I2C SDA Hold Time Length Register - I2C SDA Hold Time Length Register The bits [15:0] of this register are used to control the hold time of SDA during transmit in both slave and master mode (after SCL goes from HIGH to LOW). The bits [23:16] of this register are used to extend the SDA transition (if any) whenever SCL is HIGH in the receiver in either master or slave mode. Writes to this register succeed only when IC_ENABLE[0]=0. The values in this register are in units of ic_clk period. The value programmed in IC_SDA_TX_HOLD must be greater than the minimum hold time in each mode one cycle in master mode, seven cycles in slave mode for the value to be implemented. The programmed SDA hold time during transmit (IC_SDA_TX_HOLD) cannot exceed at any time the duration of the low part of scl. Therefore the programmed value cannot be larger than N_SCL_LOW-2, where N_SCL_LOW is the duration of the low part of the scl period measured in ic_clk cycles.

Type	Size	Offset	Default
MMIO	32 bit	4010407Ch	00000005h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:16	00h RW	**IC_SDA_RX_HOLD:** Sets the required SDA hold time in units of ic_clk period, when DW_apb_i2c acts as a receiver.
15:0	0005h RW	**IC_SDA_TX_HOLD:** Sets the required SDA hold time in units of ic_clk period, when DW_apb_i2c acts as a transmitter.

14.1.3.33 IC_TX_ABRT_SOURCE — Offset 40104080h

I2C Transmit Abort Source Register - I2C Transmit Abort Source Register This register has 32 bits that indicate the source of the TX_ABRT bit. Except for Bit 9, this register is cleared whenever the IC_CLR_TX_ABRT register or the IC_CLR_INTR register is read. To clear Bit 9, the source of the ABRT_SBYTE_NORSTRT must be fixed first; RESTART must be enabled (IC_CON[5]=1), the SPECIAL bit must be cleared (IC_TAR[11]), or the GC_OR_START bit must be cleared (IC_TAR[10]). Once the source of the ABRT_SBYTE_NORSTRT is fixed, then this bit can be cleared in the same manner as other bits in this register. If the source of the ABRT_SBYTE_NORSTRT is not fixed before attempting to clear this bit, Bit 9 clears for one cycle and is then re-asserted.

Type	Size	Offset	Default
MMIO	32 bit	40104080h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:23	000h RO/V	**TX_FLUSH_CNT:** This field indicates the number of Tx FIFO Data Commands which are flushed due to TX_ABRT interrupt. It is cleared whenever I2C is disabled. Role of DW_apb_i2c: Master-Transmitter or Slave-Transmitter
22:17	0h RO	**Reserved**
16	0h RO/V	**ABRT_USER_ABRT:** This is a master-mode-only bit. Master has detected the transfer abort (IC_ENABLE[1]) Role of DW_apb_i2c: Master-Transmitter
15	0h RO/V	**ABRT_SLVRD_INTX:** 1: When the processor side responds to a slave mode request for data to be transmitted to a remote master and user writes a 1 in CMD (bit 8) of IC_DATA_CMD register. Role of DW_apb_i2c: Slave-Transmitter
14	0h RO/V	**ABRT_SLV_ARBLOST:** This field indicates that a Slave has lost the bus while transmitting data to a remote master. IC_TX_ABRT_SOURCE[12] is set at the same time. Note: Even though the slave never 'owns' the bus, something could go wrong on the bus. This is a fail safe check. For instance, during a data transmission at the low-to-high transition of SCL, if what is on the data bus is not what is supposed to be transmitted, then DW_apb_i2c no longer own the bus. Role of DW_apb_i2c: Slave-Transmitter
13	0h RO/V	**ABRT_SLVFLUSH_TXFIFO:** This field specifies that the Slave has received a read command and some data exists in the TX FIFO, so the slave issues a TX_ABRT interrupt to flush old data in TX FIFO. Role of DW_apb_i2c: Slave-Transmitter
12	0h RO/V	**ARB_LOST:** This field specifies that the Master has lost arbitration, or if IC_TX_ABRT_SOURCE[14] is also set, then the slave transmitter has lost arbitration. Role of DW_apb_i2c: Master-Transmitter or Slave-Transmitter
11	0h RO/V	**ABRT_MASTER_DIS:** This field indicates that the User tries to initiate a Master operation with the Master mode disabled. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver

Bit Range	Default & Access	Field Name (ID): Description
10	0h RO/V	**ABRT_10B_RD_NORSTRT:** This field indicates that the restart is disabled (IC_RESTART_EN bit (IC_CON[5]) =0) and the master sends a read command in 10-bit addressing mode. Role of DW_apb_i2c: Master-Receiver
9	0h RO/V	**ABRT_SBYTE_NORSTRT:** To clear Bit 9, the source of the ABRT_SBYTE_NORSTRT must be fixed first; restart must be enabled (IC_CON[5]=1), the SPECIAL bit must be cleared (IC_TAR[11]), or the GC_OR_START bit must be cleared (IC_TAR[10]). Once the source of the ABRT_SBYTE_NORSTRT is fixed, then this bit can be cleared in the same manner as other bits in this register. If the source of the ABRT_SBYTE_NORSTRT is not fixed before attempting to clear this bit, bit 9 clears for one cycle and then gets reasserted. When this field is set to 1, the restart is disabled (IC_RESTART_EN bit (IC_CON[5]) =0) and the user is trying to send a START Byte. Role of DW_apb_i2c: Master
8	0h RO/V	**ABRT_HS_NORSTRT:** This field indicates that the restart is disabled (IC_RESTART_EN bit (IC_CON[5]) =0) and the user is trying to use the master to transfer data in High Speed mode. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver
7	0h RO/V	**ABRT_SBYTE_ACKDET:** This field indicates that the Master has sent a START Byte and the START Byte was acknowledged (wrong behavior). Role of DW_apb_i2c: Master
6	0h RO/V	**ABRT_HS_ACKDET:** This field indicates that the Master is in High Speed mode and the High Speed Master code was acknowledged (wrong behavior). Role of DW_apb_i2c: Master
5	0h RO/V	**ABRT_GCALL_READ:** This field indicates that DW_apb_i2c in the master mode has sent a General Call but the user programmed the byte following the General Call to be a read from the bus (IC_DATA_CMD[9] is set to 1). Role of DW_apb_i2c: Master-Transmitter
4	0h RO/V	**ABRT_GCALL_NOACK:** This field indicates that DW_apb_i2c in master mode has sent a General Call and no slave on the bus acknowledged the General Call. Role of DW_apb_i2c: Master-Transmitter
3	0h RO/V	**ABRT_TXDATA_NOACK:** This field indicates the master-mode only bit. When the master receives an acknowledgement for the address, but when it sends data byte(s) following the address, it did not receive an acknowledge from the remote slave(s). Role of DW_apb_i2c: Master-Transmitter
2	0h RO/V	**ABRT_10ADDR2_NOACK:** This field indicates that the Master is in 10-bit address mode and that the second address byte of the 10-bit address was not acknowledged by any slave. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver
1	0h RO/V	**ABRT_10ADDR1_NOACK:** This field indicates that the Master is in 10-bit address mode and the first 10-bit address byte was not acknowledged by any slave. Reset value: 0x0 Role of DW_apb_i2c: Master-Transmitter or Master-Receiver
0	0h RO/V	**ABRT_7B_ADDR_NOACK:** This field indicates that the Master is in 7-bit addressing mode and the address sent was not acknowledged by any slave. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver

14.1.3.34 IC_DMA_CR — Offset 40104088h

DMA Control Register - DMA Control Register This register is only valid when DW_apb_i2c is configured with a set of DMA Controller interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist and writing to the register's address has no effect and reading from this register

address will return zero. The register is used to enable the DMA Controller interface operation. There is a separate bit for transmit and receive. This can be programmed regardless of the state of IC_ENABLE.

Type	Size	Offset	Default
MMIO	32 bit	40104088h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1	0h RW	**TDMAE:** Transmit DMA Enable. This bit enables/disables the transmit FIFO DMA channel.
0	0h RW	**RDMAE:** Receive DMA Enable. This bit enables/disables the receive FIFO DMA channel.

14.1.3.35 IC_DMA_TDLR — Offset 4010408Ch

DMA Transmit Data Level Register - DMA Transmit Data Level Register This register is only valid when the DW_apb_i2c is configured with a set of DMA interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist; writing to its address has no effect; reading from its address returns zero.

Type	Size	Offset	Default
MMIO	32 bit	4010408Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:0	00h RW	**DMATDL:** Transmit Data Level. This bit field controls the level at which a DMA request is made by the transmit logic. It is equal to the watermark level; that is, the dma_tx_req signal is generated when the number of valid data entries in the transmit FIFO is equal to or below this field value, and TDMAE = 1.

14.1.3.36 IC_DMA_RDLR — Offset 40104090h

DMA Transmit Data Level Register - I2C Receive Data Level Register This register is only valid when DW_apb_i2c is configured with a set of DMA interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist; writing to its address has no effect; reading from its address returns zero.

Type	Size	Offset	Default
MMIO	32 bit	40104090h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:0	00h RW	**DMARDL:** Receive Data Level. This bit field controls the level at which a DMA request is made by the receive logic. The watermark level = DMARDL+1; that is, dma_rx_req is generated when the number of valid data entries in the receive FIFO is equal to or more than this field value + 1, and RDMAE =1. For instance, when DMARDL is 0, then dma_rx_req is asserted when 1 or more data entries are present in the receive FIFO.

14.1.3.37 IC_SDA_SETUP — Offset 40104094h

I2C SDA Setup Register - I2C SDA Setup Register This register controls the amount of time delay (in terms of number of ic_clk clock periods) introduced in the rising edge of SCL - relative to SDA changing - when DW_apb_i2c services a read request in a slave-transmitter operation. The relevant I2C requirement is tSU:DAT as detailed in the I2C Bus Specification. This register must be programmed with a value equal to or greater than 2. Writes to this register succeed only when IC_ENABLE[0] = 0. Note: The length of setup time is calculated using [(IC_SDA_SETUP - 1) * (ic_clk_period)], so if the user requires 10 ic_clk periods of setup time, they should program a value of 11. The IC_SDA_SETUP register is only used by the DW_apb_i2c when operating as a slave transmitter.

Type	Size	Offset	Default
MMIO	32 bit	40104094h	00000002h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	02h RW	**SDA_SETUP:** SDA Setup. It is recommended that if the required delay is 1000ns, then for an ic_clk frequency of 10 MHz, IC_SDA_SETUP should be programmed to a value of 11. IC_SDA_SETUP must be programmed with a minimum value of 2.

14.1.3.38 IC_ACK_GENERAL_CALL — Offset 40104098h

I2C ACK General Call Register - I2C ACK General Call Register The register controls whether DW_apb_i2c responds with a ACK or NACK when it receives an I2C General Call address. This register is applicable only when the DW_apb_i2c is in slave mode.

Type	Size	Offset	Default
MMIO	32 bit	40104098h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**ACK_GEN_CALL:** ACK General Call. When set to 1, DW_apb_i2c responds with a ACK (by asserting ic_data_oe) when it receives a General Call. Otherwise, DW_apb_i2c responds with a NACK (by negating ic_data_oe).

14.1.3.39 IC_ENABLE_STATUS — Offset 4010409Ch

I2C Enable Status Register - I2C Enable Status Register The register is used to report the DW_apb_i2c hardware status when the IC_ENABLE[0] register is set from 1 to 0; that is, when DW_apb_i2c is disabled. If IC_ENABLE[0] has been set to 1, bits 2:1 are forced to 0, and bit 0 is forced to 1. If IC_ENABLE[0] has been set to 0, bits 2:1 is only be valid as soon as bit 0 is read as '0'. Note: When IC_ENABLE[0] has been set to 0, a delay occurs for bit 0 to be read as 0 because disabling the DW_apb_i2c depends on I2C bus activities.

Type	Size	Offset	Default
MMIO	32 bit	4010409Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2	0h RO/V	**SLV_RX_DATA_LOST:** Slave Received Data Lost. This bit indicates if a Slave-Receiver operation has been aborted with at least one data byte received from an I2C transfer due to the setting bit 0 of IC_ENABLE from 1 to 0. When read as 1, DW_apb_i2c is deemed to have been actively engaged in an aborted I2C transfer (with matching address) and the data phase of the I2C transfer has been entered, even though a data byte has been responded with a NACK. Note: If the remote I2C master terminates the transfer with a STOP condition before the DW_apb_i2c has a chance to NACK a transfer, and IC_ENABLE[0] has been set to 0, then this bit is also set to 1. When read as 0, DW_apb_i2c is deemed to have been disabled without being actively involved in the data phase of a Slave-Receiver transfer. Note: The CPU can safely read this bit when IC_EN (bit 0) is read as 0.
1	0h RO/V	**SLV_DISABLED_WHILE_BUSY:** Slave Disabled While Busy (Transmit, Receive). This bit indicates if a potential or active Slave operation has been aborted due to the setting bit 0 of the IC_ENABLE register from 1 to 0. This bit is set when the CPU writes a 0 to the IC_ENABLE register while: (a) DW_apb_i2c is receiving the address byte of the Slave-Transmitter operation from a remote master; OR, (b) address and data bytes of the Slave-Receiver operation from a remote master. When read as 1, DW_apb_i2c is deemed to have forced a NACK during any part of an I2C transfer, irrespective of whether the I2C address matches the slave address set in DW_apb_i2c (IC_SAR register) OR if the transfer is completed before IC_ENABLE is set to 0 but has not taken effect. Note: If the remote I2C master terminates the transfer with a STOP condition before the DW_apb_i2c has a chance to NACK a transfer, and IC_ENABLE[0] has been set to 0, then this bit will also be set to 1. When read as 0, DW_apb_i2c is deemed to have been disabled when there is master activity, or when the I2C bus is idle. Note: The CPU can safely read this bit when IC_EN (bit 0) is read as 0.
0	0h RO/V	**IC_EN:** ic_en Status. This bit always reflects the value driven on the output port ic_en. - When read as 1, DW_apb_i2c is deemed to be in an enabled state. - When read as 0, DW_apb_i2c is deemed completely inactive. Note: The CPU can safely read this bit anytime. When this bit is read as 0, the CPU can safely read SLV_RX_DATA_LOST (bit 2) and SLV_DISABLED_WHILE_BUSY (bit 1).

14.1.3.40 IC_FS_SPKLEN — Offset 401040A0h

I2C SS, FS or FM+ spike suppression limit - I2C SS, FS or FM+ spike suppression limit This register is used to store the duration, measured in ic_clk cycles, of the longest spike that is filtered out by the spike suppression logic w hen the component is operating in SS, FS or FM+ modes. This register must be programmed with a minimum value of 1.

Type	Size	Offset	Default
MMIO	32 bit	401040A0h	00000005h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	05h RW	**IC_FS_SPKLEN:** This register must be set before any I2C bus transaction can take place to ensure stable operation. This register sets the duration, measured in ic_clk cycles, of the longest spike in the SCL or SDA lines that will be filtered out by the spike suppression logic. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. The minimum valid value is 1; hardware prevents values less than this being written, and if attempted results in 1 being set.

14.1.3.41 IC_HS_SPKLEN — Offset 401040A4h

I2C HS spike suppression limit register - I2C HS spike suppression limit register This register is used to store the duration, measured in ic_clk cycles, of the longest spike that is filtered out by the spike suppression logic when the component is operating in HS modes. This register must be programmed with a minimum value of 1 and is implemented only if the component is configured to support HS mode; that is, if the IC_MAX_SPEED_MODE parameter is set to 3.

Type	Size	Offset	Default
MMIO	32 bit	401040A4h	00000002h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	02h RW	**IC_HS_SPKLEN:** This register must be set before any I2C bus transaction can take place to ensure stable operation. This register sets the duration, measured in ic_clk cycles, of the longest spike in the SCL or SDA lines that will be filtered out by the spike suppression logic. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. The minimum valid value is 1; hardware prevents values less than this being written, and if attempted results in 1 being set.

14.1.3.42 IC_CLR_RESTART_DET — Offset 401040A8h

Clear RESTART_DET Interrupt Register - Clear RESTART_DET Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	401040A8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RESTART_DET:** Read this register to clear the RESTART_DET interrupt (bit 12) of IC_RAW_INTR_STAT register.

14.1.3.43 IC_COMP_PARAM_1 — Offset 401040F4h

Component Parameter Register 1 - Component Parameter Register 1 Note This is a constant read-only register that contains encoded information about the component's parameter settings. The reset value depends on coreConsultant parameter(s).

Type	Size	Offset	Default
MMIO	32 bit	401040F4h	003F3FEEh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:16	3Fh RO/V	**TX_BUFFER_DEPTH:** The value of this register is derived from the IC_TX_BUFFER_DEPTH coreConsultant parameter. - 0x00 = Reserved - 0x01 = 2 - 0x02 = 3 - ... - 0xFF = 256
15:8	3Fh RO/V	**RX_BUFFER_DEPTH:** The value of this register is derived from the IC_RX_BUFFER_DEPTH coreConsultant parameter. - 0x00: Reserved - 0x01: 2 - 0x02: 3 - ... - 0xFF: 256
7	1h RO/V	**ADD_ENCODED_PARAMS:** The value of this register is derived from the IC_ADD_ENCODED_PARAMS coreConsultant parameter. Reading 1 in this bit means that the capability of reading these encoded parameters via software has been included. Otherwise, the entire register is 0 regardless of the setting of any other parameters that are encoded in the bits.

Bit Range	Default & Access	Field Name (ID): Description
6	1h RO/V	**HAS_DMA:** The value of this register is derived from the IC_HAS_DMA coreConsultant parameter.
5	1h RO/V	**INTR_IO:** The value of this register is derived from the IC_INTR_IO coreConsultant parameter.
4	0h RO/V	**HC_COUNT_VALUES:** The value of this register is derived from the IC_HC_COUNT VALUES coreConsultant parameter.
3:2	3h RO/V	**MAX_SPEED_MODE:** The value of this register is derived from the IC_MAX_SPEED_MODE coreConsultant parameter. - 0x0: Reserved - 0x1: Standard - 0x2: Fast - 0x3: High
1:0	2h RO/V	**APB_DATA_WIDTH:** The value of this register is derived from the APB_DATA_WIDTH coreConsultant parameter.

14.1.3.44 IC_COMP_VERSION — Offset 401040F8h

I2C Component Version Register - I2C Component Version Register

Type	Size	Offset	Default
MMIO	32 bit	401040F8h	3230322Ah

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	3230322Ah RO/V	**IC_COMP_VERSION:**

14.1.3.45 IC_COMP_TYPE — Offset 401040FCh

I2C Component Type Register - I2C Component Type Register

Type	Size	Offset	Default
MMIO	32 bit	401040FCh	44570140h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	44570140h RO/V	**IC_COMP_TYPE:** Designware Component Type number = 0x44_57_01_40. This assigned unique hex value is constant and is derived from the two ASCII letters 'DW' followed by a 16-bit unsigned number.

14.1.4 I2C_3 Registers Summary

Table 14-4. Summary of I2C_3 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
40106000h	4	IC_CON	00000067h

14.1.4.1 IC_CON — Offset 40106000h

I2C Control Register - I2C Control Register. This register can be written only when the DW_apb_i2c is disabled, which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. Read/Write Access: - If configuration parameter I2C_DYNAMIC_TAR_UPDATE=1, bit 4 is read only. - If configuration parameter IC_RX_FULL_HLD_BUS_EN =0, bit 9 is read only. - If configuration parameter IC_STOP_DET_IF_MASTER_ACTIVE =0, bit 10 is read only. - If configuration parameter IC_BUS_CLEAR_FEATURE=0, bit 11 is read only - If configuration parameter IC_OPTIONAL_SAR=0, bit 16 is read only - If configuration parameter IC_SMBUS=0, bit 17 is read only - If configuration parameter IC_SMBUS_ARP=0, bits 18 and 19 are read only.

Type	Size	Offset	Default
MMIO	32 bit	40106000h	00000067h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved**
10	0h RW	**STOP_DET_IF_MASTER_ACTIVE:** In Master mode: - 1'b1: issues the STOP_DET interrupt only when master is active. - 1'b0: issues the STOP_DET irrespective of whether master is active or not.
9	0h RW	**RX_FIFO_FULL_HLD_CTRL:** This bit controls whether DW_apb_i2c should hold the bus when the Rx FIFO is physically full to its RX_BUFFER_DEPTH, as described in the IC_RX_FULL_HLD_BUS_EN parameter.
8	0h RW	**TX_EMPTY_CTRL:** This bit controls the generation of the TX_EMPTY interrupt, as described in the IC_RAW_INTR_STAT register.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**STOP_DET_IFADDRESSED:** In slave mode: - 1'b1: issues the STOP_DET interrrupt only when it is addressed. - 0'b0: issues the STOP_DET irrespective of whether it's addressed or not. NOTE: During a general call address, this slave does not issue the STOP_DET interrupt if STOP_DET_IF_ADDRESSED = 1'b1, even if the slave responds to the general call address by generating ACK. The STOP_DET interrupt is generated only when the transmitted address matches the slave address (SAR).
6	1h RW	**IC_SLAVE_DISABLE:** This bit controls whether I2C has its slave disabled, which means once the presetn signal is applied, then this bit takes on the value of the configuration parameter IC_SLAVE_DISABLE. You have the choice of having the slave enabled or disabled after reset is applied, which means software does not have to configure the slave. By default, the slave is always enabled (in reset state as well). If you need to disable it after reset, set this bit to 1. If this bit is set (slave is disabled), DW_apb_i2c functions only as a master and does not perform any action that requires a slave. NOTE: Software should ensure that if this bit is written with 0, then bit 0 should also be written with a 0.
5	1h RW	**IC_RESTART_EN:** Determines whether RESTART conditions may be sent when acting as a master. Some older slaves do not support handling RESTART conditions; however, RESTART conditions are used in several DW_apb_i2c operations. When RESTART is disabled, the master is prohibited from performing the following functions: - Sending a START BYTE - Performing any high-speed mode operation - High-speed mode operation - Performing direction changes in combined format mode - Performing a read operation with a 10-bit address By replacing RESTART condition followed by a STOP and a subsequent START condition, split operations are broken down into multiple DW_apb_i2c transfers. If the above operations are performed, it will result in setting bit 6 (TX_ABRT) of the IC_RAW_INTR_STAT register. .
4	0h RO/V	**IC_10BITADDR_MASTER_RD_ONLY:** If the I2C_DYNAMIC_TAR_UPDATE configuration parameter is set to 'No' (0), this bit is named IC_10BITADDR_MASTER and controls whether the DW_apb_i2c starts its transfers in 7 or 10-bit addressing mode when acting as a master. If I2C_DYNAMIC_TAR_UPDATE is set to 'Yes' (1), the function of this bit is handled by bit 12 of IC_TAR register, and becomes a read-only copy called IC_10BITADDR_MASTER_rd_only. - 0: 7-bit addressing - 1: 10-bit addressing
3	0h RW	**IC_10BITADDR_SLAVE:** When acting as a slave, this bit controls whether the DW_apb_i2c responds to 7- or 10-bit addresses. - 0: 7-bit addressing. The DW_apb_i2c ignores transactions that involve 10-bit addressing; for 7-bit addressing, only the lower 7 bits of the IC_SAR register are compared. - 1: 10-bit addressing. The DW_apb_i2c responds to only 10-bit addressing transfers that match the full 10 bits of the IC_SAR register.
2:1	3h RW	**SPEED:** These bits control at which speed the DW_apb_i2c operates; its setting is relevant only if one is operating the DW_apb_i2c in master mode. Hardware protects against illegal values being programmed by software. These bits must be programmed appropriately for slave mode also, as it is used to capture correct value of spike filter as per the speed mode. This register should be programmed only with a value in the range of 1 to IC_MAX_SPEED_MODE; otherwise, hardware updates this register with the value of IC_MAX_SPEED_MODE. 1: standard mode (100 kbit/s) 2: fast mode (<=400 kbit/s) or fast mode plus (<=1000Kbit/s) 3: high speed mode (3.4 Mbit/s) Note: This field is not applicable when IC_ULTRA_FAST_MODE=1
0	1h RW	**MASTER_MODE:** This bit controls whether the DW_apb_i2c master is enabled. NOTE: Software should ensure that if this bit is written with '1' then bit 6 should also be written with a '1'.

14.1.4.2 IC_TAR — Offset 40106004h

I2C Target Address Register - I2C Target Address Register If the configuration parameter I2C_DYNAMIC_TAR_UPDATE is set to 'No' (0), this register is 12 bits wide, and bits 31:12 are reserved. This register can be written to only when IC_ENABLE[0] is set to 0. However, if I2C_DYNAMIC_TAR_UPDATE = 1, then the register becomes 13

bits wide. In this case, writes to IC_TAR succeed when one of the following conditions are true: - DW_apb_i2c is NOT enabled (IC_ENABLE[0] is set to 0); or - DW_apb_i2c is enabled (IC_ENABLE[0]=1); AND DW_apb_i2c is NOT engaged in any Master (tx, rx) operation (IC_STATUS[5]=0); AND DW_apb_i2c is enabled to operate in Master mode (IC_CON[0]=1); AND there are NO entries in the TX FIFO (IC_STATUS[2]=1) You can change the TAR address dynamically without losing the bus, only if the following conditions are met. - DW_apb_i2c is enabled (IC_ENABLE[0]=1); AND IC_EMPTYFIFO_HOLD_MASTER_EN configuration parameter is set to 1; AND DW_apb_i2c is enabled to operate in Master mode (IC_CON[0]=1); AND there are NO entries in the Tx FIFO and the master is in HOLD state (IC_INTR_STAT[13]=1). Note: If the software or application is aware that the DW_apb_i2c is not using the TAR address for the pending commands in the Tx FIFO, then it is possible to update the TAR address even while the Tx FIFO has entries (IC_STATUS[2]= 0). - It is not necessary to perform any write to this register if DW_apb_i2c is enabled as an I2C slave only.

Type	Size	Offset	Default
MMIO	32 bit	40106004h	00000055h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	**Reserved**
12	0h RW	**IC_10BITADDR_MASTER:** This bit controls whether the DW_apb_i2c starts its transfers in 7- or 10-bit addressing mode when acting as a master. - 0: 7-bit addressing - 1: 10-bit addressing
11	0h RW	**SPECIAL:** This bit indicates whether software performs a Device-ID or General Call or START BYTE command. - 0: ignore bit 10 GC_OR_START and use IC_TAR normally - 1: perform special I2C command as specified in Device_ID or GC_OR_START bit
10	0h RW	**GC_OR_START:** If bit 11 (SPECIAL) is set to 1 and bit 13(Device-ID) is set to 0, then this bit indicates whether a General Call or START byte command is to be performed by the DW_apb_i2c. - 0: General Call Address - after issuing a General Call, only writes may be performed. Attempting to issue a read command results in setting bit 6 (TX_ABRT) of the IC_RAW_INTR_STAT register. The DW_apb_i2c remains in General Call mode until the SPECIAL bit value (bit 11) is cleared. - 1: START BYTE
9:0	055h RW	**IC_TAR:** This is the target address for any master transaction. When transmitting a General Call, these bits are ignored. To generate a START BYTE, the CPU needs to write only once into these bits. If the IC_TAR and IC_SAR are the same, loopback exists but the FIFOs are shared between master and slave, so full loopback is not feasible. Only one direction loopback mode is supported (simplex), not duplex. A master cannot transmit to itself; it can transmit to only a slave.

14.1.4.3 IC_SAR — Offset 40106008h

I2C Slave Address Register - I2C Slave Address Register

Type	Size	Offset	Default
MMIO	32 bit	40106008h	00000055h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:0	055h RW	**IC_SAR:** The IC_SAR holds the slave address when the I2C is operating as a slave. For 7-bit addressing, only IC_SAR[6:0] is used. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. Note: The default values cannot be any of the reserved address locations: that is, 0x00 to 0x07, or 0x78 to 0x7f. The correct operation of the device is not guaranteed if you program the IC_SAR or IC_TAR to a reserved value.

14.1.4.4 IC_HS_MADDR — Offset 4010600Ch

I2C High Speed Master Mode Code Address Register - I2C High Speed Master Mode Code Address Register

Type	Size	Offset	Default
MMIO	32 bit	4010600Ch	00000001h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2:0	1h RW	**IC_HS_MAR:** This bit field holds the value of the I2C HS mode master code. HS-mode master codes are reserved 8-bit codes (00001xxx) that are not used for slave addressing or other purposes. Each master has its unique master code; up to eight high-speed mode masters can be present on the same I2C bus system. Valid values are from 0 to 7. This register goes away and becomes read-only returning 0's if the IC_MAX_SPEED_MODE configuration parameter is set to either Standard (1) or Fast (2). This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect.

14.1.4.5 IC_DATA_CMD — Offset 40106010h

I2C Rx/Tx Data Buffer and Command Register - I2C Rx/Tx Data Buffer and Command Register; this is the register the CPU writes to when filling the TX FIFO and the CPU reads from when retrieving bytes from RX FIFO. The size of the register changes as follows: Write: - 11 bits when IC_EMPTYFIFO_HOLD_MASTER_EN=1 - 9 bits when IC_EMPTYFIFO_HOLD_MASTER_EN=0 Read: - 12 bits when IC_FIRST_DATA_BYTE_STATUS = 1 - 8 bits when IC_FIRST_DATA_BYTE_STATUS = 0 Note: In order for the DW_apb_i2c to continue acknowledging reads, a read command should be written for every byte that is to be received; otherwise the DW_apb_i2c will stop acknowledging.

Type	Size	Offset	Default
MMIO	32 bit	40106010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RO/V	**FIRST_DATA_BYTE:** Indicates the first data byte received after the address phase for receive transfer in Master receiver or Slave receiver mode. NOTE: In case of APB_DATA_WIDTH=8, 1. The user has to perform two APB Reads to IC_DATA_CMD in order to get status on 11 bit. 2. Inorder to read the 11 bit, the user has to perform the first data byte read [7:0] (offset 0x10) and then perform the second read[15:8](offset 0x11) in order to know the status of 11 bit (whether the data received in previous read is a first data byte or not). 3. The 11th bit is an optional read field, user can ignore 2nd byte read [15:8] (offset 0x11) if not interested in FIRST_DATA_BYTE status.
10	0h WO	**RESTART:** This bit controls whether a RESTART is issued before the byte is sent or received. This bit is available only if IC_EMPTYFIFO_HOLD_MASTER_EN is configured to 1. 1 - If IC_RESTART_EN is 1, a RESTART is issued before the data is sent/received (according to the value of CMD), regardless of whether or not the transfer direction is changing from the previous command; if IC_RESTART_EN is 0, a STOP followed by a START is issued instead. 0 - If IC_RESTART_EN is 1, a RESTART is issued only if the transfer direction is changing from the previous command; if IC_RESTART_EN is 0, a STOP followed by a START is issued instead.

Bit Range	Default & Access	Field Name (ID): Description
9	0h WO	**STOP:** This bit controls whether a STOP is issued after the byte is sent or received. This bit is available only if IC_EMPTYFIFO_HOLD_MASTER_EN is configured to 1. - 1 - STOP is issued after this byte, regardless of whether or not the Tx FIFO is empty. If the Tx FIFO is not empty, the master immediately tries to start a new transfer by issuing a START and arbitrating for the bus. - 0 - STOP is not issued after this byte, regardless of whether or not the Tx FIFO is empty. If the Tx FIFO is not empty, the master continues the current transfer by sending/receiving data bytes according to the value of the CMD bit. If the Tx FIFO is empty, the master holds the SCL line low and stalls the bus until a new command is available in the Tx FIFO.
8	0h WO	**CMD:** This bit controls whether a read or a write is performed. This bit does not control the direction when the DW_apb_i2c acts as a slave. It controls only the direction when it acts as a master. When a command is entered in the TX FIFO, this bit distinguishes the write and read commands. In slave-receiver mode, this bit is a "don't care" because writes to this register are not required. In slave-transmitter mode, a "0" indicates that the data in IC_DATA_CMD is to be transmitted. When programming this bit, you should remember the following: attempting to perform a read operation after a General Call command has been sent results in a TX_ABRT interrupt (bit 6 of the IC_RAW_INTR_STAT register), unless bit 11 (SPECIAL) in the IC_TAR register has been cleared. If a "1" is written to this bit after receiving a RD_REQ interrupt, then a TX_ABRT interrupt occurs.
7:0	00h RW/V	**DAT:** This register contains the data to be transmitted or received on the I2C bus. If you are writing to this register and want to perform a read, bits 7:0 (DAT) are ignored by the DW_apb_i2c. However, when you read this register, these bits return the value of data received on the DW_apb_i2c interface.

14.1.4.6 IC_SS_SCL_HCNT — Offset 40106014h

Standard Speed I2C Clock SCL High Count Register - Standard Speed I2C Clock SCL High Count Register

Type	Size	Offset	Default
MMIO	32 bit	40106014h	000001E8h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	01E8h RW	**IC_SS_SCL_HCNT:** This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock high-period count for standard speed. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. The minimum valid value is 6; hardware prevents values less than this being written, and if attempted results in 6 being set. For designs with APB_DATA_WIDTH = 8, the order of programming is important to ensure the correct operation of the DW_apb_i2c. The lower byte must be programmed first. Then the upper byte is programmed. When the configuration parameter IC_HC_COUNT_VALUES is set to 1, this register is read only. NOTE: This register must not be programmed to a value higher than 65525, because DW_apb_i2c uses a 16-bit counter to flag an I2C bus idle condition when this counter reaches a value of IC_SS_SCL_HCNT + 10.

14.1.4.7 IC_SS_SCL_LCNT — Offset 40106018h

Standard Speed I2C Clock SCL Low Count Register - Standard Speed I2C Clock SCL Low Count Register

11	0h RO/V	**R_GEN_CALL:** See IC_RAW_INTR_STAT for a detailed description of R_GEN_CALL bit.

Bit Range	Default & Access	Field Name (ID): Description
10	0h RO/V	**R_START_DET:** See IC_RAW_INTR_STAT for a detailed description of R_START_DET bit.
9	0h RO/V	**R_STOP_DET:** See IC_RAW_INTR_STAT for a detailed description of R_STOP_DET bit.
8	0h RO/V	**R_ACTIVITY:** See IC_RAW_INTR_STAT for a detailed description of R_ACTIVITY bit.
7	0h RO/V	**R_RX_DONE:** See IC_RAW_INTR_STAT for a detailed description of R_RX_DONE bit.
6	0h RO/V	**R_TX_ABRT:** See IC_RAW_INTR_STAT for a detailed description of R_TX_ABRT bit.
5	0h RO/V	**R_RD_REQ:** See IC_RAW_INTR_STAT for a detailed description of R_RD_REQ bit.
4	0h RO/V	**R_TX_EMPTY:** See IC_RAW_INTR_STAT for a detailed description of R_TX_EMPTY bit.
3	0h RO/V	**R_TX_OVER:** See IC_RAW_INTR_STAT for a detailed description of R_TX_OVER bit.
2	0h RO/V	**R_RX_FULL:** See IC_RAW_INTR_STAT for a detailed description of R_RX_FULL bit.
1	0h RO/V	**R_RX_OVER:** See IC_RAW_INTR_STAT for a detailed description of R_RX_OVER bit.
0	0h RO/V	**R_RX_UNDER:** See IC_RAW_INTR_STAT for a detailed description of R_RX_UNDER bit.

14.1.4.13 IC_INTR_MASK — Offset 40106030h

I2C Interrupt Mask Register - I2C Interrupt Mask Register. These bits mask their corresponding interrupt status bits. This register is active low; a value of 0 masks the interrupt, whereas a value of 1 unmasks the interrupt.

Type	Size	Offset	Default
MMIO	32 bit	40106030h	000008FFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13	0h RW	**M_MASTER_ON_HOLD:** This bit masks the R_MASTER_ON_HOLD interrupt in IC_INTR_STAT register.
12	0h RW	**M_RESTART_DET:** This bit masks the R_RESTART_DET interrupt in IC_INTR_STAT register.

Bit Range	Default & Access	Field Name (ID): Description
11	1h RW	**M_GEN_CALL:** This bit masks the R_GEN_CALL interrupt in IC_INTR_STAT register.
10	0h RW	**M_START_DET:** This bit masks the R_START_DET interrupt in IC_INTR_STAT register.
9	0h RW	**M_STOP_DET:** This bit masks the R_STOP_DET interrupt in IC_INTR_STAT register.
8	0h RW	**M_ACTIVITY:** This bit masks the R_ACTIVITY interrupt in IC_INTR_STAT register.
7	1h RW	**M_RX_DONE:** This bit masks the R_RX_DONE interrupt in IC_INTR_STAT register.
6	1h RW	**M_TX_ABRT:** This bit masks the R_TX_ABRT interrupt in IC_INTR_STAT register.
5	1h RW	**M_RD_REQ:** This bit masks the R_RD_REQ interrupt in IC_INTR_STAT register.
4	1h RW	**M_TX_EMPTY:** This bit masks the R_TX_EMPTY interrupt in IC_INTR_STAT register.
3	1h RW	**M_TX_OVER:** This bit masks the R_TX_OVER interrupt in IC_INTR_STAT register.
2	1h RW	**M_RX_FULL:** This bit masks the R_RX_FULL interrupt in IC_INTR_STAT register.
1	1h RW	**M_RX_OVER:** This bit masks the R_RX_OVER interrupt in IC_INTR_STAT register.
0	1h RW	**M_RX_UNDER:** This bit masks the R_RX_UNDER interrupt in IC_INTR_STAT register.

14.1.4.14 IC_RAW_INTR_STAT — Offset 40106034h

I2C Raw Interrupt Status Register - I2C Raw Interrupt Status Register Unlike the IC_INTR_STAT register, these bits are not masked so they always show the true status of the DW_apb_i2c.

Type	Size	Offset	Default
MMIO	32 bit	40106034h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13	0h RO/V	**MASTER_ON_HOLD:** Indicates whether master is holding the bus and TX FIFO is empty. Enabled only when I2C_DYNAMIC_TAR_UPDATE=1 and IC_EMPTYFIFO_HOLD_MASTER_EN=1.
12	0h RO/V	**RESTART_DET:** Indicates whether a RESTART condition has occurred on the I2C interface when DW_apb_i2c is operating in Slave mode and the slave is being addressed. Enabled only when IC_SLV_RESTART_DET_EN=1. Note: However, in high-speed mode or during a START BYTE transfer, the RESTART comes before the address field as per the I2C protocol. In this case, the slave is not the addressed slave when the RESTART is issued, therefore DW_apb_i2c does not generate the RESTART_DET interrupt.
11	0h RO/V	**GEN_CALL:** Set only when a General Call address is received and it is acknowledged. It stays set until it is cleared either by disabling DW_apb_i2c or when the CPU reads bit 0 of the IC_CLR_GEN_CALL register. DW_apb_i2c stores the received data in the Rx buffer.
10	0h RO/V	**START_DET:** Indicates whether a START or RESTART condition has occurred on the I2C interface regardless of whether DW_apb_i2c is operating in slave or master mode.
9	0h RO/V	**STOP_DET:** Indicates whether a STOP condition has occurred on the I2C interface regardless of whether DW_apb_i2c is operating in slave or master mode. In Slave Mode: - If IC_CON[7]=1'b1 (STOP_DET_IFADDRESSED), the STOP_DET interrupt will be issued only if slave is addressed. Note: During a general call address, this slave does not issue a STOP_DET interrupt if STOP_DET_IF_ADDRESSED=1'b1, even if the slave responds to the general call address by generating ACK. The STOP_DET interrupt is generated only when the transmitted address matches the slave address (SAR). - If IC_CON[7]=1'b0 (STOP_DET_IFADDRESSED), the STOP_DET interrupt is issued irrespective of whether it is being addressed. In Master Mode: - If IC_CON[10]=1'b1 (STOP_DET_IF_MASTER_ACTIVE),the STOP_DET interrupt will be issued only if Master is active. - If IC_CON[10]=1'b0 (STOP_DET_IFADDRESSED),the STOP_DET interrupt will be issued irrespective of whether master is active or not.
8	0h RO/V	**ACTIVITY:** This bit captures DW_apb_i2c activity and stays set until it is cleared. There are four ways to clear it: - Disabling the DW_apb_i2c - Reading the IC_CLR_ACTIVITY register - Reading the IC_CLR_INTR register - System reset Once this bit is set, it stays set unless one of the four methods is used to clear it. Even if the DW_apb_i2c module is idle, this bit remains set until cleared, indicating that there was activity on the bus.
7	0h RO/V	**RX_DONE:** When the DW_apb_i2c is acting as a slave-transmitter, this bit is set to 1 if the master does not acknowledge a transmitted byte. This occurs on the last byte of the transmission, indicating that the transmission is done.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RO/V	**TX_ABRT:** This bit indicates if DW_apb_i2c, as an I2C transmitter, is unable to complete the intended actions on the contents of the transmit FIFO. This situation can occur both as an I2C master or an I2C slave, and is referred to as a 'transmit abort'. When this bit is set to 1, the IC_TX_ABRT_SOURCE register indicates the reason why the transmit abort takes places. Note: The DW_apb_i2c flushes/resets/empties only the TX_FIFO whenever there is a transmit abort caused by any of the events tracked by the IC_TX_ABRT_SOURCE register. The Tx FIFO remains in this flushed state until the register IC_CLR_TX_ABRT is read. Once this read is performed, the Tx FIFO is then ready to accept more data bytes from the APB interface. RX FIFO flush because of TX_ABRT is controlled by the coreConsultant parameter IC_AVOID_RX_FIFO_FLUSH_ON_TX_ABRT.
5	0h RO/V	**RD_REQ:** This bit is set to 1 when DW_apb_i2c is acting as a slave and another I2C master is attempting to read data from DW_apb_i2c. The DW_apb_i2c holds the I2C bus in a wait state (SCL=0) until this interrupt is serviced, which means that the slave has been addressed by a remote master that is asking for data to be transferred. The processor must respond to this interrupt and then write the requested data to the IC_DATA_CMD register. This bit is set to 0 just after the processor reads the IC_CLR_RD_REQ register.
4	0h RO/V	**TX_EMPTY:** The behavior of the TX_EMPTY interrupt status differs based on the TX_EMPTY_CTRL selection in the IC_CON register. - When TX_EMPTY_CTRL = 0: This bit is set to 1 when the transmit buffer is at or below the threshold value set in the IC_TX_TL register. - When TX_EMPTY_CTRL = 1: This bit is set to 1 when the transmit buffer is at or below the threshold value set in the IC_TX_TL register and the transmission of the address/data from the internal shift register for the most recently popped command is completed. It is automatically cleared by hardware when the buffer level goes above the threshold. When IC_ENABLE[0] is set to 0, the TX FIFO is flushed and held in reset. There the TX FIFO looks like it has no data within it, so this bit is set to 1, provided there is activity in the master or slave state machines. When there is no longer any activity, then with ic_en=0, this bit is set to 0.
3	0h RO/V	**TX_OVER:** Set during transmit if the transmit buffer is filled to IC_TX_BUFFER_DEPTH and the processor attempts to issue another I2C command by writing to the IC_DATA_CMD register. When the module is disabled, this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared.
2	0h RO/V	**RX_FULL:** Set when the receive buffer reaches or goes above the RX_TL threshold in the IC_RX_TL register. It is automatically cleared by hardware when buffer level goes below the threshold. If the module is disabled (IC_ENABLE[0]=0), the RX FIFO is flushed and held in reset; therefore the RX FIFO is not full. So this bit is cleared once the IC_ENABLE bit 0 is programmed with a 0, regardless of the activity that continues.
1	0h RO/V	**RX_OVER:** Set if the receive buffer is completely filled to IC_RX_BUFFER_DEPTH and an additional byte is received from an external I2C device. The DW_apb_i2c acknowledges this, but any data bytes received after the FIFO is full are lost. If the module is disabled (IC_ENABLE[0]=0), this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared. Note: If the configuration parameter IC_RX_FULL_HLD_BUS_EN is enabled and bit 9 of the IC_CON register (RX_FIFO_FULL_HLD_CTRL) is programmed to HIGH, then the RX_OVER interrupt never occurs, because the Rx FIFO never overflows.
0	0h RO/V	**RX_UNDER:** Set if the processor attempts to read the receive buffer when it is empty by reading from the IC_DATA_CMD register. If the module is disabled (IC_ENABLE[0]=0), this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared.

14.1.4.15 IC_RX_TL — Offset 40106038h

I2C Receive FIFO Threshold Register - I2C Receive FIFO Threshold Register

Type	Size	Offset	Default
MMIO	32 bit	40106038h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**RX_TL:** Receive FIFO Threshold Level. Controls the level of entries (or above) that triggers the RX_FULL interrupt (bit 2 in IC_RAW_INTR_STAT register). The valid range is 0-255, with the additional restriction that hardware does not allow this value to be set to a value larger than the depth of the buffer. If an attempt is made to do that, the actual value set will be the maximum depth of the buffer. A value of 0 sets the threshold for 1 entry, and a value of 255 sets the threshold for 256 entries.

14.1.4.16 IC_TX_TL — Offset 4010603Ch

I2C Transmit FIFO Threshold Register - I2C Transmit FIFO Threshold Register

Type	Size	Offset	Default
MMIO	32 bit	4010603Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**TX_TL:** Transmit FIFO Threshold Level. Controls the level of entries (or below) that trigger the TX_EMPTY interrupt (bit 4 in IC_RAW_INTR_STAT register). The valid range is 0-255, with the additional restriction that it may not be set to value larger than the depth of the buffer. If an attempt is made to do that, the actual value set will be the maximum depth of the buffer. A value of 0 sets the threshold for 0 entries, and a value of 255 sets the threshold for 255 entries.

14.1.4.17 IC_CLR_INTR — Offset 40106040h

Clear Combined and Individual Interrupt Register - Clear Combined and Individual Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40106040h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_INTR:** Read this register to clear the combined interrupt, all individual interrupts, and the IC_TX_ABRT_SOURCE register. This bit does not clear hardware clearable interrupts but software clearable interrupts. Refer to Bit 9 of the IC_TX_ABRT_SOURCE register for an exception to clearing IC_TX_ABRT_SOURCE.

14.1.4.18 IC_CLR_RX_UNDER — Offset 40106044h

Clear RX_UNDER Interrupt Register - Clear RX_UNDER Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40106044h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RX_UNDER:** Read this register to clear the RX_UNDER interrupt (bit 0) of the IC_RAW_INTR_STAT register.

14.1.4.19 IC_CLR_RX_OVER — Offset 40106048h

Clear RX_OVER Interrupt Register - Clear RX_OVER Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40106048h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RX_OVER:** Read this register to clear the RX_OVER interrupt (bit 1) of the IC_RAW_INTR_STAT register.

14.1.4.20 IC_CLR_TX_OVER — Offset 4010604Ch

Clear TX_OVER Interrupt Register - Clear TX_OVER Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010604Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_TX_OVER:** Read this register to clear the TX_OVER interrupt (bit 3) of the IC_RAW_INTR_STAT register.

14.1.4.21 IC_CLR_RD_REQ — Offset 40106050h

Clear RD_REQ Interrupt Register - Clear RD_REQ Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40106050h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RD_REQ:** Read this register to clear the RD_REQ interrupt (bit 5) of the IC_RAW_INTR_STAT register.

14.1.4.22 IC_CLR_TX_ABRT — Offset 40106054h

Clear TX_ABRT Interrupt Register - Clear TX_ABRT Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40106054h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_TX_ABRT:** Read this register to clear the TX_ABRT interrupt (bit 6) of the IC_RAW_INTR_STAT register, and the IC_TX_ABRT_SOURCE register. This also releases the TX FIFO from the flushed/reset state, allowing more writes to the TX FIFO. Refer to Bit 9 of the IC_TX_ABRT_SOURCE register for an exception to clearing IC_TX_ABRT_SOURCE.

14.1.4.23 IC_CLR_RX_DONE — Offset 40106058h

Clear RX_DONE Interrupt Register - Clear RX_DONE Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40106058h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RX_DONE:** Read this register to clear the RX_DONE interrupt (bit 7) of the IC_RAW_INTR_STAT register.

14.1.4.24 IC_CLR_ACTIVITY — Offset 4010605Ch

Clear ACTIVITY Interrupt Register - Clear ACTIVITY Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010605Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_ACTIVITY:** Reading this register clears the ACTIVITY interrupt if the I2C is not active anymore. If the I2C module is still active on the bus, the ACTIVITY interrupt bit continues to be set. It is automatically cleared by hardware if the module is disabled and if there is no further activity on the bus. The value read from this register to get status of the ACTIVITY interrupt (bit 8) of the IC_RAW_INTR_STAT register.

14.1.4.25 IC_CLR_STOP_DET — Offset 40106060h

Clear STOP_DET Interrupt Register - Clear STOP_DET Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40106060h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_STOP_DET:** Read this register to clear the STOP_DET interrupt (bit 9) of the IC_RAW_INTR_STAT register.

14.1.4.26 IC_CLR_START_DET — Offset 40106064h

Clear START_DET Interrupt Register - Clear START_DET Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40106064h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_START_DET:** Read this register to clear the START_DET interrupt (bit 10) of the IC_RAW_INTR_STAT register.

14.1.4.27 IC_CLR_GEN_CALL — Offset 40106068h

Clear GEN_CALL Interrupt Register - Clear GEN_CALL Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40106068h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_GEN_CALL:** Read this register to clear the GEN_CALL interrupt (bit 11) of IC_RAW_INTR_STAT register.

14.1.4.28 IC_ENABLE — Offset 4010606Ch

I2C ENABLE Register - I2C Enable Register

Type	Size	Offset	Default
MMIO	32 bit	4010606Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**TX_CMD_BLOCK:** In Master mode: - 1'b1: Blocks the transmission of data on I2C bus even if Tx FIFO has data to transmit. - 1'b0: The transmission of data starts on I2C bus automatically, as soon as the first data is available in the Tx FIFO. Note: To block the execution of Master commands, set the TX_CMD_BLOCK bit only when Tx FIFO is empty (IC_STATUS[2]==1) and Master is in Idle state (IC_STATUS[5] == 0). Any further commands put in the Tx FIFO are not executed until TX_CMD_BLOCK bit is unset.
1	0h RW	**ABORT:** When set, the controller initiates the transfer abort. - 0: ABORT not initiated or ABORT done - 1: ABORT operation in progress The software can abort the I2C transfer in master mode by setting this bit. The software can set this bit only when ENABLE is already set; otherwise, the controller ignores any write to ABORT bit. The software cannot clear the ABORT bit once set. In response to an ABORT, the controller issues a STOP and flushes the Tx FIFO after completing the current transfer, then sets the TX_ABORT interrupt after the abort operation. The ABORT bit is cleared automatically after the abort operation.
0	0h RW	**ENABLE:** Controls whether the DW_apb_i2c is enabled. - 0: Disables DW_apb_i2c (TX and RX FIFOs are held in an erased state) - 1: Enables DW_apb_i2c Software can disable DW_apb_i2c while it is active. However, it is important that care be taken to ensure that DW_apb_i2c is disabled properly. A recommended procedure is described in "Disabling DW_apb_i2c". When DW_apb_i2c is disabled, the following occurs: - The TX FIFO and RX FIFO get flushed. - Status bits in the IC_INTR_STAT register are still active until DW_apb_i2c goes into IDLE state. If the module is transmitting, it stops as well as deletes the contents of the transmit buffer after the current transfer is complete. If the module is receiving, the DW_apb_i2c stops the current transfer at the end of the current byte and does not acknowledge the transfer. In systems with asynchronous pclk and ic_clk when IC_CLK_TYPE parameter set to asynchronous (1), there is a two ic_clk delay when enabling or disabling the DW_apb_i2c.

14.1.4.29 IC_STATUS — Offset 40106070h

I2C STATUS Register - I2C Status Register This is a read-only register used to indicate the current transfer status and FIFO status. The status register may be read at any time. None of the bits in this register request an interrupt. When the I2C is disabled by writing 0 in bit 0 of the IC_ENABLE register: - Bits 1 and 2 are set to 1 - Bits 3 and 10 are set to 0 When the master or slave state machines goes to idle and ic_en=0: - Bits 5 and 6 are set to 0

Type	Size	Offset	Default
MMIO	32 bit	40106070h	00000006h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved**
10	0h RO/V	**SLV_HOLD_RX_FIFO_FULL:** This bit indicates the BUS Hold in Slave mode due to Rx FIFO is Full and an additional byte has been received (This kind of Bus hold is applicable if IC_RX_FULL_HLD_BUS_EN is set to 1).
9	0h RO/V	**SLV_HOLD_TX_FIFO_EMPTY:** This bit indicates the BUS Hold in Slave mode for the Read request when the Tx FIFO is empty. The Bus is in hold until the Tx FIFO has data to Transmit for the read request.
8	0h RO/V	**MST_HOLD_RX_FIFO_FULL:** This bit indicates the BUS Hold in Master mode due to Rx FIFO is Full and additional byte has been received (This kind of Bus hold is applicable if IC_RX_FULL_HLD_BUS_EN is set to 1).
7	0h RO/V	**MST_HOLD_TX_FIFO_EMPTY:** If the IC_EMPTYFIFO_HOLD_MASTER_EN parameter is set to 1, the DW_apb_i2c master stalls the write transfer when Tx FIFO is empty, and the the last byte does not have the Stop bit set. This bit indicates the BUS hold when the master holds the bus because of the Tx FIFO being empty, and the the previous transferred command does not have the Stop bit set. (This kind of Bus hold is applicable if IC_EMPTYFIFO_HOLD_MASTER_EN is set to 1).
6	0h RO/V	**SLV_ACTIVITY:** Slave FSM Activity Status. When the Slave Finite State Machine (FSM) is not in the IDLE state, this bit is set. - 0: Slave FSM is in IDLE state so the Slave part of DW_apb_i2c is not Active - 1: Slave FSM is not in IDLE state so the Slave part of DW_apb_i2c is Active
5	0h RO/V	**MST_ACTIVITY:** Master FSM Activity Status. When the Master Finite State Machine (FSM) is not in the IDLE state, this bit is set. - 0: Master FSM is in IDLE state so the Master part of DW_apb_i2c is not Active - 1: Master FSM is not in IDLE state so the Master part of DW_apb_i2c is Active Note: IC_STATUS[0]-that is, ACTIVITY bit-is the OR of SLV_ACTIVITY and MST_ACTIVITY bits.
4	0h RO/V	**RFF:** Receive FIFO Completely Full. When the receive FIFO is completely full, this bit is set. When the receive FIFO contains one or more empty location, this bit is cleared. - 0: Receive FIFO is not full - 1: Receive FIFO is full
3	0h RO/V	**RFNE:** Receive FIFO Not Empty. This bit is set when the receive FIFO contains one or more entries; it is cleared when the receive FIFO is empty. - 0: Receive FIFO is empty - 1: Receive FIFO is not empty

Bit Range	Default & Access	Field Name (ID): Description
2	1h RO/V	**TFE:** Transmit FIFO Completely Empty. When the transmit FIFO is completely empty, this bit is set. When it contains one or more valid entries, this bit is cleared. This bit field does not request an interrupt. - 0: Transmit FIFO is not empty - 1: Transmit FIFO is empty
1	1h RO/V	**TFNF:** Transmit FIFO Not Full. Set when the transmit FIFO contains one or more empty locations, and is cleared when the FIFO is full. - 0: Transmit FIFO is full - 1: Transmit FIFO is not full
0	0h RO/V	**ACTIVITY:** I2C Activity Status.

14.1.4.30 IC_TXFLR — Offset 40106074h

I2C Transmit FIFO Level Register - I2C Transmit FIFO Level Register This register contains the number of valid data entries in the transmit FIFO buffer. It is cleared whenever: - The I2C is disabled - There is a transmit abort - that is, TX_ABRT bit is set in the IC_RAW_INTR_STAT register - The slave bulk transmit mode is aborted The register increments whenever data is placed into the transmit FIFO and decrements when data is taken from the transmit FIFO.

Type	Size	Offset	Default
MMIO	32 bit	40106074h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:0	00h RO/V	**TXFLR:** Transmit FIFO Level. Contains the number of valid data entries in the transmit FIFO.

14.1.4.31 IC_RXFLR — Offset 40106078h

I2C Receive FIFO Level Register - I2C Receive FIFO Level Register This register contains the number of valid data entries in the receive FIFO buffer. It is cleared whenever: - The I2C is disabled - Whenever there is a transmit abort caused by any of the events tracked in IC_TX_ABRT_SOURCE The register increments whenever data is placed into the receive FIFO and decrements when data is taken from the receive FIFO.

Type	Size	Offset	Default
MMIO	32 bit	40106078h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:0	00h RO/V	**RXFLR:** Receive FIFO Level. Contains the number of valid data entries in the receive FIFO.

14.1.4.32 IC_SDA_HOLD — Offset 4010607Ch

I2C SDA Hold Time Length Register - I2C SDA Hold Time Length Register The bits [15:0] of this register are used to control the hold time of SDA during transmit in both slave and master mode (after SCL goes from HIGH to LOW). The bits [23:16] of this register are used to extend the SDA transition (if any) whenever SCL is HIGH in the receiver in either master or slave mode. Writes to this register succeed only when IC_ENABLE[0]=0. The values in this register are in units of ic_clk period. The value programmed in IC_SDA_TX_HOLD must be greater than the minimum hold time in each mode one cycle in master mode, seven cycles in slave mode for the value to be implemented. The programmed SDA hold time during transmit (IC_SDA_TX_HOLD) cannot exceed at any time the duration of the low part of scl. Therefore the programmed value cannot be larger than N_SCL_LOW-2, where N_SCL_LOW is the duration of the low part of the scl period measured in ic_clk cycles.

Type	Size	Offset	Default
MMIO	32 bit	4010607Ch	00000005h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:16	00h RW	**IC_SDA_RX_HOLD:** Sets the required SDA hold time in units of ic_clk period, when DW_apb_i2c acts as a receiver.
15:0	0005h RW	**IC_SDA_TX_HOLD:** Sets the required SDA hold time in units of ic_clk period, when DW_apb_i2c acts as a transmitter.

14.1.4.33 IC_TX_ABRT_SOURCE — Offset 40106080h

I2C Transmit Abort Source Register - I2C Transmit Abort Source Register This register has 32 bits that indicate the source of the TX_ABRT bit. Except for Bit 9, this register is cleared whenever the IC_CLR_TX_ABRT register or the IC_CLR_INTR register is read. To clear Bit 9, the source of the ABRT_SBYTE_NORSTRT must be fixed first; RESTART must be enabled (IC_CON[5]=1), the SPECIAL bit must be cleared (IC_TAR[11]), or the GC_OR_START bit must be cleared (IC_TAR[10]). Once the source of the ABRT_SBYTE_NORSTRT is fixed, then this bit can be cleared in the same manner as other bits in this register. If the source of the ABRT_SBYTE_NORSTRT is not fixed before attempting to clear this bit, Bit 9 clears for one cycle and is then re-asserted.

