You may not use or facilitate the use of this document in connection with any infringement or other legal analysis concerning Intel products described herein. You agree to grant Intel a non-exclusive, royalty-free license to any patent claim thereafter drafted which includes subject matter disclosed herein.

No license (express or implied, by estoppel or otherwise) to any intellectual property rights is granted by this document.

Intel technologies' features and benefits depend on system configuration and may require enabled hardware, software or service activation. Learn more at Intel.com, or from the OEM or retailer.

No computer system can be absolutely secure. Intel does not assume any liability for lost or stolen data or systems or any damages resulting from such losses.

The products described may contain design defects or errors known as errata which may cause the product to deviate from published specifications. Current characterized errata are available on request.

Intel disclaims all express and implied warranties, including without limitation, the implied warranties of merchantability, fitness for a particular purpose, and non-infringement, as well as any warranty arising from course of performance, course of dealing, or usage in trade.

Intel technologies' features and benefits depend on system configuration and may require enabled hardware, software or service activation. Learn more at intel.com, or from the OEM or retailer.

All information provided here is subject to change without notice. Contact your Intel representative to obtain the latest Intel product specifications and roadmaps.

Copies of documents which have an order number and are referenced in this document may be obtained by calling 1-800-548-4725 or visit www.intel.com/design/literature.htm.

No computer system can provide absolute security under all conditions. Intel® Trusted Execution Technology (Intel® TXT) requires a computer system with Intel® Virtualization Technology, an Intel TXT-enabled processor, chipset, BIOS, Authenticated Code Modules and an Intel TXT-compatible measured launched environment (MLE). The MLE could consist of a virtual machine monitor, an OS or an application. In addition, Intel TXT requires the system to contain a TPM v1.2, as defined by the Trusted Computing Group and specific software for some uses. For more information, see http://www.intel.com/technology/security/

Intel® Virtualization Technology requires a computer system with an enabled Intel® processor, BIOS, virtual machine monitor (VMM) and, for some uses, certain computer system software enabled for it. Functionality, performance or other benefits will vary depending on hardware and software configurations and may require a BIOS update. Software applications may not be compatible with all operating systems. Please check with your application vendor.

Intel® High Definition Audio (Intel® HD Audio): Requires an Intel® HD Audio enabled system. Consult your PC manufacturer for more information. Sound quality will depend on equipment and actual implementation. For more information about Intel® HD Audio, refer to http://www.intel.com/design/chipsets/hdaudio.htm

Hyper-Threading Technology requires a computer system with a processor supporting HT Technology and an HT Technology-enabled chipset, BIOS and operating system. Performance will vary depending on the specific hardware and software you use. For more information including details on which processors support HT Technology, see http://www.intel.com/info/hyperthreading.

Enhanced Intel SpeedStep® Technology See the Processor Spec Finder or contact your Intel representative for more information.

64-bit computing on Intel architecture requires a computer system with a processor, chipset, BIOS, operating system, device drivers and applications enabled for Intel® 64 architecture. Performance will vary depending on your hardware and software configurations. Consult with your system vendor for more information.

Intel processor numbers are not a measure of performance. Processor numbers differentiate features within each processor family, not across different processor families. See www.intel.com/products/processor_number for details.

Revision History

Revision Date	Revision Number	Description
March 2023	003	• Chapter 2, "Inter-Process Communication (IPC) Interface" — Section 2.1.22 - Updated Default & Access field for Bit Range 16 to 05h • Chapter 3, "TSN GbE Controller" — Section 3.3.2.28 - Updated Field Name and Description with 125 ps instances • Chapter 11, "Universal Asynchronous Receiver-Transmitter (UART) Interface" — Section 11.2.3 - Updated this section
September 2021	002	• Chapter 3, "TSN GbE Controller" — Section 3.2.52 - Updated field description on the register, MAC_GPIO_STATUS - Address 20Ch • Chapter 14, "Intel® PSE ARM Registers" — Section 14.20.1.51 - Updated field description on Bit19:16, MAC_GPIO_STATUS - Offset 5020020Ch — Section 14.20.3.51 - Updated field description on Bit19:16, MAC_GPIO_STATUS - Offset 5022020Ch
July 2021	001	Initial release.

§ §

1 Introduction

The Intel Atom® x6000E series, Pentium® N and J series, and Celeron® N and J series processor is targeted towards various IoT segments, such as industrial, retail, and embedded. It features real time compute with technologies such as TSN, TCC, which are expected to drive the future of IoT.

Intel Atom® x6000E series, Pentium® N and J series, and Celeron® N and J series processor is an Intel Architecture (IA) Multi-Chip Processor (MCP) 2-Chip Package, built on a 10-nanometer Compute Die and a 14-nanometer Platform Controller Hub (PCH) into a single package. Both dies are connected via the On Package Interface (OPI).

1.1 About this Manual

This document is intended for Original Equipment Manufacturers (OEMs), Original Design Manufacturers (ODM) and BIOS vendors creating products based on the Elkhart Lake family Multi Chip Package (MCP).

Throughout this document, the name "Processor" is used as a general term and refers to all Elkhart Lake family SKUs, unless specifically noted otherwise. The compute die may be referred to simply as "Compute Die" and the Platform Controller Hub may be referred to simply as "PCH".

This manual assumes a working knowledge of the vocabulary and principles of interfaces and architectures such as PCI express* (PCIe*), Universal Serial Bus (USB), Advanced Host Controller Interface (AHCI), eXtensible Host Controller Interface (xHCI), and so forth.

This manual abbreviates PCI buses as Bn, devices as Dn and functions as Fn. For example, Device 31 Function 0 is abbreviated as D31:F0, and Bus 1 Device 8 Function 0 is abbreviated as B1:D8:F0. Generally, the bus number will not be used, and can be considered to be Bus 0. These numbers are shown as decimal unless otherwise indicated.

This is the core reference document for external design specifications. Information provided here takes precedence, if there are any discrepancies found in related documents.

2 Inter-Process Communication (IPC) Interface

2.1 IPC Configuration Registers Summary

These registers in Bus: 0, Device 29, Function 0.

Table 2-1. Summary of Bus: 0, Device: 29, Function: 0 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	Device ID And Vendor ID Register (DEVVENDID) - Offset 0h	4BB30000h
4h	4	Status And Command (STATUSCOMMAND) - Offset 4h	00100000h
8h	4	Revision ID And Class Code (REVCLASSCODE) - Offset 8h	00000000h
Ch	4	Cache Line Latency Header And BIST (CLLATHEADERBIST) - Offset Ch	00000000h
10h	4	Base Address Register (BAR) - Offset 10h	00000000h
14h	4	Base Address Register High (BAR_HIGH) - Offset 14h	00000000h
18h	4	Base Address Register1 (BAR1) - Offset 18h	00000000h
1Ch	4	Base Address Register1 High (BAR1_HIGH) - Offset 1Ch	00000000h
2Ch	4	Subsystem Vendor and Subsystem ID (SUBSYSTEMID) - Offset 2Ch	00000000h
30h	4	Expansion ROM Base Address (EXPANSION_ROM_BASEADDR) - Offset 30h	00000000h
34h	4	Capabilities Pointer (CAPABILITYPTR) - Offset 34h	00000080h
3Ch	4	Interrupt Register (INTERRUPTREG) - Offset 3Ch	00000100h
80h	4	Power Management Capability ID (POWERCAPID) - Offset 80h	48030001h
84h	4	Power Management Control And Status Register (PMECTRLSTATUS) - Offset 84h	00000008h
90h	4	PCI Device Idle Vendor Capability Register (PCIDEVIDLE_CAP_RECORD) - Offset 90h	F0140009h
94h	4	Vendor Specific Extended Capability Register (DEVID_VEND_SPECIFIC_REG) - Offset 94h	01400010h
98h	4	Software LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG) - Offset 98h	00000000h
9Ch	4	Device Idle Pointer Register (DEVICE_IDLE_POINTER_REG) - Offset 9Ch	00000000h
A0h	4	D0i3 and Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG) - Offset A0h	00000800h
B0h	4	General Purpose Read Write Register1 (GEN_PCI_REGRW1) - Offset B0h	00000000h
C0h	4	General Purpose Input Register (GEN_INPUT_REG) - Offset C0h	00000000h
D0h	4	MSI Capability Register (MSI_CAP_REG) - Offset D0h	01800005h
D4h	4	MSI Message Low Address (MSI_ADDR_LOW) - Offset D4h	00000000h

Table 2-1. Summary of Bus: 0, Device: 29, Function: 0 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
D8h	4	MSI Message High Address (MSI_ADDR_HIGH) - Offset D8h	00000000h
DCh	4	MSI Message Data (MSI_MSG_DATA) - Offset DCh	00000000h
E0h	4	MSI Mask Register (MSI_MASK) - Offset E0h	00000000h
E4h	4	MSI Pending Register (MSI_PENDING) - Offset E4h	00000000h
F8h	4	Manufacturers ID (MANID) - Offset F8h	00000000h

2.1.1 Device ID And Vendor ID Register (DEVVENDID) - Offset 0h

Device ID and Vendor ID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 0h	4BB30000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	4BB3h RO/P	**Device ID Field (DEVICEID):** Device ID identifies the particular PCI device
15:0	0000h RO	**Vendor ID Field (VENDORID):** Vendor ID is a unique ID provided by the PCI SIG which identifies the manufacturer of the device

2.1.2 Status And Command (STATUSCOMMAND) - Offset 4h

Status and Command

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 4h	00100000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C	**Detected Parity Error (DPE):** Detected Parity Error
30	0h RW/1C	**Signaled System Error (SSE):** Signaled System Error
29	0h RW/1C	**RMA Field (RMA):** Received Master Abort
28	0h RW/1C	**RTA Field (RTA):** Received Target Abort

Bit Range	Default & Access	Field Name (ID): Description
27:25	0h RO	**Reserved**
24	0h RW/1C	**Master Data Parity Error (MDPE):** Master Data Parity Error
23:21	0h RO	**Reserved**
20	1h RO	**Cap List Field (CAPLIST):** Capabilities List: Indicates that the controller contains a capabilities pointer list
19	0h RO	**Interrupt Status Field (INTR_STATUS):** Interrupt Status: This bit reflects state of interrupt in the device
18:11	0h RO	**Reserved**
10	0h RW	**Interrupt Disable Field (INTR_DISABLE):** Interrupt Disable
9	0h RO	**Reserved**
8	0h RW	**SERR Enable Field (SERR_ENABLE):** SERR Enable Not implemented
7	0h RO	**Reserved**
6	0h RW	**Parity Error Response Enable (PERE):** Parity Error Response Enable
5:3	0h RO	**Reserved**
2	0h RW	**BME Field (BME):** Bus Master Enable
1	0h RW	**MSE Field (MSE):** Memory Space Enable
0	0h RO	**Reserved**

2.1.3 Revision ID And Class Code (REVCLASSCODE) - Offset 8h

Revision ID and Class Code

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	**Revision ID Field (CLASS_CODES):** Class Code register is read-only and is used to identify the generic function of the device and in some cases a specific register-level programming interface
7:0	00h RO/P	**Class Code Field (RID):** Revision ID identifies the revision of particular PCI device

2.1.4 Cache Line Latency Header And BIST (CLLATHEADERBIST) - Offset Ch

Cache Line size as RW with def 0 Latency Timer, RW with def 0 Header Type with Type 0 configuration header and Reserved BIST Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	0h RO	**Multifunction Device Field (MULFNDEV):** Multi-Function Device
22:16	00h RO	**Header Type Field (HEADERTYPE):** Header Type: Implements Type 0 Configuration header
15:8	00h RO	**Latency Timer Field (LATTIMER):** Latency Timer:. This register is implemented as R/W with default as 0
7:0	00h RW/P	**Cache Line Size Field (CACHELINE_SIZE):** Cache Line Size

2.1.5 Base Address Register (BAR) - Offset 10h

Base Address Register Low [31:2] type [2:1] in 32bit or 64bit address range and memory space indicator [0]

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR):** Base Address Register Low Base address of the AXI fabric memory space. Taken from Strap values as ones
11:4	00h RO	**Size Field (SIZEINDICATOR):** Size Indicator RO Always returns 0 The size of this register depends on the size of the memory space
3	0h RO	**Prefetchable Field (PREFETCHABLE):** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**Type Field (TYPE0):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE):** Memory Space Indicator: 0 indicates this BAR is present in the memory space

2.1.6 Base Address Register High (BAR_HIGH) - Offset 14h

Base Address Register High enabled if [2:1] of BAR_HIGH is 10

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR_HIGH):** Base Address High - MSB

2.1.7 Base Address Register1 (BAR1) - Offset 18h

Base Address Register1 accesses to PCI configuration space and is always 4K type in [2:1] and memory space indicator in [0]

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR1):** Base Address1 This field is present if BAR1 is enabled through private configuration space
11:4	00h RO	**Size Field (SIZEINDICATOR1):** Always is 0 as minimum size is 4K
3	0h RO	**Prefetchable Field (PREFETCHABLE1):** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**Type Field (TYPE1):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE1):** Memory Space Indicator: 0 Indicates this BAR is present in the memory space

2.1.8 Base Address Register1 High (BAR1_HIGH) - Offset 1Ch

Base Address Register1 High enabled only if [2:1] of BAR1_HIGH register is 10

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR1_HIGH):** Base Address: Base address of the AXI fabric memory space. Taken from Strap values as ones

2.1.9 Subsystem Vendor and Subsystem ID (SUBSYSTEMID) - Offset 2Ch

SVID Register along with SID Register is to distinguish subsystem from another

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O/P	**Subsystem ID Field (SUBSYSTEMID):** Subsystem ID: This register is implemented for any function that can be instantiated more than once in a given system
15:0	0000h RW/O/P	**Subsystem Vendor Field (SUBSYSTEMVENDORID):** Subsystem Vendor ID: This register must be implemented for any function that can be instantiated more than once in a given system

2.1.10 Expansion ROM Base Address (EXPANSION_ROM_BASEADDR) - Offset 30h

Expansion ROM Base Address Register is a RO indicates support for expansion ROMs

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Expansion Rom Base Address Field (EXPANSION_ROM_BASE):** Expansion ROM Base Address: Value of all zeros indicates no support for Expansion ROM

2.1.11 Capabilities Pointer (CAPABILITYPTR) - Offset 34h

Capabilities Pointer Register indicates what the next capability is

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 34h	00000080h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	80h RO	**Capabilities Pointer Field (CAPPTR_POWER):** Capabilities Pointer: Indicates what the next capability is

2.1.12 Interrupt Register (INTERRUPTREG) - Offset 3Ch

Interrupt Line Register is not use in Bridge directly. Interrupt Pin Register reflects the IPIN value in private configuration space. MIN_GNT register indicating the requirements of latency timers and MAX_LAT register for max latency

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 3Ch	00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Max Latency Field (MAX_LAT):** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	00h RO	**Min GNT Field (MIN_GNT):** Value of 0 indicates device has no major requirements for the settings of latency timers // Re-Check Desc Padma
15:12	0h RO	**Reserved**
11:8	1h RO	**Interrupt Pin Field (INTPIN):** Interrupt Pin: Value in this register is reflected from the IPIN value in the private configuration space
7:0	00h RW/P	**Interrupt Line Field (INTLINE):** Interrupt Line: It is used to communicate to software the interrupt line to which the interrupt pin is connected

2.1.13 Power Management Capability ID (POWERCAPID) - Offset 80h

Power Management Capability ID Register points to next capability structure and Power Management Capability with Power Management Capabilities Register for PME support and version

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 80h	48030001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	09h RO	**PME Support Field (PMESUPPORT):** This 5-bit field indicates the power states in which the function can assert the PME#
26:19	0h RO	**Reserved**
18:16	3h RO	**Version Field (VERSION):** Indicates support for Revision 1.2 of the PCI Power Management Specification
15:8	00h RO	**Next Cap Field (NXTCAP):** Next Capability: Points to the next capability structure
7:0	01h RO	**Power Capability ID Field (POWER_CAP):** Power Management Capability: Indicates this is power management capability

2.1.14 Power Management Control And Status Register (PMECTRLSTATUS) - Offset 84h

Power Management Control and Status Register to set and read PME Status, PME Enable, No Soft reset and Power State

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 84h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW/1C/P	**PME Status Field (PMESTATUS):** PME Status
14:9	0h RO	**Reserved**
8	0h RW/P	**PME Enable Field (PMEENABLE):** PME Enable
7:4	0h RO	**Reserved**
3	1h RO	**No Soft Reset Field (NO_SOFT_RESET):** This bit indicates that devices transitioning from D3hot to D0 because of Power State commands do not perform an internal reset
2	0h RO	**Reserved**
1:0	0h RW	**Power State Field (POWERSTATE):** Power State: This field is used both to determine the current Power State and to set a new Power State

2.1.15 PCI Device Idle Vendor Capability Register (PCIDEVIDLE_CAP_RECORD) - Offset 90h

PCI Device Vendor Specific Capability Register defines Vendor Specific Capability ID, Revision Length, Next Capability and CAPID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 90h	F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**Vendor Cap Field (VEND_CAP):** Vendor Specific Capability ID
27:24	0h RO	**Revision ID Field (REVID):** Revision ID of capability structure
23:16	14h RO	**Cap Length Field (CAP_LENGTH):** Vendor Specific Capability Length
15:8	00h RO	**Next Capability Field (NEXT_CAP):** Next Capability
7:0	09h RO	**Capability ID Field (CAPID):** Capability ID

2.1.16 Vendor Specific Extended Capability Register (DEVID_VEND_SPECIFIC_REG) - Offset 94h

Extended Vendor Capability Register for VSEC Length, Revision and ID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 94h	01400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	014h RO	**Vendor Specific ID Field (VSEC_LENGTH):** Vendor Specific Extended Capability Length
19:16	0h RO	**Vendor Specific Revision Field (VSEC_REV):** Vendor Specific Extended Capability Revision
15:0	0010h RO	**Vendor Specific Length Field (VSECID):** Vendor Specific Extended Capability ID

2.1.17 Software LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG) - Offset 98h

Software Location Pointer in MMIO space as an offset specified by BAR

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RO	**SW LTR Dword Offset Field (SW_LAT_DWORD_OFFSET):** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**SW LTR Bar Number Field (SW_LAT_BAR_NUM):** Indicates that the SW LTR update MMIO location is always at BAR0
0	0h RO	**SW LTR Valid Field (SW_LAT_VALID):** This value is reflected from the SW LTR valid strap at the top level

2.1.18 Device Idle Pointer Register (DEVICE_IDLE_POINTER_REG) - Offset 9Ch

Device Idle Pointer Register giving details on Device MMIO Offset Location, BAR NUM and D0i3 Valid Strap

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RO	**D0i3 Dword Offset Field (DWORD_OFFSET):** Contains the location pointer to the SW LTR register in MMIO space as an offset from the specified BAR
3:1	0h RO	**BAR NUM Field (BAR_NUM):** BAR Num: Indicates that the D0i3 MMIO location is always at BAR0
0	0h RO	**D0i3 Valid Field (VALID):** Valid: This value is reflected from the D0i3 valid strap at the top level

2.1.19 D0i3 and Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG) - Offset A0h

D0idle_Max_Power_On_Latency Register set at boot and power control enable register to enable communication with the PGCB block below the Bridge

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + A0h	00000800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21	0h RW/P	**HAE:** Hardware Autonomous Enable
20	0h RO	**Reserved**
19	0h RW/P	**Sleep Enable Field (SLEEP_EN):** Sleep Enable
18	0h RW/P	**D3 Hen Field (D3HEN):** DEVIDLE Enable (DEVIDLEN): If '1' then the function will power gate when idle and the DevIdle register (DevIdleC[2] = '1') is set
17	0h RW/P	**Device Idle En Field (DEVIDLEN):** PMCRE: PMC Request Enable
16	0h RW/P	**PMC Request Enable Field (PMCRE):** D3-Hot Enable (D3HEN): If '1' then function will power gate when idle and the PMCSR[1:0] register in the function ='11' (D3)
15:13	0h RO	**Reserved**
12:10	2h RW/O/P	**Power Latency Scale Field (POW_LAT_SCALE):** Power On Latency Scale
9:0	000h RW/O/P	**Power Latency Value Field (POW_LAT_VALUE):** Power On Latency Value

2.1.20 General Purpose Read Write Register1 (GEN_PCI_REGRW1) - Offset B0h

General Purpose PCI Read Write Register1

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Read Write Field (GEN_PCI_REG_RW1):** General Purpose PCI Register: This register value is brought out as GEN_PCI_REG_RW1

2.1.21 General Purpose Input Register (GEN_INPUT_REG) - Offset C0h

General Purpose Input Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**General Purpose Input Field (GEN_REG_INPUT_RW):** General Purpose Input Register: This register value reflects the value of GEN_REG_INPUT_RW

2.1.22 MSI Capability Register (MSI_CAP_REG) - Offset D0h

MSI Capability Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + D0h	01800005h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	1h RO	**Per Vector Masking Capability Field (PER_VECTOR_MSK_CAP):** Per Vector Masking Capability
23	1h RO	**MSI Capability Field (MSI_CAP_64B):** 64 bit message address capability
22:20	0h RW	**Multi Message En Field (MUL_MSG_EN):** Multiple Message Enable
19:17	0h RO	**Multi Message Cap Field (MUL_MSG_CAP):** Multiple Message Capable
16	05h RW	**MSI Enable Field (MSG_MSI_ENABLE):** MSI Enable
15:8	00h RO	**Next Pointer Field (MSG_NXT_PTR):** Next Capability Pointer
7:0	05h RO	**MSI Capability Field (MSG_CAP_ID):** MSI Capability ID

2.1.23 MSI Message Low Address (MSI_ADDR_LOW) - Offset D4h

MSI Message Low Address

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RW	**MSI Message Low Address Field (MSI_ADDR_LOW):** MSI Message Low Address
1:0	0h RO	**Reserved**

2.1.24 MSI Message High Address (MSI_ADDR_HIGH) - Offset D8h

MSI Message High Address

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSI Message High Address Field (MSI_ADDR_HIGH):** MSI Message High Address

2.1.25 MSI Message Data (MSI_MSG_DATA) - Offset DCh

MSI Message Data

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + DCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0000h RW	**MSI Message Data Field (MSI_MSG_DATA):** MSI Message Data

2.1.26 MSI Mask Register (MSI_MASK) - Offset E0h

MSI Mask bits

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + E0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSI Mask Field (MSI_MASK):** MSI Mask bits

2.1.27 MSI Pending Register (MSI_PENDING) - Offset E4h

MSI Pending bits

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**MSI Pending Field (MSI_PENDING):** MSI Pending bits

2.1.28 Manufacturers ID (MANID) - Offset F8h

Manufacturers ID Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + F8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/P	**Manufacturers ID Field (MANID):** Manufacturer ID: Default value comes from straps

2.2 IPC MMIO Registers Summary

Table 2-2. Summary of Bus: 0, Device: 29, Function: 0 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	Peripheral Interrupt Status - LH2OSE (PISR_LH2OSE) - Offset 0h	00000000h
4h	4	Peripheral Interrupt Mask - LH2OSE (PIMR_LH2OSE) - Offset 4h	00000000h
8h	4	LH2OSE Peripheral Interrupt Mask (HOST_PIMR_LH2OSE) - Offset 8h	00000101h
Ch	4	LH2OSE Peripheral Interrupt Status (HOST_PISR_LH2OSE) - Offset Ch	00000000h
10h	4	LH2OSE Channel Interrupt Mask (CIM_LH2OSE) - Offset 10h	00000000h
14h	4	LH2OSE Channel Interrupt Status (CIS_LH2OSE) - Offset 14h	00000000h
34h	4	LH2OSE Firmware Status (ISH_HOST_FWSTS_LH2OSE) - Offset 34h	00000000h
38h	4	LH2OSE Communication (HOST_COMM_LH2OSE) - Offset 38h	00000000h
48h	4	Inbound DoorbellLH2OSE To ISH (HOST2ISH_DOORBELL_LH2OSE) - Offset 48h	00000000h
54h	4	Outbound DoorbellISH To LH2OSE (ISH2HOST_DOORBELL_LH2OSE) - Offset 54h	00000000h
60h	4	Outbound Inter Processor Message 1 From ISH To LH2OSE (ISH2HOST_MSG1_LH2OSE) - Offset 60h	00000000h
64h	4	Outbound Inter Processor Message 2 From ISH To LH2OSE (ISH2HOST_MSG2_LH2OSE) - Offset 64h	00000000h

Table 2-2. Summary of Bus: 0, Device: 29, Function: 0 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
68h	4	Outbound Inter Processor Message 3 From ISH To LH2OSE (ISH2HOST_MSG3_LH2OSE) - Offset 68h	00000000h
6Ch	4	Outbound Inter Processor Message 4 From ISH To LH2OSE (ISH2HOST_MSG4_LH2OSE) - Offset 6Ch	00000000h
70h	4	Outbound Inter Processor Message 5 From ISH To LH2OSE (ISH2HOST_MSG5_LH2OSE) - Offset 70h	00000000h
74h	4	Outbound Inter Processor Message 6 From ISH To LH2OSE (ISH2HOST_MSG6_LH2OSE) - Offset 74h	00000000h
78h	4	Outbound Inter Processor Message 7 From ISH To LH2OSE (ISH2HOST_MSG7_LH2OSE) - Offset 78h	00000000h
7Ch	4	Outbound Inter Processor Message 8 From ISH To LH2OSE (ISH2HOST_MSG8_LH2OSE) - Offset 7Ch	00000000h
80h	4	Outbound Inter Processor Message 9 From ISH To LH2OSE (ISH2HOST_MSG9_LH2OSE) - Offset 80h	00000000h
84h	4	Outbound Inter Processor Message 10 From ISH To LH2OSE (ISH2HOST_MSG10_LH2OSE) - Offset 84h	00000000h
88h	4	Outbound Inter Processor Message 11 From ISH To LH2OSE (ISH2HOST_MSG11_LH2OSE) - Offset 88h	00000000h
8Ch	4	Outbound Inter Processor Message 12 From ISH To LH2OSE (ISH2HOST_MSG12_LH2OSE) - Offset 8Ch	00000000h
90h	4	Outbound Inter Processor Message 13 From ISH To LH2OSE (ISH2HOST_MSG13_LH2OSE) - Offset 90h	00000000h
94h	4	Outbound Inter Processor Message 14 From ISH To LH2OSE (ISH2HOST_MSG14_LH2OSE) - Offset 94h	00000000h
98h	4	Outbound Inter Processor Message 15 From ISH To LH2OSE (ISH2HOST_MSG15_LH2OSE) - Offset 98h	00000000h
9Ch	4	Outbound Inter Processor Message 16 From ISH To LH2OSE (ISH2HOST_MSG16_LH2OSE) - Offset 9Ch	00000000h
A0h	4	Outbound Inter Processor Message 17 From ISH To LH2OSE (ISH2HOST_MSG17_LH2OSE) - Offset A0h	00000000h
A4h	4	Outbound Inter Processor Message 18 From ISH To LH2OSE (ISH2HOST_MSG18_LH2OSE) - Offset A4h	00000000h
A8h	4	Outbound Inter Processor Message 19 From ISH To LH2OSE (ISH2HOST_MSG19_LH2OSE) - Offset A8h	00000000h
ACh	4	Outbound Inter Processor Message 20 From ISH To LH2OSE (ISH2HOST_MSG20_LH2OSE) - Offset ACh	00000000h
B0h	4	Outbound Inter Processor Message 21 From ISH To LH2OSE (ISH2HOST_MSG21_LH2OSE) - Offset B0h	00000000h
B4h	4	Outbound Inter Processor Message 22 From ISH To LH2OSE (ISH2HOST_MSG22_LH2OSE) - Offset B4h	00000000h
B8h	4	Outbound Inter Processor Message 23 From ISH To LH2OSE (ISH2HOST_MSG23_LH2OSE) - Offset B8h	00000000h
BCh	4	Outbound Inter Processor Message 24 From ISH To LH2OSE (ISH2HOST_MSG24_LH2OSE) - Offset BCh	00000000h
C0h	4	Outbound Inter Processor Message 25 From ISH To LH2OSE (ISH2HOST_MSG25_LH2OSE) - Offset C0h	00000000h
C4h	4	Outbound Inter Processor Message 26 From ISH To LH2OSE (ISH2HOST_MSG26_LH2OSE) - Offset C4h	00000000h

Table 2-2. Summary of Bus: 0, Device: 29, Function: 0 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
C8h	4	Outbound Inter Processor Message 27 From ISH To LH2OSE (ISH2HOST_MSG27_LH2OSE) - Offset C8h	00000000h
CCh	4	Outbound Inter Processor Message 28 From ISH To LH2OSE (ISH2HOST_MSG28_LH2OSE) - Offset CCh	00000000h
D0h	4	Outbound Inter Processor Message 29 From ISH To LH2OSE (ISH2HOST_MSG29_LH2OSE) - Offset D0h	00000000h
D4h	4	Outbound Inter Processor Message 30 From ISH To LH2OSE (ISH2HOST_MSG30_LH2OSE) - Offset D4h	00000000h
D8h	4	Outbound Inter Processor Message 31 From ISH To LH2OSE (ISH2HOST_MSG31_LH2OSE) - Offset D8h	00000000h
DCh	4	Outbound Inter Processor Message 32 From ISH To LH2OSE (ISH2HOST_MSG32_LH2OSE) - Offset DCh	00000000h
E0h	4	Inbound Inter Processor Message 1 From LH2OSE To ISH (HOST2ISH_MSG1_LH2OSE) - Offset E0h	00000000h
E4h	4	Inbound Inter Processor Message 2 From LH2OSE To ISH (HOST2ISH_MSG2_LH2OSE) - Offset E4h	00000000h
E8h	4	Inbound Inter Processor Message 3 From LH2OSE To ISH (HOST2ISH_MSG3_LH2OSE) - Offset E8h	00000000h
ECh	4	Inbound Inter Processor Message 4 From LH2OSE To ISH (HOST2ISH_MSG4_LH2OSE) - Offset ECh	00000000h
F0h	4	Inbound Inter Processor Message 5 From LH2OSE To ISH (HOST2ISH_MSG5_LH2OSE) - Offset F0h	00000000h
F4h	4	Inbound Inter Processor Message 6 From LH2OSE To ISH (HOST2ISH_MSG6_LH2OSE) - Offset F4h	00000000h
F8h	4	Inbound Inter Processor Message 7 From LH2OSE To ISH (HOST2ISH_MSG7_LH2OSE) - Offset F8h	00000000h
FCh	4	Inbound Inter Processor Message 8 From LH2OSE To ISH (HOST2ISH_MSG8_LH2OSE) - Offset FCh	00000000h
100h	4	Inbound Inter Processor Message 9 From LH2OSE To ISH (HOST2ISH_MSG9_LH2OSE) - Offset 100h	00000000h
104h	4	Inbound Inter Processor Message 10 From LH2OSE To ISH (HOST2ISH_MSG10_LH2OSE) - Offset 104h	00000000h
108h	4	Inbound Inter Processor Message 11 From LH2OSE To ISH (HOST2ISH_MSG11_LH2OSE) - Offset 108h	00000000h
10Ch	4	Inbound Inter Processor Message 12 From LH2OSE To ISH (HOST2ISH_MSG12_LH2OSE) - Offset 10Ch	00000000h
110h	4	Inbound Inter Processor Message 13 From LH2OSE To ISH (HOST2ISH_MSG13_LH2OSE) - Offset 110h	00000000h
114h	4	Inbound Inter Processor Message 14 From LH2OSE To ISH (HOST2ISH_MSG14_LH2OSE) - Offset 114h	00000000h
118h	4	Inbound Inter Processor Message 15 From LH2OSE To ISH (HOST2ISH_MSG15_LH2OSE) - Offset 118h	00000000h
11Ch	4	Inbound Inter Processor Message 16 From LH2OSE To ISH (HOST2ISH_MSG16_LH2OSE) - Offset 11Ch	00000000h
120h	4	Inbound Inter Processor Message 17 From LH2OSE To ISH (HOST2ISH_MSG17_LH2OSE) - Offset 120h	00000000h
124h	4	Inbound Inter Processor Message 18 From LH2OSE To ISH (HOST2ISH_MSG18_LH2OSE) - Offset 124h	00000000h

Table 2-2. Summary of Bus: 0, Device: 29, Function: 0 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
128h	4	Inbound Inter Processor Message 19 From LH2OSE To ISH (HOST2ISH_MSG19_LH2OSE) - Offset 128h	00000000h
12Ch	4	Inbound Inter Processor Message 20 From LH2OSE To ISH (HOST2ISH_MSG20_LH2OSE) - Offset 12Ch	00000000h
130h	4	Inbound Inter Processor Message 21 From LH2OSE To ISH (HOST2ISH_MSG21_LH2OSE) - Offset 130h	00000000h
134h	4	Inbound Inter Processor Message 22 From LH2OSE To ISH (HOST2ISH_MSG22_LH2OSE) - Offset 134h	00000000h
138h	4	Inbound Inter Processor Message 23 From LH2OSE To ISH (HOST2ISH_MSG23_LH2OSE) - Offset 138h	00000000h
13Ch	4	Inbound Inter Processor Message 24 From LH2OSE To ISH (HOST2ISH_MSG24_LH2OSE) - Offset 13Ch	00000000h
140h	4	Inbound Inter Processor Message 25 From LH2OSE To ISH (HOST2ISH_MSG25_LH2OSE) - Offset 140h	00000000h
144h	4	Inbound Inter Processor Message 26 From LH2OSE To ISH (HOST2ISH_MSG26_LH2OSE) - Offset 144h	00000000h
148h	4	Inbound Inter Processor Message 27 From LH2OSE To ISH (HOST2ISH_MSG27_LH2OSE) - Offset 148h	00000000h
14Ch	4	Inbound Inter Processor Message 28 From LH2OSE To ISH (HOST2ISH_MSG28_LH2OSE) - Offset 14Ch	00000000h
150h	4	Inbound Inter Processor Message 29 From LH2OSE To ISH (HOST2ISH_MSG29_LH2OSE) - Offset 150h	00000000h
154h	4	Inbound Inter Processor Message 30 From LH2OSE To ISH (HOST2ISH_MSG30_LH2OSE) - Offset 154h	00000000h
158h	4	Inbound Inter Processor Message 31 From LH2OSE To ISH (HOST2ISH_MSG31_LH2OSE) - Offset 158h	00000000h
15Ch	4	Inbound Inter Processor Message 32 From LH2OSE To ISH (HOST2ISH_MSG32_LH2OSE) - Offset 15Ch	00000000h
360h	4	Remap0 For LH2OSE (REMAP0_LH2OSE) - Offset 360h	00000000h
364h	4	Remap1 For LH2OSE (REMAP1_LH2OSE) - Offset 364h	00000000h
368h	4	Remap2 For LH2OSE (REMAP2_LH2OSE) - Offset 368h	00000000h
36Ch	4	Remap3 For LH2OSE (REMAP3_LH2OSE) - Offset 36Ch	00000000h
370h	4	Remap4 For LH2OSE (REMAP4_LH2OSE) - Offset 370h	00000000h
374h	4	Remap5 For LH2OSE (REMAP5_LH2OSE) - Offset 374h	00000000h
378h	4	ISH IPC Busy Clear For LH2OSE (ISH_IPC_BUSY_CLEAR_LH2OSE) - Offset 378h	00000000h
6D0h	4	D0i3 Control For LH2OSE (IPC_D0I3C_LH2OSE) - Offset 6D0h	00000008h
800h	4	Opcode Mask 0 For LH2OSE (OPCODE_MASK_REG_0_LH2OSE) - Offset 800h	00000000h
804h	4	Opcode Mask 1 For LH2OSE (OPCODE_MASK_REG_1_LH2OSE) - Offset 804h	00000000h
808h	4	Opcode Mask 2 For LH2OSE (OPCODE_MASK_REG_2_LH2OSE) - Offset 808h	00000000h
80Ch	4	Opcode Mask 3 For LH2OSE (OPCODE_MASK_REG_3_LH2OSE) - Offset 80Ch	00000000h
810h	4	Opcode Mask 4 For LH2OSE (OPCODE_MASK_REG_4_LH2OSE) - Offset 810h	00000000h

Table 2-2. Summary of Bus: 0, Device: 29, Function: 0 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
814h	4	Opcode Mask 5 For LH2OSE (OPCODE_MASK_REG_5_LH2OSE) - Offset 814h	00000000h
818h	4	Opcode Mask 6 For LH2OSE (OPCODE_MASK_REG_6_LH2OSE) - Offset 818h	00000000h
81Ch	4	Opcode Mask 7 For LH2OSE (OPCODE_MASK_REG_7_LH2OSE) - Offset 81Ch	00000000h
900h	4	Ownership Control 0 (OWNERSHIP_CTRL0_LH2OSE) - Offset 900h	00000000h
904h	4	Ownership Control 1 (OWNERSHIP_CTRL1_LH2OSE) - Offset 904h	00000000h
908h	4	Ownership Control 2 (OWNERSHIP_CTRL2_LH2OSE) - Offset 908h	00000000h
90Ch	4	Ownership Control 3 (OWNERSHIP_CTRL3_LH2OSE) - Offset 90Ch	00000000h
910h	4	Ownership Control 4 (OWNERSHIP_CTRL4_LH2OSE) - Offset 910h	00000000h
914h	4	Ownership Control 5 (OWNERSHIP_CTRL5_LH2OSE) - Offset 914h	00000000h
918h	4	Ownership Control 6 (OWNERSHIP_CTRL6_LH2OSE) - Offset 918h	00000000h
91Ch	4	Ownership Control 7 (OWNERSHIP_CTRL7_LH2OSE) - Offset 91Ch	00000000h
B00h	4	TGPIO Mux Sel 0 For LH2OSE (TGPIO_MUX_SEL_REG_0_LH2OSE) - Offset B00h	00000000h
B04h	4	TGPIO Mux Sel 1 For LH2OSE (TGPIO_MUX_SEL_REG_1_LH2OSE) - Offset B04h	00000000h
C00h	4	Feature Disable 0 For LH2OSE (FEATURE_DISABLE_REG_0_LH2OSE) - Offset C00h	00000000h
C04h	4	Feature Disable 1 For LH2OSE (FEATURE_DISABLE_REG_1_LH2OSE) - Offset C04h	00000000h
C50h	4	Fuse Disable 0 (FUSE_DISABLE_REG_0_LH2OSE) - Offset C50h	00000000h
C54h	4	LH2OSE ISH BIOS Selfshoot Reset (ISH_BIOS_SELFSHOOT_RST_LH2OSE) - Offset C54h	00000000h
4000h	4	Reg DASHBOARD_CP0 (DASHBOARD_CP0) - Offset 4000h	01200010h
4004h	4	Reg DASHBOARD_CP1 (DASHBOARD_CP1) - Offset 4004h	00000C00h
4008h	4	Reg DASHBOARD_LDR_WAP0 (DASHBOARD_LDR_WAP0) - Offset 4008h	05200010h
400Ch	4	Reg DASHBOARD_LDR_WAP1 (DASHBOARD_LDR_WAP1) - Offset 400Ch	00000C00h
4010h	4	Reg DASHBOARD_VRF_WAP0 (DASHBOARD_VRF_WAP0) - Offset 4010h	05200010h
4014h	4	Reg DASHBOARD_VRF_WAP1 (DASHBOARD_VRF_WAP1) - Offset 4014h	00000C00h
4018h	4	Reg IPINFO_REG1_0 (IPINFO_REG1_0) - Offset 4018h	00000000h
401Ch	4	Reg IPINFO_REG1_1 (IPINFO_REG1_1) - Offset 401Ch	00000000h
4020h	4	Reg IPINFO_REG2_0 (IPINFO_REG2_0) - Offset 4020h	00000000h
4024h	4	Reg IPINFO_REG2_1 (IPINFO_REG2_1) - Offset 4024h	00000000h

Table 2-2. Summary of Bus: 0, Device: 29, Function: 0 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
4030h	4	Reg VERF_ERR_STS_REG (VERF_ERR_STS_REG) - Offset 4030h	00000000h

2.2.1 Peripheral Interrupt Status - LH2OSE (PISR_LH2OSE) - Offset 0h

This register contains the inbound interrupt status bits for the LH2OSE IPC channel. Interrupts are generated when PISR[x] & PIMR[x] are both set.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27	0h NA	**PISR_H2IBCISC:** Host2ISH busy clear interrupt status clear interrupt: 1 -> Interrupt is active 0 -> Interrupt is inactive. Writing 1 to this bit clears it.
26:1	0h RO	**Reserved**
0	0h NA	**PISR_HOST2ISH:** Inbound IPC request from HOST to ISH status: 1 -> Interrupt is active 0 -> Interrupt is inactive.

2.2.2 Peripheral Interrupt Mask - LH2OSE (PIMR_LH2OSE) - Offset 4h

This register enables or disables inbound interrupts from LH2OSE to ISH. This register is not accessible by LH2OSE.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27	0h NA	**H2IBCISC_IE:** Mask bit for H2IBCISC interrupt mask 1 -> Interrupt is unmasked 0 -> Interrupt is masked.
26:12	0h RO	**Reserved**
11	0h NA	**PIMR_ISH2HOST_BUSY_CLEAR:** Mask bit for ISH2HOST busy clear interrupt 1 -> Interrupt is unmasked 0 -> Interrupt is masked.
10:1	0h RO	**Reserved**
0	0h NA	**PIMR_HOST2ISH:** Reserved

2.2.3 LH2OSE Peripheral Interrupt Mask (HOST_PIMR_LH2OSE) - Offset 8h

This register is for enabling the interrupts generated by ISH towards LH2OSE.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8h	00000101h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved**
8	1h RW	**PIMR_HOST2ISH_BUSY_CLEAR:** Host2ISH busy clear interrupt mask bit 1 -> Interrupt is unmasked 0 -> Interrupt is masked.
7:1	0h RO	**Reserved**
0	1h RW	**PIMR_ISH2HOST_IPC_REG:** Outbound IPC request from ISH to HOST Mask 1 -> Interrupt is unmasked 0 -> Interrupt is masked.

2.2.4 LH2OSE Peripheral Interrupt Status (HOST_PISR_LH2OSE) - Offset Ch

Interrupt Status Register for interrupts to LH2OSE.

Type	Size	Offset	Default
MMIO	32 bit	BAR + Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved**
8	0h RW/1C	**PISR_HOST2ISH_BUSY_CLEAR:** Host2ISH busy clear interrupt status bit 1 -> Interrupt is active.
7:1	0h RO	**Reserved**
0	0h RO	**PISR_ISH2HOST_IPC_REG:** Outbound IPC request from ISH to HOST Status 1 -> Interrupt.

2.2.5 LH2OSE Channel Interrupt Mask (CIM_LH2OSE) - Offset 10h

This register is for masking the per channel interrupt, caused by any of the interrupt sources towards ARM M7 in the IPC Channel.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h NA	**CH_INTR_MASK:** Enable interrupts towards ARM M7 for the channel. 1 -> Interrupt is masked 0 -> Interrupt is enabled.

2.2.6 LH2OSE Channel Interrupt Status (CIS_LH2OSE) - Offset 14h

This register provides the per channel interrupt status, this is set if any of the interrupt sources towards ARM M7 are set in the IPC Channel.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h NA	**CH_INTR_STATUS:** Interrupt status for the interrupts to ARM M7 for the channel. This will be set if any of the interrupt sources are enabled and their status is high.

2.2.7 LH2OSE Firmware Status (ISH_HOST_FWSTS_LH2OSE) - Offset 34h

Write by ISH, RO by LH2OSE, this is a 32 bit register which is set to 0x0000 on a system reset or a wakeup from D3Cold. As the firmware comes up after the reset or power cycle it sets bits of this register to 1b1 to indicate its status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 34h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**ISH_HOST_FWSTS:** ISH Host firmware status.

2.2.8 LH2OSE Communication (HOST_COMM_LH2OSE) - Offset 38h

Write by LH2OSE, RO by ISH, this is a 32 bit register which is set to 0x0000 on a system reset or a wakeup from D3Cold. The Host sets bits of this register to 1b1 to communicate with the ISH.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 38h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**HOST_COMM:** Host communication register.

2.2.9 Inbound DoorbellLH2OSE To ISH (HOST2ISH_DOORBELL_LH2OSE) - Offset 48h

Inbound doorbell register, from LH2OSE core to interrupt ISH. Data 30:0 is 31bits message payload used for backward compatibility. Software can use either this 31bit message payload or 256bit payload registers. When software writes the message in to respective message register, it should set bit 31(BUSY Bit) of doorbell register to indicate that new data is written. The ISH will assert a level sensitive interrupt to the IOAPIC as long as the BUSY bit is set. When the ISH reads the message code from this register it should write back to this register and clear the BUSY bit.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 48h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**BUSY:** When this bit is cleared, the ISH CPU is Ready to accept a new message.
30:0	00000000h RW	**PAYLOAD_31BIT:** 31bits message payload for backward compatibility.

2.2.10 Outbound DoorbellISH To LH2OSE (ISH2HOST_DOORBELL_LH2OSE) - Offset 54h

Outbound doorbell register for the ISH to interrupt LH2OSE. Setting bit 31 of this register causes the Host to receive a IRQn interrupt. Data 30:0 is 31bits message payload used for backward compatibility. Software can use either this 31bit message payload or 256bit payload registers. The ISH will set bit 31 of this reg to ring the doorbell after it has completed programming the message to Host. When the Host reads the message code from this register it should write back to this register and clear the BUSY bit.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 54h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**BUSY:** When this bit is cleared, the HOST CPU is Ready to accept a new message.
30:0	00000000h RW	**PAYLOAD_31BIT:** 31bits message payload for backward compatibility.

2.2.11 Outbound Inter Processor Message 1 From ISH To LH2OSE (ISH2HOST_MSG1_LH2OSE) - Offset 60h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 60h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

2.2.12 Outbound Inter Processor Message 2 From ISH To LH2OSE (ISH2HOST_MSG2_LH2OSE) - Offset 64h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 64h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

2.2.13 Outbound Inter Processor Message 3 From ISH To LH2OSE (ISH2HOST_MSG3_LH2OSE) - Offset 68h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 68h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

2.2.14 Outbound Inter Processor Message 4 From ISH To LH2OSE (ISH2HOST_MSG4_LH2OSE) - Offset 6Ch

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

2.2.15 Outbound Inter Processor Message 5 From ISH To LH2OSE (ISH2HOST_MSG5_LH2OSE) - Offset 70h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 70h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

2.2.16 Outbound Inter Processor Message 6 From ISH To LH2OSE (ISH2HOST_MSG6_LH2OSE) - Offset 74h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 74h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

2.2.17 Outbound Inter Processor Message 7 From ISH To LH2OSE (ISH2HOST_MSG7_LH2OSE) - Offset 78h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 78h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

2.2.18 Outbound Inter Processor Message 8 From ISH To LH2OSE (ISH2HOST_MSG8_LH2OSE) - Offset 7Ch

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

2.2.19 Outbound Inter Processor Message 9 From ISH To LH2OSE (ISH2HOST_MSG9_LH2OSE) - Offset 80h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 80h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

2.2.20 Outbound Inter Processor Message 10 From ISH To LH2OSE (ISH2HOST_MSG10_LH2OSE) - Offset 84h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 84h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

2.2.21 Outbound Inter Processor Message 11 From ISH To LH2OSE (ISH2HOST_MSG11_LH2OSE) - Offset 88h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 88h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

2.2.22 Outbound Inter Processor Message 12 From ISH To LH2OSE (ISH2HOST_MSG12_LH2OSE) - Offset 8Ch

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

2.2.23 Outbound Inter Processor Message 13 From ISH To LH2OSE (ISH2HOST_MSG13_LH2OSE) - Offset 90h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 90h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

2.2.24 Outbound Inter Processor Message 14 From ISH To LH2OSE (ISH2HOST_MSG14_LH2OSE) - Offset 94h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 94h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

2.2.25 Outbound Inter Processor Message 15 From ISH To LH2OSE (ISH2HOST_MSG15_LH2OSE) - Offset 98h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

2.2.26 Outbound Inter Processor Message 16 From ISH To LH2OSE (ISH2HOST_MSG16_LH2OSE) - Offset 9Ch

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

2.2.27 Outbound Inter Processor Message 17 From ISH To LH2OSE (ISH2HOST_MSG17_LH2OSE) - Offset A0h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + A0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

2.2.28 Outbound Inter Processor Message 18 From ISH To LH2OSE (ISH2HOST_MSG18_LH2OSE) - Offset A4h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + A4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

2.2.29 Outbound Inter Processor Message 19 From ISH To LH2OSE (ISH2HOST_MSG19_LH2OSE) - Offset A8h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + A8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

2.2.30 Outbound Inter Processor Message 20 From ISH To LH2OSE (ISH2HOST_MSG20_LH2OSE) - Offset ACh

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + ACh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

2.2.31 Outbound Inter Processor Message 21 From ISH To LH2OSE (ISH2HOST_MSG21_LH2OSE) - Offset B0h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

2.2.32 Outbound Inter Processor Message 22 From ISH To LH2OSE (ISH2HOST_MSG22_LH2OSE) - Offset B4h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

2.2.33 Outbound Inter Processor Message 23 From ISH To LH2OSE (ISH2HOST_MSG23_LH2OSE) - Offset B8h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

2.2.34 Outbound Inter Processor Message 24 From ISH To LH2OSE (ISH2HOST_MSG24_LH2OSE) - Offset BCh

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + BCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

2.2.35 Outbound Inter Processor Message 25 From ISH To LH2OSE (ISH2HOST_MSG25_LH2OSE) - Offset C0h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

2.2.36 Outbound Inter Processor Message 26 From ISH To LH2OSE (ISH2HOST_MSG26_LH2OSE) - Offset C4h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

2.2.37 Outbound Inter Processor Message 27 From ISH To LH2OSE (ISH2HOST_MSG27_LH2OSE) - Offset C8h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

2.2.38 Outbound Inter Processor Message 28 From ISH To LH2OSE (ISH2HOST_MSG28_LH2OSE) - Offset CCh

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + CCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

2.2.39 Outbound Inter Processor Message 29 From ISH To LH2OSE (ISH2HOST_MSG29_LH2OSE) - Offset D0h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

2.2.40 Outbound Inter Processor Message 30 From ISH To LH2OSE (ISH2HOST_MSG30_LH2OSE) - Offset D4h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

2.2.41 Outbound Inter Processor Message 31 From ISH To LH2OSE (ISH2HOST_MSG31_LH2OSE) - Offset D8h

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

2.2.42 Outbound Inter Processor Message 32 From ISH To LH2OSE (ISH2HOST_MSG32_LH2OSE) - Offset DCh

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSG:** Message from ISH to LH2OSE.

2.2.43 Inbound Inter Processor Message 1 From LH2OSE To ISH (HOST2ISH_MSG1_LH2OSE) - Offset E0h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

2.2.44 Inbound Inter Processor Message 2 From LH2OSE To ISH (HOST2ISH_MSG2_LH2OSE) - Offset E4h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

2.2.45 Inbound Inter Processor Message 3 From LH2OSE To ISH (HOST2ISH_MSG3_LH2OSE) - Offset E8h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

2.2.46 Inbound Inter Processor Message 4 From LH2OSE To ISH (HOST2ISH_MSG4_LH2OSE) - Offset ECh

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + ECh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

2.2.47 Inbound Inter Processor Message 5 From LH2OSE To ISH (HOST2ISH_MSG5_LH2OSE) - Offset F0h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + F0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

2.2.48 Inbound Inter Processor Message 6 From LH2OSE To ISH (HOST2ISH_MSG6_LH2OSE) - Offset F4h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + F4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

2.2.49 Inbound Inter Processor Message 7 From LH2OSE To ISH (HOST2ISH_MSG7_LH2OSE) - Offset F8h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + F8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

2.2.50 Inbound Inter Processor Message 8 From LH2OSE To ISH (HOST2ISH_MSG8_LH2OSE) - Offset FCh

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + FCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

2.2.51 Inbound Inter Processor Message 9 From LH2OSE To ISH (HOST2ISH_MSG9_LH2OSE) - Offset 100h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 100h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

2.2.52 Inbound Inter Processor Message 10 From LH2OSE To ISH (HOST2ISH_MSG10_LH2OSE) - Offset 104h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 104h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

2.2.53 Inbound Inter Processor Message 11 From LH2OSE To ISH (HOST2ISH_MSG11_LH2OSE) - Offset 108h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 108h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

2.2.54 Inbound Inter Processor Message 12 From LH2OSE To ISH (HOST2ISH_MSG12_LH2OSE) - Offset 10Ch

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

2.2.55 Inbound Inter Processor Message 13 From LH2OSE To ISH (HOST2ISH_MSG13_LH2OSE) - Offset 110h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 110h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

2.2.56 Inbound Inter Processor Message 14 From LH2OSE To ISH (HOST2ISH_MSG14_LH2OSE) - Offset 114h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 114h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

2.2.57 Inbound Inter Processor Message 15 From LH2OSE To ISH (HOST2ISH_MSG15_LH2OSE) - Offset 118h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 118h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

2.2.58 Inbound Inter Processor Message 16 From LH2OSE To ISH (HOST2ISH_MSG16_LH2OSE) - Offset 11Ch

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

2.2.59 Inbound Inter Processor Message 17 From LH2OSE To ISH (HOST2ISH_MSG17_LH2OSE) - Offset 120h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 120h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

2.2.60 Inbound Inter Processor Message 18 From LH2OSE To ISH (HOST2ISH_MSG18_LH2OSE) - Offset 124h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 124h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

2.2.61 Inbound Inter Processor Message 19 From LH2OSE To ISH (HOST2ISH_MSG19_LH2OSE) - Offset 128h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 128h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

2.2.62 Inbound Inter Processor Message 20 From LH2OSE To ISH (HOST2ISH_MSG20_LH2OSE) - Offset 12Ch

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

2.2.63 Inbound Inter Processor Message 21 From LH2OSE To ISH (HOST2ISH_MSG21_LH2OSE) - Offset 130h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 130h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

2.2.64 Inbound Inter Processor Message 22 From LH2OSE To ISH (HOST2ISH_MSG22_LH2OSE) - Offset 134h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 134h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

2.2.65 Inbound Inter Processor Message 23 From LH2OSE To ISH (HOST2ISH_MSG23_LH2OSE) - Offset 138h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 138h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

2.2.66 Inbound Inter Processor Message 24 From LH2OSE To ISH (HOST2ISH_MSG24_LH2OSE) - Offset 13Ch

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

2.2.67 Inbound Inter Processor Message 25 From LH2OSE To ISH (HOST2ISH_MSG25_LH2OSE) - Offset 140h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 140h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

2.2.68 Inbound Inter Processor Message 26 From LH2OSE To ISH (HOST2ISH_MSG26_LH2OSE) - Offset 144h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 144h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

2.2.69 Inbound Inter Processor Message 27 From LH2OSE To ISH (HOST2ISH_MSG27_LH2OSE) - Offset 148h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 148h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

2.2.70 Inbound Inter Processor Message 28 From LH2OSE To ISH (HOST2ISH_MSG28_LH2OSE) - Offset 14Ch

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

2.2.71 Inbound Inter Processor Message 29 From LH2OSE To ISH (HOST2ISH_MSG29_LH2OSE) - Offset 150h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 150h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

2.2.72 Inbound Inter Processor Message 30 From LH2OSE To ISH (HOST2ISH_MSG30_LH2OSE) - Offset 154h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 154h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

2.2.73 Inbound Inter Processor Message 31 From LH2OSE To ISH (HOST2ISH_MSG31_LH2OSE) - Offset 158h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 158h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

2.2.74 Inbound Inter Processor Message 32 From LH2OSE To ISH (HOST2ISH_MSG32_LH2OSE) - Offset 15Ch

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 15Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSG:** Message from LH2OSE to ISH.

2.2.75 Remap0 For LH2OSE (REMAP0_LH2OSE) - Offset 360h

General Purpose Remap Registers.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 360h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**REMAP:** Remap.

2.2.76 Remap1 For LH2OSE (REMAP1_LH2OSE) - Offset 364h

General Purpose Remap Registers.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 364h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**REMAP:** Remap.

2.2.77 Remap2 For LH2OSE (REMAP2_LH2OSE) - Offset 368h

General Purpose Remap Registers.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 368h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**REMAP:** Remap.

2.2.78 Remap3 For LH2OSE (REMAP3_LH2OSE) - Offset 36Ch

General Purpose Remap Registers.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 36Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**REMAP:** Remap.

2.2.79 Remap4 For LH2OSE (REMAP4_LH2OSE) - Offset 370h

General Purpose Remap Registers.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 370h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**REMAP:** Remap.

2.2.80 Remap5 For LH2OSE (REMAP5_LH2OSE) - Offset 374h

General Purpose Remap Registers.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 374h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**REMAP:** Remap.

2.2.81 ISH IPC Busy Clear For LH2OSE (ISH_IPC_BUSY_CLEAR_LH2OSE) - Offset 378h

This register holds the status of the ISH IPC busy clear interrupts. ISH IPC busy clear interrupt is set when busy bit of respective outbound doorbell register gets cleared and interrupt is cleared when ISH writes 1 to respective bit in ISH IPC busy clear register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 378h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h NA	**ISH2HOST_BUSY_CLEAR:** Busy clear interrupt bit of ISH2HOST IPC 1 -> Interrupt active 0 -> Interrupt inactive.

2.2.82 D0i3 Control For LH2OSE (IPC_D0I3C_LH2OSE) - Offset 6D0h

This register will be used for D0i3 SW flow. The description below also includes the type of access expected for the ISH FW for each configuration bit:
1. The Restore Required (RR) bit (bit [3]) should be RW for the ISH FW which can determine when to set and/or clear these bits depending on when the ISH FW determines whether restore is required although for ISH restore is never required since the power is never lost.
2. The D0i3 (i3) bit (bit [2]) should be RO for ISH FW as it needs to be written only by host SW. The ISH FW can determine to go to a low power state based on this bit.
3. The Interrupt Required (IR) bit (bit [1]) can be RO register for ISH FW and ISH FW can send an interrupt to Host by writing to the ish2host IPC doorbell register when this bit is set by SW.
4. The Command in Progress (CIP) register bit (bit [0]) is HW set and need to be cleared by ISH FW.
A simple edge detects logic can be used for the setting of this bit in HW. The CIP register bit will be tied to a RTE entry in the IOAPIC as an interrupt source. Hence ISH FW will get an interrupt when the In addition to the registers, the IOSF2OCP Bridge should be parameterized for the following:
1. The device idle capability parameter (ENABLE_PCI_IDLE_CAP) needs to be connected to a soft strap for ISH with a value of 1.
2. The STRAP for the MMIO address (strap_d0i3_offset) of D0i3 register (IPC offset address: h6D0) and the d0i3 valid (strap_d0i3_valid) bit needs should be appropriately tied.
3. The PCE register is made RO register by setting the appropriate parameter (Bridge top level strap: set_device_pg_config_type[5:0] is set to all 0s). This registers reset and clock domain will be in the OCP domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6D0h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4	0h RO	**Interrupt Request Capable (IRC):** Set to 1 by HW if it is capable of generating an interrupt on command completion, else 0. For ISH this bit will be tied to 0.
3	1h RW/1C	**Restore Required (RR):** When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up.
2	0h RW	**D0I3:** SW sets this bit to 1 to move the IP into the D0i3 state. Writing this bit to 0 will return the IP to the fully active D0 state (D0i0).
1	0h RW	**Interrupt Required (IR):** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this on each write to this register.
0	0h RO	**Command In Progress (CIP):** HW sets this bit on a 1->0 or 0->1 transition of bit [2]. While set, the other bits in this register are not valid and it is illegal for SW to write to any bit in this register. When clear all the other bits in the register are valid and SW may write to any bit.

2.2.83 Opcode Mask 0 For LH2OSE (OPCODE_MASK_REG_0_LH2OSE) - Offset 800h

Masking of opcodes for LH2OSE.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 800h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**OPCODE_MASK:** General Purpose Field.

2.2.84 Opcode Mask 1 For LH2OSE (OPCODE_MASK_REG_1_LH2OSE) - Offset 804h

Masking of opcodes for LH2OSE.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 804h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**OPCODE_MASK:** General Purpose Field.

2.2.85 Opcode Mask 2 For LH2OSE (OPCODE_MASK_REG_2_LH2OSE) - Offset 808h

Masking of opcodes for LH2OSE.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 808h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**OPCODE_MASK:** General Purpose Field.

2.2.86 Opcode Mask 3 For LH2OSE (OPCODE_MASK_REG_3_LH2OSE) - Offset 80Ch

Masking of opcodes for LH2OSE.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 80Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**OPCODE_MASK:** General Purpose Field.

2.2.87 Opcode Mask 4 For LH2OSE (OPCODE_MASK_REG_4_LH2OSE) - Offset 810h

Masking of opcodes for LH2OSE.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 810h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**OPCODE_MASK:** General Purpose Field.

2.2.88 Opcode Mask 5 For LH2OSE (OPCODE_MASK_REG_5_LH2OSE) - Offset 814h

Masking of opcodes for LH2OSE.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 814h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**OPCODE_MASK:** General Purpose Field.

2.2.89 Opcode Mask 6 For LH2OSE (OPCODE_MASK_REG_6_LH2OSE) - Offset 818h

Masking of opcodes for LH2OSE.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 818h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**OPCODE_MASK:** General Purpose Field.

2.2.90 Opcode Mask 7 For LH2OSE (OPCODE_MASK_REG_7_LH2OSE) - Offset 81Ch

Masking of opcodes for LH2OSE.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 81Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**OPCODE_MASK:** General Purpose Field.

2.2.91 Ownership Control 0 (OWNERSHIP_CTRL0_LH2OSE) - Offset 900h

Controls Ownership and Interrupt delivery for devices 7 to 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 900h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Interrupt Delivery Device7 (INTR_DELIVERY_DEV7):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
30:28	0h RW	**Ownership Device7 (OWNERSHIP_DEV7):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
27	0h RW	**Interrupt Delivery Device6 (INTR_DELIVERY_DEV6):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
26:24	0h RW	**Ownership Device6 (OWNERSHIP_DEV6):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
23	0h RW	**Interrupt Delivery Device5 (INTR_DELIVERY_DEV5):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
22:20	0h RW	**Ownership Device5 (OWNERSHIP_DEV5):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
19	0h RW	**Interrupt Delivery Device4 (INTR_DELIVERY_DEV4):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
18:16	0h RW	**Ownership Device4 (OWNERSHIP_DEV4):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
15	0h RW	**Interrupt Delivery Device3 (INTR_DELIVERY_DEV3):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
14:12	0h RW	**Ownership Device3 (OWNERSHIP_DEV3):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
11	0h RW	**Interrupt Delivery Device2 (INTR_DELIVERY_DEV2):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
10:8	0h RW	**Ownership Device2 (OWNERSHIP_DEV2):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
7	0h RW	**Interrupt Delivery Device1 (INTR_DELIVERY_DEV1):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
6:4	0h RW	**Ownership Device1 (OWNERSHIP_DEV1):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
3	0h RW	**Interrupt Delivery Device0 (INTR_DELIVERY_DEV0):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
2:0	0h RW	**Ownership Device0 (OWNERSHIP_DEV0):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).

2.2.92 Ownership Control 1 (OWNERSHIP_CTRL1_LH2OSE) - Offset 904h

Controls Ownership and Interrupt delivery for devices 15 to 8.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 904h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Interrupt Delivery Device15 (INTR_DELIVERY_DEV15):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
30:28	0h RW	**Ownership Device15 (OWNERSHIP_DEV15):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
27	0h RW	**Interrupt Delivery Device14 (INTR_DELIVERY_DEV14):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
26:24	0h RW	**Ownership Device14 (OWNERSHIP_DEV14):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
23	0h RW	**Interrupt Delivery Device13 (INTR_DELIVERY_DEV13):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
22:20	0h RW	**Ownership Device13 (OWNERSHIP_DEV13):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
19	0h RW	**Interrupt Delivery Device12 (INTR_DELIVERY_DEV12):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
18:16	0h RW	**Ownership Device12 (OWNERSHIP_DEV12):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
15	0h RW	**Interrupt Delivery Device11 (INTR_DELIVERY_DEV11):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
14:12	0h RW	**Ownership Device11 (OWNERSHIP_DEV11):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
11	0h RW	**Interrupt Delivery Device10 (INTR_DELIVERY_DEV10):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
10:8	0h RW	**Ownership Device10 (OWNERSHIP_DEV10):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
7	0h RW	**Interrupt Delivery Device9 (INTR_DELIVERY_DEV9):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.

Bit Range	Default & Access	Field Name (ID): Description
6:4	0h RW	**Ownership Device9 (OWNERSHIP_DEV9):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
3	0h RW	**Interrupt Delivery Device8 (INTR_DELIVERY_DEV8):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
2:0	0h RW	**Ownership Device8 (OWNERSHIP_DEV8):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).

2.2.93 Ownership Control 2 (OWNERSHIP_CTRL2_LH2OSE) - Offset 908h

Controls Ownership and Interrupt delivery for devices 23 to 16.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 908h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Interrupt Delivery Device23 (INTR_DELIVERY_DEV23):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
30:28	0h RW	**Ownership Device23 (OWNERSHIP_DEV23):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
27	0h RW	**Interrupt Delivery Device22 (INTR_DELIVERY_DEV22):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
26:24	0h RW	**Ownership Device22 (OWNERSHIP_DEV22):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
23	0h RW	**Interrupt Delivery Device21 (INTR_DELIVERY_DEV21):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
22:20	0h RW	**Ownership Device21 (OWNERSHIP_DEV21):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
19	0h RW	**Interrupt Delivery Device20 (INTR_DELIVERY_DEV20):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
18:16	0h RW	**Ownership Device20 (OWNERSHIP_DEV20):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
15	0h RW	**Interrupt Delivery Device19 (INTR_DELIVERY_DEV19):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.

Bit Range	Default & Access	Field Name (ID): Description
14:12	0h RW	**Ownership Device19 (OWNERSHIP_DEV19):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
11	0h RW	**Interrupt Delivery Device18 (INTR_DELIVERY_DEV18):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
10:8	0h RW	**Ownership Device18 (OWNERSHIP_DEV18):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
7	0h RW	**Interrupt Delivery Device17 (INTR_DELIVERY_DEV17):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
6:4	0h RW	**Ownership Device17 (OWNERSHIP_DEV17):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
3	0h RW	**Interrupt Delivery Device16 (INTR_DELIVERY_DEV16):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
2:0	0h RW	**Ownership Device16 (OWNERSHIP_DEV16):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).

2.2.94 Ownership Control 3 (OWNERSHIP_CTRL3_LH2OSE) - Offset 90Ch

Controls Ownership and Interrupt delivery for devices 31 to 24.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 90Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Interrupt Delivery Device31 (INTR_DELIVERY_DEV31):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
30:28	0h RW	**Ownership Device31 (OWNERSHIP_DEV31):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
27	0h RW	**Interrupt Delivery Device30 (INTR_DELIVERY_DEV30):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
26:24	0h RW	**Ownership Device30 (OWNERSHIP_DEV30):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
23	0h RW	**Interrupt Delivery Device29 (INTR_DELIVERY_DEV29):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.

Bit Range	Default & Access	Field Name (ID): Description
22:20	0h RW	**Ownership Device29 (OWNERSHIP_DEV29):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
19	0h RW	**Interrupt Delivery Device28 (INTR_DELIVERY_DEV28):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
18:16	0h RW	**Ownership Device28 (OWNERSHIP_DEV28):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
15	0h RW	**Interrupt Delivery Device27 (INTR_DELIVERY_DEV27):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
14:12	0h RW	**Ownership Device27 (OWNERSHIP_DEV27):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
11	0h RW	**Interrupt Delivery Device26 (INTR_DELIVERY_DEV26):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
10:8	0h RW	**Ownership Device26 (OWNERSHIP_DEV26):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
7	0h RW	**Interrupt Delivery Device25 (INTR_DELIVERY_DEV25):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
6:4	0h RW	**Ownership Device25 (OWNERSHIP_DEV25):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
3	0h RW	**Interrupt Delivery Device24 (INTR_DELIVERY_DEV24):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
2:0	0h RW	**Ownership Device24 (OWNERSHIP_DEV24):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).

2.2.95 Ownership Control 4 (OWNERSHIP_CTRL4_LH2OSE) - Offset 910h

Controls Ownership and Interrupt delivery for devices 39 to 32.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 910h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Interrupt Delivery Device39 (INTR_DELIVERY_DEV39):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
30:28	0h RW	**Ownership Device39 (OWNERSHIP_DEV39):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
27	0h RW	**Interrupt Delivery Device38 (INTR_DELIVERY_DEV38):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
26:24	0h RW	**Ownership Device38 (OWNERSHIP_DEV38):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
23	0h RW	**Interrupt Delivery Device37 (INTR_DELIVERY_DEV37):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
22:20	0h RW	**Ownership Device37 (OWNERSHIP_DEV37):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
19	0h RW	**Interrupt Delivery Device36 (INTR_DELIVERY_DEV36):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
18:16	0h RW	**Ownership Device36 (OWNERSHIP_DEV36):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).

23	0h RW	**Interrupt Delivery Device61 (INTR_DELIVERY_DEV61):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.

Bit Range	Default & Access	Field Name (ID): Description
22:20	0h RW	**Ownership Device61 (OWNERSHIP_DEV61):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
19	0h RW	**Interrupt Delivery Device60 (INTR_DELIVERY_DEV60):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
18:16	0h RW	**Ownership Device60 (OWNERSHIP_DEV60):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
15	0h RW	**Interrupt Delivery Device59 (INTR_DELIVERY_DEV59):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
14:12	0h RW	**Ownership Device59 (OWNERSHIP_DEV59):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
11	0h RW	**Interrupt Delivery Device58 (INTR_DELIVERY_DEV58):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
10:8	0h RW	**Ownership Device58 (OWNERSHIP_DEV58):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
7	0h RW	**Interrupt Delivery Device57 (INTR_DELIVERY_DEV57):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
6:4	0h RW	**Ownership Device57 (OWNERSHIP_DEV57):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).
3	0h RW	**Interrupt Delivery Device56 (INTR_DELIVERY_DEV56):** Interrupt Delivery: Valid only when device is owned by Host : 0 : MSI Messaging 1: IOSF SB assert/de-assert IRQ.
2:0	0h RW	**Ownership Device56 (OWNERSHIP_DEV56):** Ownership Value for device: 000 (ARM Owned) 001 (Host Owned) x1x (Null Owned or not a valid case).

2.2.99 TGPIO Mux Sel 0 For LH2OSE (TGPIO_MUX_SEL_REG_0_LH2OSE) - Offset B00h

Pin Mux Select Register for LH2OSE.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B00h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RW	**Pin Mux Sel (TGPIO_MUX_SEL):** 2'b00 -Config 1 : All 30 pins are from GPIO i.e GPIO_OUT[29:0] = GPIO[29:0] 2'b01 -Config 2 : GPIO_OUT[29:0] = {TGPIO[19:0], GPIO[9:0]} 2'b10 -Config 3 : GPIO_OUT[29:0] = {GPIO[29:20], TGPIO[19:0]} 2'b11 -Config 4: GPIO_OUT[29:0] = {TGPIO[19:10], GPIO[19:10], TGPIO[9:0]}.

2.2.100 TGPIO Mux Sel 1 For LH2OSE (TGPIO_MUX_SEL_REG_1_LH2OSE) - Offset B04h

Pin Mux Select Register for LH2OSE.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B04h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1:0	0h RW	**Pin Mux Sel (TGPIO_MUX_SEL):** 2'b00 -Config 1 : All 30 pins are from GPIO i.e GPIO_OUT[29:0] = GPIO[29:0] 2'b01 -Config 2 : GPIO_OUT[29:0] = {TGPIO[19:0], GPIO[9:0]} 2'b10 -Config 3 : GPIO_OUT[29:0] = {GPIO[29:20], TGPIO[19:0]} 2'b11 -Config 4: GPIO_OUT[29:0] = {TGPIO[19:10], GPIO[19:10], TGPIO[9:0]}.

2.2.101 Feature Disable 0 For LH2OSE (FEATURE_DISABLE_REG_0_LH2OSE) - Offset C00h

Feature Disable Register for LH2OSE.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C00h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Feature Disable (FEATURE_DISBLE):** OSE will implement a BIOS writable register called FEATURE_DISABLEn in BIOS. Below are the bit fields of that register. Each bit corresponds to a particular Sub-IP in OSE. When the FEATURE_DISABLE for that SubIP is set, OSE HW will clock gate the SubIP. If FW tries to access the clock-gated SubIP, then the access would result in a fabric timeout error/interrupt. FW has to then follow the error recovery process.

2.2.102 Feature Disable 1 For LH2OSE (FEATURE_DISABLE_REG_1_LH2OSE) - Offset C04h

Feature Disable Register for LH2OSE.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C04h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Feature Disable (FEATURE_DISBLE):** OSE will implement a BIOS writable register called FEATURE_DISABLEn in BIOS. Below are the bit fields of that register. Each bit corresponds to a particular Sub-IP in OSE. When the FEATURE_DISABLE for that SubIP is set, OSE HW will clock gate the SubIP. If FW tries to access the clock-gated SubIP, then the access would result in a fabric timeout error/interrupt. FW has to then follow the error recovery process.

2.2.103 Fuse Disable 0 (FUSE_DISABLE_REG_0_LH2OSE) - Offset C50h

Fuse Disable Info Register for LH2OSE.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C50h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RO	**Ownership Device7 (TGPIO_FUSE_DISABLE):** TGPIO Fuse Disable.When these fuses are set to disable the corresponding IPs - it is expected that BIOS will disable the corresponding PCI configuration space of the IP and program the ownership to NULL.
2	0h RO	**Reserved**
1	0h RO	**Ownership Device6 (QEP_FUSE_DISABLE):** QEP Fuse Disable.When these fuses are set to disable the corresponding IPs - it is expected that BIOS will disable the corresponding PCI configuration space of the IP and program the ownership to NULL.
0	0h RO	**Interrupt Delivery Device5 (PWM_FUSE_DISABLE):** PWM Fuse Disable.When these fuses are set to disable the corresponding IPs - it is expected that BIOS will disable the corresponding PCI configuration space of the IP and program the ownership to NULL.

2.2.104 LH2OSE ISH BIOS Selfshoot Reset (ISH_BIOS_SELFSHOOT_RST_LH2OSE) - Offset C54h

Though writeable by LH2OSE, this register is reserved for LH2OSE, LH2OSE should not write to this register. The reset register is a 32 bit register that can be written by BIOS. Setting bit 1 will cause ARM M7 to reset.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C54h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**BIOS_RESET_BIT:** ISH BIOS Self shoot Reset Register 1 -> Reset active 0 -> Reset inactive.

2.2.105 Reg DASHBOARD_CP0 (DASHBOARD_CP0) - Offset 4000h

Control Policy for Dashboard.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4000h	01200010h

Bit Range	Default & Access	Field Name (ID): Description
31:0	01200010h RW	**DASH_BOARD_CP_0:** SAI bits that can change this register, the Loader and verifier WAC registers and all other registers in the dashboard. Reads accesses are not restricted.

2.2.106 Reg DASHBOARD_CP1 (DASHBOARD_CP1) - Offset 4004h

Control Policy for Dashboard.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4004h	00000C00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000C00h RW	**DASH_BOARD_CP_1:** SAI bits that can change this register, the Loader and verifier WAC registers and all other registers in the dashboard. Reads accesses are not restricted.

2.2.107 Reg DASHBOARD_LDR_WAP0 (DASHBOARD_LDR_WAP0) - Offset 4008h

WAC for the Loader Registers.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4008h	05200010h

Bit Range	Default & Access	Field Name (ID): Description
31:0	05200010h RW	**DASH_BOARD_LDR_WAP_0:** SAI bits that can write the dashboard registers related to the Loader. Reads accesses are not restricted. The writes to this register should only be allowed to SAI s listed in the Control Policy Register.These WAC policies protect the below registers. 1. Loader Address and status_1 to 4 2. Loader Error Status 3. IP General Purpose Registers 1 and 2

2.2.108 Reg DASHBOARD_LDR_WAP1 (DASHBOARD_LDR_WAP1) - Offset 400Ch

WAC for the Loader Registers.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 400Ch	00000C00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000C00h RW	**DASH_BOARD_LDR_WAP_1:** SAI bits that can write the dashboard registers related to the Loader. Reads accesses are not restricted. The writes to this register should only be allowed to SAI s listed in the Control Policy Register.These WAC policies protect the below registers. 1. Loader Address and status_1 to 4 2. Loader Error Status 3. IP General Purpose Registers 1 and 2

2.2.109 Reg DASHBOARD_VRF_WAP0 (DASHBOARD_VRF_WAP0) - Offset 4010h

Dashboard_Verifier_WAC.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4010h	05200010h

Bit Range	Default & Access	Field Name (ID): Description
31:0	05200010h RW	**DASH_BOARD_VRF_WAP_0:** SAI bits that can write the dashboard registers related to the verifier. Reads accesses are not restricted. The writes to this register should only be allowed to SAI s listed in the Control Policy Register.These WAC policies protect the below registers. 1. Verifier Address and status_1 to 4 2. Verifier Error Status 3. Verifier Key Material registers 4. IMR Info Registers 5. General Purpose Registers 3 and 4

2.2.110 Reg DASHBOARD_VRF_WAP1 (DASHBOARD_VRF_WAP1) - Offset 4014h

Dashboard_Verifier_WAC.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4014h	00000C00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000C00h RW	**DASH_BOARD_VRF_WAP_1:** SAI bits that can write the dashboard registers related to the verifier. Reads accesses are not restricted. The writes to this register should only be allowed to SAI s listed in the Control Policy Register.These WAC policies protect the below registers. 1. Verifier Address and status_1 to 4 2. Verifier Error Status 3. Verifier Key Material registers 4. IMR Info Registers 5. General Purpose Registers 3 and 4

2.2.111 Reg IPINFO_REG1_0 (IPINFO_REG1_0) - Offset 4018h

Register describing the IPs capabilities when it comes to loading and verifying images.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4018h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**LOAD_CAP_SOC:** Loader Capabilities expected in another Processor IP (Example Security IP).
27:24	0h RO	**VERF_CAP_TEE:** Verifier Capability expected in IA SW/TEE.
23:20	0h RO	**LOAD_CAP_TEE:** Loader Capabilities expected in IA SW/TEE.
19:16	0h RO	**VERF_CAP_BIOS:** Verifier Capability expected in BIOS.
15:12	0h RO	**LOAD_CAP_BIOS:** Loader Capabilities expected in BIOS.
11:8	0h RO	**VERF_CAP_BUILTIN:** Verifier Capability is built within IP itself.
7:4	0h RO	**LOAD_CAP_BUILTIN:** Loader Capabilities is built within IP itself.
3	0h RO	**INLINE_HASH:** Inline HASHing supported by IP.
2:0	0h RO	**Reserved**

2.2.112 Reg IPINFO_REG1_1 (IPINFO_REG1_1) - Offset 401Ch

Verifier Capability register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 401Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3:0	0h RO	**VERF_CAP_SOC:** Verifier capability expected in another Processor IP (Example Security IP).

2.2.113 Reg IPINFO_REG2_0 (IPINFO_REG2_0) - Offset 4020h

IP_Loader_and_Verifier_CAP1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4020h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**DEBUG_POLICY:** Debug Policy/Mode enabled. This field should be used by the IP to reflect any non-production related states that the IP would like to inform the Loaders and verifiers. 1. Processor Policy that their Security plugin has detected. 2. SW defined encodings for any SW debug modes.
27:24	0h RO	**FLF_SPEC_VER:** SIIP FLF Spec version.
23:16	00h RO	**REVISION_ID:** This should be used by IP s to reflect the below information.
15:0	0000h RO	**IP_DEVICE_ID:** IP Device ID. This field should reflect the PCI Device ID of the IP. It along with the Revision ID will provide a unique ID that loader and verifier agents check to ensure correct firmware is being loaded and verified.

2.2.114 Reg IPINFO_REG2_1 (IPINFO_REG2_1) - Offset 4024h

IP_Loader_and_Verifier_CAP1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4024h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**Reserved**

2.2.115 Reg VERF_ERR_STS_REG (VERF_ERR_STS_REG) - Offset 4030h

VERF_ERR_STS_REG.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4030h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:12	0h RW	**FW_PUSH_BITS:** Firmware push completed: Optional bits one for each of the four FW instances. These bits should be set by the IP or the verifier when the FW load process is complete. These bits should be connected to an Interrupt to either the IP, or the verifier based on the IP's FW load model. If the IP supports a push model, this bit should interrupt the IP indicating push is complete. If the IP supports a pull model, these bits could interrupt the verifier indicating pull is complete.
11:8	0h RO	**Reserved**
7:4	0h RW	**VERF_ERR_CODE:** Verifying error code: 4 bits that could be used to exchange generic error codes. This error must correspond to the failure bit set in bits 3:0.
3:0	0h RW	**VERF_FAIL_BITS:** Verifying failed: Verifier is expected to set this bit on any failure. There are 4 bits allocated for each of the 4 images that could be loaded. IP s could further optimize the usage of this bit by connecting it to an interrupt towards the host or the IP s controller.

2.2.116 Reg VERF_ADDR_REG1_0 (VERF_ADDR_REG1_0) - Offset 4040h

VERF_ADDR_REG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4040h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/O	**VERF_ADDR_REG_1_0:** Physical address of the image after the verifier has integrity verified the image. This region should point to an integrity protected region only accessible to the verifier and the IP. This address is expected to be used by the IP to fetch the verified image into its local RAM s or to execute from. This register is updated by the verifier once it has finished verifying the IP s firmware image blobs into a physical address in the Processor memory map. These bits should be set before the verifying done bit is set. The address is aligned to a single dword.

2.2.117 Reg VERF_ADDR_REG1_1 (VERF_ADDR_REG1_1) - Offset 4044h

VERF_ADDR_REG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4044h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/O	**VERF_ADDR_REG_1_1:** Physical address of the image after the verifier has integrity verified the image. This region should point to an integrity protected region only accessible to the verifier and the IP. This address is expected to be used by the IP to fetch the verified image into its local RAM s or to execute from.This register is updated by the verifier once it has finished verifying the IP s firmware image blobs into a physical address in the Processor memory map. These bits should be set before the verifying done bit is set. The address is aligned to a single dword.

2.2.118 Reg VERF_SIZE_REG1_0 (VERF_SIZE_REG1_0) - Offset 4048h

VERF_SIZE_REG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4048h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	**Reserved**
16	0h RW/O	**DONE_PUSH_PULL_V1:** Firmware push or pull completed: Optional bits one for each of the four FW instances. These bits should be set by the IP or the verifier when the FW load process is complete. These bits should be connected to an Interrupt to either the IP, or the verifier based on the IP's FW load model. If the IP supports a push model, this bit should interrupt the IP indicating push is complete. If the IP supports a pull model, these bits could interrupt the verifier indicating pull is complete.
15:4	0h RO	**Reserved**
3:1	0h RW/O	**IOSF_ROOT_SPACE_V1:** Optional field indicating the IOSF Root Space to be used by IP to accessing the verifier address range. This is optional information that could be provided by low level firmware components like BIOS or other Processor agents to inform the IP if the physical address being loaded is not in System memory or an IMR region of system memory that is stolen from the OS. IP s should default to use RS0 and use this field only in special cases when they expect to not use OS addressable memory or a memory region accessible by a peer to peer path in the fabrics.
0	0h RW/O	**INTR_V1:** Verification Done: When this bit is set, Verifier will inform the IP (or equivalent HW logic or FW component) that the firmware corresponding to this dashboard register has successfully verified and resides at the physical memory address in bits 63:3. This bit along with the bits in the verifying error status register provide the status of the loading if verifying was triggered but not completed. IP's could further optimize the usage of this bit by connecting it to an interrupt towards the host or the IP's controller.

2.2.119 Reg VERF_SIZE_REG1_1 (VERF_SIZE_REG1_1) - Offset 404Ch

VERF_SIZE_REG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 404Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/O	**VERF_SIZE_REG_1_0:** Size of the image verified by the verifier in KB s. Note that this could only be the first block being verified. The IP could chose to use this first block of 4KB to pass on additional information on the firmware like if its not in contiguous memory, the address for the next block and the RS information to access it.

2.2.120 Reg VERF_ADDR_REG2_0 (VERF_ADDR_REG2_0) - Offset 4050h

VERF_ADDR_REG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4050h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/O	**VERF_ADDR_REG_2_0:** Physical address of the image after the verifier has integrity verified the image. This region should point to an integrity protected region only accessible to the verifier and the IP. This address is expected to be used by the IP to fetch the verified image into its local RAM's or to execute from. This register is updated by the verifier once it has finished verifying the IP's firmware image blobs into a physical address in the Processor memory map. These bits should be set before the verifying done bit is set. The address is aligned to a single dword.

2.2.121 Reg VERF_ADDR_REG2_1 (VERF_ADDR_REG2_1) - Offset 4054h

VERF_ADDR_REG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4054h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/O	**VERF_ADDR_REG_2_1:** Physical address of the image after the verifier has integrity verified the image. This region should point to an integrity protected region only accessible to the verifier and the IP. This address is expected to be used by the IP to fetch the verified image into its local RAM's or to execute from. This register is updated by the verifier once it has finished verifying the IP's firmware image blobs into a physical address in the Processor memory map. These bits should be set before the verifying done bit is set. The address is aligned to a single dword.

2.2.122 Reg VERF_SIZE_REG2_0 (VERF_SIZE_REG2_0) - Offset 4058h

VERF_SIZE_REG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4058h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	**Reserved**
16	0h RW/O	**DONE_PUSH_PULL_V2:** Firmware push or pull completed: Optional bits one for each of the four FW instances. These bits should be set by the IP or the verifier when the FW load process is complete. These bits should be connected to an Interrupt to either the IP, or the verifier based on the IP's FW load model. If the IP supports a push model, this bit should interrupt the IP indicating push is complete. If the IP supports a pull model, these bits could interrupt the verifier indicating pull is complete.
15:4	0h RO	**Reserved**
3:1	0h RW/O	**IOSF_ROOT_SPACE_V2:** Optional field indicating the IOSF Root Space to be used by IP to accessing the verifier address range. This is optional information that could be provided by low level firmware components like BIOS or other Processor agents to inform the IP if the physical address being loaded is not in System memory or an IMR region of system memory that is stolen from the OS. IP s should default to use RS0 and use this field only in special cases when they expect to not use OS addressable memory or a memory region accessible by a peer to peer path in the fabrics.
0	0h RW/O	**INTR_V2:** Verification Done: When this bit is set, Verifier will inform the IP (or equivalent HW logic or FW component) that the firmware corresponding to this dashboard register has successfully verified and resides at the physical memory address in bits 63:3. This bit along with the bits in the verifying error status register provide the status of the loading if verifying was triggered but not completed.IP s could further optimize the usage of this bit by connecting it to an interrupt towards the host or the IP s controller.

2.2.123 Reg VERF_SIZE_REG2_1 (VERF_SIZE_REG2_1) - Offset 405Ch

VERF_SIZE_REG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 405Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/O	**VERF_SIZE_REG_2_0:** Size of the image verified by the verifier in KB's. Note that this could only be the first block being verified. The IP could chose to use this first block of 4KB to pass on additional information on the firmware like if its not in contiguous memory, the address for the next block and the RS information to access it.

2.2.124 Reg VERF_ADDR_REG3_0 (VERF_ADDR_REG3_0) - Offset 4060h

VERF_ADDR_REG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4060h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/O	**VERF_ADDR_REG_3_0:** Physical address of the image after the verifier has integrity verified the image. This region should point to an integrity protected region only accessible to the verifier and the IP. This address is expected to be used by the IP to fetch the verified image into its local RAM's or to execute form. This register is updated by the verifier once it has finished verifying the IP's firmware image blobs into a physical address in the Processor memory map. These bits should be set before the verifying done bit is set. The address is aligned to a single dword.

2.2.125 Reg VERF_ADDR_REG3_1 (VERF_ADDR_REG3_1) - Offset 4064h

VERF_ADDR_REG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4064h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/O	**VERF_ADDR_REG_3_1:** Physical address of the image after the verifier has integrity verified the image. This region should point to an integrity protected region only accessible to the verifier and the IP. This address is expected to be used by the IP to fetch the verified image into its local RAM's or to execute from. This register is updated by the verifier once it has finished verifying the IP's firmware image blobs into a physical address in the Processor memory map. These bits should be set before the verifying done bit is set. The address is aligned to a single dword.

2.2.126 Reg VERF_SIZE_REG3_0 (VERF_SIZE_REG3_0) - Offset 4068h

VERF_SIZE_REG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4068h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	**Reserved**
16	0h RW/O	**DONE_PUSH_PULL_V3:** Firmware push or pull completed: Optional bits one for each of the four FW instances. These bits should be set by the IP or the verifier when the FW load process is complete. These bits should be connected to an Interrupt to either the IP, or the verifier based on the IP's FW load model. If the IP supports a push model, this bit should interrupt the IP indicating push is complete. If the IP supports a pull model, these bits could interrupt the verifier indicating pull is complete.
15:4	0h RO	**Reserved**
3:1	0h RW/O	**IOSF_ROOT_SPACE_V3:** Optional field indicating the IOSF Root Space to be used by IP to accessing the verifier address range. This is optional information that could be provided by low level firmware components like BIOS or other Processor agents to inform the IP if the physical address being loaded is not in System memory or an IMR region of system memory that is stolen from the OS. IP s should default to use RS0 and use this field only in special cases when they expect to not use OS addressable memory or a memory region accessible by a peer to peer path in the fabrics.
0	0h RW/O	**INTR_V3:** Verification Done: When this bit is set, Verifier will inform the IP (or equivalent HW logic or FW component) that the firmware corresponding to this dashboard register has successfully verified and resides at the physical memory address in bits 63:3. This bit along with the bits in the verifying error status register provide the status of the loading if verifying was triggered but not completed.IP s could further optimize the usage of this bit by connecting it to an interrupt towards the host or the IP s controller.

2.2.127 Reg VERF_SIZE_REG3_1 (VERF_SIZE_REG3_1) - Offset 406Ch

VERF_SIZE_REG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 406Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/O	**VERF_SIZE_REG_3_0:** Size of the image verified by the verifier in KB's. Note that this could only be the first block being verified. The IP could chose to use this first block of 4KB to pass on additional information on the firmware like if its not in contiguous memory, the address for the next block and the RS information to access it.

2.2.128 Reg VERF_ADDR_REG4_0 (VERF_ADDR_REG4_0) - Offset 4070h

VERF_ADDR_REG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4070h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/O	**VERF_ADDR_REG_4_0:** Physical address of the image after the verifier has integrity verified the image. This region should point to an integrity protected region only accessible to the verifier and the IP. This address is expected to be used by the IP to fetch the verified image into its local RAM's or to execute from. This register is updated by the verifier once it has finished verifying the IP's firmware image blobs into a physical address in the Processor memory map. These bits should be set before the verifying done bit is set. The address is aligned to a single dword.

2.2.129 Reg VERF_ADDR_REG4_1 (VERF_ADDR_REG4_1) - Offset 4074h

VERF_ADDR_REG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4074h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/O	**VERF_ADDR_REG_4_1:** Physical address of the image after the verifier has integrity verified the image. This region should point to an integrity protected region only accessible to the verifier and the IP. This address is expected to be used by the IP to fetch the verified image into its local RAM's or to execute from. This register is updated by the verifier once it has finished verifying the IP's firmware image blobs into a physical address in the Processor memory map. These bits should be set before the verifying done bit is set. The address is aligned to a single dword.

2.2.130 Reg VERF_SIZE_REG4_0 (VERF_SIZE_REG4_0) - Offset 4078h

VERF_SIZE_REG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4078h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	**Reserved**
16	0h RW/O	**DONE_PUSH_PULL_V4:** Firmware push or pull completed: Optional bits one for each of the four FW instances. These bits should be set by the IP or the verifier when the FW load process is complete. These bits should be connected to an Interrupt to either the IP, or the verifier based on the IP's FW load model. If the IP supports a push model, this bit should interrupt the IP indicating push is complete. If the IP supports a pull model, these bits could interrupt the verifier indicating pull is complete.
15:4	0h RO	**Reserved**
3:1	0h RW/O	**IOSF_ROOT_SPACE_V4:** Optional field indicating the IOSF Root Space to be used by IP to accessing the verifier address range. This is optional information that could be provided by low level firmware components like BIOS or other Processor agents to inform the IP if the physical address being loaded is not in System memory or an IMR region of system memory that is stolen from the OS. IP s should default to use RS0 and use this field only in special cases when they expect to not use OS addressable memory or a memory region accessible by a peer to peer path in the fabrics.
0	0h RW/O	**INTR_V4:** Verification Done: When this bit is set, Verifier will inform the IP (or equivalent HW logic or FW component) that the firmware corresponding to this dashboard register has successfully verified and resides at the physical memory address in bits 63:3. This bit along with the bits in the verifying error status register provide the status of the loading if verifying was triggered but not completed. IP s could further optimize the usage of this bit by connecting it to an interrupt towards the host or the IP s controller.

2.2.131 Reg VERF_SIZE_REG4_1 (VERF_SIZE_REG4_1) - Offset 407Ch

VERF_SIZE_REG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 407Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/O	**VERF_SIZE_REG_4_0:** Size of the image verified by the verifier in KB's. Note that this could only be the first block being verified. The IP could chose to use this first block of 4KB to pass on additional information on the firmware like if its not in contiguous memory, the address for the next block and the RS information to access it.

2.2.132 Reg IMR_INFO_ADDR_REG1_0 (IMR_INFO_ADDR_REG1_0) - Offset 4080h

IMR_INFO_ADDR_REG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4080h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IMR_INFO_ADDR_REG_1_0:** Physical base address of the IMR memory region allocated by the verifier to the IP.

2.2.133 Reg IMR_INFO_ADDR_REG1_1 (IMR_INFO_ADDR_REG1_1) - Offset 4084h

IMR_INFO_ADDR_REG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4084h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IMR_INFO_ADDR_REG_1_1:** Physical base address of the IMR memory region allocated by the verifier to the IP.

2.2.134 Reg IMR_INFO_SIZE_REG1_0 (IMR_INFO_SIZE_REG1_0) - Offset 4088h

IMR_INFO_SIZE_REG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4088h	00000006h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RW	**REG1_IMR_SIZE1:** Size of the IMR range in KB if the IMR is used and indicated by the address register.
3:1	3h RW	**REG1_ROOT_SPACE:** Optional bits indicating the Root Space to be used by the IP for accessing this address range. This is expected to be used in future if a Processor does not use RS3 to access IMR regions.
0	0h RW	**REG1_ALLOC_STS:** IMR Used: Bits used to indicate that an IMR is allocated by the Processor and the IP should use the values in this register and the size register for its address and size.

2.2.135 Reg IMR_INFO_SIZE_REG1_1 (IMR_INFO_SIZE_REG1_1) - Offset 408Ch

IMR_INFO_SIZE_REG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 408Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**REG1_IMR_SIZE0:** Size of the IMR range in KB if the IMR is used and indicated by the address register.

2.2.136 Reg IMR_INFO_ADDR_REG2_0 (IMR_INFO_ADDR_REG2_0) - Offset 4090h

IMR_INFO_ADDR_REG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4090h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IMR_INFO_ADDR_REG_2_0:** Physical base address of the IMR memory region allocated by the verifier to the IP.

2.2.137 Reg IMR_INFO_ADDR_REG2_1 (IMR_INFO_ADDR_REG2_1) - Offset 4094h

IMR_INFO_ADDR_REG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4094h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IMR_INFO_ADDR_REG_2_1:** Physical base address of the IMR memory region allocated by the verifier to the IP.

2.2.138 Reg IMR_INFO_SIZE_REG2_0 (IMR_INFO_SIZE_REG2_0) - Offset 4098h

IMR_INFO_SIZE_REG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4098h	00000006h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RW	**REG2_IMR_SIZE1:** Size of the IMR range in KB if the IMR is used and indicated by the address register.
3:1	3h RW	**REG2_ROOT_SPACE:** Optional bits indicating the Root Space to be used by the IP for accessing this address range. This is expected to be used in future if a Processor does not use RS3 to access IMR regions.
0	0h RW	**REG2_ALLOC_STS:** IMR Used: Bits used to indicate that an IMR is allocated by the Processor and the IP should use the values in this register and the size register for its address and size.

2.2.139 Reg IMR_INFO_SIZE_REG2_1 (IMR_INFO_SIZE_REG2_1) - Offset 409Ch

IMR_INFO_ADDR_REG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 409Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**REG2_IMR_SIZE0:** Size of the IMR range in KB if the IMR is used and indicated by the address register.

2.2.140 Reg VERF_MAT_ADDR_REG1_0 (VERF_MAT_ADDR_REG1_0) - Offset 4100h

VERF_MATERIAL_ADDR_REG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4100h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**REG1_PHY_ADDR0:** Physical address of the memory region hosting the verification related material. Verifier SW and trusted agents writing to this region need to agree on the structure of the data at this address.
2:1	0h RW	**REG1_ADDR_ROOT_SPACE:** Root Space to be used for accessing this address range.
0	0h RO	**Reserved**

2.2.141 Reg VERF_MAT_ADDR_REG1_1 (VERF_MAT_ADDR_REG1_1) - Offset 4104h

VERF_MATERIAL_ADDR_REG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4104h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**REG1_PHY_ADDR1:** Physical address of the memory region hosting the verification related material. Verifier SW and trusted agents writing to this region need to agree on the structure of the data at this address.

2.2.142 Reg VERF_MAT_SIZE_REG1_0 (VERF_MAT_SIZE_REG1_0) - Offset 4108h

VERF_MATERIAL_SIZE_REG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4108h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3:1	0h RW	**REG1_SIZE_ROOT_SPACE:** Root Space to be used for accessing this address range.
0	0h RO	**Reserved**

2.2.143 Reg VERF_MAT_SIZE_REG1_1 (VERF_MAT_SIZE_REG1_1) - Offset 410Ch

VERF_MATERIAL_SIZE_REG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 410Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**REG1_VERF_MAT_SIZE:** Size in KB of the data structure that holds the verification material. The IP could chose to use this first block of 4KB to pass on additional information on the firmware like if its not in contiguous memory, the address for the next block and the RS information to access it.

2.2.144 Reg VERF_MAT_ADDR_REG2_0 (VERF_MAT_ADDR_REG2_0) - Offset 4110h

VERF_MATERIAL_ADDR_REG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4110h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**REG2_PHY_ADDR0:** Physical address of the memory region hosting the verification related material. Verifier SW and trusted agents writing to this region need to agree on the structure of the data at this address.
2:1	0h RW	**REG2_ADDR_ROOT_SPACE:** Root Space to be used for accessing this address range.
0	0h RO	**Reserved**

2.2.145 Reg VERF_MAT_ADDR_REG2_1 (VERF_MAT_ADDR_REG2_1) - Offset 4114h

VERF_MATERIAL_ADDR_REG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4114h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**REG2_PHY_ADDR1:** Physical address of the memory region hosting the verification related material. Verifier SW and trusted agents writing to this region need to agree on the structure of the data at this address.

2.2.146 Reg VERF_MAT_SIZE_REG2_0 (VERF_MAT_SIZE_REG2_0) - Offset 4118h

VERF_MATERIAL_SIZE_REG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4118h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3:1	0h RW	**REG2_SIZE_ROOT_SPACE:** Root Space to be used for accessing this address range.
0	0h RO	**Reserved**

2.2.147 Reg VERF_MAT_SIZE_REG2_1 (VERF_MAT_SIZE_REG2_1) - Offset 411Ch

VERF_MATERIAL_SIZE_REG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 411Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**REG2_VERF_MAT_SIZE:** Size in KB of the data structure that holds the verification material. The IP could chose to use this first block of 4KB to pass on additional information on the firmware like if its not in contiguous memory, the address for the next block and the RS information to access it.

2.2.148 Reg VERF_MAT_ADDR_REG3_0 (VERF_MAT_ADDR_REG3_0) - Offset 4120h

VERF_MATERIAL_ADDR_REG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4120h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**REG3_PHY_ADDR0:** Physical address of the memory region hosting the verification related material. Verifier SW and trusted agents writing to this region need to agree on the structure of the data at this address.
2:1	0h RW	**REG3_ADDR_ROOT_SPACE:** Root Space to be used for accessing this address range.
0	0h RO	**Reserved**

2.2.149 Reg VERF_MAT_ADDR_REG3_1 (VERF_MAT_ADDR_REG3_1) - Offset 4124h

VERF_MATERIAL_ADDR_REG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4124h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**REG3_PHY_ADDR1:** Physical address of the memory region hosting the verification related material. Verifier SW and trusted agents writing to this region need to agree on the structure of the data at this address.

2.2.150 Reg VERF_MAT_SIZE_REG3_0 (VERF_MAT_SIZE_REG3_0) - Offset 4128h

VERF_MATERIAL_SIZE_REG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4128h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3:1	0h RW	**REG3_SIZE_ROOT_SPACE:** Root Space to be used for accessing this address range.
0	0h RO	**Reserved**

2.2.151 Reg VERF_MAT_SIZE_REG3_1 (VERF_MAT_SIZE_REG3_1) - Offset 412Ch

VERF_MATERIAL_SIZE_REG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 412Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**REG3_VERF_MAT_SIZE:** Size in KB of the data structure that holds the verification material. The IP could chose to use this first block of 4KB to pass on additional information on the firmware like if its not in contiguous memory, the address for the next block and the RS information to access it.

2.2.152 Reg VERF_MAT_ADDR_REG4_0 (VERF_MAT_ADDR_REG4_0) - Offset 4130h

VERF_MATERIAL_ADDR_REG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4130h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**REG4_PHY_ADDR0:** Physical address of the memory region hosting the verification related material. Verifier SW and trusted agents writing to this region need to agree on the structure of the data at this address.
2:1	0h RW	**REG4_ADDR_ROOT_SPACE:** Root Space to be used for accessing this address range.
0	0h RO	**Reserved**

2.2.153 Reg VERF_MAT_ADDR_REG4_1 (VERF_MAT_ADDR_REG4_1) - Offset 4134h

VERF_MATERIAL_ADDR_REG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4134h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**REG4_PHY_ADDR1:** Physical address of the memory region hosting the verification related material. Verifier SW and trusted agents writing to this region need to agree on the structure of the data at this address.

2.2.154 Reg VERF_MAT_SIZE_REG4_0 (VERF_MAT_SIZE_REG4_0) - Offset 4138h

VERF_MATERIAL_SIZE_REG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4138h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3:1	0h RW	**REG4_SIZE_ROOT_SPACE:** Root Space to be used for accessing this address range.
0	0h RO	**Reserved**

2.2.155 Reg VERF_MAT_SIZE_REG4_1 (VERF_MAT_SIZE_REG4_1) - Offset 413Ch

VERF_MATERIAL_SIZE_REG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 413Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**REG4_VERF_MAT_SIZE:** Size in KB of the data structure that holds the verification material. The IP could chose to use this first block of 4KB to pass on additional information on the firmware like if its not in contiguous memory, the address for the next block and the RS information to access it.

2.2.156 Reg IP_GP_REG3_0 (IP_GP_REG3_0) - Offset 4140h

IP_GPREG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4140h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_GPR_3_0:** Optional general purpose registers for any customized information that needs to be exchanged with IP.

2.2.157 Reg IP_GP_REG3_1 (IP_GP_REG3_1) - Offset 4144h

IP_GPREG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4144h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_GPR_3_1:** Optional general purpose registers for any customized information that needs to be exchanged with IP.

2.2.158 Reg IP_GP_REG3_2 (IP_GP_REG3_2) - Offset 4148h

IP_GPREG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4148h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_GPR_3_2:** Optional general purpose registers for any customized information that needs to be exchanged with IP.

2.2.159 Reg IP_GP_REG3_3 (IP_GP_REG3_3) - Offset 414Ch

IP_GPREG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 414Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_GPR_3_3:** Optional general purpose registers for any customized information that needs to be exchanged with IP.

2.2.160 Reg IP_GP_REG3_4 (IP_GP_REG3_4) - Offset 4150h

IP_GPREG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4150h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_GPR_3_4:** Optional general purpose registers for any customized information that needs to be exchanged with IP.

2.2.161 Reg IP_GP_REG3_5 (IP_GP_REG3_5) - Offset 4154h

IP_GPREG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4154h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_GPR_3_5:** Optional general purpose registers for any customized information that needs to be exchanged with IP.

2.2.162 Reg IP_GP_REG3_6 (IP_GP_REG3_6) - Offset 4158h

IP_GPREG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4158h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_GPR_3_6:** Optional general purpose registers for any customized information that needs to be exchanged with IP.

2.2.163 Reg IP_GP_REG3_7 (IP_GP_REG3_7) - Offset 415Ch

IP_GPREG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 415Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_GPR_3_7:** Optional general purpose registers for any customized information that needs to be exchanged with IP.

2.2.164 Reg IP_GP_REG4_0 (IP_GP_REG4_0) - Offset 4160h

IP_GPREG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4160h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_GPR_4_0:** Optional general purpose registers for any customized information that needs to be exchanged with IP.

2.2.165 Reg IP_GP_REG4_1 (IP_GP_REG4_1) - Offset 4164h

IP_GPREG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4164h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_GPR_4_1:** Optional general purpose registers for any customized information that needs to be exchanged with IP.

2.2.166 Reg IP_GP_REG4_2 (IP_GP_REG4_2) - Offset 4168h

IP_GPREG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4168h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_GPR_4_2:** Optional general purpose registers for any customized information that needs to be exchanged with IP.

2.2.167 Reg IP_GP_REG4_3 (IP_GP_REG4_3) - Offset 416Ch

IP_GPREG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 416Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_GPR_4_3:** Optional general purpose registers for any customized information that needs to be exchanged with IP.

2.2.168 Reg IP_GP_REG4_4 (IP_GP_REG4_4) - Offset 4170h

IP_GPREG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4170h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_GPR_4_4:** Optional general purpose registers for any customized information that needs to be exchanged with IP.

2.2.169 Reg IP_GP_REG4_5 (IP_GP_REG4_5) - Offset 4174h

IP_GPREG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4174h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_GPR_4_5:** Optional general purpose registers for any customized information that needs to be exchanged with IP.

2.2.170 Reg IP_GP_REG4_6 (IP_GP_REG4_6) - Offset 4178h

IP_GPREG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4178h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_GPR_4_6:** Optional general purpose registers for any customized information that needs to be exchanged with IP.

2.2.171 Reg IP_GP_REG4_7 (IP_GP_REG4_7) - Offset 417Ch

IP_GPREG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 417Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_GPR_4_7:** Optional general purpose registers for any customized information that needs to be exchanged with IP.

2.2.172 Reg LOAD_ERR_STS_REG (LOAD_ERR_STS_REG) - Offset 5030h

LOAD_ERR_STS_REG.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5030h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:4	0h RW	**LOAD_ERROR_CODE:** Loading error code: 4 bits that could be used to exchange generic error codes. This error has to correspond to the failure bit set in bits 3:0.
3:0	0h RW	**LOAD_FAIL_BITS:** Loading failed: Loader is expected to set this bit on any failure. There are 4 bits allocated for each of the 4 images that could be loaded. IP s could further optimize the usage of this bit by connecting it to an interrupt towards the host or the IP s controller.

2.2.173 Reg INT_MASK_REG (INT_MASK_REG) - Offset 5038h

INT_MASK_REG.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5038h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved**
20	0h RW	**IP_ACC_DENIED_MASK:** Access Denied mask reg.
19:16	0h RW	**IE_PUSH_PULL_DONE:** Interrupt enable bit for IP push or pull complete. One bit is allocated for each FW instance. By default all interrupts are masked at reset.
15:12	0h RW	**IE_VERF_DONE:** Interrupt enable bit for Verification done. One bit is allocated for each FW instance. By default all interrupts are masked at reset.
11:8	0h RW	**IE_VERIFIER_LOAD_DONE:** Interrupt enable bit for Verifier load complete bit. One bit is allocated for each FW instance. By default all interrupts are masked at reset.
7:4	0h RW	**IE_FW_LOAD_DONE:** Interrupt enable bit for FW loading done. One bit is allocated for each FW instance. By default all interrupts are masked at reset.
3:0	0h RW	**IE_IP_READY:** Interrupt enable bit for IP ready for FW load. One bit is allocated for each FW instance. By default all interrupts are masked at reset.

2.2.174 Reg INT_STS_REG (INT_STS_REG) - Offset 503Ch

INT_STS_REG.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 503Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved**
20	0h RW/1C	**IP_ACC_DENIED_INTR:** Access denied intr reg.
19:16	0h RW/1C	**IE_PUSH_PULL_DONE_INTR:** Interrupt status bit for IP push or pull complete. One bit is allocated for each FW instance. This bit is expected to clear the interrupt to de-assert the interrupt line.
15:12	0h RW/1C	**IE_VERF_DONE_INTR:** Interrupt status bit for Verification done. One bit is allocated for each FW instance. This bit is expected to clear the interrupt to de-assert the interrupt line.
11:8	0h RW/1C	**IE_VERIFIER_LOAD_DONE_INTR:** Interrupt status bit for Verifier load complete bit. One bit is allocated for each FW instance. This bit is expected to clear the interrupt to de-assert the interrupt line.
7:4	0h RW/1C	**IE_FW_LOAD_DONE_INTR:** Interrupt status bit for FW loading done. One bit is allocated for each FW instance. This bit is expected to clear the interrupt to de-assert the interrupt line.
3:0	0h RW/1C	**IE_IP_READY_INTR:** Interrupt status bit for IP ready for FW load. One bit is allocated for each FW instance. This bit is expected to clear the interrupt to de-assert the interrupt line.

2.2.175 Reg LOAD_ADDR_REG1_0 (LOAD_ADDR_REG1_0) - Offset 5040h

LOAD_ADDR_REG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5040h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/O	**LOAD_ADDR_REG_1_0:** Physical address of the image for the verifier to verify. This register is updated by the loader once it has finished copying the IP s firmware image blobs into a physical address in the Processor memory map. These bits should be set before the Loading done bit is set. The address is aligned to a single dword.

2.2.176 Reg LOAD_ADDR_REG1_1 (LOAD_ADDR_REG1_1) - Offset 5044h

LOAD_ADDR_REG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5044h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/O	**LOAD_ADDR_REG_1_1:** Physical address of the image for the verifier to verify. This register is updated by the loader once it has finished copying the IP s firmware image blobs into a physical address in the Processor memory map. These bits should be set before the Loading done bit is set.The address is aligned to a single dword.

2.2.177 Reg LOAD_SIZE_REG1_0 (LOAD_SIZE_REG1_0) - Offset 5048h

LOAD_SIZE_REG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5048h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17	0h RW/O	**VERFIER_COPY_DONE_LD1:** Verifier copy done: This is an optional bit set by the verifier after it has consumed the FW image form he loader and should be used if it needs to communicate to the loader that the buffer indicated by this pair of address and size register can now be reclaimed by the Loader. Note that usage of this bit will imply that the verifier should also be in the WAC of the loader registers.
16	0h RW/O	**IP_READY_LD1:** IP ready for FW download: Optional bits one for each of the four FW instances. These bits should be set by the IP HW or IP ROM when the IP is out of reset and wants to inform outside controllers of that state so that they could begin the enumeration process for FW load. These bits should be connected to an Interrupt to the verifier either via MSI or via SB message to the agent designated as the loader according to the IP Capabilities register.
15:4	0h RO	**Reserved**
3:1	0h RW/O	**IOSF_ROOT_SPACE_LD1:** Optional field indicating the IOSF Root Space to be used by IP to accessing the loader address range. This is optional information that could be provided by low level firmware components like BIOS or other Processor agents to inform the IP if the physical address being loaded is not in System memory or an IMR region of system memory that is stolen from the OS. IP s should default to use RS0 and use this field only in special cases when they expect to not use OS addressable memory or a memory region accessible by a peer to peer path in the fabrics.
0	0h RW/O	**LOAD_DONE_LD1:** Loading Done: When this bit is set, it will inform the verifier that the firmware has successfully loaded into the physical memory address in bits 63:3. This bit along with the bits in the Loading error status register provide the status of the loading if loading was triggered but not completed.IP s could further optimize the usage of this bit by connecting it to an interrupt towards the host or the IP s controller.

2.2.178 Reg LOAD_SIZE_REG1_1 (LOAD_SIZE_REG1_1) - Offset 504Ch

LOAD_SIZE_REG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 504Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/O	**LOAD_SIZE_REG_1_1:** Physical address of the image for the verifier to verify. This register is updated by the loader once it has finished copying the IP's firmware image blobs into a physical address in the Processor memory map. These bits should be set before the Loading done bit is set.The address is aligned to a single dword.

2.2.179 Reg LOAD_ADDR_REG2_0 (LOAD_ADDR_REG2_0) - Offset 5050h

LOAD_ADDR_REG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5050h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/O	**LOAD_ADDR_REG_2_0:** Physical address of the image for the verifier to verify. This register is updated by the loader once it has finished copying the IP's firmware image blobs into a physical address in the Processor memory map. These bits should be set before the Loading done bit is set.The address is aligned to a single dword.

2.2.180 Reg LOAD_ADDR_REG2_1 (LOAD_ADDR_REG2_1) - Offset 5054h

LOAD_ADDR_REG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5054h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/O	**LOAD_ADDR_REG_2_1:** Size of the image for the verifier to verify in KB's. Loader agents need to update this register before updating the loading done bit.