Type	Size	Offset	Default
MMIO	32 bit	40106080h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:23	000h RO/V	**TX_FLUSH_CNT:** This field indicates the number of Tx FIFO Data Commands which are flushed due to TX_ABRT interrupt. It is cleared whenever I2C is disabled. Role of DW_apb_i2c: Master-Transmitter or Slave-Transmitter
22:17	0h RO	**Reserved**
16	0h RO/V	**ABRT_USER_ABRT:** This is a master-mode-only bit. Master has detected the transfer abort (IC_ENABLE[1]) Role of DW_apb_i2c: Master-Transmitter
15	0h RO/V	**ABRT_SLVRD_INTX:** 1: When the processor side responds to a slave mode request for data to be transmitted to a remote master and user writes a 1 in CMD (bit 8) of IC_DATA_CMD register. Role of DW_apb_i2c: Slave-Transmitter
14	0h RO/V	**ABRT_SLV_ARBLOST:** This field indicates that a Slave has lost the bus while transmitting data to a remote master. IC_TX_ABRT_SOURCE[12] is set at the same time. Note: Even though the slave never 'owns' the bus, something could go wrong on the bus. This is a fail safe check. For instance, during a data transmission at the low-to-high transition of SCL, if what is on the data bus is not what is supposed to be transmitted, then DW_apb_i2c no longer own the bus. Role of DW_apb_i2c: Slave-Transmitter
13	0h RO/V	**ABRT_SLVFLUSH_TXFIFO:** This field specifies that the Slave has received a read command and some data exists in the TX FIFO, so the slave issues a TX_ABRT interrupt to flush old data in TX FIFO. Role of DW_apb_i2c: Slave-Transmitter
12	0h RO/V	**ARB_LOST:** This field specifies that the Master has lost arbitration, or if IC_TX_ABRT_SOURCE[14] is also set, then the slave transmitter has lost arbitration. Role of DW_apb_i2c: Master-Transmitter or Slave-Transmitter
11	0h RO/V	**ABRT_MASTER_DIS:** This field indicates that the User tries to initiate a Master operation with the Master mode disabled. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver

Bit Range	Default & Access	Field Name (ID): Description
10	0h RO/V	**ABRT_10B_RD_NORSTRT:** This field indicates that the restart is disabled (IC_RESTART_EN bit (IC_CON[5]) =0) and the master sends a read command in 10-bit addressing mode. Role of DW_apb_i2c: Master-Receiver
9	0h RO/V	**ABRT_SBYTE_NORSTRT:** To clear Bit 9, the source of the ABRT_SBYTE_NORSTRT must be fixed first; restart must be enabled (IC_CON[5]=1), the SPECIAL bit must be cleared (IC_TAR[11]), or the GC_OR_START bit must be cleared (IC_TAR[10]). Once the source of the ABRT_SBYTE_NORSTRT is fixed, then this bit can be cleared in the same manner as other bits in this register. If the source of the ABRT_SBYTE_NORSTRT is not fixed before attempting to clear this bit, bit 9 clears for one cycle and then gets reasserted. When this field is set to 1, the restart is disabled (IC_RESTART_EN bit (IC_CON[5]) =0) and the user is trying to send a START Byte. Role of DW_apb_i2c: Master
8	0h RO/V	**ABRT_HS_NORSTRT:** This field indicates that the restart is disabled (IC_RESTART_EN bit (IC_CON[5]) =0) and the user is trying to use the master to transfer data in High Speed mode. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver
7	0h RO/V	**ABRT_SBYTE_ACKDET:** This field indicates that the Master has sent a START Byte and the START Byte was acknowledged (wrong behavior). Role of DW_apb_i2c: Master
6	0h RO/V	**ABRT_HS_ACKDET:** This field indicates that the Master is in High Speed mode and the High Speed Master code was acknowledged (wrong behavior). Role of DW_apb_i2c: Master
5	0h RO/V	**ABRT_GCALL_READ:** This field indicates that DW_apb_i2c in the master mode has sent a General Call but the user programmed the byte following the General Call to be a read from the bus (IC_DATA_CMD[9] is set to 1). Role of DW_apb_i2c: Master-Transmitter
4	0h RO/V	**ABRT_GCALL_NOACK:** This field indicates that DW_apb_i2c in master mode has sent a General Call and no slave on the bus acknowledged the General Call. Role of DW_apb_i2c: Master-Transmitter
3	0h RO/V	**ABRT_TXDATA_NOACK:** This field indicates the master-mode only bit. When the master receives an acknowledgement for the address, but when it sends data byte(s) following the address, it did not receive an acknowledge from the remote slave(s). Role of DW_apb_i2c: Master-Transmitter
2	0h RO/V	**ABRT_10ADDR2_NOACK:** This field indicates that the Master is in 10-bit address mode and that the second address byte of the 10-bit address was not acknowledged by any slave. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver
1	0h RO/V	**ABRT_10ADDR1_NOACK:** This field indicates that the Master is in 10-bit address mode and the first 10-bit address byte was not acknowledged by any slave. Reset value: 0x0 Role of DW_apb_i2c: Master-Transmitter or Master-Receiver
0	0h RO/V	**ABRT_7B_ADDR_NOACK:** This field indicates that the Master is in 7-bit addressing mode and the address sent was not acknowledged by any slave. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver

14.1.4.34 IC_DMA_CR — Offset 40106088h

DMA Control Register - DMA Control Register This register is only valid when DW_apb_i2c is configured with a set of DMA Controller interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist and writing to the register's address has no effect and reading from this register

address will return zero. The register is used to enable the DMA Controller interface operation. There is a separate bit for transmit and receive. This can be programmed regardless of the state of IC_ENABLE.

Type	Size	Offset	Default
MMIO	32 bit	40106088h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1	0h RW	**TDMAE:** Transmit DMA Enable. This bit enables/disables the transmit FIFO DMA channel.
0	0h RW	**RDMAE:** Receive DMA Enable. This bit enables/disables the receive FIFO DMA channel.

14.1.4.35 IC_DMA_TDLR — Offset 4010608Ch

DMA Transmit Data Level Register - DMA Transmit Data Level Register This register is only valid when the DW_apb_i2c is configured with a set of DMA interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist; writing to its address has no effect; reading from its address returns zero.

Type	Size	Offset	Default
MMIO	32 bit	4010608Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:0	00h RW	**DMATDL:** Transmit Data Level. This bit field controls the level at which a DMA request is made by the transmit logic. It is equal to the watermark level; that is, the dma_tx_req signal is generated when the number of valid data entries in the transmit FIFO is equal to or below this field value, and TDMAE = 1.

14.1.4.36 IC_DMA_RDLR — Offset 40106090h

DMA Transmit Data Level Register - I2C Receive Data Level Register This register is only valid when DW_apb_i2c is configured with a set of DMA interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist; writing to its address has no effect; reading from its address returns zero.

Type	Size	Offset	Default
MMIO	32 bit	40106090h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:0	00h RW	**DMARDL:** Receive Data Level. This bit field controls the level at which a DMA request is made by the receive logic. The watermark level = DMARDL+1; that is, dma_rx_req is generated when the number of valid data entries in the receive FIFO is equal to or more than this field value + 1, and RDMAE =1. For instance, when DMARDL is 0, then dma_rx_req is asserted when 1 or more data entries are present in the receive FIFO.

14.1.4.37 IC_SDA_SETUP — Offset 40106094h

I2C SDA Setup Register - I2C SDA Setup Register This register controls the amount of time delay (in terms of number of ic_clk clock periods) introduced in the rising edge of SCL - relative to SDA changing - when DW_apb_i2c services a read request in a slave-transmitter operation. The relevant I2C requirement is tSU:DAT as detailed in the I2C Bus Specification. This register must be programmed with a value equal to or greater than 2. Writes to this register succeed only when IC_ENABLE[0] = 0. Note: The length of setup time is calculated using [(IC_SDA_SETUP - 1) * (ic_clk_period)], so if the user requires 10 ic_clk periods of setup time, they should program a value of 11. The IC_SDA_SETUP register is only used by the DW_apb_i2c when operating as a slave transmitter.

Type	Size	Offset	Default
MMIO	32 bit	40106094h	00000002h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	02h RW	**SDA_SETUP:** SDA Setup. It is recommended that if the required delay is 1000ns, then for an ic_clk frequency of 10 MHz, IC_SDA_SETUP should be programmed to a value of 11. IC_SDA_SETUP must be programmed with a minimum value of 2.

14.1.4.38 IC_ACK_GENERAL_CALL — Offset 40106098h

I2C ACK General Call Register - I2C ACK General Call Register The register controls whether DW_apb_i2c responds with a ACK or NACK when it receives an I2C General Call address. This register is applicable only when the DW_apb_i2c is in slave mode.

Type	Size	Offset	Default
MMIO	32 bit	40106098h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**ACK_GEN_CALL:** ACK General Call. When set to 1, DW_apb_i2c responds with a ACK (by asserting ic_data_oe) when it receives a General Call. Otherwise, DW_apb_i2c responds with a NACK (by negating ic_data_oe).

14.1.4.39 IC_ENABLE_STATUS — Offset 4010609Ch

I2C Enable Status Register - I2C Enable Status Register The register is used to report the DW_apb_i2c hardware status when the IC_ENABLE[0] register is set from 1 to 0; that is, when DW_apb_i2c is disabled. If IC_ENABLE[0] has been set to 1, bits 2:1 are forced to 0, and bit 0 is forced to 1. If IC_ENABLE[0] has been set to 0, bits 2:1 is only be valid as soon as bit 0 is read as '0'. Note: When IC_ENABLE[0] has been set to 0, a delay occurs for bit 0 to be read as 0 because disabling the DW_apb_i2c depends on I2C bus activities.

Type	Size	Offset	Default
MMIO	32 bit	4010609Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2	0h RO/V	**SLV_RX_DATA_LOST:** Slave Received Data Lost. This bit indicates if a Slave-Receiver operation has been aborted with at least one data byte received from an I2C transfer due to the setting bit 0 of IC_ENABLE from 1 to 0. When read as 1, DW_apb_i2c is deemed to have been actively engaged in an aborted I2C transfer (with matching address) and the data phase of the I2C transfer has been entered, even though a data byte has been responded with a NACK. Note: If the remote I2C master terminates the transfer with a STOP condition before the DW_apb_i2c has a chance to NACK a transfer, and IC_ENABLE[0] has been set to 0, then this bit is also set to 1. When read as 0, DW_apb_i2c is deemed to have been disabled without being actively involved in the data phase of a Slave-Receiver transfer. Note: The CPU can safely read this bit when IC_EN (bit 0) is read as 0.
1	0h RO/V	**SLV_DISABLED_WHILE_BUSY:** Slave Disabled While Busy (Transmit, Receive). This bit indicates if a potential or active Slave operation has been aborted due to the setting bit 0 of the IC_ENABLE register from 1 to 0. This bit is set when the CPU writes a 0 to the IC_ENABLE register while: (a) DW_apb_i2c is receiving the address byte of the Slave-Transmitter operation from a remote master; OR, (b) address and data bytes of the Slave-Receiver operation from a remote master. When read as 1, DW_apb_i2c is deemed to have forced a NACK during any part of an I2C transfer, irrespective of whether the I2C address matches the slave address set in DW_apb_i2c (IC_SAR register) OR if the transfer is completed before IC_ENABLE is set to 0 but has not taken effect. Note: If the remote I2C master terminates the transfer with a STOP condition before the DW_apb_i2c has a chance to NACK a transfer, and IC_ENABLE[0] has been set to 0, then this bit will also be set to 1. When read as 0, DW_apb_i2c is deemed to have been disabled when there is master activity, or when the I2C bus is idle. Note: The CPU can safely read this bit when IC_EN (bit 0) is read as 0.
0	0h RO/V	**IC_EN:** ic_en Status. This bit always reflects the value driven on the output port ic_en. - When read as 1, DW_apb_i2c is deemed to be in an enabled state. - When read as 0, DW_apb_i2c is deemed completely inactive. Note: The CPU can safely read this bit anytime. When this bit is read as 0, the CPU can safely read SLV_RX_DATA_LOST (bit 2) and SLV_DISABLED_WHILE_BUSY (bit 1).

14.1.4.40 IC_FS_SPKLEN — Offset 401060A0h

I2C SS, FS or FM+ spike suppression limit - I2C SS, FS or FM+ spike suppression limit This register is used to store the duration, measured in ic_clk cycles, of the longest spike that is filtered out by the spike suppression logic w hen the component is operating in SS, FS or FM+ modes. This register must be programmed with a minimum value of 1.

Type	Size	Offset	Default
MMIO	32 bit	401060A0h	00000005h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	05h RW	**IC_FS_SPKLEN:** This register must be set before any I2C bus transaction can take place to ensure stable operation. This register sets the duration, measured in ic_clk cycles, of the longest spike in the SCL or SDA lines that will be filtered out by the spike suppression logic. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. The minimum valid value is 1; hardware prevents values less than this being written, and if attempted results in 1 being set.

14.1.4.41 IC_HS_SPKLEN — Offset 401060A4h

I2C HS spike suppression limit register - I2C HS spike suppression limit register This register is used to store the duration, measured in ic_clk cycles, of the longest spike that is filtered out by the spike suppression logic when the component is operating in HS modes. This register must be programmed with a minimum value of 1 and is implemented only if the component is configured to support HS mode; that is, if the IC_MAX_SPEED_MODE parameter is set to 3.

Type	Size	Offset	Default
MMIO	32 bit	401060A4h	00000002h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	02h RW	**IC_HS_SPKLEN:** This register must be set before any I2C bus transaction can take place to ensure stable operation. This register sets the duration, measured in ic_clk cycles, of the longest spike in the SCL or SDA lines that will be filtered out by the spike suppression logic. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. The minimum valid value is 1; hardware prevents values less than this being written, and if attempted results in 1 being set.

14.1.4.42 IC_CLR_RESTART_DET — Offset 401060A8h

Clear RESTART_DET Interrupt Register - Clear RESTART_DET Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	401060A8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RESTART_DET:** Read this register to clear the RESTART_DET interrupt (bit 12) of IC_RAW_INTR_STAT register.

14.1.4.43 IC_COMP_PARAM_1 — Offset 401060F4h

Component Parameter Register 1 - Component Parameter Register 1 Note This is a constant read-only register that contains encoded information about the component's parameter settings. The reset value depends on coreConsultant parameter(s).

Type	Size	Offset	Default
MMIO	32 bit	401060F4h	003F3FEEh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:16	3Fh RO/V	**TX_BUFFER_DEPTH:** The value of this register is derived from the IC_TX_BUFFER_DEPTH coreConsultant parameter. - 0x00 = Reserved - 0x01 = 2 - 0x02 = 3 - ... - 0xFF = 256
15:8	3Fh RO/V	**RX_BUFFER_DEPTH:** The value of this register is derived from the IC_RX_BUFFER_DEPTH coreConsultant parameter. - 0x00: Reserved - 0x01: 2 - 0x02: 3 - ... - 0xFF: 256
7	1h RO/V	**ADD_ENCODED_PARAMS:** The value of this register is derived from the IC_ADD_ENCODED_PARAMS coreConsultant parameter. Reading 1 in this bit means that the capability of reading these encoded parameters via software has been included. Otherwise, the entire register is 0 regardless of the setting of any other parameters that are encoded in the bits.

Bit Range	Default & Access	Field Name (ID): Description
6	1h RO/V	**HAS_DMA:** The value of this register is derived from the IC_HAS_DMA coreConsultant parameter.
5	1h RO/V	**INTR_IO:** The value of this register is derived from the IC_INTR_IO coreConsultant parameter.
4	0h RO/V	**HC_COUNT_VALUES:** The value of this register is derived from the IC_HC_COUNT VALUES coreConsultant parameter.
3:2	3h RO/V	**MAX_SPEED_MODE:** The value of this register is derived from the IC_MAX_SPEED_MODE coreConsultant parameter. - 0x0: Reserved - 0x1: Standard - 0x2: Fast - 0x3: High
1:0	2h RO/V	**APB_DATA_WIDTH:** The value of this register is derived from the APB_DATA_WIDTH coreConsultant parameter.

14.1.4.44 IC_COMP_VERSION — Offset 401060F8h

I2C Component Version Register - I2C Component Version Register

Type	Size	Offset	Default
MMIO	32 bit	401060F8h	3230322Ah

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	3230322Ah RO/V	**IC_COMP_VERSION:**

14.1.4.45 IC_COMP_TYPE — Offset 401060FCh

I2C Component Type Register - I2C Component Type Register

14.1.5.1 IC_CON — Offset 40108000h

I2C Control Register - I2C Control Register. This register can be written only when the DW_apb_i2c is disabled, which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. Read/Write Access: - If configuration parameter I2C_DYNAMIC_TAR_UPDATE=1, bit 4 is read only. - If configuration parameter IC_RX_FULL_HLD_BUS_EN =0, bit 9 is read only. - If configuration parameter IC_STOP_DET_IF_MASTER_ACTIVE =0, bit 10 is read only. - If configuration parameter IC_BUS_CLEAR_FEATURE=0, bit 11 is read only - If configuration parameter IC_OPTIONAL_SAR=0, bit 16 is read only - If configuration parameter IC_SMBUS=0, bit 17 is read only - If configuration parameter IC_SMBUS_ARP=0, bits 18 and 19 are read only.

Type	Size	Offset	Default
MMIO	32 bit	40108000h	00000067h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved**
10	0h RW	**STOP_DET_IF_MASTER_ACTIVE:** In Master mode: - 1'b1: issues the STOP_DET interrupt only when master is active. - 1'b0: issues the STOP_DET irrespective of whether master is active or not.
9	0h RW	**RX_FIFO_FULL_HLD_CTRL:** This bit controls whether DW_apb_i2c should hold the bus when the Rx FIFO is physically full to its RX_BUFFER_DEPTH, as described in the IC_RX_FULL_HLD_BUS_EN parameter.
8	0h RW	**TX_EMPTY_CTRL:** This bit controls the generation of the TX_EMPTY interrupt, as described in the IC_RAW_INTR_STAT register.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**STOP_DET_IFADDRESSED:** In slave mode: - 1'b1: issues the STOP_DET interrrupt only when it is addressed. - 0'b0: issues the STOP_DET irrespective of whether it's addressed or not. NOTE: During a general call address, this slave does not issue the STOP_DET interrupt if STOP_DET_IF_ADDRESSED = 1'b1, even if the slave responds to the general call address by generating ACK. The STOP_DET interrupt is generated only when the transmitted address matches the slave address (SAR).
6	1h RW	**IC_SLAVE_DISABLE:** This bit controls whether I2C has its slave disabled, which means once the presetn signal is applied, then this bit takes on the value of the configuration parameter IC_SLAVE_DISABLE. You have the choice of having the slave enabled or disabled after reset is applied, which means software does not have to configure the slave. By default, the slave is always enabled (in reset state as well). If you need to disable it after reset, set this bit to 1. If this bit is set (slave is disabled), DW_apb_i2c functions only as a master and does not perform any action that requires a slave. NOTE: Software should ensure that if this bit is written with 0, then bit 0 should also be written with a 0.
5	1h RW	**IC_RESTART_EN:** Determines whether RESTART conditions may be sent when acting as a master. Some older slaves do not support handling RESTART conditions; however, RESTART conditions are used in several DW_apb_i2c operations. When RESTART is disabled, the master is prohibited from performing the following functions: - Sending a START BYTE - Performing any high-speed mode operation - High-speed mode operation - Performing direction changes in combined format mode - Performing a read operation with a 10-bit address By replacing RESTART condition followed by a STOP and a subsequent START condition, split operations are broken down into multiple DW_apb_i2c transfers. If the above operations are performed, it will result in setting bit 6 (TX_ABRT) of the IC_RAW_INTR_STAT register. .
4	0h RO/V	**IC_10BITADDR_MASTER_RD_ONLY:** If the I2C_DYNAMIC_TAR_UPDATE configuration parameter is set to 'No' (0), this bit is named IC_10BITADDR_MASTER and controls whether the DW_apb_i2c starts its transfers in 7 or 10-bit addressing mode when acting as a master. If I2C_DYNAMIC_TAR_UPDATE is set to 'Yes' (1), the function of this bit is handled by bit 12 of IC_TAR register, and becomes a read-only copy called IC_10BITADDR_MASTER_rd_only. - 0: 7-bit addressing - 1: 10-bit addressing
3	0h RW	**IC_10BITADDR_SLAVE:** When acting as a slave, this bit controls whether the DW_apb_i2c responds to 7- or 10-bit addresses. - 0: 7-bit addressing. The DW_apb_i2c ignores transactions that involve 10-bit addressing; for 7-bit addressing, only the lower 7 bits of the IC_SAR register are compared. - 1: 10-bit addressing. The DW_apb_i2c responds to only 10-bit addressing transfers that match the full 10 bits of the IC_SAR register.
2:1	3h RW	**SPEED:** These bits control at which speed the DW_apb_i2c operates; its setting is relevant only if one is operating the DW_apb_i2c in master mode. Hardware protects against illegal values being programmed by software. These bits must be programmed appropriately for slave mode also, as it is used to capture correct value of spike filter as per the speed mode. This register should be programmed only with a value in the range of 1 to IC_MAX_SPEED_MODE; otherwise, hardware updates this register with the value of IC_MAX_SPEED_MODE. 1: standard mode (100 kbit/s) 2: fast mode (<=400 kbit/s) or fast mode plus (<=1000Kbit/s) 3: high speed mode (3.4 Mbit/s) Note: This field is not applicable when IC_ULTRA_FAST_MODE=1
0	1h RW	**MASTER_MODE:** This bit controls whether the DW_apb_i2c master is enabled. NOTE: Software should ensure that if this bit is written with '1' then bit 6 should also be written with a '1'.

14.1.5.2 IC_TAR — Offset 40108004h

I2C Target Address Register - I2C Target Address Register If the configuration parameter I2C_DYNAMIC_TAR_UPDATE is set to 'No' (0), this register is 12 bits wide, and bits 31:12 are reserved. This register can be written to only when IC_ENABLE[0] is set to 0. However, if I2C_DYNAMIC_TAR_UPDATE = 1, then the register becomes 13

bits wide. In this case, writes to IC_TAR succeed when one of the following conditions are true: - DW_apb_i2c is NOT enabled (IC_ENABLE[0] is set to 0); or - DW_apb_i2c is enabled (IC_ENABLE[0]=1); AND DW_apb_i2c is NOT engaged in any Master (tx, rx) operation (IC_STATUS[5]=0); AND DW_apb_i2c is enabled to operate in Master mode (IC_CON[0]=1); AND there are NO entries in the TX FIFO (IC_STATUS[2]=1) You can change the TAR address dynamically without losing the bus, only if the following conditions are met. - DW_apb_i2c is enabled (IC_ENABLE[0]=1); AND IC_EMPTYFIFO_HOLD_MASTER_EN configuration parameter is set to 1; AND DW_apb_i2c is enabled to operate in Master mode (IC_CON[0]=1); AND there are NO entries in the Tx FIFO and the master is in HOLD state (IC_INTR_STAT[13]=1). Note: If the software or application is aware that the DW_apb_i2c is not using the TAR address for the pending commands in the Tx FIFO, then it is possible to update the TAR address even while the Tx FIFO has entries (IC_STATUS[2]= 0). - It is not necessary to perform any write to this register if DW_apb_i2c is enabled as an I2C slave only.

Type	Size	Offset	Default
MMIO	32 bit	40108004h	00000055h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	**Reserved**
12	0h RW	**IC_10BITADDR_MASTER:** This bit controls whether the DW_apb_i2c starts its transfers in 7- or 10-bit addressing mode when acting as a master. - 0: 7-bit addressing - 1: 10-bit addressing
11	0h RW	**SPECIAL:** This bit indicates whether software performs a Device-ID or General Call or START BYTE command. - 0: ignore bit 10 GC_OR_START and use IC_TAR normally - 1: perform special I2C command as specified in Device_ID or GC_OR_START bit
10	0h RW	**GC_OR_START:** If bit 11 (SPECIAL) is set to 1 and bit 13(Device-ID) is set to 0, then this bit indicates whether a General Call or START byte command is to be performed by the DW_apb_i2c. - 0: General Call Address - after issuing a General Call, only writes may be performed. Attempting to issue a read command results in setting bit 6 (TX_ABRT) of the IC_RAW_INTR_STAT register. The DW_apb_i2c remains in General Call mode until the SPECIAL bit value (bit 11) is cleared. - 1: START BYTE
9:0	055h RW	**IC_TAR:** This is the target address for any master transaction. When transmitting a General Call, these bits are ignored. To generate a START BYTE, the CPU needs to write only once into these bits. If the IC_TAR and IC_SAR are the same, loopback exists but the FIFOs are shared between master and slave, so full loopback is not feasible. Only one direction loopback mode is supported (simplex), not duplex. A master cannot transmit to itself; it can transmit to only a slave.

14.1.5.3 IC_SAR — Offset 40108008h

I2C Slave Address Register - I2C Slave Address Register

Type	Size	Offset	Default
MMIO	32 bit	40108008h	00000055h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:0	055h RW	**IC_SAR:** The IC_SAR holds the slave address when the I2C is operating as a slave. For 7-bit addressing, only IC_SAR[6:0] is used. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. Note: The default values cannot be any of the reserved address locations: that is, 0x00 to 0x07, or 0x78 to 0x7f. The correct operation of the device is not guaranteed if you program the IC_SAR or IC_TAR to a reserved value.

14.1.5.4 IC_HS_MADDR — Offset 4010800Ch

I2C High Speed Master Mode Code Address Register - I2C High Speed Master Mode Code Address Register

Type	Size	Offset	Default
MMIO	32 bit	4010800Ch	00000001h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2:0	1h RW	**IC_HS_MAR:** This bit field holds the value of the I2C HS mode master code. HS-mode master codes are reserved 8-bit codes (00001xxx) that are not used for slave addressing or other purposes. Each master has its unique master code; up to eight high-speed mode masters can be present on the same I2C bus system. Valid values are from 0 to 7. This register goes away and becomes read-only returning 0's if the IC_MAX_SPEED_MODE configuration parameter is set to either Standard (1) or Fast (2). This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect.

14.1.5.5 IC_DATA_CMD — Offset 40108010h

I2C Rx/Tx Data Buffer and Command Register - I2C Rx/Tx Data Buffer and Command Register; this is the register the CPU writes to when filling the TX FIFO and the CPU reads from when retrieving bytes from RX FIFO. The size of the register changes as follows: Write: - 11 bits when IC_EMPTYFIFO_HOLD_MASTER_EN=1 - 9 bits when IC_EMPTYFIFO_HOLD_MASTER_EN=0 Read: - 12 bits when IC_FIRST_DATA_BYTE_STATUS = 1 - 8 bits when IC_FIRST_DATA_BYTE_STATUS = 0 Note: In order for the DW_apb_i2c to continue acknowledging reads, a read command should be written for every byte that is to be received; otherwise the DW_apb_i2c will stop acknowledging.

Type	Size	Offset	Default
MMIO	32 bit	40108010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RO/V	**FIRST_DATA_BYTE:** Indicates the first data byte received after the address phase for receive transfer in Master receiver or Slave receiver mode. NOTE: In case of APB_DATA_WIDTH=8, 1. The user has to perform two APB Reads to IC_DATA_CMD in order to get status on 11 bit. 2. Inorder to read the 11 bit, the user has to perform the first data byte read [7:0] (offset 0x10) and then perform the second read[15:8](offset 0x11) in order to know the status of 11 bit (whether the data received in previous read is a first data byte or not). 3. The 11th bit is an optional read field, user can ignore 2nd byte read [15:8] (offset 0x11) if not interested in FIRST_DATA_BYTE status.
10	0h WO	**RESTART:** This bit controls whether a RESTART is issued before the byte is sent or received. This bit is available only if IC_EMPTYFIFO_HOLD_MASTER_EN is configured to 1. 1 - If IC_RESTART_EN is 1, a RESTART is issued before the data is sent/received (according to the value of CMD), regardless of whether or not the transfer direction is changing from the previous command; if IC_RESTART_EN is 0, a STOP followed by a START is issued instead. 0 - If IC_RESTART_EN is 1, a RESTART is issued only if the transfer direction is changing from the previous command; if IC_RESTART_EN is 0, a STOP followed by a START is issued instead.

Bit Range	Default & Access	Field Name (ID): Description
9	0h WO	**STOP:** This bit controls whether a STOP is issued after the byte is sent or received. This bit is available only if IC_EMPTYFIFO_HOLD_MASTER_EN is configured to 1. - 1 - STOP is issued after this byte, regardless of whether or not the Tx FIFO is empty. If the Tx FIFO is not empty, the master immediately tries to start a new transfer by issuing a START and arbitrating for the bus. - 0 - STOP is not issued after this byte, regardless of whether or not the Tx FIFO is empty. If the Tx FIFO is not empty, the master continues the current transfer by sending/receiving data bytes according to the value of the CMD bit. If the Tx FIFO is empty, the master holds the SCL line low and stalls the bus until a new command is available in the Tx FIFO.
8	0h WO	**CMD:** This bit controls whether a read or a write is performed. This bit does not control the direction when the DW_apb_i2c acts as a slave. It controls only the direction when it acts as a master. When a command is entered in the TX FIFO, this bit distinguishes the write and read commands. In slave-receiver mode, this bit is a "don't care" because writes to this register are not required. In slave-transmitter mode, a "0" indicates that the data in IC_DATA_CMD is to be transmitted. When programming this bit, you should remember the following: attempting to perform a read operation after a General Call command has been sent results in a TX_ABRT interrupt (bit 6 of the IC_RAW_INTR_STAT register), unless bit 11 (SPECIAL) in the IC_TAR register has been cleared. If a "1" is written to this bit after receiving a RD_REQ interrupt, then a TX_ABRT interrupt occurs.
7:0	00h RW/V	**DAT:** This register contains the data to be transmitted or received on the I2C bus. If you are writing to this register and want to perform a read, bits 7:0 (DAT) are ignored by the DW_apb_i2c. However, when you read this register, these bits return the value of data received on the DW_apb_i2c interface.

14.1.5.6 IC_SS_SCL_HCNT — Offset 40108014h

Standard Speed I2C Clock SCL High Count Register - Standard Speed I2C Clock SCL High Count Register

Type	Size	Offset	Default
MMIO	32 bit	40108014h	000001E8h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	01E8h RW	**IC_SS_SCL_HCNT:** This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock high-period count for standard speed. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. The minimum valid value is 6; hardware prevents values less than this being written, and if attempted results in 6 being set. For designs with APB_DATA_WIDTH = 8, the order of programming is important to ensure the correct operation of the DW_apb_i2c. The lower byte must be programmed first. Then the upper byte is programmed. When the configuration parameter IC_HC_COUNT_VALUES is set to 1, this register is read only. NOTE: This register must not be programmed to a value higher than 65525, because DW_apb_i2c uses a 16-bit counter to flag an I2C bus idle condition when this counter reaches a value of IC_SS_SCL_HCNT + 10.

14.1.5.7 IC_SS_SCL_LCNT — Offset 40108018h

Standard Speed I2C Clock SCL Low Count Register - Standard Speed I2C Clock SCL Low Count Register

11	0h RO/V	**R_GEN_CALL:** See IC_RAW_INTR_STAT for a detailed description of R_GEN_CALL bit.

Bit Range	Default & Access	Field Name (ID): Description
10	0h RO/V	**R_START_DET:** See IC_RAW_INTR_STAT for a detailed description of R_START_DET bit.
9	0h RO/V	**R_STOP_DET:** See IC_RAW_INTR_STAT for a detailed description of R_STOP_DET bit.
8	0h RO/V	**R_ACTIVITY:** See IC_RAW_INTR_STAT for a detailed description of R_ACTIVITY bit.
7	0h RO/V	**R_RX_DONE:** See IC_RAW_INTR_STAT for a detailed description of R_RX_DONE bit.
6	0h RO/V	**R_TX_ABRT:** See IC_RAW_INTR_STAT for a detailed description of R_TX_ABRT bit.
5	0h RO/V	**R_RD_REQ:** See IC_RAW_INTR_STAT for a detailed description of R_RD_REQ bit.
4	0h RO/V	**R_TX_EMPTY:** See IC_RAW_INTR_STAT for a detailed description of R_TX_EMPTY bit.
3	0h RO/V	**R_TX_OVER:** See IC_RAW_INTR_STAT for a detailed description of R_TX_OVER bit.
2	0h RO/V	**R_RX_FULL:** See IC_RAW_INTR_STAT for a detailed description of R_RX_FULL bit.
1	0h RO/V	**R_RX_OVER:** See IC_RAW_INTR_STAT for a detailed description of R_RX_OVER bit.
0	0h RO/V	**R_RX_UNDER:** See IC_RAW_INTR_STAT for a detailed description of R_RX_UNDER bit.

14.1.5.13 IC_INTR_MASK — Offset 40108030h

I2C Interrupt Mask Register - I2C Interrupt Mask Register. These bits mask their corresponding interrupt status bits. This register is active low; a value of 0 masks the interrupt, whereas a value of 1 unmasks the interrupt.

Type	Size	Offset	Default
MMIO	32 bit	40108030h	000008FFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13	0h RW	**M_MASTER_ON_HOLD:** This bit masks the R_MASTER_ON_HOLD interrupt in IC_INTR_STAT register.
12	0h RW	**M_RESTART_DET:** This bit masks the R_RESTART_DET interrupt in IC_INTR_STAT register.

Bit Range	Default & Access	Field Name (ID): Description
11	1h RW	**M_GEN_CALL:** This bit masks the R_GEN_CALL interrupt in IC_INTR_STAT register.
10	0h RW	**M_START_DET:** This bit masks the R_START_DET interrupt in IC_INTR_STAT register.
9	0h RW	**M_STOP_DET:** This bit masks the R_STOP_DET interrupt in IC_INTR_STAT register.
8	0h RW	**M_ACTIVITY:** This bit masks the R_ACTIVITY interrupt in IC_INTR_STAT register.
7	1h RW	**M_RX_DONE:** This bit masks the R_RX_DONE interrupt in IC_INTR_STAT register.
6	1h RW	**M_TX_ABRT:** This bit masks the R_TX_ABRT interrupt in IC_INTR_STAT register.
5	1h RW	**M_RD_REQ:** This bit masks the R_RD_REQ interrupt in IC_INTR_STAT register.
4	1h RW	**M_TX_EMPTY:** This bit masks the R_TX_EMPTY interrupt in IC_INTR_STAT register.
3	1h RW	**M_TX_OVER:** This bit masks the R_TX_OVER interrupt in IC_INTR_STAT register.
2	1h RW	**M_RX_FULL:** This bit masks the R_RX_FULL interrupt in IC_INTR_STAT register.
1	1h RW	**M_RX_OVER:** This bit masks the R_RX_OVER interrupt in IC_INTR_STAT register.
0	1h RW	**M_RX_UNDER:** This bit masks the R_RX_UNDER interrupt in IC_INTR_STAT register.

14.1.5.14 IC_RAW_INTR_STAT — Offset 40108034h

I2C Raw Interrupt Status Register - I2C Raw Interrupt Status Register Unlike the IC_INTR_STAT register, these bits are not masked so they always show the true status of the DW_apb_i2c.

Type	Size	Offset	Default
MMIO	32 bit	40108034h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13	0h RO/V	**MASTER_ON_HOLD:** Indicates whether master is holding the bus and TX FIFO is empty. Enabled only when I2C_DYNAMIC_TAR_UPDATE=1 and IC_EMPTYFIFO_HOLD_MASTER_EN=1.
12	0h RO/V	**RESTART_DET:** Indicates whether a RESTART condition has occurred on the I2C interface when DW_apb_i2c is operating in Slave mode and the slave is being addressed. Enabled only when IC_SLV_RESTART_DET_EN=1. Note: However, in high-speed mode or during a START BYTE transfer, the RESTART comes before the address field as per the I2C protocol. In this case, the slave is not the addressed slave when the RESTART is issued, therefore DW_apb_i2c does not generate the RESTART_DET interrupt.
11	0h RO/V	**GEN_CALL:** Set only when a General Call address is received and it is acknowledged. It stays set until it is cleared either by disabling DW_apb_i2c or when the CPU reads bit 0 of the IC_CLR_GEN_CALL register. DW_apb_i2c stores the received data in the Rx buffer.
10	0h RO/V	**START_DET:** Indicates whether a START or RESTART condition has occurred on the I2C interface regardless of whether DW_apb_i2c is operating in slave or master mode.
9	0h RO/V	**STOP_DET:** Indicates whether a STOP condition has occurred on the I2C interface regardless of whether DW_apb_i2c is operating in slave or master mode. In Slave Mode: - If IC_CON[7]=1'b1 (STOP_DET_IFADDRESSED), the STOP_DET interrupt will be issued only if slave is addressed. Note: During a general call address, this slave does not issue a STOP_DET interrupt if STOP_DET_IF_ADDRESSED=1'b1, even if the slave responds to the general call address by generating ACK. The STOP_DET interrupt is generated only when the transmitted address matches the slave address (SAR). - If IC_CON[7]=1'b0 (STOP_DET_IFADDRESSED), the STOP_DET interrupt is issued irrespective of whether it is being addressed. In Master Mode: - If IC_CON[10]=1'b1 (STOP_DET_IF_MASTER_ACTIVE),the STOP_DET interrupt will be issued only if Master is active. - If IC_CON[10]=1'b0 (STOP_DET_IFADDRESSED),the STOP_DET interrupt will be issued irrespective of whether master is active or not.
8	0h RO/V	**ACTIVITY:** This bit captures DW_apb_i2c activity and stays set until it is cleared. There are four ways to clear it: - Disabling the DW_apb_i2c - Reading the IC_CLR_ACTIVITY register - Reading the IC_CLR_INTR register - System reset Once this bit is set, it stays set unless one of the four methods is used to clear it. Even if the DW_apb_i2c module is idle, this bit remains set until cleared, indicating that there was activity on the bus.
7	0h RO/V	**RX_DONE:** When the DW_apb_i2c is acting as a slave-transmitter, this bit is set to 1 if the master does not acknowledge a transmitted byte. This occurs on the last byte of the transmission, indicating that the transmission is done.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RO/V	**TX_ABRT:** This bit indicates if DW_apb_i2c, as an I2C transmitter, is unable to complete the intended actions on the contents of the transmit FIFO. This situation can occur both as an I2C master or an I2C slave, and is referred to as a 'transmit abort'. When this bit is set to 1, the IC_TX_ABRT_SOURCE register indicates the reason why the transmit abort takes places. Note: The DW_apb_i2c flushes/resets/empties only the TX_FIFO whenever there is a transmit abort caused by any of the events tracked by the IC_TX_ABRT_SOURCE register. The Tx FIFO remains in this flushed state until the register IC_CLR_TX_ABRT is read. Once this read is performed, the Tx FIFO is then ready to accept more data bytes from the APB interface. RX FIFO flush because of TX_ABRT is controlled by the coreConsultant parameter IC_AVOID_RX_FIFO_FLUSH_ON_TX_ABRT.
5	0h RO/V	**RD_REQ:** This bit is set to 1 when DW_apb_i2c is acting as a slave and another I2C master is attempting to read data from DW_apb_i2c. The DW_apb_i2c holds the I2C bus in a wait state (SCL=0) until this interrupt is serviced, which means that the slave has been addressed by a remote master that is asking for data to be transferred. The processor must respond to this interrupt and then write the requested data to the IC_DATA_CMD register. This bit is set to 0 just after the processor reads the IC_CLR_RD_REQ register.
4	0h RO/V	**TX_EMPTY:** The behavior of the TX_EMPTY interrupt status differs based on the TX_EMPTY_CTRL selection in the IC_CON register. - When TX_EMPTY_CTRL = 0: This bit is set to 1 when the transmit buffer is at or below the threshold value set in the IC_TX_TL register. - When TX_EMPTY_CTRL = 1: This bit is set to 1 when the transmit buffer is at or below the threshold value set in the IC_TX_TL register and the transmission of the address/data from the internal shift register for the most recently popped command is completed. It is automatically cleared by hardware when the buffer level goes above the threshold. When IC_ENABLE[0] is set to 0, the TX FIFO is flushed and held in reset. There the TX FIFO looks like it has no data within it, so this bit is set to 1, provided there is activity in the master or slave state machines. When there is no longer any activity, then with ic_en=0, this bit is set to 0.
3	0h RO/V	**TX_OVER:** Set during transmit if the transmit buffer is filled to IC_TX_BUFFER_DEPTH and the processor attempts to issue another I2C command by writing to the IC_DATA_CMD register. When the module is disabled, this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared.
2	0h RO/V	**RX_FULL:** Set when the receive buffer reaches or goes above the RX_TL threshold in the IC_RX_TL register. It is automatically cleared by hardware when buffer level goes below the threshold. If the module is disabled (IC_ENABLE[0]=0), the RX FIFO is flushed and held in reset; therefore the RX FIFO is not full. So this bit is cleared once the IC_ENABLE bit 0 is programmed with a 0, regardless of the activity that continues.
1	0h RO/V	**RX_OVER:** Set if the receive buffer is completely filled to IC_RX_BUFFER_DEPTH and an additional byte is received from an external I2C device. The DW_apb_i2c acknowledges this, but any data bytes received after the FIFO is full are lost. If the module is disabled (IC_ENABLE[0]=0), this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared. Note: If the configuration parameter IC_RX_FULL_HLD_BUS_EN is enabled and bit 9 of the IC_CON register (RX_FIFO_FULL_HLD_CTRL) is programmed to HIGH, then the RX_OVER interrupt never occurs, because the Rx FIFO never overflows.
0	0h RO/V	**RX_UNDER:** Set if the processor attempts to read the receive buffer when it is empty by reading from the IC_DATA_CMD register. If the module is disabled (IC_ENABLE[0]=0), this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared.

14.1.5.15 IC_RX_TL — Offset 40108038h

I2C Receive FIFO Threshold Register - I2C Receive FIFO Threshold Register

Type	Size	Offset	Default
MMIO	32 bit	40108038h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**RX_TL:** Receive FIFO Threshold Level. Controls the level of entries (or above) that triggers the RX_FULL interrupt (bit 2 in IC_RAW_INTR_STAT register). The valid range is 0-255, with the additional restriction that hardware does not allow this value to be set to a value larger than the depth of the buffer. If an attempt is made to do that, the actual value set will be the maximum depth of the buffer. A value of 0 sets the threshold for 1 entry, and a value of 255 sets the threshold for 256 entries.

14.1.5.16 IC_TX_TL — Offset 4010803Ch

I2C Transmit FIFO Threshold Register - I2C Transmit FIFO Threshold Register

Type	Size	Offset	Default
MMIO	32 bit	4010803Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**TX_TL:** Transmit FIFO Threshold Level. Controls the level of entries (or below) that trigger the TX_EMPTY interrupt (bit 4 in IC_RAW_INTR_STAT register). The valid range is 0-255, with the additional restriction that it may not be set to value larger than the depth of the buffer. If an attempt is made to do that, the actual value set will be the maximum depth of the buffer. A value of 0 sets the threshold for 0 entries, and a value of 255 sets the threshold for 255 entries.

14.1.5.17 IC_CLR_INTR — Offset 40108040h

Clear Combined and Individual Interrupt Register - Clear Combined and Individual Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40108040h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_INTR:** Read this register to clear the combined interrupt, all individual interrupts, and the IC_TX_ABRT_SOURCE register. This bit does not clear hardware clearable interrupts but software clearable interrupts. Refer to Bit 9 of the IC_TX_ABRT_SOURCE register for an exception to clearing IC_TX_ABRT_SOURCE.

14.1.5.18 IC_CLR_RX_UNDER — Offset 40108044h

Clear RX_UNDER Interrupt Register - Clear RX_UNDER Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40108044h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RX_UNDER:** Read this register to clear the RX_UNDER interrupt (bit 0) of the IC_RAW_INTR_STAT register.

14.1.5.19 IC_CLR_RX_OVER — Offset 40108048h

Clear RX_OVER Interrupt Register - Clear RX_OVER Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40108048h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RX_OVER:** Read this register to clear the RX_OVER interrupt (bit 1) of the IC_RAW_INTR_STAT register.

14.1.5.20 IC_CLR_TX_OVER — Offset 4010804Ch

Clear TX_OVER Interrupt Register - Clear TX_OVER Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010804Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_TX_OVER:** Read this register to clear the TX_OVER interrupt (bit 3) of the IC_RAW_INTR_STAT register.

14.1.5.21 IC_CLR_RD_REQ — Offset 40108050h

Clear RD_REQ Interrupt Register - Clear RD_REQ Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40108050h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RD_REQ:** Read this register to clear the RD_REQ interrupt (bit 5) of the IC_RAW_INTR_STAT register.

14.1.5.22 IC_CLR_TX_ABRT — Offset 40108054h

Clear TX_ABRT Interrupt Register - Clear TX_ABRT Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40108054h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_TX_ABRT:** Read this register to clear the TX_ABRT interrupt (bit 6) of the IC_RAW_INTR_STAT register, and the IC_TX_ABRT_SOURCE register. This also releases the TX FIFO from the flushed/reset state, allowing more writes to the TX FIFO. Refer to Bit 9 of the IC_TX_ABRT_SOURCE register for an exception to clearing IC_TX_ABRT_SOURCE.

14.1.5.23 IC_CLR_RX_DONE — Offset 40108058h

Clear RX_DONE Interrupt Register - Clear RX_DONE Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40108058h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RX_DONE:** Read this register to clear the RX_DONE interrupt (bit 7) of the IC_RAW_INTR_STAT register.

14.1.5.24 IC_CLR_ACTIVITY — Offset 4010805Ch

Clear ACTIVITY Interrupt Register - Clear ACTIVITY Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010805Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_ACTIVITY:** Reading this register clears the ACTIVITY interrupt if the I2C is not active anymore. If the I2C module is still active on the bus, the ACTIVITY interrupt bit continues to be set. It is automatically cleared by hardware if the module is disabled and if there is no further activity on the bus. The value read from this register to get status of the ACTIVITY interrupt (bit 8) of the IC_RAW_INTR_STAT register.

14.1.5.25 IC_CLR_STOP_DET — Offset 40108060h

Clear STOP_DET Interrupt Register - Clear STOP_DET Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40108060h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_STOP_DET:** Read this register to clear the STOP_DET interrupt (bit 9) of the IC_RAW_INTR_STAT register.

14.1.5.26 IC_CLR_START_DET — Offset 40108064h

Clear START_DET Interrupt Register - Clear START_DET Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40108064h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_START_DET:** Read this register to clear the START_DET interrupt (bit 10) of the IC_RAW_INTR_STAT register.

14.1.5.27 IC_CLR_GEN_CALL — Offset 40108068h

Clear GEN_CALL Interrupt Register - Clear GEN_CALL Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	40108068h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_GEN_CALL:** Read this register to clear the GEN_CALL interrupt (bit 11) of IC_RAW_INTR_STAT register.

14.1.5.28 IC_ENABLE — Offset 4010806Ch

I2C ENABLE Register - I2C Enable Register

Type	Size	Offset	Default
MMIO	32 bit	4010806Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**TX_CMD_BLOCK:** In Master mode: - 1'b1: Blocks the transmission of data on I2C bus even if Tx FIFO has data to transmit. - 1'b0: The transmission of data starts on I2C bus automatically, as soon as the first data is available in the Tx FIFO. Note: To block the execution of Master commands, set the TX_CMD_BLOCK bit only when Tx FIFO is empty (IC_STATUS[2]==1) and Master is in Idle state (IC_STATUS[5] == 0). Any further commands put in the Tx FIFO are not executed until TX_CMD_BLOCK bit is unset.
1	0h RW	**ABORT:** When set, the controller initiates the transfer abort. - 0: ABORT not initiated or ABORT done - 1: ABORT operation in progress The software can abort the I2C transfer in master mode by setting this bit. The software can set this bit only when ENABLE is already set; otherwise, the controller ignores any write to ABORT bit. The software cannot clear the ABORT bit once set. In response to an ABORT, the controller issues a STOP and flushes the Tx FIFO after completing the current transfer, then sets the TX_ABORT interrupt after the abort operation. The ABORT bit is cleared automatically after the abort operation.
0	0h RW	**ENABLE:** Controls whether the DW_apb_i2c is enabled. - 0: Disables DW_apb_i2c (TX and RX FIFOs are held in an erased state) - 1: Enables DW_apb_i2c Software can disable DW_apb_i2c while it is active. However, it is important that care be taken to ensure that DW_apb_i2c is disabled properly. A recommended procedure is described in "Disabling DW_apb_i2c". When DW_apb_i2c is disabled, the following occurs: - The TX FIFO and RX FIFO get flushed. - Status bits in the IC_INTR_STAT register are still active until DW_apb_i2c goes into IDLE state. If the module is transmitting, it stops as well as deletes the contents of the transmit buffer after the current transfer is complete. If the module is receiving, the DW_apb_i2c stops the current transfer at the end of the current byte and does not acknowledge the transfer. In systems with asynchronous pclk and ic_clk when IC_CLK_TYPE parameter set to asynchronous (1), there is a two ic_clk delay when enabling or disabling the DW_apb_i2c.

14.1.5.29 IC_STATUS — Offset 40108070h

I2C STATUS Register - I2C Status Register This is a read-only register used to indicate the current transfer status and FIFO status. The status register may be read at any time. None of the bits in this register request an interrupt. When the I2C is disabled by writing 0 in bit 0 of the IC_ENABLE register: - Bits 1 and 2 are set to 1 - Bits 3 and 10 are set to 0 When the master or slave state machines goes to idle and ic_en=0: - Bits 5 and 6 are set to 0

Type	Size	Offset	Default
MMIO	32 bit	40108070h	00000006h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved**
10	0h RO/V	**SLV_HOLD_RX_FIFO_FULL:** This bit indicates the BUS Hold in Slave mode due to Rx FIFO is Full and an additional byte has been received (This kind of Bus hold is applicable if IC_RX_FULL_HLD_BUS_EN is set to 1).
9	0h RO/V	**SLV_HOLD_TX_FIFO_EMPTY:** This bit indicates the BUS Hold in Slave mode for the Read request when the Tx FIFO is empty. The Bus is in hold until the Tx FIFO has data to Transmit for the read request.
8	0h RO/V	**MST_HOLD_RX_FIFO_FULL:** This bit indicates the BUS Hold in Master mode due to Rx FIFO is Full and additional byte has been received (This kind of Bus hold is applicable if IC_RX_FULL_HLD_BUS_EN is set to 1).
7	0h RO/V	**MST_HOLD_TX_FIFO_EMPTY:** If the IC_EMPTYFIFO_HOLD_MASTER_EN parameter is set to 1, the DW_apb_i2c master stalls the write transfer when Tx FIFO is empty, and the the last byte does not have the Stop bit set. This bit indicates the BUS hold when the master holds the bus because of the Tx FIFO being empty, and the the previous transferred command does not have the Stop bit set. (This kind of Bus hold is applicable if IC_EMPTYFIFO_HOLD_MASTER_EN is set to 1).
6	0h RO/V	**SLV_ACTIVITY:** Slave FSM Activity Status. When the Slave Finite State Machine (FSM) is not in the IDLE state, this bit is set. - 0: Slave FSM is in IDLE state so the Slave part of DW_apb_i2c is not Active - 1: Slave FSM is not in IDLE state so the Slave part of DW_apb_i2c is Active
5	0h RO/V	**MST_ACTIVITY:** Master FSM Activity Status. When the Master Finite State Machine (FSM) is not in the IDLE state, this bit is set. - 0: Master FSM is in IDLE state so the Master part of DW_apb_i2c is not Active - 1: Master FSM is not in IDLE state so the Master part of DW_apb_i2c is Active Note: IC_STATUS[0]-that is, ACTIVITY bit-is the OR of SLV_ACTIVITY and MST_ACTIVITY bits.
4	0h RO/V	**RFF:** Receive FIFO Completely Full. When the receive FIFO is completely full, this bit is set. When the receive FIFO contains one or more empty location, this bit is cleared. - 0: Receive FIFO is not full - 1: Receive FIFO is full
3	0h RO/V	**RFNE:** Receive FIFO Not Empty. This bit is set when the receive FIFO contains one or more entries; it is cleared when the receive FIFO is empty. - 0: Receive FIFO is empty - 1: Receive FIFO is not empty

Bit Range	Default & Access	Field Name (ID): Description
2	1h RO/V	**TFE:** Transmit FIFO Completely Empty. When the transmit FIFO is completely empty, this bit is set. When it contains one or more valid entries, this bit is cleared. This bit field does not request an interrupt. - 0: Transmit FIFO is not empty - 1: Transmit FIFO is empty
1	1h RO/V	**TFNF:** Transmit FIFO Not Full. Set when the transmit FIFO contains one or more empty locations, and is cleared when the FIFO is full. - 0: Transmit FIFO is full - 1: Transmit FIFO is not full
0	0h RO/V	**ACTIVITY:** I2C Activity Status.

14.1.5.30 IC_TXFLR — Offset 40108074h

I2C Transmit FIFO Level Register - I2C Transmit FIFO Level Register This register contains the number of valid data entries in the transmit FIFO buffer. It is cleared whenever: - The I2C is disabled - There is a transmit abort - that is, TX_ABRT bit is set in the IC_RAW_INTR_STAT register - The slave bulk transmit mode is aborted The register increments whenever data is placed into the transmit FIFO and decrements when data is taken from the transmit FIFO.

Type	Size	Offset	Default
MMIO	32 bit	40108074h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:0	00h RO/V	**TXFLR:** Transmit FIFO Level. Contains the number of valid data entries in the transmit FIFO.

14.1.5.31 IC_RXFLR — Offset 40108078h

I2C Receive FIFO Level Register - I2C Receive FIFO Level Register This register contains the number of valid data entries in the receive FIFO buffer. It is cleared whenever: - The I2C is disabled - Whenever there is a transmit abort caused by any of the events tracked in IC_TX_ABRT_SOURCE The register increments whenever data is placed into the receive FIFO and decrements when data is taken from the receive FIFO.

Type	Size	Offset	Default
MMIO	32 bit	40108078h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:0	00h RO/V	**RXFLR:** Receive FIFO Level. Contains the number of valid data entries in the receive FIFO.

14.1.5.32 IC_SDA_HOLD — Offset 4010807Ch

I2C SDA Hold Time Length Register - I2C SDA Hold Time Length Register The bits [15:0] of this register are used to control the hold time of SDA during transmit in both slave and master mode (after SCL goes from HIGH to LOW). The bits [23:16] of this register are used to extend the SDA transition (if any) whenever SCL is HIGH in the receiver in either master or slave mode. Writes to this register succeed only when IC_ENABLE[0]=0. The values in this register are in units of ic_clk period. The value programmed in IC_SDA_TX_HOLD must be greater than the minimum hold time in each mode one cycle in master mode, seven cycles in slave mode for the value to be implemented. The programmed SDA hold time during transmit (IC_SDA_TX_HOLD) cannot exceed at any time the duration of the low part of scl. Therefore the programmed value cannot be larger than N_SCL_LOW-2, where N_SCL_LOW is the duration of the low part of the scl period measured in ic_clk cycles.

Type	Size	Offset	Default
MMIO	32 bit	4010807Ch	00000005h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:16	00h RW	**IC_SDA_RX_HOLD:** Sets the required SDA hold time in units of ic_clk period, when DW_apb_i2c acts as a receiver.
15:0	0005h RW	**IC_SDA_TX_HOLD:** Sets the required SDA hold time in units of ic_clk period, when DW_apb_i2c acts as a transmitter.

14.1.5.33 IC_TX_ABRT_SOURCE — Offset 40108080h

I2C Transmit Abort Source Register - I2C Transmit Abort Source Register This register has 32 bits that indicate the source of the TX_ABRT bit. Except for Bit 9, this register is cleared whenever the IC_CLR_TX_ABRT register or the IC_CLR_INTR register is read. To clear Bit 9, the source of the ABRT_SBYTE_NORSTRT must be fixed first; RESTART must be enabled (IC_CON[5]=1), the SPECIAL bit must be cleared (IC_TAR[11]), or the GC_OR_START bit must be cleared (IC_TAR[10]). Once the source of the ABRT_SBYTE_NORSTRT is fixed, then this bit can be cleared in the same manner as other bits in this register. If the source of the ABRT_SBYTE_NORSTRT is not fixed before attempting to clear this bit, Bit 9 clears for one cycle and is then re-asserted.