2.2.181 Reg LOAD_SIZE_REG2_0 (LOAD_SIZE_REG2_0) - Offset 5058h

LOAD_SIZE_REG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5058h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17	0h RW/O	**VERFIER_COPY_DONE_LD2:** Verifier copy done: This is an optional bit set by the verifier after it has consumed the FW image form he loader and should be used if it needs to communicate to the loader that the buffer indicated by this pair of address and size register can now be reclaimed by the Loader. Note that usage of this bit will imply that the verifier should also be in the WAC of the loader registers.
16	0h RW/O	**IP_READY_LD2:** IP ready for FW download: Optional bits one for each of the four FW instances in their respective registers. These bits should be set by the IP HW or first stage FW when the IP is out of reset and wants to inform outside controllers of that state so that they could begin the enumeration process for FW load of this respective stage of FW. These bits should be connected to an Interrupt to the verifier either via MSI or via SB message to the agent designated as the loader according to the IP Capabilities register.
15:4	0h RO	**Reserved**
3:1	0h RW/O	**IOSF_ROOT_SPACE_LD2:** Optional field indicating the IOSF Root Space to be used by IP to accessing the loader address range. This is optional information that could be provided by low level firmware components like BIOS or other Processor agents to inform the IP if the physical address being loaded is not in System memory or an IMR region of system memory that is stolen from the OS. IP s should default to use RS0 and use this field only in special cases when they expect to not use OS addressable memory or a memory region accessible by a peer to peer path in the fabrics.
0	0h RW/O	**LOAD_DONE_LD2:** Loading Done: When this bit is set, it will inform the verifier that the firmware has successfully loaded into the physical memory address in bits 63:3. This bit along with the bits in the Loading error status register provide the status of the loading if loading was triggered but not completed.IP s could further optimize the usage of this bit by connecting it to an interrupt towards the host or the IP s controller.

2.2.182 Reg LOAD_SIZE_REG2_1 (LOAD_SIZE_REG2_1) - Offset 505Ch

LOAD_SIZE_REG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 505Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/O	**LOAD_SIZE_REG_2_1:** Physical address of the image for the verifier to verify. This register is updated by the loader once it has finished copying the IP's firmware image blobs into a physical address in the Processor memory map. These bits should be set before the Loading done bit is set.The address is aligned to a single dword.

2.2.183 Reg LOAD_ADDR_REG3_0 (LOAD_ADDR_REG3_0) - Offset 5060h

LOAD_ADDR_REG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5060h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/O	**LOAD_ADDR_REG_3_0:** Physical address of the image for the verifier to verify. This register is updated by the loader once it has finished copying the IP's firmware image blobs into a physical address in the Processor memory map. These bits should be set before the Loading done bit is set.The address is aligned to a single dword.

2.2.184 Reg LOAD_ADDR_REG3_1 (LOAD_ADDR_REG3_1) - Offset 5064h

LOAD_ADDR_REG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5064h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/O	**LOAD_ADDR_REG_3_1:** Size of the image for the verifier to verify in KB's. Loader agents need to update this register before updating the loading done bit.

2.2.185 Reg LOAD_SIZE_REG3_0 (LOAD_SIZE_REG3_0) - Offset 5068h

LOAD_SIZE_REG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5068h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17	0h RW/O	**VERFIER_COPY_DONE_LD3:** Verifier copy done: This is an optional bit set by the verifier after it has consumed the FW image form he loader and should be used if it needs to communicate to the loader that the buffer indicated by this pair of address and size register can now be reclaimed by the Loader. Note that usage of this bit will imply that the verifier should also be in the WAC of the loader registers.
16	0h RW/O	**IP_READY_LD3:** IP ready for FW download: Optional bits one for each of the four FW instances in their respective registers. These bits should be set by the IP HW or first stage FW when the IP is out of reset and wants to inform outside controllers of that state so that they could begin the enumeration process for FW load of this respective stage of FW. These bits should be connected to an Interrupt to the verifier either via MSI or via SB message to the agent designated as the loader according to the IP Capabilities register.
15:4	0h RO	**Reserved**
3:1	0h RW/O	**IOSF_ROOT_SPACE_LD3:** Optional field indicating the IOSF Root Space to be used by IP to accessing the loader address range. This is optional information that could be provided by low level firmware components like BIOS or other Processor agents to inform the IP if the physical address being loaded is not in System memory or an IMR region of system memory that is stolen from the OS. IP s should default to use RS0 and use this field only in special cases when they expect to not use OS addressable memory or a memory region accessible by a peer to peer path in the fabrics.
0	0h RW/O	**LOAD_DONE_LD3:** Loading Done: When this bit is set, it will inform the verifier that the firmware has successfully loaded into the physical memory address in bits 63:3. This bit along with the bits in the Loading error status register provide the status of the loading if loading was triggered but not completed.IP s could further optimize the usage of this bit by connecting it to an interrupt towards the host or the IP s controller.

2.2.186 Reg LOAD_SIZE_REG3_1 (LOAD_SIZE_REG3_1) - Offset 506Ch

LOAD_SIZE_REG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 506Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/O	**LOAD_SIZE_REG_3_1:** Physical address of the image for the verifier to verify. This register is updated by the loader once it has finished copying the IP's firmware image blobs into a physical address in the Processor memory map. These bits should be set before the Loading done bit is set.The address is aligned to a single dword.

2.2.187 Reg LOAD_ADDR_REG4_0 (LOAD_ADDR_REG4_0) - Offset 5070h

LOAD_ADDR_REG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5070h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/O	**LOAD_ADDR_REG_4_0:** Physical address of the image for the verifier to verify. This register is updated by the loader once it has finished copying the IP's firmware image blobs into a physical address in the Processor memory map. These bits should be set before the Loading done bit is set.The address is aligned to a single dword.

2.2.188 Reg LOAD_ADDR_REG4_1 (LOAD_ADDR_REG4_1) - Offset 5074h

LOAD_ADDR_REG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5074h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/O	**LOAD_ADDR_REG_4_1:** Size of the image for the verifier to verify in KB's. Loader agents need to update this register before updating the loading done bit.

2.2.189 Reg LOAD_SIZE_REG4_0 (LOAD_SIZE_REG4_0) - Offset 5078h

LOAD_SIZE_REG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5078h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17	0h RW/O	**VERFIER_COPY_DONE_LD4:** Verifier copy done: This is an optional bit set by the verifier after it has consumed the FW image form he loader and should be used if it needs to communicate to the loader that the buffer indicated by this pair of address and size register can now be reclaimed by the Loader. Note that usage of this bit will imply that the verifier should also be in the WAC of the loader registers.
16	0h RW/O	**IP_READY_LD4:** IP ready for FW download: Optional bits one for each of the four FW instances in their respective registers. These bits should be connected to an Interrupt to the verifier either via MSI or via SB message to the agent designated as the loader according to the IP Capabilities register.
15:4	0h RO	**Reserved**
3:1	0h RW/O	**IOSF_ROOT_SPACE_LD4:** Optional field indicating the IOSF Root Space to be used by IP to accessing the loader address range. This is optional information that could be provided by low level firmware components like BIOS or other Processor agents to inform the IP if the physical address being loaded is not in System memory or an IMR region of system memory that is stolen from the OS. IP s should default to use RS0 and use this field only in special cases when they expect to not use OS addressable memory or a memory region accessible by a peer to peer path in the fabrics.
0	0h RW/O	**LOAD_DONE_LD4:** Loading Done: When this bit is set, it will inform the verifier that the firmware has successfully loaded into the physical memory address in bits 63:3. This bit along with the bits in the Loading error status register provide the status of the loading if loading was triggered but not completed.IP s could further optimize the usage of this bit by connecting it to an interrupt towards the host or the IP s controller.

2.2.190 Reg LOAD_SIZE_REG4_1 (LOAD_SIZE_REG4_1) - Offset 507Ch

LOAD_SIZE_REG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 507Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/O	**LOAD_SIZE_REG_4_1:** Physical address of the image for the verifier to verify. This register is updated by the loader once it has finished copying the IP's firmware image blobs into a physical address in the Processor memory map. These bits should be set before the Loading done bit is set.The address is aligned to a single dword.

2.2.191 Reg IP_HASH_REG1_00 (IP_HASH_REG1_00) - Offset 50C0h

IP_HASH_REG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 50C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_1_00:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.192 Reg IP_HASH_REG1_01 (IP_HASH_REG1_01) - Offset 50C4h

IP_HASH_REG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 50C4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_1_01:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.193 Reg IP_HASH_REG1_02 (IP_HASH_REG1_02) - Offset 50C8h

IP_HASH_REG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 50C8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_1_02:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.194 Reg IP_HASH_REG1_03 (IP_HASH_REG1_03) - Offset 50CCh

IP_HASH_REG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 50CCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_1_03:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.195 Reg IP_HASH_REG1_04 (IP_HASH_REG1_04) - Offset 50D0h

IP_HASH_REG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 50D0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_1_04:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.196 Reg IP_HASH_REG1_05 (IP_HASH_REG1_05) - Offset 50D4h

IP_HASH_REG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 50D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_1_05:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.197 Reg IP_HASH_REG1_06 (IP_HASH_REG1_06) - Offset 50D8h

IP_HASH_REG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 50D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_1_06:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.198 Reg IP_HASH_REG1_07 (IP_HASH_REG1_07) - Offset 50DCh

IP_HASH_REG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 50DCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_1_07:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.199 Reg IP_HASH_REG1_08 (IP_HASH_REG1_08) - Offset 50E0h

IP_HASH_REG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 50E0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_1_08:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.200 Reg IP_HASH_REG1_09 (IP_HASH_REG1_09) - Offset 50E4h

IP_HASH_REG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 50E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_1_09:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.201 Reg IP_HASH_REG1_10 (IP_HASH_REG1_10) - Offset 50E8h

IP_HASH_REG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 50E8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_1_10:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.202 Reg IP_HASH_REG1_11 (IP_HASH_REG1_11) - Offset 50ECh

IP_HASH_REG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 50ECh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_1_11:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.203 Reg IP_HASH_REG1_12 (IP_HASH_REG1_12) - Offset 50F0h

IP_HASH_REG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 50F0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_1_12:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.204 Reg IP_HASH_REG1_13 (IP_HASH_REG1_13) - Offset 50F4h

IP_HASH_REG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 50F4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_1_13:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.205 Reg IP_HASH_REG1_14 (IP_HASH_REG1_14) - Offset 50F8h

IP_HASH_REG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 50F8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_1_14:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.206 Reg IP_HASH_REG1_15 (IP_HASH_REG1_15) - Offset 50FCh

IP_HASH_REG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 50FCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_1_15:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.207 Reg IP_HASH_REG2_00 (IP_HASH_REG2_00) - Offset 5100h

IP_HASH_REG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5100h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_2_00:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.208 Reg IP_HASH_REG2_01 (IP_HASH_REG2_01) - Offset 5104h

IP_HASH_REG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5104h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_2_01:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.209 Reg IP_HASH_REG2_02 (IP_HASH_REG2_02) - Offset 5108h

IP_HASH_REG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5108h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_2_02:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.210 Reg IP_HASH_REG2_03 (IP_HASH_REG2_03) - Offset 510Ch

IP_HASH_REG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 510Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_2_03:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.211 Reg IP_HASH_REG2_04 (IP_HASH_REG2_04) - Offset 5110h

IP_HASH_REG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5110h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_2_04:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.212 Reg IP_HASH_REG2_05 (IP_HASH_REG2_05) - Offset 5114h

IP_HASH_REG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5114h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_2_05:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.213 Reg IP_HASH_REG2_06 (IP_HASH_REG2_06) - Offset 5118h

IP_HASH_REG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5118h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_2_06:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.214 Reg IP_HASH_REG2_07 (IP_HASH_REG2_07) - Offset 511Ch

IP_HASH_REG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 511Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_2_07:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.215 Reg IP_HASH_REG2_08 (IP_HASH_REG2_08) - Offset 5120h

IP_HASH_REG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5120h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_2_08:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.216 Reg IP_HASH_REG2_09 (IP_HASH_REG2_09) - Offset 5124h

IP_HASH_REG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5124h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_2_09:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.217 Reg IP_HASH_REG2_10 (IP_HASH_REG2_10) - Offset 5128h

IP_HASH_REG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5128h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_2_10:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.218 Reg IP_HASH_REG2_11 (IP_HASH_REG2_11) - Offset 512Ch

IP_HASH_REG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 512Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_2_11:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.219 Reg IP_HASH_REG2_12 (IP_HASH_REG2_12) - Offset 5130h

IP_HASH_REG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5130h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_2_12:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.220 Reg IP_HASH_REG2_13 (IP_HASH_REG2_13) - Offset 5134h

IP_HASH_REG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5134h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_2_13:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.221 Reg IP_HASH_REG2_14 (IP_HASH_REG2_14) - Offset 5138h

IP_HASH_REG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5138h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_2_14:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.222 Reg IP_HASH_REG2_15 (IP_HASH_REG2_15) - Offset 513Ch

IP_HASH_REG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 513Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_2_15:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.223 Reg IP_HASH_REG3_00 (IP_HASH_REG3_00) - Offset 5140h

IP_HASH_REG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5140h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_3_00:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.224 Reg IP_HASH_REG3_01 (IP_HASH_REG3_01) - Offset 5144h

IP_HASH_REG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5144h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_3_01:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.225 Reg IP_HASH_REG3_02 (IP_HASH_REG3_02) - Offset 5148h

IP_HASH_REG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5148h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_3_02:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.226 Reg IP_HASH_REG3_03 (IP_HASH_REG3_03) - Offset 514Ch

IP_HASH_REG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 514Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_3_03:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.227 Reg IP_HASH_REG3_04 (IP_HASH_REG3_04) - Offset 5150h

IP_HASH_REG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5150h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_3_04:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.228 Reg IP_HASH_REG3_05 (IP_HASH_REG3_05) - Offset 5154h

IP_HASH_REG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5154h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_3_05:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.229 Reg IP_HASH_REG3_06 (IP_HASH_REG3_06) - Offset 5158h

IP_HASH_REG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5158h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_3_06:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.230 Reg IP_HASH_REG3_07 (IP_HASH_REG3_07) - Offset 515Ch

IP_HASH_REG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 515Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_3_07:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.231 Reg IP_HASH_REG3_08 (IP_HASH_REG3_08) - Offset 5160h

IP_HASH_REG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5160h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_3_08:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.232 Reg IP_HASH_REG3_09 (IP_HASH_REG3_09) - Offset 5164h

IP_HASH_REG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5164h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_3_09:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.233 Reg IP_HASH_REG3_10 (IP_HASH_REG3_10) - Offset 5168h

IP_HASH_REG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5168h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_3_10:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.234 Reg IP_HASH_REG3_11 (IP_HASH_REG3_11) - Offset 516Ch

IP_HASH_REG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 516Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_3_11:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.235 Reg IP_HASH_REG3_12 (IP_HASH_REG3_12) - Offset 5170h

IP_HASH_REG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5170h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_3_12:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.236 Reg IP_HASH_REG3_13 (IP_HASH_REG3_13) - Offset 5174h

IP_HASH_REG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5174h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_3_13:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.237 Reg IP_HASH_REG3_14 (IP_HASH_REG3_14) - Offset 5178h

IP_HASH_REG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5178h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_3_14:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.238 Reg IP_HASH_REG3_15 (IP_HASH_REG3_15) - Offset 517Ch

IP_HASH_REG3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 517Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_3_15:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.239 Reg IP_HASH_REG4_00 (IP_HASH_REG4_00) - Offset 5180h

IP_HASH_REG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5180h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_4_00:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.240 Reg IP_HASH_REG4_01 (IP_HASH_REG4_01) - Offset 5184h

IP_HASH_REG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5184h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_4_01:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.241 Reg IP_HASH_REG4_02 (IP_HASH_REG4_02) - Offset 5188h

IP_HASH_REG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5188h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_4_02:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.242 Reg IP_HASH_REG4_03 (IP_HASH_REG4_03) - Offset 518Ch

IP_HASH_REG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 518Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_4_03:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.243 Reg IP_HASH_REG4_04 (IP_HASH_REG4_04) - Offset 5190h

IP_HASH_REG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5190h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_4_04:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.244 Reg IP_HASH_REG4_05 (IP_HASH_REG4_05) - Offset 5194h

IP_HASH_REG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5194h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_4_05:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.245 Reg IP_HASH_REG4_06 (IP_HASH_REG4_06) - Offset 5198h

IP_HASH_REG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5198h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_4_06:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.246 Reg IP_HASH_REG4_07 (IP_HASH_REG4_07) - Offset 519Ch

IP_HASH_REG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 519Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_4_07:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.247 Reg IP_HASH_REG4_08 (IP_HASH_REG4_08) - Offset 51A0h

IP_HASH_REG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 51A0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_4_08:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.248 Reg IP_HASH_REG4_09 (IP_HASH_REG4_09) - Offset 51A4h

IP_HASH_REG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 51A4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_4_09:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.249 Reg IP_HASH_REG4_10 (IP_HASH_REG4_10) - Offset 51A8h

IP_HASH_REG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 51A8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_4_10:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.250 Reg IP_HASH_REG4_11 (IP_HASH_REG4_11) - Offset 51ACh

IP_HASH_REG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 51ACh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_4_11:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.251 Reg IP_HASH_REG4_12 (IP_HASH_REG4_12) - Offset 51B0h

IP_HASH_REG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 51B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_4_12:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.252 Reg IP_HASH_REG4_13 (IP_HASH_REG4_13) - Offset 51B4h

IP_HASH_REG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 51B4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_4_13:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.253 Reg IP_HASH_REG4_14 (IP_HASH_REG4_14) - Offset 51B8h

IP_HASH_REG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 51B8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_4_14:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.254 Reg IP_HASH_REG4_15 (IP_HASH_REG4_15) - Offset 51BCh

IP_HASH_REG4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 51BCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_HASH_4_15:** HASH of the image being verified. This register should be used to pass on the HASH of the image from the loader to the verifier in case they are not one and the same or in the case the IP itself is doing the loader role while the verifier is some external IP.This register needs to be enabled in IP's that have direct access to storage and can DMA or copy data to an external verifier. The IP should also support HASH algorithms in either SW or HW to make use of this register.

2.2.255 Reg IP_GP_REG1_0 (IP_GP_REG1_0) - Offset 5200h

IP_GPREG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5200h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_GPR_1_0:** Optional general purpose registers for any customized information that needs to be exchanged with IP.

2.2.256 Reg IP_GP_REG1_1 (IP_GP_REG1_1) - Offset 5204h

IP_GPREG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5204h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_GPR_1_1:** Optional general purpose registers for any customized information that needs to be exchanged with IP.

2.2.257 Reg IP_GP_REG1_2 (IP_GP_REG1_2) - Offset 5208h

IP_GPREG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5208h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_GPR_1_2:** Optional general purpose registers for any customized information that needs to be exchanged with IP.

2.2.258 Reg IP_GP_REG1_3 (IP_GP_REG1_3) - Offset 520Ch

IP_GPREG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 520Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_GPR_1_3:** Optional general purpose registers for any customized information that needs to be exchanged with IP.

2.2.259 Reg IP_GP_REG1_4 (IP_GP_REG1_4) - Offset 5210h

IP_GPREG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5210h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_GPR_1_4:** Optional general purpose registers for any customized information that needs to be exchanged with IP.

2.2.260 Reg IP_GP_REG1_5 (IP_GP_REG1_5) - Offset 5214h

IP_GPREG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5214h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_GPR_1_5:** Optional general purpose registers for any customized information that needs to be exchanged with IP.

2.2.261 Reg IP_GP_REG1_6 (IP_GP_REG1_6) - Offset 5218h

IP_GPREG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5218h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_GPR_1_6:** Optional general purpose registers for any customized information that needs to be exchanged with IP.

2.2.262 Reg IP_GP_REG1_7 (IP_GP_REG1_7) - Offset 521Ch

IP_GPREG1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 521Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_GPR_1_7:** Optional general purpose registers for any customized information that needs to be exchanged with IP.

2.2.263 Reg IP_GP_REG2_0 (IP_GP_REG2_0) - Offset 5220h

IP_GPREG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5220h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_GPR_2_0:** Optional general purpose registers for any customized information that needs to be exchanged with IP.

2.2.264 Reg IP_GP_REG2_1 (IP_GP_REG2_1) - Offset 5224h

IP_GPREG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5224h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_GPR_2_1:** Optional general purpose registers for any customized information that needs to be exchanged with IP.

2.2.265 Reg IP_GP_REG2_2 (IP_GP_REG2_2) - Offset 5228h

IP_GPREG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5228h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_GPR_2_2:** Optional general purpose registers for any customized information that needs to be exchanged with IP.

2.2.266 Reg IP_GP_REG2_3 (IP_GP_REG2_3) - Offset 522Ch

IP_GPREG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 522Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_GPR_2_3:** Optional general purpose registers for any customized information that needs to be exchanged with IP.

2.2.267 Reg IP_GP_REG2_4 (IP_GP_REG2_4) - Offset 5230h

IP_GPREG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5230h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_GPR_2_4:** Optional general purpose registers for any customized information that needs to be exchanged with IP.

2.2.268 Reg IP_GP_REG2_5 (IP_GP_REG2_5) - Offset 5234h

IP_GPREG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5234h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_GPR_2_5:** Optional general purpose registers for any customized information that needs to be exchanged with IP.

2.2.269 Reg IP_GP_REG2_6 (IP_GP_REG2_6) - Offset 5238h

IP_GPREG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5238h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_GPR_2_6:** Optional general purpose registers for any customized information that needs to be exchanged with IP.

2.2.270 Reg IP_GP_REG2_7 (IP_GP_REG2_7) - Offset 523Ch

IP_GPREG2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 523Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**IP_GPR_2_7:** Optional general purpose registers for any customized information that needs to be exchanged with IP.

2.2.271 Reg IP_ACCESS_LOG_REG (IP_ACCESS_LOG_REG) - Offset 5240h

IP_ACCESS_LOG.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5240h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	00000000h RO	**IP_ACC_ADDR_LOG:** Access log reg.
0	0h RO	**IP_ACC_RW_LOG:** Access log reg.

2.2.272 Control Policy Low (OSE_SEC_REG_LOW) - Offset 6000h

LSB 32 bit Register for configuring Control Policy.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6000h	01200010h

Bit Range	Default & Access	Field Name (ID): Description
31:0	01200010h RW	**Control Policy (LOW):** Bits 31:0.

2.2.273 Control Policy High (OSE_SEC_REG_HIGH) - Offset 6004h

MSB 32 bit Register for configuring Control Policy.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6004h	00000C00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000C00h RW	**Control Policy (HIGH):** Bits 63:32.

2.2.274 OSE_OWNED_IP_RAC_LOW - Offset 6008h

LSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6008h	05200010h

Bit Range	Default & Access	Field Name (ID): Description
31:0	05200010h RW	**LOW:** Bits 31:0.

2.2.275 OSE_OWNED_IP_RAC_HIGH - Offset 600Ch

MSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 600Ch	00000C00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000C00h RW	**HIGH:** Bits 63:32.

2.2.276 OSE_OWNED_IP_WAC_LOW - Offset 6010h

LSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6010h	05200010h

Bit Range	Default & Access	Field Name (ID): Description
31:0	05200010h RW	**LOW:** Bits 31:0.

2.2.277 OSE_OWNED_IP_WAC_HIGH - Offset 6014h

MSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6014h	00000C00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000C00h RW	**HIGH:** Bits 63:32.

2.2.278 OSE_LH_OWNED_IP_RAC_LOW - Offset 6018h

LSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6018h	0120001Fh

Bit Range	Default & Access	Field Name (ID): Description
31:0	0120001Fh RW	**LOW:** Bits 31:0.

2.2.279 OSE_LH_OWNED_IP_RAC_HIGH - Offset 601Ch

MSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 601Ch	00000E20h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000E20h RW	**HIGH:** Bits 63:32.

2.2.280 OSE_LH_OWNED_IP_WAC_LOW - Offset 6020h

LSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6020h	0120001Fh

Bit Range	Default & Access	Field Name (ID): Description
31:0	0120001Fh RW	**LOW:** Bits 31:0.

2.2.281 OSE_LH_OWNED_IP_WAC_HIGH - Offset 6024h

MSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6024h	00000E20h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000E20h RW	**HIGH:** Bits 63:32.

2.2.282 NULL_OWNED_IP_RAC_LOW - Offset 6028h

LSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6028h	01200010h

Bit Range	Default & Access	Field Name (ID): Description
31:0	01200010h RW	**LOW:** Bits 31:0.

2.2.283 NULL_OWNED_IP_RAC_HIGH - Offset 602Ch

MSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 602Ch	00000C00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000C00h RW	**HIGH:** Bits 63:32.

2.2.284 NULL_OWNED_IP_WAC_LOW - Offset 6030h

LSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6030h	01200010h

Bit Range	Default & Access	Field Name (ID): Description
31:0	01200010h RW	**LOW:** Bits 31:0.

2.2.285 NULL_OWNED_IP_WAC_HIGH - Offset 6034h

MSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6034h	00000C00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000C00h RW	**HIGH:** Bits 63:32.

2.2.286 LH2OSE_IPC_OS_REGION_RAC_LOW - Offset 6038h

LSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6038h	0520001Fh

Bit Range	Default & Access	Field Name (ID): Description
31:0	0520001Fh RW	**LOW:** Bits 31:0.

2.2.287 LH2OSE_IPC_OS_REGION_RAC_HIGH - Offset 603Ch

MSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 603Ch	00000E00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000E00h RW	**HIGH:** Bits 63:32.

2.2.288 LH2OSE_IPC_OS_REGION_WAC_LOW - Offset 6040h

LSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6040h	0520001Fh

Bit Range	Default & Access	Field Name (ID): Description
31:0	0520001Fh RW	**LOW:** Bits 31:0.

2.2.289 LH2OSE_IPC_OS_REGION_WAC_HIGH - Offset 6044h

MSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6044h	00000E00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000E00h RW	**HIGH:** Bits 63:32.

2.2.290 LH2OSE_IPC_BIOS_REGION_RAC_LOW - Offset 6048h

LSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6048h	05200010h

Bit Range	Default & Access	Field Name (ID): Description
31:0	05200010h RW	**LOW:** Bits 31:0.

2.2.291 LH2OSE_IPC_BIOS_REGION_RAC_HIGH - Offset 604Ch

MSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 604Ch	00000C00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000C00h RW	**HIGH:** Bits 63:32.

2.2.292 LH2OSE_IPC_BIOS_REGION_WAC_LOW - Offset 6050h

LSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6050h	01200010h

Bit Range	Default & Access	Field Name (ID): Description
31:0	01200010h RW	**LOW:** Bits 31:0.

2.2.293 LH2OSE_IPC_BIOS_REGION_WAC_HIGH - Offset 6054h

MSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6054h	00000C00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000C00h RW	**HIGH:** Bits 63:32.

2.2.294 OSE_SRAM_LH2OSE_REG1_REGION_RAC_LOW - Offset 6058h

LSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6058h	0520001Fh

Bit Range	Default & Access	Field Name (ID): Description
31:0	0520001Fh RW	**LOW:** Bits 31:0.

2.2.295 OSE_SRAM_LH2OSE_REG1_REGION_RAC_HIGH - Offset 605Ch

MSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 605Ch	00000E00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000E00h RW	**HIGH:** Bits 63:32.

2.2.296 OSE_SRAM_LH2OSE_REG1_REGION_WAC_LOW - Offset 6060h

LSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6060h	0520001Fh

Bit Range	Default & Access	Field Name (ID): Description
31:0	0520001Fh RW	**LOW:** Bits 31:0.

2.2.297 OSE_SRAM_LH2OSE_REG1_REGION_WAC_HIGH - Offset 6064h

MSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6064h	00000E00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000E00h RW	**HIGH:** Bits 63:32.

2.2.298 OSE_SRAM_LH2OSE_REG2_REGION_RAC_LOW - Offset 6068h

LSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6068h	0520001Fh

Bit Range	Default & Access	Field Name (ID): Description
31:0	0520001Fh RW	**LOW:** Bits 31:0.

2.2.299 OSE_SRAM_LH2OSE_REG2_REGION_RAC_HIGH - Offset 606Ch

MSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 606Ch	00000E00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000E00h RW	**HIGH:** Bits 63:32.

2.2.300 OSE_SRAM_LH2OSE_REG2_REGION_WAC_LOW - Offset 6070h

LSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6070h	0520001Fh

Bit Range	Default & Access	Field Name (ID): Description
31:0	0520001Fh RW	**LOW:** Bits 31:0.

2.2.301 OSE_SRAM_LH2OSE_REG2_REGION_WAC_HIGH - Offset 6074h

MSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6074h	00000E00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000E00h RW	**HIGH:** Bits 63:32.

2.2.302 OSE_SRAM_LH2OSE_REG3_REGION_RAC_LOW - Offset 6078h

LSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6078h	0520001Fh

Bit Range	Default & Access	Field Name (ID): Description
31:0	0520001Fh RW	**LOW:** Bits 31:0.

2.2.303 OSE_SRAM_LH2OSE_REG3_REGION_RAC_HIGH - Offset 607Ch

MSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 607Ch	00000E00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000E00h RW	**HIGH:** Bits 63:32.

2.2.304 OSE_SRAM_LH2OSE_REG3_REGION_WAC_LOW - Offset 6080h

LSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6080h	0520001Fh

Bit Range	Default & Access	Field Name (ID): Description
31:0	0520001Fh RW	**LOW:** Bits 31:0.

2.2.305 OSE_SRAM_LH2OSE_REG3_REGION_WAC_HIGH - Offset 6084h

MSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6084h	00000E00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000E00h RW	**HIGH:** Bits 63:32.

2.2.306 OSE_LH2OSE_SRAM_GBEPROXY_REGION_RAC_LOW - Offset 6088h

LSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6088h	0520001Fh

Bit Range	Default & Access	Field Name (ID): Description
31:0	0520001Fh RW	**LOW:** Bits 31:0.

2.2.307 OSE_LH2OSE_SRAM_GBEPROXY_REGION_RAC_HIGH - Offset 608Ch

MSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 608Ch	00000E00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000E00h RW	**HIGH:** Bits 63:32.

2.2.308 OSE_LH2OSE_SRAM_GBEPROXY_REGION_WAC_LOW - Offset 6090h

LSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6090h	0520001Fh

Bit Range	Default & Access	Field Name (ID): Description
31:0	0520001Fh RW	**LOW:** Bits 31:0.

2.2.309 OSE_LH2OSE_SRAM_GBEPROXY_REGION_WAC_HIGH - Offset 6094h

MSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6094h	00000E00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000E00h RW	**HIGH:** Bits 63:32.

2.2.310 OSE_CSE_IPC_RAC_LOW - Offset 6098h

LSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6098h	05210010h

Bit Range	Default & Access	Field Name (ID): Description
31:0	05210010h RW	**LOW:** Bits 31:0.

2.2.311 OSE_CSE_IPC_RAC_HIGH - Offset 609Ch

MSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 609Ch	00000C00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000C00h RW	**HIGH:** Bits 63:32.

2.2.312 OSE_CSE_IPC_WAC_LOW - Offset 60A0h

LSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 60A0h	05210010h

Bit Range	Default & Access	Field Name (ID): Description
31:0	05210010h RW	**LOW:** Bits 31:0.

2.2.313 OSE_CSE_IPC_WAC_HIGH - Offset 60A4h

MSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 60A4h	00000C00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000C00h RW	**HIGH:** Bits 63:32.

2.2.314 OSE_PMC_IPC_RAC_LOW - Offset 60A8h

LSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 60A8h	05200010h

Bit Range	Default & Access	Field Name (ID): Description
31:0	05200010h RW	**LOW:** Bits 31:0.

2.2.315 OSE_PMC_IPC_RAC_HIGH - Offset 60ACh

MSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 60ACh	00000C00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000C00h RW	**HIGH:** Bits 63:32.

2.2.316 OSE_PMC_IPC_WAC_LOW - Offset 60B0h

LSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 60B0h	05200010h

Bit Range	Default & Access	Field Name (ID): Description
31:0	05200010h RW	**LOW:** Bits 31:0.

2.2.317 OSE_PMC_IPC_WAC_HIGH - Offset 60B4h

MSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 60B4h	00000C00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000C00h RW	**HIGH:** Bits 63:32.

2.2.318 OSE_AUDIO_IPC_RAC_LOW - Offset 60B8h

LSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 60B8h	05200010h

Bit Range	Default & Access	Field Name (ID): Description
31:0	05200010h RW	**LOW:** Bits 31:0.

2.2.319 OSE_AUDIO_IPC_RAC_HIGH - Offset 60BCh

MSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 60BCh	00020C00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00020C00h RW	**HIGH:** Bits 63:32.

2.2.320 OSE_AUDIO_IPC_WAC_LOW - Offset 60C0h

LSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 60C0h	05200010h

Bit Range	Default & Access	Field Name (ID): Description
31:0	05200010h RW	**LOW:** Bits 31:0.

2.2.321 OSE_AUDIO_IPC_WAC_HIGH - Offset 60C4h

MSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 60C4h	00020C00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00020C00h RW	**HIGH:** Bits 63:32.

2.2.322 OSE_SBEP_WAC_LOW - Offset 60C8h

LSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 60C8h	07210010h

Bit Range	Default & Access	Field Name (ID): Description
31:0	07210010h RW	**LOW:** Bits 31:0.

2.2.323 OSE_SBEP_WAC_HIGH - Offset 60CCh

MSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 60CCh	00020C00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00020C00h RW	**HIGH:** Bits 63:32.

2.2.324 OSE_SBEP_BOOTPREP_WAC_LOW - Offset 60D0h

LSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 60D0h	05200000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	05200000h RW	**LOW:** Bits 31:0.

2.2.325 OSE_SBEP_BOOTPREP_WAC_HIGH - Offset 60D4h

MSB 32 bit Register for configuring Policy/Range.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 60D4h	00000C00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000C00h RW	**HIGH:** Bits 63:32.

3 TSN GbE Controller

3.1 TSN GbE Configuration Registers Summary

This registers of the Intel® PSE devices. This contains multiple Intel® PSE TSN GbE Controller devices:

- Intel® PSE TSN GbE Controller #0 - Bus: 0, Device: 29, Function: 1
- Intel® PSE TSN GbE Controller #1 - Bus: 0, Device: 29, Function: 2

DID Values:

- Intel® PSE TSN GbE Controller #0 - D29: F1
  - 4BA0h (RGMII: 1Gb Mode)
  - 4BA1h (SGMII: 1Gb Mode)
  - 4BA2h (SGMII: 2.5Gb Mode)
- Intel® PSE TSN GbE Controller #1 - D29: F2
  - 4BB0h (RGMII: 1Gb Mode)
  - 4BB1h (SGMII: 1Gb Mode)
  - 4BB2h (SGMII: 2.5Gb Mode)

The Function is discovered by software as a Root Complex integrated Endpoint (RCiEP). The PCI Bus Number, Device Number, and Function Number are assigned by the PCH design and not enumerated. Because it is an RCiEP, some of the register fields are designed to be altered by BIOS for a particular system implementation.

Note: BIOS has the capability to disable software access to the PCI Configuration Space of this Function. When disabled, the Function returns Unsupported Request (UR) to requests to access its configuration registers.

Table 3-1. Summary of Bus: 0, Devices: 29, Function: 1 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	Device ID and Vendor ID Register (DEVVENDID)	4BAx0000h
4h	4	Status and Command (STATUSCOMMAND)	00100000h
8h	4	Revision ID and Class Code (REVCLASSCODE)	00000000h
Ch	4	Cache Line Latency Header and BIST (CLLATHEADERBIST)	00000000h
10h	4	Base Address Register (BAR)	00000000h
14h	4	Base Address Register High (BAR_HIGH)	00000000h
18h	4	Base Address Register1 (BAR1)	00000000h
1Ch	4	Base Address Register1 High (BAR1_HIGH)	00000000h
2Ch	4	Subsystem Vendor and Subsystem ID (SUBSYSTEMID)	00000000h
30h	4	Expansion ROM Base Address (EXPANSION_ROM_BASEADDR)	00000000h
34h	4	Capabilities Pointer (CAPABILITYPTR)	00000080h

3.1.1 Device ID and Vendor ID Register (DEVVENDID) — Offset 0h

Device ID and Vendor ID.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + 0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	4BAxh RO/P	**Device ID Field (DEVICEID):** Device ID identifies the particular PCI device - 4BA0h (RGMII: 1Gb Mode) - 4BA1h (SGMII: 1Gb Mode) - 4BA2h (SGMII: 2.5Gb Mode)
15:0	0000h RO	**Vendor ID Field (VENDORID):** Vendor ID is a unique ID provided by the PCI SIG which identifies the manufacturer of the device

3.1.2 Status and Command (STATUSCOMMAND) — Offset 4h

Command Register and Status Register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + 4h	00100000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C	**Detected Parity Error (DPE):** Detected Parity Error
30	0h RW/1C	**Signaled System Error (SSE):** Signaled System Error
29	0h RW/1C	**RMA Field (RMA):** Received Master Abort
28	0h RW/1C	**RTA Field (RTA):** Received Target Abort
27:25	0h RO	**Reserved**
24	0h RW/1C	**Master Data Parity Error (MDPE):** Master Data Parity Error
23:21	0h RO	**Reserved**
20	1h RO	**Cap List Field (CAPLIST):** Capabilities List: Indicates that the controller contains a capabilities pointer list
19	0h RO	**Interrupt Status Field (INTR_STATUS):** Interrupt Status: This bit reflects state of interrupt in the device

Bit Range	Default & Access	Field Name (ID): Description
18:11	0h RO	**Reserved**
10	0h RW	**Interrupt Disable Field (INTR_DISABLE):** If '1', SB Interrupt generation is disabled If '0', SB Interrupt generation is enabled
9	0h RO	**Reserved**
8	0h RW	**SERR Enable Field (SERR_ENABLE):** SERR Enable Not implemented
7	0h RO	**Reserved**
6	0h RW	**Parity Error Response Enable (PERE):** Parity Error Response Enable
5:3	0h RO	**Reserved**
2	0h RW	**BME Field (BME):** Bus Master Enable
1	0h RW	**MSE Field (MSE):** Memory Space Enable
0	0h RO	**Reserved**

3.1.3 Revision ID and Class Code (REVCLASSCODE) — Offset 8h

Revision ID register and Class Code Register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + 8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	**Revision Id Field (CLASS_CODES):** Class Code register is read-only and is used to identify the generic function of the device and in some cases a specific register-level programming interface
7:0	00h RO/P	**Class Code Field (RID):** Revision ID identifies the revision of particular PCI device.

3.1.4 Cache Line Latency Header and BIST (CLLATHEADERBIST) — Offset Ch

Cache Line size as RW with def 0 Latency timer RW with def 0 Header type with Type 0 configuration header and Reserved BIST Register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	0h RO	**MultifunctionDevice Field (MULFNDEV):** Multi-Function Device: This bit is set only if the device has multiple functions. For VF, this bit is set to 0
22:16	00h RO	**Header Type Field (HEADERTYPE):** Header Type: Implements Type 0 Configuration header
15:8	00h RO	**Latency Timer Field (LATTIMER):** Latency Timer:. This register is implemented as R/W with default as 0
7:0	00h RW/P	**Cache Line Size Field (CACHELINE_SIZE):** Cache Line Size: Does not apply to PCI Express. PCI Express spec requires this to be implemented as an R/W register but has no functional impact on the AMBA Device connected. This field is RO and tied to 0 for VFs.

3.1.5 Base Address Register (BAR) — Offset 10h

Base Address Register low [31:2] type[2:1] in 32bit or 64bit address range and memory space indicator [0].

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR):** Base Address Register Low Base address of the AXI fabric memory space. Taken from Strap values as ones
11:4	00h RO	**Size Field (SIZEINDICATOR):** Size Indicator RO Always returns 0 The size of this register depends on the size of the memory space
3	0h RO	**Prefetchable Field (PREFETCHABLE):** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**Type Field (TYPE0):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE):** Memory Space Indicator: 0 indicates this BAR is present in the memory space.

3.1.6 Base Address Register High (BAR_HIGH) — Offset 14h

Base Address Register High enabled if [2:1] of BAR_HIGH is 10.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR_HIGH):** Base Address High - MSB

3.1.7 Base Address Register1 (BAR1) — Offset 18h

Base Address Register1 accesses to PCI configuration space and is always 4K type in [2:1] and memory space indicator in [0].

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + 18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR1):** Base Address1 This field is present if BAR1 is enabled through private configuration space.
11:4	00h RO	**Size Field (SIZEINDICATOR1):** Always is 0 as minimum size is 4K
3	0h RO	**Prefetchable Field (PREFETCHABLE1):** Prefetchable: Indicates that this BAR is not prefetchable.
2:1	0h RO	**Type Field (TYPE1):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE1):** Memory Space Indicator: 0 Indicates this BAR is present in the memory space

3.1.8 Base Address Register1 High (BAR1_HIGH) — Offset 1Ch

Base Address Register1 High enabled only if [2:1] of BAR1_HIGH Register is 10.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + 1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR1_HIGH):** Base Address: Base address of the AXI fabric memory space. Taken from Strap values as ones

3.1.9 Subsystem Vendor and Subsystem ID (SUBSYSTEMID) — Offset 2Ch

SVID Register along with SID Register is to distinguish subsystem from another.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + 2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O/P	**Subsystem ID Field (SUBSYSTEMID):** Subsystem ID: This register is implemented for any function that can be instantiated more than once in a given system.
15:0	0000h RW/O/P	**Subsystem Vendor Field (SUBSYSTEMVENDORID):** Subsystem Vendor ID: This register must be implemented for any function that can be instantiated more than once in a given system

3.1.10 Expansion ROM Base Address (EXPANSION_ROM_BASEADDR) — Offset 30h

Expansion ROM Base Address Register is a RO indicates support for Expansion ROMs

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + 30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Expansion Rom Base Address Field (EXPANSION_ROM_BASE):** Expansion ROM Base Address: Value of all zeros indicates no support for Expansion ROM

3.1.11 Capabilities Pointer (CAPABILITYPTR) — Offset 34h

Capabilities Pointer Register indicates what the next capability is.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + 34h	00000080h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	80h RO	**Capabilities Pointer Field (CAPPTR_POWER):** Capabilities Pointer: Indicates what the next capability is.

3.1.12 Interrupt Register (INTERRUPTREG) — Offset 3Ch

Interrupt Line Register isn't used in Bridge directly Interrupt Pin Register reflects the IPIN value in private configuration space. MIN_GNT Register indicating the requirement of latency timers and MAX_LAT Register max latency.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + 3Ch	00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Max Latency Field (MAX_LAT):** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	00h RO	**Min GNT Field (MIN_GNT):** Value of 0 indicates device has no major requirements for the settings of latency timers
15:12	0h RO	**Reserved**
11:8	1h RO	**Interrupt Pin Field (INTPIN):** Interrupt Pin: Value in this register is reflected from the IPIN value in the private configuration space.
7:0	00h RW/P	**Interrupt Line Field (INTLINE):** Interrupt Line: It is used to communicate to software the interrupt line to which the interrupt pin is connected

3.1.13 PCIe Capabilities Register (PCIECAPREG) — Offset 40h

PCIe Capabilities Register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + 40h	00920010h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:25	00h RO/V	**Interrupt Message Number Field (INTR_MSG_NUM):** PCIe Interrupt Message Number
24	0h RO	**Slot Implemented Field (SLOT_IMPLEMENTED):** Slot Implemented. Tied to 0
23:20	9h RO	**Dev Port Type Field (DEV_PORT_TYPE):** Device Port Type. Taken from strap
19:16	2h RO	**Cap Version Field (CAP_VER):** PCI Capability Version
15:8	00h RO	**Next Capability Pointer Field (NEXT_CAP_PTR):** Next Capability Pointer
7:0	10h RO	**Capability ID Field (PCIE_CAP_ID):** PCIe Capability ID

3.1.14 PCIe Device Capability Register (DEVCAPREG) — Offset 44h

PCIe Device Cap Register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + 44h	10008FC0h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	1h RO	**FLR Capability Field (FLR_CAP):** FLR Capability
27:26	0h RO	**Captured Slot Power Limit Scale Field (CAP_SLOT_PWR_LIM_SCALE):** Captured Slot Power Limit Scale. Tied to 0
25:18	00h RO	**Captured Slot Power Limit Value Field (CAP_SLOT_PWR_LIM_VAL):** Captured Slot Power Limit Value. Tied to 0
17:16	0h RO	**Reserved**
15	1h RO	**RB error PTR Field (RB_ERR_RPTR):** Role Based Error Reporting
14:12	0h RO	**Reserved**
11:9	7h RO	**EP L01 Acceptable Latency Field (EP_L1_ACC_LAT):** L1 Acceptable Latency
8:6	7h RO	**EP L0 Acceptable Latency Field (EP_L0_ACC_LAT):** L0 Acceptable Latency
5	0h RO	**ETF Support Field (ETF_SUPPORT):** Extended Tag Field Support
4:3	0h RO	**Phantom Functions Support Field (PHANTOM_FUNC_SUPPORT):** Phantom Functions SUPPORT. NA for Bridge
2:0	0h RO	**Max Pl Size Support Field (MAX_PL_SIZE_SUPPORT):** Max Payload Size

3.1.15 PCIe Device Control Status Register (DEVCTRLSTAT) — Offset 48h

PCIe Device Status Register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + 48h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21	0h RO/V	**TXN Pending Field (TXN_PENDING):** Transaction Pending bit
20	0h RO	**Aux Power Detected Field (AUX_PWR_DETECTED):** Aux Power Detected. Always tied to 0
19	0h RW/1C	**UR Field (UR_DETECTED):** Unsupported Request Detected
18	0h RW/1C	**Fatal Error Detected Field (FER_DETECTED):** Fatal Error Detected
17	0h RO	**Non Fatal Err Detected Field (NFER_DETECTED):** Non Fatal Error Detected
16	0h RO	**Correctable Error Detected Field (CER_DETECTED):** Correctable Error Detected
15	0h WO	**Initiate FLR Field (INITIATE_FLR):** Initiate Function Level Reset
14:12	0h RO	**Max Read Request Size Field (MAX_RD_REQ_SIZE):** Max Read Request Size
11	0h RW	**Enable No Snoop Field (EN_NS):** Enable No Snoop
10	0h RO	**Aux Power Detected Field (AUX_PWR_PM_EN):** Aux Power Enable
9	0h RO	**Phantom Function En Field (PHANTOM_FUNC_EN):** Phantom Function Enable. Not support by Bridge
8	0h RW	**ETF En Field (ETF_EN):** Extended Tag Field Enable
7:5	0h RO	**Max Payload Size Field (MAX_PL_SIZE):** Maximum Payload Size
4	0h RW	**Enable Relaxed Ordering Field (EN_RO):** Enable Relaxed Ordering
3	0h RW	**UR Reporting En Field (URR_EN):** Unsupported Request Reporting Enable
2	0h RW	**Fatal Err Reporting En Field (FER_EN):** Fatal Error Reporting Enable
1	0h RW	**Non Fatal Err Reporting En Field (NFER_EN):** Non Fatal Error Reporting Enable
0	0h RW	**Correctable Error Reporting En Field (CER_EN):** Correctable Error Reporting Enable

3.1.16 PCIe Device Capability2 Register (DEVCAPREG2) — Offset 64h

PCIe Device Cap Register2.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + 64h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:22	0h RO	**Max End2end TLP Prefix Field (MAX_EE_TLP_PREFIXES):** Max End2End TLP Prefixes
21	0h RO	**End2end TLP Prefix Supported Field (EE_TLP_PREFIX_SUPPORT):** End2End TLP Prefixes Support
20	0h RO	**Ext Format Support Field (EXTD_FMT_SUPPORT):** Extended Format Support
19:18	0h RO	**OBFF Support Field (OBFF_SUPPORT):** PCI OBFF Support
17:14	0h RO	**Reserved**
13:12	0h RO	**TPH Completer Supported Field (TPH_CPL_SUPPORT):** TPH Completer Support
11	0h RO	**LTR Support Field (LTR_SUPPORT):** LTR Support
10	0h RO	**No RO Enable Field (NRO_EN_PRPR_PASS):** No RO based PR-PR Passing
9	0h RO	**CAS Cpl 128 Support Field (CAS_CPL_SUPPORT_128):** CAS128 Support
8	0h RO	**CAS Cpl 64 Support Field (ATM_OP_CPL_SUPPORT_64):** CAS64 Completion Support
7	0h RO	**CAS Cpl 32 Support Field (ATM_OP_CPL_SUPPORT_32):** CAS32 Completion Support
6	0h RO	**Atomic Operation Routing Field (ATOR_SUPPORT):** Atomic Operation Routing Support
5	0h RO	**PCI Ari Forwarding Support Field (ARI_FWD_SUPPORT):** ARI Forwarding Support
4	0h RO	**Cpl Timeout Disable Support Field (CPL_TO_DIS_SUPPORT):** Completion Timeout Disable Support
3:0	0h RO	**Cpl Timeout Range Support Field (CPL_TO_RNG_SUPPORT):** Completion Timeout Ranges Support

3.1.17 PCIe Device Control2 Status Register (DEVCTRLSTAT2) — Offset 68h

PCIe Device Status Register2.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + 68h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RO	**End2end TLP Prefix Blocking Field (EE_TLP_PREFIX_EN):** End2End TLP Prefixes Blocking
14:13	0h RO	**OBFF Enable Field (OBFF_EN):** OBFF Enable
12:11	0h RO	**Reserved**
10	0h RW	**LTR Mechanism Enable Field (LTR_MECH_EN):** LTR Mechanism Enable
9	0h RO	**IDO Based Cpl Enable Field (IDO_CPL_EN):** IDO Completion Enable
8	0h RO	**IDO Based Request Enable Field (IDO_REQ_EN):** IDO Request Enable
7	0h RO	**Atomic Op Egress Blocking Field (ATM_OP_EGR_BLK):** Atomic Operation Egress Blocking
6	0h RO	**Atomic Op Requester Enable Field (ATM_OP_REQ_EN):** Atomic Operation Requester Enable
5	0h RO	**ARI Fwd Enable Field (ARI_FWD_EN):** ARI Forwarding Enable
4	0h RW	**Cpl Timeout Disable Field (CPL_TO_DIS):** Completion Timeout Disable Support
3:0	0h RW	**Cpl Timeout Value Field (CPL_TO_VAL):** Completion Timeout Value

3.1.18 Power Management Capability ID (POWERCAPID) — Offset 80h

Power Management Capability ID Register points to Next Capability Structure and Power Management Capability with pOwer Management Capabilities Register for PME Support and Version.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + 80h	48030001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	09h RO	**PME Support Field (PMESUPPORT):** This 5-bit field indicates the power states in which the function can assert the PME#
26:19	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
18:16	3h RO	**Version Field (VERSION):** Indicates support for Revision 1.2 of the PCI Power Management Specification
15:8	00h RO	**Next Cap Field (NXTCAP):** Next Capability: Points to the next capability structure.
7:0	01h RO	**Power Capability ID Field (POWER_CAP):** Power Management Capability: Indicates this is power management capability

3.1.19 Power Management Control and Status Register (PMECTRLSTATUS) — Offset 84h

Power Management Control and Status Register to set and read PME Status, PME Enable No Soft Reset and Power State.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + 84h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW/1C/P	**PME Status Field (PMESTATUS):** PME Status: 0 = Software clears the bit by writing a 1 to it. 1 = This bit is set when the AMBA Device would normally assert the PME# signal independent of the state of the PME Enable bit (bit 8 in this register)
14:9	0h RO	**Reserved**
8	0h RW/P	**PME Enable Field (PMEENABLE):** PME Enable: A 1 enables the function to assert PME#. When 0, PME# message on Sideband is disabled.
7:4	0h RO	**Reserved**
3	1h RO	**No Soft Reset Field (NO_SOFT_RESET):** This bit indicates that devices transitioning from D3hot to D0 because of Power State commands do not perform an internal reset
2	0h RO	**Reserved**
1:0	0h RW	**Power State Field (POWERSTATE):** Power State: This field is used both to determine the current power state and to set a new power state

3.1.20 PCI Device Idle Vendor Capability Register (PCIDEVIDLE_CAP_RECORD) — Offset 90h

PCI Device Vendor Specific Capability Register defines Vendor Specific Capability ID, Revision Length, Next Capability and CAPID.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + 90h	F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**Vendor Cap Field (VEND_CAP):** Vendor Specific Capability ID
27:24	0h RO	**Revision ID Field (REVID):** Revision ID of capability structure
23:16	14h RO	**Cap Length Field (CAP_LENGTH):** Vendor Specific Capability Length
15:8	00h RO	**Next Capability Field (NEXT_CAP):** Next Capability
7:0	09h RO	**Capability ID Field (CAPID):** Capability ID

3.1.21 Vendor Specific Extended Capability Register (DEVID_VEND_SPECIFIC_REG) — Offset 94h

Extended Vendor Capability Register for VSEC Length, Revision and ID.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1]+ 94h	01400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	014h RO	**Vendor Specific ID Field (VSEC_LENGTH):** Vendor Specific Extended Capability Length
19:16	0h RO	**Vendor Specific Revision Field (VSEC_REV):** Vendor specific Extended Capability revision
15:0	0010h RO	**Vendor Specific Length Field (VSECID):** Vendor Specific Extended Capability ID

3.1.22 Software LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG) — Offset 98h

Software Location Pointer in MMIO space as an offset specified by BAR.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + 98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RO	**SW LTR DWord Offset Field (SW_LAT_DWORD_OFFSET):** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**SW LTR Bar Number Field (SW_LAT_BAR_NUM):** Indicates that the SW LTR update MMIO location is always at BAR0
0	0h RO	**SW LTR Valid Field (SW_LAT_VALID):** This value is reflected from the SW LTR valid strap at the top level

3.1.23 Device Idle Pointer Register (DEVICE_IDLE_POINTER_REG) — Offset 9Ch

Device IDLE Pointer Register giving details on Device MMIO Offset, Location BAR NUM and D0i3 Valid Strap.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + 9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RO	**D0i3 DWord Offset Field (DWORD_OFFSET):** contains the location pointer to the SW LTR register in MMIO space as an offset from the specified BAR
3:1	0h RO	**BAR NUM Field (BAR_NUM):** BAR NUM: Indicates that the D0i3 MMIO location is always at BAR0
0	0h RO	**D0i3 Valid Field (VALID):** Valid: This value is reflected from the D0i3 valid strap at the top level.

3.1.24 D0i3 and Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG) — Offset A0h

D0idle_Max_Power_On_Latency Register set at boot and Power Control Enable Register to enable communication with the PGCB block below the Bridge.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + A0h	00000800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21	0h RW/P	**HAE:** Hardware Autonomous Enable: If 1, then hardware may request power gating whenever it has reached an idle condition.
20	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
19	0h RW/P	**Sleep Enable Field (SLEEP_EN):** SE: Sleep Enable: If 1, then the function may assert Sleep during power gating. If 0, then function will never asset Sleep to the retention flops. Note that some platforms may default this bit to 0, others to 1.
18	0h RW/P	**D3 Hen Field (D3HEN):** DEVIDLE Enable (DEVIDLEN): If '1' then the function will power gate when idle and the DevIdle register (DevIdleC[2] = '1') is set.
17	0h RW/P	**Device Idle En Field (DEVIDLEN):** PMCRE: PMC Request Enable
16	0h RW/P	**PMC Request Enable Field (PMCRE):** D3-Hot Enable (D3HEN): If 1, then function will power gate when idle and the PMCSR[1:0] register in the function ='11' (D3).
15:13	0h RO	**Reserved**
12:10	2h RW/O/P	**Power Latency Scale Field (POW_LAT_SCALE):** Power On Latency Scale
9:0	000h RW/O/P	**Power Latency Value Field (POW_LAT_VALUE):** Power On Latency Value

3.1.25 General Purpose Read Write Register1 (GEN_PCI_REGRW1) — Offset B0h

General Purpose PCI Read Write Register1.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Read Write Field (GEN_PCI_REG_RW1):** General Purpose PCI Register: This register value is brought out as GEN_PCI_REG_RW1

3.1.26 General Purpose Read Write Register2 (GEN_PCI_REGRW2) — Offset B4h

General Purpose PCI Read Write Register2.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + B4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Read Write Field (GEN_PCI_REG_RW2):** General Purpose PCI Register: This register value is brought out as GEN_PCI_REG_RW2

3.1.27 General Purpose Read Write Register3 (GEN_PCI_REGRW3) — Offset B8h

General Purpose PCI Read Write Register3.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + B8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Read Write Field (GEN_PCI_REG_RW3):** General Purpose PCI Register: This register value is brought out as GEN_PCI_REG_RW3

3.1.28 General Purpose Read Write Register4 (GEN_PCI_REGRW4) — Offset BCh

General Purpose PCI Read Write Register4.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + BCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Read Write Field (GEN_PCI_REG_RW4):** General Purpose PCI Register: This register value is brought out as GEN_PCI_REG_RW4

3.1.29 General Purpose Input Register (GEN_INPUT_REG) — Offset C0h

General Purpose Input Register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**General Purpose Input Field (GEN_REG_INPUT_RW):** General Purpose Input Register: This register value reflects the value of GEN_REG_INPUT_RW

3.1.30 MSI Capability Register (MSI_CAP_REG) — Offset D0h

MSI Capability Register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + D0h	01800005h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	1h RO	**Per Vector Masking Capability Field (PER_VECTOR_MSK_CAP):** Per Vector Masking Capability
23	1h RO	**MSI Capability Field (MSI_CAP_64B):** 64 bit message address capability
22:20	0h RW	**Multi Message En Field (MUL_MSG_EN):** Multiple Message Enable
19:17	0h RO	**Multi Message Cap Field (MUL_MSG_CAP):** Multiple Message Capable
16	0h RW	**MSI Enable Field (MSG_MSI_ENABLE):** MSI Enable: If 1, then the PCI Device is allowed to use MSI to request service. The PCI Device is prohibited to use INTx, when MSI is enabled If 0, then the PCI Device is prohibited from using MSI to request service.
15:8	00h RO	**Next Pointer Field (MSG_NXT_PTR):** Next Capability Pointer
7:0	05h RO	**MSI Capability Field (MSG_CAP_ID):** MSI Capability ID

3.1.31 MSI Message Low Address (MSI_ADDR_LOW) — Offset D4h

MSI Message Low Address.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RW	**MSI Message Low Address Field (MSI_ADDR_LOW):** MSI Message Low Address
1:0	0h RO	**Reserved**

3.1.32 MSI Message High Address (MSI_ADDR_HIGH) — Offset D8h

MSI Message High Address.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSI Message High Address Field (MSI_ADDR_HIGH):** MSI Message High Address

3.1.33 MSI Message Data (MSI_MSG_DATA) — Offset DCh

MSI Message Data.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + DCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0000h RW	**MSI Message Data Field (MSI_MSG_DATA):** MSI Message Data

3.1.34 MSI Mask Register (MSI_MASK) — Offset E0h

MSI Mask Bits.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + E0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSI Mask Field (MSI_MASK):** MSI Mask bits

3.1.35 MSI Pending Register (MSI_PENDING) — Offset E4h

MSI Pending Bits.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**MSI Pending Field (MSI_PENDING):** MSI Pending bits

3.1.36 Manufacturers ID (MANID) — Offset F8h

Manufacturers ID register.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:1] + F8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/P	**Manufacturers ID Field (MANID):** Manufacturer ID: Default value comes from straps.

3.2 TSN GbE Memory Mapped Registers Summary

These are the I/O Registers in Memory Space for this Function that are accessible to BIOS and software running on the Host Root (RS0) processor. The Base Address Register (BAR) is located at offset 10h in PCI Configuration Space.

Table 3-2. Summary of TSN GbE Memory Mapped Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	MAC_CONFIGURATION	00000000h
4h	4	MAC_EXT_CONFIGURATION	00000000h
8h	4	MAC_PACKET_FILTER	00000000h
Ch	4	MAC_WATCHDOG_TIMEOUT	00000000h
10h	4	MAC_HASH_TABLE_REG0	00000000h
14h	4	MAC_HASH_TABLE_REG1	00000000h
50h	4	MAC_VLAN_TAG_CTRL	00000000h
54h	4	MAC_VLAN_TAG_DATA	00000000h
58h	4	MAC_VLAN_HASH_TABLE	00000000h
60h	4	MAC_VLAN_INCL	00000000h
64h	4	MAC_INNER_VLAN_INCL	00000000h
70h	4	MAC_Q0_TX_FLOW_CTRL	00000000h
74h	4	MAC_Q1_TX_FLOW_CTRL	00000000h
78h	4	MAC_Q2_TX_FLOW_CTRL	00000000h
7Ch	4	MAC_Q3_TX_FLOW_CTRL	00000000h
80h	4	MAC_Q4_TX_FLOW_CTRL	00000000h
84h	4	MAC_Q5_TX_FLOW_CTRL	00000000h

3.2.1 MAC_CONFIGURATION — Offset 0h

The MAC Configuration Register establishes the operating mode of the MAC.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**ARP Offload Enable (ARPEN):** When this bit is set, the MAC can recognize an incoming ARP request packet and schedules the ARP packet for transmission. It forwards the ARP packet to the application and also indicate the events in the RxStatus. When this bit is reset, the MAC receiver does not recognize any ARP packet and indicates them as Type frame in the RxStatus. This bit is available only when the Enable IPv4 ARP Offload is selected. 0x0 (DISABLE): ARP Offload is disabled. 0x1 (ENABLE): ARP Offload is enabled.
30:28	0h RW	**Source Address Insertion or Replacement Control (SARC):** This field controls the source address insertion or replacement for all transmitted packets. Bit 30 specifies which MAC Address register (0 or 1) is used for source address insertion or replacement based on the values of Bits[29:28]: 2'b0x: - The mti_sa_ctrl_i and ati_sa_ctrl_i input signals control the SA field generation. 2'b10: - If Bit 30 is set to 0, the MAC inserts the content of the MAC Address 0 registers in the SA field of all transmitted packets. - If Bit 30 is set to 1 and the Enable MAC Address Register 1 option is selected while configuring the core, the MAC inserts the content of the MAC Address 1 registers in the SA field of all transmitted packets. 2'b11: - If Bit 30 is set to 0, the MAC replaces the content of the MAC Address 0 registers in the SA field of all transmitted packets. - If Bit 30 is set to 1 and the MAC Address Register 1 is enabled, the MAC replaces the content of the MAC Address 1 registers in the SA field of all transmitted packets. Note: - Changes to this field take effect only on the start of a packet. If you write to this register field when a packet is being transmitted, only the subsequent packet can use the updated value, that is, the current packet does not use the updated value. 0x0 (SA_CTRL_IN): mti_sa_ctrl_i and ati_sa_ctrl_i input signals control the SA field generation. 0x2 (MAC0_INS_SA): Contents of MAC Addr-0 inserted in SA field. 0x3 (MAC0_REP_SA): Contents of MAC Addr-0 replaces SA field. 0x6 (MAC1_INS_SA): Contents of MAC Addr-1 inserted in SA field. 0x7 (MAC1_REP_SA): Contents of MAC Addr-1 replaces SA field.
27	0h RW	**Checksum Offload (IPC):** When set, this bit enables the IPv4 header checksum checking and IPv4 or IPv6 TCP, UDP, or ICMP payload checksum checking. When this bit is reset, the COE function in the receiver is disabled. The Layer 3 and Layer 4 Packet Filter and Enable Split Header features automatically selects the IPC Full Checksum Offload Engine on the Receive side. When any of these features are enabled, you must set the IPC bit. 0x0 (DISABLE): IP header/payload checksum checking is disabled. 0x1 (ENABLE): IP header/payload checksum checking is enabled.

Bit Range	Default & Access	Field Name (ID): Description
26:24	0h RW	**Inter-Packet Gap (IPG):** These bits control the minimum IPG between packets during transmission. This range of minimum IPG is valid in full-duplex mode. In the half-duplex mode, the minimum IPG can be configured only for 64-bit times (IPG = 100). Lower values are not considered. When a JAM pattern is being transmitted because of backpressure activation, the MAC does not consider the minimum IPG. The above function (IPG less than 96 bit times) is valid only when EIPGEN bit in MAC_Ext_Configuration register is reset. When EIPGEN is set, then the minimum IPG (greater than 96 bit times) is controlled as per the description given in EIPG field in MAC_Ext_Configuration register. 0x0 (IPG96): 96 bit times IPG. 0x1 (IPG88): 88 bit times IPG. 0x2 (IPG80): 80 bit times IPG. 0x3 (IPG72): 72 bit times IPG. 0x4 (IPG64): 64 bit times IPG. 0x5 (IPG56): 56 bit times IPG. 0x6 (IPG48): 48 bit times IPG. 0x7 (IPG40): 40 bit times IPG.
23	0h RW	**Giant Packet Size Limit Control Enable (GPSLCE):** When this bit is set, the MAC considers the value in GPSL field in MAC_Ext_Configuration register to declare a received packet as Giant packet. This field must be programmed to more than 1,518 bytes. Otherwise, the MAC considers 1,518 bytes as giant packet limit. When this bit is reset, the MAC considers a received packet as Giant packet when its size is greater than 1,518 bytes (1522 bytes for tagged packet). The watchdog timeout limit, Jumbo Packet Enable and 2K Packet Enable have higher precedence over this bit, that is the MAC considers a received packet as Giant packet when its size is greater than 9,018 bytes (9,022 bytes for tagged packet) with Jumbo Packet Enabled and greater than 2,000 bytes with 2K Packet Enabled. The watchdog timeout, if enabled, terminates the received packet when watchdog limit is reached. Therefore, the programmed giant packet limit should be less than the watchdog limit to get the giant packet status. 0x0 (DISABLE): Giant Packet Size Limit Control is disabled. 0x1 (ENABLE): Giant Packet Size Limit Control is enabled.
22	0h RW	**IEEE 802.3as Support for 2K Packets (S2KP):** When this bit is set, the MAC considers all packets with up to 2,000 bytes length as normal packets. When the JE bit is not set, the MAC considers all received packets of size more than 2K bytes as Giant packets. When this bit is reset and the JE bit is not set, the MAC considers all received packets of size more than 1,518 bytes (1,522 bytes for tagged) as giant packets. Note: When the JE bit is set, setting this bit has no effect on the giant packet status. 0x0 (DISABLE): Support upto 2K packet is disabled. 0x1 (ENABLE): Support upto 2K packet is Enabled.
21	0h RW	**CRC stripping for Type packets (CST):** When this bit is set, the last four bytes (FCS) of all packets of Ether type (type field greater than 1,536) are stripped and dropped before forwarding the packet to the application. 0x0 (DISABLE): CRC stripping for Type packets is disabled. 0x1 (ENABLE): CRC stripping for Type packets is enabled.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**Automatic Pad or CRC Stripping (ACS):** When this bit is set, the MAC strips the Pad or FCS field on the incoming packets only if the value of the length field is less than 1,536 bytes. All received packets with length field greater than or equal to 1,536 bytes are passed to the application without stripping the Pad or FCS field. When this bit is reset, the MAC passes all incoming packets to the application, without any modification. 0x0 (DISABLE): Automatic Pad or CRC Stripping is disabled. 0x1 (ENABLE): Automatic Pad or CRC Stripping is enabled.
19	0h RW	**Watchdog Disable (WD):** When this bit is set, the MAC disables the watchdog timer on the receiver. The MAC can receive packets of up to 16,383 bytes. When this bit is reset, the MAC does not allow more than 2,048 bytes (10,240 if JE is set high) of the packet being received. The MAC cuts off any bytes received after 2,048 bytes. 0x0 (ENABLE): Watchdog is enabled. 0x1 (DISABLE): Watchdog is disabled.
18	0h RW	**Packet Burst Enable (BE):** When this bit is set, the MAC allows packet bursting during transmission in the GMII half-duplex mode. 0x0 (DISABLE): Packet Burst is disabled. 0x1 (ENABLE): Packet Burst is enabled.
17	0h RW	**Jabber Disable (JD):** When this bit is set, the MAC disables the jabber timer on the transmitter. The MAC can transfer packets of up to 16,383 bytes. When this bit is reset, if the application sends more than 2,048 bytes of data (10,240 if JE is set high) during transmission, the MAC does not send rest of the bytes in that packet. 0x0 (ENABLE): Jabber is enabled. 0x1 (DISABLE): Jabber is disabled.
16	0h RW	**Jumbo Packet Enable (JE):** When this bit is set, the MAC allows jumbo packets of 9,018 bytes (9,022 bytes for VLAN tagged packets) without reporting a giant packet error in the Rx packet status. 0x0 (DISABLE): Jumbo packet is disabled. 0x1 (ENABLE): Jumbo packet is enabled.
15	0h RW	**Port Select (PS):** This bit selects the Ethernet line speed. This bit, along with Bit 14, selects the exact line speed. In the 10/100 Mbps-only (always 1) or 1000 Mbps-only (always 0) configurations, this bit is read-only (RO) with appropriate value. In default 10/100/1000 Mbps configurations, this bit is read-write (R/W). 0x0 (M_1000_2500M): For 1000 or 2500 Mbps operations. 0x1 (M_10_100M): For 10 or 100 Mbps operations.
14	0h RW	**FES:** This bit selects the speed mode. 0x0 (M_10_1000M): 10 Mbps when PS bit is 1 and 1 Gbps when PS bit is 0. 0x1 (M_100_2500M): 100 Mbps when PS bit is 1 and 2.5 Gbps when PS bit is 0.
13	0h RW	**Duplex Mode (DM):** When this bit is set, the MAC operates in the full-duplex mode in which it can transmit and receive simultaneously. This bit is RO with default value of 1'b1 in the full-duplex-only configurations. 0x0 (HDUPLX): Half-duplex mode. 0x1 (FDUPLX): Full-duplex mode.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW	**Loopback Mode (LM):** When this bit is set, the MAC operates in the loopback mode at GMII or MII. The (G)MII Rx clock input (clk_rx_i) is required for the loopback to work properly. This is because the Tx clock is not internally looped back. 0x0 (DISABLE): Loopback is disabled. 0x1 (ENABLE): Loopback is enabled.
11	0h RW	**Enable Carrier Sense Before Transmission in Full-Duplex Mode (ECRSFD):** When this bit is set, the MAC transmitter checks the CRS signal before packet transmission in the full-duplex mode. The MAC starts the transmission only when the CRS signal is low. When this bit is reset, the MAC transmitter ignores the status of the CRS signal. 0x0 (DISABLE): ECRSFD is disabled. 0x1 (ENABLE): ECRSFD is enabled.
10	0h RW	**Disable Receive Own (DO):** When this bit is set, the MAC disables the reception of packets when the GMII signal TX_EN is asserted in the half-duplex mode. When this bit is reset, the MAC receives all packets given by the PHY. This bit is not applicable in the full-duplex mode. 0x0 (ENABLE): Enable Receive Own. 0x1 (DISABLE): Disable Receive Own.
9	0h RW	**Disable Carrier Sense During Transmission (DCRS):** When this bit is set, the MAC transmitter ignores the (G)MII CRS signal during packet transmission in the half-duplex mode. As a result, no errors are generated because of Loss of Carrier or No Carrier during transmission. When this bit is reset, the MAC transmitter generates errors because of Carrier Sense. The MAC can even abort the transmission. 0x0 (ENABLE): Enable Carrier Sense During Transmission. 0x1 (DISABLE): Disable Carrier Sense During Transmission.
8	0h RW	**Disable Retry (DR):** When this bit is set, the MAC attempts only one transmission. When a collision occurs on the GMII or MII interface, the MAC ignores the current packet transmission and reports a Packet Abort with excessive collision error in the Tx packet status. When this bit is reset, the MAC retries based on the settings of the BL field. This bit is applicable only in the half-duplex mode. 0x0 (ENABLE): Enable Retry. 0x1 (DISABLE): Disable Retry.
7	0h RO	**Reserved**
6:5	0h RW	**Back-Off Limit (BL):** The back-off limit determines the random integer number (r) of slot time delays (4,096 bit times for 1000/2500 Mbps; 512 bit times for 10/100 Mbps) for which the MAC waits before rescheduling a transmission attempt during retries after a collision. n = retransmission attempt. The random integer r takes the value in the range 0 <= r < 2^k This bit is applicable only in the half-duplex mode. 0x0 (MIN_N_10): k = min(n,10). 0x1 (MIN_N_8): k = min(n,8). 0x2 (MIN_N_4): k = min(n,4). 0x3 (MIN_N_1): k = min(n,1).

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	**Deferral Check (DC):** When this bit is set, the deferral check function is enabled in the MAC. The MAC issues a Packet Abort status, along with the excessive deferral error bit set in the Tx packet status, when the Tx state machine is deferred for more than 24,288 bit times in 10 or 100 Mbps mode. If the MAC is configured for 1000/2500 Mbps operation, the threshold for deferral is 155,680 bits times. Deferral begins when the transmitter is ready to transmit, but it is prevented because of an active carrier sense signal (CRS) on GMII or MII. The defer time is not cumulative. For example, if the transmitter defers for 10,000 bit times because the CRS signal is active and the CRS signal becomes inactive, the transmitter transmits and collision happens. Because of collision, the transmitter needs to back off and then defer again after back off completion. In such a scenario, the deferral timer is reset to 0, and it is restarted. When this bit is reset, the deferral check function is disabled and the MAC defers until the CRS signal goes inactive. This bit is applicable only in the half-duplex mode. 0x0 (DISABLE): Deferral check function is disabled. 0x1 (ENABLE): Deferral check function is enabled.
3:2	0h RW	**Preamble Length for Transmit packets (PRELEN):** These bits control the number of preamble bytes that are added to the beginning of every Tx packet. The preamble reduction occurs only when the MAC is operating in the full-duplex mode. 0x0 (M_7BYTES): 7 bytes of preamble. 0x1 (M_5BYTES): 5 bytes of preamble. 0x2 (M_3BYTES): 3 bytes of preamble. 0x3 (RESERVED): Reserved.
1	0h RW	**Transmitter Enable (TE):** When this bit is set, the Tx state machine of the MAC is enabled for transmission on the GMII or MII interface. When this bit is reset, the MAC Tx state machine is disabled after it completes the transmission of the current packet. The Tx state machine does not transmit any more packets. 0x0 (DISABLE): Transmitter is disabled. 0x1 (ENABLE): Transmitter is enabled.
0	0h RW	**Receiver Enable (RE):** When this bit is set, the Rx state machine of the MAC is enabled for receiving packets from the GMII or MII interface. When this bit is reset, the MAC Rx state machine is disabled after it completes the reception of the current packet. The Rx state machine does not receive any more packets from the GMII or MII interface. 0x0 (DISABLE): Receiver is disabled. 0x1 (ENABLE): Receiver is enabled.

3.2.2 MAC_EXT_CONFIGURATION — Offset 4h

The MAC Extended Configuration Register establishes the operating mode of the MAC.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30	0h RW	**ARP Packet Drop if IP Mismatch (APDIM):** When set, Packet for which Target Protocol Address does not match IPv4 address is dropped in the MTL layer. When reset, when target Protocol Address does not match, packet is forwarded to MTL maintaining backward compatibility. 0x0 (DISABLE): mux select to drop the arp packet if Trgt prot address mismatches IPv4 address disabled. 0x1 (ENABLE): mux select to drop the arp packet if Trgt prot address mismatches IPv4 address enabled.
29:25	00h RW	**Extended Inter-Packet Gap (EIPG):** The value in this field is applicable when the EIPGEN bit is set. This field (as Most Significant bits), along with IPG field in MAC_Configuration register, gives the minimum IPG greater than 96 bit times in steps of 8 bit times: {EIPG, IPG} 8'h00 - 104 bit times 8'h01 - 112 bit times 8'h02 - 120 bit times ---------- 8'hFF - 2144 bit times
24	0h RW	**Extended Inter-Packet Gap Enable (EIPGEN):** When this bit is set, the MAC interprets EIPG field and IPG field in MAC_Configuration register together as minimum IPG greater than 96 bit times in steps of 8 bit times. When this bit is reset, the MAC ignores EIPG field and interprets IPG field in MAC_Configuration register as minimum IPG less than or equal to 96 bit times in steps of 8 bit times. Note: The extended Inter-Packet Gap feature must be enabled when operating in Full-Duplex mode only. There might be undesirable effects on back-pressure function and frame transmission if it is enabled in Half-Duplex mode. 0x0 (DISABLE): Extended Inter-Packet Gap is disabled. 0x1 (ENABLE): Extended Inter-Packet Gap is enabled.
23	0h RO	**Reserved**
22:20	0h RW	**Maximum Size for Splitting the Header Data (HDSMS):** These bits indicate the maximum header size allowed for splitting the header data in the received packet. 0x0 (M_64BYTES): Maximum Size for Splitting the Header Data is 64 bytes. 0x1 (M_128BYTES): Maximum Size for Splitting the Header Data is 128 bytes. 0x2 (M_256BYTES): Maximum Size for Splitting the Header Data is 256 bytes. 0x3 (M_512BYTES): Maximum Size for Splitting the Header Data is 512 bytes. 0x4 (M_1024BYTES): Maximum Size for Splitting the Header Data is 1024 bytes. 0x5 (RSVD): Reserved.
19	0h RW	**Packet Duplication Control (PDC):** When this bit is set, the received packet with Multicast/Broadcast Destination address is routed to multiple Receive DMA Channels. The Receive DMA Channels is identified by the DCS field of MAC_Address(#i)_High register corresponding to the MAC Address register that matches the Multicast/Broadcast Destination address in the received packet. The DCS field is interpreted to be a one-hot value, each bit corresponding to the Receive DMA Channel. When this bit is reset, the received packet is routed to single Receive DMA Channel. The Receive DMA Channel is identified by the DCS field of MAC_Address(#i)_High register corresponding to the MAC Address register that matches the Destination address in the received packet. The DCS field is interpreted as a binary value. 0x0 (DISABLE): Packet Duplication Control is disabled. 0x1 (ENABLE): Packet Duplication Control is enabled.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RW	**Unicast Slow Protocol Packet Detect (USP):** When this bit is set, the MAC detects the Slow Protocol packets with unicast address of the station specified in the MAC_Address0_High and MAC_Address0_Low registers. The MAC also detects the Slow Protocol packets with the Slow Protocols multicast address (01-80-C2-00-00-02). When this bit is reset, the MAC detects only Slow Protocol packets with the Slow Protocol multicast address specified in the IEEE 802.3-2015, Section 5. 0x0 (DISABLE): Unicast Slow Protocol Packet Detection is disabled. 0x1 (ENABLE): Unicast Slow Protocol Packet Detection is enabled.
17	0h RW	**Slow Protocol Detection Enable (SPEN):** When this bit is set, MAC processes the Slow Protocol packets (Ether Type 0x8809) and provides the Slow Protocol Sub-Type and Code fields in Rx status. When this bit is reset, the MAC forwards all error-free Slow Protocol packets to the application. The MAC considers such packets as normal Type packets. 0x0 (DISABLE): Slow Protocol Detection is disabled. 0x1 (ENABLE): Slow Protocol Detection is enabled.
16	0h RW	**Disable CRC Checking for Received Packets (DCRCC):** When this bit is set, the MAC receiver does not check the CRC field in the received packets. When this bit is reset, the MAC receiver always checks the CRC field in the received packets. 0x0 (ENABLE): CRC Checking is enabled. 0x1 (DISABLE): CRC Checking is disabled.
15:14	0h RO	**Reserved**
13:0	0000h RW	**Giant Packet Size Limit (GPSL):** If the received packet size is greater than the value programmed in this field in units of bytes, the MAC declares the received packet as Giant packet. The value programmed in this field must be greater than or equal to 1,518 bytes. Any other programmed value is considered as 1,518 bytes. For VLAN tagged packets, the MAC adds 4 bytes to the programmed value. When the Enable Double VLAN Processing option is selected, the MAC adds 8 bytes to the programmed value for double VLAN tagged packets. The value in this field is applicable when the GPSLCE bit is set in MAC_Configuration register.

3.2.3 MAC_PACKET_FILTER — Offset 8h

The MAC Packet Filter register contains the filter controls for receiving packets. Some of the controls from this register go to the address check block of the MAC which performs the first level of address filtering. The second level of filtering is performed on the incoming packet based on other controls such as Pass Bad Packets and Pass Control Packets.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Receive All (RA):** When this bit is set, the MAC Receiver module passes all received packets to the application, irrespective of whether they pass the address filter or not. The result of the SA or DA filtering is updated (pass or fail) in the corresponding bit in the Rx Status Word. When this bit is reset, the Receiver module passes only those packets to the application that pass the SA or DA address filter. 0x0 (DISABLE): Receive All is disabled. 0x1 (ENABLE): Receive All is enabled.
30:22	0h RO	**Reserved**
21	0h RW	**Drop Non-TCP/UDP over IP Packets (DNTU):** When this bit is set, the MAC drops the non-TCP or UDP over IP packets. The MAC forward only those packets that are processed by the Layer 4 filter. When this bit is reset, the MAC forwards all non-TCP or UDP over IP packets. 0x0 (FWD): Forward Non-TCP/UDP over IP Packets. 0x1 (DROP): Drop Non-TCP/UDP over IP Packets.
20	0h RW	**Layer 3 and Layer 4 Filter Enable (IPFE):** When this bit is set, the MAC drops packets that do not match the enabled Layer 3 and Layer 4 filters. If Layer 3 or Layer 4 filters are not enabled for matching, this bit does not have any effect. When this bit is reset, the MAC forwards all packets irrespective of the match status of the Layer 3 and Layer 4 fields. 0x0 (DISABLE): Layer 3 and Layer 4 Filters are disabled. 0x1 (ENABLE): Layer 3 and Layer 4 Filters are enabled.
19:17	0h RO	**Reserved**
16	0h RW	**VLAN Tag Filter Enable (VTFE):** When this bit is set, the MAC drops the VLAN tagged packets that do not match the VLAN Tag. When this bit is reset, the MAC forwards all packets irrespective of the match status of the VLAN Tag. 0x0 (DISABLE): VLAN Tag Filter is disabled. 0x1 (ENABLE): VLAN Tag Filter is enabled.
15:11	0h RO	**Reserved**
10	0h RW	**Hash or Perfect Filter (HPF):** When this bit is set, the address filter passes a packet if it matches either the perfect filtering or hash filtering as set by the HMC or HUC bit. When this bit is reset and the HUC or HMC bit is set, the packet is passed only if it matches the Hash filter. 0x0 (DISABLE): Hash or Perfect Filter is disabled. 0x1 (ENABLE): Hash or Perfect Filter is enabled.
9	0h RW	**Source Address Filter Enable (SAF):** When this bit is set, the MAC compares the SA field of the received packets with the values programmed in the enabled SA registers. If the comparison fails, the MAC drops the packet. When this bit is reset, the MAC forwards the received packet to the application with updated SAF bit of the Rx Status depending on the SA address comparison. Note: According to the IEEE specification, Bit 47 of the SA is reserved. However, in GbE Controller, the MAC compares all 48 bits. The software driver should take this into consideration while programming the MAC address registers for SA. 0x0 (DISABLE): SA Filtering is disabled. 0x1 (ENABLE): SA Filtering is enabled.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**SA Inverse Filtering (SAIF):** When this bit is set, the Address Check block operates in the inverse filtering mode for SA address comparison. If the SA of a packet matches the values programmed in the SA registers, it is marked as failing the SA Address filter. When this bit is reset, if the SA of a packet does not match the values programmed in the SA registers, it is marked as failing the SA Address filter. 0x0 (DISABLE): SA Inverse Filtering is disabled. 0x1 (ENABLE): SA Inverse Filtering is enabled.
7:6	0h RW	**Pass Control Packets (PCF):** These bits control the forwarding of all control packets (including unicast and multicast Pause packets). 0x0 (FLTR_ALL): MAC filters all control packets from reaching the application. 0x1 (FW_XCPT_PAU): MAC forwards all control packets except Pause packets to the application even if they fail the Address filter. 0x2 (FW_ALL): MAC forwards all control packets to the application even if they fail the Address filter. 0x3 (FW_PASS): MAC forwards the control packets that pass the Address filter.
5	0h RW	**Disable Broadcast Packets (DBF):** When this bit is set, the AFM module blocks all incoming broadcast packets. In addition, it overrides all other filter settings. When this bit is reset, the AFM module passes all received broadcast packets. 0x0 (ENABLE): Enable Broadcast Packets. 0x1 (DISABLE): Disable Broadcast Packets.
4	0h RW	**Pass All Multicast (PM):** When this bit is set, it indicates that all received packets with a multicast destination address (first bit in the destination address field is '1') are passed. When this bit is reset, filtering of multicast packet depends on HMC bit. 0x0 (DISABLE): Pass All Multicast is disabled. 0x1 (ENABLE): Pass All Multicast is enabled.
3	0h RW	**DA Inverse Filtering (DAIF):** When this bit is set, the Address Check block operates in inverse filtering mode for the DA address comparison for both unicast and multicast packets. When this bit is reset, normal filtering of packets is performed. 0x0 (DISABLE): DA Inverse Filtering is disabled. 0x1 (ENABLE): DA Inverse Filtering is enabled.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Hash Multicast (HMC):** When this bit is set, the MAC performs the destination address filtering of received multicast packets according to the hash table. When this bit is reset, the MAC performs the perfect destination address filtering for multicast packets, that is, it compares the DA field with the values programmed in DA registers. 0x0 (DISABLE): Hash Multicast is disabled. 0x1 (ENABLE): Hash Multicast is enabled.
1	0h RW	**Hash Unicast (HUC):** When this bit is set, the MAC performs the destination address filtering of unicast packets according to the hash table. When this bit is reset, the MAC performs a perfect destination address filtering for unicast packets, that is, it compares the DA field with the values programmed in DA registers. 0x0 (DISABLE): Hash Unicast is disabled. 0x1 (ENABLE): Hash Unicast is enabled.
0	0h RW	**Promiscuous Mode (PR):** When this bit is set, the Address Filtering module passes all incoming packets irrespective of the destination or source address. The SA or DA Filter Fails status bits of the Rx Status Word are always cleared when PR is set. 0x0 (DISABLE): Promiscuous Mode is disabled. 0x1 (ENABLE): Promiscuous Mode is enabled.

3.2.4 MAC_WATCHDOG_TIMEOUT — Offset Ch

The Watchdog Timeout register controls the watchdog timeout for received packets.

Type	Size	Offset	Default
MMIO	32 bit	BAR + Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**Programmable Watchdog Enable (PWE):** When this bit is set and the WD bit of the MAC_Configuration register is reset, the WTO field is used as watchdog timeout for a received packet. When this bit is cleared, the watchdog timeout for a received packet is controlled by setting of WD and JE bits in MAC_Configuration register. 0x0 (DISABLE): Programmable Watchdog is disabled. 0x1 (ENABLE): Programmable Watchdog is enabled.
7:4	0h RO	**Reserved**
3:0	0h RW	**Watchdog Timeout (WTO):** When the PWE bit is set and the WD bit of the MAC_Configuration register is reset, this field is used as watchdog timeout for a received packet. If the length of a received packet exceeds the value of this field, such packet is terminated and declared as an error packet. Note: When the PWE bit is set, the value in this field should be more than 1,522 (0x05F2). Otherwise, the IEEE 802.3-specified valid tagged packets are declared as error packets and then dropped. 0x0 (M_2KBYTES): 2 KB. 0x1 (M_3KBYTES): 3 KB. 0x2 (M_4KBYTES): 4 KB. 0x3 (M_5KBYTES): 5 KB. 0x4 (M_6KBYTES): 6 KB. 0x5 (M_7KBYTES): 7 KB. 0x6 (M_8KBYTES): 8 KB. 0x7 (M_9KBYTES): 9 KB. 0x08 (M_10KBYTES): 10 KB. 0x09 (M_11KBYTES): 11 KB. 0x0A (M_12KBYTES): 12 KB. 0x0B (M_13KBYTES): 13 KB. 0x0C (M_14KBYTES): 14 KB. 0x0D (M_15KBYTES): 15 KB. 0x0E (M_16383BYTES): 16383 Bytes. 0x0F (RESERVED): Reserved.

3.2.5 MAC_HASH_TABLE_REG0 — Offset 10h

The Hash Table Register 0 contains the first 32 bits of the hash table, when the width of the hash table is 128 or 256 bits. This design has set the Hash Table Size (width of the hash table) to 64.

The Hash table is used for group address filtering. For hash filtering, the content of the destination address in the incoming packet is passed through the CRC logic and the upper six (seven in 128-bit Hash or eight in 256-bit Hash) bits of the CRC register are used to index the content of the Hash table. The most significant bits determines the register to be used (Hash Table Register X), and the least significant five bits determine the bit within the register. For example, a hash value of 6'b100000 (in 64-bit Hash) selects Bit 0 of the Hash Table Register 1, a value of 7b'1110000 (in 128-bit Hash) selects Bit 16 of the Hash Table Register 3 and a value of 8b'10111111 (in 256-bit Hash) selects Bit 31 of the Hash Table Register 5.

The hash value of the destination address is calculated in the following way:

- Calculate the 32-bit CRC for the DA (See IEEE 802.3, Section 3.2.8 for the steps to calculate CRC32).

- Perform bitwise reversal for the value obtained in Step 1.

- Take the upper 6 (or 7 or 8) bits from the value obtained in Step 2.

If the corresponding bit value of the register is 1'b1, the packet is accepted. Otherwise, it is rejected. If the PM bit is set in MAC_Packet_Filter, all multicast packets are accepted regardless of the multicast hash values.

If the Hash Table register is configured to be double-synchronized to the (G)MII clock domain, the synchronization is triggered only when Bits[31:24] of the Hash Table Register X registers are written.

If double-synchronization is enabled, consecutive writes to this register should be performed after at least four clock cycles in the destination clock domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MAC Hash Table First 32 Bits (HT31T0):** This field contains the first 32 Bits [31:0] of the Hash table.

3.2.6 MAC_HASH_TABLE_REG1 — Offset 14h

The Hash Table Register 1 contains the second 32 bits of the hash table.

The Hash table is used for group address filtering. For hash filtering, the content of the destination address in the incoming packet is passed through the CRC logic and the upper six (seven in 128-bit Hash or eight in 256-bit Hash) bits of the CRC register are used to index the content of the Hash table. The most significant bits determines the register to be used (Hash Table Register X), and the least significant five bits determine the bit within the register. For example, a hash value of 6'b100000 (in 64-bit Hash) selects Bit 0 of the Hash Table Register 1, a value of 7b'1110000 (in 128-bit Hash) selects Bit 16 of the Hash Table Register 3 and a value of 8b'10111111 (in 256-bit Hash) selects Bit 31 of the Hash Table Register 5.

The hash value of the destination address is calculated in the following way:

- Calculate the 32-bit CRC for the DA (See IEEE 802.3, Section 3.2.8 for the steps to calculate CRC32).

- Perform bitwise reversal for the value obtained in Step 1.

- Take the upper 6 (or 7 or 8) bits from the value obtained in Step 2.

If the corresponding bit value of the register is 1'b1, the packet is accepted. Otherwise, it is rejected. If the PM bit is set in MAC_Packet_Filter, all multicast packets are accepted regardless of the multicast hash values.

If the Hash Table register is configured to be double-synchronized to the (G)MII clock domain, the synchronization is triggered only when Bits[31:24] of the Hash Table Register X registers are written.

If double-synchronization is enabled, consecutive writes to this register should be performed after at least four clock cycles in the destination clock domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MAC Hash Table Second 32 Bits (HT63T32):** This field contains the second 32 Bits [63:32] of the Hash table.

3.2.7 MAC_VLAN_TAG_CTRL — Offset 50h

This register is the redefined format of the MAC VLAN Tag Register. It is used for indirect addressing. It contains the address offset, command type and Busy Bit for CSR access of the Per VLAN Tag registers.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 50h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable Inner VLAN Tag in Rx Status (EIVLRXS):** When this bit is set, the MAC provides the inner VLAN Tag in the Rx status. When this bit is reset, the MAC does not provide the inner VLAN Tag in Rx status. 0x0 (DISABLE): Inner VLAN Tag in Rx status is disabled. 0x1 (ENABLE): Inner VLAN Tag in Rx status is enabled.
30	0h RO	**Reserved**
29:28	0h RW	**Enable Inner VLAN Tag Stripping on Receive (EIVLS):** This field indicates the stripping operation on inner VLAN Tag in received packet. 0x0 (DONOT): Do not strip. 0x1 (IFPASS): Strip if VLAN filter passes. 0x2 (IFFAIL): Strip if VLAN filter fails. 0x3 (ALWAYS): Always strip.
27	0h RW	**Enable Inner VLAN Tag Comparison (ERIVLT):** When this bit, VTHM bit and the EDVLP field are set, the MAC receiver enables VLAN Hash filtering operation on the inner VLAN Tag (if present). When this bit is reset and VTHM bit is set, the MAC receiver enables VLAN Hash filtering operation on the outer VLAN Tag (if present). The ERSVLM bit and DOVLTC bit determines which VLAN type is enabled for filtering. 0x0 (DISABLE): Inner VLAN tag is disabled. 0x1 (ENABLE): Inner VLAN tag is enabled.
26	0h RW	**Enable Double VLAN Processing (EDVLP):** When this bit is set, the MAC enables processing of up to two VLAN Tags on Tx and Rx (if present). When this bit is reset, the MAC enables processing of up to one VLAN Tag on Tx and Rx (if present). 0x0 (DISABLE): Double VLAN Processing is disabled. 0x1 (ENABLE): Double VLAN Processing is enabled.

Bit Range	Default & Access	Field Name (ID): Description
25	0h RW	**VLAN Tag Hash Table Match Enable (VTHM):** When this bit is set, the most significant four bits of CRC of VLAN Tag are used to index the content of the MAC_VLAN_Hash_Table register. A value of 1 in the VLAN Hash Table register, corresponding to the index, indicates that the packet matched the VLAN hash table. When the ETV bit is set, the CRC of the 12-bit VLAN Identifier (VID) is used for comparison. When the ETV bit is reset, the CRC of the 16-bit VLAN tag is used for comparison. When this bit is reset, the VLAN Hash Match operation is not performed. 0x0 (DISABLE): VLAN Tag Hash Table Match is disabled. 0x1 (ENABLE): VLAN Tag Hash Table Match is enabled.
24	0h RW	**Enable VLAN Tag in Rx status (EVLRXS):** When this bit is set, MAC provides the outer VLAN Tag in the Rx status. When this bit is reset, the MAC does not provide the outer VLAN Tag in Rx status. 0x0 (DISABLE): VLAN Tag in Rx status is disabled. 0x1 (ENABLE): VLAN Tag in Rx status is enabled.
23	0h RO	**Reserved**
22:21	0h RW	**Enable VLAN Tag Stripping on Receive (EVLS):** This field indicates the stripping operation on the outer VLAN Tag in received packet. 0x0 (DONOT): Do not strip. 0x1 (IFPASS): Strip if VLAN filter passes. 0x2 (IFFAIL): Strip if VLAN filter fails. 0x3 (ALWAYS): Always strip.
20	0h RW	**Disable VLAN Type Check for VLAN Hash Filtering (DOVLTC):** When this bit is set, the MAC VLAN Hash Filter does not check whether the VLAN Tag specified by the ERIVLT bit is of type S-VLAN or C-VLAN. When this bit is reset, the MAC VLAN Hash Filter filters or matches the VLAN Tag specified by the ERIVLT bit only when VLAN Tag type is similar to the one specified by the ERSVLM bit. 0x0 (ENABLE): VLAN Type Check is enabled. 0x1 (DISABLE): VLAN Type Check is disabled.
19	0h RW	**Enable Receive S-VLAN Match for VLAN Hash Filtering (ERSVLM):** When this bit is set, the MAC receiver enables VLAN Hash filtering or matching for S-VLAN (Type = 0x88A8) packets. When this bit is reset, the MAC receiver enables VLAN Hash filtering or matching for C-VLAN (Type = 0x8100) packets. The ERIVLT bit determines the VLAN tag position considered for VLAN Hash filtering or matching. 0x0 (DISABLE): Receive S-VLAN Match is disabled. 0x1 (ENABLE): Receive S-VLAN Match is enabled.
18	0h RW	**Enable S-VLAN (ESVL):** When this bit is set, the MAC transmitter and receiver consider the S-VLAN packets (Type = 0x88A8) as valid VLAN tagged packets. 0x0 (DISABLE): S-VLAN is disabled. 0x1 (ENABLE): S-VLAN is enabled.
17	0h RW	**VLAN Tag Inverse Match Enable (VTIM):** When this bit is set, this bit enables the VLAN Tag inverse matching. The packets without matching VLAN Tag are marked as matched. When reset, this bit enables the VLAN Tag perfect matching. The packets with matched VLAN Tag are marked as matched. 0x0 (DISABLE): VLAN Tag Inverse Match is disabled. 0x1 (ENABLE): VLAN Tag Inverse Match is enabled.

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**Enable 12-Bit VLAN Tag Comparison for VLAN Hash Filtering (ETV):** When this bit is set, a 12-bit VLAN identifier is used for VLAN Hash filtering instead of the complete 16-bit VLAN tag. Bits[11:0] of VLAN tag in the received VLAN-tagged packet are used for hash-based VLAN filtering. When this bit is reset, all 16 bits of the 15th and 16th bytes of the received VLAN packet are used for VLAN hash filtering. 0x0 (DISABLE): 12-Bit VLAN Tag Comparison is disabled. 0x1 (ENABLE): 12-Bit VLAN Tag Comparison is enabled.
15:5	0h RO	**Reserved**
4:2	0h RW	**OFS:** This field holds the address offset of the MAC VLAN Tag Filter Register which the application is trying to access. The width of the field depends on the number of MAC VLAN Tag Registers enabled.
1	0h RW	**Command Type (CT):** This bit indicates if the current register access is a read or a write. When set, it indicate a read operation. When reset, it indicates a write operation. 0x0 (WRITE): Write operation. 0x1 (READ): Read operation.
0	0h RW	**Operation Busy (OB):** This bit is set along with a read or write command for initiating the indirect access to per VLAN Tag Filter register. This bit is reset when the read or write command to per VLAN Tag Filter indirect access register is complete. The next indirect register access can be initiated only after this bit is reset. During a write operation, the bit is reset only after the data has been written into the Per VLAN Tag register. During a read operation, the data should be read from the MAC_VLAN_Tag_Data register only after this bit is reset. 0x0 (DISABLE): Operation Busy is disabled. 0x1 (ENABLE): Operation Busy is enabled.

3.2.8 MAC_VLAN_TAG_DATA — Offset 54h

This register holds the read/write data for Indirect Access of the Per VLAN Tag registers. During the read access, this field contains valid read data only after the OB bit is reset.

During the write access, this field should be valid prior to setting the OB bit in the MAC_VLAN_Tag_Ctrl Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 54h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27:25	0h RW	**DMA Channel Number (DMACHN):** The DMA Channel number to which the VLAN Tagged Frame is to be routed if it passes this VLAN Tag Filter is programmed in this field. If the Routing based on VLAN Tag Filter is not necessary, this field need not be programmed.
24	0h RW	**DMA Channel Number Enable (DMACHEN):** This bit is the Enable for the DMA Channel Number value programmed in the field DMACH. When this bit is reset, the Routing does not occur based on VLAN Filter result. The frame is routed based on DA Based DMA Channel Routing. 0x0 (DISABLE): DMA Channel Number is disabled. 0x1 (ENABLE): DMA Channel Number is enabled.
23:21	0h RO	**Reserved**
20	0h RW	**Enable Inner VLAN Tag Comparison (ERIVLT):** This bit is valid only when Double VLAN Tag Enable of the Filter is set. When this bit and the EDVLP field are set, the MAC receiver enables operation on the inner VLAN Tag (if present). When this bit is reset, the MAC receiver enables operation on the outer VLAN Tag (if present). 0x0 (DISABLE): Inner VLAN tag comparison is disabled. 0x1 (ENABLE): Inner VLAN tag comparison is enabled.
19	0h RW	**Enable S-VLAN Match for received Frames (ERSVLM):** This bit is valid only when VLAN Tag Enable of the Filter is set. When this bit is set, the MAC receiver enables filtering or matching for S-VLAN (Type = 0x88A8) packets. When this bit is reset, the MAC receiver enables filtering or matching for C-VLAN (Type = 0x8100) packets. 0x0 (DISABLE): Receive S-VLAN Match is disabled. 0x1 (ENABLE): Receive S-VLAN Match is enabled.
18	0h RW	**Disable VLAN Type Comparison (DOVLTC):** This bit is valid only when VLAN Tag Enable of the Filter is set. When this bit is set, the MAC does not check whether the VLAN Tag specified by the Enable Inner VLAN Tag Comparison bit is of type S-VLAN or C-VLAN. When this bit is reset, the MAC filters or matches the VLAN Tag specified by the Enable Inner VLAN Tag Comparison bit only when VLAN Tag type is similar to the one specified by the Enable S-VLAN Match for received Frames bit. 0x0 (ENABLE): VLAN type comparison is enabled. 0x1 (DISABLE): VLAN type comparison is disabled.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**12bits or 16bits VLAN comparison (ETV):** This bit is valid only when VEN of the Filter is set. When this bit is set, a 12-bit VLAN identifier is used for comparing and filtering instead of the complete 16-bit VLAN tag. Bits [11:0] of VLAN tag are compared with the corresponding field in the received VLAN-tagged packet. 0x0 (M_16BIT): 16 bit VLAN comparison. 0x1 (M_12BIT): 12 bit VLAN comparison.
16	0h RW	**VLAN Tag Enable (VEN):** This bit is used to enable or disable the VLAN Tag. When this bit is set, the MAC compares the VLAN Tag of received packet with the VLAN Tag ID. When this bit is reset, no comparison is performed irrespective of the programming of the other fields. 0x0 (DISABLE): VLAN Tag is disabled. 0x1 (ENABLE): VLAN Tag is enabled.
15:0	0000h RW	**VLAN Tag ID (VID):** This field holds the VLAN Tag value which is used by the MAC for perfect comparison. It is valid when VLAN Tag Enable is set.

3.2.9 MAC_VLAN_HASH_TABLE — Offset 58h

When VTHM bit of the MAC_VLAN_Tag register is set, the 16-bit VLAN Hash Table register is used for group address filtering based on the VLAN tag. For hash filtering, the content of the 16-bit VLAN tag or 12-bit VLAN ID (based on the ETV bit of MAC_VLAN_Tag Register) in the incoming packet is passed through the CRC logic. The upper four bits of the calculated hash value are used to index the contents of the VLAN Hash table. For example, hash value of 4b'1000 selects Bit 8 of the VLAN Hash table.

The hash value of the destination address is calculated in the following way:

- Calculate the 32-bit CRC for the VLAN tag or ID (For steps to calculate CRC32, see Section 3.2.8 of IEEE 802.3).

- Perform bitwise reversal for the value obtained in step 1.

- Take the upper four bits from the value obtained in step 2.

If the VLAN hash Table register is configured to be double-synchronized to the (G)MII clock domain, the synchronization is triggered only when Bits[15:8] of this register are written.

- If double-synchronization is enabled, consecutive writes to this register should be performed after at least four clock cycles in the destination clock domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 58h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0000h RW	**VLAN Hash Table (VLHT):** This field contains the 16-bit VLAN Hash Table.

3.2.10 MAC_VLAN_INCL — Offset 60h

The VLAN Tag Inclusion or Replacement register contains the VLAN tag for insertion or replacement in the Transmit packets. It also contains the VLAN tag insertion controls.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 60h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**BUSY:** This bit indicates the status of the read/write operation of indirect access to the queue/channel specific VLAN inclusion register. For write operation write to a register is complete when this bit is reset. For read operation the read data is valid when the bit is reset. The application must make sure that this bit is reset before attempting subsequent access to this register. 0x0 (INACTIVE): Busy status not detected. 0x1 (ACTIVE): Busy status detected.
30	0h RW	**Read write control (RDWR):** This bit controls the read or write operation for indirectly accessing the queue/ channel specific VLAN Inclusion register. When set indicates write operation and when reset indicates read operation. This does not have any effect when CBTI is reset. 0x0 (READ): Read operation of indirect access. 0x1 (WRITE): Write operation of indirect access.
29:27	0h RO	**Reserved**
26:24	0h RW	**ADDR:** This field selects one of the queue/channel specific VLAN Inclusion register for read/ write access. This does not have any effect when CBTI is reset.
23:22	0h RO	**Reserved**
21	0h RW	**Channel based tag insertion (CBTI):** When this bit is set, outer VLAN tag is inserted for every packets transmitted by the MAC. The tag value is taken from the queue/channel specific VLAN tag register. The VLTI, VLP, VLC, and VLT fields of this register are ignored when this bit is set. When this bit is set, a write operation to byte 3 of this register initiates the read/write access to the indirect register. When reset, outer VLAN operation is based on the setting of VLTI, VLP, VLC and VLT fields of this register. 0x0 (DISABLE): Channel based tag insertion is disabled. 0x1 (ENABLE): Channel based tag insertion is enabled.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**VLAN Tag Input (VLTI):** When this bit is set, it indicates that the VLAN tag to be inserted or replaced in Tx packet should be taken from: - The Tx descriptor 0x0 (DISABLE): VLAN Tag Input is disabled. 0x1 (ENABLE): VLAN Tag Input is enabled.
19	0h RW	**C-VLAN or S-VLAN (CSVL):** When this bit is set, S-VLAN type (0x88A8) is inserted in the 13th and 14th bytes of transmitted packets. When this bit is reset, C-VLAN type (0x8100) is inserted in the 13th and 14th bytes of transmitted packets. 0x0 (C_VLAN): C-VLAN type (0x8100) is inserted. 0x1 (S_VLAN): S-VLAN type (0x88A8) is inserted.
18	0h RW	**VLAN Priority Control (VLP):** When this bit is set, the control bits[17:16] are used for VLAN deletion, insertion, or replacement. When this bit is reset, the mti_vlan_ctrl_i control input is used and bits[17:16] are ignored. 0x0 (DISABLE): VLAN Priority Control is disabled. 0x1 (ENABLE): VLAN Priority Control is enabled.
17:16	0h RW	**VLC:** VLAN Tag Control in Transmit Packets - 2'b00: No VLAN tag deletion, insertion, or replacement - 2'b01: VLAN tag deletion The MAC removes the VLAN type (bytes 13 and 14) and VLAN tag (bytes 15 and 16) of all transmitted packets with VLAN tags. - 2'b10: VLAN tag insertion The MAC inserts VLT in bytes 15 and 16 of the packet after inserting the Type value (0x8100 or 0x88a8) in bytes 13 and 14. This operation is performed on all transmitted packets, irrespective of whether they already have a VLAN tag. - 2'b11: VLAN tag replacement The MAC replaces VLT in bytes 15 and 16 of all VLAN-type transmitted packets (Bytes 13 and 14 are 0x8100 or 0x88a8). Note: Changes to this field take effect only on the start of a packet. If you write this register field when a packet is being transmitted, only the subsequent packet can use the updated value, that is, the current packet does not use the updated value. 0x0 (NONE): No VLAN tag deletion, insertion, or replacement. 0x1 (DELETE): VLAN tag deletion. 0x2 (INSERT): VLAN tag insertion. 0x3 (REPLACE): VLAN tag replacement.
15:0	0000h RW	**VLAN Tag for Transmit Packets (VLT):** This field contains the value of the VLAN tag to be inserted. The value must only be changed when the transmit lines are inactive or during the initialization phase. Bits[15:13] are the User Priority field, Bit 12 is the CFI/DEI field, and Bits[11:0] are the VID field in the VLAN tag. The following list describes the bits of this field: - Bits[15:13]: User Priority - Bit 12: Canonical Format Indicator (CFI) or Drop Eligible Indicator (DEI) - Bits[11:0]: VLAN Identifier (VID) field of VLAN tag

3.2.11 MAC_INNER_VLAN_INCL — Offset 64h

The Inner VLAN Tag Inclusion or Replacement register contains the inner VLAN tag to be inserted or replaced in the Transmit packet. It also contains the inner VLAN tag insertion controls.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 64h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved**

17:16	0h RW	**VLC:** VLAN Tag Control in Transmit Packets - 2'b00: No VLAN tag deletion, insertion, or replacement - 2'b01: VLAN tag deletion The MAC removes the VLAN type (bytes 17 and 18) and VLAN tag (bytes 19 and 20) of all transmitted packets with VLAN tags. - 2'b10: VLAN tag insertion The MAC inserts VLT in bytes 19 and 20 of the packet after inserting the Type value (0x8100 or 0x88a8) in bytes 17 and 18. This operation is performed on all transmitted packets, irrespective of whether they already have a VLAN tag. - 2'b11: VLAN tag replacement The MAC replaces VLT in bytes 19 and 20 of all VLAN-type transmitted packets (Bytes 17 and 18 are 0x8100 or 0x88a8). Note: Changes to this field take effect only on the start of a packet. If you write this register field when a packet is being transmitted, only the subsequent packet can use the updated value, that is, the current packet does not use the updated value. 0x0 (NONE): No VLAN tag deletion, insertion, or replacement. 0x1 (DELETE): VLAN tag deletion. 0x2 (INSERT): VLAN tag insertion. 0x3 (REPLACE): VLAN tag replacement.
15:0	0000h RW	**VLAN Tag for Transmit Packets (VLT):** This field contains the value of the VLAN tag to be inserted or replaced. The value must only be changed when the transmit lines are inactive or during the initialization phase. Bits[15:13] are the User Priority field, Bit 12 is the CFI/DEI field, and Bits[11:0] are the VID field in the VLAN tag. The following list describes the bits of this field: - Bits[15:13]: User Priority - Bit 12: Canonical Format Indicator (CFI) or Drop Eligible Indicator (DEI) - Bits[11:0]: VLAN Identifier (VID) field of VLAN tag

3.2.12 MAC_Q0_TX_FLOW_CTRL — Offset 70h

The Flow Control register controls the generation and reception of the Control (Pause Command) packets by the Flow control module of the MAC. A Write to a register with the Busy bit set to 1 triggers the Flow Control block to generate a Pause packet. The fields of the control packet are selected as specified in the 802.3x specification, and the Pause Time value from this register is used in the Pause Time field of the control packet. The Busy bit remains set until the control packet is transferred onto the cable. The application must make sure that the Busy bit is cleared before writing to the register.

When the PFCE bit in the MAC_Rx_Flow_Ctrl register is enabled, this register controls the generation of Priority Flow Control (PFC) frames with priorities mapped according to PSRQ0 in the MAC_RxQ_Ctrl2 register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 70h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**Pause Time (PT):** This field holds the value to be used in the Pause Time field in the Tx control packet. If the Pause Time bits are configured to be double-synchronized to the (G)MII clock domain, consecutive writes to this register should be performed only after at least four clock cycles in the destination clock domain.
15:8	0h RO	**Reserved**
7	0h RW	**Disable Zero-Quanta Pause (DZPQ):** When this bit is set, it disables the automatic generation of the zero-quanta Pause packets on de-assertion of the flow-control signal from the FIFO layer (MTL or external sideband flow control signal sbd_flowctrl_i or mti_flowctrl_i). When this bit is reset, normal operation with automatic zero-quanta Pause packet generation is enabled. 0x0 (ENABLE): Zero-Quanta Pause packet generation is enabled. 0x1 (DISABLE): Zero-Quanta Pause packet generation is disabled.
6:4	0h RW	**Pause Low Threshold (PLT):** This field configures the threshold of the Pause timer at which the input flow control signal mti_flowctrl_i (or sbd_flowctrl_i) is checked for automatic retransmission of the Pause packet. The threshold values should be always less than the Pause Time configured in Bits[31:16]. For example, if PT = 100H (256 slot times), and PLT = 001, a second Pause packet is automatically transmitted if the mti_flowctrl_i signal is asserted at 228 (256-28) slot times after the first Pause packet is transmitted. The following list provides the threshold values for different values. The slot time is defined as the time taken to transmit 512 bits (64 bytes) on the GMII or MII interface. This (approximate) computation is based on the packet size (64, 1518, 2000, 9018, 16384, or 32768) + 2 Pause Packet Size + IPG in Slot Times. 0x0 (PT4): Pause Time minus 4 Slot Times (PT -4 slot times). 0x1 (PT28): Pause Time minus 28 Slot Times (PT -28 slot times). 0x2 (PT36): Pause Time minus 36 Slot Times (PT -36 slot times). 0x3 (PT144): Pause Time minus 144 Slot Times (PT -144 slot times). 0x4 (PT256): Pause Time minus 256 Slot Times (PT -256 slot times). 0x5 (PT512): Pause Time minus 512 Slot Times (PT -512 slot times). 0x6 (RSVD): Reserved.

Bit Range	Default & Access	Field Name (ID): Description
3:2	0h RO	**Reserved**
1	0h RW	**Transmit Flow Control Enable (TFE):** Full-Duplex Mode: In the full-duplex mode, when this bit is set, the MAC enables the flow control operation to Tx Pause packets. When this bit is reset, the flow control operation in the MAC is disabled, and the MAC does not transmit any Pause packets. Half-Duplex Mode: In the half-duplex mode, when this bit is set, the MAC enables the backpressure operation. When this bit is reset, the backpressure feature is disabled. 0x0 (DISABLE): Transmit Flow Control is disabled. 0x1 (ENABLE): Transmit Flow Control is enabled.
0	0h RW	**Flow Control Busy or Backpressure Activate (FCB_BPA):** This bit initiates a Pause packet in the full-duplex mode and activates the backpressure function in the half-duplex mode if the TFE bit is set. Full-Duplex Mode: In the full-duplex mode, this bit should be read as 1'b0 before writing to this register. To initiate a Pause packet, the application must set this bit to 1'b1. During Control packet transfer, this bit continues to be set to indicate that a packet transmission is in progress. When Pause packet transmission is complete, the MAC resets this bit to 1'b0. You should not write to this register until this bit is cleared. Half-Duplex Mode: When this bit is set (and TFE bit is set) in the half-duplex mode, the MAC asserts the backpressure. During backpressure, when the MAC receives a new packet, the transmitter starts sending a JAM pattern resulting in a collision. This control register bit is logically ORed with the mti_flowctrl_i input signal for the backpressure function. When the MAC is configured for the full-duplex mode, the BPA is automatically disabled. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Flow Control Busy or Backpressure Activate is disabled. 0x1 (ENABLE): Flow Control Busy or Backpressure Activate is enabled.