Type	Size	Offset	Default
MMIO	32 bit	40108080h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:23	000h RO/V	**TX_FLUSH_CNT:** This field indicates the number of Tx FIFO Data Commands which are flushed due to TX_ABRT interrupt. It is cleared whenever I2C is disabled. Role of DW_apb_i2c: Master-Transmitter or Slave-Transmitter
22:17	0h RO	**Reserved**
16	0h RO/V	**ABRT_USER_ABRT:** This is a master-mode-only bit. Master has detected the transfer abort (IC_ENABLE[1]) Role of DW_apb_i2c: Master-Transmitter
15	0h RO/V	**ABRT_SLVRD_INTX:** 1: When the processor side responds to a slave mode request for data to be transmitted to a remote master and user writes a 1 in CMD (bit 8) of IC_DATA_CMD register. Role of DW_apb_i2c: Slave-Transmitter
14	0h RO/V	**ABRT_SLV_ARBLOST:** This field indicates that a Slave has lost the bus while transmitting data to a remote master. IC_TX_ABRT_SOURCE[12] is set at the same time. Note: Even though the slave never 'owns' the bus, something could go wrong on the bus. This is a fail safe check. For instance, during a data transmission at the low-to-high transition of SCL, if what is on the data bus is not what is supposed to be transmitted, then DW_apb_i2c no longer own the bus. Role of DW_apb_i2c: Slave-Transmitter
13	0h RO/V	**ABRT_SLVFLUSH_TXFIFO:** This field specifies that the Slave has received a read command and some data exists in the TX FIFO, so the slave issues a TX_ABRT interrupt to flush old data in TX FIFO. Role of DW_apb_i2c: Slave-Transmitter
12	0h RO/V	**ARB_LOST:** This field specifies that the Master has lost arbitration, or if IC_TX_ABRT_SOURCE[14] is also set, then the slave transmitter has lost arbitration. Role of DW_apb_i2c: Master-Transmitter or Slave-Transmitter
11	0h RO/V	**ABRT_MASTER_DIS:** This field indicates that the User tries to initiate a Master operation with the Master mode disabled. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver

Bit Range	Default & Access	Field Name (ID): Description
10	0h RO/V	**ABRT_10B_RD_NORSTRT:** This field indicates that the restart is disabled (IC_RESTART_EN bit (IC_CON[5]) =0) and the master sends a read command in 10-bit addressing mode. Role of DW_apb_i2c: Master-Receiver
9	0h RO/V	**ABRT_SBYTE_NORSTRT:** To clear Bit 9, the source of the ABRT_SBYTE_NORSTRT must be fixed first; restart must be enabled (IC_CON[5]=1), the SPECIAL bit must be cleared (IC_TAR[11]), or the GC_OR_START bit must be cleared (IC_TAR[10]). Once the source of the ABRT_SBYTE_NORSTRT is fixed, then this bit can be cleared in the same manner as other bits in this register. If the source of the ABRT_SBYTE_NORSTRT is not fixed before attempting to clear this bit, bit 9 clears for one cycle and then gets reasserted. When this field is set to 1, the restart is disabled (IC_RESTART_EN bit (IC_CON[5]) =0) and the user is trying to send a START Byte. Role of DW_apb_i2c: Master
8	0h RO/V	**ABRT_HS_NORSTRT:** This field indicates that the restart is disabled (IC_RESTART_EN bit (IC_CON[5]) =0) and the user is trying to use the master to transfer data in High Speed mode. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver
7	0h RO/V	**ABRT_SBYTE_ACKDET:** This field indicates that the Master has sent a START Byte and the START Byte was acknowledged (wrong behavior). Role of DW_apb_i2c: Master
6	0h RO/V	**ABRT_HS_ACKDET:** This field indicates that the Master is in High Speed mode and the High Speed Master code was acknowledged (wrong behavior). Role of DW_apb_i2c: Master
5	0h RO/V	**ABRT_GCALL_READ:** This field indicates that DW_apb_i2c in the master mode has sent a General Call but the user programmed the byte following the General Call to be a read from the bus (IC_DATA_CMD[9] is set to 1). Role of DW_apb_i2c: Master-Transmitter
4	0h RO/V	**ABRT_GCALL_NOACK:** This field indicates that DW_apb_i2c in master mode has sent a General Call and no slave on the bus acknowledged the General Call. Role of DW_apb_i2c: Master-Transmitter
3	0h RO/V	**ABRT_TXDATA_NOACK:** This field indicates the master-mode only bit. When the master receives an acknowledgement for the address, but when it sends data byte(s) following the address, it did not receive an acknowledge from the remote slave(s). Role of DW_apb_i2c: Master-Transmitter
2	0h RO/V	**ABRT_10ADDR2_NOACK:** This field indicates that the Master is in 10-bit address mode and that the second address byte of the 10-bit address was not acknowledged by any slave. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver
1	0h RO/V	**ABRT_10ADDR1_NOACK:** This field indicates that the Master is in 10-bit address mode and the first 10-bit address byte was not acknowledged by any slave. Reset value: 0x0 Role of DW_apb_i2c: Master-Transmitter or Master-Receiver
0	0h RO/V	**ABRT_7B_ADDR_NOACK:** This field indicates that the Master is in 7-bit addressing mode and the address sent was not acknowledged by any slave. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver

14.1.5.34 IC_DMA_CR — Offset 40108088h

DMA Control Register - DMA Control Register This register is only valid when DW_apb_i2c is configured with a set of DMA Controller interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist and writing to the register's address has no effect and reading from this register

address will return zero. The register is used to enable the DMA Controller interface operation. There is a separate bit for transmit and receive. This can be programmed regardless of the state of IC_ENABLE.

Type	Size	Offset	Default
MMIO	32 bit	40108088h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1	0h RW	**TDMAE:** Transmit DMA Enable. This bit enables/disables the transmit FIFO DMA channel.
0	0h RW	**RDMAE:** Receive DMA Enable. This bit enables/disables the receive FIFO DMA channel.

14.1.5.35 IC_DMA_TDLR — Offset 4010808Ch

DMA Transmit Data Level Register - DMA Transmit Data Level Register This register is only valid when the DW_apb_i2c is configured with a set of DMA interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist; writing to its address has no effect; reading from its address returns zero.

Type	Size	Offset	Default
MMIO	32 bit	4010808Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:0	00h RW	**DMATDL:** Transmit Data Level. This bit field controls the level at which a DMA request is made by the transmit logic. It is equal to the watermark level; that is, the dma_tx_req signal is generated when the number of valid data entries in the transmit FIFO is equal to or below this field value, and TDMAE = 1.

14.1.5.36 IC_DMA_RDLR — Offset 40108090h

DMA Transmit Data Level Register - I2C Receive Data Level Register This register is only valid when DW_apb_i2c is configured with a set of DMA interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist; writing to its address has no effect; reading from its address returns zero.

Type	Size	Offset	Default
MMIO	32 bit	40108090h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:0	00h RW	**DMARDL:** Receive Data Level. This bit field controls the level at which a DMA request is made by the receive logic. The watermark level = DMARDL+1; that is, dma_rx_req is generated when the number of valid data entries in the receive FIFO is equal to or more than this field value + 1, and RDMAE =1. For instance, when DMARDL is 0, then dma_rx_req is asserted when 1 or more data entries are present in the receive FIFO.

14.1.5.37 IC_SDA_SETUP — Offset 40108094h

I2C SDA Setup Register - I2C SDA Setup Register This register controls the amount of time delay (in terms of number of ic_clk clock periods) introduced in the rising edge of SCL - relative to SDA changing - when DW_apb_i2c services a read request in a slave-transmitter operation. The relevant I2C requirement is tSU:DAT as detailed in the I2C Bus Specification. This register must be programmed with a value equal to or greater than 2. Writes to this register succeed only when IC_ENABLE[0] = 0. Note: The length of setup time is calculated using [(IC_SDA_SETUP - 1) * (ic_clk_period)], so if the user requires 10 ic_clk periods of setup time, they should program a value of 11. The IC_SDA_SETUP register is only used by the DW_apb_i2c when operating as a slave transmitter.

Type	Size	Offset	Default
MMIO	32 bit	40108094h	00000002h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	02h RW	**SDA_SETUP:** SDA Setup. It is recommended that if the required delay is 1000ns, then for an ic_clk frequency of 10 MHz, IC_SDA_SETUP should be programmed to a value of 11. IC_SDA_SETUP must be programmed with a minimum value of 2.

14.1.5.38 IC_ACK_GENERAL_CALL — Offset 40108098h

I2C ACK General Call Register - I2C ACK General Call Register The register controls whether DW_apb_i2c responds with a ACK or NACK when it receives an I2C General Call address. This register is applicable only when the DW_apb_i2c is in slave mode.

Type	Size	Offset	Default
MMIO	32 bit	40108098h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**ACK_GEN_CALL:** ACK General Call. When set to 1, DW_apb_i2c responds with a ACK (by asserting ic_data_oe) when it receives a General Call. Otherwise, DW_apb_i2c responds with a NACK (by negating ic_data_oe).

14.1.5.39 IC_ENABLE_STATUS — Offset 4010809Ch

I2C Enable Status Register - I2C Enable Status Register The register is used to report the DW_apb_i2c hardware status when the IC_ENABLE[0] register is set from 1 to 0; that is, when DW_apb_i2c is disabled. If IC_ENABLE[0] has been set to 1, bits 2:1 are forced to 0, and bit 0 is forced to 1. If IC_ENABLE[0] has been set to 0, bits 2:1 is only be valid as soon as bit 0 is read as '0'. Note: When IC_ENABLE[0] has been set to 0, a delay occurs for bit 0 to be read as 0 because disabling the DW_apb_i2c depends on I2C bus activities.

Type	Size	Offset	Default
MMIO	32 bit	4010809Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2	0h RO/V	**SLV_RX_DATA_LOST:** Slave Received Data Lost. This bit indicates if a Slave-Receiver operation has been aborted with at least one data byte received from an I2C transfer due to the setting bit 0 of IC_ENABLE from 1 to 0. When read as 1, DW_apb_i2c is deemed to have been actively engaged in an aborted I2C transfer (with matching address) and the data phase of the I2C transfer has been entered, even though a data byte has been responded with a NACK. Note: If the remote I2C master terminates the transfer with a STOP condition before the DW_apb_i2c has a chance to NACK a transfer, and IC_ENABLE[0] has been set to 0, then this bit is also set to 1. When read as 0, DW_apb_i2c is deemed to have been disabled without being actively involved in the data phase of a Slave-Receiver transfer. Note: The CPU can safely read this bit when IC_EN (bit 0) is read as 0.
1	0h RO/V	**SLV_DISABLED_WHILE_BUSY:** Slave Disabled While Busy (Transmit, Receive). This bit indicates if a potential or active Slave operation has been aborted due to the setting bit 0 of the IC_ENABLE register from 1 to 0. This bit is set when the CPU writes a 0 to the IC_ENABLE register while: (a) DW_apb_i2c is receiving the address byte of the Slave-Transmitter operation from a remote master; OR, (b) address and data bytes of the Slave-Receiver operation from a remote master. When read as 1, DW_apb_i2c is deemed to have forced a NACK during any part of an I2C transfer, irrespective of whether the I2C address matches the slave address set in DW_apb_i2c (IC_SAR register) OR if the transfer is completed before IC_ENABLE is set to 0 but has not taken effect. Note: If the remote I2C master terminates the transfer with a STOP condition before the DW_apb_i2c has a chance to NACK a transfer, and IC_ENABLE[0] has been set to 0, then this bit will also be set to 1. When read as 0, DW_apb_i2c is deemed to have been disabled when there is master activity, or when the I2C bus is idle. Note: The CPU can safely read this bit when IC_EN (bit 0) is read as 0.
0	0h RO/V	**IC_EN:** ic_en Status. This bit always reflects the value driven on the output port ic_en. - When read as 1, DW_apb_i2c is deemed to be in an enabled state. - When read as 0, DW_apb_i2c is deemed completely inactive. Note: The CPU can safely read this bit anytime. When this bit is read as 0, the CPU can safely read SLV_RX_DATA_LOST (bit 2) and SLV_DISABLED_WHILE_BUSY (bit 1).

14.1.5.40 IC_FS_SPKLEN — Offset 401080A0h

I2C SS, FS or FM+ spike suppression limit - I2C SS, FS or FM+ spike suppression limit This register is used to store the duration, measured in ic_clk cycles, of the longest spike that is filtered out by the spike suppression logic w hen the component is operating in SS, FS or FM+ modes. This register must be programmed with a minimum value of 1.

Type	Size	Offset	Default
MMIO	32 bit	401080A0h	00000005h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	05h RW	**IC_FS_SPKLEN:** This register must be set before any I2C bus transaction can take place to ensure stable operation. This register sets the duration, measured in ic_clk cycles, of the longest spike in the SCL or SDA lines that will be filtered out by the spike suppression logic. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. The minimum valid value is 1; hardware prevents values less than this being written, and if attempted results in 1 being set.

14.1.5.41 IC_HS_SPKLEN — Offset 401080A4h

I2C HS spike suppression limit register - I2C HS spike suppression limit register This register is used to store the duration, measured in ic_clk cycles, of the longest spike that is filtered out by the spike suppression logic when the component is operating in HS modes. This register must be programmed with a minimum value of 1 and is implemented only if the component is configured to support HS mode; that is, if the IC_MAX_SPEED_MODE parameter is set to 3.

Type	Size	Offset	Default
MMIO	32 bit	401080A4h	00000002h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	02h RW	**IC_HS_SPKLEN:** This register must be set before any I2C bus transaction can take place to ensure stable operation. This register sets the duration, measured in ic_clk cycles, of the longest spike in the SCL or SDA lines that will be filtered out by the spike suppression logic. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. The minimum valid value is 1; hardware prevents values less than this being written, and if attempted results in 1 being set.

14.1.5.42 IC_CLR_RESTART_DET — Offset 401080A8h

Clear RESTART_DET Interrupt Register - Clear RESTART_DET Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	401080A8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RESTART_DET:** Read this register to clear the RESTART_DET interrupt (bit 12) of IC_RAW_INTR_STAT register.

14.1.5.43 IC_COMP_PARAM_1 — Offset 401080F4h

Component Parameter Register 1 - Component Parameter Register 1 Note This is a constant read-only register that contains encoded information about the component's parameter settings. The reset value depends on coreConsultant parameter(s).

Type	Size	Offset	Default
MMIO	32 bit	401080F4h	003F3FEEh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:16	3Fh RO/V	**TX_BUFFER_DEPTH:** The value of this register is derived from the IC_TX_BUFFER_DEPTH coreConsultant parameter. - 0x00 = Reserved - 0x01 = 2 - 0x02 = 3 - ... - 0xFF = 256
15:8	3Fh RO/V	**RX_BUFFER_DEPTH:** The value of this register is derived from the IC_RX_BUFFER_DEPTH coreConsultant parameter. - 0x00: Reserved - 0x01: 2 - 0x02: 3 - ... - 0xFF: 256
7	1h RO/V	**ADD_ENCODED_PARAMS:** The value of this register is derived from the IC_ADD_ENCODED_PARAMS coreConsultant parameter. Reading 1 in this bit means that the capability of reading these encoded parameters via software has been included. Otherwise, the entire register is 0 regardless of the setting of any other parameters that are encoded in the bits.

Bit Range	Default & Access	Field Name (ID): Description
6	1h RO/V	**HAS_DMA:** The value of this register is derived from the IC_HAS_DMA coreConsultant parameter.
5	1h RO/V	**INTR_IO:** The value of this register is derived from the IC_INTR_IO coreConsultant parameter.
4	0h RO/V	**HC_COUNT_VALUES:** The value of this register is derived from the IC_HC_COUNT VALUES coreConsultant parameter.
3:2	3h RO/V	**MAX_SPEED_MODE:** The value of this register is derived from the IC_MAX_SPEED_MODE coreConsultant parameter. - 0x0: Reserved - 0x1: Standard - 0x2: Fast - 0x3: High
1:0	2h RO/V	**APB_DATA_WIDTH:** The value of this register is derived from the APB_DATA_WIDTH coreConsultant parameter.

14.1.5.44 IC_COMP_VERSION — Offset 401080F8h

I2C Component Version Register - I2C Component Version Register

Type	Size	Offset	Default
MMIO	32 bit	401080F8h	3230322Ah

Register Level Access:

BIOS Access	SMM Access	OS Access

14.1.6.1 IC_CON — Offset 4010A000h

I2C Control Register - I2C Control Register. This register can be written only when the DW_apb_i2c is disabled, which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. Read/Write Access: - If configuration parameter I2C_DYNAMIC_TAR_UPDATE=1, bit 4 is read only. - If configuration parameter IC_RX_FULL_HLD_BUS_EN =0, bit 9 is read only. - If configuration parameter IC_STOP_DET_IF_MASTER_ACTIVE =0, bit 10 is read only. - If configuration parameter IC_BUS_CLEAR_FEATURE=0, bit 11 is read only - If configuration parameter IC_OPTIONAL_SAR=0, bit 16 is read only - If configuration parameter IC_SMBUS=0, bit 17 is read only - If configuration parameter IC_SMBUS_ARP=0, bits 18 and 19 are read only.

Type	Size	Offset	Default
MMIO	32 bit	4010A000h	00000067h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved**
10	0h RW	**STOP_DET_IF_MASTER_ACTIVE:** In Master mode: - 1'b1: issues the STOP_DET interrupt only when master is active. - 1'b0: issues the STOP_DET irrespective of whether master is active or not.
9	0h RW	**RX_FIFO_FULL_HLD_CTRL:** This bit controls whether DW_apb_i2c should hold the bus when the Rx FIFO is physically full to its RX_BUFFER_DEPTH, as described in the IC_RX_FULL_HLD_BUS_EN parameter.
8	0h RW	**TX_EMPTY_CTRL:** This bit controls the generation of the TX_EMPTY interrupt, as described in the IC_RAW_INTR_STAT register.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**STOP_DET_IFADDRESSED:** In slave mode: - 1'b1: issues the STOP_DET interrrupt only when it is addressed. - 0'b0: issues the STOP_DET irrespective of whether it's addressed or not. NOTE: During a general call address, this slave does not issue the STOP_DET interrupt if STOP_DET_IF_ADDRESSED = 1'b1, even if the slave responds to the general call address by generating ACK. The STOP_DET interrupt is generated only when the transmitted address matches the slave address (SAR).
6	1h RW	**IC_SLAVE_DISABLE:** This bit controls whether I2C has its slave disabled, which means once the presetn signal is applied, then this bit takes on the value of the configuration parameter IC_SLAVE_DISABLE. You have the choice of having the slave enabled or disabled after reset is applied, which means software does not have to configure the slave. By default, the slave is always enabled (in reset state as well). If you need to disable it after reset, set this bit to 1. If this bit is set (slave is disabled), DW_apb_i2c functions only as a master and does not perform any action that requires a slave. NOTE: Software should ensure that if this bit is written with 0, then bit 0 should also be written with a 0.
5	1h RW	**IC_RESTART_EN:** Determines whether RESTART conditions may be sent when acting as a master. Some older slaves do not support handling RESTART conditions; however, RESTART conditions are used in several DW_apb_i2c operations. When RESTART is disabled, the master is prohibited from performing the following functions: - Sending a START BYTE - Performing any high-speed mode operation - High-speed mode operation - Performing direction changes in combined format mode - Performing a read operation with a 10-bit address By replacing RESTART condition followed by a STOP and a subsequent START condition, split operations are broken down into multiple DW_apb_i2c transfers. If the above operations are performed, it will result in setting bit 6 (TX_ABRT) of the IC_RAW_INTR_STAT register. .
4	0h RO/V	**IC_10BITADDR_MASTER_RD_ONLY:** If the I2C_DYNAMIC_TAR_UPDATE configuration parameter is set to 'No' (0), this bit is named IC_10BITADDR_MASTER and controls whether the DW_apb_i2c starts its transfers in 7 or 10-bit addressing mode when acting as a master. If I2C_DYNAMIC_TAR_UPDATE is set to 'Yes' (1), the function of this bit is handled by bit 12 of IC_TAR register, and becomes a read-only copy called IC_10BITADDR_MASTER_rd_only. - 0: 7-bit addressing - 1: 10-bit addressing
3	0h RW	**IC_10BITADDR_SLAVE:** When acting as a slave, this bit controls whether the DW_apb_i2c responds to 7- or 10-bit addresses. - 0: 7-bit addressing. The DW_apb_i2c ignores transactions that involve 10-bit addressing; for 7-bit addressing, only the lower 7 bits of the IC_SAR register are compared. - 1: 10-bit addressing. The DW_apb_i2c responds to only 10-bit addressing transfers that match the full 10 bits of the IC_SAR register.
2:1	3h RW	**SPEED:** These bits control at which speed the DW_apb_i2c operates; its setting is relevant only if one is operating the DW_apb_i2c in master mode. Hardware protects against illegal values being programmed by software. These bits must be programmed appropriately for slave mode also, as it is used to capture correct value of spike filter as per the speed mode. This register should be programmed only with a value in the range of 1 to IC_MAX_SPEED_MODE; otherwise, hardware updates this register with the value of IC_MAX_SPEED_MODE. 1: standard mode (100 kbit/s) 2: fast mode (<=400 kbit/s) or fast mode plus (<=1000Kbit/s) 3: high speed mode (3.4 Mbit/s) Note: This field is not applicable when IC_ULTRA_FAST_MODE=1
0	1h RW	**MASTER_MODE:** This bit controls whether the DW_apb_i2c master is enabled. NOTE: Software should ensure that if this bit is written with '1' then bit 6 should also be written with a '1'.

14.1.6.2 IC_TAR — Offset 4010A004h

I2C Target Address Register - I2C Target Address Register If the configuration parameter I2C_DYNAMIC_TAR_UPDATE is set to 'No' (0), this register is 12 bits wide, and bits 31:12 are reserved. This register can be written to only when IC_ENABLE[0] is set to 0. However, if I2C_DYNAMIC_TAR_UPDATE = 1, then the register becomes 13

bits wide. In this case, writes to IC_TAR succeed when one of the following conditions are true: - DW_apb_i2c is NOT enabled (IC_ENABLE[0] is set to 0); or - DW_apb_i2c is enabled (IC_ENABLE[0]=1); AND DW_apb_i2c is NOT engaged in any Master (tx, rx) operation (IC_STATUS[5]=0); AND DW_apb_i2c is enabled to operate in Master mode (IC_CON[0]=1); AND there are NO entries in the TX FIFO (IC_STATUS[2]=1) You can change the TAR address dynamically without losing the bus, only if the following conditions are met. - DW_apb_i2c is enabled (IC_ENABLE[0]=1); AND IC_EMPTYFIFO_HOLD_MASTER_EN configuration parameter is set to 1; AND DW_apb_i2c is enabled to operate in Master mode (IC_CON[0]=1); AND there are NO entries in the Tx FIFO and the master is in HOLD state (IC_INTR_STAT[13]=1). Note: If the software or application is aware that the DW_apb_i2c is not using the TAR address for the pending commands in the Tx FIFO, then it is possible to update the TAR address even while the Tx FIFO has entries (IC_STATUS[2]= 0). - It is not necessary to perform any write to this register if DW_apb_i2c is enabled as an I2C slave only.

Type	Size	Offset	Default
MMIO	32 bit	4010A004h	00000055h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	**Reserved**
12	0h RW	**IC_10BITADDR_MASTER:** This bit controls whether the DW_apb_i2c starts its transfers in 7- or 10-bit addressing mode when acting as a master. - 0: 7-bit addressing - 1: 10-bit addressing
11	0h RW	**SPECIAL:** This bit indicates whether software performs a Device-ID or General Call or START BYTE command. - 0: ignore bit 10 GC_OR_START and use IC_TAR normally - 1: perform special I2C command as specified in Device_ID or GC_OR_START bit
10	0h RW	**GC_OR_START:** If bit 11 (SPECIAL) is set to 1 and bit 13(Device-ID) is set to 0, then this bit indicates whether a General Call or START byte command is to be performed by the DW_apb_i2c. - 0: General Call Address - after issuing a General Call, only writes may be performed. Attempting to issue a read command results in setting bit 6 (TX_ABRT) of the IC_RAW_INTR_STAT register. The DW_apb_i2c remains in General Call mode until the SPECIAL bit value (bit 11) is cleared. - 1: START BYTE
9:0	055h RW	**IC_TAR:** This is the target address for any master transaction. When transmitting a General Call, these bits are ignored. To generate a START BYTE, the CPU needs to write only once into these bits. If the IC_TAR and IC_SAR are the same, loopback exists but the FIFOs are shared between master and slave, so full loopback is not feasible. Only one direction loopback mode is supported (simplex), not duplex. A master cannot transmit to itself; it can transmit to only a slave.

14.1.6.3 IC_SAR — Offset 4010A008h

I2C Slave Address Register - I2C Slave Address Register

Type	Size	Offset	Default
MMIO	32 bit	4010A008h	00000055h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:0	055h RW	**IC_SAR:** The IC_SAR holds the slave address when the I2C is operating as a slave. For 7-bit addressing, only IC_SAR[6:0] is used. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. Note: The default values cannot be any of the reserved address locations: that is, 0x00 to 0x07, or 0x78 to 0x7f. The correct operation of the device is not guaranteed if you program the IC_SAR or IC_TAR to a reserved value.

14.1.6.4 IC_HS_MADDR — Offset 4010A00Ch

I2C High Speed Master Mode Code Address Register - I2C High Speed Master Mode Code Address Register

Type	Size	Offset	Default
MMIO	32 bit	4010A00Ch	00000001h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2:0	1h RW	**IC_HS_MAR:** This bit field holds the value of the I2C HS mode master code. HS-mode master codes are reserved 8-bit codes (00001xxx) that are not used for slave addressing or other purposes. Each master has its unique master code; up to eight high-speed mode masters can be present on the same I2C bus system. Valid values are from 0 to 7. This register goes away and becomes read-only returning 0's if the IC_MAX_SPEED_MODE configuration parameter is set to either Standard (1) or Fast (2). This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect.

14.1.6.5 IC_DATA_CMD — Offset 4010A010h

I2C Rx/Tx Data Buffer and Command Register - I2C Rx/Tx Data Buffer and Command Register; this is the register the CPU writes to when filling the TX FIFO and the CPU reads from when retrieving bytes from RX FIFO. The size of the register changes as follows: Write: - 11 bits when IC_EMPTYFIFO_HOLD_MASTER_EN=1 - 9 bits when IC_EMPTYFIFO_HOLD_MASTER_EN=0 Read: - 12 bits when IC_FIRST_DATA_BYTE_STATUS = 1 - 8 bits when IC_FIRST_DATA_BYTE_STATUS = 0 Note: In order for the DW_apb_i2c to continue acknowledging reads, a read command should be written for every byte that is to be received; otherwise the DW_apb_i2c will stop acknowledging.

Type	Size	Offset	Default
MMIO	32 bit	4010A010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RO/V	**FIRST_DATA_BYTE:** Indicates the first data byte received after the address phase for receive transfer in Master receiver or Slave receiver mode. NOTE: In case of APB_DATA_WIDTH=8, 1. The user has to perform two APB Reads to IC_DATA_CMD in order to get status on 11 bit. 2. Inorder to read the 11 bit, the user has to perform the first data byte read [7:0] (offset 0x10) and then perform the second read[15:8](offset 0x11) in order to know the status of 11 bit (whether the data received in previous read is a first data byte or not). 3. The 11th bit is an optional read field, user can ignore 2nd byte read [15:8] (offset 0x11) if not interested in FIRST_DATA_BYTE status.
10	0h WO	**RESTART:** This bit controls whether a RESTART is issued before the byte is sent or received. This bit is available only if IC_EMPTYFIFO_HOLD_MASTER_EN is configured to 1. 1 - If IC_RESTART_EN is 1, a RESTART is issued before the data is sent/received (according to the value of CMD), regardless of whether or not the transfer direction is changing from the previous command; if IC_RESTART_EN is 0, a STOP followed by a START is issued instead. 0 - If IC_RESTART_EN is 1, a RESTART is issued only if the transfer direction is changing from the previous command; if IC_RESTART_EN is 0, a STOP followed by a START is issued instead.

Bit Range	Default & Access	Field Name (ID): Description
9	0h WO	**STOP:** This bit controls whether a STOP is issued after the byte is sent or received. This bit is available only if IC_EMPTYFIFO_HOLD_MASTER_EN is configured to 1. - 1 - STOP is issued after this byte, regardless of whether or not the Tx FIFO is empty. If the Tx FIFO is not empty, the master immediately tries to start a new transfer by issuing a START and arbitrating for the bus. - 0 - STOP is not issued after this byte, regardless of whether or not the Tx FIFO is empty. If the Tx FIFO is not empty, the master continues the current transfer by sending/receiving data bytes according to the value of the CMD bit. If the Tx FIFO is empty, the master holds the SCL line low and stalls the bus until a new command is available in the Tx FIFO.
8	0h WO	**CMD:** This bit controls whether a read or a write is performed. This bit does not control the direction when the DW_apb_i2c acts as a slave. It controls only the direction when it acts as a master. When a command is entered in the TX FIFO, this bit distinguishes the write and read commands. In slave-receiver mode, this bit is a "don't care" because writes to this register are not required. In slave-transmitter mode, a "0" indicates that the data in IC_DATA_CMD is to be transmitted. When programming this bit, you should remember the following: attempting to perform a read operation after a General Call command has been sent results in a TX_ABRT interrupt (bit 6 of the IC_RAW_INTR_STAT register), unless bit 11 (SPECIAL) in the IC_TAR register has been cleared. If a "1" is written to this bit after receiving a RD_REQ interrupt, then a TX_ABRT interrupt occurs.
7:0	00h RW/V	**DAT:** This register contains the data to be transmitted or received on the I2C bus. If you are writing to this register and want to perform a read, bits 7:0 (DAT) are ignored by the DW_apb_i2c. However, when you read this register, these bits return the value of data received on the DW_apb_i2c interface.

14.1.6.6 IC_SS_SCL_HCNT — Offset 4010A014h

Standard Speed I2C Clock SCL High Count Register - Standard Speed I2C Clock SCL High Count Register

Type	Size	Offset	Default
MMIO	32 bit	4010A014h	000001E8h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	01E8h RW	**IC_SS_SCL_HCNT:** This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock high-period count for standard speed. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. The minimum valid value is 6; hardware prevents values less than this being written, and if attempted results in 6 being set. For designs with APB_DATA_WIDTH = 8, the order of programming is important to ensure the correct operation of the DW_apb_i2c. The lower byte must be programmed first. Then the upper byte is programmed. When the configuration parameter IC_HC_COUNT_VALUES is set to 1, this register is read only. NOTE: This register must not be programmed to a value higher than 65525, because DW_apb_i2c uses a 16-bit counter to flag an I2C bus idle condition when this counter reaches a value of IC_SS_SCL_HCNT + 10.

14.1.6.7 IC_SS_SCL_LCNT — Offset 4010A018h

Standard Speed I2C Clock SCL Low Count Register - Standard Speed I2C Clock SCL Low Count Register

11	0h RO/V	**R_GEN_CALL:** See IC_RAW_INTR_STAT for a detailed description of R_GEN_CALL bit.

Bit Range	Default & Access	Field Name (ID): Description
10	0h RO/V	**R_START_DET:** See IC_RAW_INTR_STAT for a detailed description of R_START_DET bit.
9	0h RO/V	**R_STOP_DET:** See IC_RAW_INTR_STAT for a detailed description of R_STOP_DET bit.
8	0h RO/V	**R_ACTIVITY:** See IC_RAW_INTR_STAT for a detailed description of R_ACTIVITY bit.
7	0h RO/V	**R_RX_DONE:** See IC_RAW_INTR_STAT for a detailed description of R_RX_DONE bit.
6	0h RO/V	**R_TX_ABRT:** See IC_RAW_INTR_STAT for a detailed description of R_TX_ABRT bit.
5	0h RO/V	**R_RD_REQ:** See IC_RAW_INTR_STAT for a detailed description of R_RD_REQ bit.
4	0h RO/V	**R_TX_EMPTY:** See IC_RAW_INTR_STAT for a detailed description of R_TX_EMPTY bit.
3	0h RO/V	**R_TX_OVER:** See IC_RAW_INTR_STAT for a detailed description of R_TX_OVER bit.
2	0h RO/V	**R_RX_FULL:** See IC_RAW_INTR_STAT for a detailed description of R_RX_FULL bit.
1	0h RO/V	**R_RX_OVER:** See IC_RAW_INTR_STAT for a detailed description of R_RX_OVER bit.
0	0h RO/V	**R_RX_UNDER:** See IC_RAW_INTR_STAT for a detailed description of R_RX_UNDER bit.

14.1.6.13 IC_INTR_MASK — Offset 4010A030h

I2C Interrupt Mask Register - I2C Interrupt Mask Register. These bits mask their corresponding interrupt status bits. This register is active low; a value of 0 masks the interrupt, whereas a value of 1 unmasks the interrupt.

Type	Size	Offset	Default
MMIO	32 bit	4010A030h	000008FFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13	0h RW	**M_MASTER_ON_HOLD:** This bit masks the R_MASTER_ON_HOLD interrupt in IC_INTR_STAT register.
12	0h RW	**M_RESTART_DET:** This bit masks the R_RESTART_DET interrupt in IC_INTR_STAT register.

Bit Range	Default & Access	Field Name (ID): Description
11	1h RW	**M_GEN_CALL:** This bit masks the R_GEN_CALL interrupt in IC_INTR_STAT register.
10	0h RW	**M_START_DET:** This bit masks the R_START_DET interrupt in IC_INTR_STAT register.
9	0h RW	**M_STOP_DET:** This bit masks the R_STOP_DET interrupt in IC_INTR_STAT register.
8	0h RW	**M_ACTIVITY:** This bit masks the R_ACTIVITY interrupt in IC_INTR_STAT register.
7	1h RW	**M_RX_DONE:** This bit masks the R_RX_DONE interrupt in IC_INTR_STAT register.
6	1h RW	**M_TX_ABRT:** This bit masks the R_TX_ABRT interrupt in IC_INTR_STAT register.
5	1h RW	**M_RD_REQ:** This bit masks the R_RD_REQ interrupt in IC_INTR_STAT register.
4	1h RW	**M_TX_EMPTY:** This bit masks the R_TX_EMPTY interrupt in IC_INTR_STAT register.
3	1h RW	**M_TX_OVER:** This bit masks the R_TX_OVER interrupt in IC_INTR_STAT register.
2	1h RW	**M_RX_FULL:** This bit masks the R_RX_FULL interrupt in IC_INTR_STAT register.
1	1h RW	**M_RX_OVER:** This bit masks the R_RX_OVER interrupt in IC_INTR_STAT register.
0	1h RW	**M_RX_UNDER:** This bit masks the R_RX_UNDER interrupt in IC_INTR_STAT register.

14.1.6.14 IC_RAW_INTR_STAT — Offset 4010A034h

I2C Raw Interrupt Status Register - I2C Raw Interrupt Status Register Unlike the IC_INTR_STAT register, these bits are not masked so they always show the true status of the DW_apb_i2c.

Type	Size	Offset	Default
MMIO	32 bit	4010A034h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13	0h RO/V	**MASTER_ON_HOLD:** Indicates whether master is holding the bus and TX FIFO is empty. Enabled only when I2C_DYNAMIC_TAR_UPDATE=1 and IC_EMPTYFIFO_HOLD_MASTER_EN=1.
12	0h RO/V	**RESTART_DET:** Indicates whether a RESTART condition has occurred on the I2C interface when DW_apb_i2c is operating in Slave mode and the slave is being addressed. Enabled only when IC_SLV_RESTART_DET_EN=1. Note: However, in high-speed mode or during a START BYTE transfer, the RESTART comes before the address field as per the I2C protocol. In this case, the slave is not the addressed slave when the RESTART is issued, therefore DW_apb_i2c does not generate the RESTART_DET interrupt.
11	0h RO/V	**GEN_CALL:** Set only when a General Call address is received and it is acknowledged. It stays set until it is cleared either by disabling DW_apb_i2c or when the CPU reads bit 0 of the IC_CLR_GEN_CALL register. DW_apb_i2c stores the received data in the Rx buffer.
10	0h RO/V	**START_DET:** Indicates whether a START or RESTART condition has occurred on the I2C interface regardless of whether DW_apb_i2c is operating in slave or master mode.
9	0h RO/V	**STOP_DET:** Indicates whether a STOP condition has occurred on the I2C interface regardless of whether DW_apb_i2c is operating in slave or master mode. In Slave Mode: - If IC_CON[7]=1'b1 (STOP_DET_IFADDRESSED), the STOP_DET interrupt will be issued only if slave is addressed. Note: During a general call address, this slave does not issue a STOP_DET interrupt if STOP_DET_IF_ADDRESSED=1'b1, even if the slave responds to the general call address by generating ACK. The STOP_DET interrupt is generated only when the transmitted address matches the slave address (SAR). - If IC_CON[7]=1'b0 (STOP_DET_IFADDRESSED), the STOP_DET interrupt is issued irrespective of whether it is being addressed. In Master Mode: - If IC_CON[10]=1'b1 (STOP_DET_IF_MASTER_ACTIVE),the STOP_DET interrupt will be issued only if Master is active. - If IC_CON[10]=1'b0 (STOP_DET_IFADDRESSED),the STOP_DET interrupt will be issued irrespective of whether master is active or not.
8	0h RO/V	**ACTIVITY:** This bit captures DW_apb_i2c activity and stays set until it is cleared. There are four ways to clear it: - Disabling the DW_apb_i2c - Reading the IC_CLR_ACTIVITY register - Reading the IC_CLR_INTR register - System reset Once this bit is set, it stays set unless one of the four methods is used to clear it. Even if the DW_apb_i2c module is idle, this bit remains set until cleared, indicating that there was activity on the bus.
7	0h RO/V	**RX_DONE:** When the DW_apb_i2c is acting as a slave-transmitter, this bit is set to 1 if the master does not acknowledge a transmitted byte. This occurs on the last byte of the transmission, indicating that the transmission is done.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RO/V	**TX_ABRT:** This bit indicates if DW_apb_i2c, as an I2C transmitter, is unable to complete the intended actions on the contents of the transmit FIFO. This situation can occur both as an I2C master or an I2C slave, and is referred to as a 'transmit abort'. When this bit is set to 1, the IC_TX_ABRT_SOURCE register indicates the reason why the transmit abort takes places. Note: The DW_apb_i2c flushes/resets/empties only the TX_FIFO whenever there is a transmit abort caused by any of the events tracked by the IC_TX_ABRT_SOURCE register. The Tx FIFO remains in this flushed state until the register IC_CLR_TX_ABRT is read. Once this read is performed, the Tx FIFO is then ready to accept more data bytes from the APB interface. RX FIFO flush because of TX_ABRT is controlled by the coreConsultant parameter IC_AVOID_RX_FIFO_FLUSH_ON_TX_ABRT.
5	0h RO/V	**RD_REQ:** This bit is set to 1 when DW_apb_i2c is acting as a slave and another I2C master is attempting to read data from DW_apb_i2c. The DW_apb_i2c holds the I2C bus in a wait state (SCL=0) until this interrupt is serviced, which means that the slave has been addressed by a remote master that is asking for data to be transferred. The processor must respond to this interrupt and then write the requested data to the IC_DATA_CMD register. This bit is set to 0 just after the processor reads the IC_CLR_RD_REQ register.
4	0h RO/V	**TX_EMPTY:** The behavior of the TX_EMPTY interrupt status differs based on the TX_EMPTY_CTRL selection in the IC_CON register. - When TX_EMPTY_CTRL = 0: This bit is set to 1 when the transmit buffer is at or below the threshold value set in the IC_TX_TL register. - When TX_EMPTY_CTRL = 1: This bit is set to 1 when the transmit buffer is at or below the threshold value set in the IC_TX_TL register and the transmission of the address/data from the internal shift register for the most recently popped command is completed. It is automatically cleared by hardware when the buffer level goes above the threshold. When IC_ENABLE[0] is set to 0, the TX FIFO is flushed and held in reset. There the TX FIFO looks like it has no data within it, so this bit is set to 1, provided there is activity in the master or slave state machines. When there is no longer any activity, then with ic_en=0, this bit is set to 0.
3	0h RO/V	**TX_OVER:** Set during transmit if the transmit buffer is filled to IC_TX_BUFFER_DEPTH and the processor attempts to issue another I2C command by writing to the IC_DATA_CMD register. When the module is disabled, this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared.
2	0h RO/V	**RX_FULL:** Set when the receive buffer reaches or goes above the RX_TL threshold in the IC_RX_TL register. It is automatically cleared by hardware when buffer level goes below the threshold. If the module is disabled (IC_ENABLE[0]=0), the RX FIFO is flushed and held in reset; therefore the RX FIFO is not full. So this bit is cleared once the IC_ENABLE bit 0 is programmed with a 0, regardless of the activity that continues.
1	0h RO/V	**RX_OVER:** Set if the receive buffer is completely filled to IC_RX_BUFFER_DEPTH and an additional byte is received from an external I2C device. The DW_apb_i2c acknowledges this, but any data bytes received after the FIFO is full are lost. If the module is disabled (IC_ENABLE[0]=0), this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared. Note: If the configuration parameter IC_RX_FULL_HLD_BUS_EN is enabled and bit 9 of the IC_CON register (RX_FIFO_FULL_HLD_CTRL) is programmed to HIGH, then the RX_OVER interrupt never occurs, because the Rx FIFO never overflows.
0	0h RO/V	**RX_UNDER:** Set if the processor attempts to read the receive buffer when it is empty by reading from the IC_DATA_CMD register. If the module is disabled (IC_ENABLE[0]=0), this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared.

14.1.6.15 IC_RX_TL — Offset 4010A038h

I2C Receive FIFO Threshold Register - I2C Receive FIFO Threshold Register

Type	Size	Offset	Default
MMIO	32 bit	4010A038h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**RX_TL:** Receive FIFO Threshold Level. Controls the level of entries (or above) that triggers the RX_FULL interrupt (bit 2 in IC_RAW_INTR_STAT register). The valid range is 0-255, with the additional restriction that hardware does not allow this value to be set to a value larger than the depth of the buffer. If an attempt is made to do that, the actual value set will be the maximum depth of the buffer. A value of 0 sets the threshold for 1 entry, and a value of 255 sets the threshold for 256 entries.

14.1.6.16 IC_TX_TL — Offset 4010A03Ch

I2C Transmit FIFO Threshold Register - I2C Transmit FIFO Threshold Register

Type	Size	Offset	Default
MMIO	32 bit	4010A03Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**TX_TL:** Transmit FIFO Threshold Level. Controls the level of entries (or below) that trigger the TX_EMPTY interrupt (bit 4 in IC_RAW_INTR_STAT register). The valid range is 0-255, with the additional restriction that it may not be set to value larger than the depth of the buffer. If an attempt is made to do that, the actual value set will be the maximum depth of the buffer. A value of 0 sets the threshold for 0 entries, and a value of 255 sets the threshold for 255 entries.

14.1.6.17 IC_CLR_INTR — Offset 4010A040h

Clear Combined and Individual Interrupt Register - Clear Combined and Individual Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010A040h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_INTR:** Read this register to clear the combined interrupt, all individual interrupts, and the IC_TX_ABRT_SOURCE register. This bit does not clear hardware clearable interrupts but software clearable interrupts. Refer to Bit 9 of the IC_TX_ABRT_SOURCE register for an exception to clearing IC_TX_ABRT_SOURCE.

14.1.6.18 IC_CLR_RX_UNDER — Offset 4010A044h

Clear RX_UNDER Interrupt Register - Clear RX_UNDER Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010A044h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RX_UNDER:** Read this register to clear the RX_UNDER interrupt (bit 0) of the IC_RAW_INTR_STAT register.

14.1.6.19 IC_CLR_RX_OVER — Offset 4010A048h

Clear RX_OVER Interrupt Register - Clear RX_OVER Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010A048h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RX_OVER:** Read this register to clear the RX_OVER interrupt (bit 1) of the IC_RAW_INTR_STAT register.

14.1.6.20 IC_CLR_TX_OVER — Offset 4010A04Ch

Clear TX_OVER Interrupt Register - Clear TX_OVER Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010A04Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_TX_OVER:** Read this register to clear the TX_OVER interrupt (bit 3) of the IC_RAW_INTR_STAT register.

14.1.6.21 IC_CLR_RD_REQ — Offset 4010A050h

Clear RD_REQ Interrupt Register - Clear RD_REQ Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010A050h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RD_REQ:** Read this register to clear the RD_REQ interrupt (bit 5) of the IC_RAW_INTR_STAT register.

14.1.6.22 IC_CLR_TX_ABRT — Offset 4010A054h

Clear TX_ABRT Interrupt Register - Clear TX_ABRT Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010A054h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_TX_ABRT:** Read this register to clear the TX_ABRT interrupt (bit 6) of the IC_RAW_INTR_STAT register, and the IC_TX_ABRT_SOURCE register. This also releases the TX FIFO from the flushed/reset state, allowing more writes to the TX FIFO. Refer to Bit 9 of the IC_TX_ABRT_SOURCE register for an exception to clearing IC_TX_ABRT_SOURCE.

14.1.6.23 IC_CLR_RX_DONE — Offset 4010A058h

Clear RX_DONE Interrupt Register - Clear RX_DONE Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010A058h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RX_DONE:** Read this register to clear the RX_DONE interrupt (bit 7) of the IC_RAW_INTR_STAT register.

14.1.6.24 IC_CLR_ACTIVITY — Offset 4010A05Ch

Clear ACTIVITY Interrupt Register - Clear ACTIVITY Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010A05Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_ACTIVITY:** Reading this register clears the ACTIVITY interrupt if the I2C is not active anymore. If the I2C module is still active on the bus, the ACTIVITY interrupt bit continues to be set. It is automatically cleared by hardware if the module is disabled and if there is no further activity on the bus. The value read from this register to get status of the ACTIVITY interrupt (bit 8) of the IC_RAW_INTR_STAT register.

14.1.6.25 IC_CLR_STOP_DET — Offset 4010A060h

Clear STOP_DET Interrupt Register - Clear STOP_DET Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010A060h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_STOP_DET:** Read this register to clear the STOP_DET interrupt (bit 9) of the IC_RAW_INTR_STAT register.

14.1.6.26 IC_CLR_START_DET — Offset 4010A064h

Clear START_DET Interrupt Register - Clear START_DET Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010A064h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_START_DET:** Read this register to clear the START_DET interrupt (bit 10) of the IC_RAW_INTR_STAT register.

14.1.6.27 IC_CLR_GEN_CALL — Offset 4010A068h

Clear GEN_CALL Interrupt Register - Clear GEN_CALL Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010A068h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_GEN_CALL:** Read this register to clear the GEN_CALL interrupt (bit 11) of IC_RAW_INTR_STAT register.

14.1.6.28 IC_ENABLE — Offset 4010A06Ch

I2C ENABLE Register - I2C Enable Register

Type	Size	Offset	Default
MMIO	32 bit	4010A06Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**TX_CMD_BLOCK:** In Master mode: - 1'b1: Blocks the transmission of data on I2C bus even if Tx FIFO has data to transmit. - 1'b0: The transmission of data starts on I2C bus automatically, as soon as the first data is available in the Tx FIFO. Note: To block the execution of Master commands, set the TX_CMD_BLOCK bit only when Tx FIFO is empty (IC_STATUS[2]==1) and Master is in Idle state (IC_STATUS[5] == 0). Any further commands put in the Tx FIFO are not executed until TX_CMD_BLOCK bit is unset.
1	0h RW	**ABORT:** When set, the controller initiates the transfer abort. - 0: ABORT not initiated or ABORT done - 1: ABORT operation in progress The software can abort the I2C transfer in master mode by setting this bit. The software can set this bit only when ENABLE is already set; otherwise, the controller ignores any write to ABORT bit. The software cannot clear the ABORT bit once set. In response to an ABORT, the controller issues a STOP and flushes the Tx FIFO after completing the current transfer, then sets the TX_ABORT interrupt after the abort operation. The ABORT bit is cleared automatically after the abort operation.
0	0h RW	**ENABLE:** Controls whether the DW_apb_i2c is enabled. - 0: Disables DW_apb_i2c (TX and RX FIFOs are held in an erased state) - 1: Enables DW_apb_i2c Software can disable DW_apb_i2c while it is active. However, it is important that care be taken to ensure that DW_apb_i2c is disabled properly. A recommended procedure is described in "Disabling DW_apb_i2c". When DW_apb_i2c is disabled, the following occurs: - The TX FIFO and RX FIFO get flushed. - Status bits in the IC_INTR_STAT register are still active until DW_apb_i2c goes into IDLE state. If the module is transmitting, it stops as well as deletes the contents of the transmit buffer after the current transfer is complete. If the module is receiving, the DW_apb_i2c stops the current transfer at the end of the current byte and does not acknowledge the transfer. In systems with asynchronous pclk and ic_clk when IC_CLK_TYPE parameter set to asynchronous (1), there is a two ic_clk delay when enabling or disabling the DW_apb_i2c.

14.1.6.29 IC_STATUS — Offset 4010A070h

I2C STATUS Register - I2C Status Register This is a read-only register used to indicate the current transfer status and FIFO status. The status register may be read at any time. None of the bits in this register request an interrupt. When the I2C is disabled by writing 0 in bit 0 of the IC_ENABLE register: - Bits 1 and 2 are set to 1 - Bits 3 and 10 are set to 0 When the master or slave state machines goes to idle and ic_en=0: - Bits 5 and 6 are set to 0

Type	Size	Offset	Default
MMIO	32 bit	4010A070h	00000006h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved**
10	0h RO/V	**SLV_HOLD_RX_FIFO_FULL:** This bit indicates the BUS Hold in Slave mode due to Rx FIFO is Full and an additional byte has been received (This kind of Bus hold is applicable if IC_RX_FULL_HLD_BUS_EN is set to 1).
9	0h RO/V	**SLV_HOLD_TX_FIFO_EMPTY:** This bit indicates the BUS Hold in Slave mode for the Read request when the Tx FIFO is empty. The Bus is in hold until the Tx FIFO has data to Transmit for the read request.
8	0h RO/V	**MST_HOLD_RX_FIFO_FULL:** This bit indicates the BUS Hold in Master mode due to Rx FIFO is Full and additional byte has been received (This kind of Bus hold is applicable if IC_RX_FULL_HLD_BUS_EN is set to 1).
7	0h RO/V	**MST_HOLD_TX_FIFO_EMPTY:** If the IC_EMPTYFIFO_HOLD_MASTER_EN parameter is set to 1, the DW_apb_i2c master stalls the write transfer when Tx FIFO is empty, and the the last byte does not have the Stop bit set. This bit indicates the BUS hold when the master holds the bus because of the Tx FIFO being empty, and the the previous transferred command does not have the Stop bit set. (This kind of Bus hold is applicable if IC_EMPTYFIFO_HOLD_MASTER_EN is set to 1).
6	0h RO/V	**SLV_ACTIVITY:** Slave FSM Activity Status. When the Slave Finite State Machine (FSM) is not in the IDLE state, this bit is set. - 0: Slave FSM is in IDLE state so the Slave part of DW_apb_i2c is not Active - 1: Slave FSM is not in IDLE state so the Slave part of DW_apb_i2c is Active
5	0h RO/V	**MST_ACTIVITY:** Master FSM Activity Status. When the Master Finite State Machine (FSM) is not in the IDLE state, this bit is set. - 0: Master FSM is in IDLE state so the Master part of DW_apb_i2c is not Active - 1: Master FSM is not in IDLE state so the Master part of DW_apb_i2c is Active Note: IC_STATUS[0]-that is, ACTIVITY bit-is the OR of SLV_ACTIVITY and MST_ACTIVITY bits.
4	0h RO/V	**RFF:** Receive FIFO Completely Full. When the receive FIFO is completely full, this bit is set. When the receive FIFO contains one or more empty location, this bit is cleared. - 0: Receive FIFO is not full - 1: Receive FIFO is full
3	0h RO/V	**RFNE:** Receive FIFO Not Empty. This bit is set when the receive FIFO contains one or more entries; it is cleared when the receive FIFO is empty. - 0: Receive FIFO is empty - 1: Receive FIFO is not empty

Bit Range	Default & Access	Field Name (ID): Description
2	1h RO/V	**TFE:** Transmit FIFO Completely Empty. When the transmit FIFO is completely empty, this bit is set. When it contains one or more valid entries, this bit is cleared. This bit field does not request an interrupt. - 0: Transmit FIFO is not empty - 1: Transmit FIFO is empty
1	1h RO/V	**TFNF:** Transmit FIFO Not Full. Set when the transmit FIFO contains one or more empty locations, and is cleared when the FIFO is full. - 0: Transmit FIFO is full - 1: Transmit FIFO is not full
0	0h RO/V	**ACTIVITY:** I2C Activity Status.

14.1.6.30 IC_TXFLR — Offset 4010A074h

I2C Transmit FIFO Level Register - I2C Transmit FIFO Level Register This register contains the number of valid data entries in the transmit FIFO buffer. It is cleared whenever: - The I2C is disabled - There is a transmit abort - that is, TX_ABRT bit is set in the IC_RAW_INTR_STAT register - The slave bulk transmit mode is aborted The register increments whenever data is placed into the transmit FIFO and decrements when data is taken from the transmit FIFO.

Type	Size	Offset	Default
MMIO	32 bit	4010A074h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:0	00h RO/V	**TXFLR:** Transmit FIFO Level. Contains the number of valid data entries in the transmit FIFO.

14.1.6.31 IC_RXFLR — Offset 4010A078h

I2C Receive FIFO Level Register - I2C Receive FIFO Level Register This register contains the number of valid data entries in the receive FIFO buffer. It is cleared whenever: - The I2C is disabled - Whenever there is a transmit abort caused by any of the events tracked in IC_TX_ABRT_SOURCE The register increments whenever data is placed into the receive FIFO and decrements when data is taken from the receive FIFO.

Type	Size	Offset	Default
MMIO	32 bit	4010A078h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:0	00h RO/V	**RXFLR:** Receive FIFO Level. Contains the number of valid data entries in the receive FIFO.

14.1.6.32 IC_SDA_HOLD — Offset 4010A07Ch

I2C SDA Hold Time Length Register - I2C SDA Hold Time Length Register The bits [15:0] of this register are used to control the hold time of SDA during transmit in both slave and master mode (after SCL goes from HIGH to LOW). The bits [23:16] of this register are used to extend the SDA transition (if any) whenever SCL is HIGH in the receiver in either master or slave mode. Writes to this register succeed only when IC_ENABLE[0]=0. The values in this register are in units of ic_clk period. The value programmed in IC_SDA_TX_HOLD must be greater than the minimum hold time in each mode one cycle in master mode, seven cycles in slave mode for the value to be implemented. The programmed SDA hold time during transmit (IC_SDA_TX_HOLD) cannot exceed at any time the duration of the low part of scl. Therefore the programmed value cannot be larger than N_SCL_LOW-2, where N_SCL_LOW is the duration of the low part of the scl period measured in ic_clk cycles.

Type	Size	Offset	Default
MMIO	32 bit	4010A07Ch	00000005h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:16	00h RW	**IC_SDA_RX_HOLD:** Sets the required SDA hold time in units of ic_clk period, when DW_apb_i2c acts as a receiver.
15:0	0005h RW	**IC_SDA_TX_HOLD:** Sets the required SDA hold time in units of ic_clk period, when DW_apb_i2c acts as a transmitter.

14.1.6.33 IC_TX_ABRT_SOURCE — Offset 4010A080h

I2C Transmit Abort Source Register - I2C Transmit Abort Source Register This register has 32 bits that indicate the source of the TX_ABRT bit. Except for Bit 9, this register is cleared whenever the IC_CLR_TX_ABRT register or the IC_CLR_INTR register is read. To clear Bit 9, the source of the ABRT_SBYTE_NORSTRT must be fixed first; RESTART must be enabled (IC_CON[5]=1), the SPECIAL bit must be cleared (IC_TAR[11]), or the GC_OR_START bit must be cleared (IC_TAR[10]). Once the source of the ABRT_SBYTE_NORSTRT is fixed, then this bit can be cleared in the same manner as other bits in this register. If the source of the ABRT_SBYTE_NORSTRT is not fixed before attempting to clear this bit, Bit 9 clears for one cycle and is then re-asserted.

Type	Size	Offset	Default
MMIO	32 bit	4010A080h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:23	000h RO/V	**TX_FLUSH_CNT:** This field indicates the number of Tx FIFO Data Commands which are flushed due to TX_ABRT interrupt. It is cleared whenever I2C is disabled. Role of DW_apb_i2c: Master-Transmitter or Slave-Transmitter
22:17	0h RO	**Reserved**
16	0h RO/V	**ABRT_USER_ABRT:** This is a master-mode-only bit. Master has detected the transfer abort (IC_ENABLE[1]) Role of DW_apb_i2c: Master-Transmitter
15	0h RO/V	**ABRT_SLVRD_INTX:** 1: When the processor side responds to a slave mode request for data to be transmitted to a remote master and user writes a 1 in CMD (bit 8) of IC_DATA_CMD register. Role of DW_apb_i2c: Slave-Transmitter
14	0h RO/V	**ABRT_SLV_ARBLOST:** This field indicates that a Slave has lost the bus while transmitting data to a remote master. IC_TX_ABRT_SOURCE[12] is set at the same time. Note: Even though the slave never 'owns' the bus, something could go wrong on the bus. This is a fail safe check. For instance, during a data transmission at the low-to-high transition of SCL, if what is on the data bus is not what is supposed to be transmitted, then DW_apb_i2c no longer own the bus. Role of DW_apb_i2c: Slave-Transmitter
13	0h RO/V	**ABRT_SLVFLUSH_TXFIFO:** This field specifies that the Slave has received a read command and some data exists in the TX FIFO, so the slave issues a TX_ABRT interrupt to flush old data in TX FIFO. Role of DW_apb_i2c: Slave-Transmitter
12	0h RO/V	**ARB_LOST:** This field specifies that the Master has lost arbitration, or if IC_TX_ABRT_SOURCE[14] is also set, then the slave transmitter has lost arbitration. Role of DW_apb_i2c: Master-Transmitter or Slave-Transmitter
11	0h RO/V	**ABRT_MASTER_DIS:** This field indicates that the User tries to initiate a Master operation with the Master mode disabled. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver

Bit Range	Default & Access	Field Name (ID): Description
10	0h RO/V	**ABRT_10B_RD_NORSTRT:** This field indicates that the restart is disabled (IC_RESTART_EN bit (IC_CON[5]) =0) and the master sends a read command in 10-bit addressing mode. Role of DW_apb_i2c: Master-Receiver
9	0h RO/V	**ABRT_SBYTE_NORSTRT:** To clear Bit 9, the source of the ABRT_SBYTE_NORSTRT must be fixed first; restart must be enabled (IC_CON[5]=1), the SPECIAL bit must be cleared (IC_TAR[11]), or the GC_OR_START bit must be cleared (IC_TAR[10]). Once the source of the ABRT_SBYTE_NORSTRT is fixed, then this bit can be cleared in the same manner as other bits in this register. If the source of the ABRT_SBYTE_NORSTRT is not fixed before attempting to clear this bit, bit 9 clears for one cycle and then gets reasserted. When this field is set to 1, the restart is disabled (IC_RESTART_EN bit (IC_CON[5]) =0) and the user is trying to send a START Byte. Role of DW_apb_i2c: Master
8	0h RO/V	**ABRT_HS_NORSTRT:** This field indicates that the restart is disabled (IC_RESTART_EN bit (IC_CON[5]) =0) and the user is trying to use the master to transfer data in High Speed mode. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver
7	0h RO/V	**ABRT_SBYTE_ACKDET:** This field indicates that the Master has sent a START Byte and the START Byte was acknowledged (wrong behavior). Role of DW_apb_i2c: Master
6	0h RO/V	**ABRT_HS_ACKDET:** This field indicates that the Master is in High Speed mode and the High Speed Master code was acknowledged (wrong behavior). Role of DW_apb_i2c: Master
5	0h RO/V	**ABRT_GCALL_READ:** This field indicates that DW_apb_i2c in the master mode has sent a General Call but the user programmed the byte following the General Call to be a read from the bus (IC_DATA_CMD[9] is set to 1). Role of DW_apb_i2c: Master-Transmitter
4	0h RO/V	**ABRT_GCALL_NOACK:** This field indicates that DW_apb_i2c in master mode has sent a General Call and no slave on the bus acknowledged the General Call. Role of DW_apb_i2c: Master-Transmitter
3	0h RO/V	**ABRT_TXDATA_NOACK:** This field indicates the master-mode only bit. When the master receives an acknowledgement for the address, but when it sends data byte(s) following the address, it did not receive an acknowledge from the remote slave(s). Role of DW_apb_i2c: Master-Transmitter
2	0h RO/V	**ABRT_10ADDR2_NOACK:** This field indicates that the Master is in 10-bit address mode and that the second address byte of the 10-bit address was not acknowledged by any slave. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver
1	0h RO/V	**ABRT_10ADDR1_NOACK:** This field indicates that the Master is in 10-bit address mode and the first 10-bit address byte was not acknowledged by any slave. Reset value: 0x0 Role of DW_apb_i2c: Master-Transmitter or Master-Receiver
0	0h RO/V	**ABRT_7B_ADDR_NOACK:** This field indicates that the Master is in 7-bit addressing mode and the address sent was not acknowledged by any slave. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver

14.1.6.34 IC_DMA_CR — Offset 4010A088h

DMA Control Register - DMA Control Register This register is only valid when DW_apb_i2c is configured with a set of DMA Controller interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist and writing to the register's address has no effect and reading from this register

address will return zero. The register is used to enable the DMA Controller interface operation. There is a separate bit for transmit and receive. This can be programmed regardless of the state of IC_ENABLE.