3.2.13 MAC_Q1_TX_FLOW_CTRL — Offset 74h

This register controls the generation of PFC Control packets of priorities mapped as per the PSRQi field in the MAC_RxQ_Ctrl2/MAC_RxQ_Ctrl3 registers.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 74h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**Pause Time (PT):** This field holds the value to be used in the Pause Time field in the Tx control packet. 3.2.15 MAC_Q3_TX_FLOW_CTRL — Offset 7Ch

This register controls the generation of PFC Control packets of priorities mapped as per the PSRQi field in the MAC_RxQ_Ctrl2/MAC_RxQ_Ctrl3 registers.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**Pause Time (PT):** This field holds the value to be used in the Pause Time field in the Tx control packet. If the Pause Time bits are configured to be double-synchronized to the (G)MII clock domain, consecutive writes to this register should be performed only after at least four clock cycles in the destination clock domain.
15:8	0h RO	**Reserved**
7	0h RW	**Disable Zero-Quanta Pause (DZPQ):** When this bit is set, it disables the automatic generation of the zero-quanta Pause packets on de-assertion of the flow-control signal from the FIFO layer (MTL or external sideband flow control signal sbd_flowctrl_i or mti_flowctrl_i). When this bit is reset, normal operation with automatic zero-quanta Pause packet generation is enabled. 0x0 (ENABLE): Zero-Quanta Pause packet generation is enabled. 0x1 (DISABLE): Zero-Quanta Pause packet generation is disabled.

Bit Range	Default & Access	Field Name (ID): Description
6:4	0h RW	**Pause Low Threshold (PLT):** This field configures the threshold of the Pause timer at which the input flow control signal mti_flowctrl_i (or sbd_flowctrl_i) is checked for automatic retransmission of the Pause packet. The threshold values should be always less than the Pause Time configured in Bits[31:16]. For example, if PT = 100H (256 slot times), and PLT = 001, a second Pause packet is automatically transmitted if the mti_flowctrl_i signal is asserted at 228 (256-28) slot times after the first Pause packet is transmitted. The following list provides the threshold values for different values. The slot time is defined as the time taken to transmit 512 bits (64 bytes) on the GMII or MII interface. This (approximate) computation is based on the packet size (64, 1518, 2000, 9018, 16384, or 32768) + 2 Pause Packet Size + IPG in Slot Times. 0x0 (PT4): Pause Time minus 4 Slot Times (PT -4 slot times). 0x1 (PT28): Pause Time minus 28 Slot Times (PT -28 slot times). 0x2 (PT36): Pause Time minus 36 Slot Times (PT -36 slot times). 0x3 (PT144): Pause Time minus 144 Slot Times (PT -144 slot times). 0x4 (PT256): Pause Time minus 256 Slot Times (PT -256 slot times). 0x5 (PT512): Pause Time minus 512 Slot Times (PT -512 slot times). 0x6 (RSVD): Reserved.
3:2	0h RO	**Reserved**
1	0h RW	**Transmit Flow Control Enable (TFE):** When this bit is set in full-duplex mode, the MAC enables the flow control operation to Tx Pause packets. When this bit is reset, the flow control operation in the MAC is disabled, and the MAC does not transmit any Pause packets. 0x0 (DISABLE): Transmit Flow Control is disabled. 0x1 (ENABLE): Transmit Flow Control is enabled.
0	0h RW	**Flow Control Busy (FCB_BPA):** This bit initiates a PFC packet if the TFE bit is set. To initiate a PFC packet, the application must set this bit to 1'b1. During Control packet transfer, this bit continues to be set to indicate that a packet transmission is in progress. When PFC packet transmission is complete, the MAC resets this bit to 1'b0. You should not write to this register until this bit is cleared. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Flow Control Busy or Backpressure Activate is disabled. 0x1 (ENABLE): Flow Control Busy or Backpressure Activate is enabled.

3.2.16 MAC_Q4_TX_FLOW_CTRL — Offset 80h

This register controls the generation of PFC Control packets of priorities mapped as per the PSRQi field in the MAC_RxQ_Ctrl2/MAC_RxQ_Ctrl3 registers.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 80h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**Pause Time (PT):** This field holds the value to be used in the Pause Time field in the Tx control packet. If the Pause Time bits are configured to be double-synchronized to the (G)MII clock domain, consecutive writes to this register should be performed only after at least four clock cycles in the destination clock domain.
15:8	0h RO	**Reserved**
7	0h RW	**Disable Zero-Quanta Pause (DZPQ):** When this bit is set, it disables the automatic generation of the zero-quanta Pause packets on de-assertion of the flow-control signal from the FIFO layer (MTL or external sideband flow control signal sbd_flowctrl_i or mti_flowctrl_i). When this bit is reset, normal operation with automatic zero-quanta Pause packet generation is enabled. 0x0 (ENABLE): Zero-Quanta Pause packet generation is enabled. 0x1 (DISABLE): Zero-Quanta Pause packet generation is disabled.
6:4	0h RW	**Pause Low Threshold (PLT):** This field configures the threshold of the Pause timer at which the input flow control signal mti_flowctrl_i (or sbd_flowctrl_i) is checked for automatic retransmission of the Pause packet. The threshold values should be always less than the Pause Time configured in Bits[31:16]. For example, if PT = 100H (256 slot times), and PLT = 001, a second Pause packet is automatically transmitted if the mti_flowctrl_i signal is asserted at 228 (256-28) slot times after the first Pause packet is transmitted. The following list provides the threshold values for different values. The slot time is defined as the time taken to transmit 512 bits (64 bytes) on the GMII or MII interface. This (approximate) computation is based on the packet size (64, 1518, 2000, 9018, 16384, or 32768) + 2 Pause Packet Size + IPG in Slot Times. 0x0 (PT4): Pause Time minus 4 Slot Times (PT -4 slot times). 0x1 (PT28): Pause Time minus 28 Slot Times (PT -28 slot times). 0x2 (PT36): Pause Time minus 36 Slot Times (PT -36 slot times). 0x3 (PT144): Pause Time minus 144 Slot Times (PT -144 slot times). 0x4 (PT256): Pause Time minus 256 Slot Times (PT -256 slot times). 0x5 (PT512): Pause Time minus 512 Slot Times (PT -512 slot times). 0x6 (RSVD): Reserved.
3:2	0h RO	**Reserved**
1	0h RW	**Transmit Flow Control Enable (TFE):** When this bit is set in full-duplex mode, the MAC enables the flow control operation to Tx Pause packets. When this bit is reset, the flow control operation in the MAC is disabled, and the MAC does not transmit any Pause packets. 0x0 (DISABLE): Transmit Flow Control is disabled. 0x1 (ENABLE): Transmit Flow Control is enabled.
0	0h RW	**Flow Control Busy (FCB_BPA):** This bit initiates a PFC packet if the TFE bit is set. To initiate a PFC packet, the application must set this bit to 1'b1. During Control packet transfer, this bit continues to be set to indicate that a packet transmission is in progress. When PFC packet transmission is complete, the MAC resets this bit to 1'b0. You should not write to this register until this bit is cleared. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Flow Control Busy or Backpressure Activate is disabled. 0x1 (ENABLE): Flow Control Busy or Backpressure Activate is enabled.

3.2.17 MAC_Q5_TX_FLOW_CTRL — Offset 84h

This register controls the generation of PFC Control packets of priorities mapped as per the PSRQi field in the MAC_RxQ_Ctrl2/MAC_RxQ_Ctrl3 registers.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 84h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**Pause Time (PT):** This field holds the value to be used in the Pause Time field in the Tx control packet. If the Pause Time bits are configured to be double-synchronized to the (G)MII clock domain, consecutive writes to this register should be performed only after at least four clock cycles in the destination clock domain.
15:8	0h RO	**Reserved**
7	0h RW	**Disable Zero-Quanta Pause (DZPQ):** When this bit is set, it disables the automatic generation of the zero-quanta Pause packets on de-assertion of the flow-control signal from the FIFO layer (MTL or external sideband flow control signal sbd_flowctrl_i or mti_flowctrl_i). When this bit is reset, normal operation with automatic zero-quanta Pause packet generation is enabled. 0x0 (ENABLE): Zero-Quanta Pause packet generation is enabled. 0x1 (DISABLE): Zero-Quanta Pause packet generation is disabled.
6:4	0h RW	**Pause Low Threshold (PLT):** This field configures the threshold of the Pause timer at which the input flow control signal mti_flowctrl_i (or sbd_flowctrl_i) is checked for automatic retransmission of the Pause packet. The threshold values should be always less than the Pause Time configured in Bits[31:16]. For example, if PT = 100H (256 slot times), and PLT = 001, a second Pause packet is automatically transmitted if the mti_flowctrl_i signal is asserted at 228 (256-28) slot times after the first Pause packet is transmitted. 3:2	0h RO	**Reserved**
1	0h RW	**Transmit Flow Control Enable (TFE):** When this bit is set in full-duplex mode, the MAC enables the flow control operation to Tx Pause packets. When this bit is reset, the flow control operation in the MAC is disabled, and the MAC does not transmit any Pause packets. 0x0 (DISABLE): Transmit Flow Control is disabled. 0x1 (ENABLE): Transmit Flow Control is enabled.
0	0h RW	**Flow Control Busy (FCB_BPA):** This bit initiates a PFC packet if the TFE bit is set. To initiate a PFC packet, the application must set this bit to 1'b1. During Control packet transfer, this bit continues to be set to indicate that a packet transmission is in progress. When PFC packet transmission is complete, the MAC resets this bit to 1'b0. You should not write to this register until this bit is cleared. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Flow Control Busy or Backpressure Activate is disabled. 0x1 (ENABLE): Flow Control Busy or Backpressure Activate is enabled.

3.2.20 MAC_RX_FLOW_CTRL — Offset 90h

The Receive Flow Control register controls the pausing of MAC Transmit based on the received Pause packet.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 90h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved**
8	0h RW	**Priority Based Flow Control Enable (PFCE):** When this bit is set, it enables generation and reception of priority-based flow control (PFC) packets. When this bit is reset, it enables generation and reception of 802.3x Pause control packets. 0x0 (DISABLE): Priority Based Flow Control is disabled. 0x1 (ENABLE): Priority Based Flow Control is enabled.
7:2	0h RO	**Reserved**
1	0h RW	**Unicast Pause Packet Detect (UP):** A pause packet is processed when it has the unique multicast address specified in the IEEE 802.3. When this bit is set, the MAC can also detect Pause packets with unicast address of the station. This unicast address should be as specified in MAC_Address0_High and MAC_Address0_Low. When this bit is reset, the MAC only detects Pause packets with unique multicast address. Note: The MAC does not process a Pause packet if the multicast address is different from the unique multicast address. This is also applicable to the received PFC packet when the Priority Flow Control (PFC) is enabled. The unique multicast address (0x01_80_C2_00_00_01) is as specified in IEEE 802.1 Qbb-2011. 0x0 (DISABLE): Unicast Pause Packet Detect disabled. 0x1 (ENABLE): Unicast Pause Packet Detect enabled.
0	0h RW	**Receive Flow Control Enable (RFE):** When this bit is set and the MAC is operating in full-duplex mode, the MAC decodes the received Pause packet and disables its transmitter for a specified (Pause) time. When this bit is reset or the MAC is operating in half-duplex mode, the decode function of the Pause packet is disabled. When PFC is enabled, flow control is enabled for PFC packets. The MAC decodes the received PFC packet and disables the Transmit queue, with matching priorities, for a duration of received Pause time. 0x0 (DISABLE): Receive Flow Control is disabled. 0x1 (ENABLE): Receive Flow Control is enabled.

3.2.21 MAC_RXQ_CTRL4 — Offset 94h

The Receive Queue Control 4 register controls the routing of unicast and multicast packets that fail the Destination or Source address filter to the Rx queues.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 94h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19:17	0h RW	**VLAN Tag Filter Fail Packets Queue (VFFQ):** This field holds the Rx queue number to which the tagged packets failing the Destination or Source Address filter (and UFFQE/MFFQE not enabled) or failing the VLAN tag filter must be routed to. This field is valid only when the VFFQE bit is set.
16	0h RW	**VLAN Tag Filter Fail Packets Queuing Enable (VFFQE):** When this bit is set, the tagged packets which fail the Destination or Source address filter or fail the VLAN tag filter, are routed to the Rx Queue Number programmed in the VFFQ. When this bit is reset, the tagged packets which fail the Destination or Source address filter or fail the VLAN tag filter are routed based on other routing options. This bit is valid only when the RA bit of the MAC_Packet_Filter register is set. 0x0 (DISABLE): VLAN tag Filter Fail Packets Queuing is disabled. 0x1 (ENABLE): VLAN tag Filter Fail Packets Queuing is enabled.
15:12	0h RO	**Reserved**
11:9	0h RW	**Multicast Address Filter Fail Packets Queue. (MFFQ):** This field holds the Rx queue number to which the Multicast packets failing the Destination or Source Address filter are routed to. This field is valid only when the MFFQE bit is set.
8	0h RW	**Multicast Address Filter Fail Packets Queuing Enable. (MFFQE):** When this bit is set, the Multicast packets which fail the Destination or Source address filter is routed to the Rx Queue Number programmed in the MFFQ. When this bit is reset, the Multicast packets which fail the Destination or Source address filter is routed based on other routing options. This bit is valid only when the RA bit of the MAC_Packet_Filter register is set. 0x0 (DISABLE): Multicast Address Filter Fail Packets Queuing is disabled. 0x1 (ENABLE): Multicast Address Filter Fail Packets Queuing is enabled.
7:4	0h RO	**Reserved**
3:1	0h RW	**Unicast Address Filter Fail Packets Queue. (UFFQ):** This field holds the Rx queue number to which the Unicast packets failing the Destination or Source Address filter are routed to. This field is valid only when the UFFQE bit is set.
0	0h RW	**Unicast Address Filter Fail Packets Queuing Enable. (UFFQE):** When this bit is set, the Unicast packets which fail the Destination or Source address filter is routed to the Rx Queue Number programmed in the UFFQ. When this bit is reset, the Unicast packets which fail the Destination or Source address filter is routed based on other routing options. This bit is valid only when the RA bit of the MAC_Packet_Filter register is set. 0x0 (DISABLE): Unicast Address Filter Fail Packets Queuing is disabled. 0x1 (ENABLE): Unicast Address Filter Fail Packets Queuing is enabled.

3.2.22 MAC_TXQ_PRTY_MAP0 — Offset 98h

The Transmit Queue Priority Mapping 0 register contains the priority values assigned to Tx Queue 0 through Tx Queue 3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RW	**Priorities Selected in Transmit Queue 3 (PSTQ3):** This bit is similar to the PSTQ0 bit.
23:16	00h RW	**Priorities Selected in Transmit Queue 2 (PSTQ2):** This bit is similar to the PSTQ0 bit.
15:8	00h RW	**Priorities Selected in Transmit Queue 1 (PSTQ1):** This bit is similar to the PSTQ0 bit.
7:0	00h RW	**Priorities Selected in Transmit Queue 0 (PSTQ0):** This field holds the priorities assigned to Tx Queue 0 by the software. This field determines if Tx Queue 0 should be blocked from transmitting specified pause time when a PFC packet is received with priorities matching the priorities programmed in this field. If the content of this field is not mutually exclusive to corresponding fields of other Transmit queues, that is, same priority is mapped to multiple Tx queues, the MAC blocks all queues with matching priority for specified time.

3.2.23 MAC_TXQ_PRTY_MAP1 — Offset 9Ch

The Transmit Queue Priority Mapping 1 register contains the priority values assigned to Tx Queue 4 through Tx Queue 7.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RW	**Priorities Selected in Transmit Queue 7 (PSTQ7):** This bit is similar to the PSTQ4 bit.
23:16	00h RW	**Priorities Selected in Transmit Queue 6 (PSTQ6):** This bit is similar to the PSTQ4 bit.
15:8	00h RW	**Priorities Selected in Transmit Queue 5 (PSTQ5):** This bit is similar to the PSTQ4 bit.
7:0	00h RW	**Priorities Selected in Transmit Queue 4 (PSTQ4):** This field holds the priorities assigned to Tx Queue 4 by the software. This field determines if Tx Queue 4 should be blocked from transmitting specified pause time when a PFC packet is received with priorities matching the priorities programmed in this field. If the content of this field is not mutually exclusive to corresponding fields of other Transmit queues, that is, same priority is mapped to multiple Tx queues, the MAC blocks all queues with matching priority for specified time.

3.2.24 MAC_RXQ_CTRL0 — Offset A0h

The Receive Queue Control 0 register controls the queue management in the MAC Receiver.

Note: In multiple Rx queues configuration, all the queues are disabled by default. Enable the Rx queue by programming the corresponding field in this register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + A0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:14	0h RW	**Receive Queue 7 Enable (RXQ7EN):** This field is similar to the RXQ0EN field. 0x0 (DISABLE): Queue not enabled. 0x1 (EN_AV): Queue enabled for AV. 0x2 (EN_DCB_GEN): Queue enabled for DCB/Generic. 0x3 (RSVD): Reserved.
13:12	0h RW	**Receive Queue 6 Enable (RXQ6EN):** This field is similar to the RXQ0EN field. 0x0 (DISABLE): Queue not enabled. 0x1 (EN_AV): Queue enabled for AV. 0x2 (EN_DCB_GEN): Queue enabled for DCB/Generic. 0x3 (RSVD): Reserved.
11:10	0h RW	**Receive Queue 5 Enable (RXQ5EN):** This field is similar to the RXQ0EN field. 0x0 (DISABLE): Queue not enabled. 0x1 (EN_AV): Queue enabled for AV. 0x2 (EN_DCB_GEN): Queue enabled for DCB/Generic. 0x3 (RSVD): Reserved.
9:8	0h RW	**Receive Queue 4 Enable (RXQ4EN):** This field is similar to the RXQ0EN field. 0x0 (DISABLE): Queue not enabled. 0x1 (EN_AV): Queue enabled for AV. 0x2 (EN_DCB_GEN): Queue enabled for DCB/Generic. 0x3 (RSVD): Reserved.
7:6	0h RW	**Receive Queue 3 Enable (RXQ3EN):** This field is similar to the RXQ0EN field. 0x0 (DISABLE): Queue not enabled. 0x1 (EN_AV): Queue enabled for AV. 0x2 (EN_DCB_GEN): Queue enabled for DCB/Generic. 0x3 (RSVD): Reserved.

Bit Range	Default & Access	Field Name (ID): Description
5:4	0h RW	**Receive Queue 2 Enable (RXQ2EN):** This field is similar to the RXQ0EN field. 0x0 (DISABLE): Queue not enabled. 0x1 (EN_AV): Queue enabled for AV. 0x2 (EN_DCB_GEN): Queue enabled for DCB/Generic. 0x3 (RSVD): Reserved.
3:2	0h RW	**Receive Queue 1 Enable (RXQ1EN):** This field is similar to the RXQ0EN field. 0x0 (DISABLE): Queue not enabled. 0x1 (EN_AV): Queue enabled for AV. 0x2 (EN_DCB_GEN): Queue enabled for DCB/Generic. 0x3 (RSVD): Reserved.
1:0	0h RW	**Receive Queue 0 Enable (RXQ0EN):** This field indicates whether Rx Queue 0 is enabled for AV or DCB. 0x0 (DISABLE): Queue not enabled. 0x1 (EN_AV): Queue enabled for AV. 0x2 (EN_DCB_GEN): Queue enabled for DCB/Generic. 0x3 (RSVD): Reserved.

3.2.25 MAC_RXQ_CTRL1 — Offset A4h

The Receive Queue Control 1 register controls the routing of multicast, broadcast, AV, DCB, and untagged packets to the Rx queues.

Type	Size	Offset	Default
MMIO	32 bit	BAR + A4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**OMCBCQ:** 0x0 (DISABLE): overriding MCBCQ priority disabled. 0x1 (ENABLE): overriding MCBCQ priority enabled.
27	0h RO	**Reserved**
26:24	0h RW	**Frame Preemption Residue Queue (FPRQ):** This field holds the Rx queue number to which the residual preemption frames must be forwarded. Preemption frames that are tagged and pass the SA/DA/VLAN filtering are routed based on PSRQ and all other frames are treated as residual frames and is routed to the queue number mentioned in this field. The Queue-0 is used as a default queue for express frames, so this field cannot be programmed to a value 0.

Bit Range	Default & Access	Field Name (ID): Description
23:22	0h RW	**Tagged PTP over Ethernet Packets Queuing Control. (TPQC):** This field controls the routing of the VLAN Tagged PTPoE packets. The following programmable options are allowed. - 2'b00: VLAN Tagged PTPoE packets are routed as generic VLAN Tagged packet (based on PSRQ for only non-AV enabled Rx Queues). - 2'b01: VLAN Tagged PTPoE packets are routed to Rx Queue specified by PTPQ field (That Rx Queue can be enabled for AV or non-AV traffic). - 2'b10: VLAN Tagged PTPoE packets are routed to only AV enabled Rx Queues based on PSRQ. - 2'b11: Reserved
21	0h RW	**Tagged AV Control Packets Queuing Enable. (TACPQE):** When set, the MAC routes the received Tagged AV Control packets to the Rx queue specified by AVCPQ field. When reset, the MAC routes the received Tagged AV Control packets based on the tag priority matching the PSRQ fields in MAC_RxQ_Ctrl2 and MAC_RxQ_Ctrl3 registers. 0x0 (DISABLE): Tagged AV Control Packets Queuing is disabled. 0x1 (ENABLE): Tagged AV Control Packets Queuing is enabled.
20	0h RW	**Multicast and Broadcast Queue Enable (MCBCQEN):** This bit specifies that Multicast or Broadcast packets routing to the Rx Queue is enabled and the Multicast or Broadcast packets must be routed to Rx Queue specified in MCBCQ field. 0x0 (DISABLE): Multicast and Broadcast Queue is disabled. 0x1 (ENABLE): Multicast and Broadcast Queue is enabled.
19	0h RO	**Reserved**
18:16	0h RW	**Multicast and Broadcast Queue (MCBCQ):** This field specifies the Rx Queue onto which Multicast or Broadcast Packets are routed. Any Rx Queue enabled for Generic/DCB/AV traffic can be used to route the Multicast or Broadcast Packets. 0x0 (QUEUE0): Receive Queue 0. 0x1 (QUEUE1): Receive Queue 1. 0x2 (QUEUE2): Receive Queue 2. 0x3 (QUEUE3): Receive Queue 3. 0x4 (QUEUE4): Receive Queue 4. 0x5 (QUEUE5): Receive Queue 5. 0x6 (QUEUE6): Receive Queue 6. 0x7 (QUEUE7): Receive Queue 7.
15	0h RO	**Reserved**
14:12	0h RW	**Untagged Packet Queue (UPQ):** This field indicates the Rx Queue to which Untagged Packets are to be routed. Any Rx Queue enabled for Generic/DCB/AV traffic can be used to route the Untagged Packets. 0x0 (QUEUE0): Receive Queue 0. 0x1 (QUEUE1): Receive Queue 1. 0x2 (QUEUE2): Receive Queue 2. 0x3 (QUEUE3): Receive Queue 3. 0x4 (QUEUE4): Receive Queue 4. 0x5 (QUEUE5): Receive Queue 5. 0x6 (QUEUE6): Receive Queue 6. 0x7 (QUEUE7): Receive Queue 7.
11	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
10:8	0h RW	**DCB Control Packets Queue (DCBCPQ):** This field specifies the Rx queue on which the received DCB control packets are routed. The DCB data packets are routed based on the PSRQ field of the Transmit Flow Control Register of corresponding queue. 0x0 (QUEUE0): Receive Queue 0. 0x1 (QUEUE1): Receive Queue 1. 0x2 (QUEUE2): Receive Queue 2. 0x3 (QUEUE3): Receive Queue 3. 0x4 (QUEUE4): Receive Queue 4. 0x5 (QUEUE5): Receive Queue 5. 0x6 (QUEUE6): Receive Queue 6. 0x7 (QUEUE7): Receive Queue 7.
7	0h RO	**Reserved**
6:4	0h RW	**PTP Packets Queue (PTPQ):** This field specifies the Rx queue on which the PTP packets sent over the Ethernet payload (not over IPv4 or IPv6) are routed. When the AV8021ASMEN bit of MAC_Timestamp_Control register is set, only untagged PTP over Ethernet packets are routed on an Rx Queue. If the bit is not set, then based on programming of TPQC field, both tagged and untagged PTPoE packets can be routed to this Rx Queue. 0x0 (QUEUE0): Receive Queue 0. 0x1 (QUEUE1): Receive Queue 1. 0x2 (QUEUE2): Receive Queue 2. 0x3 (QUEUE3): Receive Queue 3. 0x4 (QUEUE4): Receive Queue 4. 0x5 (QUEUE5): Receive Queue 5. 0x6 (QUEUE6): Receive Queue 6. 0x7 (QUEUE7): Receive Queue 7.
3	0h RO	**Reserved**
2:0	0h RW	**AV Untagged Control Packets Queue (AVCPQ):** This field specifies the Receive queue on which the received AV tagged and untagged control packets are routed. The AV tagged (when TACPQE bit is set) and untagged control packets are routed to Receive queue specified by this field. 0x0 (QUEUE0): Receive Queue 0. 0x1 (QUEUE1): Receive Queue 1. 0x2 (QUEUE2): Receive Queue 2. 0x3 (QUEUE3): Receive Queue 3. 0x4 (QUEUE4): Receive Queue 4. 0x5 (QUEUE5): Receive Queue 5. 0x6 (QUEUE6): Receive Queue 6. 0x7 (QUEUE7): Receive Queue 7.

3.2.26 MAC_RXQ_CTRL2 — Offset A8h

This register controls the routing of tagged packets based on the USP (user Priority) field of the received packets to the RxQueues 0 to 3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + A8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RW	**Priorities Selected in the Receive Queue 3 (PSRQ3):** This field decides the priorities assigned to Rx Queue 3. All packets with priorities that match the values set in this field are routed to Rx Queue 3. For example, if PSRQ3[6, 3] are set, packets with USP field equal to 3 or 6 are routed to Rx Queue 3. The software must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues. this field also determines the priorities to be included in the PFC packet sent to remote station when Rx Queue 3 crosses the flow control threshold settings.
23:16	00h RW	**Priorities Selected in the Receive Queue 2 (PSRQ2):** This field decides the priorities assigned to Rx Queue 2. All packets with priorities that match the values set in this field are routed to Rx Queue 2. For example, if PSRQ2[1, 0] are set, packets with USP field equal to 1 or 0 are routed to Rx Queue 2. The software must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues. this field also determines the priorities to be included in the PFC packet sent to remote station when Rx Queue 2 crosses the flow control threshold settings.
15:8	00h RW	**Priorities Selected in the Receive Queue 1 (PSRQ1):** This field decides the priorities assigned to Rx Queue 1. All packets with priorities that match the values set in this field are routed to Rx Queue 1. For example, if PSRQ1[4] is set, packets with USP field equal to 4 are routed to Rx Queue 1. The software must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues. this field also determines the priorities to be included in the PFC packet sent to remote station when Rx Queue 1 crosses the flow control threshold settings.
7:0	00h RW	**Priorities Selected in the Receive Queue 0 (PSRQ0):** This field decides the priorities assigned to Rx Queue 0. All packets with priorities that match the values set in this field are routed to Rx Queue 0. For example, if PSRQ0[5] is set, packets with USP field equal to 5 are routed to Rx Queue 0. The software must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues. this field also determines the priorities to be included in the PFC packet sent to remote station when Rx Queue 0 crosses the flow control threshold settings.

3.2.27 MAC_RXQ_CTRL3 — Offset ACh

This register controls the routing of tagged packets based on the USP (user Priority) field of the received packets to the RxQueues 4 to 7.

Type	Size	Offset	Default
MMIO	32 bit	BAR + ACh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RW	**Priorities Selected in the Receive Queue 7 (PSRQ7):** This field decides the priorities assigned to Rx Queue 7. All packets with priorities that match the values set in this field are routed to Rx Queue 7. For example, if PSRQ7[7, 4] are set, packets with USP field equal to 7 or 4 are routed to Rx Queue 7. The software must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues. this field also determines the priorities to be included in the PFC packet sent to remote station when Rx Queue 7 crosses the flow control threshold settings.
23:16	00h RW	**Priorities Selected in the Receive Queue 6 (PSRQ6):** This field decides the priorities assigned to Rx Queue 6. All packets with priorities that match the values set in this field are routed to Rx Queue 6. For example, if PSRQ6[5] are set, packets with USP field equal to 5 are routed to Rx Queue 6. The software must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues. this field also determines the priorities to be included in the PFC packet sent to remote station when Rx Queue 6 crosses the flow control threshold settings.
15:8	00h RW	**Priorities Selected in the Receive Queue 5 (PSRQ5):** This field decides the priorities assigned to Rx Queue 5. All packets with priorities that match the values set in this field are routed to Rx Queue 5. For example, if PSRQ5[6] is set, packets with USP field equal to 6 are routed to Rx Queue 5. The software must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues. this field also determines the priorities to be included in the PFC packet sent to remote station when Rx Queue 5 crosses the flow control threshold settings.
7:0	00h RW	**Priorities Selected in the Receive Queue 4 (PSRQ4):** This field decides the priorities assigned to Rx Queue 4. All packets with priorities that match the values set in this field are routed to Rx Queue 4. For example, if PSRQ4[7:4] is set, packets with USP field equal to 7, 6, 5, or 4 are routed to Rx Queue 4. The software must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues. this field also determines the priorities to be included in the PFC packet sent to remote station when Rx Queue 4 crosses the flow control threshold settings.

3.2.28 MAC_INTERRUPT_STATUS — Offset B0h

The Interrupt Status register contains the status of interrupts.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved**
20	0h RO	**MMC FPE Receive Interrupt Status (MFRIS):** This bit is set high when an interrupt is generated in the MMC FPE Receive Interrupt Register. This bit is cleared when all bits in this interrupt register are cleared. This bit is valid only when you select the Enable MAC Management Counters (MMC) option along with FPE support. 0x0 (INACTIVE): MMC FPE Receive Interrupt status not active. 0x1 (ACTIVE): MMC FPE Receive Interrupt status active.
19	0h RO	**MMC FPE Transmit Interrupt Status (MFTIS):** This bit is set high when an interrupt is generated in the MMC FPE Transmit Interrupt Register. This bit is cleared when all bits in this interrupt register are cleared. This bit is valid only when you select the Enable MAC Management Counters (MMC) option along with FPE support. 0x0 (INACTIVE): MMC FPE Transmit Interrupt status not active. 0x1 (ACTIVE): MMC FPE Transmit Interrupt status active.
18	0h RO	**MDIO Interrupt Status (MDIOIS):** This bit indicates an interrupt event after the completion of MDIO operation. To reset this bit, the application has to read this bit/Write 1 to this bit when RCWE bit of MAC_CSR_SW_Ctrl register is set. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): MDIO Interrupt status not active. 0x1 (ACTIVE): MDIO Interrupt status active.
17	0h RO	**Frame Preemption Interrupt Status (FPEIS):** This bit indicates an interrupt event during the operation of Frame Preemption (Bits[19:16] of MAC_FPE_CTRL_STS register is set). To reset this bit, the application must clear the event in MAC_FPE_CTRL_STS that has caused the Interrupt. 0x0 (INACTIVE): Frame Preemption Interrupt status not active. 0x1 (ACTIVE): Frame Preemption Interrupt status active.
16	0h RO	**Reserved**
15	0h RO	**GPI Interrupt Status (GPIIS):** When the GPIO feature is enabled, this bit is set when any active event (LL or LH) occurs on the GPIS field of the MAC_GPIO_Status register and the corresponding GPIE bit is enabled in the MAC_GPIO_Control register. This bit is cleared on reading lane 0 (GPIS) of the MAC_GPIO_Status register. 0x0 (INACTIVE): GPI Interrupt status not active. 0x1 (ACTIVE): GPI Interrupt status active.
14	0h RO	**Receive Status Interrupt (RXSTSIS):** This bit indicates the status of received packets. This bit is set when the RWT bit is set in the MAC_Rx_Tx_Status register. This bit is cleared when the corresponding interrupt source bit is read (or corresponding interrupt source bit is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set) in the MAC_Rx_Tx_Status register. 0x0 (INACTIVE): Receive Interrupt status not active. 0x1 (ACTIVE): Receive Interrupt status active.

Bit Range	Default & Access	Field Name (ID): Description
13	0h RO	**Transmit Status Interrupt (TXSTSIS):** This bit indicates the status of transmitted packets. This bit is set when any of the following bits is set in the MAC_Rx_Tx_Status register: - Excessive Collision (EXCOL) - Late Collision (LCOL) - Excessive Deferral (EXDEF) - Loss of Carrier (LCARR) - No Carrier (NCARR) - Jabber Timeout (TJT) This bit is cleared when the corresponding interrupt source bit is read (or corresponding interrupt source bit is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set) in the MAC_Rx_Tx_Status register. 0x0 (INACTIVE): Transmit Interrupt status not active. 0x1 (ACTIVE): Transmit Interrupt status active.
12	0h RO	**Timestamp Interrupt Status (TSIS):** If the Timestamp feature is enabled, this bit is set when any of the following conditions is true: - The system time value is equal to or exceeds the value specified in the Target Time High and Low registers. - There is an overflow in the Seconds register. - The Target Time Error occurred, that is, programmed target time already elapsed. If the Auxiliary Snapshot feature is enabled, this bit is set when the auxiliary snapshot trigger is asserted. In configurations other than EQOS_CORE, when drop transmit status is enabled in MTL, this bit is set when the captured transmit timestamp is updated in the MAC_Tx_Timestamp_Status_Nanoseconds and Mac_TxTimestamp_Status_Seconds registers. When PTP offload feature is enabled, this bit is set when the captured transmit timestamp is updated in the MAC_Tx_Timestamp_Status_Nanoseconds and MAC_Tx_Timestamp_Status_Seconds registers, for PTO generated Delay Request and Pdelay request packets. This bit is cleared when the corresponding interrupt source bit is read (or corresponding interrupt source bit is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set) in the MAC_Timestamp_Status register. 0x0 (INACTIVE): Timestamp Interrupt status not active. 0x1 (ACTIVE): Timestamp Interrupt status active.
11	0h RO	**MMC Receive Checksum Offload Interrupt Status (MMCRXIPIS):** This bit is set high when an interrupt is generated in the MMC Receive Checksum Offload Interrupt Register. This bit is cleared when all bits in this interrupt register are cleared. This bit is valid only when you select the Enable MAC Management Counters (MMC) and Enable Receive TCP/IP Checksum Check options. 0x0 (INACTIVE): MMC Receive Checksum Offload Interrupt status not active. 0x1 (ACTIVE): MMC Receive Checksum Offload Interrupt status active.
10	0h RO	**MMC Transmit Interrupt Status (MMCTXIS):** This bit is set high when an interrupt is generated in the MMC Transmit Interrupt Register. This bit is cleared when all bits in this interrupt register are cleared. This bit is valid only when you select the Enable MAC Management Counters (MMC) option. 0x0 (INACTIVE): MMC Transmit Interrupt status not active. 0x1 (ACTIVE): MMC Transmit Interrupt status active.
9	0h RO	**MMC Receive Interrupt Status (MMCRXIS):** This bit is set high when an interrupt is generated in the MMC Receive Interrupt Register. This bit is cleared when all bits in this interrupt register are cleared. This bit is valid only when you select the Enable MAC Management Counters (MMC) option. 0x0 (INACTIVE): MMC Receive Interrupt status not active. 0x1 (ACTIVE): MMC Receive Interrupt status active.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RO	**MMC Interrupt Status (MMCIS):** This bit is set high when Bit 11, Bit 10, or Bit 9 is set high. This bit is cleared only when all these bits are low. This bit is valid only when you select the Enable MAC Management Counters (MMC) option. 0x0 (INACTIVE): MMC Interrupt status not active. 0x1 (ACTIVE): MMC Interrupt status active.
7:6	0h RO	**Reserved**
5	0h RO	**LPI Interrupt Status (LPIIS):** When the Energy Efficient Ethernet feature is enabled, this bit is set for any LPI state entry or exit in the MAC Transmitter or Receiver. This bit is cleared when the corresponding interrupt source bit of MAC_LPI_Control_Status register is read (or corresponding interrupt source bit of MAC_LPI_Control_Status register is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set). 0x0 (INACTIVE): LPI Interrupt status not active. 0x1 (ACTIVE): LPI Interrupt status active.
4	0h RO	**PMT Interrupt Status (PMTIS):** This bit is set when a Magic packet or Wake-on-LAN packet is received in the power-down mode (RWKPRCVD and MGKPRCVD bits in MAC_PMT_Control_Status register). This bit is cleared when corresponding interrupt source bit are cleared because of a Read operation to the MAC_PMT_Control_Status register (or corresponding interrupt source bit of MAC_PMT_Control_Status register is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set). This bit is valid only when you select the Enable Power Management option. 0x0 (INACTIVE): PMT Interrupt status not active. 0x1 (ACTIVE): PMT Interrupt status active.
3	0h RO	**PHY Interrupt (PHYIS):** This bit is set when rising edge is detected on the phy_intr_i input. This bit is cleared when this register is read (or this bit is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set). 0x0 (INACTIVE): PHY Interrupt not detected. 0x1 (ACTIVE): PHY Interrupt detected.
2:1	0h RO	**Reserved**
0	0h RO	**RGMII or SMII Interrupt Status (RGSMIIIS):** This bit is set because of any change in value of the Link Status of RGMII or SMII interface (LNKSTS bit in MAC_PHYIF_Control_Status register). This bit is cleared when the MAC_PHYIF_Control_Status register is read (or LNKSTS bit of MAC_PHYIF_Control_Status register is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set). This bit is valid only when you select the optional RGMII or SMII PHY interface. 0x0 (INACTIVE): RGMII or SMII Interrupt Status is not active. 0x1 (ACTIVE): RGMII or SMII Interrupt Status is active.

3.2.29 MAC_INTERRUPT_ENABLE — Offset B4h

The Interrupt Enable register contains the masks for generating the interrupts.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	**Reserved**
18	0h RW	**MDIO Interrupt Enable (MDIOIE):** When this bit is set, it enables the assertion of the interrupt when MDIOIS field is set in the MAC_Interrupt_Status register. 0x0 (DISABLE): MDIO Interrupt is disabled. 0x1 (ENABLE): MDIO Interrupt is enabled.
17	0h RW	**Frame Preemption Interrupt Enable (FPEIE):** When this bit is set, it enables the assertion of the interrupt when FPEIS field is set in the MAC_Interrupt_Status register. 0x0 (DISABLE): Frame Preemption Interrupt is disabled. 0x1 (ENABLE): Frame Preemption Interrupt is enabled.
16:15	0h RO	**Reserved**
14	0h RW	**Receive Status Interrupt Enable (RXSTSIE):** When this bit is set, it enables the assertion of the interrupt signal because of the setting of RXSTSIS bit in the MAC_Interrupt_Status register. 0x0 (DISABLE): Receive Status Interrupt is disabled. 0x1 (ENABLE): Receive Status Interrupt is enabled.
13	0h RW	**Transmit Status Interrupt Enable (TXSTSIE):** When this bit is set, it enables the assertion of the interrupt signal because of the setting of TXSTSIS bit in the MAC_Interrupt_Status register. 0x0 (DISABLE): Timestamp Status Interrupt is disabled. 0x1 (ENABLE): Timestamp Status Interrupt is enabled.
12	0h RW	**Timestamp Interrupt Enable (TSIE):** When this bit is set, it enables the assertion of the interrupt signal because of the setting of TSIS bit in MAC_Interrupt_Status register. 0x0 (DISABLE): Timestamp Interrupt is disabled. 0x1 (ENABLE): Timestamp Interrupt is enabled.
11:6	0h RO	**Reserved**
5	0h RW	**LPI Interrupt Enable (LPIIE):** When this bit is set, it enables the assertion of the interrupt signal because of the setting of LPIIS bit in MAC_Interrupt_Status register. 0x0 (DISABLE): LPI Interrupt is disabled. 0x1 (ENABLE): LPI Interrupt is enabled.
4	0h RW	**PMT Interrupt Enable (PMTIE):** When this bit is set, it enables the assertion of the interrupt signal because of the setting of PMTIS bit in MAC_Interrupt_Status register. 0x0 (DISABLE): PMT Interrupt is disabled. 0x1 (ENABLE): PMT Interrupt is enabled.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**PHY Interrupt Enable (PHYIE):** When this bit is set, it enables the assertion of the interrupt signal because of the setting of PHYIS bit in MAC_Interrupt_Status register. 0x0 (DISABLE): PHY Interrupt is disabled. 0x1 (ENABLE): PHY Interrupt is enabled.
2:1	0h RO	**Reserved**
0	0h RW	**RGMII or SMII Interrupt Enable (RGSMIIIE):** When this bit is set, it enables the assertion of the interrupt signal because of the setting of RGSMIIIS bit in MAC_Interrupt_Status register. 0x0 (DISABLE): RGMII or SMII Interrupt is disabled. 0x1 (ENABLE): RGMII or SMII Interrupt is enabled.

3.2.30 MAC_RX_TX_STATUS — Offset B8h

The Receive Transmit Status register contains the Receive and Transmit Error status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved**
8	0h RO	**Receive Watchdog Timeout (RWT):** This bit is set when a packet with length greater than 2,048 bytes is received (10,240 bytes when Jumbo Packet mode is enabled) and the WD bit is reset in the MAC_Configuration register. This bit is set when a packet with length greater than 16,383 bytes is received and the WD bit is set in the MAC_Configuration register. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): No receive watchdog timeout. 0x1 (ACTIVE): Receive watchdog timed out.
7:6	0h RO	**Reserved**
5	0h RO	**Excessive Collisions (EXCOL):** When the DTXSTS bit is set in the MTL_Operation_Mode register, this bit indicates that the transmission aborted after 16 successive collisions while attempting to transmit the current packet. If the DR bit is set in the MAC_Configuration register, this bit is set after the first collision and the packet transmission is aborted. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): No collision. 0x1 (ACTIVE): Excessive collision is sensed.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO	**Late Collision (LCOL):** When the DTXSTS bit is set in the MTL_Operation_Mode register, this bit indicates that the packet transmission aborted because a collision occurred after the collision window (64 bytes including Preamble in MII mode; 512 bytes including Preamble and Carrier Extension in GMII mode). This bit is not valid if the Underflow error occurs. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): No collision. 0x1 (ACTIVE): Late collision is sensed.
3	0h RO	**Excessive Deferral (EXDEF):** When the DTXSTS bit is set in the MTL_Operation_Mode register and the DC bit is set in the MAC_Configuration register, this bit indicates that the transmission ended because of excessive deferral of over 24,288 bit times (155,680 in 1000/2500 Mbps mode or when Jumbo packet is enabled). Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): No Excessive deferral. 0x1 (ACTIVE): Excessive deferral.
2	0h RO	**Loss of Carrier (LCARR):** When the DTXSTS bit is set in the MTL_Operation_Mode register, this bit indicates that the loss of carrier occurred during packet transmission, that is, the phy_crs_i signal was inactive for one or more transmission clock periods during packet transmission. This bit is valid only for packets transmitted without collision. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): Carrier is present. 0x1 (ACTIVE): Loss of carrier.
1	0h RO	**No Carrier (NCARR):** When the DTXSTS bit is set in the MTL_Operation_Mode register, this bit indicates that the carrier signal from the PHY is not present at the end of preamble transmission. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): Carrier is present. 0x1 (ACTIVE): No carrier.
0	0h RO	**Transmit Jabber Timeout (TJT):** This bit indicates that the Transmit Jabber Timer expired which happens when the packet size exceeds 2,048 bytes (10,240 bytes when the Jumbo packet is enabled) and JD bit is reset in the MAC_Configuration register. This bit is set when the packet size exceeds 16,383 bytes and the JD bit is set in the MAC_Configuration register. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): No Transmit Jabber Timeout. 0x1 (ACTIVE): Transmit Jabber Timeout occurred.

3.2.31 MAC_PMT_CONTROL_STATUS — Offset C0h

The PMT Control and Status Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Remote Wake-Up Packet Filter Register Pointer Reset (RWKFILTRST):** When this bit is set, the remote wake-up packet filter register pointer is reset to 3'b000. It is automatically cleared after 1 clock cycle. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Remote Wake-Up Packet Filter Register Pointer is not Reset. 0x1 (ENABLE): Remote Wake-Up Packet Filter Register Pointer is Reset.
30:29	0h RO	**Reserved**
28:24	00h RO	**Remote Wake-up FIFO Pointer (RWKPTR):** This field gives the current value (0 to 7, 15, or 31 when 4, 8, or 16 Remote Wake-up Packet Filters are selected) of the Remote Wake-up Packet Filter register pointer. When the value of this pointer is equal to maximum for the selected number of Remote Wake-up Packet Filters, the contents of the Remote Wake-up Packet Filter Register are transferred to the clk_rx_i domain when a Write occurs to that register.
23:11	0h RO	**Reserved**
10	0h RW	**Remote Wake-up Packet Forwarding Enable (RWKPFE):** When this bit is set along with RWKPKTEN, the MAC receiver drops all received frames until it receives the expected Wake-up frame. All frames after that event including the received wake-up frame are forwarded to application. This bit is then self-cleared on receiving the wake-up packet. The application can also clear this bit before the expected wake-up frame is received. In such cases, the MAC reverts to the default behavior where packets received are forwarded to the application. This bit must only be set when RWKPKTEN is set high and PWRDWN is set low. The setting of this bit has no effect when PWRDWN is set high. Note: If Magic Packet Enable and Wake-Up Frame Enable are both set along with setting of this bit and Magic Packet is received prior to wake-up frame, this bit is self-cleared on receiving Magic Packet, the received Magic packet is dropped, and all frames after received Magic Packet are forwarded to application. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Remote Wake-up Packet Forwarding is disabled. 0x1 (ENABLE): Remote Wake-up Packet Forwarding is enabled.
9	0h RW	**Global Unicast (GLBLUCAST):** When this bit set, any unicast packet filtered by the MAC (DAF) address recognition is detected as a remote wake-up packet. 0x0 (DISABLE): Global unicast is disabled. 0x1 (ENABLE): Global unicast is enabled.
8:7	0h RO	**Reserved**
6	0h RO	**Remote Wake-Up Packet Received (RWKPRCVD):** When this bit is set, it indicates that the power management event is generated because of the reception of a remote wake-up packet. This bit is cleared when this register is read. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): Remote wake-up packet is received. 0x1 (ACTIVE): Remote wake-up packet is received.
5	0h RO	**Magic Packet Received (MGKPRCVD):** When this bit is set, it indicates that the power management event is generated because of the reception of a magic packet. This bit is cleared when this register is read. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): No Magic packet is received. 0x1 (ACTIVE): Magic packet is received.

Bit Range	Default & Access	Field Name (ID): Description
4:3	0h RO	**Reserved**
2	0h RW	**Remote Wake-Up Packet Enable (RWKPKTEN):** When this bit is set, a power management event is generated when the MAC receives a remote wake-up packet. 0x0 (DISABLE): Remote wake-up packet is disabled. 0x1 (ENABLE): Remote wake-up packet is enabled.
1	0h RW	**Magic Packet Enable (MGKPKTEN):** When this bit is set, a power management event is generated when the MAC receives a magic packet. 0x0 (DISABLE): Magic Packet is disabled. 0x1 (ENABLE): Magic Packet is enabled.
0	0h RW	**Power Down (PWRDWN):** When this bit is set, the MAC receiver drops all received packets until it receives the expected magic packet or remote wake-up packet. This bit is then self-cleared and the power-down mode is disabled. The software can clear this bit before the expected magic packet or remote wake-up packet is received. The packets received by the MAC after this bit is cleared are forwarded to the application. This bit must only be set when the Magic Packet Enable, Global Unicast, or Remote Wake-Up Packet Enable bit is set high. Note: You can gate-off the CSR clock during the power-down mode. However, when the CSR clock is gated-off, you cannot perform any read or write operations on this register. Therefore, the Software cannot clear this bit. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Power down is disabled. 0x1 (ENABLE): Power down is enabled.

3.2.32 MAC_RWK_PACKET_FILTER — Offset C4h

The TSN-GbE implements a filter lookup table programmed through the MAC_RWK_Packet_Filter register in which CRC, offset, and byte mask of the pattern embedded in the remote wakeup packet, and the filter-operation commands are programmed.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**RWK Packet Filter (WKUPFRMFTR):** This field contains the various controls of RWK Packet filter.

3.2.33 MAC_LPI_CONTROL_STATUS — Offset D0h

The LPI Control and Status Register controls the LPI functions and provides the LPI interrupt status. The status bits are cleared when this register is read.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21	0h RW	**LPI Tx Clock Stop Enable (LPITCSE):** When this bit is set, the MAC indicates that the Tx clock to MAC can be stopped. When this bit is reset, the MAC does not indicate that the Tx clock to MAC can be stopped after it enters Tx LPI mode. If RGMII Interface is selected, the Tx clock is required for transmitting the LPI pattern. The Tx Clock cannot be gated and so the LPITCSE bit cannot be programmed. 0x0 (DISABLE): LPI Tx Clock Stop is disabled. 0x1 (ENABLE): LPI Tx Clock Stop is enabled.
20	0h RW	**LPI Timer Enable (LPIATE):** This bit controls the automatic entry of the MAC Transmitter into and exit out of the LPI state. When LPIATE, LPITXA and LPIEN bits are set, the MAC Transmitter enters LPI state only when the complete MAC TX data path is IDLE for a period indicated by the MAC_LPI_Entry_Timer register. After entering LPI state, if the data path becomes non-IDLE (due to a new packet being accepted for transmission), the Transmitter exits LPI state but does not clear LPIEN bit. This enables the re-entry into LPI state when it is IDLE again. When LPIATE is 0, the LPI Auto timer is disabled and MAC Transmitter enters LPI state based on the settings of LPITXA and LPIEN bit descriptions. 0x0 (DISABLE): LPI Timer is disabled. 0x1 (ENABLE): LPI Timer is enabled.
19	0h RW	**LPI Tx Automate (LPITXA):** This bit controls the behavior of the MAC when it is entering or coming out of the LPI mode on the Transmit side. This bit is not functional in the EQOS-CORE configurations in which the Tx clock gating is done during the LPI mode. If the LPITXA and LPIEN bits are set to 1, the MAC enters the LPI mode only after all outstanding packets (in the core) and pending packets (in the application interface) have been transmitted. The MAC comes out of the LPI mode when the application sends any packet for transmission or the application issues a Tx FIFO Flush command. In addition, the MAC automatically clears the LPIEN bit when it exits the LPI state. If Tx FIFO Flush is set in the FTQ bit of MTL_TxQ0_Operation_Mode register, when the MAC is in the LPI mode, it exits the LPI mode. When this bit is 0, the LPIEN bit directly controls behavior of the MAC when it is entering or coming out of the LPI mode. 0x0 (DISABLE): LPI Tx Automate is disabled. 0x1 (ENABLE): LPI Tx Automate is enabled.
18	0h RW	**PHY Link Status Enable (PLSEN):** This bit enables the link status received on the RGMII, SGMII, or SMII Receive paths to be used for activating the LPI LS TIMER. When this bit is set, the MAC uses the link-status bits of the MAC_PHYIF_Control_Status register and the PLS bit for the LPI LS Timer trigger. When this bit is reset, the MAC ignores the link-status bits of the MAC_PHYIF_Control_Status register and takes only the PLS bit. 0x0 (DISABLE): PHY Link Status is disabled. 0x1 (ENABLE): PHY Link Status is enabled.
17	0h RW	**PHY Link Status (PLS):** This bit indicates the link status of the PHY. The MAC Transmitter asserts the LPI pattern only when the link status is up (OKAY) at least for the time indicated by the LPI LS TIMER. When this bit is set, the link is considered to be okay (UP) and when this bit is reset, the link is considered to be down. 0x0 (DISABLE): link is down. 0x1 (ENABLE): link is okay (UP).

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**LPI Enable (LPIEN):** When this bit is set, it instructs the MAC Transmitter to enter the LPI state. When this bit is reset, it instructs the MAC to exit the LPI state and resume normal transmission. This bit is cleared when the LPITXA bit is set and the MAC exits the LPI state because of the arrival of a new packet for transmission. 0x0 (DISABLE): LPI state is disabled. 0x1 (ENABLE): LPI state is enabled.
15:10	0h RO	**Reserved**
9	0h RO	**Receive LPI State (RLPIST):** When this bit is set, it indicates that the MAC is receiving the LPI pattern on the GMII or MII interface. 0x0 (INACTIVE): Receive LPI state not detected. 0x1 (ACTIVE): Receive LPI state detected.
8	0h RO	**Transmit LPI State (TLPIST):** When this bit is set, it indicates that the MAC is transmitting the LPI pattern on the GMII or MII interface. 0x0 (INACTIVE): Transmit LPI state not detected. 0x1 (ACTIVE): Transmit LPI state detected.
7:4	0h RO	**Reserved**
3	0h RO	**Receive LPI Exit (RLPIEX):** When this bit is set, it indicates that the MAC Receiver has stopped receiving the LPI pattern on the GMII or MII interface, exited the LPI state, and resumed the normal reception. This bit is cleared by a read into this register (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Note: This bit might not be set if the MAC stops receiving the LPI pattern for a very short duration, such as, less than three clock cycles of CSR clock. 0x0 (INACTIVE): Receive LPI exit not detected. 0x1 (ACTIVE): Receive LPI exit detected.
2	0h RO	**Receive LPI Entry (RLPIEN):** When this bit is set, it indicates that the MAC Receiver has received an LPI pattern and entered the LPI state. This bit is cleared by a read into this register (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Note: This bit might not be set if the MAC stops receiving the LPI pattern for a very short duration, such as, less than three clock cycles of CSR clock. 0x0 (INACTIVE): Receive LPI entry not detected. 0x1 (ACTIVE): Receive LPI entry detected.
1	0h RO	**Transmit LPI Exit (TLPIEX):** When this bit is set, it indicates that the MAC transmitter exited the LPI state after the application cleared the LPIEN bit and the LPI TW Timer has expired. This bit is cleared by a read into this register (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). 0x0 (INACTIVE): Transmit LPI exit not detected. 0x1 (ACTIVE): Transmit LPI exit detected.
0	0h RO	**Transmit LPI Entry (TLPIEN):** When this bit is set, it indicates that the MAC Transmitter has entered the LPI state because of the setting of the LPIEN bit. This bit is cleared by a read into this register (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). 0x0 (INACTIVE): Transmit LPI entry not detected. 0x1 (ACTIVE): Transmit LPI entry detected.

3.2.34 MAC_LPI_TIMERS_CONTROL — Offset D4h

The LPI Timers Control register controls the timeout values in the LPI states. It specifies the time for which the MAC transmits the LPI pattern and also the time for which the MAC waits before resuming the normal transmission.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D4h	03E80000h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved**
25:16	3E8h RW	**LPI LS Timer (LST):** This field specifies the minimum time (in milliseconds) for which the link status from the PHY should be up (OKAY) before the LPI pattern can be transmitted to the PHY. The MAC does not transmit the LPI pattern even when the LPIEN bit is set unless the LPI LS Timer reaches the programmed terminal count. The default value of the LPI LS Timer is 1000 (1 sec) as defined in the IEEE standard.
15:0	0000h RW	**LPI TW Timer (TWT):** This field specifies the minimum time (in microseconds) for which the MAC waits after it stops transmitting the LPI pattern to the PHY and before it resumes the normal transmission. The TLPIEX status bit is set after the expiry of this timer.

3.2.35 MAC_LPI_ENTRY_TIMER — Offset D8h

This register controls the Tx LPI entry timer. This counter is enabled only when bit[20](LPITE) bit of MAC_LPI_Control_Status is set to 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19:3	00000h RW	**LPI Entry Timer (LPIET):** This field specifies the time in microseconds the MAC waits to enter LPI mode, after it has transmitted all the frames. This field is valid and used only when LPITE and LPITXA are set to 1. Bits [2:0] are read-only so that the granularity of this timer is in steps of 8 micro-seconds.
2:0	0h RO	**Reserved**

3.2.36 MAC_1US_TIC_COUNTER — Offset DCh

This register controls the generation of the Reference time (1 microsecond tic) for all the LPI timers. This timer has to be programmed by the software initially.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DCh	00000063h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11:0	063h RW	**1US TIC Counter (TIC_1US_CNTR):** The application must program this counter so that the number of clock cycles of CSR clock is 1us. (Subtract 1 from the value before programming). For example if the CSR clock is 100MHz then this field needs to be programmed to value 100 - 1 = 99 (which is 0x63). This is required to generate the 1US events that are used to update some of the EEE related counters.

3.2.37 MAC_PHYIF_CONTROL_STATUS — Offset F8h

The PHY Interface Control and Status register indicates the status signals received by the SGMII or RGMII interface (selected at reset) from the PHY. This register is optional.

Type	Size	Offset	Default
MMIO	32 bit	BAR + F8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19	0h RO	**Link Status (LNKSTS):** This bit indicates whether the link is up (1'b1) or down (1'b0). 0x0 (INACTIVE): Link down. 0x1 (ACTIVE): Link up.
18:17	0h RO	**Link Speed (LNKSPEED):** This bit indicates the current speed of the link. 0x0 (M_2500K): 2.5 MHz. 0x1 (M_25M): 25 MHz. 0x2 (M_125M): 125 MHz. 0x3 (RSVD): Reserved.
16	0h RO	**Link Mode (LNKMOD):** This bit indicates the current mode of operation of the link. 0x0 (HDUPLX): Half-duplex mode. 0x1 (FDUPLX): Full-duplex mode.

Bit Range	Default & Access	Field Name (ID): Description
15:2	0h RO	**Reserved**
1	0h RW	**Link Up or Down (LUD):** This bit indicates whether the link is up or down during transmission of configuration in the RGMII or SGMII interface. 0x0 (LINKDOWN): Link down. 0x1 (LINKUP): Link up.
0	0h RW	**Transmit Configuration in RGMII or SGMII (TC):** When set, this bit enables the transmission of duplex mode, link speed, and link up or down information to the PHY in the RGMII or SGMII port. When this bit is reset, no such information is driven to the PHY. The details of this feature are provided in the following sections: - "Reduced Gigabit Media Independent Interface" - "Serial Media Independent Interface" - "Serial Gigabit Media Independent Interface" 0x0 (DISABLE): Disable Transmit Configuration in RGMII or SGMII. 0x1 (ENABLE): Enable Transmit Configuration in RGMII or SGMII.

3.2.38 MAC_VERSION — Offset 110h

The version register identifies the version of the GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 110h	00005152h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:8	51h RO	**USERVER:** Version code
7:0	52h RO	**SNPSVER:** Version code

3.2.39 MAC_DEBUG — Offset 114h

The Debug register provides the debug status of various MAC blocks.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 114h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	**Reserved**
18:17	0h RO	**MAC Transmit Packet Controller Status (TFCSTS):** This field indicates the state of the MAC Transmit Packet Controller module. 0x0 (IDLE): Idle state. 0x1 (WAITING): Waiting for one of the following: Status of the previous packet OR IPG or back off period to be over. 0x2 (GEN_TX_PAU): Generating and transmitting a Pause control packet (in full-duplex mode). 0x3 (TRNSFR): Transferring input packet for transmission.
16	0h RO	**MAC GMII or MII Transmit Protocol Engine Status (TPESTS):** When this bit is set, it indicates that the MAC GMII or MII transmit protocol engine is actively transmitting data, and it is not in the Idle state. 0x0 (INACTIVE): MAC GMII or MII Transmit Protocol Engine Status not detected. 0x1 (ACTIVE): MAC GMII or MII Transmit Protocol Engine Status detected.
15:3	0h RO	**Reserved**
2:1	0h RO	**MAC Receive Packet Controller FIFO Status (RFCFCSTS):** When this bit is set, this field indicates the active state of the small FIFO Read and Write controllers of the MAC Receive Packet Controller module.
0	0h RO	**MAC GMII or MII Receive Protocol Engine Status (RPESTS):** When this bit is set, it indicates that the MAC GMII or MII receive protocol engine is actively receiving data, and it is not in the Idle state. 0x0 (INACTIVE): MAC GMII or MII Receive Protocol Engine Status not detected. 0x1 (ACTIVE): MAC GMII or MII Receive Protocol Engine Status detected.

3.2.40 MAC_HW_FEATURE0 — Offset 11Ch

This register indicates the presence of first set of the optional features or functions of the GbE Controller. The software driver can use this register to dynamically enable or disable the programs related to the optional blocks.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11Ch	0EFD73F7h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:28	0h RO	**Active PHY Selected (ACTPHYSEL):** When you have multiple PHY interfaces in your configuration, this field indicates the sampled value of phy_intf_sel_i during reset de-assertion. 0x0 (GMII_MII): GMII or MII. 0x1 (RGMII): RGMII. 0x2 (SGMII): SGMII. 0x3 (TBI): TBI. 0x4 (RMII): RMII. 0x5 (RTBI): RTBI. 0x6 (SMII): SMII. 0x7 (REVMIII): RevMII.
27	1h RO	**Source Address or VLAN Insertion Enable (SAVLANINS):** This bit is set to 1 when the Enable SA and VLAN Insertion on Tx option is selected 0x0 (INACTIVE): Source Address or VLAN Insertion Enable option is not selected. 0x1 (ACTIVE): Source Address or VLAN Insertion Enable option is selected.
26:25	3h RO	**Timestamp System Time Source (TSSTSSEL):** This bit indicates the source of the Timestamp system time: This bit is set to 1 when the Enable IEEE 1588 Timestamp Support option is selected 0x0 (INTRNL): Internal. 0x1 (EXTRNL): External. 0x2 (BOTH): Both. 0x3 (RSVD): Reserved.
24	0h RO	**MAC Addresses 64-127 Selected (MACADR64SEL):** This bit is set to 1 when the Enable Additional 64 MAC Address Registers (64-127) option is selected 0x0 (INACTIVE): MAC Addresses 64-127 Select option is not selected. 0x1 (ACTIVE): MAC Addresses 64-127 Select option is selected.
23	1h RO	**MAC Addresses 32-63 Selected (MACADR32SEL):** This bit is set to 1 when the Enable Additional 32 MAC Address Registers (32-63) option is selected 0x0 (INACTIVE): MAC Addresses 32-63 Select option is not selected. 0x1 (ACTIVE): MAC Addresses 32-63 Select option is selected.
22:18	1Fh RO	**MAC Addresses 1-31 Selected (ADDMACADRSEL):** This bit is set to 1 when the non-zero value is selected for Enable Additional 1-31 MAC Address Registers option
17	0h RO	**Reserved**
16	1h RO	**Receive Checksum Offload Enabled (RXCOESEL):** This bit is set to 1 when the Enable Receive TCP/IP Checksum Check option is selected 0x0 (INACTIVE): Receive Checksum Offload Enable option is not selected. 0x1 (ACTIVE): Receive Checksum Offload Enable option is selected.
15	0h RO	**Reserved**
14	1h RO	**Transmit Checksum Offload Enabled (TXCOESEL):** This bit is set to 1 when the Enable Transmit TCP/IP Checksum Insertion option is selected 0x0 (INACTIVE): Transmit Checksum Offload Enable option is not selected. 0x1 (ACTIVE): Transmit Checksum Offload Enable option is selected.

Bit Range	Default & Access	Field Name (ID): Description
13	1h RO	**Energy Efficient Ethernet Enabled (EEESEL):** This bit is set to 1 when the Enable Energy Efficient Ethernet (EEE) option is selected 0x0 (INACTIVE): Energy Efficient Ethernet Enable option is not selected. 0x1 (ACTIVE): Energy Efficient Ethernet Enable option is selected.
12	1h RO	**IEEE 1588-2008 Timestamp Enabled (TSSEL):** This bit is set to 1 when the Enable IEEE 1588 Timestamp Support option is selected 0x0 (INACTIVE): IEEE 1588-2008 Timestamp Enable option is not selected. 0x1 (ACTIVE): IEEE 1588-2008 Timestamp Enable option is selected.
11:10	0h RO	**Reserved**
9	1h RO	**ARP Offload Enabled (ARPOFFSEL):** This bit is set to 1 when the Enable IPv4 ARP Offload option is selected 0x0 (INACTIVE): ARP Offload Enable option is not selected. 0x1 (ACTIVE): ARP Offload Enable option is selected.
8	1h RO	**RMON Module Enable (MMCSEL):** This bit is set to 1 when the Enable MAC Management Counters (MMC) option is selected 0x0 (INACTIVE): RMON Module Enable option is not selected. 0x1 (ACTIVE): RMON Module Enable option is selected.
7	1h RO	**PMT Magic Packet Enable (MGKSEL):** This bit is set to 1 when the Enable Magic Packet Detection option is selected 0x0 (INACTIVE): PMT Magic Packet Enable option is not selected. 0x1 (ACTIVE): PMT Magic Packet Enable option is selected.
6	1h RO	**PMT Remote Wake-up Packet Enable (RWKSEL):** This bit is set to 1 when the Enable Remote Wake-Up Packet Detection option is selected 0x0 (INACTIVE): PMT Remote Wake-up Packet Enable option is not selected. 0x1 (ACTIVE): PMT Remote Wake-up Packet Enable option is selected.
5	1h RO	**SMA (MDIO) Interface (SMASEL):** This bit is set to 1 when the Enable Station Management (MDIO Interface) option is selected 0x0 (INACTIVE): SMA (MDIO) Interface not selected. 0x1 (ACTIVE): SMA (MDIO) Interface selected.
4	1h RO	**VLAN Hash Filter Selected (VLHASH):** This bit is set to 1 when the Enable VLAN Hash Table Based Filtering option is selected 0x0 (INACTIVE): VLAN Hash Filter not selected. 0x1 (ACTIVE): VLAN Hash Filter selected.
3	0h RO	**PCS Registers (TBI, SGMII, or RTBI PHY interface) (PCSSEL):** This bit is set to 1 when the TBI, SGMII, or RTBI PHY interface option is selected 0x0 (INACTIVE): No PCS Registers (TBI, SGMII, or RTBI PHY interface). 0x1 (ACTIVE): PCS Registers (TBI, SGMII, or RTBI PHY interface).

Bit Range	Default & Access	Field Name (ID): Description
2	1h RO	**Half-duplex Support (HDSEL):** This bit is set to 1 when the half-duplex mode is selected 0x0 (INACTIVE): No Half-duplex support. 0x1 (ACTIVE): Half-duplex support.
1	1h RO	**1000 Mbps Support (GMIISEL):** This bit is set to 1 when 1000 Mbps is selected as the Mode of Operation 0x0 (INACTIVE): No 1000 Mbps support. 0x1 (ACTIVE): 1000 Mbps support.
0	1h RO	**10 or 100 Mbps Support (MIISEL):** This bit is set to 1 when 10/100 Mbps is selected as the Mode of Operation 0x0 (INACTIVE): No 10 or 100 Mbps support. 0x1 (ACTIVE): 10 or 100 Mbps support.

3.2.41 MAC_HW_FEATURE1 — Offset 120h

This register indicates the presence of second set of the optional features or functions of the GbE Controller. The software driver can use this register to dynamically enable or disable the programs related to the optional blocks.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 120h	119F7A28h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:27	2h RO	**Total number of L3 or L4 Filters (L3L4FNUM):** This field indicates the total number of L3 or L4 filters: 0x0 (NOFILT): No L3 or L4 Filter. 0x1 (M_1FILT): 1 L3 or L4 Filter. 0x2 (M_2FILT): 2 L3 or L4 Filters. 0x3 (M_3FILT): 3 L3 or L4 Filters. 0x4 (M_4FILT): 4 L3 or L4 Filters. 0x5 (M_5FILT): 5 L3 or L4 Filters. 0x6 (M_6FILT): 6 L3 or L4 Filters. 0x7 (M_7FILT): 7 L3 or L4 Filters. 0x08 (M_8FILT): 8 L3 or L4 Filters.
26	0h RO	**Reserved**
25:24	1h RO	**Hash Table Size (HASHTBLSZ):** This field indicates the size of the hash table: 0x0 (NO_HT): No hash table. 0x1 (M_64): 64. 0x2 (M_128): 128. 0x3 (M_256): 256.

Bit Range	Default & Access	Field Name (ID): Description
23	1h RO	**One Step for PTP over UDP/IP Feature Enable (POUOST):** This bit is set to 1 when the Enable One step timestamp for PTP over UDP/IP feature is selected. 0x0 (INACTIVE): One Step for PTP over UDP/IP Feature is not selected. 0x1 (ACTIVE): One Step for PTP over UDP/IP Feature is selected.
22	0h RO	**Reserved**
21	0h RO	**Rx Side Only AV Feature Enable (RAVSEL):** This bit is set to 1 when the Enable Audio Video Bridging option on Rx Side Only is selected. 0x0 (INACTIVE): Rx Side Only AV Feature is not selected. 0x1 (ACTIVE): Rx Side Only AV Feature is selected.
20	1h RO	**AV Feature Enable (AVSEL):** This bit is set to 1 when the Enable Audio Video Bridging option is selected. 0x0 (INACTIVE): AV Feature is not selected. 0x1 (ACTIVE): AV Feature is selected.
19	1h RO	**DMA Debug Registers Enable (DBGMEMA):** This bit is set to 1 when the Debug Mode Enable option is selected 0x0 (INACTIVE): DMA Debug Registers option is not selected. 0x1 (ACTIVE): DMA Debug Registers option is selected.
18	1h RO	**TCP Segmentation Offload Enable (TSOEN):** This bit is set to 1 when the Enable TCP Segmentation Offloading for TCP/IP Packets option is selected 0x0 (INACTIVE): TCP Segmentation Offload Feature is not selected. 0x1 (ACTIVE): TCP Segmentation Offload Feature is selected.
17	1h RO	**Split Header Feature Enable (SPHEN):** This bit is set to 1 when the Enable Split Header Structure option is selected 0x0 (INACTIVE): Split Header Feature is not selected. 0x1 (ACTIVE): Split Header Feature is selected.
16	1h RO	**DCB Feature Enable (DCBEN):** This bit is set to 1 when the Enable Data Center Bridging option is selected 0x0 (INACTIVE): DCB Feature is not selected. 0x1 (ACTIVE): DCB Feature is selected.
15:14	1h RO	**Address Width. (ADDR64):** This field indicates the configured address width: 0x0 (M_32): 32. 0x1 (M_40): 40. 0x2 (M_48): 48. 0x3 (RSVD): Reserved.
13	1h RO	**IEEE 1588 High Word Register Enable (ADVTHWORD):** This bit is set to 1 when the Add IEEE 1588 Higher Word Register option is selected 0x0 (INACTIVE): IEEE 1588 High Word Register option is not selected. 0x1 (ACTIVE): IEEE 1588 High Word Register option is selected.
12	1h RO	**PTP Offload Enable (PTOEN):** This bit is set to 1 when the Enable PTP Timestamp Offload Feature is selected. 0x0 (INACTIVE): PTP Offload feature is not selected. 0x1 (ACTIVE): PTP Offload feature is selected.
11	1h RO	**One-Step Timestamping Enable (OSTEN):** This bit is set to 1 when the Enable One-Step Timestamp Feature is selected. 0x0 (INACTIVE): One-Step Timestamping feature is not selected. 0x1 (ACTIVE): One-Step Timestamping feature is selected.

Bit Range	Default & Access	Field Name (ID): Description

15:10	0h RO	**Reserved**
9:0	000h RW	**TMR:** This field indicates the number of CSR clocks required to generate 1us tic.

3.2.48 SNPS_SCS_REG1 — Offset 150h

Reserved

Type	Size	Offset	Default
MMIO	32 bit	BAR + 150h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Reserved**

3.2.49 MAC_MDIO_ADDRESS — Offset 200h

The MDIO Address register controls the management cycles to external PHY through a management interface.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 200h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27	0h RW	**Preamble Suppression Enable (PSE):** When this bit is set, the SMA suppresses the 32-bit preamble and transmits MDIO frames with only 1 preamble bit. When this bit is 0, the MDIO frame always has 32 bits of preamble as defined in the IEEE specifications. 0x0 (DISABLE): Preamble Suppression disabled. 0x1 (ENABLE): Preamble Suppression enabled.
26	0h RW	**Back to Back transactions (BTB):** When this bit is set and the NTC has value greater than 0, then the MAC informs the completion of a read or write command at the end of frame transfer (before the trailing clocks are transmitted). The software can thus initiate the next command which is executed immediately irrespective of the number trailing clocks generated for the previous frame. When this bit is reset, then the read/write command completion (GB is cleared) only after the trailing clocks are generated. In this mode, it is ensured that the NTC is always generated after each frame. This bit must not be set when NTC=0. 0x0 (DISABLE): Back to Back transactions disabled. 0x1 (ENABLE): Back to Back transactions enabled.
25:21	00h RW	**Physical Layer Address (PA):** This field indicates which Clause 22 PHY devices (out of 32 devices) the MAC is accessing. This field indicates which Clause 45 capable PHYs (out of 32 PHYs) the MAC is accessing.
20:16	00h RW	**Register/Device Address (RDA):** These bits select the PHY register in selected Clause 22 PHY device. These bits select the Device (MMD) in selected Clause 45 capable PHY.
15	0h RO	**Reserved**
14:12	0h RW	**Number of Trailing Clocks (NTC):** This field controls the number of trailing clock cycles generated on the MDIO Clock (MDC) after the end of transmission of MDIO frame. The valid values can be from 0 to 7. Programming the value to 3'h3 indicates that there are additional three clock cycles on the MDC line after the end of MDIO frame transfer.

Bit Range	Default & Access	Field Name (ID): Description
11:8	0h RW	**CSR Clock Range (CR):** The CSR Clock Range selection determines the frequency of the MDC clock according to the CSR clock frequency used in your design: - 0000: CSR clock = 60-100 MHz; MDC clock = CSR clock/42 - 0001: CSR clock = 100-150 MHz; MDC clock = CSR clock/62 - 0010: CSR clock = 20-35 MHz; MDC clock = CSR clock/16 - 0011: CSR clock = 35-60 MHz; MDC clock = CSR clock/26 - 0100: CSR clock = 150-250 MHz; MDC clock = CSR clock/102 - 0101: CSR clock = 250-300 MHz; MDC clock = CSR clock/124 - 0110: CSR clock = 300-500 MHz; MDC clock = CSR clock/204 - 0111: CSR clock = 500-800 MHz; MDC clock = CSR clock/324 The suggested range of CSR clock frequency applicable for each value (when Bit 11 = 0) ensures that the MDC clock is approximately between 1.0 MHz to 2.5 MHz freqency range. When Bit 11 is set, you can achieve a higher frequency of the MDC clock than the frequency limit of 2.5 MHz (specified in the IEEE 802.3) and program a clock divider of lower value. For example, when CSR clock is of 100 MHz frequency and you program these bits as 1010, the resultant MDC clock is of 12.5 MHz which is above the range specified in IEEE 802.3. Program the following values only if the interfacing chips support faster MDC clocks: - 1000: CSR clock/4 - 1001: CSR clock/6 - 1010: CSR clock/8 - 1011: CSR clock/10 - 1100: CSR clock/12 - 1101: CSR clock/14 - 1110: CSR clock/16 - 1111: CSR clock/18
7:5	0h RO	**Reserved**
4	0h RW	**Skip Address Packet (SKAP):** When this bit is set, the SMA does not send the address packets before read, write, or post-read increment address packets. This bit is valid only when C45E is set. 0x0 (DISABLE): Skip Address Packet is disabled. 0x1 (ENABLE): Skip Address Packet is enabled.
3	0h RW	**GMII Operation Command 1 (GOC_1):** This bit is higher bit of the operation command to the PHY or GOC_1 and GOC_O are encoded as follows: - 00: Reserved - 01: Write - 10: Post Read Increment Address for Clause 45 PHY - 11: Read When Clause 22 PHY is enabled, only Write and Read commands are valid. 0x0 (DISABLE): GMII Operation Command 1 is disabled. 0x1 (ENABLE): GMII Operation Command 1 is enabled.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**GMII Operation Command 0 (GOC_0):** This is the lower bit of the operation command to the PHY or RevMII. When in SMA mode (MDIO master) this bit along with GOC_1 determines the operation to be performed to the PHY. 0x0 (DISABLE): GMII Operation Command 0 is disabled. 0x1 (ENABLE): GMII Operation Command 0 is enabled.
1	0h RW	**Clause 45 PHY Enable (C45E):** When this bit is set, Clause 45 capable PHY is connected to MDIO. When this bit is reset, Clause 22 capable PHY is connected to MDIO. 0x0 (DISABLE): Clause 45 PHY is disabled. 0x1 (ENABLE): Clause 45 PHY is enabled.
0	0h RW	**GMII Busy (GB):** The application sets this bit to instruct the SMA to initiate a Read or Write access to the MDIO slave. The MAC clears this bit after the MDIO frame transfer is completed. Hence the software must not write or change any of the fields in MAC_MDIO_Address and MAC_MDIO_Data registers as long as this bit is set. For write transfers, the application must first write 16-bit data in the GDI field (and also RA field when C45E is set) in MAC_MDIO_Data register before setting this bit. When C45E is set, it should also write into the RA field of MAC_MDIO_Data register before initiating a read transfer. When a read transfer is completed (GB=0), the data read from the PHY register is valid in the GD field of the MAC_MDIO_Data register. Note: Even if the addressed PHY is not present, there is no change in the functionality of this bit. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): GMII Busy is disabled. 0x1 (ENABLE): GMII Busy is enabled.

3.2.50 MAC_MDIO_DATA — Offset 204h

The MDIO Data register stores the Write data to be written to the PHY register located at the address specified in MAC_MDIO_Address. This register also stores the Read data from the PHY register located at the address specified by MDIO Address register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 204h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**Register Address (RA):** This field is valid only when C45E is set. It contains the Register Address in the PHY to which the MDIO frame is intended for.
15:0	0000h RW	**GMII Data (GD):** This field contains the 16-bit data value read from the PHY or RevMII after a Management Read operation or the 16-bit data value to be written to the PHY or RevMII before a Management Write operation.

3.2.51 MAC_GPIO_CONTROL — Offset 208h

The GPIO Control register controls the GPIO.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 208h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**Reserved**

3.2.52 MAC_GPIO_STATUS — Offset 20Ch

The General Purpose IO register provides the control to drive the following: up to 16 bits of output ports (GPO) and status of up to 16 input ports (GPIS).

Type	Size	Offset	Default
MMIO	32 bit	BAR + 20Ch	00000000h

- Latched-Low (LL): This field is cleared when the corresponding gpi_i input becomes low. This field remains low until the application reads this field after which this field reflects the current value of gpi_i input.
- Latched-High (LH): This field is set when the corresponding gpi_i input becomes high. This field remains high until the application reads this field after which this field reflects the current value of gpi_i input. The number of bits available in this field depends on the GP Input Signal Width option. Other bits are not used (reserved and always reset). 0000H</td></tr>
</table>

3.2.53 MAC_ARP_ADDRESS — Offset 210h

The ARP Address register contains the IPv4 Destination Address of the MAC.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 210h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**ARP Protocol Address (ARPPA):** This field contains the IPv4 Destination Address of the MAC. This address is used for perfect match with the Protocol Address of Target field in the received ARP packet. This field is available only when the Enable IPv4 ARP Offload option is selected.

3.2.54 MAC_CSR_SW_CTRL — Offset 230h

This register contains SW programmable controls for changing the CSR access response and status bits clearing.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 230h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved**
8	0h RW	**Slave Error Response Enable (SEEN):** When this bit is set, the MAC responds with Slave Error for accesses to reserved registers in CSR space. When this bit is reset, the MAC responds with Okay response to any register accessed from CSR space. 0x0 (DISABLE): Slave Error Response is disabled. 0x1 (ENABLE): Slave Error Response is enabled.
7:1	0h RO	**Reserved**
0	0h RW	**Register Clear on Write 1 Enable (RCWE):** When this bit is set, the access mode of some register fields changes to Clear on Write 1, the application needs to set that respective bit to 1 to clear it. When this bit is reset, the access mode of these register fields remain as Clear on Read. 0x0 (DISABLE): Register Clear on Write 1 is disabled. 0x1 (ENABLE): Register Clear on Write 1 is enabled.

3.2.55 MAC_FPE_CTRL_STS — Offset 234h

This register controls the operation of Frame Preemption.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 234h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19	0h RW	**Transmitted Respond Frame (TRSP):** Set when a Respond mPacket is transmitted (triggered by setting SRSP field). An interrupt can be generated for this event if FPEIE bit of MAC_Interrupt_Enable is set. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): Not transmitted Respond Frame. 0x1 (ACTIVE): transmitted Respond Frame.
18	0h RW	**Transmitted Verify Frame (TVER):** Set when a Verify mPacket is transmitted (triggered by setting SVER field). An interrupt can be generated for this event if FPEIE bit of MAC_Interrupt_Enable is set. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): Not transmitted Verify Frame. 0x1 (ACTIVE): transmitted Verify Frame.
17	0h RW	**Received Respond Frame (RRSP):** Set when a Respond mPacket is received. An interrupt can be generated for this event if FPEIE bit of MAC_Interrupt_Enable is set. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): Not received Respond Frame. 0x1 (ACTIVE): Received Respond Frame.
16	0h RW	**Received Verify Frame (RVER):** Set when a Verify mPacket is received. An interrupt can be generated for this event if FPEIE bit of MAC_Interrupt_Enable is set. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): Not received Verify Frame. 0x1 (ACTIVE): Received Verify Frame.
15:4	0h RO	**Reserved**
3	0h RW	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Send Respond mPacket (SRSP):** When set indicates hardware to send a Respond mPacket. Reset by hardware after sending the Respond mPacket. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Send Respond mPacket is disabled. 0x1 (ENABLE): Send Respond mPacket is enabled.
1	0h RW	**Send Verify mPacket (SVER):** When set indicates hardware to send a verify mPacket. Reset by hardware after sending the Verify mPacket. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Send Verify mPacket is disabled. 0x1 (ENABLE): Send Verify mPacket is enabled.
0	0h RW	**Enable Tx Frame Preemption (EFPE):** When set Frame Preemption Tx functionality is enabled. 0x0 (DISABLE): Tx Frame Preemption is disabled. 0x1 (ENABLE): Tx Frame Preemption is enabled.

3.2.56 MAC_EXT_CFG1 — Offset 238h

This register contains Split mode control field and offset field for Split Header feature.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 238h	00000002h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:8	0h RW	**Split Mode (SPLM):** These bits indicate the mode of splitting the incoming Rx packets. They are 0x0 (L3L4): Split at L3/L4 header. 0x1 (L2OFST): Split at L2 header with an offset. Always Split at SPLOFST bytes from the beginning of Length/Type field of the Frame. 0x2 (COMBN): Combination mode: Split similar to SPLM=00 for IP packets that are untagged or tagged and VLAN stripped. 0x3 (RSVD): Reserved.
7	0h RO	**Reserved**
6:0	02h RW	**Split Offset (SPLOFST):** These bits indicate the value of offset from the beginning of Length/Type field at which header split should take place when the appropriate SPLM is selected. The reset value of this field is 2 bytes indicating a split at L2 header. Value is in terms of bytes.

3.2.57 MAC_PRESN_TIME_NS — Offset 240h

This register contains the 32-bit binary rollover equivalent time of the PTP System Time in ns.

DWC_EQOS_FLEXI_PPS_OUT_EN=1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 240h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MAC 1722 Presentation Time in ns (MPTN):** These bits indicate the value of the 32-bit binary rollover equivalent time of the PTP System Time in ns

3.2.58 MAC_PRESN_TIME_UPDT — Offset 244h

This field holds the 32-bit value of MAC 1722 Presentation Time in ns, that should be added to the Current Presentation Time Counter value. Init happens when TSINIT is set, and update happens when the TSUPDT bit is set (TSINIT and TSINIT defined in MAC_Timestamp_ Control register).

DWC_EQOS_FLEXI_PPS_OUT_EN=1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 244h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MAC 1722 Presentation Time Update (MPTU):** This field holds the init value or the update value for the presentation time. When used for update, this field holds the 32-bit value in ns, that should be added to the Current Presentation Time Counter value. Init happens when TSINIT is set, and update happens when the TSUPDT bit is set (TSINIT and TSINIT defined in MAC_Timestamp_ Control register). When ADDSUB field of MAC_System_Time_Nanoseconds_Update is set, this value is directly used for subtraction

3.2.59 MAC_ADDRESS0_HIGH — Offset 300h

The MAC Address0 High register holds the upper 16 bits of the first 6-byte MAC address of the station. The first DA byte that is received on the (G)MII interface corresponds to the LS byte (Bits [7:0]) of the MAC Address Low register. For example, if 0x112233445566 is received (0x11 in lane 0 of the first column) on the (G)MII as the destination address, then the MacAddress0 Register [47:0] is compared with 0x665544332211.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, then the synchronization is triggered only when Bits[31:24] of the MAC Address0 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 300h	8000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	1h RO	**Address Enable (AE):** This bit is always set to 1. 0x0 (DISABLE): INVALID : This bit must be always set to 1. 0x1 (ENABLE): This bit is always set to 1.
30:24	0h RO	**Reserved**
23:16	00h RW	**DMA Channel Select (DCS):** If the PDC bit of MAC_Ext_Configuration register is not set: This field contains the binary representation of the DMA Channel number to which an Rx packet whose DA matches the MAC Address0 content is routed. If the PDC bit of MAC_Ext_Configuration register is set: This field contains the one-hot representation of one or more DMA Channel numbers to which an Rx packet whose DA matches the MAC Address0 content is routed.
15:0	FFFFh RW	**MAC Address0[47:32] (ADDRHI):** This field contains the upper 16 bits [47:32] of the first 6-byte MAC address. The MAC uses this field for filtering the received packets and inserting the MAC address in the Transmit Flow Control (Pause) Packets.

3.2.60 MAC_ADDRESS0_LOW — Offset 304h

The MAC Address0 Low register holds the lower 32 bits of the 6-byte first MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 304h	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address0[31:0] (ADDRLO):** This field contains the lower 32 bits of the first 6-byte MAC address. The MAC uses this field for filtering the received packets and inserting the MAC address in the Transmit Flow Control (Pause) Packets.

3.2.61 MAC_ADDRESS1_HIGH — Offset 308h

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 308h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the address filter module uses the second MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30	0h RW	**Source Address (SA):** When this bit is set, the MAC Address1[47:0] is used to compare with the SA fields of the received packet. When this bit is reset, the MAC Address1[47:0] is used to compare with the DA fields of the received packet. 0x0 (DA): Compare with Destination Address. 0x1 (SA): Compare with Source Address.
29:24	00h RW	**Mask Byte Control (MBC):** These bits are mask control bits for comparing each of the MAC Address bytes. When set high, the MAC does not compare the corresponding byte of received DA or SA with the contents of MAC Address1 registers. Each bit controls the masking of the bytes as follows: - Bit 29: MAC_Address${i}_High[15:8] - Bit 28: MAC_Address${i}_High[7:0] - Bit 27: MAC_Address${i}_Low[31:24] - .. - Bit 24: MAC_Address${i}_Low[7:0] You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address.
23:16	00h RW	**DMA Channel Select (DCS):** If the PDC bit of MAC_Ext_Configuration register is not set: This field contains the binary representation of the DMA Channel number to which an Rx packet whose DA matches the MAC Address(#i) content is routed. If the PDC bit of MAC_Ext_Configuration register is set: This field contains the one-hot representation of one or more DMA Channel numbers to which an Rx packet whose DA matches the MAC Address(#i) content is routed.
15:0	FFFFh RW	**MAC Address1 [47:32] (ADDRHI):** This field contains the upper 16 bits[47:32] of the second 6-byte MAC address.

3.2.62 MAC_ADDRESS1_LOW — Offset 30Ch

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 30Ch	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address1 [31:0] (ADDRLO):** This field contains the lower 32 bits of second 6-byte MAC address. The content of this field is undefined until loaded by the application after the initialization process.

3.2.63 MAC_ADDRESS2_HIGH — Offset 310h

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 310h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the address filter module uses the second MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30	0h RW	**Source Address (SA):** When this bit is set, the MAC Address1[47:0] is used to compare with the SA fields of the received packet. When this bit is reset, the MAC Address1[47:0] is used to compare with the DA fields of the received packet. 0x0 (DA): Compare with Destination Address. 0x1 (SA): Compare with Source Address.
29:24	00h RW	**Mask Byte Control (MBC):** These bits are mask control bits for comparing each of the MAC Address bytes. When set high, the MAC does not compare the corresponding byte of received DA or SA with the contents of MAC Address1 registers. Each bit controls the masking of the bytes as follows: - Bit 29: MAC_Address${i}_High[15:8] - Bit 28: MAC_Address${i}_High[7:0] - Bit 27: MAC_Address${i}_Low[31:24] - .. - Bit 24: MAC_Address${i}_Low[7:0] You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address.
23:16	00h RW	**DMA Channel Select (DCS):** If the PDC bit of MAC_Ext_Configuration register is not set: This field contains the binary representation of the DMA Channel number to which an Rx packet whose DA matches the MAC Address(#i) content is routed. If the PDC bit of MAC_Ext_Configuration register is set: This field contains the one-hot representation of one or more DMA Channel numbers to which an Rx packet whose DA matches the MAC Address(#i) content is routed.
15:0	FFFFh RW	**MAC Address1 [47:32] (ADDRHI):** This field contains the upper 16 bits[47:32] of the second 6-byte MAC address.

3.2.64 MAC_ADDRESS2_LOW — Offset 314h

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 314h	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address1 [31:0] (ADDRLO):** This field contains the lower 32 bits of second 6-byte MAC address. The content of this field is undefined until loaded by the application after the initialization process.

3.2.65 MAC_ADDRESS3_HIGH — Offset 318h

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 318h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the address filter module uses the second MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30	0h RW	**Source Address (SA):** When this bit is set, the MAC Address1[47:0] is used to compare with the SA fields of the received packet. When this bit is reset, the MAC Address1[47:0] is used to compare with the DA fields of the received packet. 0x0 (DA): Compare with Destination Address. 0x1 (SA): Compare with Source Address.

Bit Range	Default & Access	Field Name (ID): Description
29:24	00h RW	**Mask Byte Control (MBC):** These bits are mask control bits for comparing each of the MAC Address bytes. When set high, the MAC does not compare the corresponding byte of received DA or SA with the contents of MAC Address1 registers. Each bit controls the masking of the bytes as follows: - Bit 29: MAC_Address${i}_High[15:8] - Bit 28: MAC_Address${i}_High[7:0] - Bit 27: MAC_Address${i}_Low[31:24] - .. - Bit 24: MAC_Address${i}_Low[7:0] You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address.
23:16	00h RW	**DMA Channel Select (DCS):** If the PDC bit of MAC_Ext_Configuration register is not set: This field contains the binary representation of the DMA Channel number to which an Rx packet whose DA matches the MAC Address(#i) content is routed. If the PDC bit of MAC_Ext_Configuration register is set: This field contains the one-hot representation of one or more DMA Channel numbers to which an Rx packet whose DA matches the MAC Address(#i) content is routed.
15:0	FFFFh RW	**MAC Address1 [47:32] (ADDRHI):** This field contains the upper 16 bits[47:32] of the second 6-byte MAC address.

3.2.66 MAC_ADDRESS3_LOW — Offset 31Ch

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 31Ch	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address1 [31:0] (ADDRLO):** This field contains the lower 32 bits of second 6-byte MAC address. The content of this field is undefined until loaded by the application after the initialization process.

3.2.67 MAC_ADDRESS4_HIGH — Offset 320h

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 320h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the address filter module uses the second MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30	0h RW	**Source Address (SA):** When this bit is set, the MAC Address1[47:0] is used to compare with the SA fields of the received packet. When this bit is reset, the MAC Address1[47:0] is used to compare with the DA fields of the received packet. 0x0 (DA): Compare with Destination Address. 0x1 (SA): Compare with Source Address.
29:24	00h RW	**Mask Byte Control (MBC):** These bits are mask control bits for comparing each of the MAC Address bytes. When set high, the MAC does not compare the corresponding byte of received DA or SA with the contents of MAC Address1 registers. Each bit controls the masking of the bytes as follows: - Bit 29: MAC_Address${i}_High[15:8] - Bit 28: MAC_Address${i}_High[7:0] - Bit 27: MAC_Address${i}_Low[31:24] - .. - Bit 24: MAC_Address${i}_Low[7:0] You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address.
23:16	00h RW	**DMA Channel Select (DCS):** If the PDC bit of MAC_Ext_Configuration register is not set: This field contains the binary representation of the DMA Channel number to which an Rx packet whose DA matches the MAC Address(#i) content is routed. If the PDC bit of MAC_Ext_Configuration register is set: This field contains the one-hot representation of one or more DMA Channel numbers to which an Rx packet whose DA matches the MAC Address(#i) content is routed.
15:0	FFFFh RW	**MAC Address1 [47:32] (ADDRHI):** This field contains the upper 16 bits[47:32] of the second 6-byte MAC address.

3.2.68 MAC_ADDRESS4_LOW — Offset 324h

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 324h	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address1 [31:0] (ADDRLO):** This field contains the lower 32 bits of second 6-byte MAC address. The content of this field is undefined until loaded by the application after the initialization process.

3.2.69 MAC_ADDRESS5_HIGH — Offset 328h

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 328h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the address filter module uses the second MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30	0h RW	**Source Address (SA):** When this bit is set, the MAC Address1[47:0] is used to compare with the SA fields of the received packet. When this bit is reset, the MAC Address1[47:0] is used to compare with the DA fields of the received packet. 0x0 (DA): Compare with Destination Address. 0x1 (SA): Compare with Source Address.
29:24	00h RW	**Mask Byte Control (MBC):** These bits are mask control bits for comparing each of the MAC Address bytes. When set high, the MAC does not compare the corresponding byte of received DA or SA with the contents of MAC Address1 registers. Each bit controls the masking of the bytes as follows: - Bit 29: MAC_Address${i}_High[15:8] - Bit 28: MAC_Address${i}_High[7:0] - Bit 27: MAC_Address${i}_Low[31:24] - .. - Bit 24: MAC_Address${i}_Low[7:0] You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address.
23:16	00h RW	**DMA Channel Select (DCS):** If the PDC bit of MAC_Ext_Configuration register is not set: This field contains the binary representation of the DMA Channel number to which an Rx packet whose DA matches the MAC Address(#i) content is routed. If the PDC bit of MAC_Ext_Configuration register is set: This field contains the one-hot representation of one or more DMA Channel numbers to which an Rx packet whose DA matches the MAC Address(#i) content is routed.
15:0	FFFFh RW	**MAC Address1 [47:32] (ADDRHI):** This field contains the upper 16 bits[47:32] of the second 6-byte MAC address.

3.2.70 MAC_ADDRESS5_LOW — Offset 32Ch

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 32Ch	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address1 [31:0] (ADDRLO):** This field contains the lower 32 bits of second 6-byte MAC address. The content of this field is undefined until loaded by the application after the initialization process.

3.2.71 MAC_ADDRESS6_HIGH — Offset 330h

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 330h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the address filter module uses the second MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30	0h RW	**Source Address (SA):** When this bit is set, the MAC Address1[47:0] is used to compare with the SA fields of the received packet. When this bit is reset, the MAC Address1[47:0] is used to compare with the DA fields of the received packet. 0x0 (DA): Compare with Destination Address. 0x1 (SA): Compare with Source Address.

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 36Ch	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address1 [31:0] (ADDRLO):** This field contains the lower 32 bits of second 6-byte MAC address. The content of this field is undefined until loaded by the application after the initialization process.

3.2.87 MAC_ADDRESS14_HIGH — Offset 370h

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 370h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the address filter module uses the second MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30	0h RW	**Source Address (SA):** When this bit is set, the MAC Address1[47:0] is used to compare with the SA fields of the received packet. When this bit is reset, the MAC Address1[47:0] is used to compare with the DA fields of the received packet. 0x0 (DA): Compare with Destination Address. 0x1 (SA): Compare with Source Address.
29:24	00h RW	**Mask Byte Control (MBC):** These bits are mask control bits for comparing each of the MAC Address bytes. When set high, the MAC does not compare the corresponding byte of received DA or SA with the contents of MAC Address1 registers. Each bit controls the masking of the bytes as follows: - Bit 29: MAC_Address${i}_High[15:8] - Bit 28: MAC_Address${i}_High[7:0] - Bit 27: MAC_Address${i}_Low[31:24] - .. - Bit 24: MAC_Address${i}_Low[7:0] You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address.
23:16	00h RW	**DMA Channel Select (DCS):** If the PDC bit of MAC_Ext_Configuration register is not set: This field contains the binary representation of the DMA Channel number to which an Rx packet whose DA matches the MAC Address(#i) content is routed. If the PDC bit of MAC_Ext_Configuration register is set: This field contains the one-hot representation of one or more DMA Channel numbers to which an Rx packet whose DA matches the MAC Address(#i) content is routed.
15:0	FFFFh RW	**MAC Address1 [47:32] (ADDRHI):** This field contains the upper 16 bits[47:32] of the second 6-byte MAC address.

3.2.88 MAC_ADDRESS14_LOW — Offset 374h

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 374h	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address1 [31:0] (ADDRLO):** This field contains the lower 32 bits of second 6-byte MAC address. The content of this field is undefined until loaded by the application after the initialization process.

3.2.89 MAC_ADDRESS15_HIGH — Offset 378h

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 378h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the address filter module uses the second MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30	0h RW	**Source Address (SA):** When this bit is set, the MAC Address1[47:0] is used to compare with the SA fields of the received packet. When this bit is reset, the MAC Address1[47:0] is used to compare with the DA fields of the received packet. 0x0 (DA): Compare with Destination Address. 0x1 (SA): Compare with Source Address.

Bit Range	Default & Access	Field Name (ID): Description
29:24	00h RW	**Mask Byte Control (MBC):** These bits are mask control bits for comparing each of the MAC Address bytes. When set high, the MAC does not compare the corresponding byte of received DA or SA with the contents of MAC Address1 registers. Each bit controls the masking of the bytes as follows: - Bit 29: MAC_Address${i}_High[15:8] - Bit 28: MAC_Address${i}_High[7:0] - Bit 27: MAC_Address${i}_Low[31:24] - .. - Bit 24: MAC_Address${i}_Low[7:0] You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address.
23:16	00h RW	**DMA Channel Select (DCS):** If the PDC bit of MAC_Ext_Configuration register is not set: This field contains the binary representation of the DMA Channel number to which an Rx packet whose DA matches the MAC Address(#i) content is routed. 31	0h RW	**Address Enable (AE):** When this bit is set, the address filter module uses the second MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30	0h RW	**Source Address (SA):** When this bit is set, the MAC Address1[47:0] is used to compare with the SA fields of the received packet. When this bit is reset, the MAC Address1[47:0] is used to compare with the DA fields of the received packet. 0x0 (DA): Compare with Destination Address. 0x1 (SA): Compare with Source Address.
29:24	00h RW	**Mask Byte Control (MBC):** These bits are mask control bits for comparing each of the MAC Address bytes. When set high, the MAC does not compare the corresponding byte of received DA or SA with the contents of MAC Address1 registers. Each bit controls the masking of the bytes as follows: - Bit 29: MAC_Address${i}_High[15:8] - Bit 28: MAC_Address${i}_High[7:0] - Bit 27: MAC_Address${i}_Low[31:24] - .. - Bit 24: MAC_Address${i}_Low[7:0] You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address.
23:16	00h RW	**DMA Channel Select (DCS):** If the PDC bit of MAC_Ext_Configuration register is not set: This field contains the binary representation of the DMA Channel number to which an Rx packet whose DA matches the MAC Address(#i) content is routed. If the PDC bit of MAC_Ext_Configuration register is set: This field contains the one-hot representation of one or more DMA Channel numbers to which an Rx packet whose DA matches the MAC Address(#i) content is routed.
15:0	FFFFh RW	**MAC Address1 [47:32] (ADDRHI):** This field contains the upper 16 bits[47:32] of the second 6-byte MAC address.

3.2.106 MAC_ADDRESS23_LOW — Offset 3BCh

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 3BCh	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address1 [31:0] (ADDRLO):** This field contains the lower 32 bits of second 6-byte MAC address. The content of this field is undefined until loaded by the application after the initialization process.

3.2.107 MAC_ADDRESS24_HIGH — Offset 3C0h

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 3C0h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the address filter module uses the second MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30	0h RW	**Source Address (SA):** When this bit is set, the MAC Address1[47:0] is used to compare with the SA fields of the received packet. When this bit is reset, the MAC Address1[47:0] is used to compare with the DA fields of the received packet. 0x0 (DA): Compare with Destination Address. 0x1 (SA): Compare with Source Address.

Bit Range	Default & Access	Field Name (ID): Description
29:24	00h RW	**Mask Byte Control (MBC):** These bits are mask control bits for comparing each of the MAC Address bytes. When set high, the MAC does not compare the corresponding byte of received DA or SA with the contents of MAC Address1 registers. Each bit controls the masking of the bytes as follows: - Bit 29: MAC_Address${i}_High[15:8] - Bit 28: MAC_Address${i}_High[7:0] - Bit 27: MAC_Address${i}_Low[31:24] - .. - Bit 24: MAC_Address${i}_Low[7:0] You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address.
23:16	00h RW	**DMA Channel Select (DCS):** If the PDC bit of MAC_Ext_Configuration register is not set: This field contains the binary representation of the DMA Channel number to which an Rx packet whose DA matches the MAC Address(#i) content is routed. 15:0	FFFFh RW	**MAC Address1 [47:32] (ADDRHI):** This field contains the upper 16 bits[47:32] of the second 6-byte MAC address.

3.2.122 MAC_ADDRESS31_LOW — Offset 3FCh

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 3FCh	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address1 [31:0] (ADDRLO):** This field contains the lower 32 bits of second 6-byte MAC address. The content of this field is undefined until loaded by the application after the initialization process.

3.2.123 MAC_ADDRESS32_HIGH — Offset 400h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 400h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the Address filter module uses the 33rd MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30:19	0h RO	**Reserved**
18:16	0h RW	**DMA Channel Select (DCS):** This field contains the DMA Channel number to which an Rx packet whose DA matches the MAC Address32 content is routed.
15:0	FFFFh RW	**MAC Address32 [47:32] (ADDRHI):** This field contains the upper 16 bits (47:32) of the 33rd 6-byte MAC address.

3.2.124 MAC_ADDRESS32_LOW — Offset 404h

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 404h	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

3.2.125 MAC_ADDRESS33_HIGH — Offset 408h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 408h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the Address filter module uses the 33rd MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30:19	0h RO	**Reserved**
18:16	0h RW	**DMA Channel Select (DCS):** This field contains the DMA Channel number to which an Rx packet whose DA matches the MAC Address32 content is routed.
15:0	FFFFh RW	**MAC Address32 [47:32] (ADDRHI):** This field contains the upper 16 bits (47:32) of the 33rd 6-byte MAC address.

3.2.126 MAC_ADDRESS33_LOW — Offset 40Ch

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 40Ch	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

3.2.127 MAC_ADDRESS34_HIGH — Offset 410h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 410h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the Address filter module uses the 33rd MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30:19	0h RO	**Reserved**
18:16	0h RW	**DMA Channel Select (DCS):** This field contains the DMA Channel number to which an Rx packet whose DA matches the MAC Address32 content is routed.
15:0	FFFFh RW	**MAC Address32 [47:32] (ADDRHI):** This field contains the upper 16 bits (47:32) of the 33rd 6-byte MAC address.

3.2.128 MAC_ADDRESS34_LOW — Offset 414h

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 414h	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

3.2.129 MAC_ADDRESS35_HIGH — Offset 418h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 418h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the Address filter module uses the 33rd MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30:19	0h RO	**Reserved**
18:16	0h RW	**DMA Channel Select (DCS):** This field contains the DMA Channel number to which an Rx packet whose DA matches the MAC Address32 content is routed.
15:0	FFFFh RW	**MAC Address32 [47:32] (ADDRHI):** This field contains the upper 16 bits (47:32) of the 33rd 6-byte MAC address.

3.2.130 MAC_ADDRESS35_LOW — Offset 41Ch

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 41Ch	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

3.2.131 MAC_ADDRESS36_HIGH — Offset 420h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 420h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the Address filter module uses the 33rd MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30:19	0h RO	**Reserved**
18:16	0h RW	**DMA Channel Select (DCS):** This field contains the DMA Channel number to which an Rx packet whose DA matches the MAC Address32 content is routed.
15:0	FFFFh RW	**MAC Address32 [47:32] (ADDRHI):** This field contains the upper 16 bits (47:32) of the 33rd 6-byte MAC address.

3.2.132 MAC_ADDRESS36_LOW — Offset 424h

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 424h	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

3.2.133 MAC_ADDRESS37_HIGH — Offset 428h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 428h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the Address filter module uses the 33rd MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30:19	0h RO	**Reserved**
18:16	0h RW	**DMA Channel Select (DCS):** This field contains the DMA Channel number to which an Rx packet whose DA matches the MAC Address32 content is routed.
15:0	FFFFh RW	**MAC Address32 [47:32] (ADDRHI):** This field contains the upper 16 bits (47:32) of the 33rd 6-byte MAC address.

3.2.134 MAC_ADDRESS37_LOW — Offset 42Ch

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 42Ch	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

3.2.135 MAC_ADDRESS38_HIGH — Offset 430h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 430h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the Address filter module uses the 33rd MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30:19	0h RO	**Reserved**
18:16	0h RW	**DMA Channel Select (DCS):** This field contains the DMA Channel number to which an Rx packet whose DA matches the MAC Address32 content is routed.
15:0	FFFFh RW	**MAC Address32 [47:32] (ADDRHI):** This field contains the upper 16 bits (47:32) of the 33rd 6-byte MAC address.

3.2.136 MAC_ADDRESS38_LOW — Offset 434h

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 434h	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

3.2.137 MAC_ADDRESS39_HIGH — Offset 438h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 438h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the Address filter module uses the 33rd MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30:19	0h RO	**Reserved**
18:16	0h RW	**DMA Channel Select (DCS):** This field contains the DMA Channel number to which an Rx packet whose DA matches the MAC Address32 content is routed.
15:0	FFFFh RW	**MAC Address32 [47:32] (ADDRHI):** This field contains the upper 16 bits (47:32) of the 33rd 6-byte MAC address.

3.2.138 MAC_ADDRESS39_LOW — Offset 43Ch

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 43Ch	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

3.2.139 MAC_ADDRESS40_HIGH — Offset 440h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 440h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the Address filter module uses the 33rd MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30:19	0h RO	**Reserved**
18:16	0h RW	**DMA Channel Select (DCS):** This field contains the DMA Channel number to which an Rx packet whose DA matches the MAC Address32 content is routed.
15:0	FFFFh RW	**MAC Address32 [47:32] (ADDRHI):** This field contains the upper 16 bits (47:32) of the 33rd 6-byte MAC address.

3.2.140 MAC_ADDRESS40_LOW — Offset 444h

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 444h	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

3.2.141 MAC_ADDRESS41_HIGH — Offset 448h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 448h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the Address filter module uses the 33rd MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30:19	0h RO	**Reserved**
18:16	0h RW	**DMA Channel Select (DCS):** This field contains the DMA Channel number to which an Rx packet whose DA matches the MAC Address32 content is routed.
15:0	FFFFh RW	**MAC Address32 [47:32] (ADDRHI):** This field contains the upper 16 bits (47:32) of the 33rd 6-byte MAC address.

3.2.142 MAC_ADDRESS41_LOW — Offset 44Ch

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 44Ch	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

3.2.143 MAC_ADDRESS42_HIGH — Offset 450h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 450h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the Address filter module uses the 33rd MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30:19	0h RO	**Reserved**
18:16	0h RW	**DMA Channel Select (DCS):** This field contains the DMA Channel number to which an Rx packet whose DA matches the MAC Address32 content is routed.
15:0	FFFFh RW	**MAC Address32 [47:32] (ADDRHI):** This field contains the upper 16 bits (47:32) of the 33rd 6-byte MAC address.

3.2.144 MAC_ADDRESS42_LOW — Offset 454h

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 454h	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

3.2.145 MAC_ADDRESS43_HIGH — Offset 458h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 458h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the Address filter module uses the 33rd MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.

18:16	0h RW	**DMA Channel Select (DCS):** This field contains the DMA Channel number to which an Rx packet whose DA matches the MAC Address32 content is routed.
15:0	FFFFh RW	**MAC Address32 [47:32] (ADDRHI):** This field contains the upper 16 bits (47:32) of the 33rd 6-byte MAC address.

3.2.150 MAC_ADDRESS45_LOW — Offset 46Ch

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 46Ch	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

3.2.151 MAC_ADDRESS46_HIGH — Offset 470h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 470h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the Address filter module uses the 33rd MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30:19	0h RO	**Reserved**
18:16	0h RW	**DMA Channel Select (DCS):** This field contains the DMA Channel number to which an Rx packet whose DA matches the MAC Address32 content is routed.
15:0	FFFFh RW	**MAC Address32 [47:32] (ADDRHI):** This field contains the upper 16 bits (47:32) of the 33rd 6-byte MAC address.

3.2.152 MAC_ADDRESS46_LOW — Offset 474h

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 474h	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

3.2.153 MAC_ADDRESS47_HIGH — Offset 478h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 478h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the Address filter module uses the 33rd MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30:19	0h RO	**Reserved**
18:16	0h RW	**DMA Channel Select (DCS):** This field contains the DMA Channel number to which an Rx packet whose DA matches the MAC Address32 content is routed.
15:0	FFFFh RW	**MAC Address32 [47:32] (ADDRHI):** This field contains the upper 16 bits (47:32) of the 33rd 6-byte MAC address.

3.2.154 MAC_ADDRESS47_LOW — Offset 47Ch

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 47Ch	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

3.2.155 MAC_ADDRESS48_HIGH — Offset 480h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 480h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the Address filter module uses the 33rd MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30:19	0h RO	**Reserved**
18:16	0h RW	**DMA Channel Select (DCS):** This field contains the DMA Channel number to which an Rx packet whose DA matches the MAC Address32 content is routed.
15:0	FFFFh RW	**MAC Address32 [47:32] (ADDRHI):** This field contains the upper 16 bits (47:32) of the 33rd 6-byte MAC address.

3.2.156 MAC_ADDRESS48_LOW — Offset 484h

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 484h	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

3.2.157 MAC_ADDRESS49_HIGH — Offset 488h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 488h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the Address filter module uses the 33rd MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30:19	0h RO	**Reserved**
18:16	0h RW	**DMA Channel Select (DCS):** This field contains the DMA Channel number to which an Rx packet whose DA matches the MAC Address32 content is routed.
15:0	FFFFh RW	**MAC Address32 [47:32] (ADDRHI):** This field contains the upper 16 bits (47:32) of the 33rd 6-byte MAC address.

3.2.158 MAC_ADDRESS49_LOW — Offset 48Ch

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 48Ch	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

3.2.159 MAC_ADDRESS50_HIGH — Offset 490h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 490h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the Address filter module uses the 33rd MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30:19	0h RO	**Reserved**
18:16	0h RW	**DMA Channel Select (DCS):** This field contains the DMA Channel number to which an Rx packet whose DA matches the MAC Address32 content is routed.
15:0	FFFFh RW	**MAC Address32 [47:32] (ADDRHI):** This field contains the upper 16 bits (47:32) of the 33rd 6-byte MAC address.

3.2.160 MAC_ADDRESS50_LOW — Offset 494h

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 494h	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

3.2.161 MAC_ADDRESS51_HIGH — Offset 498h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 498h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the Address filter module uses the 33rd MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30:19	0h RO	**Reserved**
18:16	0h RW	**DMA Channel Select (DCS):** This field contains the DMA Channel number to which an Rx packet whose DA matches the MAC Address32 content is routed.
15:0	FFFFh RW	**MAC Address32 [47:32] (ADDRHI):** This field contains the upper 16 bits (47:32) of the 33rd 6-byte MAC address.

3.2.162 MAC_ADDRESS51_LOW — Offset 49Ch

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 49Ch	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

3.2.163 MAC_ADDRESS52_HIGH — Offset 4A0h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4A0h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the Address filter module uses the 33rd MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30:19	0h RO	**Reserved**
18:16	0h RW	**DMA Channel Select (DCS):** This field contains the DMA Channel number to which an Rx packet whose DA matches the MAC Address32 content is routed.
15:0	FFFFh RW	**MAC Address32 [47:32] (ADDRHI):** This field contains the upper 16 bits (47:32) of the 33rd 6-byte MAC address.

3.2.164 MAC_ADDRESS52_LOW — Offset 4A4h

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4A4h	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

3.2.165 MAC_ADDRESS53_HIGH — Offset 4A8h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4A8h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the Address filter module uses the 33rd MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30:19	0h RO	**Reserved**
18:16	0h RW	**DMA Channel Select (DCS):** This field contains the DMA Channel number to which an Rx packet whose DA matches the MAC Address32 content is routed.
15:0	FFFFh RW	**MAC Address32 [47:32] (ADDRHI):** This field contains the upper 16 bits (47:32) of the 33rd 6-byte MAC address.

3.2.166 MAC_ADDRESS53_LOW — Offset 4ACh

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4ACh	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

3.2.167 MAC_ADDRESS54_HIGH — Offset 4B0h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4B0h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the Address filter module uses the 33rd MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30:19	0h RO	**Reserved**
18:16	0h RW	**DMA Channel Select (DCS):** This field contains the DMA Channel number to which an Rx packet whose DA matches the MAC Address32 content is routed.
15:0	FFFFh RW	**MAC Address32 [47:32] (ADDRHI):** This field contains the upper 16 bits (47:32) of the 33rd 6-byte MAC address.