Type	Size	Offset	Default
MMIO	32 bit	4010A088h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1	0h RW	**TDMAE:** Transmit DMA Enable. This bit enables/disables the transmit FIFO DMA channel.
0	0h RW	**RDMAE:** Receive DMA Enable. This bit enables/disables the receive FIFO DMA channel.

14.1.6.35 IC_DMA_TDLR — Offset 4010A08Ch

DMA Transmit Data Level Register - DMA Transmit Data Level Register This register is only valid when the DW_apb_i2c is configured with a set of DMA interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist; writing to its address has no effect; reading from its address returns zero.

Type	Size	Offset	Default
MMIO	32 bit	4010A08Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:0	00h RW	**DMATDL:** Transmit Data Level. This bit field controls the level at which a DMA request is made by the transmit logic. It is equal to the watermark level; that is, the dma_tx_req signal is generated when the number of valid data entries in the transmit FIFO is equal to or below this field value, and TDMAE = 1.

14.1.6.36 IC_DMA_RDLR — Offset 4010A090h

DMA Transmit Data Level Register - I2C Receive Data Level Register This register is only valid when DW_apb_i2c is configured with a set of DMA interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist; writing to its address has no effect; reading from its address returns zero.

Type	Size	Offset	Default
MMIO	32 bit	4010A090h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:0	00h RW	**DMARDL:** Receive Data Level. This bit field controls the level at which a DMA request is made by the receive logic. The watermark level = DMARDL+1; that is, dma_rx_req is generated when the number of valid data entries in the receive FIFO is equal to or more than this field value + 1, and RDMAE =1. For instance, when DMARDL is 0, then dma_rx_req is asserted when 1 or more data entries are present in the receive FIFO.

14.1.6.37 IC_SDA_SETUP — Offset 4010A094h

I2C SDA Setup Register - I2C SDA Setup Register This register controls the amount of time delay (in terms of number of ic_clk clock periods) introduced in the rising edge of SCL - relative to SDA changing - when DW_apb_i2c services a read request in a slave-transmitter operation. The relevant I2C requirement is tSU:DAT as detailed in the I2C Bus Specification. This register must be programmed with a value equal to or greater than 2. Writes to this register succeed only when IC_ENABLE[0] = 0. Note: The length of setup time is calculated using [(IC_SDA_SETUP - 1) * (ic_clk_period)], so if the user requires 10 ic_clk periods of setup time, they should program a value of 11. The IC_SDA_SETUP register is only used by the DW_apb_i2c when operating as a slave transmitter.

Type	Size	Offset	Default
MMIO	32 bit	4010A094h	00000002h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	02h RW	**SDA_SETUP:** SDA Setup. It is recommended that if the required delay is 1000ns, then for an ic_clk frequency of 10 MHz, IC_SDA_SETUP should be programmed to a value of 11. IC_SDA_SETUP must be programmed with a minimum value of 2.

14.1.6.38 IC_ACK_GENERAL_CALL — Offset 4010A098h

I2C ACK General Call Register - I2C ACK General Call Register The register controls whether DW_apb_i2c responds with a ACK or NACK when it receives an I2C General Call address. This register is applicable only when the DW_apb_i2c is in slave mode.

Type	Size	Offset	Default
MMIO	32 bit	4010A098h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**ACK_GEN_CALL:** ACK General Call. When set to 1, DW_apb_i2c responds with a ACK (by asserting ic_data_oe) when it receives a General Call. Otherwise, DW_apb_i2c responds with a NACK (by negating ic_data_oe).

14.1.6.39 IC_ENABLE_STATUS — Offset 4010A09Ch

I2C Enable Status Register - I2C Enable Status Register The register is used to report the DW_apb_i2c hardware status when the IC_ENABLE[0] register is set from 1 to 0; that is, when DW_apb_i2c is disabled. If IC_ENABLE[0] has been set to 1, bits 2:1 are forced to 0, and bit 0 is forced to 1. If IC_ENABLE[0] has been set to 0, bits 2:1 is only be valid as soon as bit 0 is read as '0'. Note: When IC_ENABLE[0] has been set to 0, a delay occurs for bit 0 to be read as 0 because disabling the DW_apb_i2c depends on I2C bus activities.

Type	Size	Offset	Default
MMIO	32 bit	4010A09Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2	0h RO/V	**SLV_RX_DATA_LOST:** Slave Received Data Lost. This bit indicates if a Slave-Receiver operation has been aborted with at least one data byte received from an I2C transfer due to the setting bit 0 of IC_ENABLE from 1 to 0. When read as 1, DW_apb_i2c is deemed to have been actively engaged in an aborted I2C transfer (with matching address) and the data phase of the I2C transfer has been entered, even though a data byte has been responded with a NACK. Note: If the remote I2C master terminates the transfer with a STOP condition before the DW_apb_i2c has a chance to NACK a transfer, and IC_ENABLE[0] has been set to 0, then this bit is also set to 1. When read as 0, DW_apb_i2c is deemed to have been disabled without being actively involved in the data phase of a Slave-Receiver transfer. Note: The CPU can safely read this bit when IC_EN (bit 0) is read as 0.
1	0h RO/V	**SLV_DISABLED_WHILE_BUSY:** Slave Disabled While Busy (Transmit, Receive). This bit indicates if a potential or active Slave operation has been aborted due to the setting bit 0 of the IC_ENABLE register from 1 to 0. This bit is set when the CPU writes a 0 to the IC_ENABLE register while: (a) DW_apb_i2c is receiving the address byte of the Slave-Transmitter operation from a remote master; OR, (b) address and data bytes of the Slave-Receiver operation from a remote master. When read as 1, DW_apb_i2c is deemed to have forced a NACK during any part of an I2C transfer, irrespective of whether the I2C address matches the slave address set in DW_apb_i2c (IC_SAR register) OR if the transfer is completed before IC_ENABLE is set to 0 but has not taken effect. Note: If the remote I2C master terminates the transfer with a STOP condition before the DW_apb_i2c has a chance to NACK a transfer, and IC_ENABLE[0] has been set to 0, then this bit will also be set to 1. When read as 0, DW_apb_i2c is deemed to have been disabled when there is master activity, or when the I2C bus is idle. Note: The CPU can safely read this bit when IC_EN (bit 0) is read as 0.
0	0h RO/V	**IC_EN:** ic_en Status. This bit always reflects the value driven on the output port ic_en. - When read as 1, DW_apb_i2c is deemed to be in an enabled state. - When read as 0, DW_apb_i2c is deemed completely inactive. Note: The CPU can safely read this bit anytime. When this bit is read as 0, the CPU can safely read SLV_RX_DATA_LOST (bit 2) and SLV_DISABLED_WHILE_BUSY (bit 1).

14.1.6.40 IC_FS_SPKLEN — Offset 4010A0A0h

I2C SS, FS or FM+ spike suppression limit - I2C SS, FS or FM+ spike suppression limit This register is used to store the duration, measured in ic_clk cycles, of the longest spike that is filtered out by the spike suppression logic w hen the component is operating in SS, FS or FM+ modes. This register must be programmed with a minimum value of 1.

Type	Size	Offset	Default
MMIO	32 bit	4010A0A0h	00000005h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	05h RW	**IC_FS_SPKLEN:** This register must be set before any I2C bus transaction can take place to ensure stable operation. This register sets the duration, measured in ic_clk cycles, of the longest spike in the SCL or SDA lines that will be filtered out by the spike suppression logic. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. The minimum valid value is 1; hardware prevents values less than this being written, and if attempted results in 1 being set.

14.1.6.41 IC_HS_SPKLEN — Offset 4010A0A4h

I2C HS spike suppression limit register - I2C HS spike suppression limit register This register is used to store the duration, measured in ic_clk cycles, of the longest spike that is filtered out by the spike suppression logic when the component is operating in HS modes. This register must be programmed with a minimum value of 1 and is implemented only if the component is configured to support HS mode; that is, if the IC_MAX_SPEED_MODE parameter is set to 3.

Type	Size	Offset	Default
MMIO	32 bit	4010A0A4h	00000002h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	02h RW	**IC_HS_SPKLEN:** This register must be set before any I2C bus transaction can take place to ensure stable operation. This register sets the duration, measured in ic_clk cycles, of the longest spike in the SCL or SDA lines that will be filtered out by the spike suppression logic. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. The minimum valid value is 1; hardware prevents values less than this being written, and if attempted results in 1 being set.

14.1.6.42 IC_CLR_RESTART_DET — Offset 4010A0A8h

Clear RESTART_DET Interrupt Register - Clear RESTART_DET Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010A0A8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RESTART_DET:** Read this register to clear the RESTART_DET interrupt (bit 12) of IC_RAW_INTR_STAT register.

14.1.6.43 IC_COMP_PARAM_1 — Offset 4010A0F4h

Component Parameter Register 1 - Component Parameter Register 1 Note This is a constant read-only register that contains encoded information about the component's parameter settings. The reset value depends on coreConsultant parameter(s).

Type	Size	Offset	Default
MMIO	32 bit	4010A0F4h	003F3FEEh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:16	3Fh RO/V	**TX_BUFFER_DEPTH:** The value of this register is derived from the IC_TX_BUFFER_DEPTH coreConsultant parameter. - 0x00 = Reserved - 0x01 = 2 - 0x02 = 3 - ... - 0xFF = 256
15:8	3Fh RO/V	**RX_BUFFER_DEPTH:** The value of this register is derived from the IC_RX_BUFFER_DEPTH coreConsultant parameter. - 0x00: Reserved - 0x01: 2 - 0x02: 3 - ... - 0xFF: 256
7	1h RO/V	**ADD_ENCODED_PARAMS:** The value of this register is derived from the IC_ADD_ENCODED_PARAMS coreConsultant parameter. Reading 1 in this bit means that the capability of reading these encoded parameters via software has been included. Otherwise, the entire register is 0 regardless of the setting of any other parameters that are encoded in the bits.

Bit Range	Default & Access	Field Name (ID): Description
6	1h RO/V	**HAS_DMA:** The value of this register is derived from the IC_HAS_DMA coreConsultant parameter.
5	1h RO/V	**INTR_IO:** The value of this register is derived from the IC_INTR_IO coreConsultant parameter.
4	0h RO/V	**HC_COUNT_VALUES:** The value of this register is derived from the IC_HC_COUNT VALUES coreConsultant parameter.
3:2	3h RO/V	**MAX_SPEED_MODE:** The value of this register is derived from the IC_MAX_SPEED_MODE coreConsultant parameter. - 0x0: Reserved - 0x1: Standard - 0x2: Fast - 0x3: High
1:0	2h RO/V	**APB_DATA_WIDTH:** The value of this register is derived from the APB_DATA_WIDTH coreConsultant parameter.

14.1.6.44 IC_COMP_VERSION — Offset 4010A0F8h

I2C Component Version Register - I2C Component Version Register

Type	Size	Offset	Default
MMIO	32 bit	4010A0F8h	3230322Ah

Register Level Access:

BIOS Access	SMM Access	OS Access

14.1.7.1 IC_CON — Offset 4010C000h

I2C Control Register - I2C Control Register. This register can be written only when the DW_apb_i2c is disabled, which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. Read/Write Access: - If configuration parameter I2C_DYNAMIC_TAR_UPDATE=1, bit 4 is read only. - If configuration parameter IC_RX_FULL_HLD_BUS_EN =0, bit 9 is read only. - If configuration parameter IC_STOP_DET_IF_MASTER_ACTIVE =0, bit 10 is read only. - If configuration parameter IC_BUS_CLEAR_FEATURE=0, bit 11 is read only - If configuration parameter IC_OPTIONAL_SAR=0, bit 16 is read only - If configuration parameter IC_SMBUS=0, bit 17 is read only - If configuration parameter IC_SMBUS_ARP=0, bits 18 and 19 are read only.

Type	Size	Offset	Default
MMIO	32 bit	4010C000h	00000067h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved**
10	0h RW	**STOP_DET_IF_MASTER_ACTIVE:** In Master mode: - 1'b1: issues the STOP_DET interrupt only when master is active. - 1'b0: issues the STOP_DET irrespective of whether master is active or not.
9	0h RW	**RX_FIFO_FULL_HLD_CTRL:** This bit controls whether DW_apb_i2c should hold the bus when the Rx FIFO is physically full to its RX_BUFFER_DEPTH, as described in the IC_RX_FULL_HLD_BUS_EN parameter.
8	0h RW	**TX_EMPTY_CTRL:** This bit controls the generation of the TX_EMPTY interrupt, as described in the IC_RAW_INTR_STAT register.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**STOP_DET_IFADDRESSED:** In slave mode: - 1'b1: issues the STOP_DET interrrupt only when it is addressed. - 0'b0: issues the STOP_DET irrespective of whether it's addressed or not. NOTE: During a general call address, this slave does not issue the STOP_DET interrupt if STOP_DET_IF_ADDRESSED = 1'b1, even if the slave responds to the general call address by generating ACK. The STOP_DET interrupt is generated only when the transmitted address matches the slave address (SAR).
6	1h RW	**IC_SLAVE_DISABLE:** This bit controls whether I2C has its slave disabled, which means once the presetn signal is applied, then this bit takes on the value of the configuration parameter IC_SLAVE_DISABLE. You have the choice of having the slave enabled or disabled after reset is applied, which means software does not have to configure the slave. By default, the slave is always enabled (in reset state as well). If you need to disable it after reset, set this bit to 1. If this bit is set (slave is disabled), DW_apb_i2c functions only as a master and does not perform any action that requires a slave. NOTE: Software should ensure that if this bit is written with 0, then bit 0 should also be written with a 0.
5	1h RW	**IC_RESTART_EN:** Determines whether RESTART conditions may be sent when acting as a master. Some older slaves do not support handling RESTART conditions; however, RESTART conditions are used in several DW_apb_i2c operations. When RESTART is disabled, the master is prohibited from performing the following functions: - Sending a START BYTE - Performing any high-speed mode operation - High-speed mode operation - Performing direction changes in combined format mode - Performing a read operation with a 10-bit address By replacing RESTART condition followed by a STOP and a subsequent START condition, split operations are broken down into multiple DW_apb_i2c transfers. If the above operations are performed, it will result in setting bit 6 (TX_ABRT) of the IC_RAW_INTR_STAT register. .
4	0h RO/V	**IC_10BITADDR_MASTER_RD_ONLY:** If the I2C_DYNAMIC_TAR_UPDATE configuration parameter is set to 'No' (0), this bit is named IC_10BITADDR_MASTER and controls whether the DW_apb_i2c starts its transfers in 7 or 10-bit addressing mode when acting as a master. If I2C_DYNAMIC_TAR_UPDATE is set to 'Yes' (1), the function of this bit is handled by bit 12 of IC_TAR register, and becomes a read-only copy called IC_10BITADDR_MASTER_rd_only. - 0: 7-bit addressing - 1: 10-bit addressing
3	0h RW	**IC_10BITADDR_SLAVE:** When acting as a slave, this bit controls whether the DW_apb_i2c responds to 7- or 10-bit addresses. - 0: 7-bit addressing. The DW_apb_i2c ignores transactions that involve 10-bit addressing; for 7-bit addressing, only the lower 7 bits of the IC_SAR register are compared. - 1: 10-bit addressing. The DW_apb_i2c responds to only 10-bit addressing transfers that match the full 10 bits of the IC_SAR register.
2:1	3h RW	**SPEED:** These bits control at which speed the DW_apb_i2c operates; its setting is relevant only if one is operating the DW_apb_i2c in master mode. Hardware protects against illegal values being programmed by software. These bits must be programmed appropriately for slave mode also, as it is used to capture correct value of spike filter as per the speed mode. This register should be programmed only with a value in the range of 1 to IC_MAX_SPEED_MODE; otherwise, hardware updates this register with the value of IC_MAX_SPEED_MODE. 1: standard mode (100 kbit/s) 2: fast mode (<=400 kbit/s) or fast mode plus (<=1000Kbit/s) 3: high speed mode (3.4 Mbit/s) Note: This field is not applicable when IC_ULTRA_FAST_MODE=1
0	1h RW	**MASTER_MODE:** This bit controls whether the DW_apb_i2c master is enabled. NOTE: Software should ensure that if this bit is written with '1' then bit 6 should also be written with a '1'.

14.1.7.2 IC_TAR — Offset 4010C004h

I2C Target Address Register - I2C Target Address Register If the configuration parameter I2C_DYNAMIC_TAR_UPDATE is set to 'No' (0), this register is 12 bits wide, and bits 31:12 are reserved. This register can be written to only when IC_ENABLE[0] is set to 0. However, if I2C_DYNAMIC_TAR_UPDATE = 1, then the register becomes 13

bits wide. In this case, writes to IC_TAR succeed when one of the following conditions are true: - DW_apb_i2c is NOT enabled (IC_ENABLE[0] is set to 0); or - DW_apb_i2c is enabled (IC_ENABLE[0]=1); AND DW_apb_i2c is NOT engaged in any Master (tx, rx) operation (IC_STATUS[5]=0); AND DW_apb_i2c is enabled to operate in Master mode (IC_CON[0]=1); AND there are NO entries in the TX FIFO (IC_STATUS[2]=1) You can change the TAR address dynamically without losing the bus, only if the following conditions are met. - DW_apb_i2c is enabled (IC_ENABLE[0]=1); AND IC_EMPTYFIFO_HOLD_MASTER_EN configuration parameter is set to 1; AND DW_apb_i2c is enabled to operate in Master mode (IC_CON[0]=1); AND there are NO entries in the Tx FIFO and the master is in HOLD state (IC_INTR_STAT[13]=1). Note: If the software or application is aware that the DW_apb_i2c is not using the TAR address for the pending commands in the Tx FIFO, then it is possible to update the TAR address even while the Tx FIFO has entries (IC_STATUS[2]= 0). - It is not necessary to perform any write to this register if DW_apb_i2c is enabled as an I2C slave only.

Type	Size	Offset	Default
MMIO	32 bit	4010C004h	00000055h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	**Reserved**
12	0h RW	**IC_10BITADDR_MASTER:** This bit controls whether the DW_apb_i2c starts its transfers in 7- or 10-bit addressing mode when acting as a master. - 0: 7-bit addressing - 1: 10-bit addressing
11	0h RW	**SPECIAL:** This bit indicates whether software performs a Device-ID or General Call or START BYTE command. - 0: ignore bit 10 GC_OR_START and use IC_TAR normally - 1: perform special I2C command as specified in Device_ID or GC_OR_START bit
10	0h RW	**GC_OR_START:** If bit 11 (SPECIAL) is set to 1 and bit 13(Device-ID) is set to 0, then this bit indicates whether a General Call or START byte command is to be performed by the DW_apb_i2c. - 0: General Call Address - after issuing a General Call, only writes may be performed. Attempting to issue a read command results in setting bit 6 (TX_ABRT) of the IC_RAW_INTR_STAT register. The DW_apb_i2c remains in General Call mode until the SPECIAL bit value (bit 11) is cleared. - 1: START BYTE
9:0	055h RW	**IC_TAR:** This is the target address for any master transaction. When transmitting a General Call, these bits are ignored. To generate a START BYTE, the CPU needs to write only once into these bits. If the IC_TAR and IC_SAR are the same, loopback exists but the FIFOs are shared between master and slave, so full loopback is not feasible. Only one direction loopback mode is supported (simplex), not duplex. A master cannot transmit to itself; it can transmit to only a slave.

14.1.7.3 IC_SAR — Offset 4010C008h

I2C Slave Address Register - I2C Slave Address Register

Type	Size	Offset	Default
MMIO	32 bit	4010C008h	00000055h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:0	055h RW	**IC_SAR:** The IC_SAR holds the slave address when the I2C is operating as a slave. For 7-bit addressing, only IC_SAR[6:0] is used. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. Note: The default values cannot be any of the reserved address locations: that is, 0x00 to 0x07, or 0x78 to 0x7f. The correct operation of the device is not guaranteed if you program the IC_SAR or IC_TAR to a reserved value.

14.1.7.4 IC_HS_MADDR — Offset 4010C00Ch

I2C High Speed Master Mode Code Address Register - I2C High Speed Master Mode Code Address Register

Type	Size	Offset	Default
MMIO	32 bit	4010C00Ch	00000001h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2:0	1h RW	**IC_HS_MAR:** This bit field holds the value of the I2C HS mode master code. HS-mode master codes are reserved 8-bit codes (00001xxx) that are not used for slave addressing or other purposes. Each master has its unique master code; up to eight high-speed mode masters can be present on the same I2C bus system. Valid values are from 0 to 7. This register goes away and becomes read-only returning 0's if the IC_MAX_SPEED_MODE configuration parameter is set to either Standard (1) or Fast (2). This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect.

14.1.7.5 IC_DATA_CMD — Offset 4010C010h

I2C Rx/Tx Data Buffer and Command Register - I2C Rx/Tx Data Buffer and Command Register; this is the register the CPU writes to when filling the TX FIFO and the CPU reads from when retrieving bytes from RX FIFO. The size of the register changes as follows: Write: - 11 bits when IC_EMPTYFIFO_HOLD_MASTER_EN=1 - 9 bits when IC_EMPTYFIFO_HOLD_MASTER_EN=0 Read: - 12 bits when IC_FIRST_DATA_BYTE_STATUS = 1 - 8 bits when IC_FIRST_DATA_BYTE_STATUS = 0 Note: In order for the DW_apb_i2c to continue acknowledging reads, a read command should be written for every byte that is to be received; otherwise the DW_apb_i2c will stop acknowledging.

Type	Size	Offset	Default
MMIO	32 bit	4010C010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RO/V	**FIRST_DATA_BYTE:** Indicates the first data byte received after the address phase for receive transfer in Master receiver or Slave receiver mode. NOTE: In case of APB_DATA_WIDTH=8, 1. The user has to perform two APB Reads to IC_DATA_CMD in order to get status on 11 bit. 2. Inorder to read the 11 bit, the user has to perform the first data byte read [7:0] (offset 0x10) and then perform the second read[15:8](offset 0x11) in order to know the status of 11 bit (whether the data received in previous read is a first data byte or not). 3. The 11th bit is an optional read field, user can ignore 2nd byte read [15:8] (offset 0x11) if not interested in FIRST_DATA_BYTE status.
10	0h WO	**RESTART:** This bit controls whether a RESTART is issued before the byte is sent or received. This bit is available only if IC_EMPTYFIFO_HOLD_MASTER_EN is configured to 1. 1 - If IC_RESTART_EN is 1, a RESTART is issued before the data is sent/received (according to the value of CMD), regardless of whether or not the transfer direction is changing from the previous command; if IC_RESTART_EN is 0, a STOP followed by a START is issued instead. 0 - If IC_RESTART_EN is 1, a RESTART is issued only if the transfer direction is changing from the previous command; if IC_RESTART_EN is 0, a STOP followed by a START is issued instead.

Bit Range	Default & Access	Field Name (ID): Description
9	0h WO	**STOP:** This bit controls whether a STOP is issued after the byte is sent or received. This bit is available only if IC_EMPTYFIFO_HOLD_MASTER_EN is configured to 1. - 1 - STOP is issued after this byte, regardless of whether or not the Tx FIFO is empty. If the Tx FIFO is not empty, the master immediately tries to start a new transfer by issuing a START and arbitrating for the bus. - 0 - STOP is not issued after this byte, regardless of whether or not the Tx FIFO is empty. If the Tx FIFO is not empty, the master continues the current transfer by sending/receiving data bytes according to the value of the CMD bit. If the Tx FIFO is empty, the master holds the SCL line low and stalls the bus until a new command is available in the Tx FIFO.
8	0h WO	**CMD:** This bit controls whether a read or a write is performed. This bit does not control the direction when the DW_apb_i2c acts as a slave. It controls only the direction when it acts as a master. When a command is entered in the TX FIFO, this bit distinguishes the write and read commands. In slave-receiver mode, this bit is a "don't care" because writes to this register are not required. In slave-transmitter mode, a "0" indicates that the data in IC_DATA_CMD is to be transmitted. When programming this bit, you should remember the following: attempting to perform a read operation after a General Call command has been sent results in a TX_ABRT interrupt (bit 6 of the IC_RAW_INTR_STAT register), unless bit 11 (SPECIAL) in the IC_TAR register has been cleared. If a "1" is written to this bit after receiving a RD_REQ interrupt, then a TX_ABRT interrupt occurs.
7:0	00h RW/V	**DAT:** This register contains the data to be transmitted or received on the I2C bus. If you are writing to this register and want to perform a read, bits 7:0 (DAT) are ignored by the DW_apb_i2c. However, when you read this register, these bits return the value of data received on the DW_apb_i2c interface.

14.1.7.6 IC_SS_SCL_HCNT — Offset 4010C014h

Standard Speed I2C Clock SCL High Count Register - Standard Speed I2C Clock SCL High Count Register

Type	Size	Offset	Default
MMIO	32 bit	4010C014h	000001E8h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	01E8h RW	**IC_SS_SCL_HCNT:** This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock high-period count for standard speed. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. The minimum valid value is 6; hardware prevents values less than this being written, and if attempted results in 6 being set. For designs with APB_DATA_WIDTH = 8, the order of programming is important to ensure the correct operation of the DW_apb_i2c. The lower byte must be programmed first. Then the upper byte is programmed. When the configuration parameter IC_HC_COUNT_VALUES is set to 1, this register is read only. NOTE: This register must not be programmed to a value higher than 65525, because DW_apb_i2c uses a 16-bit counter to flag an I2C bus idle condition when this counter reaches a value of IC_SS_SCL_HCNT + 10.

14.1.7.7 IC_SS_SCL_LCNT — Offset 4010C018h

Standard Speed I2C Clock SCL Low Count Register - Standard Speed I2C Clock SCL Low Count Register

12	0h RO/V	**R_RESTART_DET:** See IC_RAW_INTR_STAT for a detailed description of R_RESTART_DET bit.
11	0h RO/V	**R_GEN_CALL:** See IC_RAW_INTR_STAT for a detailed description of R_GEN_CALL bit.

Bit Range	Default & Access	Field Name (ID): Description
10	0h RO/V	**R_START_DET:** See IC_RAW_INTR_STAT for a detailed description of R_START_DET bit.
9	0h RO/V	**R_STOP_DET:** See IC_RAW_INTR_STAT for a detailed description of R_STOP_DET bit.
8	0h RO/V	**R_ACTIVITY:** See IC_RAW_INTR_STAT for a detailed description of R_ACTIVITY bit.
7	0h RO/V	**R_RX_DONE:** See IC_RAW_INTR_STAT for a detailed description of R_RX_DONE bit.
6	0h RO/V	**R_TX_ABRT:** See IC_RAW_INTR_STAT for a detailed description of R_TX_ABRT bit.
5	0h RO/V	**R_RD_REQ:** See IC_RAW_INTR_STAT for a detailed description of R_RD_REQ bit.
4	0h RO/V	**R_TX_EMPTY:** See IC_RAW_INTR_STAT for a detailed description of R_TX_EMPTY bit.
3	0h RO/V	**R_TX_OVER:** See IC_RAW_INTR_STAT for a detailed description of R_TX_OVER bit.
2	0h RO/V	**R_RX_FULL:** See IC_RAW_INTR_STAT for a detailed description of R_RX_FULL bit.
1	0h RO/V	**R_RX_OVER:** See IC_RAW_INTR_STAT for a detailed description of R_RX_OVER bit.
0	0h RO/V	**R_RX_UNDER:** See IC_RAW_INTR_STAT for a detailed description of R_RX_UNDER bit.

14.1.7.13 IC_INTR_MASK — Offset 4010C030h

I2C Interrupt Mask Register - I2C Interrupt Mask Register. These bits mask their corresponding interrupt status bits. This register is active low; a value of 0 masks the interrupt, whereas a value of 1 unmasks the interrupt.

Type	Size	Offset	Default
MMIO	32 bit	4010C030h	000008FFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13	0h RW	**M_MASTER_ON_HOLD:** This bit masks the R_MASTER_ON_HOLD interrupt in IC_INTR_STAT register.
12	0h RW	**M_RESTART_DET:** This bit masks the R_RESTART_DET interrupt in IC_INTR_STAT register.

Bit Range	Default & Access	Field Name (ID): Description
11	1h RW	**M_GEN_CALL:** This bit masks the R_GEN_CALL interrupt in IC_INTR_STAT register.
10	0h RW	**M_START_DET:** This bit masks the R_START_DET interrupt in IC_INTR_STAT register.
9	0h RW	**M_STOP_DET:** This bit masks the R_STOP_DET interrupt in IC_INTR_STAT register.
8	0h RW	**M_ACTIVITY:** This bit masks the R_ACTIVITY interrupt in IC_INTR_STAT register.
7	1h RW	**M_RX_DONE:** This bit masks the R_RX_DONE interrupt in IC_INTR_STAT register.
6	1h RW	**M_TX_ABRT:** This bit masks the R_TX_ABRT interrupt in IC_INTR_STAT register.
5	1h RW	**M_RD_REQ:** This bit masks the R_RD_REQ interrupt in IC_INTR_STAT register.
4	1h RW	**M_TX_EMPTY:** This bit masks the R_TX_EMPTY interrupt in IC_INTR_STAT register.
3	1h RW	**M_TX_OVER:** This bit masks the R_TX_OVER interrupt in IC_INTR_STAT register.
2	1h RW	**M_RX_FULL:** This bit masks the R_RX_FULL interrupt in IC_INTR_STAT register.
1	1h RW	**M_RX_OVER:** This bit masks the R_RX_OVER interrupt in IC_INTR_STAT register.
0	1h RW	**M_RX_UNDER:** This bit masks the R_RX_UNDER interrupt in IC_INTR_STAT register.

14.1.7.14 IC_RAW_INTR_STAT — Offset 4010C034h

I2C Raw Interrupt Status Register - I2C Raw Interrupt Status Register Unlike the IC_INTR_STAT register, these bits are not masked so they always show the true status of the DW_apb_i2c.

Type	Size	Offset	Default
MMIO	32 bit	4010C034h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13	0h RO/V	**MASTER_ON_HOLD:** Indicates whether master is holding the bus and TX FIFO is empty. Enabled only when I2C_DYNAMIC_TAR_UPDATE=1 and IC_EMPTYFIFO_HOLD_MASTER_EN=1.
12	0h RO/V	**RESTART_DET:** Indicates whether a RESTART condition has occurred on the I2C interface when DW_apb_i2c is operating in Slave mode and the slave is being addressed. Enabled only when IC_SLV_RESTART_DET_EN=1. Note: However, in high-speed mode or during a START BYTE transfer, the RESTART comes before the address field as per the I2C protocol. In this case, the slave is not the addressed slave when the RESTART is issued, therefore DW_apb_i2c does not generate the RESTART_DET interrupt.
11	0h RO/V	**GEN_CALL:** Set only when a General Call address is received and it is acknowledged. It stays set until it is cleared either by disabling DW_apb_i2c or when the CPU reads bit 0 of the IC_CLR_GEN_CALL register. DW_apb_i2c stores the received data in the Rx buffer.
10	0h RO/V	**START_DET:** Indicates whether a START or RESTART condition has occurred on the I2C interface regardless of whether DW_apb_i2c is operating in slave or master mode.
9	0h RO/V	**STOP_DET:** Indicates whether a STOP condition has occurred on the I2C interface regardless of whether DW_apb_i2c is operating in slave or master mode. In Slave Mode: - If IC_CON[7]=1'b1 (STOP_DET_IFADDRESSED), the STOP_DET interrupt will be issued only if slave is addressed. Note: During a general call address, this slave does not issue a STOP_DET interrupt if STOP_DET_IF_ADDRESSED=1'b1, even if the slave responds to the general call address by generating ACK. The STOP_DET interrupt is generated only when the transmitted address matches the slave address (SAR). - If IC_CON[7]=1'b0 (STOP_DET_IFADDRESSED), the STOP_DET interrupt is issued irrespective of whether it is being addressed. In Master Mode: - If IC_CON[10]=1'b1 (STOP_DET_IF_MASTER_ACTIVE),the STOP_DET interrupt will be issued only if Master is active. - If IC_CON[10]=1'b0 (STOP_DET_IFADDRESSED),the STOP_DET interrupt will be issued irrespective of whether master is active or not.
8	0h RO/V	**ACTIVITY:** This bit captures DW_apb_i2c activity and stays set until it is cleared. There are four ways to clear it: - Disabling the DW_apb_i2c - Reading the IC_CLR_ACTIVITY register - Reading the IC_CLR_INTR register - System reset Once this bit is set, it stays set unless one of the four methods is used to clear it. Even if the DW_apb_i2c module is idle, this bit remains set until cleared, indicating that there was activity on the bus.
7	0h RO/V	**RX_DONE:** When the DW_apb_i2c is acting as a slave-transmitter, this bit is set to 1 if the master does not acknowledge a transmitted byte. This occurs on the last byte of the transmission, indicating that the transmission is done.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RO/V	**TX_ABRT:** This bit indicates if DW_apb_i2c, as an I2C transmitter, is unable to complete the intended actions on the contents of the transmit FIFO. This situation can occur both as an I2C master or an I2C slave, and is referred to as a 'transmit abort'. When this bit is set to 1, the IC_TX_ABRT_SOURCE register indicates the reason why the transmit abort takes places. Note: The DW_apb_i2c flushes/resets/empties only the TX_FIFO whenever there is a transmit abort caused by any of the events tracked by the IC_TX_ABRT_SOURCE register. The Tx FIFO remains in this flushed state until the register IC_CLR_TX_ABRT is read. Once this read is performed, the Tx FIFO is then ready to accept more data bytes from the APB interface. RX FIFO flush because of TX_ABRT is controlled by the coreConsultant parameter IC_AVOID_RX_FIFO_FLUSH_ON_TX_ABRT.
5	0h RO/V	**RD_REQ:** This bit is set to 1 when DW_apb_i2c is acting as a slave and another I2C master is attempting to read data from DW_apb_i2c. The DW_apb_i2c holds the I2C bus in a wait state (SCL=0) until this interrupt is serviced, which means that the slave has been addressed by a remote master that is asking for data to be transferred. The processor must respond to this interrupt and then write the requested data to the IC_DATA_CMD register. This bit is set to 0 just after the processor reads the IC_CLR_RD_REQ register.
4	0h RO/V	**TX_EMPTY:** The behavior of the TX_EMPTY interrupt status differs based on the TX_EMPTY_CTRL selection in the IC_CON register. - When TX_EMPTY_CTRL = 0: This bit is set to 1 when the transmit buffer is at or below the threshold value set in the IC_TX_TL register. - When TX_EMPTY_CTRL = 1: This bit is set to 1 when the transmit buffer is at or below the threshold value set in the IC_TX_TL register and the transmission of the address/data from the internal shift register for the most recently popped command is completed. It is automatically cleared by hardware when the buffer level goes above the threshold. When IC_ENABLE[0] is set to 0, the TX FIFO is flushed and held in reset. There the TX FIFO looks like it has no data within it, so this bit is set to 1, provided there is activity in the master or slave state machines. When there is no longer any activity, then with ic_en=0, this bit is set to 0.
3	0h RO/V	**TX_OVER:** Set during transmit if the transmit buffer is filled to IC_TX_BUFFER_DEPTH and the processor attempts to issue another I2C command by writing to the IC_DATA_CMD register. When the module is disabled, this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared.
2	0h RO/V	**RX_FULL:** Set when the receive buffer reaches or goes above the RX_TL threshold in the IC_RX_TL register. It is automatically cleared by hardware when buffer level goes below the threshold. If the module is disabled (IC_ENABLE[0]=0), the RX FIFO is flushed and held in reset; therefore the RX FIFO is not full. So this bit is cleared once the IC_ENABLE bit 0 is programmed with a 0, regardless of the activity that continues.
1	0h RO/V	**RX_OVER:** Set if the receive buffer is completely filled to IC_RX_BUFFER_DEPTH and an additional byte is received from an external I2C device. The DW_apb_i2c acknowledges this, but any data bytes received after the FIFO is full are lost. If the module is disabled (IC_ENABLE[0]=0), this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared. Note: If the configuration parameter IC_RX_FULL_HLD_BUS_EN is enabled and bit 9 of the IC_CON register (RX_FIFO_FULL_HLD_CTRL) is programmed to HIGH, then the RX_OVER interrupt never occurs, because the Rx FIFO never overflows.
0	0h RO/V	**RX_UNDER:** Set if the processor attempts to read the receive buffer when it is empty by reading from the IC_DATA_CMD register. If the module is disabled (IC_ENABLE[0]=0), this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared.

14.1.7.15 IC_RX_TL — Offset 4010C038h

I2C Receive FIFO Threshold Register - I2C Receive FIFO Threshold Register

Type	Size	Offset	Default
MMIO	32 bit	4010C038h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**RX_TL:** Receive FIFO Threshold Level. Controls the level of entries (or above) that triggers the RX_FULL interrupt (bit 2 in IC_RAW_INTR_STAT register). The valid range is 0-255, with the additional restriction that hardware does not allow this value to be set to a value larger than the depth of the buffer. If an attempt is made to do that, the actual value set will be the maximum depth of the buffer. A value of 0 sets the threshold for 1 entry, and a value of 255 sets the threshold for 256 entries.

14.1.7.16 IC_TX_TL — Offset 4010C03Ch

I2C Transmit FIFO Threshold Register - I2C Transmit FIFO Threshold Register

Type	Size	Offset	Default
MMIO	32 bit	4010C03Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**TX_TL:** Transmit FIFO Threshold Level. Controls the level of entries (or below) that trigger the TX_EMPTY interrupt (bit 4 in IC_RAW_INTR_STAT register). The valid range is 0-255, with the additional restriction that it may not be set to value larger than the depth of the buffer. If an attempt is made to do that, the actual value set will be the maximum depth of the buffer. A value of 0 sets the threshold for 0 entries, and a value of 255 sets the threshold for 255 entries.

14.1.7.17 IC_CLR_INTR — Offset 4010C040h

Clear Combined and Individual Interrupt Register - Clear Combined and Individual Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010C040h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_INTR:** Read this register to clear the combined interrupt, all individual interrupts, and the IC_TX_ABRT_SOURCE register. This bit does not clear hardware clearable interrupts but software clearable interrupts. Refer to Bit 9 of the IC_TX_ABRT_SOURCE register for an exception to clearing IC_TX_ABRT_SOURCE.

14.1.7.18 IC_CLR_RX_UNDER — Offset 4010C044h

Clear RX_UNDER Interrupt Register - Clear RX_UNDER Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010C044h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RX_UNDER:** Read this register to clear the RX_UNDER interrupt (bit 0) of the IC_RAW_INTR_STAT register.

14.1.7.19 IC_CLR_RX_OVER — Offset 4010C048h

Clear RX_OVER Interrupt Register - Clear RX_OVER Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010C048h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RX_OVER:** Read this register to clear the RX_OVER interrupt (bit 1) of the IC_RAW_INTR_STAT register.

14.1.7.20 IC_CLR_TX_OVER — Offset 4010C04Ch

Clear TX_OVER Interrupt Register - Clear TX_OVER Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010C04Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_TX_OVER:** Read this register to clear the TX_OVER interrupt (bit 3) of the IC_RAW_INTR_STAT register.

14.1.7.21 IC_CLR_RD_REQ — Offset 4010C050h

Clear RD_REQ Interrupt Register - Clear RD_REQ Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010C050h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RD_REQ:** Read this register to clear the RD_REQ interrupt (bit 5) of the IC_RAW_INTR_STAT register.

14.1.7.22 IC_CLR_TX_ABRT — Offset 4010C054h

Clear TX_ABRT Interrupt Register - Clear TX_ABRT Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010C054h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_TX_ABRT:** Read this register to clear the TX_ABRT interrupt (bit 6) of the IC_RAW_INTR_STAT register, and the IC_TX_ABRT_SOURCE register. This also releases the TX FIFO from the flushed/reset state, allowing more writes to the TX FIFO. Refer to Bit 9 of the IC_TX_ABRT_SOURCE register for an exception to clearing IC_TX_ABRT_SOURCE.

14.1.7.23 IC_CLR_RX_DONE — Offset 4010C058h

Clear RX_DONE Interrupt Register - Clear RX_DONE Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010C058h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RX_DONE:** Read this register to clear the RX_DONE interrupt (bit 7) of the IC_RAW_INTR_STAT register.

14.1.7.24 IC_CLR_ACTIVITY — Offset 4010C05Ch

Clear ACTIVITY Interrupt Register - Clear ACTIVITY Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010C05Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_ACTIVITY:** Reading this register clears the ACTIVITY interrupt if the I2C is not active anymore. If the I2C module is still active on the bus, the ACTIVITY interrupt bit continues to be set. It is automatically cleared by hardware if the module is disabled and if there is no further activity on the bus. The value read from this register to get status of the ACTIVITY interrupt (bit 8) of the IC_RAW_INTR_STAT register.

14.1.7.25 IC_CLR_STOP_DET — Offset 4010C060h

Clear STOP_DET Interrupt Register - Clear STOP_DET Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010C060h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_STOP_DET:** Read this register to clear the STOP_DET interrupt (bit 9) of the IC_RAW_INTR_STAT register.

14.1.7.26 IC_CLR_START_DET — Offset 4010C064h

Clear START_DET Interrupt Register - Clear START_DET Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010C064h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_START_DET:** Read this register to clear the START_DET interrupt (bit 10) of the IC_RAW_INTR_STAT register.

14.1.7.27 IC_CLR_GEN_CALL — Offset 4010C068h

Clear GEN_CALL Interrupt Register - Clear GEN_CALL Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010C068h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_GEN_CALL:** Read this register to clear the GEN_CALL interrupt (bit 11) of IC_RAW_INTR_STAT register.

14.1.7.28 IC_ENABLE — Offset 4010C06Ch

I2C ENABLE Register - I2C Enable Register

Type	Size	Offset	Default
MMIO	32 bit	4010C06Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**TX_CMD_BLOCK:** In Master mode: - 1'b1: Blocks the transmission of data on I2C bus even if Tx FIFO has data to transmit. - 1'b0: The transmission of data starts on I2C bus automatically, as soon as the first data is available in the Tx FIFO. Note: To block the execution of Master commands, set the TX_CMD_BLOCK bit only when Tx FIFO is empty (IC_STATUS[2]==1) and Master is in Idle state (IC_STATUS[5] == 0). Any further commands put in the Tx FIFO are not executed until TX_CMD_BLOCK bit is unset.
1	0h RW	**ABORT:** When set, the controller initiates the transfer abort. - 0: ABORT not initiated or ABORT done - 1: ABORT operation in progress The software can abort the I2C transfer in master mode by setting this bit. The software can set this bit only when ENABLE is already set; otherwise, the controller ignores any write to ABORT bit. The software cannot clear the ABORT bit once set. In response to an ABORT, the controller issues a STOP and flushes the Tx FIFO after completing the current transfer, then sets the TX_ABORT interrupt after the abort operation. The ABORT bit is cleared automatically after the abort operation.
0	0h RW	**ENABLE:** Controls whether the DW_apb_i2c is enabled. - 0: Disables DW_apb_i2c (TX and RX FIFOs are held in an erased state) - 1: Enables DW_apb_i2c Software can disable DW_apb_i2c while it is active. However, it is important that care be taken to ensure that DW_apb_i2c is disabled properly. A recommended procedure is described in "Disabling DW_apb_i2c". When DW_apb_i2c is disabled, the following occurs: - The TX FIFO and RX FIFO get flushed. - Status bits in the IC_INTR_STAT register are still active until DW_apb_i2c goes into IDLE state. If the module is transmitting, it stops as well as deletes the contents of the transmit buffer after the current transfer is complete. If the module is receiving, the DW_apb_i2c stops the current transfer at the end of the current byte and does not acknowledge the transfer. In systems with asynchronous pclk and ic_clk when IC_CLK_TYPE parameter set to asynchronous (1), there is a two ic_clk delay when enabling or disabling the DW_apb_i2c.

14.1.7.29 IC_STATUS — Offset 4010C070h

I2C STATUS Register - I2C Status Register This is a read-only register used to indicate the current transfer status and FIFO status. The status register may be read at any time. None of the bits in this register request an interrupt. When the I2C is disabled by writing 0 in bit 0 of the IC_ENABLE register: - Bits 1 and 2 are set to 1 - Bits 3 and 10 are set to 0 When the master or slave state machines goes to idle and ic_en=0: - Bits 5 and 6 are set to 0

Type	Size	Offset	Default
MMIO	32 bit	4010C070h	00000006h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved**
10	0h RO/V	**SLV_HOLD_RX_FIFO_FULL:** This bit indicates the BUS Hold in Slave mode due to Rx FIFO is Full and an additional byte has been received (This kind of Bus hold is applicable if IC_RX_FULL_HLD_BUS_EN is set to 1).
9	0h RO/V	**SLV_HOLD_TX_FIFO_EMPTY:** This bit indicates the BUS Hold in Slave mode for the Read request when the Tx FIFO is empty. The Bus is in hold until the Tx FIFO has data to Transmit for the read request.
8	0h RO/V	**MST_HOLD_RX_FIFO_FULL:** This bit indicates the BUS Hold in Master mode due to Rx FIFO is Full and additional byte has been received (This kind of Bus hold is applicable if IC_RX_FULL_HLD_BUS_EN is set to 1).
7	0h RO/V	**MST_HOLD_TX_FIFO_EMPTY:** If the IC_EMPTYFIFO_HOLD_MASTER_EN parameter is set to 1, the DW_apb_i2c master stalls the write transfer when Tx FIFO is empty, and the the last byte does not have the Stop bit set. This bit indicates the BUS hold when the master holds the bus because of the Tx FIFO being empty, and the the previous transferred command does not have the Stop bit set. (This kind of Bus hold is applicable if IC_EMPTYFIFO_HOLD_MASTER_EN is set to 1).
6	0h RO/V	**SLV_ACTIVITY:** Slave FSM Activity Status. When the Slave Finite State Machine (FSM) is not in the IDLE state, this bit is set. - 0: Slave FSM is in IDLE state so the Slave part of DW_apb_i2c is not Active - 1: Slave FSM is not in IDLE state so the Slave part of DW_apb_i2c is Active
5	0h RO/V	**MST_ACTIVITY:** Master FSM Activity Status. When the Master Finite State Machine (FSM) is not in the IDLE state, this bit is set. - 0: Master FSM is in IDLE state so the Master part of DW_apb_i2c is not Active - 1: Master FSM is not in IDLE state so the Master part of DW_apb_i2c is Active Note: IC_STATUS[0]-that is, ACTIVITY bit-is the OR of SLV_ACTIVITY and MST_ACTIVITY bits.
4	0h RO/V	**RFF:** Receive FIFO Completely Full. When the receive FIFO is completely full, this bit is set. When the receive FIFO contains one or more empty location, this bit is cleared. - 0: Receive FIFO is not full - 1: Receive FIFO is full
3	0h RO/V	**RFNE:** Receive FIFO Not Empty. This bit is set when the receive FIFO contains one or more entries; it is cleared when the receive FIFO is empty. - 0: Receive FIFO is empty - 1: Receive FIFO is not empty

Bit Range	Default & Access	Field Name (ID): Description
2	1h RO/V	**TFE:** Transmit FIFO Completely Empty. When the transmit FIFO is completely empty, this bit is set. When it contains one or more valid entries, this bit is cleared. This bit field does not request an interrupt. - 0: Transmit FIFO is not empty - 1: Transmit FIFO is empty
1	1h RO/V	**TFNF:** Transmit FIFO Not Full. Set when the transmit FIFO contains one or more empty locations, and is cleared when the FIFO is full. - 0: Transmit FIFO is full - 1: Transmit FIFO is not full
0	0h RO/V	**ACTIVITY:** I2C Activity Status.

14.1.7.30 IC_TXFLR — Offset 4010C074h

I2C Transmit FIFO Level Register - I2C Transmit FIFO Level Register This register contains the number of valid data entries in the transmit FIFO buffer. It is cleared whenever: - The I2C is disabled - There is a transmit abort - that is, TX_ABRT bit is set in the IC_RAW_INTR_STAT register - The slave bulk transmit mode is aborted The register increments whenever data is placed into the transmit FIFO and decrements when data is taken from the transmit FIFO.

Type	Size	Offset	Default
MMIO	32 bit	4010C074h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:0	00h RO/V	**TXFLR:** Transmit FIFO Level. Contains the number of valid data entries in the transmit FIFO.

14.1.7.31 IC_RXFLR — Offset 4010C078h

I2C Receive FIFO Level Register - I2C Receive FIFO Level Register This register contains the number of valid data entries in the receive FIFO buffer. It is cleared whenever: - The I2C is disabled - Whenever there is a transmit abort caused by any of the events tracked in IC_TX_ABRT_SOURCE The register increments whenever data is placed into the receive FIFO and decrements when data is taken from the receive FIFO.

Type	Size	Offset	Default
MMIO	32 bit	4010C078h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:0	00h RO/V	**RXFLR:** Receive FIFO Level. Contains the number of valid data entries in the receive FIFO.

14.1.7.32 IC_SDA_HOLD — Offset 4010C07Ch

I2C SDA Hold Time Length Register - I2C SDA Hold Time Length Register The bits [15:0] of this register are used to control the hold time of SDA during transmit in both slave and master mode (after SCL goes from HIGH to LOW). The bits [23:16] of this register are used to extend the SDA transition (if any) whenever SCL is HIGH in the receiver in either master or slave mode. Writes to this register succeed only when IC_ENABLE[0]=0. The values in this register are in units of ic_clk period. The value programmed in IC_SDA_TX_HOLD must be greater than the minimum hold time in each mode one cycle in master mode, seven cycles in slave mode for the value to be implemented. The programmed SDA hold time during transmit (IC_SDA_TX_HOLD) cannot exceed at any time the duration of the low part of scl. Therefore the programmed value cannot be larger than N_SCL_LOW-2, where N_SCL_LOW is the duration of the low part of the scl period measured in ic_clk cycles.

Type	Size	Offset	Default
MMIO	32 bit	4010C07Ch	00000005h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:16	00h RW	**IC_SDA_RX_HOLD:** Sets the required SDA hold time in units of ic_clk period, when DW_apb_i2c acts as a receiver.
15:0	0005h RW	**IC_SDA_TX_HOLD:** Sets the required SDA hold time in units of ic_clk period, when DW_apb_i2c acts as a transmitter.

14.1.7.33 IC_TX_ABRT_SOURCE — Offset 4010C080h

I2C Transmit Abort Source Register - I2C Transmit Abort Source Register This register has 32 bits that indicate the source of the TX_ABRT bit. Except for Bit 9, this register is cleared whenever the IC_CLR_TX_ABRT register or the IC_CLR_INTR register is read. To clear Bit 9, the source of the ABRT_SBYTE_NORSTRT must be fixed first; RESTART must be enabled (IC_CON[5]=1), the SPECIAL bit must be cleared (IC_TAR[11]), or the GC_OR_START bit must be cleared (IC_TAR[10]). Once the source of the ABRT_SBYTE_NORSTRT is fixed, then this bit can be cleared in the same manner as other bits in this register. If the source of the ABRT_SBYTE_NORSTRT is not fixed before attempting to clear this bit, Bit 9 clears for one cycle and is then re-asserted.

Type	Size	Offset	Default
MMIO	32 bit	4010C080h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:23	000h RO/V	**TX_FLUSH_CNT:** This field indicates the number of Tx FIFO Data Commands which are flushed due to TX_ABRT interrupt. It is cleared whenever I2C is disabled. Role of DW_apb_i2c: Master-Transmitter or Slave-Transmitter
22:17	0h RO	**Reserved**
16	0h RO/V	**ABRT_USER_ABRT:** This is a master-mode-only bit. Master has detected the transfer abort (IC_ENABLE[1]) Role of DW_apb_i2c: Master-Transmitter
15	0h RO/V	**ABRT_SLVRD_INTX:** 1: When the processor side responds to a slave mode request for data to be transmitted to a remote master and user writes a 1 in CMD (bit 8) of IC_DATA_CMD register. Role of DW_apb_i2c: Slave-Transmitter
14	0h RO/V	**ABRT_SLV_ARBLOST:** This field indicates that a Slave has lost the bus while transmitting data to a remote master. IC_TX_ABRT_SOURCE[12] is set at the same time. Note: Even though the slave never 'owns' the bus, something could go wrong on the bus. This is a fail safe check. For instance, during a data transmission at the low-to-high transition of SCL, if what is on the data bus is not what is supposed to be transmitted, then DW_apb_i2c no longer own the bus. Role of DW_apb_i2c: Slave-Transmitter
13	0h RO/V	**ABRT_SLVFLUSH_TXFIFO:** This field specifies that the Slave has received a read command and some data exists in the TX FIFO, so the slave issues a TX_ABRT interrupt to flush old data in TX FIFO. Role of DW_apb_i2c: Slave-Transmitter
12	0h RO/V	**ARB_LOST:** This field specifies that the Master has lost arbitration, or if IC_TX_ABRT_SOURCE[14] is also set, then the slave transmitter has lost arbitration. Role of DW_apb_i2c: Master-Transmitter or Slave-Transmitter
11	0h RO/V	**ABRT_MASTER_DIS:** This field indicates that the User tries to initiate a Master operation with the Master mode disabled. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver

Bit Range	Default & Access	Field Name (ID): Description
10	0h RO/V	**ABRT_10B_RD_NORSTRT:** This field indicates that the restart is disabled (IC_RESTART_EN bit (IC_CON[5]) =0) and the master sends a read command in 10-bit addressing mode. Role of DW_apb_i2c: Master-Receiver
9	0h RO/V	**ABRT_SBYTE_NORSTRT:** To clear Bit 9, the source of the ABRT_SBYTE_NORSTRT must be fixed first; restart must be enabled (IC_CON[5]=1), the SPECIAL bit must be cleared (IC_TAR[11]), or the GC_OR_START bit must be cleared (IC_TAR[10]). Once the source of the ABRT_SBYTE_NORSTRT is fixed, then this bit can be cleared in the same manner as other bits in this register. If the source of the ABRT_SBYTE_NORSTRT is not fixed before attempting to clear this bit, bit 9 clears for one cycle and then gets reasserted. When this field is set to 1, the restart is disabled (IC_RESTART_EN bit (IC_CON[5]) =0) and the user is trying to send a START Byte. Role of DW_apb_i2c: Master
8	0h RO/V	**ABRT_HS_NORSTRT:** This field indicates that the restart is disabled (IC_RESTART_EN bit (IC_CON[5]) =0) and the user is trying to use the master to transfer data in High Speed mode. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver
7	0h RO/V	**ABRT_SBYTE_ACKDET:** This field indicates that the Master has sent a START Byte and the START Byte was acknowledged (wrong behavior). Role of DW_apb_i2c: Master
6	0h RO/V	**ABRT_HS_ACKDET:** This field indicates that the Master is in High Speed mode and the High Speed Master code was acknowledged (wrong behavior). Role of DW_apb_i2c: Master
5	0h RO/V	**ABRT_GCALL_READ:** This field indicates that DW_apb_i2c in the master mode has sent a General Call but the user programmed the byte following the General Call to be a read from the bus (IC_DATA_CMD[9] is set to 1). Role of DW_apb_i2c: Master-Transmitter
4	0h RO/V	**ABRT_GCALL_NOACK:** This field indicates that DW_apb_i2c in master mode has sent a General Call and no slave on the bus acknowledged the General Call. Role of DW_apb_i2c: Master-Transmitter
3	0h RO/V	**ABRT_TXDATA_NOACK:** This field indicates the master-mode only bit. When the master receives an acknowledgement for the address, but when it sends data byte(s) following the address, it did not receive an acknowledge from the remote slave(s). Role of DW_apb_i2c: Master-Transmitter
2	0h RO/V	**ABRT_10ADDR2_NOACK:** This field indicates that the Master is in 10-bit address mode and that the second address byte of the 10-bit address was not acknowledged by any slave. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver
1	0h RO/V	**ABRT_10ADDR1_NOACK:** This field indicates that the Master is in 10-bit address mode and the first 10-bit address byte was not acknowledged by any slave. Reset value: 0x0 Role of DW_apb_i2c: Master-Transmitter or Master-Receiver
0	0h RO/V	**ABRT_7B_ADDR_NOACK:** This field indicates that the Master is in 7-bit addressing mode and the address sent was not acknowledged by any slave. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver

14.1.7.34 IC_DMA_CR — Offset 4010C088h

DMA Control Register - DMA Control Register This register is only valid when DW_apb_i2c is configured with a set of DMA Controller interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist and writing to the register's address has no effect and reading from this register

address will return zero. The register is used to enable the DMA Controller interface operation. There is a separate bit for transmit and receive. This can be programmed regardless of the state of IC_ENABLE.

Type	Size	Offset	Default
MMIO	32 bit	4010C088h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1	0h RW	**TDMAE:** Transmit DMA Enable. This bit enables/disables the transmit FIFO DMA channel.
0	0h RW	**RDMAE:** Receive DMA Enable. This bit enables/disables the receive FIFO DMA channel.

14.1.7.35 IC_DMA_TDLR — Offset 4010C08Ch

DMA Transmit Data Level Register - DMA Transmit Data Level Register This register is only valid when the DW_apb_i2c is configured with a set of DMA interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist; writing to its address has no effect; reading from its address returns zero.

Type	Size	Offset	Default
MMIO	32 bit	4010C08Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:0	00h RW	**DMATDL:** Transmit Data Level. This bit field controls the level at which a DMA request is made by the transmit logic. It is equal to the watermark level; that is, the dma_tx_req signal is generated when the number of valid data entries in the transmit FIFO is equal to or below this field value, and TDMAE = 1.

14.1.7.36 IC_DMA_RDLR — Offset 4010C090h

DMA Transmit Data Level Register - I2C Receive Data Level Register This register is only valid when DW_apb_i2c is configured with a set of DMA interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist; writing to its address has no effect; reading from its address returns zero.

Type	Size	Offset	Default
MMIO	32 bit	4010C090h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:0	00h RW	**DMARDL:** Receive Data Level. This bit field controls the level at which a DMA request is made by the receive logic. The watermark level = DMARDL+1; that is, dma_rx_req is generated when the number of valid data entries in the receive FIFO is equal to or more than this field value + 1, and RDMAE =1. For instance, when DMARDL is 0, then dma_rx_req is asserted when 1 or more data entries are present in the receive FIFO.

14.1.7.37 IC_SDA_SETUP — Offset 4010C094h

I2C SDA Setup Register - I2C SDA Setup Register This register controls the amount of time delay (in terms of number of ic_clk clock periods) introduced in the rising edge of SCL - relative to SDA changing - when DW_apb_i2c services a read request in a slave-transmitter operation. The relevant I2C requirement is tSU:DAT as detailed in the I2C Bus Specification. This register must be programmed with a value equal to or greater than 2. Writes to this register succeed only when IC_ENABLE[0] = 0. Note: The length of setup time is calculated using [(IC_SDA_SETUP - 1) * (ic_clk_period)], so if the user requires 10 ic_clk periods of setup time, they should program a value of 11. The IC_SDA_SETUP register is only used by the DW_apb_i2c when operating as a slave transmitter.

Type	Size	Offset	Default
MMIO	32 bit	4010C094h	00000002h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	02h RW	**SDA_SETUP:** SDA Setup. It is recommended that if the required delay is 1000ns, then for an ic_clk frequency of 10 MHz, IC_SDA_SETUP should be programmed to a value of 11. IC_SDA_SETUP must be programmed with a minimum value of 2.

14.1.7.38 IC_ACK_GENERAL_CALL — Offset 4010C098h

I2C ACK General Call Register - I2C ACK General Call Register The register controls whether DW_apb_i2c responds with a ACK or NACK when it receives an I2C General Call address. This register is applicable only when the DW_apb_i2c is in slave mode.

Type	Size	Offset	Default
MMIO	32 bit	4010C098h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**ACK_GEN_CALL:** ACK General Call. When set to 1, DW_apb_i2c responds with a ACK (by asserting ic_data_oe) when it receives a General Call. Otherwise, DW_apb_i2c responds with a NACK (by negating ic_data_oe).

14.1.7.39 IC_ENABLE_STATUS — Offset 4010C09Ch

I2C Enable Status Register - I2C Enable Status Register The register is used to report the DW_apb_i2c hardware status when the IC_ENABLE[0] register is set from 1 to 0; that is, when DW_apb_i2c is disabled. If IC_ENABLE[0] has been set to 1, bits 2:1 are forced to 0, and bit 0 is forced to 1. If IC_ENABLE[0] has been set to 0, bits 2:1 is only be valid as soon as bit 0 is read as '0'. Note: When IC_ENABLE[0] has been set to 0, a delay occurs for bit 0 to be read as 0 because disabling the DW_apb_i2c depends on I2C bus activities.

Type	Size	Offset	Default
MMIO	32 bit	4010C09Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2	0h RO/V	**SLV_RX_DATA_LOST:** Slave Received Data Lost. This bit indicates if a Slave-Receiver operation has been aborted with at least one data byte received from an I2C transfer due to the setting bit 0 of IC_ENABLE from 1 to 0. When read as 1, DW_apb_i2c is deemed to have been actively engaged in an aborted I2C transfer (with matching address) and the data phase of the I2C transfer has been entered, even though a data byte has been responded with a NACK. Note: If the remote I2C master terminates the transfer with a STOP condition before the DW_apb_i2c has a chance to NACK a transfer, and IC_ENABLE[0] has been set to 0, then this bit is also set to 1. When read as 0, DW_apb_i2c is deemed to have been disabled without being actively involved in the data phase of a Slave-Receiver transfer. Note: The CPU can safely read this bit when IC_EN (bit 0) is read as 0.
1	0h RO/V	**SLV_DISABLED_WHILE_BUSY:** Slave Disabled While Busy (Transmit, Receive). This bit indicates if a potential or active Slave operation has been aborted due to the setting bit 0 of the IC_ENABLE register from 1 to 0. This bit is set when the CPU writes a 0 to the IC_ENABLE register while: (a) DW_apb_i2c is receiving the address byte of the Slave-Transmitter operation from a remote master; OR, (b) address and data bytes of the Slave-Receiver operation from a remote master. When read as 1, DW_apb_i2c is deemed to have forced a NACK during any part of an I2C transfer, irrespective of whether the I2C address matches the slave address set in DW_apb_i2c (IC_SAR register) OR if the transfer is completed before IC_ENABLE is set to 0 but has not taken effect. Note: If the remote I2C master terminates the transfer with a STOP condition before the DW_apb_i2c has a chance to NACK a transfer, and IC_ENABLE[0] has been set to 0, then this bit will also be set to 1. When read as 0, DW_apb_i2c is deemed to have been disabled when there is master activity, or when the I2C bus is idle. Note: The CPU can safely read this bit when IC_EN (bit 0) is read as 0.
0	0h RO/V	**IC_EN:** ic_en Status. This bit always reflects the value driven on the output port ic_en. - When read as 1, DW_apb_i2c is deemed to be in an enabled state. - When read as 0, DW_apb_i2c is deemed completely inactive. Note: The CPU can safely read this bit anytime. When this bit is read as 0, the CPU can safely read SLV_RX_DATA_LOST (bit 2) and SLV_DISABLED_WHILE_BUSY (bit 1).

14.1.7.40 IC_FS_SPKLEN — Offset 4010C0A0h

I2C SS, FS or FM+ spike suppression limit - I2C SS, FS or FM+ spike suppression limit This register is used to store the duration, measured in ic_clk cycles, of the longest spike that is filtered out by the spike suppression logic w hen the component is operating in SS, FS or FM+ modes. This register must be programmed with a minimum value of 1.

Type	Size	Offset	Default
MMIO	32 bit	4010C0A0h	00000005h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	05h RW	**IC_FS_SPKLEN:** This register must be set before any I2C bus transaction can take place to ensure stable operation. This register sets the duration, measured in ic_clk cycles, of the longest spike in the SCL or SDA lines that will be filtered out by the spike suppression logic. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. The minimum valid value is 1; hardware prevents values less than this being written, and if attempted results in 1 being set.

14.1.7.41 IC_HS_SPKLEN — Offset 4010C0A4h

I2C HS spike suppression limit register - I2C HS spike suppression limit register This register is used to store the duration, measured in ic_clk cycles, of the longest spike that is filtered out by the spike suppression logic when the component is operating in HS modes. This register must be programmed with a minimum value of 1 and is implemented only if the component is configured to support HS mode; that is, if the IC_MAX_SPEED_MODE parameter is set to 3.

Type	Size	Offset	Default
MMIO	32 bit	4010C0A4h	00000002h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	02h RW	**IC_HS_SPKLEN:** This register must be set before any I2C bus transaction can take place to ensure stable operation. This register sets the duration, measured in ic_clk cycles, of the longest spike in the SCL or SDA lines that will be filtered out by the spike suppression logic. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. The minimum valid value is 1; hardware prevents values less than this being written, and if attempted results in 1 being set.

14.1.7.42 IC_CLR_RESTART_DET — Offset 4010C0A8h

Clear RESTART_DET Interrupt Register - Clear RESTART_DET Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010C0A8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RESTART_DET:** Read this register to clear the RESTART_DET interrupt (bit 12) of IC_RAW_INTR_STAT register.

14.1.7.43 IC_COMP_PARAM_1 — Offset 4010C0F4h

Component Parameter Register 1 - Component Parameter Register 1 Note This is a constant read-only register that contains encoded information about the component's parameter settings. The reset value depends on coreConsultant parameter(s).

Type	Size	Offset	Default
MMIO	32 bit	4010C0F4h	003F3FEEh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:16	3Fh RO/V	**TX_BUFFER_DEPTH:** The value of this register is derived from the IC_TX_BUFFER_DEPTH coreConsultant parameter. - 0x00 = Reserved - 0x01 = 2 - 0x02 = 3 - ... - 0xFF = 256
15:8	3Fh RO/V	**RX_BUFFER_DEPTH:** The value of this register is derived from the IC_RX_BUFFER_DEPTH coreConsultant parameter. - 0x00: Reserved - 0x01: 2 - 0x02: 3 - ... - 0xFF: 256
7	1h RO/V	**ADD_ENCODED_PARAMS:** The value of this register is derived from the IC_ADD_ENCODED_PARAMS coreConsultant parameter. Reading 1 in this bit means that the capability of reading these encoded parameters via software has been included. Otherwise, the entire register is 0 regardless of the setting of any other parameters that are encoded in the bits.

Bit Range	Default & Access	Field Name (ID): Description
6	1h RO/V	**HAS_DMA:** The value of this register is derived from the IC_HAS_DMA coreConsultant parameter.
5	1h RO/V	**INTR_IO:** The value of this register is derived from the IC_INTR_IO coreConsultant parameter.
4	0h RO/V	**HC_COUNT_VALUES:** The value of this register is derived from the IC_HC_COUNT VALUES coreConsultant parameter.
3:2	3h RO/V	**MAX_SPEED_MODE:** The value of this register is derived from the IC_MAX_SPEED_MODE coreConsultant parameter. - 0x0: Reserved - 0x1: Standard - 0x2: Fast - 0x3: High
1:0	2h RO/V	**APB_DATA_WIDTH:** The value of this register is derived from the APB_DATA_WIDTH coreConsultant parameter.

14.1.7.44 IC_COMP_VERSION — Offset 4010C0F8h

I2C Component Version Register - I2C Component Version Register

Type	Size	Offset	Default
MMIO	32 bit	4010C0F8h	3230322Ah

Register Level Access:

BIOS Access	SMM Access	OS Access

14.1.8.1 IC_CON — Offset 4010E000h

I2C Control Register - I2C Control Register. This register can be written only when the DW_apb_i2c is disabled, which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. Read/Write Access: - If configuration parameter I2C_DYNAMIC_TAR_UPDATE=1, bit 4 is read only. - If configuration parameter IC_RX_FULL_HLD_BUS_EN =0, bit 9 is read only. - If configuration parameter IC_STOP_DET_IF_MASTER_ACTIVE =0, bit 10 is read only. - If configuration parameter IC_BUS_CLEAR_FEATURE=0, bit 11 is read only - If configuration parameter IC_OPTIONAL_SAR=0, bit 16 is read only - If configuration parameter IC_SMBUS=0, bit 17 is read only - If configuration parameter IC_SMBUS_ARP=0, bits 18 and 19 are read only.

Type	Size	Offset	Default
MMIO	32 bit	4010E000h	00000067h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved**
10	0h RW	**STOP_DET_IF_MASTER_ACTIVE:** In Master mode: - 1'b1: issues the STOP_DET interrupt only when master is active. - 1'b0: issues the STOP_DET irrespective of whether master is active or not.
9	0h RW	**RX_FIFO_FULL_HLD_CTRL:** This bit controls whether DW_apb_i2c should hold the bus when the Rx FIFO is physically full to its RX_BUFFER_DEPTH, as described in the IC_RX_FULL_HLD_BUS_EN parameter.
8	0h RW	**TX_EMPTY_CTRL:** This bit controls the generation of the TX_EMPTY interrupt, as described in the IC_RAW_INTR_STAT register.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**STOP_DET_IFADDRESSED:** In slave mode: - 1'b1: issues the STOP_DET interrrupt only when it is addressed. - 0'b0: issues the STOP_DET irrespective of whether it's addressed or not. NOTE: During a general call address, this slave does not issue the STOP_DET interrupt if STOP_DET_IF_ADDRESSED = 1'b1, even if the slave responds to the general call address by generating ACK. The STOP_DET interrupt is generated only when the transmitted address matches the slave address (SAR).
6	1h RW	**IC_SLAVE_DISABLE:** This bit controls whether I2C has its slave disabled, which means once the presetn signal is applied, then this bit takes on the value of the configuration parameter IC_SLAVE_DISABLE. You have the choice of having the slave enabled or disabled after reset is applied, which means software does not have to configure the slave. By default, the slave is always enabled (in reset state as well). If you need to disable it after reset, set this bit to 1. If this bit is set (slave is disabled), DW_apb_i2c functions only as a master and does not perform any action that requires a slave. NOTE: Software should ensure that if this bit is written with 0, then bit 0 should also be written with a 0.
5	1h RW	**IC_RESTART_EN:** Determines whether RESTART conditions may be sent when acting as a master. Some older slaves do not support handling RESTART conditions; however, RESTART conditions are used in several DW_apb_i2c operations. When RESTART is disabled, the master is prohibited from performing the following functions: - Sending a START BYTE - Performing any high-speed mode operation - High-speed mode operation - Performing direction changes in combined format mode - Performing a read operation with a 10-bit address By replacing RESTART condition followed by a STOP and a subsequent START condition, split operations are broken down into multiple DW_apb_i2c transfers. If the above operations are performed, it will result in setting bit 6 (TX_ABRT) of the IC_RAW_INTR_STAT register. .
4	0h RO/V	**IC_10BITADDR_MASTER_RD_ONLY:** If the I2C_DYNAMIC_TAR_UPDATE configuration parameter is set to 'No' (0), this bit is named IC_10BITADDR_MASTER and controls whether the DW_apb_i2c starts its transfers in 7 or 10-bit addressing mode when acting as a master. If I2C_DYNAMIC_TAR_UPDATE is set to 'Yes' (1), the function of this bit is handled by bit 12 of IC_TAR register, and becomes a read-only copy called IC_10BITADDR_MASTER_rd_only. - 0: 7-bit addressing - 1: 10-bit addressing
3	0h RW	**IC_10BITADDR_SLAVE:** When acting as a slave, this bit controls whether the DW_apb_i2c responds to 7- or 10-bit addresses. - 0: 7-bit addressing. The DW_apb_i2c ignores transactions that involve 10-bit addressing; for 7-bit addressing, only the lower 7 bits of the IC_SAR register are compared. - 1: 10-bit addressing. The DW_apb_i2c responds to only 10-bit addressing transfers that match the full 10 bits of the IC_SAR register.
2:1	3h RW	**SPEED:** These bits control at which speed the DW_apb_i2c operates; its setting is relevant only if one is operating the DW_apb_i2c in master mode. Hardware protects against illegal values being programmed by software. These bits must be programmed appropriately for slave mode also, as it is used to capture correct value of spike filter as per the speed mode. This register should be programmed only with a value in the range of 1 to IC_MAX_SPEED_MODE; otherwise, hardware updates this register with the value of IC_MAX_SPEED_MODE. 1: standard mode (100 kbit/s) 2: fast mode (<=400 kbit/s) or fast mode plus (<=1000Kbit/s) 3: high speed mode (3.4 Mbit/s) Note: This field is not applicable when IC_ULTRA_FAST_MODE=1
0	1h RW	**MASTER_MODE:** This bit controls whether the DW_apb_i2c master is enabled. NOTE: Software should ensure that if this bit is written with '1' then bit 6 should also be written with a '1'.

14.1.8.2 IC_TAR — Offset 4010E004h

I2C Target Address Register - I2C Target Address Register If the configuration parameter I2C_DYNAMIC_TAR_UPDATE is set to 'No' (0), this register is 12 bits wide, and bits 31:12 are reserved. This register can be written to only when IC_ENABLE[0] is set to 0. However, if I2C_DYNAMIC_TAR_UPDATE = 1, then the register becomes 13

bits wide. In this case, writes to IC_TAR succeed when one of the following conditions are true: - DW_apb_i2c is NOT enabled (IC_ENABLE[0] is set to 0); or - DW_apb_i2c is enabled (IC_ENABLE[0]=1); AND DW_apb_i2c is NOT engaged in any Master (tx, rx) operation (IC_STATUS[5]=0); AND DW_apb_i2c is enabled to operate in Master mode (IC_CON[0]=1); AND there are NO entries in the TX FIFO (IC_STATUS[2]=1) You can change the TAR address dynamically without losing the bus, only if the following conditions are met. - DW_apb_i2c is enabled (IC_ENABLE[0]=1); AND IC_EMPTYFIFO_HOLD_MASTER_EN configuration parameter is set to 1; AND DW_apb_i2c is enabled to operate in Master mode (IC_CON[0]=1); AND there are NO entries in the Tx FIFO and the master is in HOLD state (IC_INTR_STAT[13]=1). Note: If the software or application is aware that the DW_apb_i2c is not using the TAR address for the pending commands in the Tx FIFO, then it is possible to update the TAR address even while the Tx FIFO has entries (IC_STATUS[2]= 0). - It is not necessary to perform any write to this register if DW_apb_i2c is enabled as an I2C slave only.

Type	Size	Offset	Default
MMIO	32 bit	4010E004h	00000055h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	**Reserved**
12	0h RW	**IC_10BITADDR_MASTER:** This bit controls whether the DW_apb_i2c starts its transfers in 7- or 10-bit addressing mode when acting as a master. - 0: 7-bit addressing - 1: 10-bit addressing
11	0h RW	**SPECIAL:** This bit indicates whether software performs a Device-ID or General Call or START BYTE command. - 0: ignore bit 10 GC_OR_START and use IC_TAR normally - 1: perform special I2C command as specified in Device_ID or GC_OR_START bit
10	0h RW	**GC_OR_START:** If bit 11 (SPECIAL) is set to 1 and bit 13(Device-ID) is set to 0, then this bit indicates whether a General Call or START byte command is to be performed by the DW_apb_i2c. - 0: General Call Address - after issuing a General Call, only writes may be performed. Attempting to issue a read command results in setting bit 6 (TX_ABRT) of the IC_RAW_INTR_STAT register. The DW_apb_i2c remains in General Call mode until the SPECIAL bit value (bit 11) is cleared. - 1: START BYTE
9:0	055h RW	**IC_TAR:** This is the target address for any master transaction. When transmitting a General Call, these bits are ignored. To generate a START BYTE, the CPU needs to write only once into these bits. If the IC_TAR and IC_SAR are the same, loopback exists but the FIFOs are shared between master and slave, so full loopback is not feasible. Only one direction loopback mode is supported (simplex), not duplex. A master cannot transmit to itself; it can transmit to only a slave.

14.1.8.3 IC_SAR — Offset 4010E008h

I2C Slave Address Register - I2C Slave Address Register

Type	Size	Offset	Default
MMIO	32 bit	4010E008h	00000055h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:0	055h RW	**IC_SAR:** The IC_SAR holds the slave address when the I2C is operating as a slave. For 7-bit addressing, only IC_SAR[6:0] is used. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. Note: The default values cannot be any of the reserved address locations: that is, 0x00 to 0x07, or 0x78 to 0x7f. The correct operation of the device is not guaranteed if you program the IC_SAR or IC_TAR to a reserved value.

14.1.8.4 IC_HS_MADDR — Offset 4010E00Ch

I2C High Speed Master Mode Code Address Register - I2C High Speed Master Mode Code Address Register

Type	Size	Offset	Default
MMIO	32 bit	4010E00Ch	00000001h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2:0	1h RW	**IC_HS_MAR:** This bit field holds the value of the I2C HS mode master code. HS-mode master codes are reserved 8-bit codes (00001xxx) that are not used for slave addressing or other purposes. Each master has its unique master code; up to eight high-speed mode masters can be present on the same I2C bus system. Valid values are from 0 to 7. This register goes away and becomes read-only returning 0's if the IC_MAX_SPEED_MODE configuration parameter is set to either Standard (1) or Fast (2). This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect.

14.1.8.5 IC_DATA_CMD — Offset 4010E010h

I2C Rx/Tx Data Buffer and Command Register - I2C Rx/Tx Data Buffer and Command Register; this is the register the CPU writes to when filling the TX FIFO and the CPU reads from when retrieving bytes from RX FIFO. The size of the register changes as follows: Write: - 11 bits when IC_EMPTYFIFO_HOLD_MASTER_EN=1 - 9 bits when IC_EMPTYFIFO_HOLD_MASTER_EN=0 Read: - 12 bits when IC_FIRST_DATA_BYTE_STATUS = 1 - 8 bits when IC_FIRST_DATA_BYTE_STATUS = 0 Note: In order for the DW_apb_i2c to continue acknowledging reads, a read command should be written for every byte that is to be received; otherwise the DW_apb_i2c will stop acknowledging.

Type	Size	Offset	Default
MMIO	32 bit	4010E010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RO/V	**FIRST_DATA_BYTE:** Indicates the first data byte received after the address phase for receive transfer in Master receiver or Slave receiver mode. NOTE: In case of APB_DATA_WIDTH=8, 1. The user has to perform two APB Reads to IC_DATA_CMD in order to get status on 11 bit. 2. Inorder to read the 11 bit, the user has to perform the first data byte read [7:0] (offset 0x10) and then perform the second read[15:8](offset 0x11) in order to know the status of 11 bit (whether the data received in previous read is a first data byte or not). 3. The 11th bit is an optional read field, user can ignore 2nd byte read [15:8] (offset 0x11) if not interested in FIRST_DATA_BYTE status.
10	0h WO	**RESTART:** This bit controls whether a RESTART is issued before the byte is sent or received. This bit is available only if IC_EMPTYFIFO_HOLD_MASTER_EN is configured to 1. 1 - If IC_RESTART_EN is 1, a RESTART is issued before the data is sent/received (according to the value of CMD), regardless of whether or not the transfer direction is changing from the previous command; if IC_RESTART_EN is 0, a STOP followed by a START is issued instead. 0 - If IC_RESTART_EN is 1, a RESTART is issued only if the transfer direction is changing from the previous command; if IC_RESTART_EN is 0, a STOP followed by a START is issued instead.

Bit Range	Default & Access	Field Name (ID): Description
9	0h WO	**STOP:** This bit controls whether a STOP is issued after the byte is sent or received. This bit is available only if IC_EMPTYFIFO_HOLD_MASTER_EN is configured to 1. - 1 - STOP is issued after this byte, regardless of whether or not the Tx FIFO is empty. If the Tx FIFO is not empty, the master immediately tries to start a new transfer by issuing a START and arbitrating for the bus. - 0 - STOP is not issued after this byte, regardless of whether or not the Tx FIFO is empty. If the Tx FIFO is not empty, the master continues the current transfer by sending/receiving data bytes according to the value of the CMD bit. If the Tx FIFO is empty, the master holds the SCL line low and stalls the bus until a new command is available in the Tx FIFO.
8	0h WO	**CMD:** This bit controls whether a read or a write is performed. This bit does not control the direction when the DW_apb_i2c acts as a slave. It controls only the direction when it acts as a master. When a command is entered in the TX FIFO, this bit distinguishes the write and read commands. In slave-receiver mode, this bit is a "don't care" because writes to this register are not required. In slave-transmitter mode, a "0" indicates that the data in IC_DATA_CMD is to be transmitted. When programming this bit, you should remember the following: attempting to perform a read operation after a General Call command has been sent results in a TX_ABRT interrupt (bit 6 of the IC_RAW_INTR_STAT register), unless bit 11 (SPECIAL) in the IC_TAR register has been cleared. If a "1" is written to this bit after receiving a RD_REQ interrupt, then a TX_ABRT interrupt occurs.
7:0	00h RW/V	**DAT:** This register contains the data to be transmitted or received on the I2C bus. If you are writing to this register and want to perform a read, bits 7:0 (DAT) are ignored by the DW_apb_i2c. However, when you read this register, these bits return the value of data received on the DW_apb_i2c interface.

14.1.8.6 IC_SS_SCL_HCNT — Offset 4010E014h

Standard Speed I2C Clock SCL High Count Register - Standard Speed I2C Clock SCL High Count Register

Type	Size	Offset	Default
MMIO	32 bit	4010E014h	000001E8h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	01E8h RW	**IC_SS_SCL_HCNT:** This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock high-period count for standard speed. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. The minimum valid value is 6; hardware prevents values less than this being written, and if attempted results in 6 being set. For designs with APB_DATA_WIDTH = 8, the order of programming is important to ensure the correct operation of the DW_apb_i2c. The lower byte must be programmed first. Then the upper byte is programmed. When the configuration parameter IC_HC_COUNT_VALUES is set to 1, this register is read only. NOTE: This register must not be programmed to a value higher than 65525, because DW_apb_i2c uses a 16-bit counter to flag an I2C bus idle condition when this counter reaches a value of IC_SS_SCL_HCNT + 10.

14.1.8.7 IC_SS_SCL_LCNT — Offset 4010E018h

Standard Speed I2C Clock SCL Low Count Register - Standard Speed I2C Clock SCL Low Count Register

4	0h RO/V	**R_TX_EMPTY:** See IC_RAW_INTR_STAT for a detailed description of R_TX_EMPTY bit.
3	0h RO/V	**R_TX_OVER:** See IC_RAW_INTR_STAT for a detailed description of R_TX_OVER bit.
2	0h RO/V	**R_RX_FULL:** See IC_RAW_INTR_STAT for a detailed description of R_RX_FULL bit.
1	0h RO/V	**R_RX_OVER:** See IC_RAW_INTR_STAT for a detailed description of R_RX_OVER bit.
0	0h RO/V	**R_RX_UNDER:** See IC_RAW_INTR_STAT for a detailed description of R_RX_UNDER bit.

14.1.8.13 IC_INTR_MASK — Offset 4010E030h

I2C Interrupt Mask Register - I2C Interrupt Mask Register. These bits mask their corresponding interrupt status bits. This register is active low; a value of 0 masks the interrupt, whereas a value of 1 unmasks the interrupt.

Type	Size	Offset	Default
MMIO	32 bit	4010E030h	000008FFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13	0h RW	**M_MASTER_ON_HOLD:** This bit masks the R_MASTER_ON_HOLD interrupt in IC_INTR_STAT register.
12	0h RW	**M_RESTART_DET:** This bit masks the R_RESTART_DET interrupt in IC_INTR_STAT register.

Bit Range	Default & Access	Field Name (ID): Description
11	1h RW	**M_GEN_CALL:** This bit masks the R_GEN_CALL interrupt in IC_INTR_STAT register.
10	0h RW	**M_START_DET:** This bit masks the R_START_DET interrupt in IC_INTR_STAT register.
9	0h RW	**M_STOP_DET:** This bit masks the R_STOP_DET interrupt in IC_INTR_STAT register.
8	0h RW	**M_ACTIVITY:** This bit masks the R_ACTIVITY interrupt in IC_INTR_STAT register.
7	1h RW	**M_RX_DONE:** This bit masks the R_RX_DONE interrupt in IC_INTR_STAT register.
6	1h RW	**M_TX_ABRT:** This bit masks the R_TX_ABRT interrupt in IC_INTR_STAT register.
5	1h RW	**M_RD_REQ:** This bit masks the R_RD_REQ interrupt in IC_INTR_STAT register.
4	1h RW	**M_TX_EMPTY:** This bit masks the R_TX_EMPTY interrupt in IC_INTR_STAT register.
3	1h RW	**M_TX_OVER:** This bit masks the R_TX_OVER interrupt in IC_INTR_STAT register.
2	1h RW	**M_RX_FULL:** This bit masks the R_RX_FULL interrupt in IC_INTR_STAT register.
1	1h RW	**M_RX_OVER:** This bit masks the R_RX_OVER interrupt in IC_INTR_STAT register.
0	1h RW	**M_RX_UNDER:** This bit masks the R_RX_UNDER interrupt in IC_INTR_STAT register.

14.1.8.14 IC_RAW_INTR_STAT — Offset 4010E034h

I2C Raw Interrupt Status Register - I2C Raw Interrupt Status Register Unlike the IC_INTR_STAT register, these bits are not masked so they always show the true status of the DW_apb_i2c.

Type	Size	Offset	Default
MMIO	32 bit	4010E034h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13	0h RO/V	**MASTER_ON_HOLD:** Indicates whether master is holding the bus and TX FIFO is empty. Enabled only when I2C_DYNAMIC_TAR_UPDATE=1 and IC_EMPTYFIFO_HOLD_MASTER_EN=1.
12	0h RO/V	**RESTART_DET:** Indicates whether a RESTART condition has occurred on the I2C interface when DW_apb_i2c is operating in Slave mode and the slave is being addressed. Enabled only when IC_SLV_RESTART_DET_EN=1. Note: However, in high-speed mode or during a START BYTE transfer, the RESTART comes before the address field as per the I2C protocol. In this case, the slave is not the addressed slave when the RESTART is issued, therefore DW_apb_i2c does not generate the RESTART_DET interrupt.
11	0h RO/V	**GEN_CALL:** Set only when a General Call address is received and it is acknowledged. It stays set until it is cleared either by disabling DW_apb_i2c or when the CPU reads bit 0 of the IC_CLR_GEN_CALL register. DW_apb_i2c stores the received data in the Rx buffer.
10	0h RO/V	**START_DET:** Indicates whether a START or RESTART condition has occurred on the I2C interface regardless of whether DW_apb_i2c is operating in slave or master mode.
9	0h RO/V	**STOP_DET:** Indicates whether a STOP condition has occurred on the I2C interface regardless of whether DW_apb_i2c is operating in slave or master mode. In Slave Mode: - If IC_CON[7]=1'b1 (STOP_DET_IFADDRESSED), the STOP_DET interrupt will be issued only if slave is addressed. Note: During a general call address, this slave does not issue a STOP_DET interrupt if STOP_DET_IF_ADDRESSED=1'b1, even if the slave responds to the general call address by generating ACK. The STOP_DET interrupt is generated only when the transmitted address matches the slave address (SAR). - If IC_CON[7]=1'b0 (STOP_DET_IFADDRESSED), the STOP_DET interrupt is issued irrespective of whether it is being addressed. In Master Mode: - If IC_CON[10]=1'b1 (STOP_DET_IF_MASTER_ACTIVE),the STOP_DET interrupt will be issued only if Master is active. - If IC_CON[10]=1'b0 (STOP_DET_IFADDRESSED),the STOP_DET interrupt will be issued irrespective of whether master is active or not.
8	0h RO/V	**ACTIVITY:** This bit captures DW_apb_i2c activity and stays set until it is cleared. There are four ways to clear it: - Disabling the DW_apb_i2c - Reading the IC_CLR_ACTIVITY register - Reading the IC_CLR_INTR register - System reset Once this bit is set, it stays set unless one of the four methods is used to clear it. Even if the DW_apb_i2c module is idle, this bit remains set until cleared, indicating that there was activity on the bus.
7	0h RO/V	**RX_DONE:** When the DW_apb_i2c is acting as a slave-transmitter, this bit is set to 1 if the master does not acknowledge a transmitted byte. This occurs on the last byte of the transmission, indicating that the transmission is done.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RO/V	**TX_ABRT:** This bit indicates if DW_apb_i2c, as an I2C transmitter, is unable to complete the intended actions on the contents of the transmit FIFO. This situation can occur both as an I2C master or an I2C slave, and is referred to as a 'transmit abort'. When this bit is set to 1, the IC_TX_ABRT_SOURCE register indicates the reason why the transmit abort takes places. Note: The DW_apb_i2c flushes/resets/empties only the TX_FIFO whenever there is a transmit abort caused by any of the events tracked by the IC_TX_ABRT_SOURCE register. The Tx FIFO remains in this flushed state until the register IC_CLR_TX_ABRT is read. Once this read is performed, the Tx FIFO is then ready to accept more data bytes from the APB interface. RX FIFO flush because of TX_ABRT is controlled by the coreConsultant parameter IC_AVOID_RX_FIFO_FLUSH_ON_TX_ABRT.
5	0h RO/V	**RD_REQ:** This bit is set to 1 when DW_apb_i2c is acting as a slave and another I2C master is attempting to read data from DW_apb_i2c. The DW_apb_i2c holds the I2C bus in a wait state (SCL=0) until this interrupt is serviced, which means that the slave has been addressed by a remote master that is asking for data to be transferred. The processor must respond to this interrupt and then write the requested data to the IC_DATA_CMD register. This bit is set to 0 just after the processor reads the IC_CLR_RD_REQ register.
4	0h RO/V	**TX_EMPTY:** The behavior of the TX_EMPTY interrupt status differs based on the TX_EMPTY_CTRL selection in the IC_CON register. - When TX_EMPTY_CTRL = 0: This bit is set to 1 when the transmit buffer is at or below the threshold value set in the IC_TX_TL register. - When TX_EMPTY_CTRL = 1: This bit is set to 1 when the transmit buffer is at or below the threshold value set in the IC_TX_TL register and the transmission of the address/data from the internal shift register for the most recently popped command is completed. It is automatically cleared by hardware when the buffer level goes above the threshold. When IC_ENABLE[0] is set to 0, the TX FIFO is flushed and held in reset. There the TX FIFO looks like it has no data within it, so this bit is set to 1, provided there is activity in the master or slave state machines. When there is no longer any activity, then with ic_en=0, this bit is set to 0.
3	0h RO/V	**TX_OVER:** Set during transmit if the transmit buffer is filled to IC_TX_BUFFER_DEPTH and the processor attempts to issue another I2C command by writing to the IC_DATA_CMD register. When the module is disabled, this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared.
2	0h RO/V	**RX_FULL:** Set when the receive buffer reaches or goes above the RX_TL threshold in the IC_RX_TL register. It is automatically cleared by hardware when buffer level goes below the threshold. If the module is disabled (IC_ENABLE[0]=0), the RX FIFO is flushed and held in reset; therefore the RX FIFO is not full. So this bit is cleared once the IC_ENABLE bit 0 is programmed with a 0, regardless of the activity that continues.
1	0h RO/V	**RX_OVER:** Set if the receive buffer is completely filled to IC_RX_BUFFER_DEPTH and an additional byte is received from an external I2C device. The DW_apb_i2c acknowledges this, but any data bytes received after the FIFO is full are lost. If the module is disabled (IC_ENABLE[0]=0), this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared. Note: If the configuration parameter IC_RX_FULL_HLD_BUS_EN is enabled and bit 9 of the IC_CON register (RX_FIFO_FULL_HLD_CTRL) is programmed to HIGH, then the RX_OVER interrupt never occurs, because the Rx FIFO never overflows.
0	0h RO/V	**RX_UNDER:** Set if the processor attempts to read the receive buffer when it is empty by reading from the IC_DATA_CMD register. If the module is disabled (IC_ENABLE[0]=0), this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared.

14.1.8.15 IC_RX_TL — Offset 4010E038h

I2C Receive FIFO Threshold Register - I2C Receive FIFO Threshold Register

Type	Size	Offset	Default
MMIO	32 bit	4010E038h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**RX_TL:** Receive FIFO Threshold Level. Controls the level of entries (or above) that triggers the RX_FULL interrupt (bit 2 in IC_RAW_INTR_STAT register). The valid range is 0-255, with the additional restriction that hardware does not allow this value to be set to a value larger than the depth of the buffer. If an attempt is made to do that, the actual value set will be the maximum depth of the buffer. A value of 0 sets the threshold for 1 entry, and a value of 255 sets the threshold for 256 entries.

14.1.8.16 IC_TX_TL — Offset 4010E03Ch

I2C Transmit FIFO Threshold Register - I2C Transmit FIFO Threshold Register

Type	Size	Offset	Default
MMIO	32 bit	4010E03Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**TX_TL:** Transmit FIFO Threshold Level. Controls the level of entries (or below) that trigger the TX_EMPTY interrupt (bit 4 in IC_RAW_INTR_STAT register). The valid range is 0-255, with the additional restriction that it may not be set to value larger than the depth of the buffer. If an attempt is made to do that, the actual value set will be the maximum depth of the buffer. A value of 0 sets the threshold for 0 entries, and a value of 255 sets the threshold for 255 entries.

14.1.8.17 IC_CLR_INTR — Offset 4010E040h

Clear Combined and Individual Interrupt Register - Clear Combined and Individual Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010E040h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_INTR:** Read this register to clear the combined interrupt, all individual interrupts, and the IC_TX_ABRT_SOURCE register. This bit does not clear hardware clearable interrupts but software clearable interrupts. Refer to Bit 9 of the IC_TX_ABRT_SOURCE register for an exception to clearing IC_TX_ABRT_SOURCE.

14.1.8.18 IC_CLR_RX_UNDER — Offset 4010E044h

Clear RX_UNDER Interrupt Register - Clear RX_UNDER Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010E044h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RX_UNDER:** Read this register to clear the RX_UNDER interrupt (bit 0) of the IC_RAW_INTR_STAT register.

14.1.8.19 IC_CLR_RX_OVER — Offset 4010E048h

Clear RX_OVER Interrupt Register - Clear RX_OVER Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010E048h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RX_OVER:** Read this register to clear the RX_OVER interrupt (bit 1) of the IC_RAW_INTR_STAT register.

14.1.8.20 IC_CLR_TX_OVER — Offset 4010E04Ch

Clear TX_OVER Interrupt Register - Clear TX_OVER Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010E04Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_TX_OVER:** Read this register to clear the TX_OVER interrupt (bit 3) of the IC_RAW_INTR_STAT register.

14.1.8.21 IC_CLR_RD_REQ — Offset 4010E050h

Clear RD_REQ Interrupt Register - Clear RD_REQ Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010E050h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RD_REQ:** Read this register to clear the RD_REQ interrupt (bit 5) of the IC_RAW_INTR_STAT register.

14.1.8.22 IC_CLR_TX_ABRT — Offset 4010E054h

Clear TX_ABRT Interrupt Register - Clear TX_ABRT Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010E054h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_TX_ABRT:** Read this register to clear the TX_ABRT interrupt (bit 6) of the IC_RAW_INTR_STAT register, and the IC_TX_ABRT_SOURCE register. This also releases the TX FIFO from the flushed/reset state, allowing more writes to the TX FIFO. Refer to Bit 9 of the IC_TX_ABRT_SOURCE register for an exception to clearing IC_TX_ABRT_SOURCE.

14.1.8.23 IC_CLR_RX_DONE — Offset 4010E058h

Clear RX_DONE Interrupt Register - Clear RX_DONE Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010E058h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RX_DONE:** Read this register to clear the RX_DONE interrupt (bit 7) of the IC_RAW_INTR_STAT register.

14.1.8.24 IC_CLR_ACTIVITY — Offset 4010E05Ch

Clear ACTIVITY Interrupt Register - Clear ACTIVITY Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010E05Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_ACTIVITY:** Reading this register clears the ACTIVITY interrupt if the I2C is not active anymore. If the I2C module is still active on the bus, the ACTIVITY interrupt bit continues to be set. It is automatically cleared by hardware if the module is disabled and if there is no further activity on the bus. The value read from this register to get status of the ACTIVITY interrupt (bit 8) of the IC_RAW_INTR_STAT register.

14.1.8.25 IC_CLR_STOP_DET — Offset 4010E060h

Clear STOP_DET Interrupt Register - Clear STOP_DET Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010E060h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_STOP_DET:** Read this register to clear the STOP_DET interrupt (bit 9) of the IC_RAW_INTR_STAT register.

14.1.8.26 IC_CLR_START_DET — Offset 4010E064h

Clear START_DET Interrupt Register - Clear START_DET Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010E064h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_START_DET:** Read this register to clear the START_DET interrupt (bit 10) of the IC_RAW_INTR_STAT register.

14.1.8.27 IC_CLR_GEN_CALL — Offset 4010E068h

Clear GEN_CALL Interrupt Register - Clear GEN_CALL Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010E068h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_GEN_CALL:** Read this register to clear the GEN_CALL interrupt (bit 11) of IC_RAW_INTR_STAT register.

14.1.8.28 IC_ENABLE — Offset 4010E06Ch

I2C ENABLE Register - I2C Enable Register

Type	Size	Offset	Default
MMIO	32 bit	4010E06Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**TX_CMD_BLOCK:** In Master mode: - 1'b1: Blocks the transmission of data on I2C bus even if Tx FIFO has data to transmit. - 1'b0: The transmission of data starts on I2C bus automatically, as soon as the first data is available in the Tx FIFO. Note: To block the execution of Master commands, set the TX_CMD_BLOCK bit only when Tx FIFO is empty (IC_STATUS[2]==1) and Master is in Idle state (IC_STATUS[5] == 0). Any further commands put in the Tx FIFO are not executed until TX_CMD_BLOCK bit is unset.
1	0h RW	**ABORT:** When set, the controller initiates the transfer abort. - 0: ABORT not initiated or ABORT done - 1: ABORT operation in progress The software can abort the I2C transfer in master mode by setting this bit. The software can set this bit only when ENABLE is already set; otherwise, the controller ignores any write to ABORT bit. The software cannot clear the ABORT bit once set. In response to an ABORT, the controller issues a STOP and flushes the Tx FIFO after completing the current transfer, then sets the TX_ABORT interrupt after the abort operation. The ABORT bit is cleared automatically after the abort operation.
0	0h RW	**ENABLE:** Controls whether the DW_apb_i2c is enabled. - 0: Disables DW_apb_i2c (TX and RX FIFOs are held in an erased state) - 1: Enables DW_apb_i2c Software can disable DW_apb_i2c while it is active. However, it is important that care be taken to ensure that DW_apb_i2c is disabled properly. A recommended procedure is described in "Disabling DW_apb_i2c". When DW_apb_i2c is disabled, the following occurs: - The TX FIFO and RX FIFO get flushed. - Status bits in the IC_INTR_STAT register are still active until DW_apb_i2c goes into IDLE state. If the module is transmitting, it stops as well as deletes the contents of the transmit buffer after the current transfer is complete. If the module is receiving, the DW_apb_i2c stops the current transfer at the end of the current byte and does not acknowledge the transfer. In systems with asynchronous pclk and ic_clk when IC_CLK_TYPE parameter set to asynchronous (1), there is a two ic_clk delay when enabling or disabling the DW_apb_i2c.

14.1.8.29 IC_STATUS — Offset 4010E070h

I2C STATUS Register - I2C Status Register This is a read-only register used to indicate the current transfer status and FIFO status. The status register may be read at any time. None of the bits in this register request an interrupt. When the I2C is disabled by writing 0 in bit 0 of the IC_ENABLE register: - Bits 1 and 2 are set to 1 - Bits 3 and 10 are set to 0 When the master or slave state machines goes to idle and ic_en=0: - Bits 5 and 6 are set to 0

Type	Size	Offset	Default
MMIO	32 bit	4010E070h	00000006h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved**
10	0h RO/V	**SLV_HOLD_RX_FIFO_FULL:** This bit indicates the BUS Hold in Slave mode due to Rx FIFO is Full and an additional byte has been received (This kind of Bus hold is applicable if IC_RX_FULL_HLD_BUS_EN is set to 1).
9	0h RO/V	**SLV_HOLD_TX_FIFO_EMPTY:** This bit indicates the BUS Hold in Slave mode for the Read request when the Tx FIFO is empty. The Bus is in hold until the Tx FIFO has data to Transmit for the read request.
8	0h RO/V	**MST_HOLD_RX_FIFO_FULL:** This bit indicates the BUS Hold in Master mode due to Rx FIFO is Full and additional byte has been received (This kind of Bus hold is applicable if IC_RX_FULL_HLD_BUS_EN is set to 1).
7	0h RO/V	**MST_HOLD_TX_FIFO_EMPTY:** If the IC_EMPTYFIFO_HOLD_MASTER_EN parameter is set to 1, the DW_apb_i2c master stalls the write transfer when Tx FIFO is empty, and the the last byte does not have the Stop bit set. This bit indicates the BUS hold when the master holds the bus because of the Tx FIFO being empty, and the the previous transferred command does not have the Stop bit set. (This kind of Bus hold is applicable if IC_EMPTYFIFO_HOLD_MASTER_EN is set to 1).
6	0h RO/V	**SLV_ACTIVITY:** Slave FSM Activity Status. When the Slave Finite State Machine (FSM) is not in the IDLE state, this bit is set. - 0: Slave FSM is in IDLE state so the Slave part of DW_apb_i2c is not Active - 1: Slave FSM is not in IDLE state so the Slave part of DW_apb_i2c is Active
5	0h RO/V	**MST_ACTIVITY:** Master FSM Activity Status. When the Master Finite State Machine (FSM) is not in the IDLE state, this bit is set. - 0: Master FSM is in IDLE state so the Master part of DW_apb_i2c is not Active - 1: Master FSM is not in IDLE state so the Master part of DW_apb_i2c is Active Note: IC_STATUS[0]-that is, ACTIVITY bit-is the OR of SLV_ACTIVITY and MST_ACTIVITY bits.
4	0h RO/V	**RFF:** Receive FIFO Completely Full. When the receive FIFO is completely full, this bit is set. When the receive FIFO contains one or more empty location, this bit is cleared. - 0: Receive FIFO is not full - 1: Receive FIFO is full
3	0h RO/V	**RFNE:** Receive FIFO Not Empty. This bit is set when the receive FIFO contains one or more entries; it is cleared when the receive FIFO is empty. - 0: Receive FIFO is empty - 1: Receive FIFO is not empty

Bit Range	Default & Access	Field Name (ID): Description
2	1h RO/V	**TFE:** Transmit FIFO Completely Empty. When the transmit FIFO is completely empty, this bit is set. When it contains one or more valid entries, this bit is cleared. This bit field does not request an interrupt. - 0: Transmit FIFO is not empty - 1: Transmit FIFO is empty
1	1h RO/V	**TFNF:** Transmit FIFO Not Full. Set when the transmit FIFO contains one or more empty locations, and is cleared when the FIFO is full. - 0: Transmit FIFO is full - 1: Transmit FIFO is not full
0	0h RO/V	**ACTIVITY:** I2C Activity Status.

14.1.8.30 IC_TXFLR — Offset 4010E074h

I2C Transmit FIFO Level Register - I2C Transmit FIFO Level Register This register contains the number of valid data entries in the transmit FIFO buffer. It is cleared whenever: - The I2C is disabled - There is a transmit abort - that is, TX_ABRT bit is set in the IC_RAW_INTR_STAT register - The slave bulk transmit mode is aborted The register increments whenever data is placed into the transmit FIFO and decrements when data is taken from the transmit FIFO.

Type	Size	Offset	Default
MMIO	32 bit	4010E074h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:0	00h RO/V	**TXFLR:** Transmit FIFO Level. Contains the number of valid data entries in the transmit FIFO.

14.1.8.31 IC_RXFLR — Offset 4010E078h

I2C Receive FIFO Level Register - I2C Receive FIFO Level Register This register contains the number of valid data entries in the receive FIFO buffer. It is cleared whenever: - The I2C is disabled - Whenever there is a transmit abort caused by any of the events tracked in IC_TX_ABRT_SOURCE The register increments whenever data is placed into the receive FIFO and decrements when data is taken from the receive FIFO.

Type	Size	Offset	Default
MMIO	32 bit	4010E078h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:0	00h RO/V	**RXFLR:** Receive FIFO Level. Contains the number of valid data entries in the receive FIFO.

14.1.8.32 IC_SDA_HOLD — Offset 4010E07Ch

I2C SDA Hold Time Length Register - I2C SDA Hold Time Length Register The bits [15:0] of this register are used to control the hold time of SDA during transmit in both slave and master mode (after SCL goes from HIGH to LOW). The bits [23:16] of this register are used to extend the SDA transition (if any) whenever SCL is HIGH in the receiver in either master or slave mode. Writes to this register succeed only when IC_ENABLE[0]=0. The values in this register are in units of ic_clk period. The value programmed in IC_SDA_TX_HOLD must be greater than the minimum hold time in each mode one cycle in master mode, seven cycles in slave mode for the value to be implemented. The programmed SDA hold time during transmit (IC_SDA_TX_HOLD) cannot exceed at any time the duration of the low part of scl. Therefore the programmed value cannot be larger than N_SCL_LOW-2, where N_SCL_LOW is the duration of the low part of the scl period measured in ic_clk cycles.

Type	Size	Offset	Default
MMIO	32 bit	4010E07Ch	00000005h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:16	00h RW	**IC_SDA_RX_HOLD:** Sets the required SDA hold time in units of ic_clk period, when DW_apb_i2c acts as a receiver.
15:0	0005h RW	**IC_SDA_TX_HOLD:** Sets the required SDA hold time in units of ic_clk period, when DW_apb_i2c acts as a transmitter.

14.1.8.33 IC_TX_ABRT_SOURCE — Offset 4010E080h

I2C Transmit Abort Source Register - I2C Transmit Abort Source Register This register has 32 bits that indicate the source of the TX_ABRT bit. Except for Bit 9, this register is cleared whenever the IC_CLR_TX_ABRT register or the IC_CLR_INTR register is read. To clear Bit 9, the source of the ABRT_SBYTE_NORSTRT must be fixed first; RESTART must be enabled (IC_CON[5]=1), the SPECIAL bit must be cleared (IC_TAR[11]), or the GC_OR_START bit must be cleared (IC_TAR[10]). Once the source of the ABRT_SBYTE_NORSTRT is fixed, then this bit can be cleared in the same manner as other bits in this register. If the source of the ABRT_SBYTE_NORSTRT is not fixed before attempting to clear this bit, Bit 9 clears for one cycle and is then re-asserted.

Type	Size	Offset	Default
MMIO	32 bit	4010E080h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:23	000h RO/V	**TX_FLUSH_CNT:** This field indicates the number of Tx FIFO Data Commands which are flushed due to TX_ABRT interrupt. It is cleared whenever I2C is disabled. Role of DW_apb_i2c: Master-Transmitter or Slave-Transmitter
22:17	0h RO	**Reserved**
16	0h RO/V	**ABRT_USER_ABRT:** This is a master-mode-only bit. Master has detected the transfer abort (IC_ENABLE[1]) Role of DW_apb_i2c: Master-Transmitter
15	0h RO/V	**ABRT_SLVRD_INTX:** 1: When the processor side responds to a slave mode request for data to be transmitted to a remote master and user writes a 1 in CMD (bit 8) of IC_DATA_CMD register. Role of DW_apb_i2c: Slave-Transmitter
14	0h RO/V	**ABRT_SLV_ARBLOST:** This field indicates that a Slave has lost the bus while transmitting data to a remote master. IC_TX_ABRT_SOURCE[12] is set at the same time. Note: Even though the slave never 'owns' the bus, something could go wrong on the bus. This is a fail safe check. For instance, during a data transmission at the low-to-high transition of SCL, if what is on the data bus is not what is supposed to be transmitted, then DW_apb_i2c no longer own the bus. Role of DW_apb_i2c: Slave-Transmitter
13	0h RO/V	**ABRT_SLVFLUSH_TXFIFO:** This field specifies that the Slave has received a read command and some data exists in the TX FIFO, so the slave issues a TX_ABRT interrupt to flush old data in TX FIFO. Role of DW_apb_i2c: Slave-Transmitter
12	0h RO/V	**ARB_LOST:** This field specifies that the Master has lost arbitration, or if IC_TX_ABRT_SOURCE[14] is also set, then the slave transmitter has lost arbitration. Role of DW_apb_i2c: Master-Transmitter or Slave-Transmitter
11	0h RO/V	**ABRT_MASTER_DIS:** This field indicates that the User tries to initiate a Master operation with the Master mode disabled. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver

Bit Range	Default & Access	Field Name (ID): Description
10	0h RO/V	**ABRT_10B_RD_NORSTRT:** This field indicates that the restart is disabled (IC_RESTART_EN bit (IC_CON[5]) =0) and the master sends a read command in 10-bit addressing mode. Role of DW_apb_i2c: Master-Receiver
9	0h RO/V	**ABRT_SBYTE_NORSTRT:** To clear Bit 9, the source of the ABRT_SBYTE_NORSTRT must be fixed first; restart must be enabled (IC_CON[5]=1), the SPECIAL bit must be cleared (IC_TAR[11]), or the GC_OR_START bit must be cleared (IC_TAR[10]). Once the source of the ABRT_SBYTE_NORSTRT is fixed, then this bit can be cleared in the same manner as other bits in this register. If the source of the ABRT_SBYTE_NORSTRT is not fixed before attempting to clear this bit, bit 9 clears for one cycle and then gets reasserted. When this field is set to 1, the restart is disabled (IC_RESTART_EN bit (IC_CON[5]) =0) and the user is trying to send a START Byte. Role of DW_apb_i2c: Master
8	0h RO/V	**ABRT_HS_NORSTRT:** This field indicates that the restart is disabled (IC_RESTART_EN bit (IC_CON[5]) =0) and the user is trying to use the master to transfer data in High Speed mode. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver
7	0h RO/V	**ABRT_SBYTE_ACKDET:** This field indicates that the Master has sent a START Byte and the START Byte was acknowledged (wrong behavior). Role of DW_apb_i2c: Master
6	0h RO/V	**ABRT_HS_ACKDET:** This field indicates that the Master is in High Speed mode and the High Speed Master code was acknowledged (wrong behavior). Role of DW_apb_i2c: Master
5	0h RO/V	**ABRT_GCALL_READ:** This field indicates that DW_apb_i2c in the master mode has sent a General Call but the user programmed the byte following the General Call to be a read from the bus (IC_DATA_CMD[9] is set to 1). Role of DW_apb_i2c: Master-Transmitter
4	0h RO/V	**ABRT_GCALL_NOACK:** This field indicates that DW_apb_i2c in master mode has sent a General Call and no slave on the bus acknowledged the General Call. Role of DW_apb_i2c: Master-Transmitter
3	0h RO/V	**ABRT_TXDATA_NOACK:** This field indicates the master-mode only bit. When the master receives an acknowledgement for the address, but when it sends data byte(s) following the address, it did not receive an acknowledge from the remote slave(s). Role of DW_apb_i2c: Master-Transmitter
2	0h RO/V	**ABRT_10ADDR2_NOACK:** This field indicates that the Master is in 10-bit address mode and that the second address byte of the 10-bit address was not acknowledged by any slave. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver
1	0h RO/V	**ABRT_10ADDR1_NOACK:** This field indicates that the Master is in 10-bit address mode and the first 10-bit address byte was not acknowledged by any slave. Reset value: 0x0 Role of DW_apb_i2c: Master-Transmitter or Master-Receiver
0	0h RO/V	**ABRT_7B_ADDR_NOACK:** This field indicates that the Master is in 7-bit addressing mode and the address sent was not acknowledged by any slave. Role of DW_apb_i2c: Master-Transmitter or Master-Receiver

14.1.8.34 IC_DMA_CR — Offset 4010E088h

DMA Control Register - DMA Control Register This register is only valid when DW_apb_i2c is configured with a set of DMA Controller interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist and writing to the register's address has no effect and reading from this register

address will return zero. The register is used to enable the DMA Controller interface operation. There is a separate bit for transmit and receive. This can be programmed regardless of the state of IC_ENABLE.

Type	Size	Offset	Default
MMIO	32 bit	4010E088h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1	0h RW	**TDMAE:** Transmit DMA Enable. This bit enables/disables the transmit FIFO DMA channel.
0	0h RW	**RDMAE:** Receive DMA Enable. This bit enables/disables the receive FIFO DMA channel.

14.1.8.35 IC_DMA_TDLR — Offset 4010E08Ch

DMA Transmit Data Level Register - DMA Transmit Data Level Register This register is only valid when the DW_apb_i2c is configured with a set of DMA interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist; writing to its address has no effect; reading from its address returns zero.

Type	Size	Offset	Default
MMIO	32 bit	4010E08Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:0	00h RW	**DMATDL:** Transmit Data Level. This bit field controls the level at which a DMA request is made by the transmit logic. It is equal to the watermark level; that is, the dma_tx_req signal is generated when the number of valid data entries in the transmit FIFO is equal to or below this field value, and TDMAE = 1.

14.1.8.36 IC_DMA_RDLR — Offset 4010E090h

DMA Transmit Data Level Register - I2C Receive Data Level Register This register is only valid when DW_apb_i2c is configured with a set of DMA interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist; writing to its address has no effect; reading from its address returns zero.

Type	Size	Offset	Default
MMIO	32 bit	4010E090h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:0	00h RW	**DMARDL:** Receive Data Level. This bit field controls the level at which a DMA request is made by the receive logic. The watermark level = DMARDL+1; that is, dma_rx_req is generated when the number of valid data entries in the receive FIFO is equal to or more than this field value + 1, and RDMAE =1. For instance, when DMARDL is 0, then dma_rx_req is asserted when 1 or more data entries are present in the receive FIFO.

14.1.8.37 IC_SDA_SETUP — Offset 4010E094h

I2C SDA Setup Register - I2C SDA Setup Register This register controls the amount of time delay (in terms of number of ic_clk clock periods) introduced in the rising edge of SCL - relative to SDA changing - when DW_apb_i2c services a read request in a slave-transmitter operation. The relevant I2C requirement is tSU:DAT as detailed in the I2C Bus Specification. This register must be programmed with a value equal to or greater than 2. Writes to this register succeed only when IC_ENABLE[0] = 0. Note: The length of setup time is calculated using [(IC_SDA_SETUP - 1) * (ic_clk_period)], so if the user requires 10 ic_clk periods of setup time, they should program a value of 11. The IC_SDA_SETUP register is only used by the DW_apb_i2c when operating as a slave transmitter.

Type	Size	Offset	Default
MMIO	32 bit	4010E094h	00000002h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	02h RW	**SDA_SETUP:** SDA Setup. It is recommended that if the required delay is 1000ns, then for an ic_clk frequency of 10 MHz, IC_SDA_SETUP should be programmed to a value of 11. IC_SDA_SETUP must be programmed with a minimum value of 2.

14.1.8.38 IC_ACK_GENERAL_CALL — Offset 4010E098h

I2C ACK General Call Register - I2C ACK General Call Register The register controls whether DW_apb_i2c responds with a ACK or NACK when it receives an I2C General Call address. This register is applicable only when the DW_apb_i2c is in slave mode.

Type	Size	Offset	Default
MMIO	32 bit	4010E098h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**ACK_GEN_CALL:** ACK General Call. When set to 1, DW_apb_i2c responds with a ACK (by asserting ic_data_oe) when it receives a General Call. Otherwise, DW_apb_i2c responds with a NACK (by negating ic_data_oe).

14.1.8.39 IC_ENABLE_STATUS — Offset 4010E09Ch

I2C Enable Status Register - I2C Enable Status Register The register is used to report the DW_apb_i2c hardware status when the IC_ENABLE[0] register is set from 1 to 0; that is, when DW_apb_i2c is disabled. If IC_ENABLE[0] has been set to 1, bits 2:1 are forced to 0, and bit 0 is forced to 1. If IC_ENABLE[0] has been set to 0, bits 2:1 is only be valid as soon as bit 0 is read as '0'. Note: When IC_ENABLE[0] has been set to 0, a delay occurs for bit 0 to be read as 0 because disabling the DW_apb_i2c depends on I2C bus activities.