3.2.168 MAC_ADDRESS54_LOW — Offset 4B4h

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4B4h	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

3.2.169 MAC_ADDRESS55_HIGH — Offset 4B8h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

3.2.185 MAC_ADDRESS63_HIGH — Offset 4F8h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4F8h	0000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Address Enable (AE):** When this bit is set, the Address filter module uses the 33rd MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0x0 (DISABLE): Address is ignored. 0x1 (ENABLE): Address is enabled.
30:19	0h RO	**Reserved**
18:16	0h RW	**DMA Channel Select (DCS):** This field contains the DMA Channel number to which an Rx packet whose DA matches the MAC Address32 content is routed.
15:0	FFFFh RW	**MAC Address32 [47:32] (ADDRHI):** This field contains the upper 16 bits (47:32) of the 33rd 6-byte MAC address.

3.2.186 MAC_ADDRESS63_LOW — Offset 4FCh

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4FCh	FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**MAC Address32 [31:0] (ADDRLO):** This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

3.2.187 MMC_CONTROL — Offset 700h

This register establishes the operating mode of MAC Management Counters.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 700h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved**
8	0h RW	**Update MMC Counters for Dropped Broadcast Packets (UCDBC):** Note: The CNTRST bit has a higher priority than the CNTPRST bit. Therefore, when the software tries to set both bits in the same write cycle, all counters are cleared and the CNTPRST bit is not set. When set, the MAC updates all related MMC Counters for Broadcast packets that are dropped because of the setting of the DBF bit of MAC_Packet_Filter register. When reset, the MMC Counters are not updated for dropped Broadcast packets. 0x0 (DISABLE): Update MMC Counters for Dropped Broadcast Packets is disabled. 0x1 (ENABLE): Update MMC Counters for Dropped Broadcast Packets is enabled.
7:6	0h RO	**Reserved**
5	0h RW	**Full-Half Preset (CNTPRSTLVL):** When this bit is low and the CNTPRST bit is set, all MMC counters get preset to almost-half value. All octet counters get preset to 0x7FFF_F800 (Half 2KBytes) and all packet-counters gets preset to 0x7FFF_FFF0 (Half 16). When this bit is high and the CNTPRST bit is set, all MMC counters get preset to almost-full value. All octet counters get preset to 0xFFFF_F800 (Full 2KBytes) and all packet-counters gets preset to 0xFFFF_FFF0 (Full 16). For 16-bit counters, the almost-half preset values are 0x7800 and 0x7FF0 for the respective octet and packet counters. Similarly, the almost-full preset values for the 16-bit counters are 0xF800 and 0xFFF0. 0x0 (DISABLE): Full-Half Preset is disabled. 0x1 (ENABLE): Full-Half Preset is enabled.
4	0h RW	**Counters Preset (CNTPRST):** When this bit is set, all counters are initialized or preset to almost full or almost half according to the CNTPRSTLVL bit. This bit is cleared automatically after 1 clock cycle. This bit, along with the CNTPRSTLVL bit, is useful for debugging and testing the assertion of interrupts because of MMC counter becoming half-full or full. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets. 0x0 (DISABLE): Counters Preset is disabled. 0x1 (ENABLE): Counters Preset is enabled.
3	0h RW	**MMC Counter Freeze (CNTFREEZ):** When this bit is set, it freezes all MMC counters to their current value. Until this bit is reset to 0, no MMC counter is updated because of any transmitted or received packet. If any MMC counter is read with the Reset on Read bit set, then that counter is also cleared in this mode. 0x0 (DISABLE): MMC Counter Freeze is disabled. 0x1 (ENABLE): MMC Counter Freeze is enabled.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Reset on Read (RSTONRD):** When this bit is set, the MMC counters are reset to zero after Read (self-clearing after reset). The counters are cleared when the least significant byte lane (Bits[7:0]) is read. 0x0 (DISABLE): Reset on Read is disabled. 0x1 (ENABLE): Reset on Read is enabled.
1	0h RW	**Counter Stop Rollover (CNTSTOPRO):** When this bit is set, the counter does not roll over to zero after reaching the maximum value. 0x0 (DISABLE): Counter Stop Rollover is disabled. 0x1 (ENABLE): Counter Stop Rollover is enabled.
0	0h RW	**Counters Reset (CNTRST):** When this bit is set, all counters are reset. This bit is cleared automatically after 1 clock cycle. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets. 0x0 (DISABLE): Counters are not reset. 0x1 (ENABLE): All counters are reset.

3.2.188 MMC_RX_INTERRUPT — Offset 704h

This register maintains the interrupts generated from all Receive statistics counters.

The MMC Receive Interrupt register maintains the interrupts that are generated when the following occur:

- Receive statistic counters reach half of their maximum values (0x8000_0000 for 32 bit counter and 0x8000 for 16 bit counter).

- Receive statistic counters cross their maximum values (0xFFFF_FFFF for 32 bit counter and 0xFFFF for 16 bit counter).

When the Counter Stop Rollover is set, interrupts are set but the counter remains at all-ones. The MMC Receive Interrupt register is a 32 bit register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read. The least significant byte lane (Bits[7:0]) of the respective counter must be read to clear the interrupt bit.

Note: R_SS_RC means that this register bit is set internally, and it is cleared when the Counter register is read.

3.2.189 MMC_TX_INTERRUPT — Offset 708h

This register maintains the interrupts generated from all Transmit statistics counters.

The MMC Transmit Interrupt register maintains the interrupts generated when transmit statistic counters reach half their maximum values (0x8000_0000 for 32 bit counter and 0x8000 for 16 bit counter), and when they cross their maximum values (0xFFFF_FFFF for 32-bit counter and 0xFFFF for 16-bit counter).

When Counter Stop Rollover is set, the interrupts are set but the counter remains at all-ones.

The MMC Transmit Interrupt register is a 32 bit register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read.

The least significant byte lane (Bits[7:0]) of the respective counter must be read to clear the interrupt bit.

Type	Size	Offset	Default

3.2.190 MMC_RX_INTERRUPT_MASK — Offset 70Ch

This register maintains the masks for interrupts generated from all Receive statistics counters.

The MMC Receive Interrupt Mask register maintains the masks for the interrupts generated when receive statistic counters reach half of their maximum value or the maximum values.

This register is 32 bit wide.

Type	Size	Offset	Default

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx 512To1023Octets Packets Good Bad (TX512_1023OCTGB):** This field indicates the number of good and bad packets transmitted with length between 512 and 1023 (inclusive) bytes, exclusive of preamble and retried packets.

3.2.201 TX_1024TOMAXOCTETS_PACKETS_GOOD_BAD — Offset 738h

This register provides the number of good and bad packets transmitted by GbE Controller with length 1024 to maxsize (inclusive) bytes, exclusive of preamble and retried packets.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 738h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx 1024ToMaxOctets Packets Good Bad (TX1024_MAXOCTGB):** This field indicates the number of good and bad packets transmitted with length between 1024 and maxsize (inclusive) bytes, exclusive of preamble and retried packets.

3.2.202 TX_UNICAST_PACKETS_GOOD_BAD — Offset 73Ch

This register provides the number of good and bad unicast packets transmitted by GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 73Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Unicast Packets Good Bad (TXUCASTGB):** This field indicates the number of good and bad unicast packets transmitted.

3.2.203 TX_MULTICAST_PACKETS_GOOD_BAD — Offset 740h

This register provides the number of good and bad multicast packets transmitted by GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 740h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Multicast Packets Good Bad (TXMCASTGB):** This field indicates the number of good and bad multicast packets transmitted.

3.2.204 TX_BROADCAST_PACKETS_GOOD_BAD — Offset 744h

This register provides the number of good and bad broadcast packets transmitted by GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 744h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Broadcast Packets Good Bad (TXBCASTGB):** This field indicates the number of good and bad broadcast packets transmitted.

3.2.205 TX_UNDERFLOW_ERROR_PACKETS — Offset 748h

This register provides the number of packets aborted by GbE Controller because of packets underflow error.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 748h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Underflow Error Packets (TXUNDRFLW):** This field indicates the number of packets aborted because of packets underflow error.

3.2.206 TX_SINGLE_COLLISION_GOOD_PACKETS — Offset 74Ch

This register provides the number of successfully transmitted packets by GbE Controller after a single collision in the half-duplex mode.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 74Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Single Collision Good Packets (TXSNGLCOLG):** This field indicates the number of successfully transmitted packets after a single collision in the half-duplex mode.

3.2.207 TX_MULTIPLE_COLLISION_GOOD_PACKETS — Offset 750h

This register provides the number of successfully transmitted packets by GbE Controller after multiple collisions in the half-duplex mode.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 750h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Multiple Collision Good Packets (TXMULTCOLG):** This field indicates the number of successfully transmitted packets after multiple collisions in the half-duplex mode.

3.2.208 TX_DEFERRED_PACKETS — Offset 754h

This register provides the number of successfully transmitted by GbE Controller after a deferral in the half-duplex mode.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 754h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Deferred Packets (TXDEFRD):** This field indicates the number of successfully transmitted after a deferral in the half-duplex mode.

3.2.209 TX_LATE_COLLISION_PACKETS — Offset 758h

This register provides the number of packets aborted by GbE Controller because of late collision error.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 758h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Late Collision Packets (TXLATECOL):** This field indicates the number of packets aborted because of late collision error.

3.2.210 TX_EXCESSIVE_COLLISION_PACKETS — Offset 75Ch

This register provides the number of packets aborted by GbE Controller because of excessive (16) collision errors.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 75Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Excessive Collision Packets (TXEXSCOL):** This field indicates the number of packets aborted because of excessive (16) collision errors.

3.2.211 TX_CARRIER_ERROR_PACKETS — Offset 760h

This register provides the number of packets aborted by GbE Controller because of carrier sense error (no carrier or loss of carrier).

Type	Size	Offset	Default
MMIO	32 bit	BAR + 760h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Carrier Error Packets (TXCARR):** This field indicates the number of packets aborted because of carrier sense error (no carrier or loss of carrier).

3.2.212 TX_OCTET_COUNT_GOOD — Offset 764h

This register provides the number of bytes transmitted by GbE Controller, exclusive of preamble, only in good packets.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 764h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Octet Count Good (TXOCTG):** This field indicates the number of bytes transmitted, exclusive of preamble, only in good packets.

3.2.213 TX_PACKET_COUNT_GOOD — Offset 768h

This register provides the number of good packets transmitted by GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 768h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Packet Count Good (TXPKTG):** This field indicates the number of good packets transmitted.

3.2.214 TX_EXCESSIVE_DEFERRAL_ERROR — Offset 76Ch

This register provides the number of packets aborted by GbE Controller because of excessive deferral error (deferred for more than two max-sized packet times).

Type	Size	Offset	Default
MMIO	32 bit	BAR + 76Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Excessive Deferral Error (TXEXSDEF):** This field indicates the number of packets aborted because of excessive deferral error (deferred for more than two max-sized packet times).

3.2.215 TX_PAUSE_PACKETS — Offset 770h

This register provides the number of good Pause packets transmitted by GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 770h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Pause Packets (TXPAUSE):** This field indicates the number of good Pause packets transmitted.

3.2.216 TX_VLAN_PACKETS_GOOD — Offset 774h

This register provides the number of good VLAN packets transmitted by GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 774h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx VLAN Packets Good (TXVLANG):** This field provides the number of good VLAN packets transmitted.

3.2.217 TX_OSIZE_PACKETS_GOOD — Offset 778h

This register provides the number of packets transmitted by GbE Controller without errors and with length greater than the maxsize (1,518 or 1,522 bytes for VLAN tagged packets; 2000 bytes if enabled in S2KP bit of the MAC_Configuration register).

Type	Size	Offset	Default
MMIO	32 bit	BAR + 778h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx OSize Packets Good (TXOSIZG):** This field indicates the number of packets transmitted without errors and with length greater than the maxsize (1,518 or 1,522 bytes for VLAN tagged packets; 2000 bytes if enabled in S2KP bit of the MAC_Configuration register).

3.2.218 RX_PACKETS_COUNT_GOOD_BAD — Offset 780h

This register provides the number of good and bad packets received by GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 780h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Packets Count Good Bad (RXPKTGB):** This field indicates the number of good and bad packets received.

3.2.219 RX_OCTET_COUNT_GOOD_BAD — Offset 784h

This register provides the number of bytes received, exclusive of preamble, in good and bad packets.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 784h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Octet Count Good Bad (RXOCTGB):** This field indicates the number of bytes received, exclusive of preamble, in good and bad packets.

3.2.220 RX_OCTET_COUNT_GOOD — Offset 788h

This register provides the number of bytes received by GbE Controller, exclusive of preamble, only in good packets.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 788h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Octet Count Good (RXOCTG):** This field indicates the number of bytes received, exclusive of preamble, only in good packets.

3.2.221 RX_BROADCAST_PACKETS_GOOD — Offset 78Ch

This register provides the number of good broadcast packets received by GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 78Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Broadcast Packets Good (RXBCASTG):** This field indicates the number of good broadcast packets received.

3.2.222 RX_MULTICAST_PACKETS_GOOD — Offset 790h

This register provides the number of good multicast packets received by GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 790h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Multicast Packets Good (RXMCASTG):** This field indicates the number of good multicast packets received.

3.2.223 RX_CRC_ERROR_PACKETS — Offset 794h

This register provides the number of packets received by GbE Controller with CRC error.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 794h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx CRC Error Packets (RXCRCERR):** This field indicates the number of packets received with CRC error.

3.2.224 RX_ALIGNMENT_ERROR_PACKETS — Offset 798h

This register provides the number of packets received by GbE Controller with alignment (dribble) error. It is valid only in 10/100 mode.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 798h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Alignment Error Packets (RXALGNERR):** This field indicates the number of packets received with alignment (dribble) error. It is valid only in 10/100 mode.

3.2.225 RX_RUNT_ERROR_PACKETS — Offset 79Ch

This register provides the number of packets received by GbE Controller with runt (length less than 64 bytes and CRC error) error.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 79Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Runt Error Packets (RXRUNTERR):** This field indicates the number of packets received with runt (length less than 64 bytes and CRC error) error.

3.2.226 RX_JABBER_ERROR_PACKETS — Offset 7A0h

This register provides the number of giant packets received by GbE Controller with length (including CRC) greater than 1,518 bytes (1,522 bytes for VLAN tagged) and with CRC error. If Jumbo Packet mode is enabled, packets of length greater than 9,018 bytes (9,022 bytes for VLAN tagged) are considered as giant packets.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7A0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Jabber Error Packets (RXJABERR):** This field indicates the number of giant packets received with length (including CRC) greater than 1,518 bytes (1,522 bytes for VLAN tagged) and with CRC error. If Jumbo Packet mode is enabled, packets of length greater than 9,018 bytes (9,022 bytes for VLAN tagged) are considered as giant packets.

3.2.227 RX_UNDERSIZE_PACKETS_GOOD — Offset 7A4h

This register provides the number of packets received by GbE Controller with length less than 64 bytes, without any errors.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7A4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Undersize Packets Good (RXUNDERSZG):** This field indicates the number of packets received with length less than 64 bytes, without any errors.

3.2.228 RX_OVERSIZE_PACKETS_GOOD — Offset 7A8h

This register provides the number of packets received by GbE Controller without errors, with length greater than the maxsize (1,518 bytes or 1,522 bytes for VLAN tagged packets; 2000 bytes if enabled in the S2KP bit of the MAC_Configuration register).

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7A8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Oversize Packets Good (RXOVERSZG):** This field indicates the number of packets received without errors, with length greater than the maxsize (1,518 bytes or 1,522 bytes for VLAN tagged packets; 2000 bytes if enabled in the S2KP bit of the MAC_Configuration register).

3.2.229 RX_64OCTETS_PACKETS_GOOD_BAD — Offset 7ACh

This register provides the number of good and bad packets received by GbE Controller with length 64 bytes, exclusive of the preamble.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7ACh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx 64 Octets Packets Good Bad (RX64OCTGB):** This field indicates the number of good and bad packets received with length 64 bytes, exclusive of the preamble.

3.2.230 RX_65TO127OCTETS_PACKETS_GOOD_BAD — Offset 7B0h

This register provides the number of good and bad packets received by GbE Controller with length between 65 and 127 (inclusive) bytes, exclusive of the preamble.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RX65_127OCTGB:** Rx 65-127 Octets Packets Good Bad This field indicates the number of good and bad packets received with length between 65 and 127 (inclusive) bytes, exclusive of the preamble.

3.2.231 RX_128TO255OCTETS_PACKETS_GOOD_BAD — Offset 7B4h

This register provides the number of good and bad packets received by GbE Controller with length between 128 and 255 (inclusive) bytes, exclusive of the preamble.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7B4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RX128_255OCTGB:** Rx 128-255 Octets Packets Good Bad This field indicates the number of good and bad packets received with length between 128 and 255 (inclusive) bytes, exclusive of the preamble.

3.2.232 RX_256TO511OCTETS_PACKETS_GOOD_BAD — Offset 7B8h

This register provides the number of good and bad packets received by GbE ControllerGbE Controller with length between 256 and 511 (inclusive) bytes, exclusive of the preamble.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7B8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RX256_511OCTGB:** Rx 256-511 Octets Packets Good Bad This field indicates the number of good and bad packets received with length between 256 and 511 (inclusive) bytes, exclusive of the preamble.

3.2.233 RX_512TO1023OCTETS_PACKETS_GOOD_BAD — Offset 7BCh

This register provides the number of good and bad packets received by GbE Controller with length between 512 and 1023 (inclusive) bytes, exclusive of the preamble.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7BCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RX 512-1023 Octets Packets Good Bad (RX512_1023OCTGB):** This field indicates the number of good and bad packets received with length between 512 and 1023 (inclusive) bytes, exclusive of the preamble.

3.2.234 RX_1024TOMAXOCTETS_PACKETS_GOOD_BAD — Offset 7C0h

This register provides the number of good and bad packets received by GbE Controller with length between 1024 and maxsize (inclusive) bytes, exclusive of the preamble.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx 1024-Max Octets Good Bad (RX1024_MAXOCTGB):** This field indicates the number of good and bad packets received with length between 1024 and maxsize (inclusive) bytes, exclusive of the preamble.

3.2.235 RX_UNICAST_PACKETS_GOOD — Offset 7C4h

This register provides the number of good unicast packets received by GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7C4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Unicast Packets Good (RXUCASTG):** This field indicates the number of good unicast packets received.

3.2.236 RX_LENGTH_ERROR_PACKETS — Offset 7C8h

This register provides the number of packets received by GbE Controller with length error (Length Type field not equal to packet size), for all packets with valid length field.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7C8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Length Error Packets (RXLENERR):** This field indicates the number of packets received with length error (Length Type field not equal to packet size), for all packets with valid length field.

3.2.237 RX_OUT_OF_RANGE_TYPE_PACKETS — Offset 7CCh

This register provides the number of packets received by GbE Controller with length field not equal to the valid packet size (greater than 1,500 but less than 1,536).

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7CCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Out of Range Type Packet (RXOUTOFRNG):** This field indicates the number of packets received with length field not equal to the valid packet size (greater than 1,500 but less than 1,536).

3.2.238 RX_PAUSE_PACKETS — Offset 7D0h

This register provides the number of good and valid Pause packets received by GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7D0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Pause Packets (RXPAUSEPKT):** This field indicates the number of good and valid Pause packets received.

3.2.239 RX_FIFO_OVERFLOW_PACKETS — Offset 7D4h

This register provides the number of missed received packets because of FIFO overflow in GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx FIFO Overflow Packets (RXFIFOOVFL):** This field indicates the number of missed received packets because of FIFO overflow.

3.2.240 RX_VLAN_PACKETS_GOOD_BAD — Offset 7D8h

This register provides the number of good and bad VLAN packets received by GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx VLAN Packets Good Bad (RXVLANPKTGB):** This field indicates the number of good and bad VLAN packets received.

3.2.241 RX_WATCHDOG_ERROR_PACKETS — Offset 7DCh

This register provides the number of packets received by GbE Controller with error because of watchdog timeout error (packets with a data load larger than 2,048 bytes (when JE and WD bits are reset in MAC_Configuration register), 10,240 bytes (when JE bit is set and WD bit is reset in MAC_Configuration register), 16,384 bytes (when WD bit is set in MAC_Configuration register) or the value programmed in the MAC_Watchdog_Timeout register).

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7DCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Watchdog Error Packets (RXWDGERR):** This field indicates the number of packets received with error because of watchdog timeout error (packets with a data load larger than 2,048 bytes (when JE and WD bits are reset in MAC_Configuration register), 10,240 bytes (when JE bit is set and WD bit is reset in MAC_Configuration register), 16,384 bytes (when WD bit is set in MAC_Configuration register) or the value programmed in the MAC_Watchdog_Timeout register).

3.2.242 RX_RECEIVE_ERROR_PACKETS — Offset 7E0h

This register provides the number of packets received by GbE Controller with Receive error or Packet Extension error on the GMII or MII interface.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7E0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Receive Error Packets (RXRCVERR):** This field indicates the number of packets received with Receive error or Packet Extension error on the GMII or MII interface.

3.2.243 RX_CONTROL_PACKETS_GOOD — Offset 7E4h

This register provides the number of good control packets received by GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Control Packets Good (RXCTRLG):** This field indicates the number of good control packets received.

3.2.244 TX_LPI_USEC_CNTR — Offset 7ECh

This register provides the number of microseconds Tx LPI is asserted by GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7ECh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx LPI Microseconds Counter (TXLPIUSC):** This field indicates the number of microseconds Tx LPI is asserted. For every Tx LPI Entry and Exit, the Timer value can have an error of +/- 1 microsecond.

3.2.245 TX_LPI_TRAN_CNTR — Offset 7F0h

This register provides the number of times GbE Controller has entered Tx LPI.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7F0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx LPI Transition counter (TXLPITRC):** This field indicates the number of times Tx LPI Entry has occurred. Even if Tx LPI Entry occurs in Automate Mode (because of LPITXA bit set in the LPI Control and Status register), the counter increments.

3.2.246 RX_LPI_USEC_CNTR — Offset 7F4h

This register provides the number of microseconds Rx LPI is sampled by GbE Controller.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7F4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx LPI Microseconds Counter (RXLPIUSC):** This field indicates the number of microseconds Rx LPI is asserted. For every Rx LPI Entry and Exit, the Timer value can have an error of +/- 1 microsecond.

3.2.247 RX_LPI_TRAN_CNTR — Offset 7F8h

This register provides the number of times GbE Controller has entered Rx LPI.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7F8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx LPI Transition counter (RXLPITRC):** This field indicates the number of times Rx LPI Entry has occurred.

3.2.248 MMC_IPC_RX_INTERRUPT_MASK — Offset 800h

This register maintains the mask for the interrupt generated from the receive IPC statistic counters.

The MMC Receive Checksum Off load Interrupt Mask register maintains the masks for the interrupts generated when the receive IPC (Checksum Off load) statistic counters reach half their maximum value, and when they reach their maximum values. This register is 32 bits wide.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 800h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**

3.2.249 MMC_IPC_RX_INTERRUPT — Offset 808h

This register maintains the interrupt that the receive IPC statistic counters generate.

The MMC Receive Checksum Offload Interrupt register maintains the interrupts generated when receive IPC statistic counters reach half their maximum values (0x8000_0000 for 32 bit counter and 0x8000 for 16 bit counter), and when they cross their maximum values (0xFFFF_FFFF for 32 bit counter and 0xFFFF for 16 bit counter). When Counter Stop Rollover is set, the interrupts are set but the counter remains at all-ones.

The MMC Receive Checksum Offload Interrupt register is 32 bit wide. When the MMC IPC counter that caused the interrupt is read, its corresponding interrupt bit is cleared. The counter's least-significant byte lane (Bits[7:0]) must be read to clear the interrupt bit.

Type	Size	Offset	Default

3.2.250 RXIPV4_GOOD_PACKETS — Offset 810h

This register provides the number of good IPv4 datagrams received by GbE Controller with the TCP, UDP, or ICMP payload.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 810h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxIPv4 Good Packets (RXIPV4GDPKT):** This field indicates the number of good IPv4 datagrams received with the TCP, UDP, or ICMP payload.

3.2.251 RXIPV4_HEADER_ERROR_PACKETS — Offset 814h

RxIPv4 Header Error Packets

This register provides the number of IPv4 datagrams received by GbE Controller with header (checksum, length, or version mismatch) errors.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 814h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxIPv4 Header Error Packets (RXIPV4HDRERRPKT):** This field indicates the number of IPv4 datagrams received with header (checksum, length, or version mismatch) errors.

3.2.252 RXIPV4_NO_PAYLOAD_PACKETS — Offset 818h

This register provides the number of IPv4 datagram packets received by GbE Controller that did not have a TCP, UDP, or ICMP payload.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 818h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxIPv4 Payload Packets (RXIPV4NOPAYPKT):** This field indicates the number of IPv4 datagram packets received that did not have a TCP, UDP, or ICMP payload.

3.2.253 RXIPV4_FRAGMENTED_PACKETS — Offset 81Ch

This register provides the number of good IPv4 datagrams received by GbE Controller with fragmentation.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 81Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxIPv4 Fragmented Packets (RXIPV4FRAGPKT):** This field indicates the number of good IPv4 datagrams received with fragmentation.

3.2.254 RXIPV4_UDP_CHECKSUM_DISABLED_PACKETS — Offset 820h

This register provides the number of good IPv4 datagrams received by GbE Controller that had a UDP payload with checksum disabled.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 820h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxIPv4 UDP Checksum Disabled Packets (RXIPV4UDSBLPKT):** This field indicates the number of good IPv4 datagrams received that had a UDP payload with checksum disabled.

3.2.255 RXIPV6_GOOD_PACKETS — Offset 824h

This register provides the number of good IPv6 datagrams received by GbE Controller with the TCP, UDP, or ICMP payload.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 824h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxIPv6 Good Packets (RXIPV6GDPKT):** This field indicates the number of good IPv6 datagrams received with the TCP, UDP, or ICMP payload.

3.2.256 RXIPV6_HEADER_ERROR_PACKETS — Offset 828h

This register provides the number of IPv6 datagrams received by GbE Controller with header (length or version mismatch) errors.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 828h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxIPv6 Header Error Packets (RXIPV6HDRERRPKT):** This field indicates the number of IPv6 datagrams received with header (length or version mismatch) errors.

3.2.257 RXIPV6_NO_PAYLOAD_PACKETS — Offset 82Ch

This register provides the number of IPv6 datagram packets received by GbE Controller that did not have a TCP, UDP, or ICMP payload. This includes all IPv6 datagrams with fragmentation or security extension headers.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 82Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxIPv6 Payload Packets (RXIPV6NOPAYPKT):** This field indicates the number of IPv6 datagram packets received that did not have a TCP, UDP, or ICMP payload. This includes all IPv6 datagrams with fragmentation or security extension headers.

3.2.258 RXUDP_GOOD_PACKETS — Offset 830h

This register provides the number of good IP datagrams received by GbE Controller with a good UDP payload. This counter is not updated when the RxIPv4_UDP_Checksum_Disabled_Packets counter is incremented.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 830h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxUDP Good Packets (RXUDPGDPKT):** This field indicates the number of good IP datagrams received with a good UDP payload. This counter is not updated when the RxIPv4_UDP_Checksum_Disabled_Packets counter is incremented.

3.2.259 RXUDP_ERROR_PACKETS — Offset 834h

This register provides the number of good IP datagrams received by GbE Controller whose UDP payload has a checksum error.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 834h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxUDP Error Packets (RXUDPERRPKT):** This field indicates the number of good IP datagrams received whose UDP payload has a checksum error.

3.2.260 RXTCP_GOOD_PACKETS — Offset 838h

This register provides the number of good IP datagrams received by GbE Controller with a good TCP payload.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 838h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxTCP Good Packets (RXTCPGDPKT):** This field indicates the number of good IP datagrams received with a good TCP payload.

3.2.261 RXTCP_ERROR_PACKETS — Offset 83Ch

This register provides the number of good IP datagrams received by GbE Controller whose TCP payload has a checksum error.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 83Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxTCP Error Packets (RXTCPERRPKT):** This field indicates the number of good IP datagrams received whose TCP payload has a checksum error.

3.2.262 RXICMP_GOOD_PACKETS — Offset 840h

This register provides the number of good IP datagrams received by GbE Controller with a good ICMP payload.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 840h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxICMP Good Packets (RXICMPGDPKT):** This field indicates the number of good IP datagrams received with a good ICMP payload.

3.2.263 RXICMP_ERROR_PACKETS — Offset 844h

This register provides the number of good IP datagrams received by GbE Controller whose ICMP payload has a checksum error.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 844h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxICMP Error Packets (RXICMPERRPKT):** This field indicates the number of good IP datagrams received whose ICMP payload has a checksum error.

3.2.264 RXIPV4_GOOD_OCTETS — Offset 850h

This register provides the number of bytes received by GbE Controller in good IPv4 datagrams encapsulating TCP, UDP, or ICMP data. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 850h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxIPv4 Good Octets (RXIPV4GDOCT):** This field indicates the number of bytes received in good IPv4 datagrams encapsulating TCP, UDP, or ICMP data. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

3.2.265 RXIPV4_HEADER_ERROR_OCTETS — Offset 854h

This register provides the number of bytes received by GbE Controller in IPv4 datagrams with header errors (checksum, length, version mismatch). The value in the Length field of IPv4 header is used to update this counter. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 854h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxIPv4 Header Error Octets (RXIPV4HDRERROCT):** This field indicates the number of bytes received in IPv4 datagrams with header errors (checksum, length, version mismatch). The value in the Length field of IPv4 header is used to update this counter. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

3.2.266 RXIPV4_NO_PAYLOAD_OCTETS — Offset 858h

This register provides the number of bytes received by GbE Controller in IPv4 datagrams that did not have a TCP, UDP, or ICMP payload. The value in the Length field of IPv4 header is used to update this counter. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 858h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxIPv4 Payload Octets (RXIPV4NOPAYOCT):** This field indicates the number of bytes received in IPv4 datagrams that did not have a TCP, UDP, or ICMP payload. The value in the Length field of IPv4 header is used to update this counter. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

3.2.267 RXIPV4_FRAGMENTED_OCTETS — Offset 85Ch

This register provides the number of bytes received by GbE Controller in fragmented IPv4 datagrams. The value in the Length field of IPv4 header is used to update this counter. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 85Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxIPv4 Fragmented Octets (RXIPV4FRAGOCT):** This field indicates the number of bytes received in fragmented IPv4 datagrams. The value in the Length field of IPv4 header is used to update this counter. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

3.2.268 RXIPV4_UDP_CHECKSUM_DISABLE_OCTETS — Offset 860h

This register provides the number of bytes received by GbE Controller in a UDP segment that had the UDP checksum disabled. This counter does not count IP Header bytes. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 860h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxIPv4 UDP Checksum Disable Octets (RXIPV4UDSBLOCT):** This field indicates the number of bytes received in a UDP segment that had the UDP checksum disabled. This counter does not count IP Header bytes. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

3.2.269 RXIPV6_GOOD_OCTETS — Offset 864h

This register provides the number of bytes received by GbE Controller in good IPv6 datagrams encapsulating TCP, UDP, or ICMP data. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 864h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxIPv6 Good Octets (RXIPV6GDOCT):** This field indicates the number of bytes received in good IPv6 datagrams encapsulating TCP, UDP, or ICMP data. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

3.2.270 RXIPV6_HEADER_ERROR_OCTETS — Offset 868h

This register provides the number of bytes received by GbE Controller in IPv6 datagrams with header errors (length, version mismatch). The value in the Length field of IPv6 header is used to update this counter. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 868h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxIPv6 Header Error Octets (RXIPV6HDRERROCT):** This field indicates the number of bytes received in IPv6 datagrams with header errors (length, version mismatch). The value in the Length field of IPv6 header is used to update this counter. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

3.2.271 RXIPV6_NO_PAYLOAD_OCTETS — Offset 86Ch

This register provides the number of bytes received by GbE Controller in IPv6 datagrams that did not have a TCP, UDP, or ICMP payload. The value in the Length field of IPv6 header is used to update this counter. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 86Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxIPv6 Payload Octets (RXIPV6NOPAYOCT):** This field indicates the number of bytes received in IPv6 datagrams that did not have a TCP, UDP, or ICMP payload. The value in the Length field of IPv6 header is used to update this counter. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

3.2.272 RXUDP_GOOD_OCTETS — Offset 870h

This register provides the number of bytes received by GbE Controller in a good UDP segment. This counter does not count IP header bytes.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 870h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxUDP Good Octets (RXUDPGDOCT):** This field indicates the number of bytes received in a good UDP segment. This counter does not count IP header bytes.

3.2.273 RXUDP_ERROR_OCTETS — Offset 874h

This register provides the number of bytes received by GbE Controller in a UDP segment that had checksum errors. This counter does not count IP header bytes.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 874h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxUDP Error Octets (RXUDPERROCT):** This field indicates the number of bytes received in a UDP segment that had checksum errors. This counter does not count IP header bytes.

3.2.274 RXTCP_GOOD_OCTETS — Offset 878h

This register provides the number of bytes received by GbE Controller in a good TCP segment. This counter does not count IP header bytes.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 878h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxTCP Good Octets (RXTCPGDOCT):** This field indicates the number of bytes received in a good TCP segment. This counter does not count IP header bytes.

3.2.275 RXTCP_ERROR_OCTETS — Offset 87Ch

This register provides the number of bytes received by GbE Controller in a TCP segment that had checksum errors. This counter does not count IP header bytes.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 87Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxTCP Error Octets (RXTCPERROCT):** This field indicates the number of bytes received in a TCP segment that had checksum errors. This counter does not count IP header bytes.

3.2.276 RXICMP_GOOD_OCTETS — Offset 880h

This register provides the number of bytes received by GbE Controller in a good ICMP segment. This counter does not count IP header bytes.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 880h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxICMP Good Octets (RXICMPGDOCT):** This field indicates the number of bytes received in a good ICMP segment. This counter does not count IP header bytes.

3.2.277 RXICMP_ERROR_OCTETS — Offset 884h

This register provides the number of bytes received by GbE Controller in a ICMP segment that had checksum errors. This counter does not count IP header bytes.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 884h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**RxICMP Error Octets (RXICMPERROCT):** This field indicates the number of bytes received in a ICMP segment that had checksum errors. This counter does not count IP header bytes.

3.2.278 MMC_FPE_TX_INTERRUPT — Offset 8A0h

This register maintains the interrupts generated from all FPE related Transmit statistics counters. The MMC FPE Transmit Interrupt register maintains the interrupts generated when transmit statistic counters reach half their maximum values (0x8000_0000 for 32 bit counter and 0x8000 for 16 bit counter), and when they cross their maximum values (0xFFFF_FFFF for 32-bit counter and 0xFFFF for 16-bit counter). When Counter Stop Rollover is set, the interrupts are set but the counter remains at all-ones. The MMC FPE Transmit Interrupt register is a 32 bit register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read. The least significant byte lane (Bits[7:0]) of the respective counter must be read to clear the interrupt bit.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8A0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1	0h RO	**MMC Tx Hold Request Counter Interrupt Status (HRCIS):** This bit is set when the Tx_Hold_Req_Cntr counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. Exists when any one of the RX/TX MMC counters are enabled during FPE with AV_EST Enabled configuration. 0x0 (INACTIVE): MMC Tx Hold Request Counter Interrupt Status not detected. 0x1 (ACTIVE): MMC Tx Hold Request Counter Interrupt Status detected.
0	0h RO	**MMC Tx FPE Fragment Counter Interrupt status (FCIS):** This bit is set when the Tx_FPE_Fragment_Cntr counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. Exists when any one of the RX/TX MMC counters are enabled during FPE Enabled configuration. 0x0 (INACTIVE): MMC Tx FPE Fragment Counter Interrupt status not detected. 0x1 (ACTIVE): MMC Tx FPE Fragment Counter Interrupt status detected.

3.2.279 MMC_FPE_TX_INTERRUPT_MASK — Offset 8A4h

This register maintains the masks for interrupts generated from all FPE related Transmit statistics counters. The MMC Receive Interrupt Mask register maintains the masks for the interrupts generated when FPE related receive statistic counters reach half of their maximum value or the maximum values. This register is 32 bit wide.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8A4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1	0h RW	**MMC Transmit Hold Request Counter Interrupt Mask (HRCIM):** Setting this bit masks the interrupt when the Tx_Hold_Req_Cntr counter reaches half of the maximum value or the maximum value. Exists when any one of the RX/TX MMC counters are enabled during FPE with AV_EST Enabled configuration. 0x0 (DISABLE): MMC Transmit Hold Request Counter Interrupt Mask is disabled. 0x1 (ENABLE): MMC Transmit Hold Request Counter Interrupt Mask is enabled.
0	0h RW	**MMC Transmit Fragment Counter Interrupt Mask (FCIM):** Setting this bit masks the interrupt when the Tx_FPE_Fragment_Cntr counter reaches half of the maximum value or the maximum value. Exists when any one of the RX/TX MMC counters are enabled during FPE Enabled configuration. 0x0 (DISABLE): MMC Transmit Fragment Counter Interrupt Mask is disabled. 0x1 (ENABLE): MMC Transmit Fragment Counter Interrupt Mask is enabled.

3.2.280 MMC_TX_FPE_FRAGMENT_CNTR — Offset 8A8h

This register provides the number of additional mPackets transmitted due to preemption.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8A8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx FPE Fragment counter (TXFFC):** This field indicates the number of additional mPackets that has been transmitted due to preemption Exists when any one of the RX/TX MMC counters are enabled during FPE Enabled configuration.

3.2.281 MMC_TX_HOLD_REQ_CNTR — Offset 8ACh

This register provides the count of number of times a hold request is given to MAC

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8ACh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Tx Hold Request Counter (TXHRC):** This field indicates count of number of a hold request is given to MAC. Exists when any one of the RX/TX MMC counters are enabled during FPE with AV_EST Enabled configuration.

3.2.282 MMC_FPE_RX_INTERRUPT — Offset 8C0h

This register maintains the interrupts generated from all FPE related Receive statistics counters. The MMC FPE Receive Interrupt register maintains the interrupts generated when transmit statistic counters reach half their maximum values (0x8000_0000 for 32 bit counter and 0x8000 for 16 bit counter), and when they cross their maximum values (0xFFFF_FFFF for 32-bit counter and 0xFFFF for 16-bit counter). When Counter Stop Rollover is set, the interrupts are set but the counter remains at all-ones. The MMC FPE Receive Interrupt register is a 32 bit register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read. The least significant byte lane (Bits[7:0]) of the respective counter must be read to clear the interrupt bit.

Type	Size	Offset	Default

3.2.284 MMC_RX_PACKET_ASSEMBLY_ERR_CNTR — Offset 8C8h

This register provides the number of MAC frames with reassembly errors on the Receiver, due to mismatch in the Fragment Count value.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8C8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Packet Assembly Error Counter (PAEC):** This field indicates the number of MAC frames with reassembly errors on the Receiver, due to mismatch in the Fragment Count value. Exists when any one of the RX/TX MMC counters are enabled during FPE Enabled configuration.

3.2.285 MMC_RX_PACKET_SMD_ERR_CNTR — Offset 8CCh

This register provides the number of received MAC frames rejected due to unknown SMD value and MAC frame fragments rejected due to arriving with an SMD-C when there was no preceding preempted frame.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8CCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Packet SMD Error Counter (PSEC):** This field indicates the number of MAC frames rejected due to unknown SMD value and MAC frame fragments rejected due to arriving with an SMD-C when there was no preceding preempted frame. Exists when at least one of the RX/TX MMC counters are enabled during FPE Enabled configuration.

3.2.286 MMC_RX_PACKET_ASSEMBLY_OK_CNTR — Offset 8D0h

This register provides the number of MAC frames that were successfully reassembled and delivered to MAC.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8D0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx Packet Assembly OK Counter (PAOC):** This field indicates the number of MAC frames that were successfully reassembled and delivered to MAC. Exists when at least one of the RX/TX MMC counters are enabled during FPE Enabled configuration.

3.2.287 MMC_RX_FPE_FRAGMENT_CNTR — Offset 8D4h

This register provides the number of additional mPackets received due to preemption.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Rx FPE Fragment Counter (FFC):** This field indicates the number of additional mPackets received due to preemption Exists when at least one of the RX/TX MMC counters are enabled during FPE Enabled configuration.

3.2.288 MAC_L3_L4_CONTROL0 — Offset 900h

The Layer 3 and Layer 4 Control register controls the operations of filter 0 of Layer 3 and Layer 4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 900h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**DMA Channel Select Enable (DMCHEN0):** When set, this bit enables the selection of the DMA channel number for the packet that is passed by this L3_L4 filter. The DMA channel is indicated by the DMCHN bits. When this bit is reset, the DMA channel is not decided by this filter. 0x0 (DISABLE): DMA Channel Select is disabled. 0x1 (ENABLE): DMA Channel Select is enabled.
27	0h RO	**Reserved**
26:24	0h RW	**DMA Channel Number (DMCHN0):** When DMCHEN is set high, this field selects the DMA Channel number to which the packet passed by this filter is routed. The width of this field depends on the number of the DMA channels present in your configuration.
23:22	0h RO	**Reserved**
21	0h RW	**Layer 4 Destination Port Inverse Match Enable (L4DPIM0):** When this bit is set, the Layer 4 Destination Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Destination Port number field is enabled for perfect matching. This bit is valid and applicable only when the L4DPM0 bit is set high. 0x0 (DISABLE): Layer 4 Destination Port Inverse Match is disabled. 0x1 (ENABLE): Layer 4 Destination Port Inverse Match is enabled.
20	0h RW	**Layer 4 Destination Port Match Enable (L4DPM0):** When this bit is set, the Layer 4 Destination Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Destination Port number field for matching. 0x0 (DISABLE): Layer 4 Destination Port Match is disabled. 0x1 (ENABLE): Layer 4 Destination Port Match is enabled.
19	0h RW	**Layer 4 Source Port Inverse Match Enable (L4SPIM0):** When this bit is set, the Layer 4 Source Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Source Port number field is enabled for perfect matching. This bit is valid and applicable only when the L4SPM0 bit is set high. 0x0 (DISABLE): Layer 4 Source Port Inverse Match is disabled. 0x1 (ENABLE): Layer 4 Source Port Inverse Match is enabled.
18	0h RW	**Layer 4 Source Port Match Enable (L4SPM0):** When this bit is set, the Layer 4 Source Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Source Port number field for matching. 0x0 (DISABLE): Layer 4 Source Port Match is disabled. 0x1 (ENABLE): Layer 4 Source Port Match is enabled.

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**Layer 4 Protocol Enable (L4PEN0):** When this bit is set, the Source and Destination Port number fields of UDP packets are used for matching. When this bit is reset, the Source and Destination Port number fields of TCP packets are used for matching. The Layer 4 matching is done only when the L4SPM0 or L4DPM0 bit is set. 0x0 (DISABLE): Layer 4 Protocol is disabled. 0x1 (ENABLE): Layer 4 Protocol is enabled.
15:11	00h RW	**L3HDBM0:** Layer 3 IP DA Higher Bits Match IPv4 Packets: This field contains the number of higher bits of IP Destination Address that are matched in the IPv4 packets. The following list describes the values of this field: - 0: No bits are masked. - 1: LSb[0] is masked - 2: Two LSbs [1:0] are masked - .. - 31: All bits except MSb are masked. IPv6 Packets: Bits[12:11] of this field correspond to Bits[6:5] of L3HSBM0 which indicate the number of lower bits of IP Source or Destination Address that are masked in the IPv6 packets. The following list describes the concatenated values of the L3HDBM0[1:0] and L3HSBM0 bits: - 0: No bits are masked. - 1: LSb[0] is masked. - 2: Two LSbs [1:0] are masked - .. - 127: All bits except MSb are masked. This field is valid and applicable only when the L3DAM0 or L3SAM0 bit is set.
10:6	00h RW	**L3HSBM0:** Layer 3 IP SA Higher Bits Match IPv4 Packets: This field contains the number of lower bits of IP Source Address that are masked for matching in the IPv4 packets. The following list describes the values of this field: - 0: No bits are masked. - 1: LSb[0] is masked - 2: Two LSbs [1:0] are masked - .. - 31: All bits except MSb are masked. IPv6 Packets: This field contains Bits[4:0] of L3HSBM0. These bits indicate the number of higher bits of IP Source or Destination Address matched in the IPv6 packets. This field is valid and applicable only when the L3DAM0 or L3SAM0 bit is set high.
5	0h RW	**Layer 3 IP DA Inverse Match Enable (L3DAIM0):** When this bit is set, the Layer 3 IP Destination Address field is enabled for inverse matching. When this bit is reset, the Layer 3 IP Destination Address field is enabled for perfect matching. This bit is valid and applicable only when the L3DAM0 bit is set high. 0x0 (DISABLE): Layer 3 IP DA Inverse Match is disabled. 0x1 (ENABLE): Layer 3 IP DA Inverse Match is enabled.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	**Layer 3 IP DA Match Enable (L3DAM0):** When this bit is set, the Layer 3 IP Destination Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Destination Address field for matching. Note: When the L3PEN0 bit is set, you should set either this bit or the L3SAM0 bit because either IPv6 DA or SA can be checked for filtering. 0x0 (DISABLE): Layer 3 IP DA Match is disabled. 0x1 (ENABLE): Layer 3 IP DA Match is enabled.
3	0h RW	**Layer 3 IP SA Inverse Match Enable (L3SAIM0):** When this bit is set, the Layer 3 IP Source Address field is enabled for inverse matching. When this bit reset, the Layer 3 IP Source Address field is enabled for perfect matching. This bit is valid and applicable only when the L3SAM0 bit is set. 0x0 (DISABLE): Layer 3 IP SA Inverse Match is disabled. 0x1 (ENABLE): Layer 3 IP SA Inverse Match is enabled.
2	0h RW	**Layer 3 IP SA Match Enable (L3SAM0):** When this bit is set, the Layer 3 IP Source Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Source Address field for matching. Note: When the L3PEN0 bit is set, you should set either this bit or the L3DAM0 bit because either IPv6 SA or DA can be checked for filtering. 0x0 (DISABLE): Layer 3 IP SA Match is disabled. 0x1 (ENABLE): Layer 3 IP SA Match is enabled.
1	0h RO	**Reserved**
0	0h RW	**Layer 3 Protocol Enable (L3PEN0):** When this bit is set, the Layer 3 IP Source or Destination Address matching is enabled for IPv6 packets. When this bit is reset, the Layer 3 IP Source or Destination Address matching is enabled for IPv4 packets. The Layer 3 matching is done only when the L3SAM0 or L3DAM0 bit is set. 0x0 (DISABLE): Layer 3 Protocol is disabled. 0x1 (ENABLE): Layer 3 Protocol is enabled.

3.2.289 MAC_LAYER4_ADDRESS0 — Offset 904h

The MAC_Layer4_Address(#i), MAC_L3_L4_Control(#i), MAC_Layer3_Addr0_Reg(#i), MAC_Layer3_Addr1_Reg(#i), MAC_Layer3_Addr2_Reg(#i) and MAC_Layer3_Addr3_Reg(#i) registers are reserved (RO with default value) if Enable Layer 3 and Layer 4 Packet Filter option is not selected while configuring the core.

You can configure the Layer 3 and Layer 4 Address Registers to be double-synchronized by selecting the Synchronize Layer 3 and Layer 4 Address Registers to Rx Clock Domain option while configuring the core. When you select this option, the synchronization is triggered only when Bits[31:24] of the Layer 3 and Layer 4 Address Registers are written. For proper synchronization updates, you should perform consecutive writes to same Layer 3 and Layer 4 Address Registers after at least four clock cycles delay of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 904h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**Layer 4 Destination Port Number Field (L4DP0):** When the L4PEN0 bit is reset and the L4DPM0 bit is set in the MAC_L3_L4_Control0 register, this field contains the value to be matched with the TCP Destination Port Number field in the IPv4 or IPv6 packets. When the L4PEN0 and L4DPM0 bits are set in MAC_L3_L4_Control0 register, this field contains the value to be matched with the UDP Destination Port Number field in the IPv4 or IPv6 packets.
15:0	0000h RW	**Layer 4 Source Port Number Field (L4SP0):** When the L4PEN0 bit is reset and the L4SPM0 bit is set in the MAC_L3_L4_Control0 register, this field contains the value to be matched with the TCP Source Port Number field in the IPv4 or IPv6 packets. When the L4PEN0 and L4SPM0 bits are set in MAC_L3_L4_Control0 register, this field contains the value to be matched with the UDP Source Port Number field in the IPv4 or IPv6 packets.

3.2.290 MAC_LAYER3_ADDR0_REG0 — Offset 910h

For IPv4 packets, the Layer 3 Address 0 Register 0 register contains the 32-bit IP Source Address field. For IPv6 packets, it contains Bits[31:0] of the 128-bit IP Source Address or Destination Address field.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 910h	00000000h

When the L3PEN0 bit is reset in the MAC_L3_L4_Control0 register, this field is not used.

3.2.300 MAC_TIMESTAMP_CONTROL — Offset B00h

This register controls the operation of the System Time generator and processing of PTP packets for time stamping in the Receiver.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B00h	00002000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**AV 802.1AS Mode Enable (AV8021ASMEN):** When this bit is set, the MAC processes only untagged PTP over Ethernet packets for providing PTP status and capturing timestamp snapshots, that is, IEEE 802.1AS mode of operation. When PTP offload feature is enabled, for the purpose of PTP offload, the transport specific field in the PTP header is generated and checked based on the value of this bit. 0x0 (DISABLE): AV 802.1AS Mode is disabled. 0x1 (ENABLE): AV 802.1AS Mode is enabled.
27:25	0h RO	**Reserved**
24	0h RW	**Transmit Timestamp Status Mode (TXTSSTSM):** When this bit is set, the MAC overwrites the earlier transmit timestamp status even if it is not read by the software. The MAC indicates this by setting the TXTSSMIS bit of the MAC_Tx_Timestamp_Status_Nanoseconds register. When this bit is reset, the MAC ignores the timestamp status of current packet if the timestamp status of previous packet is not read by the software. The MAC indicates this by setting the TXTSSMIS bit of the MAC_Tx_Timestamp_Status_Nanoseconds register. 0x0 (DISABLE): Transmit Timestamp Status Mode is disabled. 0x1 (ENABLE): Transmit Timestamp Status Mode is enabled.
23:21	0h RO	**Reserved**
20	0h RW	**External System Time Input (ESTI):** When this bit is set, the MAC uses the external 64-bit reference System Time input for the following: - To take the timestamp provided as status - To insert the timestamp in transmit PTP packets when One-step Timestamp or Timestamp Offload feature is enabled. When this bit is reset, the MAC uses the internal reference System Time. 0x0 (DISABLE): External System Time Input is disabled. 0x1 (ENABLE): External System Time Input is enabled.
19	0h RW	**Enable checksum correction during OST for PTP over UDP/IPv4 packets (CSC):** When this bit is set, the last two bytes of PTP message sent over UDP/IPv4 is updated to keep the UDP checksum correct, for changes made to origin timestamp and/or correction field as part of one step timestamp operation. The application shall form the packet with these two dummy bytes. When reset, no updates are done to keep the UDP checksum correct. The application shall form the packet with UDP checksum set to 0. 0x0 (DISABLE): checksum correction during OST for PTP over UDP/IPv4 packets is disabled. 0x1 (ENABLE): checksum correction during OST for PTP over UDP/IPv4 packets is enabled.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RW	**Enable MAC Address for PTP Packet Filtering (TSENMACADDR):** When this bit is set, the DA MAC address (that matches any MAC Address register) is used to filter the PTP packets when PTP is directly sent over Ethernet. When this bit is set, received PTP packets with DA containing a special multicast or unicast address that matches the one programmed in MAC address registers are considered for processing as indicated below, when PTP is directly sent over Ethernet. For normal time stamping operation, MAC address registers 0 to 31 is considered for unicast destination address matching. For PTP offload, only MAC address register 0 is considered for unicast destination address matching. 0x0 (DISABLE): MAC Address for PTP Packet Filtering is disabled. 0x1 (ENABLE): MAC Address for PTP Packet Filtering is enabled.
17:16	0h RW	**Select PTP packets for Taking Snapshots (SNAPTYPSEL):** These bits, along with Bits 15 and 14, decide the set of PTP packet types for which snapshot needs to be taken. The encoding is given in Timestamp Snapshot Dependency on Register Bits Table.
15	0h RW	**Enable Snapshot for Messages Relevant to Master (TSMSTRENA):** When this bit is set, the snapshot is taken only for the messages that are relevant to the master node. Otherwise, the snapshot is taken for the messages relevant to the slave node. 0x0 (DISABLE): Snapshot for Messages Relevant to Master is disabled. 0x1 (ENABLE): Snapshot for Messages Relevant to Master is enabled.
14	0h RW	**Enable Timestamp Snapshot for Event Messages (TSEVNTENA):** When this bit is set, the timestamp snapshot is taken only for event messages (SYNC, Delay_Req, Pdelay_Req, or Pdelay_Resp). When this bit is reset, the snapshot is taken for all messages except Announce, Management, and Signaling. For more information about the timestamp snapshots, see Timestamp Snapshot Dependency on Register Bits Table. 0x0 (DISABLE): Timestamp Snapshot for Event Messages is disabled. 0x1 (ENABLE): Timestamp Snapshot for Event Messages is enabled.
13	1h RW	**Enable Processing of PTP Packets Sent over IPv4-UDP (TSIPV4ENA):** When this bit is set, the MAC receiver processes the PTP packets encapsulated in IPv4-UDP packets. When this bit is reset, the MAC ignores the PTP transported over IPv4-UDP packets. This bit is set by default. 0x0 (DISABLE): Processing of PTP Packets Sent over IPv4-UDP is disabled. 0x1 (ENABLE): Processing of PTP Packets Sent over IPv4-UDP is enabled.
12	0h RW	**Enable Processing of PTP Packets Sent over IPv6-UDP (TSIPV6ENA):** When this bit is set, the MAC receiver processes the PTP packets encapsulated in IPv6-UDP packets. When this bit is clear, the MAC ignores the PTP transported over IPv6-UDP packets. 0x0 (DISABLE): Processing of PTP Packets Sent over IPv6-UDP is disabled. 0x1 (ENABLE): Processing of PTP Packets Sent over IPv6-UDP is enabled.
11	0h RW	**Enable Processing of PTP over Ethernet Packets (TSIPENA):** When this bit is set, the MAC receiver processes the PTP packets encapsulated directly in the Ethernet packets. When this bit is reset, the MAC ignores the PTP over Ethernet packets. 0x0 (DISABLE): Processing of PTP over Ethernet Packets is disabled. 0x1 (ENABLE): Processing of PTP over Ethernet Packets is enabled.
10	0h RW	**Enable PTP Packet Processing for Version 2 Format (TSVER2ENA):** When this bit is set, the IEEE 1588 version 2 format is used to process the PTP packets. When this bit is reset, the IEEE 1588 version 1 format is used to process the PTP packets. The IEEE 1588 formats are described in 'PTP Processing and Control'. 0x0 (DISABLE): PTP Packet Processing for Version 2 Format is disabled. 0x1 (ENABLE): PTP Packet Processing for Version 2 Format is enabled.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**Timestamp Digital or Binary Rollover Control (TSCTRLSSR):** When this bit is set, the Timestamp Low register rolls over after 0x3B9A_C9FF value (that is, 1 nanosecond accuracy) and increments the timestamp (High) seconds. When this bit is reset, the rollover value of sub-second register is 0x7FFF_FFFF. The sub-second increment must be programmed correctly depending on the PTP reference clock frequency and the value of this bit. 0x0 (DISABLE): Timestamp Digital or Binary Rollover Control is disabled. 0x1 (ENABLE): Timestamp Digital or Binary Rollover Control is enabled.
8	0h RW	**Enable Timestamp for All Packets (TSENALL):** When this bit is set, the timestamp snapshot is enabled for all packets received by the MAC. 0x0 (DISABLE): Timestamp for All Packets disabled. 0x1 (ENABLE): Timestamp for All Packets enabled.
7	0h RO	**Reserved**
6	0h RW	**Presentation Time Generation Enable (PTGE):** When this bit is set the Presentation Time generation is enabled. 0x0 (DISABLE): Presentation Time Generation is disabled. 0x1 (ENABLE): Presentation Time Generation is enabled.
5	0h RW	**Update Addend Register (TSADDREG):** When this bit is set, the content of the Timestamp Addend register is updated in the PTP block for fine correction. This bit is cleared when the update is complete. This bit should be zero before it is set. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Addend Register is not updated. 0x1 (ENABLE): Addend Register is updated.
4	0h RO	**Reserved**
3	0h RW	**Update Timestamp (TSUPDT):** When this bit is set, the system time is updated (added or subtracted) with the value specified in MAC_System_Time_Seconds_Update and MAC_System_Time_Nanoseconds_Update registers. This bit should be zero before updating it. This bit is reset when the update is complete in hardware. The Timestamp Higher Word register (if enabled during core configuration) is not updated. When Media Clock Generation and Recovery is DWC_EQOS_FLEXI_PPS_OUT_EN=1 enabled MAC_Presn_Time_Updt should also be updated before setting this field. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Timestamp is not updated. 0x1 (ENABLE): Timestamp is updated.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Initialize Timestamp (TSINIT):** When this bit is set, the system time is initialized (overwritten) with the value specified in the MAC_System_Time_Seconds_Update and MAC_System_Time_Nanoseconds_Update registers. This bit should be zero before it is updated. This bit is reset when the initialization is complete. The Timestamp Higher Word register (if enabled during core configuration) can only be initialized. When Media Clock Generation and Recovery is DWC_EQOS_FLEXI_PPS_OUT_EN=1 enabled MAC_Presn_Time_Updt should also be updated before setting this field. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Timestamp is not initialized. 0x1 (ENABLE): Timestamp is initialized.
1	0h RW	**Fine or Coarse Timestamp Update (TSCFUPDT):** When this bit is set, the Fine method is used to update system timestamp. When this bit is reset, Coarse method is used to update the system timestamp. 0x0 (COARSE): Coarse method is used to update system timestamp. 0x1 (FINE): Fine method is used to update system timestamp.
0	0h RW	**Enable Timestamp (TSENA):** When this bit is set, the timestamp is added for Transmit and Receive packets. When disabled, timestamp is not added for transmit and receive packets and the Timestamp Generator is also suspended. You need to initialize the Timestamp (system time) after enabling this mode. On the Receive side, the MAC processes the 1588 packets only if this bit is set. 0x0 (DISABLE): Timestamp is disabled. 0x1 (ENABLE): Timestamp is enabled.