Type	Size	Offset	Default
MMIO	32 bit	4010E09Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2	0h RO/V	**SLV_RX_DATA_LOST:** Slave Received Data Lost. This bit indicates if a Slave-Receiver operation has been aborted with at least one data byte received from an I2C transfer due to the setting bit 0 of IC_ENABLE from 1 to 0. When read as 1, DW_apb_i2c is deemed to have been actively engaged in an aborted I2C transfer (with matching address) and the data phase of the I2C transfer has been entered, even though a data byte has been responded with a NACK. Note: If the remote I2C master terminates the transfer with a STOP condition before the DW_apb_i2c has a chance to NACK a transfer, and IC_ENABLE[0] has been set to 0, then this bit is also set to 1. When read as 0, DW_apb_i2c is deemed to have been disabled without being actively involved in the data phase of a Slave-Receiver transfer. Note: The CPU can safely read this bit when IC_EN (bit 0) is read as 0.
1	0h RO/V	**SLV_DISABLED_WHILE_BUSY:** Slave Disabled While Busy (Transmit, Receive). This bit indicates if a potential or active Slave operation has been aborted due to the setting bit 0 of the IC_ENABLE register from 1 to 0. This bit is set when the CPU writes a 0 to the IC_ENABLE register while: (a) DW_apb_i2c is receiving the address byte of the Slave-Transmitter operation from a remote master; OR, (b) address and data bytes of the Slave-Receiver operation from a remote master. When read as 1, DW_apb_i2c is deemed to have forced a NACK during any part of an I2C transfer, irrespective of whether the I2C address matches the slave address set in DW_apb_i2c (IC_SAR register) OR if the transfer is completed before IC_ENABLE is set to 0 but has not taken effect. Note: If the remote I2C master terminates the transfer with a STOP condition before the DW_apb_i2c has a chance to NACK a transfer, and IC_ENABLE[0] has been set to 0, then this bit will also be set to 1. When read as 0, DW_apb_i2c is deemed to have been disabled when there is master activity, or when the I2C bus is idle. Note: The CPU can safely read this bit when IC_EN (bit 0) is read as 0.
0	0h RO/V	**IC_EN:** ic_en Status. This bit always reflects the value driven on the output port ic_en. - When read as 1, DW_apb_i2c is deemed to be in an enabled state. - When read as 0, DW_apb_i2c is deemed completely inactive. Note: The CPU can safely read this bit anytime. When this bit is read as 0, the CPU can safely read SLV_RX_DATA_LOST (bit 2) and SLV_DISABLED_WHILE_BUSY (bit 1).

14.1.8.40 IC_FS_SPKLEN — Offset 4010E0A0h

I2C SS, FS or FM+ spike suppression limit - I2C SS, FS or FM+ spike suppression limit This register is used to store the duration, measured in ic_clk cycles, of the longest spike that is filtered out by the spike suppression logic w hen the component is operating in SS, FS or FM+ modes. This register must be programmed with a minimum value of 1.

Type	Size	Offset	Default
MMIO	32 bit	4010E0A0h	00000005h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	05h RW	**IC_FS_SPKLEN:** This register must be set before any I2C bus transaction can take place to ensure stable operation. This register sets the duration, measured in ic_clk cycles, of the longest spike in the SCL or SDA lines that will be filtered out by the spike suppression logic. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. The minimum valid value is 1; hardware prevents values less than this being written, and if attempted results in 1 being set.

14.1.8.41 IC_HS_SPKLEN — Offset 4010E0A4h

I2C HS spike suppression limit register - I2C HS spike suppression limit register This register is used to store the duration, measured in ic_clk cycles, of the longest spike that is filtered out by the spike suppression logic when the component is operating in HS modes. This register must be programmed with a minimum value of 1 and is implemented only if the component is configured to support HS mode; that is, if the IC_MAX_SPEED_MODE parameter is set to 3.

Type	Size	Offset	Default
MMIO	32 bit	4010E0A4h	00000002h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	02h RW	**IC_HS_SPKLEN:** This register must be set before any I2C bus transaction can take place to ensure stable operation. This register sets the duration, measured in ic_clk cycles, of the longest spike in the SCL or SDA lines that will be filtered out by the spike suppression logic. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE[0] register being set to 0. Writes at other times have no effect. The minimum valid value is 1; hardware prevents values less than this being written, and if attempted results in 1 being set.

14.1.8.42 IC_CLR_RESTART_DET — Offset 4010E0A8h

Clear RESTART_DET Interrupt Register - Clear RESTART_DET Interrupt Register

Type	Size	Offset	Default
MMIO	32 bit	4010E0A8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**CLR_RESTART_DET:** Read this register to clear the RESTART_DET interrupt (bit 12) of IC_RAW_INTR_STAT register.

14.1.8.43 IC_COMP_PARAM_1 — Offset 4010E0F4h

Component Parameter Register 1 - Component Parameter Register 1 Note This is a constant read-only register that contains encoded information about the component's parameter settings. The reset value depends on coreConsultant parameter(s).

Type	Size	Offset	Default
MMIO	32 bit	4010E0F4h	003F3FEEh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:16	3Fh RO/V	**TX_BUFFER_DEPTH:** The value of this register is derived from the IC_TX_BUFFER_DEPTH coreConsultant parameter. - 0x00 = Reserved - 0x01 = 2 - 0x02 = 3 - ... - 0xFF = 256
15:8	3Fh RO/V	**RX_BUFFER_DEPTH:** The value of this register is derived from the IC_RX_BUFFER_DEPTH coreConsultant parameter. - 0x00: Reserved - 0x01: 2 - 0x02: 3 - ... - 0xFF: 256
7	1h RO/V	**ADD_ENCODED_PARAMS:** The value of this register is derived from the IC_ADD_ENCODED_PARAMS coreConsultant parameter. Reading 1 in this bit means that the capability of reading these encoded parameters via software has been included. Otherwise, the entire register is 0 regardless of the setting of any other parameters that are encoded in the bits.

Bit Range	Default & Access	Field Name (ID): Description
6	1h RO/V	**HAS_DMA:** The value of this register is derived from the IC_HAS_DMA coreConsultant parameter.
5	1h RO/V	**INTR_IO:** The value of this register is derived from the IC_INTR_IO coreConsultant parameter.
4	0h RO/V	**HC_COUNT_VALUES:** The value of this register is derived from the IC_HC_COUNT VALUES coreConsultant parameter.
3:2	3h RO/V	**MAX_SPEED_MODE:** The value of this register is derived from the IC_MAX_SPEED_MODE coreConsultant parameter. - 0x0: Reserved - 0x1: Standard - 0x2: Fast - 0x3: High
1:0	2h RO/V	**APB_DATA_WIDTH:** The value of this register is derived from the APB_DATA_WIDTH coreConsultant parameter.

14.1.8.44 IC_COMP_VERSION — Offset 4010E0F8h

I2C Component Version Register - I2C Component Version Register

Type	Size	Offset	Default
MMIO	32 bit	4010E0F8h	3230322Ah

Register Level Access:

BIOS Access	SMM Access	OS Access

40200094h	4	GPIO Glitch Filter Bypass (GFBR0)	00000000h
40200098h	4	GPIO Glitch Filter Bypass (GFBR1)	00000000h
402000ACh	4	GPIO Interrupt Mask (GIMR0)	00000000h
402000B0h	4	GPIO Interrupt Mask (GIMR1)	00000000h
402000C4h	4	GPIO Interrupt Source (GISR0)	00000000h
402000C8h	4	GPIO Interrupt Source (GISR1)	00000000h
40200100h	4	GPIO Wake Mask (GWMR0)	00000000h
40200104h	4	GPIO Wake Mask (GWMR1)	00000000h
40200118h	4	GPIO Wake Source (GWSR0)	00000000h
4020011Ch	4	GPIO Wake Source (GWSR1)	00000000h
40200130h	4	GPIO Secure Input (GSEC)	00000000h

14.2.1.1 GPIO Pin DirectionLock (GCCR) — Offset 40200000h

Register to lock GPIO Pin direction.

Type	Size	Offset	Default
MMIO	32 bit	40200000h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**GPDR_LOCK:** This bit locks the GPDR register from being modified and is a write once bit which is cleared on a powergood assertion. This field is valid both when GPIO is input or output. 0 = GPDR is Unlocked 1 = GPDR is Locked.

14.2.1.2 GPIO Pin Level (GPLR0) — Offset 40200004h

Register for reading current value of GPIO pin. Valid when GPIO direction set as input.

Type	Size	Offset	Default
MMIO	32 bit	40200004h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**GPLR0:** Check the state of each of the GPIO pins by reading the GPIO Pin Level register (GPLR). Each bit in the GPLR corresponds to one pin in the GPIO. GPLR0 31 to 0 correspond to GPIO 31 to 0. Use the GPLRx read-only registers to determine the current value of a particular pin (only available during GPIO input mode). For reserved bits, reads return zero.

14.2.1.3 GPIO Pin Level (GPLR1) — Offset 40200008h

Register for reading current value of GPIO pin. Valid when GPIO direction set as input.

Type	Size	Offset	Default
MMIO	32 bit	40200008h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**GPLR1:** Check the state of each of the GPIO pins by reading the GPIO Pin Level register (GPLR). Each bit in the GPLR corresponds to one pin in the GPIO. GPLR0 31 to 0 correspond to GPIO 31 to 0. Use the GPLRx read-only registers to determine the current value of a particular pin (only available during GPIO input mode). For reserved bits, reads return zero.

14.2.1.4 GPIO Pin Direction (GPDR0) — Offset 4020001Ch

Register to set GPIO direction.

Type	Size	Offset	Default
MMIO	32 bit	4020001Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GPDR0:** Setting whether a pin is an input or output is controlled by programming the GPIO pin direction registers (GPDR0-5). The GPDR registers contain one direction control bit for each of the 192 GPIO pins. If a direction bit is programmed to 1, the GPIO is an output. If it is programmed to 0, it is an input. A reset clears all bits in the GPDR0-5 registers and configures all GPIO pins as inputs..

14.2.1.5 GPIO Pin Direction (GPDR1) — Offset 40200020h

Register to set GPIO direction.

Type	Size	Offset	Default
MMIO	32 bit	40200020h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GPDR1:** Setting whether a pin is an input or output is controlled by programming the GPIO pin direction registers (GPDR0-5). The GPDR registers contain one direction control bit for each of the 192 GPIO pins. If a direction bit is programmed to 1, the GPIO is an output. If it is programmed to 0, it is an input. A reset clears all bits in the GPDR0-5 registers and configures all GPIO pins as inputs..

14.2.1.6 GPIO Pin Output Set (GPSR0) — Offset 40200034h

Register to assert GPIO output pin, valid for output pins.

Type	Size	Offset	Default
MMIO	32 bit	40200034h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h WO	**GPSR0:** When a GPIO is configured as an output, the state of the pin is controlled by writing to either the GPIO Pin Output Set registers (GPSR0-5) or the GPIO Pin Output Clear registers (GPCR0-5). An output pin is set by setting to its corresponding bit within the GPSR. To clear an output pin, set the corresponding GPCR bit. Writing 0 to any of the GPSR or GPCR bits has no effect on the state of the pin. Writing 1 to a GPSR or GPCR bit corresponding to a pin that is configured as an input is effective only after the pin is configured as an output. When a GPIO pin is reconfigured as an output, the most recent write to GPSR or GPCR determines the pins output state. The GPIO Pin-Output Set registers (GPSR0-5) and GPIO Pin-Output Clear registers (GPCR0-5) are write-only registers. Reads return unpredictable values. GPSR and GPCR arent actually registers they toggle the Set and Reset pins of a D-Flip-Flop. The reason for this implementation was to prevent the need for read-modify-writes from SW to toggle an external pin. .

14.2.1.7 GPIO Pin Output Set (GPSR1) — Offset 40200038h

Register to assert GPIO output pin, valid for output pins.

Type	Size	Offset	Default
MMIO	32 bit	40200038h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h WO	**GPSR1:** When a GPIO is configured as an output, the state of the pin is controlled by writing to either the GPIO Pin Output Set registers (GPSR0-5) or the GPIO Pin Output Clear registers (GPCR0-5). An output pin is set by setting to its corresponding bit within the GPSR. To clear an output pin, set the corresponding GPCR bit. Writing 0 to any of the GPSR or GPCR bits has no effect on the state of the pin. Writing 1 to a GPSR or GPCR bit corresponding to a pin that is configured as an input is effective only after the pin is configured as an output. When a GPIO pin is reconfigured as an output, the most recent write to GPSR or GPCR determines the pins output state. The GPIO Pin-Output Set registers (GPSR0-5) and GPIO Pin-Output Clear registers (GPCR0-5) are write-only registers. Reads return unpredictable values. GPSR and GPCR arent actually registers they toggle the Set and Reset pins of a D-Flip-Flop. The reason for this implementation was to prevent the need for read-modify-writes from SW to toggle an external pin. .

14.2.1.8 GPIO Pin Output Clear (GPCR0) — Offset 4020004Ch

Register to deassert GPIO output pin, valid for output pins.

Type	Size	Offset	Default
MMIO	32 bit	4020004Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h WO	**GPCR0:** When a GPIO is configured as an output, the state of the pin is controlled by writing to either the GPIO Pin Output Set registers (GPSR0-5) or the GPIO Pin Output Clear registers (GPCR0-5). An output pin is set by setting to its corresponding bit within the GPSR. To clear an output pin, set the corresponding GPCR bit. Writing 0 to any of the GPSR or GPCR bits has no effect on the state of the pin. The reason for this implementation was to prevent the need for read-modify-writes from SW to toggle an external pin. .

14.2.1.9 GPIO Pin Output Clear (GPCR1) — Offset 40200050h

Register to deassert GPIO output pin, valid for output pins.

Type	Size	Offset	Default
MMIO	32 bit	40200050h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h WO	**GPCR1:** When a GPIO is configured as an output, the state of the pin is controlled by writing to either the GPIO Pin Output Set registers (GPSR0-5) or the GPIO Pin Output Clear registers (GPCR0-5). An output pin is set by setting to its corresponding bit within the GPSR. To clear an output pin, set the corresponding GPCR bit. Writing 0 to any of the GPSR or GPCR bits has no effect on the state of the pin. Writing 1 to a GPSR or GPCR bit corresponding to a pin that is configured as an input is effective only after the pin is configured as an output. When a GPIO pin is reconfigured as an output, the most recent write to GPSR or GPCR determines the pins output state. The GPIO Pin-Output Set registers (GPSR0-5) and GPIO Pin-Output Clear registers (GPCR0-5) are write-only registers. Reads return unpredictable values. GPSR and GPCR arent actually registers they toggle the Set and Reset pins of a D-Flip-Flop. The reason for this implementation was to prevent the need for read-modify-writes from SW to toggle an external pin. .

14.2.1.10 GPIO Rising Edge Detect Enable (GRER0) — Offset 40200064h

Register to enable rising edge detect for GPIO Input pin.

Type	Size	Offset	Default
MMIO	32 bit	40200064h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GRER0:** Each GPIO can also be programmed to detect rising-edge or falling-edge transition on a pin. When an edge is detected that matches the type of edge programmed for the pin, a status bit is set. The GPIO Rising-Edge Detect Enable register (GRERx) and Falling Edge Detect Enable register (GFERx) select the type of transition on a GPIO pin that causes an interrupt or wake to be propogated. For a given GPIO pin, if its corresponding GRER bit is set, an interrupt or wake source bit is set when the pin transitions from logic level zero to logic level one. Likewise, GFER sets the corresponding interrupt or wake source bit when a transition from logic level one to logic level zero occurs on the pin. When the corresponding bits are set in both registers, either a falling- or a rising-edge transition causes will cause the Interrupt or Wake Source registers to be set if they are unmasked. For the interrupt or wake source bits to be set it first has to be unmasked through the Interrupt Mask or Wake Mask register. Minimum pulse-width timing requirements exist to guarantee that an edge or level transition is detected. .

14.2.1.11 GPIO Rising Edge Detect Enable (GRER1) — Offset 40200068h

Register to enable rising edge detect for GPIO Input pin.

Type	Size	Offset	Default
MMIO	32 bit	40200068h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GRER1:** Each GPIO can also be programmed to detect rising-edge or falling-edge transition on a pin. Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GSEC:** 1 = Hide Pin Level Status Updates to GPLR and Mask Pin Interrupts to IO-APIC 0 = Unhidden.

14.2.2 GPIO_1 Registers Summary

Table 14-10. Summary of GPIO_1 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
40300000h	4	GPIO Pin DirectionLock (GCCR)	00000000h
40300004h	4	GPIO Pin Level (GPLR0)	00000000h
40300008h	4	GPIO Pin Level (GPLR1)	00000000h
4030001Ch	4	GPIO Pin Direction (GPDR0)	00000000h
40300020h	4	GPIO Pin Direction (GPDR1)	00000000h
40300034h	4	GPIO Pin Output Set (GPSR0)	00000000h
40300038h	4	GPIO Pin Output Set (GPSR1)	00000000h
4030004Ch	4	GPIO Pin Output Clear (GPCR0)	00000000h
40300050h	4	GPIO Pin Output Clear (GPCR1)	00000000h
40300064h	4	GPIO Rising Edge Detect Enable (GRER0)	00000000h
40300068h	4	GPIO Rising Edge Detect Enable (GRER1)	00000000h
4030007Ch	4	GPIO Falling Edge Detect Enable (GFER0)	00000000h
40300080h	4	GPIO Falling Edge Detect Enable (GFER1)	00000000h
40300094h	4	GPIO Glitch Filter Bypass (GFBR0)	00000000h
40300098h	4	GPIO Glitch Filter Bypass (GFBR1)	00000000h
403000ACh	4	GPIO Interrupt Mask (GIMR0)	00000000h
403000B0h	4	GPIO Interrupt Mask (GIMR1)	00000000h
403000C4h	4	GPIO Interrupt Source (GISR0)	00000000h
403000C8h	4	GPIO Interrupt Source (GISR1)	00000000h
40300100h	4	GPIO Wake Mask (GWMR0)	00000000h
40300104h	4	GPIO Wake Mask (GWMR1)	00000000h
40300118h	4	GPIO Wake Source (GWSR0)	00000000h
4030011Ch	4	GPIO Wake Source (GWSR1)	00000000h
40300130h	4	GPIO Secure Input (GSEC)	00000000h

14.2.2.1 GPIO Pin DirectionLock (GCCR) — Offset 40300000h

Register to lock GPIO Pin direction.

Type	Size	Offset	Default
MMIO	32 bit	40300000h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**GPDR_LOCK:** This bit locks the GPDR register from being modified and is a write once bit which is cleared on a powergood assertion. This field is valid both when GPIO is input or output. 0 = GPDR is Unlocked 1 = GPDR is Locked.

14.2.2.2 GPIO Pin Level (GPLR0) — Offset 40300004h

Register for reading current value of GPIO pin. Valid when GPIO direction set as input.

Type	Size	Offset	Default
MMIO	32 bit	40300004h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**GPLR0:** Check the state of each of the GPIO pins by reading the GPIO Pin Level register (GPLR). Each bit in the GPLR corresponds to one pin in the GPIO. GPLR0 31 to 0 correspond to GPIO 31 to 0. Use the GPLRx read-only registers to determine the current value of a particular pin (regardless of the programmed pin direction). For reserved bits, reads return zero.

14.2.2.3 GPIO Pin Level (GPLR1) — Offset 40300008h

Register for reading current value of GPIO pin. Valid when GPIO direction set as input.

Type	Size	Offset	Default
MMIO	32 bit	40300008h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**GPLR1:** Check the state of each of the GPIO pins by reading the GPIO Pin Level register (GPLR). Each bit in the GPLR corresponds to one pin in the GPIO. GPLR0 31 to 0 correspond to GPIO 31 to 0. Use the GPLRx read-only registers to determine the current value of a particular pin (regardless of the programmed pin direction). For reserved bits, reads return zero.

14.2.2.4 GPIO Pin Direction (GPDR0) — Offset 4030001Ch

Register to set GPIO direction.

Type	Size	Offset	Default
MMIO	32 bit	4030001Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GPDR0:** Setting whether a pin is an input or output is controlled by programming the GPIO pin direction registers (GPDR0-5). The GPDR registers contain one direction control bit for each of the 192 GPIO pins. If a direction bit is programmed to 1, the GPIO is an output. If it is programmed to 0, it is an input. A reset clears all bits in the GPDR0-5 registers and configures all GPIO pins as inputs..

14.2.2.5 GPIO Pin Direction (GPDR1) — Offset 40300020h

Register to set GPIO direction.

Type	Size	Offset	Default
MMIO	32 bit	40300020h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GPDR1:** Setting whether a pin is an input or output is controlled by programming the GPIO pin direction registers (GPDR0-5). The GPDR registers contain one direction control bit for each of the 192 GPIO pins. If a direction bit is programmed to 1, the GPIO is an output. If it is programmed to 0, it is an input. A reset clears all bits in the GPDR0-5 registers and configures all GPIO pins as inputs..

14.2.2.6 GPIO Pin Output Set (GPSR0) — Offset 40300034h

Register to assert GPIO output pin, valid for output pins.

Type	Size	Offset	Default
MMIO	32 bit	40300034h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h WO	**GPSR0:** When a GPIO is configured as an output, the state of the pin is controlled by writing to either the GPIO Pin Output Set registers (GPSR0-5) or the GPIO Pin Output Clear registers (GPCR0-5). An output pin is set by setting to its corresponding bit within the GPSR. To clear an output pin, set the corresponding GPCR bit. Writing 0 to any of the GPSR or GPCR bits has no effect on the state of the pin. Writing 1 to a GPSR or GPCR bit corresponding to a pin that is configured as an input is effective only after the pin is configured as an output. When a GPIO pin is reconfigured as an output, the most recent write to GPSR or GPCR determines the pins output state. The GPIO Pin-Output Set registers (GPSR0-5) and GPIO Pin-Output Clear registers (GPCR0-5) are write-only registers. Reads return unpredictable values. GPSR and GPCR arent actually registers they toggle the Set and Reset pins of a D-Flip-Flop. The reason for this implementation was to prevent the need for read-modify-writes from SW to toggle an external pin. .

14.2.2.7 GPIO Pin Output Set (GPSR1) — Offset 40300038h

Register to assert GPIO output pin, valid for output pins.

Type	Size	Offset	Default
MMIO	32 bit	40300038h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h WO	**GPSR1:** When a GPIO is configured as an output, the state of the pin is controlled by writing to either the GPIO Pin Output Set registers (GPSR0-5) or the GPIO Pin Output Clear registers (GPCR0-5). An output pin is set by setting to its corresponding bit within the GPSR. To clear an output pin, set the corresponding GPCR bit. GPSR and GPCR arent actually registers they toggle the Set and Reset pins of a D-Flip-Flop. The reason for this implementation was to prevent the need for read-modify-writes from SW to toggle an external pin. .

14.2.2.10 GPIO Rising Edge Detect Enable (GRER0) — Offset 40300064h

Register to enable rising edge detect for GPIO Input pin.

Type	Size	Offset	Default
MMIO	32 bit	40300064h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GRER0:** Each GPIO can also be programmed to detect rising-edge or falling-edge transition on a pin. When an edge is detected that matches the type of edge programmed for the pin, a status bit is set. The GPIO Rising-Edge Detect Enable register (GRERx) and Falling Edge Detect Enable register (GFERx) select the type of transition on a GPIO pin that causes an interrupt or wake to be propogated. For a given GPIO pin, if its corresponding GRER bit is set, an interrupt or wake source bit is set when the pin transitions from logic level zero to logic level one. Likewise, GFER sets the corresponding interrupt or wake source bit when a transition from logic level one to logic level zero occurs on the pin. When the corresponding bits are set in both registers, either a falling- or a rising-edge transition causes will cause the Interrupt or Wake Source registers to be set if they are unmasked. For the interrupt or wake source bits to be set it first has to be unmasked through the Interrupt Mask or Wake Mask register. Minimum pulse-width timing requirements exist to guarantee that an edge or level transition is detected. .

14.2.2.11 GPIO Rising Edge Detect Enable (GRER1) — Offset 40300068h

Register to enable rising edge detect for GPIO Input pin.

Type	Size	Offset	Default
MMIO	32 bit	40300068h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GRER1:** Each GPIO can also be programmed to detect rising-edge or falling-edge transition on a pin. When an edge is detected that matches the type of edge programmed for the pin, a status bit is set. The GPIO Rising-Edge Detect Enable register (GRERx) and Falling Edge Detect Enable register (GFERx) select the type of transition on a GPIO pin that causes an interrupt or wake to be propogated. For a given GPIO pin, if its corresponding GRER bit is set, an interrupt or wake source bit is set when the pin transitions from logic level zero to logic level one. Likewise, GFER sets the corresponding interrupt or wake source bit when a transition from logic level one to logic level zero occurs on the pin. When the corresponding bits are set in both registers, either a falling- or a rising-edge transition causes will cause the Interrupt or Wake Source registers to be set if they are unmasked. For the interrupt or wake source bits to be set it first has to be unmasked through the Interrupt Mask or Wake Mask register. Minimum pulse-width timing requirements exist to guarantee that an edge or level transition is detected. .

14.2.2.12 GPIO Falling Edge Detect Enable (GFER0) — Offset 4030007Ch

Register to enable falling edge detect for GPIO Input pin.

Type	Size	Offset	Default
MMIO	32 bit	4030007Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GFER0:** Each GPIO can also be programmed to detect rising-edge or falling-edge transition on a pin. When an edge is detected that matches the type of edge programmed for the pin, a status bit is set. The GPIO Rising-Edge Detect Enable register (GRERx) and Falling Edge Detect Enable register (GFERx) select the type of transition on a GPIO pin that causes an interrupt or wake to be propogated. For a given GPIO pin, if its corresponding GRER bit is set, an interrupt or wake source bit is set when the pin transitions from logic level zero to logic level one. Likewise, GFER sets the corresponding interrupt or wake source bit when a transition from logic level one to logic level zero occurs on the pin. When the corresponding bits are set in both registers, either a falling- or a rising-edge transition causes will cause the Interrupt or Wake Source registers to be set if they are unmasked. For the interrupt or wake source bits to be set it first has to be unmasked through the Interrupt Mask or Wake Mask register. Minimum pulse-width timing requirements exist to guarantee that an edge or level transition is detected. .

14.2.2.13 GPIO Falling Edge Detect Enable (GFER1) — Offset 40300080h

Register to enable falling edge detect for GPIO Input pin.

Type	Size	Offset	Default
MMIO	32 bit	40300080h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GFER1:** Each GPIO can also be programmed to detect rising-edge or falling-edge transition on a pin. When an edge is detected that matches the type of edge programmed for the pin, a status bit is set. The GPIO Rising-Edge Detect Enable register (GRERx) and Falling Edge Detect Enable register (GFERx) select the type of transition on a GPIO pin that causes an interrupt or wake to be propogated. For a given GPIO pin, if its corresponding GRER bit is set, an interrupt or wake source bit is set when the pin transitions from logic level zero to logic level one. Likewise, GFER sets the corresponding interrupt or wake source bit when a transition from logic level one to logic level zero occurs on the pin. When the corresponding bits are set in both registers, either a falling- or a rising-edge transition causes will cause the Interrupt or Wake Source registers to be set if they are unmasked. For the interrupt or wake source bits to be set it first has to be unmasked through the Interrupt Mask or Wake Mask register. Minimum pulse-width timing requirements exist to guarantee that an edge or level transition is detected. .

14.2.2.14 GPIO Glitch Filter Bypass (GFBR0) — Offset 40300094h

Register to bypass Glitch filter for input pin.

Type	Size	Offset	Default
MMIO	32 bit	40300094h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GFBR0:** The GPIO Glitch Filter Bypass registers (GFBR0-5) contain a total of 192 bits that correspond to the 192 GPIO pins. When in general purpose mode, all GPIO pins go through the glitch filter logic by default. The glitch filter allows input signals that are stable for a certain number of clock cycles to propagate to the GPIO edge detection logic. Each GPIO pin can be individually configured to bypass this glitch filter..

14.2.2.15 GPIO Glitch Filter Bypass (GFBR1) — Offset 40300098h

Register to bypass Glitch filter for input pin.

Type	Size	Offset	Default
MMIO	32 bit	40300098h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GFBR1:** The GPIO Glitch Filter Bypass registers (GFBR0-5) contain a total of 192 bits that correspond to the 192 GPIO pins. When in general purpose mode, all GPIO pins go through the glitch filter logic by default. The glitch filter allows input signals that are stable for a certain number of clock cycles to propagate to the GPIO edge detection logic. Each GPIO pin can be individually configured to bypass this glitch filter..

14.2.2.16 GPIO Interrupt Mask (GIMR0) — Offset 403000ACh

Register to mask interrupts for GPIO input pins.

Type	Size	Offset	Default
MMIO	32 bit	403000ACh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GIMR0:** The GPIO Interrupt Mask, Interrupt Source, Wake Mask, and Wake Source registers are new registers for Tangier and are used to differentiate wakes and interrupts. These registers control if a GPIO pin is wake or interrupt enabled and the source registers contain information on which pin initiated the wake or interrupt..

14.2.2.17 GPIO Interrupt Mask (GIMR1) — Offset 403000B0h

Register to mask interrupts for GPIO input pins.

Type	Size	Offset	Default
MMIO	32 bit	403000B0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GIMR1:** The GPIO Interrupt Mask, Interrupt Source, Wake Mask, and Wake Source registers are new registers for Tangier and are used to differentiate wakes and interrupts. These registers control if a GPIO pin is wake or interrupt enabled and the source registers contain information on which pin initiated the wake or interrupt..

14.2.2.18 GPIO Interrupt Source (GISR0) — Offset 403000C4h

Register for interrupts status of GPIO input pins.

Type	Size	Offset	Default
MMIO	32 bit	403000C4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/1C	**GISR0:** The GPIO Interrupt Mask, Interrupt Source, Wake Mask, and Wake Source registers are new registers for Tangier and are used to differentiate wakes and interrupts. These registers control if a GPIO pin is wake or interrupt enabled and the source registers contain information on which pin initiated the wake or interrupt..

14.2.2.19 GPIO Interrupt Source (GISR1) — Offset 403000C8h

Register for interrupts status of GPIO input pins.

Type	Size	Offset	Default
MMIO	32 bit	403000C8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/1C	**GISR1:** The GPIO Interrupt Mask, Interrupt Source, Wake Mask, and Wake Source registers are new registers for Tangier and are used to differentiate wakes and interrupts. These registers control if a GPIO pin is wake or interrupt enabled and the source registers contain information on which pin initiated the wake or interrupt..

14.2.2.20 GPIO Wake Mask (GWMR0) — Offset 40300100h

Register to mask wake from GPIO input pin.

Type	Size	Offset	Default
MMIO	32 bit	40300100h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GWMR0:** The GPIO Interrupt Mask, Interrupt Source, Wake Mask, and Wake Source registers are new registers for Tangier and are used to differentiate wakes and interrupts. These registers control if a GPIO pin is wake or interrupt enabled and the source registers contain information on which pin initiated the wake or interrupt..

14.2.2.21 GPIO Wake Mask (GWMR1) — Offset 40300104h

Register to mask wake from GPIO input pin.

Type	Size	Offset	Default
MMIO	32 bit	40300104h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GWMR1:** The GPIO Interrupt Mask, Interrupt Source, Wake Mask, and Wake Source registers are new registers for Tangier and are used to differentiate wakes and interrupts. These registers control if a GPIO pin is wake or interrupt enabled and the source registers contain information on which pin initiated the wake or interrupt..

14.2.2.22 GPIO Wake Source (GWSR0) — Offset 40300118h

Register for indicating wake source from GPIO input pin.

Type	Size	Offset	Default
MMIO	32 bit	40300118h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/1C	**GWSR0:** The GPIO Interrupt Mask, Interrupt Source, Wake Mask, and Wake Source registers are new registers for Tangier and are used to differentiate wakes and interrupts. These registers control if a GPIO pin is wake or interrupt enabled and the source registers contain information on which pin initiated the wake or interrupt..

14.2.2.23 GPIO Wake Source (GWSR1) — Offset 4030011Ch

Register for indicating wake source from GPIO input pin.

Type	Size	Offset	Default
MMIO	32 bit	4030011Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/1C	**GWSR1:** The GPIO Interrupt Mask, Interrupt Source, Wake Mask, and Wake Source registers are new registers for Tangier and are used to differentiate wakes and interrupts. These registers control if a GPIO pin is wake or interrupt enabled and the source registers contain information on which pin initiated the wake or interrupt..

14.2.2.24 GPIO Secure Input (GSEC) — Offset 40300130h

UNUSED FOR ISH.

Type	Size	Offset	Default
MMIO	32 bit	40300130h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GSEC:** 1 = Hide Pin Level Status Updates to GPLR and Mask Pin Interrupts to IO-APIC 0 = Unhidden.

14.3 TGPIO Interface Registers

There are two TGPIO Interface registers:-

- TGPIO_0 Registers
- TGPIO_1 Registers

TGPIO Registers	Address Offset	Table
TGPIO_0	40201000h - 402016ACh	Table 14-11
TGPIO_1	40301000h - 403016ACh	Table 14-12

14.3.1 TGPIO_0 Registers Summary

Table 14-11. Summary of TGPIO_0 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
40201000h	4	REG TGPIOCTL0 (TGPIO0_CTL_REG)	00002000h
40201004h	4	REG TGPIOCOMPV0_31_0 (TGPIO0_COMPV_31_0)	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO19_COMPV_REG_31_0:** If periodic mode is not enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. The value in this register does not change. If periodic mode is enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. When this occurs, the value in this register is increased by the value in the Periodic Interval register. .

14.3.1.250 REG TGPIOCOMPV19_63_32 (TGPIO19_COMPV_63_32) — Offset 402014C8h

Comparator Value 1.

Type	Size	Offset	Default
MMIO	32 bit	402014C8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO19_COMPV_REG_63_32:** If periodic mode is not enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. The value in this register does not change. If periodic mode is enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. When this occurs, the value in this register is increased by the value in the Periodic Interval register. .

14.3.1.251 REG TGPIOPIV19_31_0 (TGPIO19_PIV_31_0) — Offset 402014CCh

Periodic Interval value 0.

Type	Size	Offset	Default
MMIO	32 bit	402014CCh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TGPIO19_PIV_REG_31_0:** The value in this register is written by SW to set the interval for the periodic Timed GPIO event.

14.3.1.252 REG TGPIOPIV19_63:32 (TGPIO19_PIV_63_32) — Offset 402014D0h

Periodic Interval value 1.

Type	Size	Offset	Default
MMIO	32 bit	402014D0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TGPIO19_PIV_REG_63_32:** The value in this register is written by SW to set the interval for the periodic Timed GPIO event.

14.3.1.253 REG TGPIOTCV19_31_0 (TGPIO19_TCV_31_0) — Offset 402014D4h

Timestamp Capture Value 0.

Type	Size	Offset	Default
MMIO	32 bit	402014D4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO19_TCV_REG_31_0:** When Timed GPIO event triggers, HW captures the current ART time into this register.

14.3.1.254 REG TGPIOTCV19_63_32 (TGPIO19_TCV_63_32) — Offset 402014D8h

Timestamp Capture Value 1.

Type	Size	Offset	Default
MMIO	32 bit	402014D8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO19_TCV_REG_63_32:** When Timed GPIO event triggers, HW captures the current ART time into this register.

14.3.1.255 REG TGPIOECCV19_31_0 (TGPIO19_ECCV_31_0) — Offset 402014DCh

Event Counter capture value 0.

Type	Size	Offset	Default
MMIO	32 bit	402014DCh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO19_ECCV_REG_31_0:** The value in this register must be the Timed GPIO event count associated with the time captured in the Time Capture Value register.

14.3.1.256 REG TGPIOECCV19_63_32 (TGPIO19_ECCV_63_32) — Offset 402014E0h

Event Counter capture value 1.

Type	Size	Offset	Default
MMIO	32 bit	402014E0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO19_ECCV_REG_63_32:** The value in this register must be the Timed GPIO event count associated with the time captured in the Time Capture Value register.

14.3.1.257 REG TGPIOEC19_31_0 (TGPIO19_EC_31_0) — Offset 402014E4h

Event counter value 0.

Type	Size	Offset	Default
MMIO	32 bit	402014E4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO19_EC_REG_31_0:** When Timed GPIO is configured as input, event counter will increment by 1 for every input event triggered. When Timed GPIO is configured as output, event counter will increment by 1 for every output event generated.

14.3.1.258 REG TGPIOEC19_63_32 (TGPIO19_EC_63_32) — Offset 402014E8h

Event counter value 1.

Type	Size	Offset	Default
MMIO	32 bit	402014E8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO19_EC_REG_63_32:** When Timed GPIO is configured as input, event counter will increment by 1 for every input event triggered. When Timed GPIO is configured as output, event counter will increment by 1 for every output event generated.

14.3.1.259 REG TGPIOMATCHMASK19_31_0 (TGPIO19_MATCH_MASK_31_0) — Offset 402014ECh

Comparator mask register 0.

Type	Size	Offset	Default
MMIO	32 bit	402014ECh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TGPIO19_MATCH_MSK_REG_31_0:** When a bit in this register is set then the corresponding match function between the corresponding COMPV and input Timer Value are ignored and a match is forced.

14.3.1.260 REG TGPIOMATCHMASK19_63_32 (TGPIO19_MATCH_MASK_63_32) — Offset 402014F0h

Comparator mask register 1.

Type	Size	Offset	Default
MMIO	32 bit	402014F0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TGPIO19_MATCH_MSK_REG_63_32:** When a bit in this register is set then the corresponding match function between the corresponding COMPV and input Timer Value are ignored and a match is forced.

14.3.1.261 REG TGPIOINTRCTL (TGPIO_INTR_CTL_REG) — Offset 40201500h

Interrupt control register.

Type	Size	Offset	Default
MMIO	32 bit	40201500h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**Disable Interrupt Coalescing (TGPIO_INTR_COALESCE_DISABLE):** When set will prevent coalescing of interrupts. The default is to enable interrupt coalescing.

14.3.1.262 REG TGPIORIS (TGPIO_INTR_RIS_REG) — Offset 40201504h

Raw interrupt status register.

Type	Size	Offset	Default
MMIO	32 bit	40201504h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved**
25	0h RO	**TGPIO_RIS_TMT_NESC_WRAP_GLOBAL:** Set when the TMT GLOBAL nanosecond counter wraps which is about every 1s.
24	0h RO	**TGPIO_RIS_TMT_NESC_WRAP_WORKING:** Set when the TMT WORKING nanosecond counter wraps which is about every 1s.
23	0h RO	**TGPIO_RIS_TMT_NESC_WRAP_TSG:** Set when the TMT TSG nanosecond counter wraps which is about every 1s.
22	0h RO	**Time Adjust Complete TADJ_TMT_GLOBAL_CMPLT (TGPIO_RIS_TADJ_TMT_GLOBAL_CMPLT):** 0-No Interrupt 1-Interrupt.

Bit Range	Default & Access	Field Name (ID): Description
21	0h RO	**Time Adjust Complete TADJ_TMT_WORKING_CMPLT (TGPIO_RIS_TADJ_TMT_WORKING_CMPLT):** 0-No Interrupt 1-Interrupt.
20	0h RO	**Time Adjust Complete TADJ_TMT_TSG_CMPLT (TGPIO_RIS_TADJ_TMT_TSG_CMPLT):** 0-No Interrupt 1-Interrupt.
19:0	00000h RO	**Event Interrupt (TGPIO_RIS_EVENT_INTR):** 0-No Interrupt 1-Interrupt Pending.

14.3.1.263 REG TGPIOMSC (TGPIO_INTR_MSC_REG) — Offset 40201508h

Interrupt mask control register.

Type	Size	Offset	Default
MMIO	32 bit	40201508h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved**
25	0h RW	**TGPIO_MSC_TMT_NESC_WRAP_GLOBAL_EN:** 0-Interrupt Disabled 1-Interrupt Enabled.
24	0h RW	**TGPIO_MSC_TMT_NESC_WRAP_WORKING_EN:** 0-Interrupt Disabled 1-Interrupt Enabled.
23	0h RW	**TGPIO_MSC_TMT_NESC_WRAP_TSG_EN:** 0-Interrupt Disabled 1-Interrupt Enabled.
22	0h RW	**Time Adjust Complete Enable TADJ_TMT_GLOBAL_EN (TGPIO_MSC_TADJ_TMT_GLOBAL_EN):** 0-Interrupt Disabled 1-Interrupt Enabled.
21	0h RW	**Time Adjust Complete Enable TADJ_TMT_WORKING_EN (TGPIO_MSC_TADJ_TMT_WORKING_EN):** 0-Interrupt Disabled 1-Interrupt Enabled.
20	0h RW	**Time Adjust Complete Enable TADJ_TMT_TSG_EN (TGPIO_MSC_TADJ_TMT_TSG_EN):** 0-Interrupt Disabled 1-Interrupt Enabled.
19:0	00000h RW	**Event Interrupt (TGPIO_MSC_EVENT_INTR):** 0-Interrupt Disabled 1-Interrupt Enabled.

14.3.1.264 REG TGPIOMIS (TGPIO_INTR_MIS_REG) — Offset 4020150Ch

Masked interrupt status register.

Type	Size	Offset	Default
MMIO	32 bit	4020150Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved**
25	0h RO	**TGPIO_MIS_TMT_NESC_WRAP_GLOBAL:** 0- No Interrupt 1-Interrupt.
24	0h RO	**TGPIO_MIS_TMT_NESC_WRAP_WORKING:** 0- No Interrupt 1-Interrupt.
23	0h RO	**TGPIO_MIS_TMT_NESC_WRAP_TSG:** 0- No Interrupt 1-Interrupt.
22	0h RO	**Time Adjust Complete TADJ_TMT_GLOBAL_CMPLT (TGPIO_MIS_TADJ_TMT_GLOBAL):** 0- No Interrupt 1-Interrupt.
21	0h RO	**Time Adjust Complete TADJ_TMT_WORKING_CMPLT (TGPIO_MIS_TADJ_TMT_WORKING):** 0- No Interrupt 1-Interrupt.
20	0h RO	**Time Adjust Complete TADJ_TMT_TSG_CMPLT (TGPIO_MIS_TADJ_TMT_TSG):** 0- No Interrupt 1-Interrupt.
19:0	00000h RO	**Event Interrupt (TGPIO_MIS_EVENT_INTR):** 1-No Interrupt 2-Interrupt Pending.

14.3.1.265 REG TGPIOICR (TGPIO_INTR_ICR_REG) — Offset 40201510h

Interrupt clear register.

Type	Size	Offset	Default
MMIO	32 bit	40201510h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved**
25	0h WO	**TGPIO_ICR_TMT_NESC_WRAP_GLOBAL:** 0 No change 1-Clear Interrupt Request.
24	0h WO	**TGPIO_ICR_TMT_NESC_WRAP_WORKING:** 0 No change 1-Clear Interrupt Request.
23	0h WO	**TGPIO_ICR_TMT_NESC_WRAP_TSG:** 0 No change 1-Clear Interrupt Request.
22	0h WO	**Clear Time Adjust Complete CLR_TADJ_TMT_GLOBAL_CMPLT (TGPIO_ICR_CLR_TADJ_TMT_GLOBAL):** 0 No change 1-Clear Interrupt Request.
21	0h WO	**Clear Time Adjust Complete CLR_TADJ_TMT_WORKING_CMPLT (TGPIO_ICR_CLR_TADJ_TMT_WORKING):** 0 No change 1-Clear Interrupt Request.
20	0h WO	**Clear Time Adjust Complete CLR_TADJ_TMT_TSG_CMPLT (TGPIO_ICR_CLR_TADJ_TMT_TSG):** 0 No change 1-Clear Interrupt Request.
19:0	00000h WO	**Clear Event Interrupt [19:0] (TGPIO_ICR_CLR_EVENT_INTR):** 0 No change 1-Clear Interrupt Request.

14.3.1.266 REG TGPIO_CLK_SEL_REG (TGPIO_CLK_SEL_REG) — Offset 40201514h

Timed GPIO clock select register.

Type	Size	Offset	Default
MMIO	32 bit	40201514h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19:0	00000h RW	**Clock Select (TGPIO_CLK_SEL_REG):** Timed GPIO clock select register.

14.3.1.267 REG TGPIO_CLK_SEL_REG (TGPIO_XTAL_CG_REG) — Offset 40201518h

Timed GPIO XTAL Clock Gate enable registe.

Type	Size	Offset	Default
MMIO	32 bit	40201518h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**TGPIO_XTL_CG_REG:** This clock needs to be gated before writing to the clk_sel register.

14.3.1.268 Reg TGPIO_PTP_CG_REG (TGPIO_PTP_CG_REG) — Offset 4020151Ch

Timed GPIO PTP Clock Gate enable register.

Type	Size	Offset	Default
MMIO	32 bit	4020151Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**TGPIO_PPT_CG_REG:** This clock needs to be gated before writing to the clk_sel register.

14.3.1.269 REG TGPIO_TS_SEL_0_REG (TGPIO_TS_SEL_0_REG) — Offset 40201520h

TGPIO input timestamp select register 0.

Type	Size	Offset	Default
MMIO	32 bit	40201520h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Timestamp Select 0 (TGPIO_TS_SEL_0_REG):** TGPIO input timestamp select register 0.

14.3.1.270 REG TGPIO_TS_SEL_1_REG (TGPIO_TS_SEL_1_REG) — Offset 40201524h

TGPIO input timestamp select register 1.

Type	Size	Offset	Default
MMIO	32 bit	40201524h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Timestamp Select 1 (TGPIO_TS_SEL_1_REG):** TGPIO input timestamp select register 1.

14.3.1.271 REG TMT_CLK_SEL_REG (TGPIO_TMT_CLK_SEL_REG) — Offset 40201528h

TMT clock select register.

Type	Size	Offset	Default
MMIO	32 bit	40201528h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2:0	0h RW	**TMT Clock Select (TGPIO_TMT_CLK_SEL_REG):** TMT clock select register.

14.3.1.272 REG TGPIO_TSC_CTL_REG (TGPIO_CTS_ENABLE_REG) — Offset 40201530h

TGPIO cross timestamp control register.

Type	Size	Offset	Default
MMIO	32 bit	40201530h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:4	0h RW	**TMT CTS En 2 (TMT_CTS_ENABLE_REG_2):** TMT Cross Time Stamp Control [2].
3:2	0h RW	**TMT CTS En 1 (TMT_CTS_ENABLE_REG_1):** TMT Cross Time Stamp Control [1].
1:0	0h RW	**TMT CTS En 0 (TMT_CTS_ENABLE_REG_0):** TMT Cross Time Stamp Control [0].

14.3.1.273 REG TGPIO_TSC_STATUS_REG (TGPIO_CTS_VALID_REG) — Offset 40201534h

TGPIO cross timestamp status register.

Type	Size	Offset	Default
MMIO	32 bit	40201534h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:4	0h RO	**TMT CTS STATUS 2 (TMT_CTS_VALID_REG_2):** TMT Cross Time Stamp Status [2].
3:2	0h RO	**TMT CTS STATUS 1 (TMT_CTS_VALID_REG_1):** TMT Cross Time Stamp Status [1].
1:0	0h RO	**TMT CTS STATUS 0 (TMT_CTS_VALID_REG_0):** TMT Cross Time Stamp Status [0].

14.3.1.274 REG TMTCTL_TSG (TMT_CTL_TSG_REG) — Offset 40201600h

TMT control register.

Type	Size	Offset	Default
MMIO	32 bit	40201600h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**TMT ENABLE (TGPIO_TMT_CTRL_TSG_REG):** Enables incrementing TMT when set Should be cleared before initializing TMT.

14.3.1.275 REG TMTR_TSG (TMTR_TSG_REG) — Offset 40201604h

TMT timestamp residue register.

Type	Size	Offset	Default
MMIO	32 bit	40201604h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO_TMT_TMTR_TSG_REG:** TMT residue value defined with a resolution of 2^-32ns.

14.3.1.276 REG TMTL_TSG (TMTL_TSG_REG) — Offset 40201608h

TMT timestamp low register.

Type	Size	Offset	Default
MMIO	32 bit	40201608h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:0	00000000h RW/V	**TGPIO_TMT_TMTL_TSG_REG:** Lower Half of the TMT defined in ns..

14.3.1.277 REG TMTH_TSG (TMTH_TSG_REG) — Offset 4020160Ch

TMT timestamp high register.

Type	Size	Offset	Default
MMIO	32 bit	4020160Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO_TMT_TMTH_TSG_REG:** Upper Half of the TMT defined in ns.

14.3.1.278 REG TIMINCA_TSG (TMT_TIMINCA_TSG_REG) — Offset 40201610h

TMT Time Increment Adjust Register.

Type	Size	Offset	Default
MMIO	32 bit	40201610h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**TGPIO_TMT_TSG_TIMINCA_ISIGN:** Increment Sign 0 Each 5ns cycle add to the TMT Timer a value of 5ns + Incvalue*2^-32ns 1 Each 5ns cycle add to the TMT Timer a value of 5ns IncValue*2^-32ns.
30:0	00000000h RW	**TGPIO_TMT_TSG_TIMINCA_INC_VALUE:** Increment Value to be added or subtracted from 5ns clock cycle.

14.3.1.279 REG TIMADJ_TSG (TMT_TIMADJ_TSG_REG) — Offset 40201614h

TMT Time Offset Adjust register.

Type	Size	Offset	Default
MMIO	32 bit	40201614h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**TGPIO_TMT_TSG_TIMADJ_SIGN:** 0 = positive 1 = Negative.
30	0h RW	**Zero Bit (TGPIO_TMT_TSG_TIMADJ_ZERO_BIT):** Zero bit.
29:0	00000000h RW	**TGPIO_TMT_TSG_TIMADJ_TADJUS:** Time Adjust Value.

14.3.1.280 REG LXTS_TMT_HIGH_TSG (TMT_LXTS_SNAPSHOT_TSG_REG_1) — Offset 40201618h

TMT local cross timestamp snapshot register 1.

Type	Size	Offset	Default
MMIO	32 bit	40201618h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_TMTH_TSG_REG:** TMTH captured when a local cross time stamp capture is enabled.

14.3.1.281 REG LXTS_TMT_LOW_TSG (TMT_LXTS_SNAPSHOT_TSG_REG_0) — Offset 4020161Ch

TMT local cross timestamp snapshot register 0.

Type	Size	Offset	Default
MMIO	32 bit	4020161Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_TMTL_TSG_REG:** TMTL captured when a local cross time stamp capture is enabled.

14.3.1.282 REG LXTS_ART_HIGH_TSG (TMT_ART_SNAPSHOT_TSG_REG_1) — Offset 40201620h

TMT local cross timestamp ART snapshot register 1.

Type	Size	Offset	Default
MMIO	32 bit	40201620h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_ART_HIGH_TSG_REG:** ART bits [63:0] captured when a local cross time stamp capture is enabled.

14.3.1.283 REG LXTS_ART_LOW_TSG (TMT_ART_SNAPSHOT_TSG_REG_0) — Offset 40201624h

TMT local cross timestamp ART snapshot register 0.

Type	Size	Offset	Default
MMIO	32 bit	40201624h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_ART_LOW_TSG_REG:** ART bits [31:0]captured when a local cross time stamp capture is enabled.

14.3.1.284 REG RXTS_TMT_HIGH_TSG (TMT_RXTS_SNAPSHOT_TSG_REG_1) — Offset 40201628h

TMT remote cross timestamp snapshot register 1.

Type	Size	Offset	Default
MMIO	32 bit	40201628h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_RXTS_TMTH_TSG_REG:** TMTH captured when a remote time stamp capture is enabled.

14.3.1.285 REG RXTS_TMT_LOW_TSG (TMT_RXTS_SNAPSHOT_TSG_REG_0) — Offset 4020162Ch

TMT remote cross timestamp snapshot register 0.

Type	Size	Offset	Default
MMIO	32 bit	4020162Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_RXTS_TMTL_TSG_REG:** TMTL captured when a remote time stamp capture is enabled.

14.3.1.286 REG TMTCTL_GLOBAL (TMT_CTL_GLOBAL_REG) — Offset 40201640h

TMT control register.

Type	Size	Offset	Default
MMIO	32 bit	40201640h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**TMT ENABLE (TGPIO_TMT_CTRL_GLOBAL_REG):** Enables incrementing TMT when set Should be cleared before initializing TMT.

14.3.1.287 REG TMTR_GLOBAL (TMTR_GLOBAL_REG) — Offset 40201644h

TMT timestamp residue register.

Type	Size	Offset	Default
MMIO	32 bit	40201644h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO_TMT_TMTR_GLOBAL_REG:** TMT residue value defined with a resolution of 2^-32ns.

14.3.1.288 REG TMTL_GLOBAL (TMTL_GLOBAL_REG) — Offset 40201648h

TMT timestamp low register.

Type	Size	Offset	Default
MMIO	32 bit	40201648h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:0	00000000h RW/V	**TGPIO_TMT_TMTL_GLOBAL_REG:** Lower Half of the TMT defined in ns..

14.3.1.289 REG TMTH_GLOBAL (TMTH_GLOBAL_REG) — Offset 4020164Ch

TMT timestamp high register.

Type	Size	Offset	Default
MMIO	32 bit	4020164Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO_TMT_TMTH_GLOBAL_REG:** Upper Half of the TMT defined in ns.

14.3.1.290 REG TIMINCA_GLOBAL (TMT_TIMINCA_GLOBAL_REG) — Offset 40201650h

TMT Time Increment Adjust Register.

Type	Size	Offset	Default
MMIO	32 bit	40201650h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**TGPIO_TMT_GLOBAL_TIMINCA_ISIGN:** Increment Sign 0 Each 5ns cycle add to the TMT Timer a value of 5ns + Incvalue*2^-32ns 1 Each 5ns cycle add to the TMT Timer a value of 5ns IncValue*2^-32ns.
30:0	00000000h RW	**TGPIO_TMT_GLOBAL_TIMINCA_INC_VALUE:** Increment Value to be added or subtracted from 5ns clock cycle.

14.3.1.291 REG TIMADJ_GLOBAL (TMT_TIMADJ_GLOBAL_REG) — Offset 40201654h

TMT Time Offset Adjust register.

Type	Size	Offset	Default
MMIO	32 bit	40201654h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**TGPIO_TMT_GLOBAL_TIMADJ_SIGN:** 0 = positive 1 = Negative.
30	0h RW	**Zero Bit (TGPIO_TMT_GLOBAL_TIMADJ_ZERO_BIT):** Zero bit.
29:0	00000000h RW	**TGPIO_TMT_GLOBAL_TIMADJ_TADJUS:** Time Adjust Value.

14.3.1.292 REG LXTS_TMT_LOW_GLOBAL (TMT_LXTS_SNAPSHOT_GLOBAL_REG_0) — Offset 40201658h

TMT local cross timestamp snapshot register 0.

Type	Size	Offset	Default
MMIO	32 bit	40201658h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_TMTL_GLOBAL_REG:** TMTL captured when a local cross time stamp capture is enabled.

14.3.1.293 REG LXTS_TMT_HIGH_GLOBAL (TMT_LXTS_SNAPSHOT_GLOBAL_REG_1) — Offset 4020165Ch

TMT local cross timestamp snapshot register 1.

Type	Size	Offset	Default
MMIO	32 bit	4020165Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_TMTH_GLOBAL_REG:** TMTH captured when a local cross time stamp capture is enabled.

14.3.1.294 REG LXTS_ART_LOW_GLOBAL (TMT_ART_SNAPSHOT_GLOBAL_REG_0) — Offset 40201660h

TMT local cross timestamp ART snapshot register 0.

Type	Size	Offset	Default
MMIO	32 bit	40201660h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_ART_LOW_GLOBAL_REG:** ART bits [31:0]captured when a local cross time stamp capture is enabled.

14.3.1.295 REG LXTS_ART_HIGH_GLOBAL (TMT_ART_SNAPSHOT_GLOBAL_REG_1) — Offset 40201664h

TMT local cross timestamp ART snapshot register 1.

Type	Size	Offset	Default
MMIO	32 bit	40201664h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_ART_HIGH_GLOBAL_REG:** ART bits [63:0] captured when a local cross time stamp capture is enabled.

14.3.1.296 REG RXTS_TMT_LOW_GLOBAL (TMT_RXTS_SNAPSHOT_GLOBAL_REG_0) — Offset 40201668h

TMT remote cross timestamp snapshot register 0.

Type	Size	Offset	Default
MMIO	32 bit	40201668h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_RXTS_TMTL_GLOBAL_REG:** TMTL captured when a remote time stamp capture is enabled.

14.3.1.297 REG RXTS_TMT_HIGH_GLOBAL (TMT_RXTS_SNAPSHOT_GLOBAL_REG_1) — Offset 4020166Ch

TMT remote cross timestamp snapshot register 1.

Type	Size	Offset	Default
MMIO	32 bit	4020166Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_RXTS_TMTH_GLOBAL_REG:** TMTH captured when a remote time stamp capture is enabled.

14.3.1.298 REG TMTCTL_WORKING (TMT_CTL_WORKING_REG) — Offset 40201680h

TMT control register.

Type	Size	Offset	Default
MMIO	32 bit	40201680h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**TMT ENABLE (TGPIO_TMT_CTRL_WORKING_REG):** Enables incrementing TMT when set Should be cleared before initializing TMT.

14.3.1.299 REG TMTR_WORKING (TMTR_WORKING_REG) — Offset 40201684h

TMT timestamp residue register.

Type	Size	Offset	Default
MMIO	32 bit	40201684h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO_TMT_TMTR_WORKING_REG:** TMT residue value defined with a resolution of 2^-32ns.

14.3.1.300 REG TMTL_WORKING (TMTL_WORKING_REG) — Offset 40201688h

TMT timestamp low register.

Type	Size	Offset	Default
MMIO	32 bit	40201688h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:0	00000000h RW/V	**TGPIO_TMT_TMTL_WORKING_REG:** Lower Half of the TMT defined in ns..

14.3.1.301 REG TMTH_WORKING (TMTH_WORKING_REG) — Offset 4020168Ch

TMT timestamp high register.

Type	Size	Offset	Default
MMIO	32 bit	4020168Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO_TMT_TMTH_WORKING_REG:** Upper Half of the TMT defined in ns.

14.3.1.302 REG TIMINCA_WORKING (TMT_TIMINCA_WORKING_REG) — Offset 40201690h

TMT Time Increment Adjust Register.

Type	Size	Offset	Default
MMIO	32 bit	40201690h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**TGPIO_TMT_WORKING_TIMINCA_ISIGN:** Increment Sign 0 Each 5ns cycle add to the TMT Timer a value of 5ns + Incvalue*2^-32ns 1 Each 5ns cycle add to the TMT Timer a value of 5ns IncValue*2^-32ns.
30:0	00000000h RW	**TGPIO_TMT_WORKING_TIMINCA_INC_VALUE:** Increment Value to be added or subtracted from 5ns clock cycle.

14.3.1.303 REG TIMADJ_WORKING (TMT_TIMADJ_WORKING_REG) — Offset 40201694h

TMT Time Offset Adjust register.

Type	Size	Offset	Default
MMIO	32 bit	40201694h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**TGPIO_TMT_WORKING_TIMADJ_SIGN:** 0 = positive 1 = Negative.
30	0h RW	**Zero Bit (TGPIO_TMT_WORKING_TIMADJ_ZERO_BIT):** Zero bit.
29:0	00000000h RW	**TGPIO_TMT_WORKING_TIMADJ_TADJUS:** Time Adjust Value.

14.3.1.304 REG LXTS_TMT_LOW_WORKING (TMT_LXTS_SNAPSHOT_WORKING_REG_0) — Offset 40201698h

TMT local cross timestamp snapshot register 0.

Type	Size	Offset	Default
MMIO	32 bit	40201698h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_TMTL_WORKING_REG:** TMTL captured when a local cross time stamp capture is enabled.

14.3.1.305 REG LXTS_TMT_HIGH_WORKING (TMT_LXTS_SNAPSHOT_WORKING_REG_1) — Offset 4020169Ch

TMT local cross timestamp snapshot register 1.

Type	Size	Offset	Default
MMIO	32 bit	4020169Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_TMTH_WORKING_REG:** TMTH captured when a local cross time stamp capture is enabled.

14.3.1.306 REG LXTS_ART_LOW_WORKING (TMT_ART_SNAPSHOT_WORKING_REG_0) — Offset 402016A0h

TMT local cross timestamp ART snapshot register 0.

Type	Size	Offset	Default
MMIO	32 bit	402016A0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_ART_LOW_WORKING_REG:** ART bits [31:0]captured when a local cross time stamp capture is enabled.

14.3.1.307 REG LXTS_ART_HIGH_WORKING (TMT_ART_SNAPSHOT_WORKING_REG_1) — Offset 402016A4h

TMT local cross timestamp ART snapshot register 1.

Type	Size	Offset	Default
MMIO	32 bit	402016A4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_ART_HIGH_WORKING_REG:** ART bits [63:0] captured when a local cross time stamp capture is enabled.

14.3.1.308 REG RXTS_TMT_LOW_WORKING (TMT_RXTS_SNAPSHOT_WORKING_REG_0) — Offset 402016A8h

TMT remote cross timestamp snapshot register 0.

Type	Size	Offset	Default
MMIO	32 bit	402016A8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_RXTS_TMTL_WORKING_REG:** TMTL captured when a remote time stamp capture is enabled.

14.3.1.309 REG RXTS_TMT_HIGH_WORKING (TMT_RXTS_SNAPSHOT_WORKING_REG_1) — Offset 402016ACh

TMT remote cross timestamp snapshot register 1.

Type	Size	Offset	Default
MMIO	32 bit	402016ACh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_RXTS_TMTH_WORKING_REG:** TMTH captured when a remote time stamp capture is enabled.

14.3.2 TGPIO_1 Registers Summary

Table 14-12. Summary of TGPIO_1 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
403010 00h	4	REG TGPIOCTL0 (TGPIO0_CTL_REG)	00002000h
403010 04h	4	REG TGPIOCOMPV0_31_0 (TGPIO0_COMPV_31_0)	00000000h
403010 08h	4	REG TGPIOCOMPV0_63_32 (TGPIO0_COMPV_63_32)	00000000h
403010 0Ch	4	REG TGPIOPIV0_31_0 (TGPIO0_PIV_31_0)	00000000h
403010 10h	4	REG TGPIOPIV0_63:32 (TGPIO0_PIV_63_32)	00000000h
403010 14h	4	REG TGPIOTCV0_31_0 (TGPIO0_TCV_31_0)	00000000h
403010 18h	4	REG TGPIOTCV0_63_32 (TGPIO0_TCV_63_32)	00000000h
403010 1Ch	4	REG TGPIOECCV0_31_0 (TGPIO0_ECCV_31_0)	00000000h
403010 20h	4	REG TGPIOECCV0_63_32 (TGPIO0_ECCV_63_32)	00000000h
403010 24h	4	REG TGPIOEC0_31_0 (TGPIO0_EC_31_0)	00000000h
403010 28h	4	REG TGPIOEC0_63_32 (TGPIO0_EC_63_32)	00000000h
403010 2Ch	4	REG TGPIOMATCHMASK0_31_0 (TGPIO0_MATCH_MASK_31_0)	00000000h
403010 30h	4	REG TGPIOMATCHMASK0_63_32 (TGPIO0_MATCH_MASK_63_32)	00000000h
403010 40h	4	REG TGPIOCTL1 (TGPIO1_CTL_REG)	00002000h
403010 44h	4	REG TGPIOCOMPV1_31_0 (TGPIO1_COMPV_31_0)	00000000h
403010 48h	4	REG TGPIOCOMPV1_63_32 (TGPIO1_COMPV_63_32)	00000000h
403010 4Ch	4	REG TGPIOPIV1_31_0 (TGPIO1_PIV_31_0)	00000000h
403010 50h	4	REG TGPIOPIV1_63:32 (TGPIO1_PIV_63_32)	00000000h
403010 54h	4	REG TGPIOTCV1_31_0 (TGPIO1_TCV_31_0)	00000000h
403010 58h	4	REG TGPIOTCV1_63_32 (TGPIO1_TCV_63_32)	00000000h
403010 5Ch	4	REG TGPIOECCV1_31_0 (TGPIO1_ECCV_31_0)	00000000h
403010 60h	4	REG TGPIOECCV1_63_32 (TGPIO1_ECCV_63_32)	00000000h
403010 64h	4	REG TGPIOEC1_31_0 (TGPIO1_EC_31_0)	00000000h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
403010 68h	4	REG TGPIOEC1_63_32 (TGPIO1_EC_63_32)	00000000h
403010 6Ch	4	REG TGPIOMATCHMASK1_31_0 (TGPIO1_MATCH_MASK_31_0)	00000000h
403010 70h	4	REG TGPIOMATCHMASK1_63_32 (TGPIO1_MATCH_MASK_63_32)	00000000h
403010 80h	4	REG TGPIOCTL2 (TGPIO2_CTL_REG)	00002000h
403010 84h	4	REG TGPIOCOMPV2_31_0 (TGPIO2_COMPV_31_0)	00000000h

14.3.2.1 REG TGPIOCTL0 (TGPIO0_CTL_REG) — Offset 40301000h

TGPIO control register.

Type	Size	Offset	Default
MMIO	32 bit	40301000h	00002000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24:17	00h RW	**Periodic Sequence Length (TGPIO0_CTL_PRDC_SEQ_LEN_O):** 8'b0 = continues infinitely, Any other value defines the length of sequence.
16	0h RW	**EC Counter (TGPIO0_CTL_EC_CTR_O):** Applicable only when the GPIO is configured as an output. 1 b0 EC not used 1 b1 EC increments from whatever initial value was programmed every clock cycle. .

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RW	**Input Event Control (TGPIO0_CTL_IN_EVNT_CTL_O):** This is applicable only when the GPIO is configured as an Input. 2 b00 An input transition will cause the EC to increment, Time Stamp to be captured in TCV and interrupt to be signaled if enabled. 2 b01 An input transition causes the EC to be incremented only. The EC value could be fed back by connecting the Output Event Counter to the Input Event counter pins. An interrupt could be signaled when a match occurs with the programmed value in the COMPV. 2 b10 - reserved 2 b11 - reserved .
13	1h RW	**Freeze Input Timestamp (TGPIO0_FREEZE_IN_TS_O):** When set the an input time stamp is captured and not cleared until the corresponding raw interrupt status bit is cleared.
12:10	0h RO	**Reserved**
9	0h RW	**Input Counter Select (TGPIO0_CTL_IN_CTR_SEL_O):** 0 Select Input Time Stamp Counter 1 Select Input Event Counter.
8:5	0h RW	**Pulse Width Stretch (TGPIO0_CTL_PW_STRETCH_O):** Default - 2 clk cycles Range - 2 to 17 clk cycles.
4	0h RW	**Periodic Mode (PM) (TGPIO0_CTL_PM_O):** 0 Periodic mode is disabled 1 Periodic mode is enabled.
3:2	0h RW	**Event Polarity (EP) (TGPIO0_CTL_EP_O):** 00 Rising edge 01 Falling edge 10 Toggle edge 11 Reserved .
1	0h RW	**Direction (DIR) (TGPIO0_CTL_DIR_O):** 0 Output 1 Input.
0	0h RW	**Enable (EN) (TGPIO0_CTL_EN_O):** 0 Timed GPIO is disabled 1 Timed GPIO is enabled.

14.3.2.2 REG TGPIOCOMPV0_31_0 (TGPIO0_COMPV_31_0) — Offset 40301004h

Comparator Value 0.

Type	Size	Offset	Default
MMIO	32 bit	40301004h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO0_COMPV_REG_31_0:** If periodic mode is not enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. The value in this register does not change. If periodic mode is enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. When this occurs, the value in this register is increased by the value in the Periodic Interval register. .

14.3.2.3 REG TGPIOCOMPV0_63_32 (TGPIO0_COMPV_63_32) — Offset 40301008h

Comparator Value 1.

Type	Size	Offset	Default
MMIO	32 bit	40301008h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO0_COMPV_REG_63_32:** If periodic mode is not enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. The value in this register does not change. If periodic mode is enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. When this occurs, the value in this register is increased by the value in the Periodic Interval register. .

14.3.2.4 REG TGPIOPIV0_31_0 (TGPIO0_PIV_31_0) — Offset 4030100Ch

Periodic Interval value 0.

Type	Size	Offset	Default
MMIO	32 bit	4030100Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TGPIO0_PIV_REG_31_0:** The value in this register is written by SW to set the interval for the periodic Timed GPIO event.

14.3.2.5 REG TGPIOPIV0_63:32 (TGPIO0_PIV_63_32) — Offset 40301010h

Periodic Interval value 1.

Type	Size	Offset	Default
MMIO	32 bit	40301010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TGPIO0_PIV_REG_63_32:** The value in this register is written by SW to set the interval for the periodic Timed GPIO event.

14.3.2.6 REG TGPIOTCV0_31_0 (TGPIO0_TCV_31_0) — Offset 40301014h

Timestamp Capture Value 0.

Type	Size	Offset	Default
MMIO	32 bit	40301014h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO0_TCV_REG_31_0:** When Timed GPIO event triggers, HW captures the current ART time into this register.

14.3.2.7 REG TGPIOTCV0_63_32 (TGPIO0_TCV_63_32) — Offset 40301018h

Timestamp Capture Value 1.

Type	Size	Offset	Default
MMIO	32 bit	40301018h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO0_TCV_REG_63_32:** When Timed GPIO event triggers, HW captures the current ART time into this register.

14.3.2.8 REG TGPIOECCV0_31_0 (TGPIO0_ECCV_31_0) — Offset 4030101Ch

Event Counter capture value 0.

Type	Size	Offset	Default
MMIO	32 bit	4030101Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO0_ECCV_REG_31_0:** The value in this register must be the Timed GPIO event count associated with the time captured in the Time Capture Value register.

14.3.2.9 REG TGPIOECCV0_63_32 (TGPIO0_ECCV_63_32) — Offset 40301020h

Event Counter capture value 1.

Type	Size	Offset	Default
MMIO	32 bit	40301020h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO0_ECCV_REG_63_32:** The value in this register must be the Timed GPIO event count associated with the time captured in the Time Capture Value register.

14.3.2.10 REG TGPIOEC0_31_0 (TGPIO0_EC_31_0) — Offset 40301024h

Event counter value 0.

Type	Size	Offset	Default
MMIO	32 bit	40301024h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO0_EC_REG_31_0:** When Timed GPIO is configured as input, event counter will increment by 1 for every input event triggered. When Timed GPIO is configured as output, event counter will increment by 1 for every output event generated.

14.3.2.11 REG TGPIOEC0_63_32 (TGPIO0_EC_63_32) — Offset 40301028h

Event counter value 1.

Type	Size	Offset	Default
MMIO	32 bit	40301028h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO0_EC_REG_63_32:** When Timed GPIO is configured as input, event counter will increment by 1 for every input event triggered. When Timed GPIO is configured as output, event counter will increment by 1 for every output event generated. .

14.3.2.12 REG TGPIOMATCHMASK0_31_0 (TGPIO0_MATCH_MASK_31_0) — Offset 4030102Ch

Comparator mask register 0.

Type	Size	Offset	Default
MMIO	32 bit	4030102Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access

Type	Size	Offset	Default
MMIO	32 bit	403014A4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO18_EC_REG_31_0:** When Timed GPIO is configured as input, event counter will increment by 1 for every input event triggered. When Timed GPIO is configured as output, event counter will increment by 1 for every output event generated.

14.3.2.245 REG TGPIOEC18_63_32 (TGPIO18_EC_63_32) — Offset 403014A8h

Event counter value 1.

Type	Size	Offset	Default
MMIO	32 bit	403014A8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO18_EC_REG_63_32:** When Timed GPIO is configured as input, event counter will increment by 1 for every input event triggered. When Timed GPIO is configured as output, event counter will increment by 1 for every output event generated.

14.3.2.246 REG TGPIOMATCHMASK18_31_0 (TGPIO18_MATCH_MASK_31_0) — Offset 403014ACh

Comparator mask register 0.

Type	Size	Offset	Default
MMIO	32 bit	403014ACh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TGPIO18_MATCH_MSK_REG_31_0:** When a bit in this register is set then the corresponding match function between the corresponding COMPV and input Timer Value are ignored and a match is forced.

14.3.2.247 REG TGPIOMATCHMASK18_63_32 (TGPIO18_MATCH_MASK_63_32) — Offset 403014B0h

Comparator mask register 1.

Type	Size	Offset	Default
MMIO	32 bit	403014B0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TGPIO18_MATCH_MSK_REG_63_32:** When a bit in this register is set then the corresponding match function between the corresponding COMPV and input Timer Value are ignored and a match is forced.

14.3.2.248 REG TGPIOCTL19 (TGPIO19_CTL_REG) — Offset 403014C0h

TGPIO control register.

Type	Size	Offset	Default
MMIO	32 bit	403014C0h	00002000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24:17	00h RW	**Periodic Sequence Length (TGPIO19_CTL_PRDC_SEQ_LEN_O):** 8'b0 = continues infinitely, Any other value defines the length of sequence.
16	0h RW	**EC Counter (TGPIO19_CTL_EC_CTR_O):** Applicable only when the GPIO is configured as an output. 1 b0 EC not used 1 b1 EC increments from whatever initial value was programmed every clock cycle.
15:14	0h RW	**Input Event Control (TGPIO19_CTL_IN_EVNT_CTL_O):** This is applicable only when the GPIO is configured as an Input. 2 b00 An input transition will cause the EC to increment, Time Stamp to be captured in TCV and interrupt to be signaled if enabled. 2 b01 An input transition causes the EC to be incremented only. The EC value could be fed back by connecting the Output Event Counter to the Input Event counter pins. An interrupt could be signaled when a match occurs with the programmed value in the COMPV. 2 b10 - reserved 2 b11 reserved.
13	1h RW	**Freeze Input Timestamp (TGPIO19_FREEZE_IN_TS_O):** When set the an input time stamp is captured and not cleared until the corresponding raw interrupt status bit is cleared.
12:10	0h RO	**Reserved**
9	0h RW	**Input Counter Select (TGPIO19_CTL_IN_CTR_SEL_O):** 0 Select Input Time Stamp Counter 1 Select Input Event Counter.

Bit Range	Default & Access	Field Name (ID): Description
8:5	0h RW	**Pulse Width Stretch (TGPIO19_CTL_PW_STRETCH_O):** Default - 2 clk cycles Range - 2 to 17 clk cycles.
4	0h RW	**Periodic Mode (PM) (TGPIO19_CTL_PM_O):** 0 Periodic mode is disabled 1 Periodic mode is enabled.
3:2	0h RW	**Event Polarity (EP) (TGPIO19_CTL_EP_O):** 00 Rising edge 01 Falling edge 10 Toggle edge 11 Reserved.
1	0h RW	**Direction (DIR) (TGPIO19_CTL_DIR_O):** 0 Output 1 Input.
0	0h RW	**Enable (EN) (TGPIO19_CTL_EN_O):** 0 Timed GPIO is disabled 1 Timed GPIO is enabled.

14.3.2.249 REG TGPIOCOMPV19_31_0 (TGPIO19_COMPV_31_0) — Offset 403014C4h

Comparator Value 0.

Type	Size	Offset	Default
MMIO	32 bit	403014C4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO19_COMPV_REG_31_0:** If periodic mode is not enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. The value in this register does not change. If periodic mode is enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. When this occurs, the value in this register is increased by the value in the Periodic Interval register. .

14.3.2.250 REG TGPIOCOMPV19_63_32 (TGPIO19_COMPV_63_32) — Offset 403014C8h

Comparator Value 1.

Type	Size	Offset	Default
MMIO	32 bit	403014C8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO19_COMPV_REG_63_32:** If periodic mode is not enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. The value in this register does not change. If periodic mode is enabled, when ART equals the value last written to this register, the Timed GPIO event is generated. When this occurs, the value in this register is increased by the value in the Periodic Interval register. .

14.3.2.251 REG TGPIOPIV19_31_0 (TGPIO19_PIV_31_0) — Offset 403014CCh

Periodic Interval value 0.

Type	Size	Offset	Default
MMIO	32 bit	403014CCh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TGPIO19_PIV_REG_31_0:** The value in this register is written by SW to set the interval for the periodic Timed GPIO event.

14.3.2.252 REG TGPIOPIV19_63:32 (TGPIO19_PIV_63_32) — Offset 403014D0h

Periodic Interval value 1.

Type	Size	Offset	Default
MMIO	32 bit	403014D0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TGPIO19_PIV_REG_63_32:** The value in this register is written by SW to set the interval for the periodic Timed GPIO event.

14.3.2.253 REG TGPIOTCV19_31_0 (TGPIO19_TCV_31_0) — Offset 403014D4h

Timestamp Capture Value 0.

Type	Size	Offset	Default
MMIO	32 bit	403014D4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO19_TCV_REG_31_0:** When Timed GPIO event triggers, HW captures the current ART time into this register.

14.3.2.254 REG TGPIOTCV19_63_32 (TGPIO19_TCV_63_32) — Offset 403014D8h

Timestamp Capture Value 1.

Type	Size	Offset	Default
MMIO	32 bit	403014D8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO19_TCV_REG_63_32:** When Timed GPIO event triggers, HW captures the current ART time into this register.

14.3.2.255 REG TGPIOECCV19_31_0 (TGPIO19_ECCV_31_0) — Offset 403014DCh

Event Counter capture value 0.

Type	Size	Offset	Default
MMIO	32 bit	403014DCh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO19_ECCV_REG_31_0:** The value in this register must be the Timed GPIO event count associated with the time captured in the Time Capture Value register.

14.3.2.256 REG TGPIOECCV19_63_32 (TGPIO19_ECCV_63_32) — Offset 403014E0h

Event Counter capture value 1.

Type	Size	Offset	Default
MMIO	32 bit	403014E0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO19_ECCV_REG_63_32:** The value in this register must be the Timed GPIO event count associated with the time captured in the Time Capture Value register.

14.3.2.257 REG TGPIOEC19_31_0 (TGPIO19_EC_31_0) — Offset 403014E4h

Event counter value 0.

Type	Size	Offset	Default
MMIO	32 bit	403014E4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO19_EC_REG_31_0:** When Timed GPIO is configured as input, event counter will increment by 1 for every input event triggered. When Timed GPIO is configured as output, event counter will increment by 1 for every output event generated.

14.3.2.258 REG TGPIOEC19_63_32 (TGPIO19_EC_63_32) — Offset 403014E8h

Event counter value 1.

Type	Size	Offset	Default
MMIO	32 bit	403014E8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**TGPIO19_EC_REG_63_32:** When Timed GPIO is configured as input, event counter will increment by 1 for every input event triggered. When Timed GPIO is configured as output, event counter will increment by 1 for every output event generated.

14.3.2.259 REG TGPIOMATCHMASK19_31_0 (TGPIO19_MATCH_MASK_31_0) — Offset 403014ECh

Comparator mask register 0.

Type	Size	Offset	Default
MMIO	32 bit	403014ECh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TGPIO19_MATCH_MSK_REG_31_0:** When a bit in this register is set then the corresponding match function between the corresponding COMPV and input Timer Value are ignored and a match is forced.

14.3.2.260 REG TGPIOMATCHMASK19_63_32 (TGPIO19_MATCH_MASK_63_32) — Offset 403014F0h

Comparator mask register 1.

Type	Size	Offset	Default
MMIO	32 bit	403014F0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TGPIO19_MATCH_MSK_REG_63_32:** When a bit in this register is set then the corresponding match function between the corresponding COMPV and input Timer Value are ignored and a match is forced.

14.3.2.261 REG TGPIOINTRCTL (TGPIO_INTR_CTL_REG) — Offset 40301500h

Interrupt control register.

Type	Size	Offset	Default
MMIO	32 bit	40301500h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**Disable Interrupt Coalescing (TGPIO_INTR_COALESCE_DISABLE):** When set will prevent coalescing of interrupts. The default is to enable interrupt coalescing.

14.3.2.262 REG TGPIORIS (TGPIO_INTR_RIS_REG) — Offset 40301504h

Raw interrupt status register.

Type	Size	Offset	Default
MMIO	32 bit	40301504h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved**
25	0h RO	**TGPIO_RIS_TMT_NESC_WRAP_GLOBAL:** Set when the TMT GLOBAL nanosecond counter wraps which is about every 1s.
24	0h RO	**TGPIO_RIS_TMT_NESC_WRAP_WORKING:** Set when the TMT WORKING nanosecond counter wraps which is about every 1s.
23	0h RO	**TGPIO_RIS_TMT_NESC_WRAP_TSG:** Set when the TMT TSG nanosecond counter wraps which is about every 1s.
22	0h RO	**Time Adjust Complete TADJ_TMT_GLOBAL_CMPLT (TGPIO_RIS_TADJ_TMT_GLOBAL_CMPLT):** 0-No Interrupt 1-Interrupt.
21	0h RO	**Time Adjust Complete TADJ_TMT_WORKING_CMPLT (TGPIO_RIS_TADJ_TMT_WORKING_CMPLT):** 0-No Interrupt 1-Interrupt.

19:0	00000h RO	**Event Interrupt (TGPIO_MIS_EVENT_INTR):** 1-No Interrupt 2-Interrupt Pending.

14.3.2.265 REG TGPIOICR (TGPIO_INTR_ICR_REG) — Offset 40301510h

Interrupt clear register.

Type	Size	Offset	Default
MMIO	32 bit	40301510h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved**
25	0h WO	**TGPIO_ICR_TMT_NESC_WRAP_GLOBAL:** 0 No change 1-Clear Interrupt Request.
24	0h WO	**TGPIO_ICR_TMT_NESC_WRAP_WORKING:** 0 No change 1-Clear Interrupt Request.
23	0h WO	**TGPIO_ICR_TMT_NESC_WRAP_TSG:** 0 No change 1-Clear Interrupt Request.
22	0h WO	**Clear Time Adjust Complete CLR_TADJ_TMT_GLOBAL_CMPLT (TGPIO_ICR_CLR_TADJ_TMT_GLOBAL):** 0 No change 1-Clear Interrupt Request.
21	0h WO	**Clear Time Adjust Complete CLR_TADJ_TMT_WORKING_CMPLT (TGPIO_ICR_CLR_TADJ_TMT_WORKING):** 0 No change 1-Clear Interrupt Request.
20	0h WO	**Clear Time Adjust Complete CLR_TADJ_TMT_TSG_CMPLT (TGPIO_ICR_CLR_TADJ_TMT_TSG):** 0 No change 1-Clear Interrupt Request.
19:0	00000h WO	**Clear Event Interrupt [19:0] (TGPIO_ICR_CLR_EVENT_INTR):** 0 No change 1-Clear Interrupt Request.

14.3.2.266 REG TGPIO_CLK_SEL_REG (TGPIO_CLK_SEL_REG) — Offset 40301514h

Timed GPIO clock select register.

Type	Size	Offset	Default
MMIO	32 bit	40301514h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19:0	00000h RW	**Clock Select (TGPIO_CLK_SEL_REG):** Timed GPIO clock select register.

14.3.2.267 REG TGPIO_CLK_SEL_REG (TGPIO_XTAL_CG_REG) — Offset 40301518h

Timed GPIO XTAL Clock Gate enable registe.

Type	Size	Offset	Default
MMIO	32 bit	40301518h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**TGPIO_XTL_CG_REG:** This clock needs to be gated before writing to the clk_sel register.

14.3.2.268 Reg TGPIO_PTP_CG_REG (TGPIO_PTP_CG_REG) — Offset 4030151Ch

Timed GPIO PTP Clock Gate enable register.

Type	Size	Offset	Default
MMIO	32 bit	4030151Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**TGPIO_PPT_CG_REG:** This clock needs to be gated before writing to the clk_sel register.

14.3.2.269 REG TGPIO_TS_SEL_0_REG (TGPIO_TS_SEL_0_REG) — Offset 40301520h

TGPIO input timestamp select register 0.

Type	Size	Offset	Default
MMIO	32 bit	40301520h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Timestamp Select 0 (TGPIO_TS_SEL_0_REG):** TGPIO input timestamp select register 0.

14.3.2.270 REG TGPIO_TS_SEL_1_REG (TGPIO_TS_SEL_1_REG) — Offset 40301524h

TGPIO input timestamp select register 1.

Type	Size	Offset	Default
MMIO	32 bit	40301524h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Timestamp Select 1 (TGPIO_TS_SEL_1_REG):** TGPIO input timestamp select register 1.

14.3.2.271 REG TMT_CLK_SEL_REG (TGPIO_TMT_CLK_SEL_REG) — Offset 40301528h

TMT clock select register.

Type	Size	Offset	Default
MMIO	32 bit	40301528h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2:0	0h RW	**TMT Clock Select (TGPIO_TMT_CLK_SEL_REG):** TMT clock select register.

14.3.2.272 REG TGPIO_TSC_CTL_REG (TGPIO_CTS_ENABLE_REG) — Offset 40301530h

TGPIO cross timestamp control register.

Type	Size	Offset	Default
MMIO	32 bit	40301530h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:4	0h RW	**TMT CTS En 2 (TMT_CTS_ENABLE_REG_2):** TMT Cross Time Stamp Control [2].
3:2	0h RW	**TMT CTS En 1 (TMT_CTS_ENABLE_REG_1):** TMT Cross Time Stamp Control [1].
1:0	0h RW	**TMT CTS En 0 (TMT_CTS_ENABLE_REG_0):** TMT Cross Time Stamp Control [0].

14.3.2.273 REG TGPIO_TSC_STATUS_REG (TGPIO_CTS_VALID_REG) — Offset 40301534h

TGPIO cross timestamp status register.

Type	Size	Offset	Default
MMIO	32 bit	40301534h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5:4	0h RO	**TMT CTS STATUS 2 (TMT_CTS_VALID_REG_2):** TMT Cross Time Stamp Status [2].
3:2	0h RO	**TMT CTS STATUS 1 (TMT_CTS_VALID_REG_1):** TMT Cross Time Stamp Status [1].
1:0	0h RO	**TMT CTS STATUS 0 (TMT_CTS_VALID_REG_0):** TMT Cross Time Stamp Status [0].

14.3.2.274 REG TMTCTL_TSG (TMT_CTL_TSG_REG) — Offset 40301600h

TMT control register.

Type	Size	Offset	Default
MMIO	32 bit	40301600h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**TMT ENABLE (TGPIO_TMT_CTRL_TSG_REG):** Enables incrementing TMT when set Should be cleared before initializing TMT.

14.3.2.275 REG TMTR_TSG (TMTR_TSG_REG) — Offset 40301604h

TMT timestamp residue register.

Type	Size	Offset	Default
MMIO	32 bit	40301604h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO_TMT_TMTR_TSG_REG:** TMT residue value defined with a resolution of 2^-32ns.

14.3.2.276 REG TMTL_TSG (TMTL_TSG_REG) — Offset 40301608h

TMT timestamp low register.

Type	Size	Offset	Default
MMIO	32 bit	40301608h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:0	00000000h RW/V	**TGPIO_TMT_TMTL_TSG_REG:** Lower Half of the TMT defined in ns..

14.3.2.277 REG TMTH_TSG (TMTH_TSG_REG) — Offset 4030160Ch

TMT timestamp high register.

Type	Size	Offset	Default
MMIO	32 bit	4030160Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO_TMT_TMTH_TSG_REG:** Upper Half of the TMT defined in ns.

14.3.2.278 REG TIMINCA_TSG (TMT_TIMINCA_TSG_REG) — Offset 40301610h

TMT Time Increment Adjust Register.

Type	Size	Offset	Default
MMIO	32 bit	40301610h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**TGPIO_TMT_TSG_TIMINCA_ISIGN:** Increment Sign 0 Each 5ns cycle add to the TMT Timer a value of 5ns + Incvalue*2^-32ns 1 Each 5ns cycle add to the TMT Timer a value of 5ns IncValue*2^-32ns.
30:0	00000000h RW	**TGPIO_TMT_TSG_TIMINCA_INC_VALUE:** Increment Value to be added or subtracted from 5ns clock cycle.

14.3.2.279 REG TIMADJ_TSG (TMT_TIMADJ_TSG_REG) — Offset 40301614h

TMT Time Offset Adjust register.

Type	Size	Offset	Default
MMIO	32 bit	40301614h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**TGPIO_TMT_TSG_TIMADJ_SIGN:** 0 = positive 1 = Negative.
30	0h RW	**Zero Bit (TGPIO_TMT_TSG_TIMADJ_ZERO_BIT):** Zero bit.
29:0	00000000h RW	**TGPIO_TMT_TSG_TIMADJ_TADJUS:** Time Adjust Value.

14.3.2.280 REG LXTS_TMT_HIGH_TSG (TMT_LXTS_SNAPSHOT_TSG_REG_1) — Offset 40301618h

TMT local cross timestamp snapshot register 1.

Type	Size	Offset	Default
MMIO	32 bit	40301618h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_TMTH_TSG_REG:** TMTH captured when a local cross time stamp capture is enabled.

14.3.2.281 REG LXTS_TMT_LOW_TSG (TMT_LXTS_SNAPSHOT_TSG_REG_0) — Offset 4030161Ch

TMT local cross timestamp snapshot register 0.

Type	Size	Offset	Default
MMIO	32 bit	4030161Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_TMTL_TSG_REG:** TMTL captured when a local cross time stamp capture is enabled.

14.3.2.282 REG LXTS_ART_HIGH_TSG (TMT_ART_SNAPSHOT_TSG_REG_1) — Offset 40301620h

TMT local cross timestamp ART snapshot register 1.

Type	Size	Offset	Default
MMIO	32 bit	40301620h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_ART_HIGH_TSG_REG:** ART bits [63:0] captured when a local cross time stamp capture is enabled.

14.3.2.283 REG LXTS_ART_LOW_TSG (TMT_ART_SNAPSHOT_TSG_REG_0) — Offset 40301624h

TMT local cross timestamp ART snapshot register 0.

Type	Size	Offset	Default
MMIO	32 bit	40301624h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_ART_LOW_TSG_REG:** ART bits [31:0]captured when a local cross time stamp capture is enabled.

14.3.2.284 REG RXTS_TMT_HIGH_TSG (TMT_RXTS_SNAPSHOT_TSG_REG_1) — Offset 40301628h

TMT remote cross timestamp snapshot register 1.

Type	Size	Offset	Default
MMIO	32 bit	40301628h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_RXTS_TMTH_TSG_REG:** TMTH captured when a remote time stamp capture is enabled.

14.3.2.285 REG RXTS_TMT_LOW_TSG (TMT_RXTS_SNAPSHOT_TSG_REG_0) — Offset 4030162Ch

TMT remote cross timestamp snapshot register 0.

Type	Size	Offset	Default
MMIO	32 bit	4030162Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_RXTS_TMTL_TSG_REG:** TMTL captured when a remote time stamp capture is enabled.

14.3.2.286 REG TMTCTL_GLOBAL (TMT_CTL_GLOBAL_REG) — Offset 40301640h

TMT control register.

Type	Size	Offset	Default
MMIO	32 bit	40301640h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**TMT ENABLE (TGPIO_TMT_CTRL_GLOBAL_REG):** Enables incrementing TMT when set Should be cleared before initializing TMT.

14.3.2.287 REG TMTR_GLOBAL (TMTR_GLOBAL_REG) — Offset 40301644h

TMT timestamp residue register.

Type	Size	Offset	Default
MMIO	32 bit	40301644h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO_TMT_TMTR_GLOBAL_REG:** TMT residue value defined with a resolution of 2^-32ns.

14.3.2.288 REG TMTL_GLOBAL (TMTL_GLOBAL_REG) — Offset 40301648h

TMT timestamp low register.

Type	Size	Offset	Default
MMIO	32 bit	40301648h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:0	00000000h RW/V	**TGPIO_TMT_TMTL_GLOBAL_REG:** Lower Half of the TMT defined in ns..

14.3.2.289 REG TMTH_GLOBAL (TMTH_GLOBAL_REG) — Offset 4030164Ch

TMT timestamp high register.

Type	Size	Offset	Default
MMIO	32 bit	4030164Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO_TMT_TMTH_GLOBAL_REG:** Upper Half of the TMT defined in ns.

14.3.2.290 REG TIMINCA_GLOBAL (TMT_TIMINCA_GLOBAL_REG) — Offset 40301650h

TMT Time Increment Adjust Register.

Type	Size	Offset	Default
MMIO	32 bit	40301650h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**TGPIO_TMT_GLOBAL_TIMINCA_ISIGN:** Increment Sign 0 Each 5ns cycle add to the TMT Timer a value of 5ns + Incvalue*2^-32ns 1 Each 5ns cycle add to the TMT Timer a value of 5ns IncValue*2^-32ns.
30:0	00000000h RW	**TGPIO_TMT_GLOBAL_TIMINCA_INC_VALUE:** Increment Value to be added or subtracted from 5ns clock cycle.

14.3.2.291 REG TIMADJ_GLOBAL (TMT_TIMADJ_GLOBAL_REG) — Offset 40301654h

TMT Time Offset Adjust register.

Type	Size	Offset	Default
MMIO	32 bit	40301654h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**TGPIO_TMT_GLOBAL_TIMADJ_SIGN:** 0 = positive 1 = Negative.
30	0h RW	**Zero Bit (TGPIO_TMT_GLOBAL_TIMADJ_ZERO_BIT):** Zero bit.
29:0	00000000h RW	**TGPIO_TMT_GLOBAL_TIMADJ_TADJUS:** Time Adjust Value.

14.3.2.292 REG LXTS_TMT_LOW_GLOBAL (TMT_LXTS_SNAPSHOT_GLOBAL_REG_0) — Offset 40301658h

TMT local cross timestamp snapshot register 0.

Type	Size	Offset	Default
MMIO	32 bit	40301658h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_TMTL_GLOBAL_REG:** TMTL captured when a local cross time stamp capture is enabled.

14.3.2.293 REG LXTS_TMT_HIGH_GLOBAL (TMT_LXTS_SNAPSHOT_GLOBAL_REG_1) — Offset 4030165Ch

TMT local cross timestamp snapshot register 1.

Type	Size	Offset	Default
MMIO	32 bit	4030165Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_TMTH_GLOBAL_REG:** TMTH captured when a local cross time stamp capture is enabled.

14.3.2.294 REG LXTS_ART_LOW_GLOBAL (TMT_ART_SNAPSHOT_GLOBAL_REG_0) — Offset 40301660h

TMT local cross timestamp ART snapshot register 0.

Type	Size	Offset	Default
MMIO	32 bit	40301660h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_ART_LOW_GLOBAL_REG:** ART bits [31:0]captured when a local cross time stamp capture is enabled.

14.3.2.295 REG LXTS_ART_HIGH_GLOBAL (TMT_ART_SNAPSHOT_GLOBAL_REG_1) — Offset 40301664h

TMT local cross timestamp ART snapshot register 1.

Type	Size	Offset	Default
MMIO	32 bit	40301664h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_ART_HIGH_GLOBAL_REG:** ART bits [63:0] captured when a local cross time stamp capture is enabled.

14.3.2.296 REG RXTS_TMT_LOW_GLOBAL (TMT_RXTS_SNAPSHOT_GLOBAL_REG_0) — Offset 40301668h

TMT remote cross timestamp snapshot register 0.

Type	Size	Offset	Default
MMIO	32 bit	40301668h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_RXTS_TMTL_GLOBAL_REG:** TMTL captured when a remote time stamp capture is enabled.

14.3.2.297 REG RXTS_TMT_HIGH_GLOBAL (TMT_RXTS_SNAPSHOT_GLOBAL_REG_1) — Offset 4030166Ch

TMT remote cross timestamp snapshot register 1.

Type	Size	Offset	Default
MMIO	32 bit	4030166Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_RXTS_TMTH_GLOBAL_REG:** TMTH captured when a remote time stamp capture is enabled.

14.3.2.298 REG TMTCTL_WORKING (TMT_CTL_WORKING_REG) — Offset 40301680h

TMT control register.

Type	Size	Offset	Default
MMIO	32 bit	40301680h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**TMT ENABLE (TGPIO_TMT_CTRL_WORKING_REG):** Enables incrementing TMT when set Should be cleared before initializing TMT.

14.3.2.299 REG TMTR_WORKING (TMTR_WORKING_REG) — Offset 40301684h

TMT timestamp residue register.

Type	Size	Offset	Default
MMIO	32 bit	40301684h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO_TMT_TMTR_WORKING_REG:** TMT residue value defined with a resolution of 2^-32ns.

14.3.2.300 REG TMTL_WORKING (TMTL_WORKING_REG) — Offset 40301688h

TMT timestamp low register.

Type	Size	Offset	Default
MMIO	32 bit	40301688h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:0	00000000h RW/V	**TGPIO_TMT_TMTL_WORKING_REG:** Lower Half of the TMT defined in ns..

14.3.2.301 REG TMTH_WORKING (TMTH_WORKING_REG) — Offset 4030168Ch

TMT timestamp high register.

Type	Size	Offset	Default
MMIO	32 bit	4030168Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	**TGPIO_TMT_TMTH_WORKING_REG:** Upper Half of the TMT defined in ns.

14.3.2.302 REG TIMINCA_WORKING (TMT_TIMINCA_WORKING_REG) — Offset 40301690h

TMT Time Increment Adjust Register.

Type	Size	Offset	Default
MMIO	32 bit	40301690h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**TGPIO_TMT_WORKING_TIMINCA_ISIGN:** Increment Sign 0 Each 5ns cycle add to the TMT Timer a value of 5ns + Incvalue*2^-32ns 1 Each 5ns cycle add to the TMT Timer a value of 5ns IncValue*2^-32ns.
30:0	00000000h RW	**TGPIO_TMT_WORKING_TIMINCA_INC_VALUE:** Increment Value to be added or subtracted from 5ns clock cycle.

14.3.2.303 REG TIMADJ_WORKING (TMT_TIMADJ_WORKING_REG) — Offset 40301694h

TMT Time Offset Adjust register.

Type	Size	Offset	Default
MMIO	32 bit	40301694h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**TGPIO_TMT_WORKING_TIMADJ_SIGN:** 0 = positive 1 = Negative.
30	0h RW	**Zero Bit (TGPIO_TMT_WORKING_TIMADJ_ZERO_BIT):** Zero bit.
29:0	00000000h RW	**TGPIO_TMT_WORKING_TIMADJ_TADJUS:** Time Adjust Value.

14.3.2.304 REG LXTS_TMT_LOW_WORKING (TMT_LXTS_SNAPSHOT_WORKING_REG_0) — Offset 40301698h

TMT local cross timestamp snapshot register 0.

Type	Size	Offset	Default
MMIO	32 bit	40301698h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_TMTL_WORKING_REG:** TMTL captured when a local cross time stamp capture is enabled.

14.3.2.305 REG LXTS_TMT_HIGH_WORKING (TMT_LXTS_SNAPSHOT_WORKING_REG_1) — Offset 4030169Ch

TMT local cross timestamp snapshot register 1.

Type	Size	Offset	Default
MMIO	32 bit	4030169Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_TMTH_WORKING_REG:** TMTH captured when a local cross time stamp capture is enabled.

14.3.2.306 REG LXTS_ART_LOW_WORKING (TMT_ART_SNAPSHOT_WORKING_REG_0) — Offset 403016A0h

TMT local cross timestamp ART snapshot register 0.

Type	Size	Offset	Default
MMIO	32 bit	403016A0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_ART_LOW_WORKING_REG:** ART bits [31:0]captured when a local cross time stamp capture is enabled.

14.3.2.307 REG LXTS_ART_HIGH_WORKING (TMT_ART_SNAPSHOT_WORKING_REG_1) — Offset 403016A4h

TMT local cross timestamp ART snapshot register 1.

Type	Size	Offset	Default
MMIO	32 bit	403016A4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_LXTS_ART_HIGH_WORKING_REG:** ART bits [63:0] captured when a local cross time stamp capture is enabled.

14.3.2.308 REG RXTS_TMT_LOW_WORKING (TMT_RXTS_SNAPSHOT_WORKING_REG_0) — Offset 403016A8h

TMT remote cross timestamp snapshot register 0.

Type	Size	Offset	Default
MMIO	32 bit	403016A8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_RXTS_TMTL_WORKING_REG:** TMTL captured when a remote time stamp capture is enabled.

14.3.2.309 REG RXTS_TMT_HIGH_WORKING (TMT_RXTS_SNAPSHOT_WORKING_REG_1) — Offset 403016ACh

TMT remote cross timestamp snapshot register 1.

Type	Size	Offset	Default
MMIO	32 bit	403016ACh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**TGPIO_RXTS_TMTH_WORKING_REG:** TMTH captured when a remote time stamp capture is enabled.

14.4 IPC Registers

The IPC registers contain:

- Host Registers
- PMC Registers

IPC Registers	Address Offset	Table
Host	40400000h - 40400C54h	Table 14-13
PMC	40411000h - 404116D4h	Table 14-14

14.4.1 Host Registers Summary

Table 14-13. Summary of Host Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
40400000h	4	Peripheral Interrupt Status - LH2OSE (PISR_LH2OSE)	00000000h
40400004h	4	Peripheral Interrupt Mask - LH2OSE (PIMR_LH2OSE)	00000000h
40400008h	4	LH2OSE Peripheral Interrupt Mask (HOST_PIMR_LH2OSE)	00000101h
4040000Ch	4	LH2OSE Peripheral Interrupt Status (HOST_PISR_LH2OSE)	00000000h
40400010h	4	LH2OSE Channel Interrupt Mask (CIM_LH2OSE)	00000000h
40400014h	4	LH2OSE Channel Interrupt Status (CIS_LH2OSE)	00000000h
40400034h	4	LH2OSE Firmware Status (ISH_HOST_FWSTS_LH2OSE)	00000000h
40400038h	4	LH2OSE Communication (HOST_COMM_LH2OSE)	00000000h
40400048h	4	Inbound DoorbellLH2OSE To ISH (HOST2ISH_DOORBELL_LH2OSE)	00000000h
40400054h	4	Outbound DoorbellISH To LH2OSE (ISH2HOST_DOORBELL_LH2OSE)	00000000h
40400060h	4	Outbound Inter Processor Message 1 From ISH To LH2OSE (ISH2HOST_MSG1_LH2OSE)	00000000h
40400064h	4	Outbound Inter Processor Message 2 From ISH To LH2OSE (ISH2HOST_MSG2_LH2OSE)	00000000h
40400068h	4	Outbound Inter Processor Message 3 From ISH To LH2OSE (ISH2HOST_MSG3_LH2OSE)	00000000h
4040006Ch	4	Outbound Inter Processor Message 4 From ISH To LH2OSE (ISH2HOST_MSG4_LH2OSE)	00000000h
40400070h	4	Outbound Inter Processor Message 5 From ISH To LH2OSE (ISH2HOST_MSG5_LH2OSE)	00000000h
40400074h	4	Outbound Inter Processor Message 6 From ISH To LH2OSE (ISH2HOST_MSG6_LH2OSE)	00000000h
40400078h	4	Outbound Inter Processor Message 7 From ISH To LH2OSE (ISH2HOST_MSG7_LH2OSE)	00000000h
4040007Ch	4	Outbound Inter Processor Message 8 From ISH To LH2OSE (ISH2HOST_MSG8_LH2OSE)	00000000h
40400080h	4	Outbound Inter Processor Message 9 From ISH To LH2OSE (ISH2HOST_MSG9_LH2OSE)	00000000h
40400084h	4	Outbound Inter Processor Message 10 From ISH To LH2OSE (ISH2HOST_MSG10_LH2OSE)	00000000h
40400088h	4	Outbound Inter Processor Message 11 From ISH To LH2OSE (ISH2HOST_MSG11_LH2OSE)	00000000h
4040008Ch	4	Outbound Inter Processor Message 12 From ISH To LH2OSE (ISH2HOST_MSG12_LH2OSE)	00000000h
40400090h	4	Outbound Inter Processor Message 13 From ISH To LH2OSE (ISH2HOST_MSG13_LH2OSE)	00000000h
40400094h	4	Outbound Inter Processor Message 14 From ISH To LH2OSE (ISH2HOST_MSG14_LH2OSE)	00000000h
40400098h	4	Outbound Inter Processor Message 15 From ISH To LH2OSE (ISH2HOST_MSG15_LH2OSE)	00000000h
4040009Ch	4	Outbound Inter Processor Message 16 From ISH To LH2OSE (ISH2HOST_MSG16_LH2OSE)	00000000h
404000A0h	4	Outbound Inter Processor Message 17 From ISH To LH2OSE (ISH2HOST_MSG17_LH2OSE)	00000000h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
404000A4h	4	Outbound Inter Processor Message 18 From ISH To LH2OSE (ISH2HOST_MSG18_LH2OSE)	00000000h
404000A8h	4	Outbound Inter Processor Message 19 From ISH To LH2OSE (ISH2HOST_MSG19_LH2OSE)	00000000h
404000ACh	4	Outbound Inter Processor Message 20 From ISH To LH2OSE (ISH2HOST_MSG20_LH2OSE)	00000000h

14.4.1.1 Peripheral Interrupt Status - LH2OSE (PISR_LH2OSE) — Offset 40400000h

This register contains the inbound interrupt status bits for the LH2OSE IPC channel. Interrupts are generated when PISR[x] & PIMR[x] are both set.

Type	Size	Offset	Default
MMIO	32 bit	40400000h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27	0h RW/1C	**PISR_H2IBCISC:** Host2ISH busy clear interrupt status clear interrupt: 1 -> Interrupt is active 0 -> Interrupt is inactive. Writing 1 to this bit clears it.
26:1	0h RO	**Reserved**
0	0h RO	**PISR_HOST2ISH:** Inbound IPC request from HOST to ISH status: 1 -> Interrupt is active 0 -> Interrupt is inactive.

14.4.1.2 Peripheral Interrupt Mask - LH2OSE (PIMR_LH2OSE) — Offset 40400004h

This register enables or disables Inbound interrupts from LH2OSE to ISH. This register is not accessible by LH2OSE.

Type	Size	Offset	Default
MMIO	32 bit	40400004h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27	0h RW	**H2IBCISC_IE:** Mask bit for H2IBCISC interrupt mask 1 -> Interrupt is unmasked 0 -> Interrupt is masked.
26:12	0h RO	**Reserved**
11	0h RW	**PIMR_ISH2HOST_BUSY_CLEAR:** Mask bit for ISH2HOST busy clear interrupt 1 -> Interrupt is unmasked 0 -> Interrupt is masked.
10:1	0h RO	**Reserved**
0	0h RW	**PIMR_HOST2ISH:** Reserved

14.4.1.3 LH2OSE Peripheral Interrupt Mask (HOST_PIMR_LH2OSE) — Offset 40400008h

This register is for enabling the interrupts generated by ISH towards LH2OSE.

Type	Size	Offset	Default
MMIO	32 bit	40400008h	00000101h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
8	1h NA	**PIMR_HOST2ISH_BUSY_CLEAR:** Host2ISH busy clear interrupt mask bit 1 -> Interrupt is unmasked 0 -> Interrupt is masked.
7:1	0h RO	**Reserved**
0	1h NA	**PIMR_ISH2HOST_IPC_REG:** Outbound IPC request from ISH to HOST Mask 1 -> Interrupt is unmasked 0 -> Interrupt is masked.

14.4.1.4 LH2OSE Peripheral Interrupt Status (HOST_PISR_LH2OSE) — Offset 4040000Ch

Interrupt status register for interrupts to LH2OSE.

Type	Size	Offset	Default
MMIO	32 bit	4040000Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved**
8	0h NA	**PISR_HOST2ISH_BUSY_CLEAR:** Host2ISH busy clear interrupt status bit 1 -> Interrupt is active.
7:1	0h RO	**Reserved**
0	0h NA	**PISR_ISH2HOST_IPC_REG:** Outbound IPC request from ISH to HOST Status 1 -> Interrupt.

14.4.1.5 LH2OSE Channel Interrupt Mask (CIM_LH2OSE) — Offset 40400010h

This register is for masking the per channel interrupt, caused by any of the interrupt sources towards mIA in the IPC Channel.

Type	Size	Offset	Default
MMIO	32 bit	40400010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**CH_INTR_MASK:** Enable interrupts towards MIA for the channel. 1 -> Interrupt is masked 0 -> Interrupt is enabled.

14.4.1.6 LH2OSE Channel Interrupt Status (CIS_LH2OSE) — Offset 40400014h

This register provides the per channel interrupt status, this is set if any of the interrupt sources towards mIA are set in the IPC Channel.

Type	Size	Offset	Default
MMIO	32 bit	40400014h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO	**CH_INTR_STATUS:** Interrupt status for the interrupts to MIA for the channel. This will be set if any of the interrupt soruces are enabled and their status is high.

14.4.1.7 LH2OSE Firmware Status (ISH_HOST_FWSTS_LH2OSE) — Offset 40400034h

Writeable by ISH, RO by LH2OSE, this is a 32 bit register which is set to 0x0000 on a system reset or a wakeup from D3Cold. As the firmware comes up after the reset or power cycle it sets bits of this register to 1b1 to indicate its status.

Type	Size	Offset	Default
MMIO	32 bit	40400034h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**ISH_HOST_FWSTS:** ISH Host firmware status.

14.4.1.8 LH2OSE Communication (HOST_COMM_LH2OSE) — Offset 40400038h

Wrtieable by LH2OSE, RO by ISH, this is a 32 bit register which is set to 0x0000 on a system reset or a wakeup from D3Cold. The Host sets bits of this register to 1b1 to communicate with the ISH.

Type	Size	Offset	Default
MMIO	32 bit	40400038h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**HOST_COMM:** Host communication register.

14.4.1.9 Inbound DoorbellLH2OSE To ISH (HOST2ISH_DOORBELL_LH2OSE) — Offset 40400048h

Inbound doorbell register, from LH2OSE core to interrupt ISH. Data 30:0 is 31bits message payload used for backward compatibility. Software can use either this 31bit message payload or 256bit payload registers. When software writes the message in to respective message register, it should set bit 31(BUSY Bit) of doorbell register to indicate that new data is written. The ISH will assert a level sensitive interrupt to the IOAPIC as long as the BUSY bit is set. When the ISH reads the message code from this register it should write back to this register and clear the BUSY bit.

Type	Size	Offset	Default
MMIO	32 bit	40400048h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**BUSY:** When this bit is cleared, the ISH CPU is Ready to accept a new message.
30:0	00000000h RW	**PAYLOAD_31BIT:** 31bits message payload for backward compatibility.

14.4.1.10 Outbound DoorbellISH To LH2OSE (ISH2HOST_DOORBELL_LH2OSE) — Offset 40400054h

Outbound doorbell register for the ISH to interrupt LH2OSE. Setting bit 31 of this register causes the Host to receive a IRQn interrupt. Data 30:0 is 31bits message payload used for backward compatibility. Software can use either this 31bit message payload or 256bit payload registers. The ISH will set bit 31 of this reg to ring the doorbell after it has completed programming the message to Host. When the Host reads the message code from this register it should write back to this register and clear the BUSY bit.

Type	Size	Offset	Default
MMIO	32 bit	40400054h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**BUSY:** When this bit is cleared, the HOST CPU is Ready to accept a new message.
30:0	00000000h RW	**PAYLOAD_31BIT:** 31bits message payload for backward compatibility.

14.4.1.11 Outbound Inter Processor Message 1 From ISH To LH2OSE (ISH2HOST_MSG1_LH2OSE) — Offset 40400060h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	40400060h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

14.4.1.12 Outbound Inter Processor Message 2 From ISH To LH2OSE (ISH2HOST_MSG2_LH2OSE) — Offset 40400064h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as ISH2HOST_MSG1_LH2OSE, offset 40400060h.

14.4.1.13 Outbound Inter Processor Message 3 From ISH To LH2OSE (ISH2HOST_MSG3_LH2OSE) — Offset 40400068h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as ISH2HOST_MSG1_LH2OSE, offset 40400060h.

14.4.1.14 Outbound Inter Processor Message 4 From ISH To LH2OSE (ISH2HOST_MSG4_LH2OSE) — Offset 4040006Ch

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as ISH2HOST_MSG1_LH2OSE, offset 40400060h.

14.4.1.15 Outbound Inter Processor Message 5 From ISH To LH2OSE (ISH2HOST_MSG5_LH2OSE) — Offset 40400070h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as ISH2HOST_MSG1_LH2OSE, offset 40400060h.

14.4.1.16 Outbound Inter Processor Message 6 From ISH To LH2OSE (ISH2HOST_MSG6_LH2OSE) — Offset 40400074h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as ISH2HOST_MSG1_LH2OSE, offset 40400060h.

14.4.1.17 Outbound Inter Processor Message 7 From ISH To LH2OSE (ISH2HOST_MSG7_LH2OSE) — Offset 40400078h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as ISH2HOST_MSG1_LH2OSE, offset 40400060h.

14.4.1.18 Outbound Inter Processor Message 8 From ISH To LH2OSE (ISH2HOST_MSG8_LH2OSE) — Offset 4040007Ch

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as ISH2HOST_MSG1_LH2OSE, offset 40400060h.

14.4.1.19 Outbound Inter Processor Message 9 From ISH To LH2OSE (ISH2HOST_MSG9_LH2OSE) — Offset 40400080h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as ISH2HOST_MSG1_LH2OSE, offset 40400060h.

14.4.1.20 Outbound Inter Processor Message 10 From ISH To LH2OSE (ISH2HOST_MSG10_LH2OSE) — Offset 40400084h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as ISH2HOST_MSG1_LH2OSE, offset 40400060h.

14.4.1.21 Outbound Inter Processor Message 11 From ISH To LH2OSE (ISH2HOST_MSG11_LH2OSE) — Offset 40400088h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as ISH2HOST_MSG1_LH2OSE, offset 40400060h.

14.4.1.22 Outbound Inter Processor Message 12 From ISH To LH2OSE (ISH2HOST_MSG12_LH2OSE) — Offset 4040008Ch

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as ISH2HOST_MSG1_LH2OSE, offset 40400060h.

14.4.1.23 Outbound Inter Processor Message 13 From ISH To LH2OSE (ISH2HOST_MSG13_LH2OSE) — Offset 40400090h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as ISH2HOST_MSG1_LH2OSE, offset 40400060h.

14.4.1.24 Outbound Inter Processor Message 14 From ISH To LH2OSE (ISH2HOST_MSG14_LH2OSE) — Offset 40400094h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as ISH2HOST_MSG1_LH2OSE, offset 40400060h.

14.4.1.25 Outbound Inter Processor Message 15 From ISH To LH2OSE (ISH2HOST_MSG15_LH2OSE) — Offset 40400098h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as ISH2HOST_MSG1_LH2OSE, offset 40400060h.

14.4.1.26 Outbound Inter Processor Message 16 From ISH To LH2OSE (ISH2HOST_MSG16_LH2OSE) — Offset 4040009Ch

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as ISH2HOST_MSG1_LH2OSE, offset 40400060h.

14.4.1.27 Outbound Inter Processor Message 17 From ISH To LH2OSE (ISH2HOST_MSG17_LH2OSE) — Offset 404000A0h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as ISH2HOST_MSG1_LH2OSE, offset 40400060h.

14.4.1.28 Outbound Inter Processor Message 18 From ISH To LH2OSE (ISH2HOST_MSG18_LH2OSE) — Offset 404000A4h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as ISH2HOST_MSG1_LH2OSE, offset 40400060h.

14.4.1.29 Outbound Inter Processor Message 19 From ISH To LH2OSE (ISH2HOST_MSG19_LH2OSE) — Offset 404000A8h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as ISH2HOST_MSG1_LH2OSE, offset 40400060h.

14.4.1.30 Outbound Inter Processor Message 20 From ISH To LH2OSE (ISH2HOST_MSG20_LH2OSE) — Offset 404000ACh

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as ISH2HOST_MSG1_LH2OSE, offset 40400060h.

14.4.1.31 Outbound Inter Processor Message 21 From ISH To LH2OSE (ISH2HOST_MSG21_LH2OSE) — Offset 404000B0h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as ISH2HOST_MSG1_LH2OSE, offset 40400060h.

14.4.1.32 Outbound Inter Processor Message 22 From ISH To LH2OSE (ISH2HOST_MSG22_LH2OSE) — Offset 404000B4h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as ISH2HOST_MSG1_LH2OSE, offset 40400060h.

14.4.1.33 Outbound Inter Processor Message 23 From ISH To LH2OSE (ISH2HOST_MSG23_LH2OSE) — Offset 404000B8h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as ISH2HOST_MSG1_LH2OSE, offset 40400060h.

14.4.1.34 Outbound Inter Processor Message 24 From ISH To LH2OSE (ISH2HOST_MSG24_LH2OSE) — Offset 404000BCh

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as ISH2HOST_MSG1_LH2OSE, offset 40400060h.

14.4.1.35 Outbound Inter Processor Message 25 From ISH To LH2OSE (ISH2HOST_MSG25_LH2OSE) — Offset 404000C0h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as ISH2HOST_MSG1_LH2OSE, offset 40400060h.

14.4.1.36 Outbound Inter Processor Message 26 From ISH To LH2OSE (ISH2HOST_MSG26_LH2OSE) — Offset 404000C4h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as ISH2HOST_MSG1_LH2OSE, offset 40400060h.

14.4.1.37 Outbound Inter Processor Message 27 From ISH To LH2OSE (ISH2HOST_MSG27_LH2OSE) — Offset 404000C8h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as ISH2HOST_MSG1_LH2OSE, offset 40400060h.

14.4.1.38 Outbound Inter Processor Message 28 From ISH To LH2OSE (ISH2HOST_MSG28_LH2OSE) — Offset 404000CCh

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as ISH2HOST_MSG1_LH2OSE, offset 40400060h.

14.4.1.39 Outbound Inter Processor Message 29 From ISH To LH2OSE (ISH2HOST_MSG29_LH2OSE) — Offset 404000D0h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as ISH2HOST_MSG1_LH2OSE, offset 40400060h.

14.4.1.40 Outbound Inter Processor Message 30 From ISH To LH2OSE (ISH2HOST_MSG30_LH2OSE) — Offset 404000D4h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as ISH2HOST_MSG1_LH2OSE, offset 40400060h.

14.4.1.41 Outbound Inter Processor Message 31 From ISH To LH2OSE (ISH2HOST_MSG31_LH2OSE) — Offset 404000D8h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as ISH2HOST_MSG1_LH2OSE, offset 40400060h.

14.4.1.42 Outbound Inter Processor Message 32 From ISH To LH2OSE (ISH2HOST_MSG32_LH2OSE) — Offset 404000DCh

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as ISH2HOST_MSG1_LH2OSE, offset 40400060h.

14.4.1.43 Inbound Inter Processor Message 1 From LH2OSE To ISH (HOST2ISH_MSG1_LH2OSE) — Offset 404000E0h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	404000E0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

14.4.1.44 Inbound Inter Processor Message 2 From LH2OSE To ISH (HOST2ISH_MSG2_LH2OSE) — Offset 404000E4h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_LH2OSE, offset 404000E0h.

14.4.1.45 Inbound Inter Processor Message 3 From LH2OSE To ISH (HOST2ISH_MSG3_LH2OSE) — Offset 404000E8h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_LH2OSE, offset 404000E0h.

14.4.1.46 Inbound Inter Processor Message 4 From LH2OSE To ISH (HOST2ISH_MSG4_LH2OSE) — Offset 404000ECh

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_LH2OSE, offset 404000E0h.

14.4.1.47 Inbound Inter Processor Message 5 From LH2OSE To ISH (HOST2ISH_MSG5_LH2OSE) — Offset 404000F0h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_LH2OSE, offset 404000E0h.

14.4.1.48 Inbound Inter Processor Message 6 From LH2OSE To ISH (HOST2ISH_MSG6_LH2OSE) — Offset 404000F4h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_LH2OSE, offset 404000E0h.

14.4.1.49 Inbound Inter Processor Message 7 From LH2OSE To ISH (HOST2ISH_MSG7_LH2OSE) — Offset 404000F8h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_LH2OSE, offset 404000E0h.

14.4.1.50 Inbound Inter Processor Message 8 From LH2OSE To ISH (HOST2ISH_MSG8_LH2OSE) — Offset 404000FCh

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_LH2OSE, offset 404000E0h.

14.4.1.51 Inbound Inter Processor Message 9 From LH2OSE To ISH (HOST2ISH_MSG9_LH2OSE) — Offset 40400100h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_LH2OSE, offset 404000E0h.

14.4.1.52 Inbound Inter Processor Message 10 From LH2OSE To ISH (HOST2ISH_MSG10_LH2OSE) — Offset 40400104h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_LH2OSE, offset 404000E0h.

14.4.1.53 Inbound Inter Processor Message 11 From LH2OSE To ISH (HOST2ISH_MSG11_LH2OSE) — Offset 40400108h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_LH2OSE, offset 404000E0h.

14.4.1.54 Inbound Inter Processor Message 12 From LH2OSE To ISH (HOST2ISH_MSG12_LH2OSE) — Offset 4040010Ch

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_LH2OSE, offset 404000E0h.

14.4.1.55 Inbound Inter Processor Message 13 From LH2OSE To ISH (HOST2ISH_MSG13_LH2OSE) — Offset 40400110h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_LH2OSE, offset 404000E0h.

14.4.1.56 Inbound Inter Processor Message 14 From LH2OSE To ISH (HOST2ISH_MSG14_LH2OSE) — Offset 40400114h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_LH2OSE, offset 404000E0h.

14.4.1.57 Inbound Inter Processor Message 15 From LH2OSE To ISH (HOST2ISH_MSG15_LH2OSE) — Offset 40400118h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_LH2OSE, offset 404000E0h.

14.4.1.58 Inbound Inter Processor Message 16 From LH2OSE To ISH (HOST2ISH_MSG16_LH2OSE) — Offset 4040011Ch

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_LH2OSE, offset 404000E0h.

14.4.1.59 Inbound Inter Processor Message 17 From LH2OSE To ISH (HOST2ISH_MSG17_LH2OSE) — Offset 40400120h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_LH2OSE, offset 404000E0h.

14.4.1.60 Inbound Inter Processor Message 18 From LH2OSE To ISH (HOST2ISH_MSG18_LH2OSE) — Offset 40400124h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_LH2OSE, offset 404000E0h.

14.4.1.61 Inbound Inter Processor Message 19 From LH2OSE To ISH (HOST2ISH_MSG19_LH2OSE) — Offset 40400128h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_LH2OSE, offset 404000E0h.

14.4.1.62 Inbound Inter Processor Message 20 From LH2OSE To ISH (HOST2ISH_MSG20_LH2OSE) — Offset 4040012Ch

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_LH2OSE, offset 404000E0h.

14.4.1.63 Inbound Inter Processor Message 21 From LH2OSE To ISH (HOST2ISH_MSG21_LH2OSE) — Offset 40400130h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_LH2OSE, offset 404000E0h.

14.4.1.64 Inbound Inter Processor Message 22 From LH2OSE To ISH (HOST2ISH_MSG22_LH2OSE) — Offset 40400134h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_LH2OSE, offset 404000E0h.

14.4.1.65 Inbound Inter Processor Message 23 From LH2OSE To ISH (HOST2ISH_MSG23_LH2OSE) — Offset 40400138h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_LH2OSE, offset 404000E0h.

14.4.1.66 Inbound Inter Processor Message 24 From LH2OSE To ISH (HOST2ISH_MSG24_LH2OSE) — Offset 4040013Ch

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_LH2OSE, offset 404000E0h.

14.4.1.67 Inbound Inter Processor Message 25 From LH2OSE To ISH (HOST2ISH_MSG25_LH2OSE) — Offset 40400140h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_LH2OSE, offset 404000E0h.

14.4.1.68 Inbound Inter Processor Message 26 From LH2OSE To ISH (HOST2ISH_MSG26_LH2OSE) — Offset 40400144h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_LH2OSE, offset 404000E0h.

14.4.1.69 Inbound Inter Processor Message 27 From LH2OSE To ISH (HOST2ISH_MSG27_LH2OSE) — Offset 40400148h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_LH2OSE, offset 404000E0h.

14.4.1.70 Inbound Inter Processor Message 28 From LH2OSE To ISH (HOST2ISH_MSG28_LH2OSE) — Offset 4040014Ch

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_LH2OSE, offset 404000E0h.

14.4.1.71 Inbound Inter Processor Message 29 From LH2OSE To ISH (HOST2ISH_MSG29_LH2OSE) — Offset 40400150h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_LH2OSE, offset 404000E0h.

14.4.1.72 Inbound Inter Processor Message 30 From LH2OSE To ISH (HOST2ISH_MSG30_LH2OSE) — Offset 40400154h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_LH2OSE, offset 404000E0h.

14.4.1.73 Inbound Inter Processor Message 31 From LH2OSE To ISH (HOST2ISH_MSG31_LH2OSE) — Offset 40400158h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_LH2OSE, offset 404000E0h.

14.4.1.74 Inbound Inter Processor Message 32 From LH2OSE To ISH (HOST2ISH_MSG32_LH2OSE) — Offset 4040015Ch

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_LH2OSE, offset 404000E0h.

14.4.1.75 Remap0 For LH2OSE (REMAP0_LH2OSE) — Offset 40400360h

General purpose Remap regs.

Type	Size	Offset	Default
MMIO	32 bit	40400360h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**REMAP:** Remap.

14.4.1.76 Remap1 For LH2OSE (REMAP1_LH2OSE) — Offset 40400364h

General purpose Remap regs.

Note: Bit definitions are the same as REMAP0_LH2OSE, offset 40400360h.

14.4.1.77 Remap2 For LH2OSE (REMAP2_LH2OSE) — Offset 40400368h

General purpose Remap regs.

Note: Bit definitions are the same as REMAP0_LH2OSE, offset 40400360h.

14.4.1.78 Remap3 For LH2OSE (REMAP3_LH2OSE) — Offset 4040036Ch

General purpose Remap regs.

Note: Bit definitions are the same as REMAP0_LH2OSE, offset 40400360h.

14.4.1.79 Remap4 For LH2OSE (REMAP4_LH2OSE) — Offset 40400370h

General purpose Remap regs.

Note: Bit definitions are the same as REMAP0_LH2OSE, offset 40400360h.

14.4.1.80 Remap5 For LH2OSE (REMAP5_LH2OSE) — Offset 40400374h

General purpose Remap regs.

Note: Bit definitions are the same as REMAP0_LH2OSE, offset 40400360h.

14.4.1.81 ISH IPC Busy Clear For LH2OSE (ISH_IPC_BUSY_CLEAR_LH2OSE) — Offset 40400378h

This register holds the status of the ISH IPC busy clear interrupts. ISH IPC busy clear interrupt is set when busy bit of respective outbound doorbell register gets cleared and interrupt is cleared when ISH writes 1 to respective bit in ISH IPC busy clear register.

Type	Size	Offset	Default
MMIO	32 bit	40400378h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW/1C	**ISH2HOST_BUSY_CLEAR:** Busy clear interrupt bit of ISH2HOST IPC 1 -> Interrupt active 0 -> Interrupt inactive.

14.4.1.82 D0i3 Control For LH2OSE (IPC_D0I3C_LH2OSE) — Offset 404006D0h

This register is will be used for D0i3 SW flow. The description below also includes the type of access expected for the ISH FW for each configuration bit: 1. The Restore Required (RR) bit (bit [3]) should be RW for the ISH FW which can determine when to set and/or clear these bits depending on when the ISH FW determines whether restore is required although for ISH restore is never required since the power is never lost. 2. The D0i3 (i3) bit (bit [2]) should be RO for ISH FW as it needs to be written only by host SW. The ISH FW can determine to go to a low power state based on this bit. 3. The Interrupt Required (IR) bit (bit [1]) can be RO register for ISH FW and ISH FW can send an interrupt to Host by writing to the ish2host IPC doorbell register when this bit is set by SW. 4. The Command in Progress (CIP) register bit (bit [0]) is HW set and need to be cleared by ISH FW (Write 1 to clear). The CIP register bit will be tied to a RTE entry in the IOAPIC as an interrupt source. Hence ISH FW will get an interrupt when the In addition to the registers, the IOSF2OCP Bridge should be parameterized for the following: 1. The device idle capability parameter (ENABLE_PCI_IDLE_CAP) need to be connected to a soft strap for ISH with a value of 1. 2. The STRAP for the MMIO address (strap_d0i3_offset) of D0i3 register (IPC offset address: h6D0) and the d0i3 valid (strap_d0i3_valid) bit needs should be appropriately tied. 3. The PCE register is made RO register by setting the appropriate parameter (Bridge top level strap: set_device_pg_config_type[5:0] is set to all 0s). This registers reset and clock domain will be in the OCP domain.

Type	Size	Offset	Default
MMIO	32 bit	404006D0h	00000008h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4	0h RO	**Interrupt Request Capable (IRC):** Set to 1 by HW if it is capable of generating an interrupt on command completion, else 0. For ISH this bit will be tied to 0.
3	1h RW/1C	**Restore Required (RR):** When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up.
2	0h RW	**D0I3:** SW sets this bit to 1 to move the IP into the D0i3 state. Writing this bit to 0 will return the IP to the fully active D0 state (D0i0).
1	0h RW	**Interrupt Required (IR):** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this on each write to this register.
0	0h RO	**Command In Progress (CIP):** HW sets this bit on a 1->0 or 0->1 transition of bit [2]. While set, the other bits in this register are not valid and it is illegal for SW to write to any bit in this register. When clear all the other bits in the register are valid and SW may write to any bit.

14.4.2 PMC Registers Summary

Table 14-14. Summary of PMC Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
40411000h	4	Peripheral Interrupt Status - PMC (PISR_PMC)	00000000h
40411004h	4	Peripheral Interrupt Mask - PMC (PIMR_PMC)	00000000h
40411008h	4	PMC Peripheral Interrupt Mask (HOST_PIMR_PMC)	00000101h
4041100Ch	4	PMC Peripheral Interrupt Status (HOST_PISR_PMC)	00000000h
40411010h	4	PMC Channel Interrupt Mask (CIM_PMC)	00000000h
40411014h	4	PMC Channel Interrupt Status (CIS_PMC)	00000000h
40411048h	4	Inbound DoorbellPMC To ISH (HOST2ISH_DOORBELL_PMC)	00000000h
40411054h	4	Outbound DoorbellISH To PMC (ISH2HOST_DOORBELL_PMC)	00000000h
404110E0h	4	Inbound Inter Processor Message 1 From PMC To ISH (HOST2ISH_MSG1_PMC)	00000000h
404110E4h	4	Inbound Inter Processor Message 2 From PMC To ISH (HOST2ISH_MSG2_PMC)	00000000h
404110E8h	4	Inbound Inter Processor Message 3 From PMC To ISH (HOST2ISH_MSG3_PMC)	00000000h
404110ECh	4	Inbound Inter Processor Message 4 From PMC To ISH (HOST2ISH_MSG4_PMC)	00000000h
404110F0h	4	Inbound Inter Processor Message 5 From PMC To ISH (HOST2ISH_MSG5_PMC)	00000000h
404110F4h	4	Inbound Inter Processor Message 6 From PMC To ISH (HOST2ISH_MSG6_PMC)	00000000h
404110F8h	4	Inbound Inter Processor Message 7 From PMC To ISH (HOST2ISH_MSG7_PMC)	00000000h
404110FCh	4	Inbound Inter Processor Message 8 From PMC To ISH (HOST2ISH_MSG8_PMC)	00000000h
40411100h	4	Inbound Inter Processor Message 9 From PMC To ISH (HOST2ISH_MSG9_PMC)	00000000h
40411104h	4	Inbound Inter Processor Message 10 From PMC To ISH (HOST2ISH_MSG10_PMC)	00000000h
40411108h	4	Inbound Inter Processor Message 11 From PMC To ISH (HOST2ISH_MSG11_PMC)	00000000h
4041110Ch	4	Inbound Inter Processor Message 12 From PMC To ISH (HOST2ISH_MSG12_PMC)	00000000h
40411110h	4	Inbound Inter Processor Message 13 From PMC To ISH (HOST2ISH_MSG13_PMC)	00000000h
40411114h	4	Inbound Inter Processor Message 14 From PMC To ISH (HOST2ISH_MSG14_PMC)	00000000h
40411118h	4	Inbound Inter Processor Message 15 From PMC To ISH (HOST2ISH_MSG15_PMC)	00000000h
4041111Ch	4	Inbound Inter Processor Message 16 From PMC To ISH (HOST2ISH_MSG16_PMC)	00000000h
40411120h	4	Inbound Inter Processor Message 17 From PMC To ISH (HOST2ISH_MSG17_PMC)	00000000h
40411124h	4	Inbound Inter Processor Message 18 From PMC To ISH (HOST2ISH_MSG18_PMC)	00000000h
40411128h	4	Inbound Inter Processor Message 19 From PMC To ISH (HOST2ISH_MSG19_PMC)	00000000h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
4041112Ch	4	Inbound Inter Processor Message 20 From PMC To ISH (HOST2ISH_MSG20_PMC)	00000000h
40411130h	4	Inbound Inter Processor Message 21 From PMC To ISH (HOST2ISH_MSG21_PMC)	00000000h
40411134h	4	Inbound Inter Processor Message 22 From PMC To ISH (HOST2ISH_MSG22_PMC)	00000000h
40411138h	4	Inbound Inter Processor Message 23 From PMC To ISH (HOST2ISH_MSG23_PMC)	00000000h
4041113Ch	4	Inbound Inter Processor Message 24 From PMC To ISH (HOST2ISH_MSG24_PMC)	00000000h
40411140h	4	Inbound Inter Processor Message 25 From PMC To ISH (HOST2ISH_MSG25_PMC)	00000000h
40411144h	4	Inbound Inter Processor Message 26 From PMC To ISH (HOST2ISH_MSG26_PMC)	00000000h
40411148h	4	Inbound Inter Processor Message 27 From PMC To ISH (HOST2ISH_MSG27_PMC)	00000000h
4041114Ch	4	Inbound Inter Processor Message 28 From PMC To ISH (HOST2ISH_MSG28_PMC)	00000000h
40411150h	4	Inbound Inter Processor Message 29 From PMC To ISH (HOST2ISH_MSG29_PMC)	00000000h
40411154h	4	Inbound Inter Processor Message 30 From PMC To ISH (HOST2ISH_MSG30_PMC)	00000000h
40411158h	4	Inbound Inter Processor Message 31 From PMC To ISH (HOST2ISH_MSG31_PMC)	00000000h
4041115Ch	4	Inbound Inter Processor Message 32 From PMC To ISH (HOST2ISH_MSG32_PMC)	00000000h
40411378h	4	ISH IPC Busy Clear For PMC (ISH_IPC_BUSY_CLEAR_PMC)	00000000h
404116D4h	4	PMC To ISH Control And Status (PMC2ISH_CSR_PMC)	00000000h

14.4.2.1 Peripheral Interrupt Status - PMC (PISR_PMC) — Offset 40411000h

This register contains the inbound interrupt status bits for the PMC IPC channel. Interrupts are generated when PISR[x] & PIMR[x] are both set.

Type	Size	Offset	Default
MMIO	32 bit	40411000h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27	0h RW/1C	**PISR_H2IBCISC:** Host2ISH busy clear interrupt status clear interrupt: 1 -> Interrupt is active 0 -> Interrupt is inactive. Writing 1 to this bit clears it.
26:1	0h RO	**Reserved**
0	0h RO	**PISR_HOST2ISH:** Inbound IPC request from HOST to ISH status: 1 -> Interrupt is active 0 -> Interrupt is inactive.

14.4.2.2 Peripheral Interrupt Mask - PMC (PIMR_PMC) — Offset 40411004h

This register enables or disables Inbound interrupts from PMC to ISH. This register is not accessible by PMC.

Type	Size	Offset	Default
MMIO	32 bit	40411004h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27	0h RW	**H2IBCISC_IE:** Mask bit for H2IBCISC interrupt mask 1 -> Interrupt is unmasked 0 -> Interrupt is masked.
26:12	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
11	0h RW	**PIMR_ISH2HOST_BUSY_CLEAR:** Mask bit for ISH2HOST busy clear interrupt 1 -> Interrupt is unmasked 0 -> Interrupt is masked.
10:1	0h RO	**Reserved**
0	0h RW	**PIMR_HOST2ISH:** Reserved

14.4.2.3 PMC Peripheral Interrupt Mask (HOST_PIMR_PMC) — Offset 40411008h

This register is for enabling the interrupts generated by ISH towards PMC.

Type	Size	Offset	Default
MMIO	32 bit	40411008h	00000101h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved**
8	1h NA	**PIMR_HOST2ISH_BUSY_CLEAR:** Host2ISH busy clear interrupt mask bit 1 -> Interrupt is unmasked 0 -> Interrupt is masked.
7:1	0h RO	**Reserved**
0	1h NA	**PIMR_ISH2HOST_IPC_REG:** Outbound IPC request from ISH to HOST Mask 1 -> Interrupt is unmasked 0 -> Interrupt is masked.

14.4.2.4 PMC Peripheral Interrupt Status (HOST_PISR_PMC) — Offset 4041100Ch

Interrupt status register for interrupts to PMC.

Type	Size	Offset	Default
MMIO	32 bit	4041100Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved**
8	0h NA	**PISR_HOST2ISH_BUSY_CLEAR:** Host2ISH busy clear interrupt status bit 1 -> Interrupt is active.
7:1	0h RO	**Reserved**
0	0h NA	**PISR_ISH2HOST_IPC_REG:** Outbound IPC request from ISH to HOST Status 1 -> Interrupt.

14.4.2.5 PMC Channel Interrupt Mask (CIM_PMC) — Offset 40411010h

This register is for masking the per channel interrupt, caused by any of the interrupt sources towards mIA in the IPC Channel.

Type	Size	Offset	Default
MMIO	32 bit	40411010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**CH_INTR_MASK:** Enable interrupts towards MIA for the channel. 1 -> Interrupt is masked 0 -> Interrupt is enabled.

14.4.2.6 PMC Channel Interrupt Status (CIS_PMC) — Offset 40411014h

This register provides the per channel interrupt status, this is set if any of the interrupt sources towards mIA are set in the IPC Channel.

Type	Size	Offset	Default
MMIO	32 bit	40411014h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO	**CH_INTR_STATUS:** Interrupt status for the interrupts to MIA for the channel. This will be set if any of the interrupt soruces are enabled and their status is high.

14.4.2.7 Inbound DoorbellPMC To ISH (HOST2ISH_DOORBELL_PMC) — Offset 40411048h

Inbound doorbell register, from PMC core to interrupt ISH. Data 30:0 is 31bits message payload used for backward compatibility. Software can use either this 31bit message payload or 256bit payload registers. When software writes the message in to respective message register, it should set bit 31(BUSY Bit) of doorbell register to indicate that new data is written. The ISH will assert a level sensitive interrupt to the IOAPIC as long as the BUSY bit is set. When the ISH reads the message code from this register it should write back to this register and clear the BUSY bit.

Type	Size	Offset	Default
MMIO	32 bit	40411048h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**BUSY:** When this bit is cleared, the ISH CPU is Ready to accept a new message.
30:0	00000000h RW	**PAYLOAD_31BIT:** 31bits message payload for backward compatibility.

14.4.2.8 Outbound DoorbellISH To PMC (ISH2HOST_DOORBELL_PMC) — Offset 40411054h

Outbound doorbell register for the ISH to interrupt PMC. Setting bit 31 of this register causes the Host to receive a IRQn interrupt. Data 30:0 is 31bits message payload used for backward compatibility. Software can use either this 31bit message payload or

256bit payload registers. The ISH will set bit 31 of this reg to ring the doorbell after it has completed programming the message to Host. When the Host reads the message code from this register it should write back to this register and clear the BUSY bit.

Type	Size	Offset	Default
MMIO	32 bit	40411054h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**BUSY:** When this bit is cleared, the HOST CPU is Ready to accept a new message.
30:0	00000000h RW	**PAYLOAD_31BIT:** 31bits message payload for backward compatibility.

14.4.2.9 Inbound Inter Processor Message 1 From PMC To ISH (HOST2ISH_MSG1_PMC) — Offset 404110E0h

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	404110E0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from PMC to ISH.

14.4.2.10 Inbound Inter Processor Message 2 From PMC To ISH (HOST2ISH_MSG2_PMC) — Offset 404110E4h

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_PMC, offset 404110E0h.

14.4.2.11 Inbound Inter Processor Message 3 From PMC To ISH (HOST2ISH_MSG3_PMC) — Offset 404110E8h

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_PMC, offset 404110E0h.

14.4.2.12 Inbound Inter Processor Message 4 From PMC To ISH (HOST2ISH_MSG4_PMC) — Offset 404110ECh

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_PMC, offset 404110E0h.

14.4.2.13 Inbound Inter Processor Message 5 From PMC To ISH (HOST2ISH_MSG5_PMC) — Offset 404110F0h

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_PMC, offset 404110E0h.

14.4.2.14 Inbound Inter Processor Message 6 From PMC To ISH (HOST2ISH_MSG6_PMC) — Offset 404110F4h

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_PMC, offset 404110E0h.

14.4.2.15 Inbound Inter Processor Message 7 From PMC To ISH (HOST2ISH_MSG7_PMC) — Offset 404110F8h

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_PMC, offset 404110E0h.

14.4.2.16 Inbound Inter Processor Message 8 From PMC To ISH (HOST2ISH_MSG8_PMC) — Offset 404110FCh

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_PMC, offset 404110E0h.

14.4.2.17 Inbound Inter Processor Message 9 From PMC To ISH (HOST2ISH_MSG9_PMC) — Offset 40411100h

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_PMC, offset 404110E0h.

14.4.2.18 Inbound Inter Processor Message 10 From PMC To ISH (HOST2ISH_MSG10_PMC) — Offset 40411104h

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_PMC, offset 404110E0h.

14.4.2.19 Inbound Inter Processor Message 11 From PMC To ISH (HOST2ISH_MSG11_PMC) — Offset 40411108h

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_PMC, offset 404110E0h.

14.4.2.20 Inbound Inter Processor Message 12 From PMC To ISH (HOST2ISH_MSG12_PMC) — Offset 4041110Ch

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_PMC, offset 404110E0h.

14.4.2.21 Inbound Inter Processor Message 13 From PMC To ISH (HOST2ISH_MSG13_PMC) — Offset 40411110h

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_PMC, offset 404110E0h.

14.4.2.22 Inbound Inter Processor Message 14 From PMC To ISH (HOST2ISH_MSG14_PMC) — Offset 40411114h

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_PMC, offset 404110E0h.

14.4.2.23 Inbound Inter Processor Message 15 From PMC To ISH (HOST2ISH_MSG15_PMC) — Offset 40411118h

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_PMC, offset 404110E0h.

14.4.2.24 Inbound Inter Processor Message 16 From PMC To ISH (HOST2ISH_MSG16_PMC) — Offset 4041111Ch

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_PMC, offset 404110E0h.

14.4.2.25 Inbound Inter Processor Message 17 From PMC To ISH (HOST2ISH_MSG17_PMC) — Offset 40411120h

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_PMC, offset 404110E0h.

14.4.2.26 Inbound Inter Processor Message 18 From PMC To ISH (HOST2ISH_MSG18_PMC) — Offset 40411124h

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_PMC, offset 404110E0h.

14.4.2.27 Inbound Inter Processor Message 19 From PMC To ISH (HOST2ISH_MSG19_PMC) — Offset 40411128h

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_PMC, offset 404110E0h.

14.4.2.28 Inbound Inter Processor Message 20 From PMC To ISH (HOST2ISH_MSG20_PMC) — Offset 4041112Ch

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_PMC, offset 404110E0h.

14.4.2.29 Inbound Inter Processor Message 21 From PMC To ISH (HOST2ISH_MSG21_PMC) — Offset 40411130h

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_PMC, offset 404110E0h.

14.4.2.30 Inbound Inter Processor Message 22 From PMC To ISH (HOST2ISH_MSG22_PMC) — Offset 40411134h

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_PMC, offset 404110E0h.

14.4.2.31 Inbound Inter Processor Message 23 From PMC To ISH (HOST2ISH_MSG23_PMC) — Offset 40411138h

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_PMC, offset 404110E0h.

14.4.2.32 Inbound Inter Processor Message 24 From PMC To ISH (HOST2ISH_MSG24_PMC) — Offset 4041113Ch

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_PMC, offset 404110E0h.

14.4.2.33 Inbound Inter Processor Message 25 From PMC To ISH (HOST2ISH_MSG25_PMC) — Offset 40411140h

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_PMC, offset 404110E0h.

14.4.2.34 Inbound Inter Processor Message 26 From PMC To ISH (HOST2ISH_MSG26_PMC) — Offset 40411144h

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_PMC, offset 404110E0h.

14.4.2.35 Inbound Inter Processor Message 27 From PMC To ISH (HOST2ISH_MSG27_PMC) — Offset 40411148h

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_PMC, offset 404110E0h.

14.4.2.36 Inbound Inter Processor Message 28 From PMC To ISH (HOST2ISH_MSG28_PMC) — Offset 4041114Ch

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_PMC, offset 404110E0h.

14.4.2.37 Inbound Inter Processor Message 29 From PMC To ISH (HOST2ISH_MSG29_PMC) — Offset 40411150h

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_PMC, offset 404110E0h.

14.4.2.38 Inbound Inter Processor Message 30 From PMC To ISH (HOST2ISH_MSG30_PMC) — Offset 40411154h

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_PMC, offset 404110E0h.

14.4.2.39 Inbound Inter Processor Message 31 From PMC To ISH (HOST2ISH_MSG31_PMC) — Offset 40411158h

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_PMC, offset 404110E0h.

14.4.2.40 Inbound Inter Processor Message 32 From PMC To ISH (HOST2ISH_MSG32_PMC) — Offset 4041115Ch

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Note: Bit definitions are the same as HOST2ISH_MSG1_PMC, offset 404110E0h.

14.4.2.41 ISH IPC Busy Clear For PMC (ISH_IPC_BUSY_CLEAR_PMC) — Offset 40411378h

This register holds the status of the ISH IPC busy clear interrupts. ISH IPC busy clear interrupt is set when busy bit of respective outbound doorbell register gets cleared and interrupt is cleared when ISH writes 1 to respective bit in ISH IPC busy clear register.

Type	Size	Offset	Default
MMIO	32 bit	40411378h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW/1C	**ISH2HOST_BUSY_CLEAR:** Busy clear interrupt bit of ISH2HOST IPC 1 -> Interrupt active 0 -> Interrupt inactive.

14.4.2.42 PMC To ISH Control And Status (PMC2ISH_CSR_PMC) — Offset 404116D4h

This is a control and status register for enabling PMC to interrupt mIA by setting any of the bits of the register. The Interrupt is then cleared by mIA by writing 1 b1 to this register after the appropriate ISR is serviced. The definitions of these bits are defined by the software.

Type	Size	Offset	Default
MMIO	32 bit	404116D4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/1C	**Control Status (CSR):** Control and status information transfer between ISH and PMC Fws and interrupt generation to mIA.

14.5 PMU Registers

PMU Registers	Address Offset	Table
PMU	40500000h - 40500F40h	Table 14-15

14.5.1 PMU Registers Summary

Table 14-15. Summary of PMU Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
40500000h	4	SRAM Bank Power Gate Enable (PMU_SRAM_PG_EN)	03FFFFFFh
40500010h	4	Wake Mask-1 (PMU_ISH_MASK_EVENT)	00000000h
40500018h	4	Fabric Idle And Time Out Count Configuration (PMU_ISH_FABRIC_CNT)	3A980008h
4050001Ch	4	Glitch Bypass Enable (PMU_ISH_GLITCH_BYPASS)	00000001h
40500020h	4	RF And ROM Clock Gate To Isolation Enable Count. (PMU_RF_ROM_CLKGATE_TO_ISOEN_CTRL)	00000002h
40500024h	4	RF And ROM Isolation Enable To Power Gate Count. (PMU_RF_ROM_ISOEN_TO_PWRGATE_CTRL)	00000002h
40500028h	4	RF And ROM Power Ungate To Isolation Disable Count (PMU_RF_ROM_PWRUNGATE_TO_ISODIS_CTRL)	00000002h
4050002Ch	4	RF And ROM Isolation Disable To Clock Gate Exit Count (PMU_RF_ROM_ISODIS_TO_CLKGATEEXIT_CTRL)	00000002h
40500030h	4	RF And ROM Power Gating Control (PMU_RF_ROM_PWR_CTRL)	00000000h
40500034h	4	SRAM Isolation Disable To Idle Count (PMU_SRAM_PWR_CTRL)	0F0F0F02h
4050003Ch	4	VNN Req Assert (PMU_VNN_REQ_31_0)	00000000h
40500040h	4	Vnn_req/Ack Live Status, Interrupts And Interrupt Masks Record (PMU_VNN_REQ_ACK)	00000000h
4050004Ch	4	Wake Mask-2 (PMU_ISH_MASK_EVENT2)	000FFC00h
40500054h	4	PGCB Clock Gating Control (PMU_PGCB_CLK_GATE_CTRL)	00000100h
40500058h	4	Vnnaon Reduction Enable (PMU_VNNAON_RED_EN)	00000000h
4050005Ch	4	Reset Prep (PMU_RESET_PREP_REG)	00000000h
40500060h	4	Fabric Idle Time Out Snapshot (PMU_FABRIC_SNAPSHOT_REG)	00000000h
40500064h	4	Context Propagation Enable (PMU_CP_EN_REG)	00000000h
40500068h	4	Clock Gating And Power Gating Status (PMU_CG_PG_STATUS_REG)	00000000h
4050006Ch	4	VNN Req Assert (PMU_VNN_REQ_63_32)	00000000h
40500070h	4	Host Wake (PMU_HOST_WAKEUP_0)	00000000h
40500074h	4	Host Wake (PMU_HOST_WAKEUP_1)	00000000h
40500078h	4	PME Status Clear Interrupt Mask (PMU_STATUS_CLR_INTR_MSK_0)	00000000h
4050007Ch	4	PME Status Clear Interrupt Mask (PMU_STATUS_CLR_INTR_MSK_1)	00000000h
40500080h	4	PME Status Clear Interrupt Status (PMU_PME_STATUS_CLR_INTR_STS_0)	00000000h
40500084h	4	PME Status Clear Interrupt Status (PMU_PME_STATUS_CLR_INTR_STS_1)	00000000h
40500088h	4	PME Live Status (PMC_STS_SHADOW_0)	00000000h
4050008Ch	4	PME Live Status (PMC_STS_SHADOW_1)	00000000h
40500100h	4	PCE ShadowFor PCI Function 0 (PCE_STATUS_0)	00000000h
40500104h	4	PCE ShadowFor PCI Function 1 (PCE_STATUS_1)	00000000h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
40500108h	4	PCE ShadowFor PCI Function 2 (PCE_STATUS_2)	00000000h
4050010Ch	4	PCE ShadowFor PCI Function 3 (PCE_STATUS_3)	00000000h
40500110h	4	PCE ShadowFor PCI Function 4 (PCE_STATUS_4)	00000000h
40500114h	4	PCE ShadowFor PCI Function 5 (PCE_STATUS_5)	00000000h
40500118h	4	PCE ShadowFor PCI Function 6 (PCE_STATUS_6)	00000000h
4050011Ch	4	PCE ShadowFor PCI Function 7 (PCE_STATUS_7)	00000000h
40500120h	4	PCE ShadowFor PCI Function 8 (PCE_STATUS_8)	00000000h
40500124h	4	PCE ShadowFor PCI Function 9 (PCE_STATUS_9)	00000000h
40500128h	4	PCE ShadowFor PCI Function 10 (PCE_STATUS_10)	00000000h
4050012Ch	4	PCE ShadowFor PCI Function 11 (PCE_STATUS_11)	00000000h
40500130h	4	PCE ShadowFor PCI Function 12 (PCE_STATUS_12)	00000000h
40500134h	4	PCE ShadowFor PCI Function 13 (PCE_STATUS_13)	00000000h
40500138h	4	PCE ShadowFor PCI Function 14 (PCE_STATUS_14)	00000000h
4050013Ch	4	PCE ShadowFor PCI Function 15 (PCE_STATUS_15)	00000000h
40500140h	4	PCE ShadowFor PCI Function 16 (PCE_STATUS_16)	00000000h
40500144h	4	PCE ShadowFor PCI Function 17 (PCE_STATUS_17)	00000000h
40500148h	4	PCE ShadowFor PCI Function 18 (PCE_STATUS_18)	00000000h
4050014Ch	4	PCE ShadowFor PCI Function 19 (PCE_STATUS_19)	00000000h
40500150h	4	PCE ShadowFor PCI Function 20 (PCE_STATUS_20)	00000000h
40500154h	4	PCE ShadowFor PCI Function 21 (PCE_STATUS_21)	00000000h
40500158h	4	PCE ShadowFor PCI Function 22 (PCE_STATUS_22)	00000000h
4050015Ch	4	PCE ShadowFor PCI Function 23 (PCE_STATUS_23)	00000000h
40500160h	4	PCE ShadowFor PCI Function 24 (PCE_STATUS_24)	00000000h
40500164h	4	PCE ShadowFor PCI Function 25 (PCE_STATUS_25)	00000000h
40500168h	4	PCE ShadowFor PCI Function 26 (PCE_STATUS_26)	00000000h
4050016Ch	4	PCE ShadowFor PCI Function 27 (PCE_STATUS_27)	00000000h
40500170h	4	PCE ShadowFor PCI Function 28 (PCE_STATUS_28)	00000000h
40500174h	4	PCE ShadowFor PCI Function 29 (PCE_STATUS_29)	00000000h
40500178h	4	PCE ShadowFor PCI Function 30 (PCE_STATUS_30)	00000000h
4050017Ch	4	PCE ShadowFor PCI Function 31 (PCE_STATUS_31)	00000000h
40500180h	4	PCE ShadowFor PCI Function 32 (PCE_STATUS_32)	00000000h
40500184h	4	PCE ShadowFor PCI Function 33 (PCE_STATUS_33)	00000000h
40500188h	4	PCE ShadowFor PCI Function 34 (PCE_STATUS_34)	00000000h
4050018Ch	4	PCE ShadowFor PCI Function 35 (PCE_STATUS_35)	00000000h
40500200h	4	Bridge D3 Rise Interrupt Wake Mask 0 (D3_RISE_INTR_MASK_REG_0)	00000000h

14.5.1.3 Fabric Idle And Time Out Count Configuration (PMU_ISH_FABRIC_CNT) — Offset 40500018h

This register stores the value of Idle count and time out count used by Func clock gate FSM during WAIT state to detect fabric idle condition and time out condition respectively.

Type	Size	Offset	Default
MMIO	32 bit	40500018h	3A980008h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	3A98h RW	**Time Out Value For PMU Fabric Timeout Counter (PMU_FABRIC_TIMEOUT_CNT):** Timeout value for PMU Fabric timeout counter.
15:0	0008h RW	**Value For The Idle Counter 0 - 16 (PMU_FABRIC_IDLE_CNT):** Count value for the idle counter 0 - 16.

14.5.1.4 Glitch Bypass Enable (PMU_ISH_GLITCH_BYPASS) — Offset 4050001Ch

This register is used to enable/disable glitch bypass circuit inside the PM for all the GPIO input signals.

Type	Size	Offset	Default
MMIO	32 bit	4050001Ch	00000001h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	1h RW	**Glitch Bypass Enable Bit (GLITCH_BYPASS):** This bit is used to enable glitch filter logic in PMU. 0 Do not bypass glitch filter 1 Bypass Glitch filter.

14.5.1.5 RF And ROM Clock Gate To Isolation Enable Count. (PMU_RF_ROM_CLKGATE_TO_ISOEN_CTRL) — Offset 40500020h

This register is used by FW to program the count value for the number of clocks between CLKGATE state and ISOEN state in func clkgate fsm.

Type	Size	Offset	Default
MMIO	32 bit	40500020h	00000002h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0002h RW	**ClkGate To ISOEN Count (CLKGATE_TO_ISOEN_COUNTER):** Count value for ClkGate to ISOEN state 0-16.

14.5.1.6 RF And ROM Isolation Enable To Power Gate Count. (PMU_RF_ROM_ISOEN_TO_PWRGATE_CTRL) — Offset 40500024h

This register is used by FW to program the count value for the number of clocks between ISOEN and PWRGATE state in func clkgate fsm.

Type	Size	Offset	Default
MMIO	32 bit	40500024h	00000002h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0002h RW	**ISOEN To POWRGATE Count (ISOEN_TO_PWRGATE_COUNTER):** Count value for ISOEN to PWRGATE state 0-16.

14.5.1.7 RF And ROM Power Ungate To Isolation Disable Count (PMU_RF_ROM_PWRUNGATE_TO_ISODIS_CTRL) — Offset 40500028h

This register is used by FW to program the count value for the number of clocks between PWRUNGATE and ISODIS states of func clock gate FSM.

Type	Size	Offset	Default
MMIO	32 bit	40500028h	00000002h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0002h RW	**PWRUNGATE To ISODIS Count (PWRUNGATE_TO_ISODIS_COUNTER):** Count value for PWRUNGATE to ISODIS state 0-16.

14.5.1.8 RF And ROM Isolation Disable To Clock Gate Exit Count (PMU_RF_ROM_ISODIS_TO_CLKGATEEXIT_CTRL) — Offset 4050002Ch

This register is used by FW to program the count value for the number of clocks between PWRUNGATE and ISODIS states of func clock gate FSM.

Type	Size	Offset	Default
MMIO	32 bit	4050002Ch	00000002h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0002h RW	**ISODIS To CLKGATEEXIT Count (ISODIS_TO_CLKGATEEXIT_COUNTER):** Count value for ISODIS to CLKGATEEXIT state 0-16.

14.5.1.9 RF And ROM Power Gating Control (PMU_RF_ROM_PWR_CTRL) — Offset 40500030h

This register is used by FW to enable power gating of RF (Cache and other IP RFs).

Type	Size	Offset	Default
MMIO	32 bit	40500030h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1	0h RW	**AON RF DeepsleepEnable 1-Enable AON_RF Deepsleep Mode 0-Disable AONRF Deepsleep Mode (AONRF_DEEPSLEEP_EN):** AONRF Deepsleep mode enable 1-AONRF enters deepsleep mode when firewall enable is high 0-AONRF deepsleep mode is disabled.
0	0h RW	**RF And ROM Power Gating Enable 1-RF ROM Power Gating Enable 0-RF ROM Power Gating Disable (RF_ROM_POWER_GATING_ENABLE):** RF ROM power gating enable 1-RF ROM power gating enable 0-RF ROM power gating disable.

14.5.1.10 SRAM Isolation Disable To Idle Count (PMU_SRAM_PWR_CTRL) — Offset 40500034h

This register is used by FW to program the count value for the number of clocks between ISODIS and IDLE states of SRAM PG FSM.

Type	Size	Offset	Default
MMIO	32 bit	40500034h	0F0F0F02h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27:24	Fh RW	**SRAM ISODIS To IDLE Count (SRAM_ISODIS_TO_IDLE_COUNTER_):** Count value for SRAM ISODIS to IDLE state 0-3.

5	0h RW	**RESET Prep Wake Mask (MASK_RESET_PREP_AVAIL_WAKE_INTERRUPT):** Mask reset prep avail interrupts 1-Mask wake from reset prep avail event 0-No mask for wake from reset prep avail event.
4	0h RW	**Sram Erase Wake Mask (MASK_SRAM_ERASE_WAKE_INTERRUPT_0):** Mask sram erase interrupts 1-Mask wake from sram erase event 0-No mask for wake from sram erase event.
3:0	0h RO	**Reserved**

14.5.1.14 PGCB Clock Gating Control (PMU_PGCB_CLK_GATE_CTRL) — Offset 40500054h

This register is used by FW to program the IP-accessible clock gating disable as well as the count value for the T_CLKGATE hysterisis timer for the PGCB clock.

Type	Size	Offset	Default
MMIO	32 bit	40500054h	00000100h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved**
8	1h RW	**Accessible Clock Gate Disable Bit For PGCB Clock (ACC_CLKGATE_DISABLED):** This bit is a disable for clock gating PGCB clock during IP-accessible flow. 1-ClkGating disabled for Acc. flow 0-ClkGating enabled for Acc. Flow.
7:4	0h RO	**Reserved**
3:0	0h RW	**T_CLKGATE Count Value (T_CLKGATE_TIMER_VALUE):** Count value for T_CLKGATE state 0-16. This is used to load the hysterisis timer in the PCGU.

14.5.1.15 Vnnaon Reduction Enable (PMU_VNNAON_RED_EN) — Offset 40500058h

This register is used to enable the vnnaon reduction handshake by the AON clock gate FSM.

Type	Size	Offset	Default
MMIO	32 bit	40500058h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW/AC	**VNNAON Reduction Enable (VNNAON_RED_EN):** This bit is used to enable VNNAON reduction feature. 1-VNNAON reduction enable 0-VNNAON reduction disable.

14.5.1.16 Reset Prep (PMU_RESET_PREP_REG) — Offset 4050005Ch

This register records the Reset Prep avail and the other associated messages for Reset Prep.

Type	Size	Offset	Default
MMIO	32 bit	4050005Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Prep Avail Mask 1- Mask Reset Prep Avail Interrupt 0-Reset Prep Avail Interrupt Not Masked. (RESET_PREP_AVAIL_MASK):** Reset Prep Avail Mask 1- mask reset prep avail interrupt 0-reset prep avail interrupt not masked.
30:18	0000h RO	**RSV:** Reserved
17:10	00h RO	**PREP_TYPE:** Prep Type.
9:2	00h RO	**RESET_TYPE:** Reset Type.
1	0h RO	**RESET_PREP_AVAIL:** Reset Prep Avail status.
0	0h RW/AC	**Prep Get 1- Reset Prep Message Read 0-Reset Prep Message Not Read (RESET_PREP_GET):** Reset Prep Get 1- reset prep message read 0-reset prep message not read.

14.5.1.17 Fabric Idle Time Out Snapshot (PMU_FABRIC_SNAPSHOT_REG) — Offset 40500060h

This register indicates the snap shot of the idle indications when the fabric time out counter expires. This register indicates the cause for the ISH HW to fail enter D0ix state. Note that this is an interrupt cause vector for a PMU wake. This means that PMU Wake Handler must read this register on every wake event. This is used for debug purposes only, as this is to be never set, in good operational conditions.

Type	Size	Offset	Default
MMIO	32 bit	40500060h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5	0h RW/1C	**HPET Write InProgress Snapshot (PMU_HPET_WR_INPROGRESS_SNAPSHOT):** This bit tis the snap shot of the HPET_REG_WR_InProgress signal from the HPET when Fabric time out counter expires.
4	0h RW/1C	**UART HSU Active Snapshot (PMU_HSU_ACTIVE_SNAPSHOT):** This bit tis the snap shot of !hsu_idle signal when Fabric time out counter expires.
3	0h RW/1C	**OCP Fabric Active Snapshot (PMU_FABRIC_ACTIVE_SNAPSHOT):** This bit tis the snap shot of the OR of all the pm_active_o inications from the OCP fabric when Fabric time out counter expires.
2	0h RW/1C	**Bridge OCP Active Snapshot (PMU_BR_OCP_ACTIVE_SNAPSHOT):** This bit tis the snap shot of !iosf2ocp_idle signal when Fabric time out counter expires.
1	0h RW/1C	**Bridge Side Active Snapshot (PMU_BR_SIDE_ACTIVE_SNAPSHOT):** This bit tis the snap shot of !iosf2ocp_sb_idle_funcclk_sync signal when Fabric time out counter expires.
0	0h RW/1C	**Bridge Prim Active Snapshot (PMU_BR_PRIM_ACTIVE_SNAPSHOT):** This bit tis the snap shot of PwrActive_funcclk_sync (!iosf2ocp_pr_idle_funcclk_sync in chassis compliant SOCs) signal when Fabric time out counter expires.

14.5.1.18 Context Propagation Enable (PMU_CP_EN_REG) — Offset 40500064h

Context Propagation Enable Register. This register can be programmed by ISH FW to enable forcing the clock for context propagation during IP accessible exit.

Type	Size	Offset	Default
MMIO	32 bit	40500064h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	00000000h RO	**RSV:** Reserved
0	0h RW	**Force Clock For Context Propagation Enable (PMU_CP_EN):** This bit is routed to the SHIM module for forcing clocks to allow for context propagation during IP accessible PG exit. When this bit is set, the force clocks for context propagation will be enabled.

14.5.1.19 Clock Gating And Power Gating Status (PMU_CG_PG_STATUS_REG) — Offset 40500068h

This register indicates the clock gating and power gating progress and status (PCR 1503884648). This can be used by FW to ensure that the clock gating and the power gating has happened as expected and specific states have been reached during the clock gating and power gating entry. FW is expected to clear this register after every exit to ensure the correct status is getting recorded during the next clock gate/power gate entry.

Type	Size	Offset	Default
MMIO	32 bit	40500068h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:13	00000h RO	**RSV:** Reserved
12	0h RW/1C	**Successful AON Clk Gating Entry Achieved (PMU_AONCG_ENTRY_STATUS):** This bit is set as soon as the AON clkreq fsm enters clk_deassert state. Note: This bit will get set only after the exit happens as the functional clock is not running at the time the aon clk gating happens.
11	0h RW/1C	**Successful PowerGate Entry Achieved (PMU_PG_ENTRY_STATUS):** This bit is set as soon as the pg_ack from the PMC is asserted. Note: This bit will get set only after the exit happens as the functional clock is not running at the time the pg_ack from PMC gets asserted. Note: When this bit is set, both the logic and the memories (RF cache and ROM) are guaranteed to be power gated during IP accessible PG.

Bit Range	Default & Access	Field Name (ID): Description
10	0h RW/1C	**Successful PowerGate Ready Achieved For SBEP Side Clock Domain (PMU_PGREADY_SBEP_ENTRY_STATUS):** This bit is set as soon as CDC for Prim domain was able to enter assert the pwrgate_ready indication to the PGCB. Note: This bit may get set only after the exit happens as the functional clock is not running at the time the Prim CDC is asserting the PwrgateReady.
9	0h RW/1C	**Successful PowerGate Ready Achieved For Bridge Side Clock Domain (PMU_PGREADY_BRSIDE_ENTRY_STATUS):** This bit is set as soon as CDC for bridge side clock domain was able to enter assert the pwrgate_ready indication to the PGCB. Note: This bit may get set only after the exit happens as the functional clock may not be running at the time the bridge side CDC is asserting the PwrgateReady.
8	0h RW/1C	**Successful PowerGate Ready Achieved For Bridge Primary Clock Domain (PMU_PGREADY_BRPRIM_ENTRY_STATUS):** This bit is set as soon as CDC for bridge primary clock domain was able to enter assert the pwrgate_ready indication to the PGCB. Note: This bit may get set only after the exit happens as the functional clock may not be running at the time the Primary domain CDC is asserting the PwrgateReady.
7	0h RW/1C	**Successful PowerGate Ready Achieved For Functional Clock Domain (PMU_PGREADY_FUNC_ENTRY_STATUS):** This bit is set as soon as CDC for functional clock domain was able to enter assert the pwrgate_ready indication to the PGCB. Note: This bit will get set only after the exit happens as the functional clock is not running at the time the functional CDC is asserting the PwrgateReady.
6	0h RW/1C	**Successful PowerGate Ready Achieved For MIA Clock Domain (PMU_PGREADY_MIA_ENTRY_STATUS):** This bit is set as soon as CDC for MIA clock domain was able to enter assert the pwrgate_ready indication to the PGCB. Note: This bit will get set only after the exit happens as the MIA clock is not running at the time the MIA CDC is asserting the PwrgateReady.
5	0h RW/1C	**Successful PowerGate Ready Achieved For Xtal Clock Domain (PMU_PGREADY_XTAL_ENTRY_STATUS):** This bit is set as soon as CDC for xtal clock domain was able to enter assert the pwrgate_ready indication to the PGCB. Note: This bit will get set only after the exit happens as the xtal clock is not running at the time the xtal CDC is asserting the PwrgateReady.
4	0h RW/1C	**Successful Vnnaon Active Deassertion Entry Achieved (PMU_VNNAON_ACT_DEASRT_ENTRY_STATUS):** This bit is set as soon as FSM2 was able to enter Vnnaon_Deassert state. Note: This bit will get set only after the exit happens as the functional clock is not running when the FSM2 enters Vnnaon_Deassert state.
3	0h RW/1C	**Successful Trunk Clock Gate Entry Achieved (PMU_TCG_ENTRY_STATUS):** This bit is set as soon as FSM2 was able to enter Clkreq_Deassert state. Note: This bit will get set only after the exit happens as the functional clock is not running when the FSM2 enters clkreq_Deassert state.
2	0h RW/1C	**Successful RF And ROM ONLY Power Gate Entry Achieved (PMU_RF_ROM_PG_ENTRY_STATUS):** This bit is set as soon as FSM1 was able to enter PowerGate state and hence when the RF and ROM only are power gated by FSM1. Note: This big does not get set when the RF and ROM are power gated by the SHIM during IP accessible PG entry.
1	0h RW/1C	**Clock Gating Abort Condition (PMU_CG_ABORT_STATUS):** This bit is set only when FSM 1 moved from WAIT => IDLE state.
0	0h RW/1C	**Successful Minute IA CG ONLY State Entry Achieved (PMU_MIA_CG_ENTRY_STATUS):** This bit indicates that the FSM 1 was able to enter Minute IA CG state and hence when Minute IA alone is clock gated. Note: This bit does not get set during TCG entry and IP accessible PG even though the Minute IA clock is expected to be gated during these states.

14.5.1.20 VNN Req Assert (PMU_VNN_REQ_63_32) — Offset 4050006Ch

This register is used by ISH FW to assert ish_pmc_vnn_req indication towards PMC.

Type	Size	Offset	Default
MMIO	32 bit	4050006Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access

2	0h RO	**D3Hot Enable (D3HEN) (D3HEN_23):** If 1 , then function will request power gating when idle and the PMCSR[1:0] register in the function = 11 (D3).
1	0h RO	**IDLE Enable (IDLEN) (IDLEN_23):** If 1 , then the function will request power gating when idle and the DEVIDLEC register (DEVIDLEC[DEVIDLE] = 1) is set. This bit should be RO if DEVIDLEC capability is not implemented. .
0	0h RO	**PMC Request Enable (PMCRE) (PMCRE_23):** If this bit is set to 1 , the function will request power gating when idle and pmc_ip_sw_pg_req_b = 0 . NOTE: PMCSR[1:0] may be any value and the function must power gate if this bit is set and pmc_ip_sw_pg_req_b is asserted and the device is idle. Default value may be SOC and/or IP specific. .

14.5.1.53 PCE ShadowFor PCI Function 24 (PCE_STATUS_24) — Offset 40500160h

This register is a shadow register for the 'Power Control Enable' Register in IOSF2OCP bridge. Register to record the live status of D3 and BME along with the rising edge and falling edge interrupts and masks.

Type	Size	Offset	Default
MMIO	32 bit	40500160h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**BME Fall Edge INTR Mask (BME_FALL_EDGE_INTR_MASK_24):** Reflect BME bit falling edge interrupt mask. 1-BME falling interrupt mask set 0-BME falling interrupt mask reset.
27	0h RW	**BME Rise Edge INTR Mask (BME_RISE_EDGE_INTR_MASK_24):** Reflect BME bit rising edge interrupt mask. 1-BME rising interrupt mask set 0-BME rising interrupt mask reset.
26	0h RW/1C	**BME Fall Edge INTR Status (BME_FALL_EDGE_INTR_STATUS_24):** Reflect BME bit falling edge interrupt. 1-BME falling interrupt set 0-BME falling interrupt reset.
25	0h RW/1C	**BME Rise Edge INTR Status (BME_RISE_EDGE_INTR_STATUS_24):** Reflect BME bit rising edge interrupt. 1-BME rising interrupt set 0-BME rising interrupt reset.
24	0h RO	**BME Live Status Bit (BME_LIVE_STATUS_24):** Reflect BME register bit in the bridge. 1-BME set 0-BME reset.
23	0h RW	**D0i3 Enable Mask (D0I3_MASK_24):** Mask for D0i3; if set D0i3 indication is ignored for PG entry.
22	0h RO/V	**D0i3 Live Status (D0I3_LIVE_STATUS_24):** Reflects D0i3 register bit (Bit 2).
21	0h RO	**D0i3 CIP Live Status (D0I3_CIP_LIVE_STATUS_24):** Reflects D0i3 CIP register bit (Bit 0).
20	0h RW	**D3 Fall Edge INTR Mask (D3_FALLING_EDGE_INTR_MASK_24):** Reflect D3 bit falling edge interrupt mask. 1-D3 falling interrupt mask set 0-D3 falling interrupt mask reset.
19	0h RW	**D3 Rise Edge INTR Mask (D3_RISING_EDGE_INTR_MASK_24):** Reflect D3 bit rising edge interrupt mask. 1-D3 rising interrupt mask set 0-D3 rising interrupt mask reset.
18	0h RW/1C	**D3 Fall Edge INTR Status (D3_FALLING_EDGE_INTR_STATUS_24):** Reflect D3 bit falling edge interrupt. 1-D3 falling interrupt set 0-D3 falling interrupt reset.
17	0h RW/1C	**D3 Rise Edge INTR Status (D3_RISING_EDGE_INTR_STATUS_24):** Reflect D3 bit rising edge interrupt. 1-D3 rising interrupt set 0-D3 rising interrupt reset.
16	0h RO/V	**D3 Live Status Bit (D3_LIVE_STATUS_24):** Reflect D3 register bit in the bridge. 1-D3 set 0-D3 reset.
15:13	0h RO	**Reserved**
12	0h RW	**Hardware Autonomous Enable Mask (HAE) (HAE_MASK_24):** Mask bit for HAE; if set PCE changes for HAE will not be detected.

Bit Range	Default & Access	Field Name (ID): Description
11	0h RW	**Sleep Enable Mask (SE) (SE_MASK_24):** Mask bit for SE; if set PCE changes for SE will not be detected.
10	0h RW	**D3Hot Enable Mask (D3HEN) (D3HEN_MASK_24):** Mask bit for D3HEN; if set PCE changes for D3HEN will not be detected.
9	0h RW	**IDLE Enable Mask (IDLEN) (IDLEN_MASK_24):** Mask bit for IDLEN; if set PCE changes for IDLEN will not be detected.
8	0h RW	**PMC Request Enable Mask (PMCRE) (PMCRE_MASK_24):** Mask bit for PMCRE; if set PCE changes for PMCRE will not be detected.
7:5	0h RO	**Reserved**
4	0h RO	**Hardware Autonomous Enable (HAE) (HAE_24):** If set, then the PGCB may request a PG whenever it is idle. NOTE: If this bit is set, then bits [2:0] must be 000 .
3	0h RO	**Sleep Enable (SE) (SE_24):** If clear, then IP will never assert Sleep to the retention flops. If set, then IP may assert Sleep during PG'ing.
2	0h RO	**D3Hot Enable (D3HEN) (D3HEN_24):** If 1 , then function will request power gating when idle and the PMCSR[1:0] register in the function = 11 (D3).
1	0h RO	**IDLE Enable (IDLEN) (IDLEN_24):** If 1 , then the function will request power gating when idle and the DEVIDLEC register (DEVIDLEC[DEVIDLE] = 1) is set. This bit should be RO if DEVIDLEC capability is not implemented. .