3.2.301 MAC_SUB_SECOND_INCREMENT — Offset B04h

This register specifies the value to be added to the internal system time register every cycle of clk_ptp_ref_i clock.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B04h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:16	00h RW	**Sub-second Increment Value (SSINC):** The value programmed in this field is accumulated every clock cycle (of clk_ptp_i) with the contents of the sub-second register. For example, when the PTP clock is 50 MHz (period is 20 ns), you should program 20 (0x14) when the System Time Nanoseconds register has an accuracy of 1 ns [Bit 9 (TSCTRLSSR) is set in MAC_Timestamp_Control]. When TSCTRLSSR is clear, the Nanoseconds register has a resolution of ~0.465 ns. In this case, you should program a value of 43 (0x2B) which is derived by 20 ns/0.465.
15:8	00h RW	**Sub-nanosecond Increment Value (SNSINC):** This field contains the sub-nanosecond increment value, represented in nanoseconds multiplied by 2^8. This value is accumulated with the sub-nanoseconds field of the subsecond register. For example, when TSCTRLSSR field in the MAC_Timestamp_Control register is set. and if the required increment is 5.3ns, then SSINC should be 0x05 and SNSINC should be 0x4C.
7:0	0h RO	**Reserved**

3.2.302 MAC_SYSTEM_TIME_SECONDS — Offset B08h

The System Time Seconds register, along with System Time Nanoseconds register, indicates the current value of the system time maintained by the MAC. Though it is updated on a continuous basis, there is some delay from the actual time because of clock domain transfer latencies (from clk_ptp_ref_i to CSR clock).

Type	Size	Offset	Default
MMIO	32 bit	BAR + B08h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Timestamp Second (TSS):** The value in this field indicates the current value in seconds of the System Time maintained by the MAC.

3.2.303 MAC_SYSTEM_TIME_NANOSECONDS — Offset B0Ch

The System Time Nanoseconds register, along with System Time Seconds register, indicates the current value of the system time maintained by the MAC.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B0Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:0	00000000h RO	**Timestamp Sub Seconds (TSSS):** The value in this field has the sub-second representation of time, with an accuracy of 0.46 ns. When Bit 9 is set in MAC_Timestamp_Control, each bit represents 1 ns. The maximum value is 0x3B9A_C9FF after which it rolls-over to zero.

3.2.304 MAC_SYSTEM_TIME_SECONDS_UPDATE — Offset B10h

The System Time Seconds Update register, along with the System Time Nanoseconds Update register, initializes or updates the system time maintained by the MAC. You must write both registers before setting the TSINIT or TSUPDT bits in MAC_Timestamp_Control register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Timestamp Seconds (TSS):** The value in this field is the seconds part of the update. When ADDSUB is reset, this field must be programmed with the seconds part of the update value. When ADDSUB is set, this field must be programmed with the complement of the seconds part of the update value. For example, if 2.000000001 seconds need to be subtracted from the system time, the TSS field in the MAC_Timestamp_Seconds_Update register must be 0xFFFF_FFFE (that is, 2^32 - 2).

3.2.305 MAC_SYSTEM_TIME_NANOSECONDS_UPDATE — Offset B14h

MAC System Time Nanoseconds Update register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Add or Subtract Time (ADDSUB):** When this bit is set, the time value is subtracted with the contents of the update register. When this bit is reset, the time value is added with the contents of the update register. 0x0 (ADD): Add time. 0x1 (SUB): Subtract time.
30:0	00000000h RW	**Timestamp Sub Seconds (TSSS):** The value in this field is the sub-seconds part of the update. When ADDSUB is reset, this field must be programmed with the sub-seconds part of the update value, with an accuracy based on the TSCTRLSSR bit of the MAC_Timestamp_Control register. When ADDSUB is set, this field must be programmed with the complement of the sub-seconds part of the update value as described below. When TSCTRLSSR bit in MAC_Timestamp_Control is set, the programmed value must be 10^9 - <sub-second value>. When TSCTRLSSR bit in MAC_Timestamp_Control is reset, the programmed value must be 2^31 - <sub-second_value>. When the TSCTRLSSR bit is reset in the MAC_Timestamp_Control register, each bit represents an accuracy of 0.46 ns. When the TSCTRLSSR bit is set in the MAC_Timestamp_Control register, each bit represents 1 ns and the programmed value should not exceed 0x3B9A_C9FF. For example, if 2.000000001 seconds need to be subtracted from the system time, then the TSSS field in the MAC_Timestamp_Nanoseconds_Update register must be 0x7FFF_FFFF (that is, 2^31 - 1), when TSCTRLSSR bit in MAC_Timestamp_Control is reset and 0x3B9A_C9FF (that is, 10^9 - 1), when TSCTRLSSR bit in MAC_Timestamp_Control is set.

3.2.306 MAC_TIMESTAMP_ADDEND — Offset B18h

Timestamp Addend register. This register value is used only when the system time is configured for Fine Update mode (TSCFUPDT bit in the MAC_Timestamp_Control register). The content of this register is added to a 32-bit accumulator in every clock cycle (of clk_ptp_ref_i) and the system time is updated whenever the accumulator overflows.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Timestamp Addend Register (TSAR):** This field indicates the 32-bit time value to be added to the Accumulator register to achieve time synchronization.

3.2.307 MAC_SYSTEM_TIME_HIGHER_WORD_SECONDS — Offset B1Ch

System Time - Higher Word Seconds register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0000h RW	**Timestamp Higher Word Register (TSHWR):** This field contains the most-significant 16-bits of timestamp seconds value. This register is optional. You can add this register by selecting the Add IEEE 1588 Higher Word Register option. This register is directly written to initialize the value and it is incremented when there is an overflow from 32-bits of the System Time Seconds register. Access restriction applies. Updated based on the event. Setting 1 sets. Setting 0 clears.

3.2.308 MAC_TIMESTAMP_STATUS — Offset B20h

Timestamp Status register. All bits except Bits[27:25] gets cleared when the application reads this register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B20h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:25	00h RO	**Number of Auxiliary Timestamp Snapshots (ATSNS):** This field indicates the number of Snapshots available in the FIFO. A value equal to the selected depth of FIFO (4, 8, or 16) indicates that the Auxiliary Snapshot FIFO is full. These bits are cleared (to 00000) when the Auxiliary snapshot FIFO clear bit is set. This bit is valid only if the Add IEEE 1588 Auxiliary Snapshot option is selected.
24	0h RO	**Auxiliary Timestamp Snapshot Trigger Missed (ATSSTM):** This bit is set when the Auxiliary timestamp snapshot FIFO is full and external trigger was set. This indicates that the latest snapshot is not stored in the FIFO. This bit is valid only if the Add IEEE 1588 Auxiliary Snapshot option is selected. 0x0 (INACTIVE): Auxiliary Timestamp Snapshot Trigger Missed status not detected. 0x1 (ACTIVE): Auxiliary Timestamp Snapshot Trigger Missed status detected.
23:20	0h RO	**Reserved**
19:16	0h RO	**Auxiliary Timestamp Snapshot Trigger Identifier (ATSSTN):** These bits identify the Auxiliary trigger inputs for which the timestamp available in the Auxiliary Snapshot Register is applicable. When more than one bit is set at the same time, it means that corresponding auxiliary triggers were sampled at the same clock. These bits are applicable only if the number of Auxiliary snapshots is more than one. One bit is assigned for each trigger as shown in the following list: - Bit 16: Auxiliary trigger 0 - Bit 17: Auxiliary trigger 1 - Bit 18: Auxiliary trigger 2 - Bit 19: Auxiliary trigger 3 The software can read this register to find the triggers that are set when the timestamp is taken. Access restriction applies. Clears on read. Self-set to 1 on internal event.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Tx Timestamp Status Interrupt Status (TXTSSIS):** In non-EQOS_CORE configurations when drop transmit status is enabled in MTL, this bit is set when the captured transmit timestamp is updated in the MAC_Tx_Timestamp_Status_Nanoseconds and MAC_Tx_Timestamp_Status_Seconds registers. When PTP offload feature is enabled, this bit is set when the captured transmit timestamp is updated in the MAC_Tx_Timestamp_Status_Nanoseconds and MAC_Tx_Timestamp_Status_Seconds registers, for PTO generated Delay Request and Pdelay request packets. This bit is cleared when the MAC_Tx_Timestamp_Status_Seconds register is read (or write to MAC_Tx_Timestamp_Status_Seconds register when RCWE bit of MAC_CSR_SW_Ctrl register is set). 0x0 (INACTIVE): Tx Timestamp Status Interrupt status not detected. 0x1 (ACTIVE): Tx Timestamp Status Interrupt status detected.
14:6	0h RO	**Reserved**
5	0h RO	**Timestamp Target Time Error (TSTRGTERR1):** This bit is set when the latest target time programmed in the MAC_PPS1_Target_Time_Seconds and MAC_PPS1_Target_Time_Nanoseconds registers elapses. This bit is cleared when the application reads this bit. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): Timestamp Target Time Error status not detected. 0x1 (ACTIVE): Timestamp Target Time Error status detected.
4	0h RO	**Timestamp Target Time Reached for Target Time PPS1 (TSTARGT1):** When this bit is set and MCGREN1 of MAC_PPS_Control register is reset, it indicates that the value of system time is greater than or equal to the value specified in the MAC_PPS1_Target_Time_Seconds and MAC_PPS1_Target_Time_Nanoseconds registers. Access restriction applies. When this bit is set and MCGREN1 of MAC_PPS_Control register is set, it indicates that mcgr_dma_req_o[1] is asserted. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event.
3	0h RO	**Timestamp Target Time Error (TSTRGTERR0):** This bit is set when the latest target time programmed in the MAC_PPS0_Target_Time_Seconds and MAC_PPS0_Target_Time_Nanoseconds registers elapses. This bit is cleared when the application reads this bit. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): Timestamp Target Time Error status not detected. 0x1 (ACTIVE): Timestamp Target Time Error status detected.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RO	**Auxiliary Timestamp Trigger Snapshot (AUXTSTRIG):** This bit is set high when the auxiliary snapshot is written to the FIFO. This bit is valid only if the Add IEEE 1588 Auxiliary Snapshot option is selected. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): Auxiliary Timestamp Trigger Snapshot status not detected. 0x1 (ACTIVE): Auxiliary Timestamp Trigger Snapshot status detected.
1	0h RO	**Timestamp Target Time Reached (TSTARGT0):** When this bit is set and MCGREN0 of MAC_PPS_Control register is reset, it indicates that the value of system time is greater than or equal to the value specified in the MAC_PPS0_Target_Time_Seconds and MAC_PPS0_Target_Time_Nanoseconds registers. Access restriction applies. When this bit is set and MCGREN0 of MAC_PPS_Control register is set, it indicates that mcgr_dma_req_o[0] is asserted. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event.
0	0h RO	**Timestamp Seconds Overflow (TSSOVF):** When this bit is set, it indicates that the seconds value of the timestamp (when supporting version 2 format) has overflowed beyond 32'hFFFF_FFFF. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0x0 (INACTIVE): Timestamp Seconds Overflow status not detected. 0x1 (ACTIVE): Timestamp Seconds Overflow status detected.

3.2.309 MAC_TX_TIMESTAMP_STATUS_NANOSECONDS — Offset B30h

This register contains the nanosecond part of timestamp captured for Transmit packets when Tx status is disabled.

The MAC_Tx_Timestamp_Status_Nanoseconds register, along with MAC_Tx_Timestamp_Status_Seconds, gives the 64-bit timestamp captured for the PTP packet successfully transmitted by the MAC. This value is considered to be read by the application when the last byte (bits [31:24]) of MAC_Tx_Timestamp_Status_Nanoseconds is read.

If the application does not read these registers and timestamp of another packet is captured, then either the current timestamp is lost (overwritten) or the new timestamp is lost (dropped), depending on the setting of the TXTSSTSM bit of the MAC_Timestamp_Control register. The status bit TXTSC bit [15] in MAC_Timestamp_Status register is set whenever the MAC transmitter captures the timestamp.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Transmit Timestamp Status Missed (TXTSSMIS):** When this bit is set, it indicates one of the following: - The timestamp of the current packet is ignored if TXTSSTSM bit of the MAC_Timestamp_Control register is reset - The timestamp of the previous packet is overwritten with timestamp of the current packet if TXTSSTSM bit of the MAC_Timestamp_Control register is set. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Transmit Timestamp Status Missed status not detected. 0x1 (ACTIVE): Transmit Timestamp Status Missed status detected.
30:0	00000000h RO	**Transmit Timestamp Status Low (TXTSSLO):** This field contains the 31 bits of the Nanoseconds field of the Transmit packet's captured timestamp.

3.2.310 MAC_TX_TIMESTAMP_STATUS_SECONDS — Offset B34h

The register contains the higher 32 bits of the timestamp (in seconds) captured when a PTP packet is transmitted.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B34h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Transmit Timestamp Status High (TXTSSHI):** This field contains the lower 32 bits of the Seconds field of Transmit packet's captured timestamp.

3.2.311 MAC_AUXILIARY_CONTROL — Offset B40h

The Auxiliary Timestamp Control register controls the Auxiliary Timestamp snapshot.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B40h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5	0h RW	**Auxiliary Snapshot 1 Enable (ATSEN1):** This bit controls the capturing of Auxiliary Snapshot Trigger 1. When this bit is set, the auxiliary snapshot of the event on ptp_aux_trig_i[1] input is enabled. When this bit is reset, the events on this input are ignored. 0x0 (DISABLE): Auxiliary Snapshot $i is disabled. 0x1 (ENABLE): Auxiliary Snapshot $i is enabled.
4	0h RW	**Auxiliary Snapshot 0 Enable (ATSEN0):** This bit controls the capturing of Auxiliary Snapshot Trigger 0. When this bit is set, the auxiliary snapshot of the event on ptp_aux_trig_i[0] input is enabled. When this bit is reset, the events on this input are ignored. 0x0 (DISABLE): Auxiliary Snapshot $i is disabled. 0x1 (ENABLE): Auxiliary Snapshot $i is enabled.
3:1	0h RO	**Reserved**
0	0h RW	**Auxiliary Snapshot FIFO Clear (ATSFC):** When set, this bit resets the pointers of the Auxiliary Snapshot FIFO. This bit is cleared when the pointers are reset and the FIFO is empty. When this bit is high, the auxiliary snapshots are stored in the FIFO. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Auxiliary Snapshot FIFO Clear is disabled. 0x1 (ENABLE): Auxiliary Snapshot FIFO Clear is enabled.

3.2.312 MAC_AUXILIARY_TIMESTAMP_NANOSECONDS — Offset B48h

The Auxiliary Timestamp Nanoseconds register, along with MAC_Auxiliary_Timestamp_Seconds, gives the 64-bit timestamp stored as auxiliary snapshot. These two registers form the read port of a 64-bit wide FIFO with a depth of 4, 8, or 16 as selected while configuring the core.

You can store multiple snapshots in this FIFO. Bits[29:25] in MAC_Timestamp_Status indicate the fill-level of the FIFO. The top of the FIFO is removed only when the last byte (bits [31:24]) of MAC_Auxiliary_Timestamp_Seconds register is read.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B48h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:0	00000000h RO	**Auxiliary Timestamp (AUXTSLO):** Contains the lower 31 bits (nanoseconds field) of the auxiliary timestamp.

3.2.313 MAC_AUXILIARY_TIMESTAMP_SECONDS — Offset B4Ch

The Auxiliary Timestamp - Seconds register contains the lower 32 bits of the Seconds field of the auxiliary timestamp register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B4Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Auxiliary Timestamp (AUXTSHI):** Contains the lower 32 bits of the Seconds field of the auxiliary timestamp.

3.2.314 MAC_TIMESTAMP_INGRESS_ASYM_CORR — Offset B50h

The MAC Timestamp Ingress Asymmetry Correction register contains the Ingress Asymmetry Correction value to be used while updating correction field in PDelay_Resp PTP messages.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B50h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**One-Step Timestamp Ingress Asymmetry Correction (OSTIAC):** This field contains the ingress path asymmetry value to be added to correctionField of Pdelay_Resp PTP packet. The programmed value should be in units of nanoseconds and multiplied by 2^16. For example, 2.5 ns is represented as 0x00028000. The value can also be negative, which is represented in 2's complement form with bit 31 representing the sign bit.

3.2.315 MAC_TIMESTAMP_EGRESS_ASYM_CORR — Offset B54h

The MAC Timestamp Egress Asymmetry Correction register contains the Egress Asymmetry Correction value to be used while updating the correction field in PDelay_Req PTP messages.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B54h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**One-Step Timestamp Egress Asymmetry Correction (OSTEAC):** This field contains the egress path asymmetry value to be subtracted from correctionField of Pdelay_Resp PTP packet. The programmed value must be the negated value in units of nanoseconds multiplied by 2^16. For example, if the required correction is +2.5 ns, the programmed value must be 0xFFFD_8000, which is the 2's complement of 0x0002_8000(2.5 * 216). Similarly, if the required correction is -3.3 ns, the programmed value is 0x0003_4CCC (3.3 * 216).

3.2.316 MAC_TIMESTAMP_INGRESS_CORR_NANOSECOND — Offset B58h

This register contains the correction value in nanoseconds to be used with the captured timestamp value in the ingress path.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B58h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Timestamp Ingress Correction (TSIC):** This field contains the ingress path correction value as defined by the Ingress Correction expression.

3.2.317 MAC_TIMESTAMP_EGRESS_CORR_NANOSECOND — Offset B5Ch

This register contains the correction value in nanoseconds to be used with the captured timestamp value in the egress path.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B5Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Timestamp Egress Correction (TSEC):** This field contains the nanoseconds part of the egress path correction value as defined by the Egress Correction expression.

3.2.318 MAC_TIMESTAMP_INGRESS_CORR_SUBNANOSEC — Offset B60h

This register contains the sub-nanosecond part of the correction value to be used with the captured timestamp value, for ingress direction.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B60h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:8	00h RW	**Timestamp Ingress Correction, sub-nanoseconds (TSICSNS):** This field contains the sub-nanoseconds part of the ingress path correction value as defined by the "Ingress Correction" expression.
7:0	0h RO	**Reserved**

3.2.319 MAC_TIMESTAMP_EGRESS_CORR_SUBNANOSEC — Offset B64h

This register contains the sub-nanosecond part of the correction value to be used with the captured timestamp value, for egress direction.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B64h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:8	00h RW	**Timestamp Egress Correction, sub-nanoseconds (TSECSNS):** This field contains the sub-nanoseconds part of the egress path correction value as defined by the "Egress Correction" expression.
7:0	0h RO	**Reserved**

3.2.320 MAC_TIMESTAMP_INGRESS_LATENCY — Offset B68h

This register holds the Ingress MAC latency.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B68h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27:16	000h RO	**Ingress Timestamp Latency, in sub-nanoseconds (ITLNS):** This register holds the average latency in sub-nanoseconds between the input ports (phy_rxd_i) of MAC and the actual point (GMII/MII) where the ingress timestamp is taken.
15:8	00h RO	**Ingress Timestamp Latency, in nanoseconds (ITLSNS):** This register holds the average latency in nanoseconds between the input ports (phy_rxd_i) of MAC and the actual point (GMII/MII) where the ingress timestamp is taken.
7:0	0h RO	**Reserved**

3.2.321 MAC_TIMESTAMP_EGRESS_LATENCY — Offset B6Ch

This register holds the Egress MAC latency.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B6Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27:16	000h RO	**Egress Timestamp Latency, in nanoseconds (ETLNS):** This register holds the average latency in nanoseconds between the actual point (GMII/MII) where the egress timestamp is taken and the output ports (phy_txd_o) of the MAC.
15:8	00h RO	**Egress Timestamp Latency, in sub-nanoseconds (ETLSNS):** This register holds the average latency in sub-nanoseconds between the actual point (GMII/MII) where the egress timestamp is taken and the output ports (phy_txd_o) of the MAC.
7:0	0h RO	**Reserved**

3.2.322 MAC_PPS_CONTROL — Offset B70h

PPS Control register.

Bits[30:24] of this register are valid only when four Flexible PPS outputs are selected.
Bits[22:16] are valid only when three or more Flexible PPS outputs are selected.
Bits[14:8] are valid only when two or more Flexible PPS outputs are selected.
Bits[6:4] are valid only when Flexible PPS feature is selected.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B70h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**Time Select (TRGTMODSEL1):** When set, 64-bit PTP time is used to capture time at MCGR trigger[0] input. When reset, presentation time is used to capture time at trigger input, maintaining backward compatibility.
27:16	0h RO	**Reserved**
15	0h RW	**MCGR Mode Enable for PPS1 Output (MCGREN1):** This field enables the 1st PPS instance to operate in PPS or MCGR mode. When set it operates in MCGR mode and on reset it operates in PPS mode. 0x0 (DISABLE): 1st PPS instance is disabled to operate in PPS or MCGR mode. 0x1 (ENABLE): 1st PPS instance is enabled to operate in PPS or MCGR mode.
14:13	0h RW	**Target Time Register Mode for PPS1 Output (TIMESEL):** This field indicates the Target Time registers (MAC_PPS1_Target_Time_Seconds and MAC_PPS1_Target_Time_Nanoseconds) mode for PPS1 output signal. 0x0 (ONLY_INT): Target Time registers are programmed only for generating the interrupt event. The Flexible PPS function must not be enabled in this mode, otherwise spurious transitions may be observed on the corresponding Pulse Per Second (PPS) output signal. 0x1 (MCGR): Enables MCGR Interrupt whose status bit is indicated by TSTARGT1 (MAC_Timestamp_Status[4]). 0x2 (INT_ST): Target Time registers are programmed for generating the interrupt event and starting or stopping the PPS0 output signal generation. 0x3 (ONLY_ST): Target Time registers are programmed only for starting or stopping the PPS0 output signal generation. No interrupt is asserted.
12	0h RO	**Reserved**
11:8	0h RW	**Flexible PPS1 Output Control (PPSCMD1):** This field controls the flexible PPS1 output signal. This field is similar to the PPSCMD0 field. If MCGREN1 is set, then PPSCMD1 indicated by these 4 bits [11:8] are taken as Presentation Time Control bits for media clock generation and recovery for comparator instance 1. This field is similar to the PPSCMD0 Presentation Time Control bits. If MCGREN1 is not set then only 3 bits from [10:8] is used as PPSCMD1 and the 4th bit is to be set as 0. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.
7	0h RW	**MCGR Mode Enable for PPS0 Output (MCGREN0):** This field enables the 0th PPS instance to operate in PPS or MCGR mode. When set it operates in MCGR mode and on reset it operates in PPS mode. 0x0 (PPS): 0th PPS instance is enabled to operate in PPS mode. 0x1 (MCGR): 0th PPS instance is enabled to operate in MCGR mode.

Bit Range	Default & Access	Field Name (ID): Description
6:5	0h RW	**Target Time Register Mode for PPS0 Output (TRGTMODSEL0):** Target Time Register Mode for PPS0 Output This field indicates the Target Time registers (MAC_PPS0_Target_Time_Seconds and MAC_PPS0_Target_Time_Nanoseconds) mode for PPS0 output signal. 0x0 (ONLY_INT): Target Time registers are programmed only for generating the interrupt event. The Flexible PPS function must not be enabled in this mode, otherwise spurious transitions may be observed on the corresponding Pulse Per Second (PPS) output signal. 0x1 (MCGR): Enables MCGR Interrupt whose status bit is indicated by TSTARGT0 (MAC_Timestamp_Status[1]) 0x2 (INT_ST): Target Time registers are programmed for generating the interrupt event and starting or stopping the PPS0 output signal generation 0x3 (ONLY_ST): Target Time registers are programmed only for starting or stopping the PPS0 output signal generation. No interrupt is asserted.
4	0h RW	**Flexible PPS Output Mode Enable (PPSEN0):** When this bit is set, Bits[3:0] function as PPSCMD. When this bit is reset, Bits[3:0] function as PPSCTRL (Fixed PPS mode). 0x0 (DISABLE): Flexible PPS Output Mode is disabled. 0x1 (ENABLE): Flexible PPS Output Mode is enabled.

Bit Range	Default & Access	Field Name (ID): Description
3:0	0h RW	**PPS Output Frequency Control (PPSCTRL_PPSCMD):** This field controls the frequency of the PPS0 output signal. The default value of PPSCTRL is 0000, and the PPS output is 1 pulse (of width clk_ptp_i) every second. For other values of PPSCTRL, the PPS output becomes a generated clock of following frequencies: - 0001: The binary rollover is 2 Hz, and the digital rollover is 1 Hz. - 0010: The binary rollover is 4 Hz, and the digital rollover is 2 Hz. - 0011: The binary rollover is 8 Hz, and the digital rollover is 4 Hz. - 0100: The binary rollover is 16 Hz, and the digital rollover is 8 Hz. - .. - 1111: The binary rollover is 32.768 KHz and the digital rollover is 16.384 KHz. Note: In the binary rollover mode, the PPS output signal has a duty cycle of 50 percent with these frequencies. In the digital rollover mode, the PPS output frequency is an average number. The actual clock is of different frequency that gets synchronized every second. For example: - When PPSCTRL = 0001, the PPS (1 Hz) has a low period of 537 ms and a high period of 463 ms - When PPSCTRL = 0010, the PPS (2 Hz) is a sequence of One clock of 50 percent duty cycle and 537 ms period Second clock of 463 ms period (268 ms low and 195 ms high) - When PPSCTRL = 0011, the PPS (4 Hz) is a sequence of Three clocks of 50 percent duty cycle and 268 ms period Fourth clock of 195 ms period (134 ms low and 61 ms high) This behavior is because of the non-linear toggling of bits in the digital rollover mode in the MAC_System_Time_Nanoseconds register. or Flexible PPS Output Control Programming these bits with a non-zero value instructs the MAC to initiate an event. When the command is transferred or synchronized to the PTP clock domain, these bits get cleared automatically. The software should ensure that these bits are programmed only when they are 'all-zero'. The following list describes the values of PPSCMD0: - 0000: No Command - 0001: START Single Pulse This command generates single pulse rising at the start point defined in MAC_PPS0_Target_Time_Seconds and MAC_PPS0_Target_Time_Nanoseconds register and of a duration defined in the PPS0 Width Register. - 0010: START Pulse Train This command generates the train of pulses rising at the start point defined in the Target Time Registers and of a duration defined in the PPS0 Width Register and repeated at interval defined in the PPS Interval Register. By default, the PPS pulse train is free-running unless stopped by the 'Stop Pulse train at time' or 'Stop Pulse Train immediately' commands. - 0011: Cancel START This command cancels the START Single Pulse and START Pulse Train commands if the system time has not crossed the programmed start time. - 0100: STOP Pulse train at time This command stops the train of pulses initiated by the START Pulse Train command (PPSCMD = 0010) after the time programmed in the Target Time registers elapses. - 0101: STOP Pulse Train immediately This command immediately stops the train of pulses initiated by the START Pulse Train command (PPSCMD = 0010). - 110: Cancel STOP Pulse train This command cancels the STOP pulse train at time command if the programmed stop time has not elapsed. The PPS pulse train becomes free-running on the successful execution of this command. - 0111-1111: Reserved or Presentation Time Control If MCGREN0 is set then these bits are treated as Presentation time control bits. The following list describes the values of PPSCMD0: - 0000: MCGR operation is not carried out. If set to this value in the mid of clock recovery or generation, all the processing inputs are flushed - 0001: Capture the Presentation time at the rising edge of mcg_pst_trig_i[0] into the MAC_PPS0_Target_Time_Seconds register - 0010: Capture the Presentation time at the falling edge of mcg_pst_trig_i[0] into the MAC_PPS0_Target_Time_Seconds register - 0011: Capture the Presentation time at both edges of mcg_pst_trig_i[0] into the MAC_PPS0_Target_Time_Seconds register - 0100-1000: Reserved - 1001: Toggle output on compare - 1010: Pulse output low on compare for one PTP-clock cycle - 1011: Pulse output high on compare for one PTP-clock cycle - 1100-1111: Reserved

3.2.323 MAC_PPS0_TARGET_TIME_SECONDS — Offset B80h

The PPS Target Time Seconds register, along with PPS Target Time Nanoseconds register, is used to schedule an interrupt event [Bit 1 of MAC_Timestamp_Status] when the system time exceeds the value programmed in these registers.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B80h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**PPS Target Time Seconds Register (TSTRH0):** This field stores the time in seconds. When the timestamp value matches or exceeds both Target Timestamp registers, the MAC starts or stops the PPS signal output and generates an interrupt (if enabled) based on Target Time mode selected for the corresponding PPS output in the MAC_PPS_Control register. If DWC_EQOS_FLEXI_PPS_OUT_EN is enabled in the configuration and PTGE field of MAC_Timestamp_Control Register is set with Presentation time control set in recovery mode, then these bits indicate the TPT being programmed by the application and in generation mode it indicates the CPT generated at the sampled trigger.

3.2.324 MAC_PPS0_TARGET_TIME_NANOSECONDS — Offset B84h

PPS0 Target Time Nanoseconds register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B84h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**PPS Target Time Register Busy (TRGTBUSY0):** The MAC sets this bit when the PPSCMD0 field in the MAC_PPS_Control register is programmed to 010 or 011. Programming the PPSCMD0 field to 010 or 011 instructs the MAC to synchronize the Target Time Registers to the PTP clock domain. The MAC clears this bit after synchronizing the Target Time Registers to the PTP clock domain The application must not update the Target Time Registers when this bit is read as 1. Otherwise, the synchronization of the previous programmed time gets corrupted. 0x0 (INACTIVE): PPS Target Time Register Busy status is not detected. 0x1 (ACTIVE): PPS Target Time Register Busy is detected.
30:0	00000000h RW	**Target Time Low for PPS Register (TTSL0):** This register stores the time in (signed) nanoseconds. When the value of the timestamp matches the value in both Target Timestamp registers, the MAC starts or stops the PPS signal output and generates an interrupt (if enabled) based on the TRGTMODSEL0 field (Bits [6:5]) in MAC_PPS_Control. When the TSCTRLSSR bit is reset in the MAC_Timestamp_Control register, this value should be (time in ns / 0.465). The actual start or stop time of the PPS signal output might have an error margin up to one unit of sub-second increment value. When the TSCTRLSSR bit is set in the MAC_Timestamp_Control register, this value should not exceed 0x3B9A_C9FF. The actual start or stop time of the PPS signal output might have an error margin up to one unit of sub-second increment value. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.

3.2.325 MAC_PPS0_INTERVAL — Offset B88h

The PPS0 Interval register contains the number of units of sub-second increment value between the rising edges of PPS0 signal output.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B88h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**PPS Output Signal Interval (PPSINT0):** These bits store the interval between the rising edges of PPS0 signal output. The interval is stored in terms of number of units of sub-second increment value. You need to program one value less than the required interval. For example, if the PTP reference clock is 50 MHz (period of 20 ns), and desired interval between the rising edges of PPS0 signal output is 100 ns (that is, 5 units of sub-second increment value), you should program value 4 (5-1) in this register.

3.2.326 MAC_PPS0_WIDTH — Offset B8Ch

The PPS0 Width register contains the number of units of sub-second increment value between the rising and corresponding falling edges of PPS0 signal output.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B8Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**PPS Output Signal Width (PPSWIDTH0):** These bits store the width between the rising edge and corresponding falling edge of PPS0 signal output. The width is stored in terms of number of units of sub-second increment value. You need to program one value less than the required interval. For example, if PTP reference clock is 50 MHz (period of 20 ns), and width between the rising and corresponding falling edges of PPS0 signal output is 80 ns (that is, four units of sub-second increment value), you should program value 3 (4-1) in this register. Note: The value programmed in this register must be lesser than the value programmed in MAC_PPS0_Interval.

3.2.327 MAC_PPS1_TARGET_TIME_SECONDS — Offset B90h

The PPS Target Time Seconds register, along with PPS Target Time Nanoseconds register, is used to schedule an interrupt event [Bit 1 of MAC_Timestamp_Status] when the system time exceeds the value programmed in these registers.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B90h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**PPS Target Time Seconds Register (TSTRH1):** This field stores the time in seconds. When the timestamp value matches or exceeds both Target Timestamp registers, the MAC starts or stops the PPS signal output and generates an interrupt (if enabled) based on Target Time mode selected for the corresponding PPS output in the MAC_PPS_Control register. If DWC_EQOS_FLEXI_PPS_OUT_EN is enabled in the configuration and PTGE field of MAC_Timestamp_Control Register is set with Presentation time control set in recovery mode, then these bits indicate the TPT being programmed by the application and in generation mode it indicates the CPT generated at the sampled trigger.

3.2.328 MAC_PPS1_TARGET_TIME_NANOSECONDS — Offset B94h

PPS0 Target Time Nanoseconds register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B94h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**PPS Target Time Register Busy (TRGTBUSY1):** The MAC sets this bit when the PPSCMD0 field in the MAC_PPS_Control register is programmed to 010 or 011. Programming the PPSCMD0 field to 010 or 011 instructs the MAC to synchronize the Target Time Registers to the PTP clock domain. The MAC clears this bit after synchronizing the Target Time Registers to the PTP clock domain The application must not update the Target Time Registers when this bit is read as 1. Otherwise, the synchronization of the previous programmed time gets corrupted. 0x0 (INACTIVE): PPS Target Time Register Busy status is not detected. 0x1 (ACTIVE): PPS Target Time Register Busy is detected.
30:0	00000000h RW	**Target Time Low for PPS Register (TTSL1):** This register stores the time in (signed) nanoseconds. When the value of the timestamp matches the value in both Target Timestamp registers, the MAC starts or stops the PPS signal output and generates an interrupt (if enabled) based on the TRGTMODSEL0 field (Bits [6:5]) in MAC_PPS_Control. When the TSCTRLSSR bit is reset in the MAC_Timestamp_Control register, this value should be (time in ns / 0.465). The actual start or stop time of the PPS signal output might have an error margin up to one unit of sub-second increment value. When the TSCTRLSSR bit is set in the MAC_Timestamp_Control register, this value should not exceed 0x3B9A_C9FF. The actual start or stop time of the PPS signal output might have an error margin up to one unit of sub-second increment value. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.

3.2.329 MAC_PPS1_INTERVAL — Offset B98h

The PPS0 Interval register contains the number of units of sub-second increment value between the rising edges of PPS0 signal output.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**PPS Output Signal Interval (PPSINT1):** These bits store the interval between the rising edges of PPS0 signal output. The interval is stored in terms of number of units of sub-second increment value. You need to program one value less than the required interval. For example, if the PTP reference clock is 50 MHz (period of 20 ns), and desired interval between the rising edges of PPS0 signal output is 100 ns (that is, 5 units of sub-second increment value), you should program value 4 (5-1) in this register.

3.2.330 MAC_PPS1_WIDTH — Offset B9Ch

The PPS0 Width register contains the number of units of sub-second increment value between the rising and corresponding falling edges of PPS0 signal output.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**PPS Output Signal Width (PPSWIDTH1):** These bits store the width between the rising edge and corresponding falling edge of PPS0 signal output. The width is stored in terms of number of units of sub-second increment value. You need to program one value less than the required interval. For example, if PTP reference clock is 50 MHz (period of 20 ns), and width between the rising and corresponding falling edges of PPS0 signal output is 80 ns (that is, four units of sub-second increment value), you should program value 3 (4-1) in this register. Note: The value programmed in this register must be lesser than the value programmed in MAC_PPS0_Interval.

3.2.331 MAC_PTO_CONTROL — Offset BC0h

This register controls the PTP Offload Engine operation. This register is available only when the Enable PTP Timestamp Offload feature is selected.

Type	Size	Offset	Default
MMIO	32 bit	BAR + BC0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:8	00h RW	**Domain Number (DN):** This field indicates the domain Number in which the PTP node is operating.
7	0h RW	**Disable Peer Delay Response response generation (PDRDIS):** When this bit is set, the Peer Delay Response (Pdelay_Resp) response is not be generated for received Peer Delay Request (Pdelay_Req) request packet, as required by the programmed mode. Note: Setting this bit to 1 affects the normal PTP Offload operation and the time synchronization. So, this bit must be set only if there is problem with Pdelay_Resp generation in Hardware and/or Pdelay_Resp generation is handled by Software. 0x0 (ENABLE): Peer Delay Response response generation is enabled. 0x1 (DISABLE): Peer Delay Response response generation is disabled.
6	0h RW	**Disable PTO Delay Request/Response response generation (DRRDIS):** When this bit is set, the Delay Request and Delay response is not generated for received SYNC and Delay request packet respectively, as required by the programmed mode. 0x0 (ENABLE): PTO Delay Request/Response response generation is enabled. 0x1 (DISABLE): PTO Delay Request/Response response generation is disabled.
5	0h RW	**Automatic PTP Pdelay_Req message Trigger (APDREQTRIG):** When this bit is set, one PTP Pdelay_Req message is transmitted. This bit is automatically cleared after the PTP Pdelay_Req message is transmitted. The application should set the APDREQEN bit for this operation. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Automatic PTP Pdelay_Req message Trigger is disabled. 0x1 (ENABLE): Automatic PTP Pdelay_Req message Trigger is enabled.
4	0h RW	**Automatic PTP SYNC message Trigger (ASYNCTRIG):** When this bit is set, one PTP SYNC message is transmitted. This bit is automatically cleared after the PTP SYNC message is transmitted. The application should set the ASYNCEN bit for this operation. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Automatic PTP SYNC message Trigger is disabled. 0x1 (ENABLE): Automatic PTP SYNC message Trigger is enabled.
3	0h RO	**Reserved**
2	0h RW	**Automatic PTP Pdelay_Req message Enable (APDREQEN):** When this bit is set, PTP Pdelay_Req message is generated periodically based on interval programmed or trigger from application, when the MAC is programmed to be in Peer-to-Peer Transparent mode. 0x0 (DISABLE): Automatic PTP Pdelay_Req message is disabled. 0x1 (ENABLE): Automatic PTP Pdelay_Req message is enabled.
1	0h RW	**Automatic PTP SYNC message Enable (ASYNCEN):** When this bit is set, PTP SYNC message is generated periodically based on interval programmed or trigger from application, when the MAC is programmed to be in Clock Master mode. 0x0 (DISABLE): Automatic PTP SYNC message is disabled. 0x1 (ENABLE): Automatic PTP SYNC message is enabled.
0	0h RW	**PTP Offload Enable (PTOEN):** When this bit is set, the PTP Offload feature is enabled. 0x0 (DISABLE): PTP Offload feature is disabled. 0x1 (ENABLE): PTP Offload feature is enabled.

3.2.332 MAC_SOURCE_PORT_IDENTITY0 — Offset BC4h

This register contains Bits[31:0] of the 80-bit Source Port Identity of the PTP node. This register is available only when the Enable PTP Timestamp Offload feature is selected.

Type	Size	Offset	Default
MMIO	32 bit	BAR + BC4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Source Port Identity 0 (SPI0):** This field indicates bits [31:0] of sourcePortIdentity of PTP node.

3.2.333 MAC_SOURCE_PORT_IDENTITY1 — Offset BC8h

This register contains Bits[63:32] of the 80-bit Source Port Identity of the PTP node. This register is available only when the Enable PTP Timestamp Offload feature is selected.

Type	Size	Offset	Default
MMIO	32 bit	BAR + BC8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Source Port Identity 1 (SPI1):** This field indicates bits [63:32] of sourcePortIdentity of PTP node.

3.2.334 MAC_SOURCE_PORT_IDENTITY2 — Offset BCCh

This register contains Bits[79:64] of the 80-bit Source Port Identity of the PTP node. This register is available only when the Enable PTP Timestamp Offload feature is selected.

Type	Size	Offset	Default
MMIO	32 bit	BAR + BCCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0000h RW	**Source Port Identity 2 (SPI2):** This field indicates bits [79:64] of sourcePortIdentity of PTP node.

3.2.335 MAC_LOG_MESSAGE_INTERVAL — Offset BD0h

This register contains the periodic intervals for automatic PTP packet generation. This register is available only when the Enable PTP Timestamp Offload feature is selected.

Type	Size	Offset	Default
MMIO	32 bit	BAR + BD0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RW	**Log Min Pdelay_Req Interval (LMPDRI):** This field indicates logMinPdelayReqInterval of PTP node. This is used to schedule the periodic Pdelay request packet transmission. Allowed values are -15 to 15.Negative value must be represented in 2's-complement form. For example, if the required value is -1, the value programmed must be 0xFF.
23:11	0h RO	**Reserved**
10:8	0h RW	**DRSYNCR:** Delay_Req to SYNC Ratio In Slave mode, it is used for controlling frequency of Delay_Req messages transmitted. - 0: DelayReq generated for every received SYNC - 1: DelayReq generated every alternate reception of SYNC - 2: for every 4 SYNC messages - 3: for every 8 SYNC messages - 4: for every 16 SYNC messages - 5: for every 32 SYNC messages - 6-7: Reserved The master sends this information (logMinDelayReqInterval) in the DelayResp PTP messages to the slave. The GbE Controller Receiver processes this value from the received DelayResp messages and updates this field accordingly. In the Slave mode, the host must not write/update this register unless it has to override the received value. In Master mode, the sum of this field and logSyncInterval (LSI) field is provided in the logMinDelayReqInterval field of the generated multicast Delay_Resp PTP message. Access restriction applies. Updated based on the event. Setting 1 sets. Setting 0 clears. 0x0 (SYNC1): DelayReq generated for every received SYNC. 0x1 (SYNC2): DelayReq generated every alternate reception of SYNC. 0x2 (SYNC4): for every 4 SYNC messages. 0x3 (SYNC8): for every 8 SYNC messages. 0x4 (SYNC16): for every 16 SYNC messages. 0x5 (SYNC32): for every 32 SYNC messages. 0x6 (RSVD): Reserved.
7:0	00h RW	**LSI:** Log Sync Interval This field indicates the periodicity of the automatically generated SYNC message when the PTP node is Master. Allowed values are -15 to 15. Negative value must be represented in 2's-complement form. For example, if the required value is -1, the value programmed must be 0xFF.

3.2.336 MTL_OPERATION_MODE — Offset C00h

The Operation Mode register establishes the Transmit and Receive operating modes and commands.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C00h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW	**Flexible Rx parser Enable (FRPE):** When this bit is set to 1, the Programmable Rx Parser functionality is enabled. When the Rx parser is disabled and if the Rx parser is in the middle of the parsing then it gets disabled only after completing the current packet parsing. When the Rx parser is enabled from disabled state then the Rx parser gets activated for the next immediate packet. 0x0 (DISABLE): Flexible Rx parser is disabled. 0x1 (ENABLE): Flexible Rx parser is enabled.
14	0h RW	**RxParser Software Error/Incomplete Parsing Packet Drop Enable (RXPED):** When set to 0, packets encountering software programming errors (NPE/NVE/frame offset overflow errors) or incomplete parsing are forwarded to application with the corresponding RxParser status. When set to 1, backward compatibility is maintained where all above mentioned packets are dropped (when RA is not set). 0x0 (DISABLE): Flexible Rx parser, packet drop in case software error is disabled. 0x1 (ENABLE): Flexible Rx parser, packet drop in case software error is enabled.
13:10	0h RO	**Reserved**
9	0h RW	**Counters Reset (CNTCLR):** When this bit is set, all counters are reset. This bit is cleared automatically after 1 clock cycle. If this bit is set along with CNT_PRESET bit, CNT_PRESET has precedence. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Counters are not reset. 0x1 (ENABLE): All counters are reset.
8	0h RW	**Counters Preset (CNTPRST):** When this bit is set, - MTL_TxQ[0-7]_Underflow register is initialized/preset to 12'h7F0. - Missed Packet and Overflow Packet counters in MTL_RxQ[0-7]_Missed_Packet_Overflow_Cnt register is initialized/preset to 12'h7F0. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Counters Preset is disabled. 0x1 (ENABLE): Counters Preset is enabled.
7	0h RO	**Reserved**
6:5	0h RW	**Tx Scheduling Algorithm (SCHALG):** This field indicates the algorithm for Tx scheduling: 0x0 (WRR): WRR algorithm. 0x1 (WFQ): WFQ algorithm when DCB feature is selected.Otherwise, Reserved. 0x2 (DWRR): DWRR algorithm when DCB feature is selected.Otherwise, Reserved. 0x3 (SP): Strict priority algorithm.
4:3	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Receive Arbitration Algorithm (RAA):** This field is used to select the arbitration algorithm for the Rx side. - 0: Strict priority (SP) Queue 0 has the lowest priority and the last queue has the highest priority. - 1: Weighted Strict Priority (WSP) 0x0 (SP): Strict priority (SP). 0x1 (WSP): Weighted Strict Priority (WSP).
1	0h RW	**Drop Transmit Status (DTXSTS):** When this bit is set, the Tx packet status received from the MAC is dropped in the MTL. When this bit is reset, the Tx packet status received from the MAC is forwarded to the application. 0x0 (DISABLE): Drop Transmit Status is disabled. 0x1 (ENABLE): Drop Transmit Status is enabled.
0	0h RO	**Reserved**

3.2.337 MTL_DBG_CTL — Offset C08h

The FIFO Debug Access Control and Status register controls the operation mode of FIFO debug access.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C08h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	**Reserved**
18:17	0h RW	**ECC Inject Error Control for Tx, Rx and TSO memories (EIEC):** When EIEE bit of this register is set, following are the errors inserted based on the value encoded in this field. 0x0 (M_1BIT): Insert 1 bit error. 0x1 (M_2BIT): Insert 2 bit errors. 0x2 (M_3BIT): Insert 3 bit errors. 0x3 (M_1BIT_ADDR): Insert 1 bit error in address field.
16	0h RW	**ECC Inject Error Enable for Tx, Rx and TSO memories (EIEE):** When set, enables the ECC error injection feature. When reset, disables the ECC error injection feature. 0x0 (DISABLE): ECC Inject Error for Tx, Rx and TSO memories is disabled. 0x1 (ENABLE): ECC Inject Error for Tx, Rx and TSO memories is enabled.
15	0h RW	**Transmit Status Available Interrupt Status Enable (STSIE):** When this bit is set, an interrupt is generated when Transmit status is available in slave mode. 0x0 (DISABLE): Transmit Packet Available Interrupt Status is disabled. 0x1 (ENABLE): Transmit Packet Available Interrupt Status is enabled.
14	0h RW	**Receive Packet Available Interrupt Status Enable (PKTIE):** When this bit is set, an interrupt is generated when EOP of received packet is written to the Rx FIFO. 0x0 (DISABLE): Receive Packet Available Interrupt Status is disabled. 0x1 (ENABLE): Receive Packet Available Interrupt Status is enabled.

Bit Range	Default & Access	Field Name (ID): Description
13:12	0h RW	**FIFO Selected for Access (FIFOSEL):** This field indicates the FIFO selected for debug access: 0x0 (TXFIFO): Tx FIFO. 0x1 (TXSTSFIFO): Tx Status FIFO (only read access when SLVMOD is set). 0x2 (TSOFIFO): TSO FIFO (cannot be accessed when SLVMOD is set). 0x3 (RXFIFO): Rx FIFO.
11	0h RW	**FIFO Write Enable (FIFOWREN):** When this bit is set, it enables the Write operation on selected FIFO when FIFO Debug Access is enabled. This bit must not be written to 1 when FIFO Debug Access is not enabled, that is FDBGEN bit is 0. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets. 0x0 (DISABLE): FIFO Write is disabled. 0x1 (ENABLE): FIFO Write is enabled.
10	0h RW	**FIFO Read Enable (FIFORDEN):** When this bit is set, it enables the Read operation on selected FIFO when FIFO Debug Access is enabled. This bit must not be written to 1 when FIFO Debug Access is not enabled, that is FDBGEN bit is 0. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets. 0x0 (DISABLE): FIFO Read is disabled. 0x1 (ENABLE): FIFO Read is enabled.
9	0h RW	**Reset Pointers of Selected FIFO (RSTSEL):** When this bit is set, the pointers of the currently-selected FIFO are reset when FIFO Debug Access is enabled. This bit must not be written to 1 when FIFO Debug Access is not enabled, that is FDBGEN bit is 0. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets. 0x0 (DISABLE): Reset Pointers of Selected FIFO is disabled. 0x1 (ENABLE): Reset Pointers of Selected FIFO is enabled.
8	0h RW	**Reset All Pointers (RSTALL):** When this bit is set, the pointers of all FIFOs are reset when FIFO Debug Access is enabled. This bit must not be written to 1 when FIFO Debug Access is not enabled, that is FDBGEN bit is 0. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets. 0x0 (DISABLE): Reset All Pointers is disabled. 0x1 (ENABLE): Reset All Pointers is enabled.
7	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
6:5	0h RW	**Encoded Packet State (PKTSTATE):** This field is used to write the control information to the Tx FIFO or Rx FIFO. Tx FIFO: - 00: Packet Data - 01: Control Word - 10: SOP Data - 11: EOP Data Rx FIFO: - 00: Packet Data - 01: Normal Status - 10: Last Status - 11: EOP 0x0 (PKT_DATA): Packet Data. 0x1 (CW_NS): Control Word/Normal Status. 0x2 (SOP_LS): SOP Data/Last Status. 0x3 (EOP): EOP Data/EOP.
4	0h RO	**Reserved**
3:2	0h RW	**Byte Enables (BYTEEN):** This field indicates the number of data bytes valid in the data register during Write operation. This is valid only when PKTSTATE is 2'b10 (EOP) and Tx FIFO or Rx FIFO is selected. 0x0 (B0_VAL): Byte 0 valid. 0x1 (B01_VAL): Byte 0 and Byte 1 are valid. 0x2 (B012_VAL): Byte 0, Byte 1, and Byte 2 are valid. 0x3 (B0123_VAL): All four bytes are valid.
1	0h RW	**Debug Mode Access to FIFO (DBGMOD):** When this bit is set, it indicates that the current access to the FIFO is read, write, and debug access. In this mode, the following access types are allowed: - Read and Write access to Tx FIFO, TSO FIFO, and Rx FIFO - Read access is allowed to Tx Status FIFO. When this bit is reset, it indicates that the current access to the FIFO is slave access bypassing the DMA. In this mode, the following access are allowed: - Write access to the Tx FIFO - Read access to the Rx FIFO and Tx Status FIFO 0x0 (DISABLE): Debug Mode Access to FIFO is disabled. 0x1 (ENABLE): Debug Mode Access to FIFO is enabled.
0	0h RW	**FIFO Debug Access Enable (FDBGEN):** When this bit is set, it indicates that the debug mode access to the FIFO is enabled. When this bit is reset, it indicates that the FIFO can be accessed only through a master interface. 0x0 (DISABLE): FIFO Debug Access is disabled. 0x1 (ENABLE): FIFO Debug Access is enabled.

3.2.338 MTL_DBG_STS — Offset C0Ch

The FIFO Debug Status register contains the status of FIFO debug access.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C0Ch	00000018h

Bit Range	Default & Access	Field Name (ID): Description
31:15	00000h RO	**Remaining Locations in the FIFO (LOCR):** Slave Access Mode: This field indicates the space available in selected FIFO. Debug Access Mode: This field contains the Write or Read pointer value of the selected FIFO during Write or Read operation, respectively.
14:10	0h RO	**Reserved**
9	0h RW	**Transmit Status Available Interrupt Status (STSI):** When set, this bit indicates that the Slave mode Tx packet is transmitted, and the status is available in Tx Status FIFO. This bit is reset when 1 is written to this bit. 0x0 (INACTIVE): Transmit Status Available Interrupt Status not detected. 0x1 (ACTIVE): Transmit Status Available Interrupt Status detected.
8	0h RW	**Receive Packet Available Interrupt Status (PKTI):** When set, this bit indicates that MAC layer has written the EOP of received packet to the Rx FIFO. This bit is reset when 1 is written to this bit. 0x0 (INACTIVE): Receive Packet Available Interrupt Status not detected. 0x1 (ACTIVE): Receive Packet Available Interrupt Status detected.
7:5	0h RO	**Reserved**
4:3	3h RO	**Byte Enables (BYTEEN):** This field indicates the number of data bytes valid in the data register during Read operation. This is valid only when PKTSTATE is 2'b10 (EOP) and Tx FIFO or Rx FIFO is selected. 0x0 (B0_VAL): Byte 0 valid. 0x1 (B01_VAL): Byte 0 and Byte 1 are valid. 0x2 (B012_VAL): Byte 0, Byte 1, and Byte 2 are valid. 0x3 (B0123_VAL): All four bytes are valid.
2:1	0h RO	**Encoded Packet State (PKTSTATE):** This field is used to get the control or status information of the selected FIFO. Tx FIFO: - 00: Packet Data - 01: Control Word - 10: SOP Data - 11: EOP Data Rx FIFO: - 00: Packet Data - 01: Normal Status - 10: Last Status - 11: EOP This field is applicable only for Tx FIFO and Rx FIFO during Read operation. 0x0 (PKT_DATA): Packet Data. 0x1 (CW_NS): Control Word/Normal Status. 0x2 (SOP_LS): SOP Data/Last Status. 0x3 (EOP): EOP Data/EOP.
0	0h RO	**FIFO Busy (FIFOBUSY):** When set, this bit indicates that a FIFO operation is in progress in the MAC and content of the following fields is not valid: - All other fields of this register - All fields of the MTL_FIFO_Debug_Data register 0x0 (INACTIVE): FIFO Busy not detected. 0x1 (ACTIVE): FIFO Busy detected.

3.2.339 MTL_FIFO_DEBUG_DATA — Offset C10h

The FIFO Debug Data register contains the data to be written to or read from the FIFOs.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**FIFO Debug Data (FDBGDATA):** During debug or slave access write operation, this field contains the data to be written to the Tx FIFO, Rx FIFO, or TSO FIFO. During debug or slave access read operation, this field contains the data read from the Tx FIFO, Rx FIFO, TSO FIFO, or Tx Status FIFO.

3.2.340 MTL_INTERRUPT_STATUS — Offset C20h

The software driver (application) reads this register during interrupt service routine or polling to determine the interrupt status of MTL queues and the MAC.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C20h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	0h RO	**MTL Rx Parser Interrupt Status (MTLPIS):** This bit indicates that there is an interrupt from Rx Parser Block. To reset this bit, the application must read the MTL_ Rxp_Interrupt_Status register to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): MTL Rx Parser Interrupt status not detected. 0x1 (ACTIVE): MTL Rx Parser Interrupt status detected.
22:19	0h RO	**Reserved**
18	0h RO	**EST (TAS- 802.1Qbv) Interrupt Status (ESTIS):** This bit indicates an interrupt event during the operation of 802.1Qbv. To reset this bit, the application must clear the error/event that has caused the Interrupt. 0x0 (INACTIVE): EST (TAS- 802.1Qbv) Interrupt status not detected. 0x1 (ACTIVE): EST (TAS- 802.1Qbv) Interrupt status detected.
17	0h RO	**Debug Interrupt status (DBGIS):** This bit indicates an interrupt event during the slave access. To reset this bit, the application must read the FIFO Debug Access Status register to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): Debug Interrupt status not detected. 0x1 (ACTIVE): Debug Interrupt status detected.
16:8	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Queue 7 Interrupt status (Q7IS):** This bit indicates that there is an interrupt from Queue 7. To reset this bit, the application must read the MTL_Q7_Interrupt_Control_Status Status register to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): Queue 7 Interrupt status not detected. 0x1 (ACTIVE): Queue 7 Interrupt status detected.
6	0h RO	**Queue 6 Interrupt status (Q6IS):** This bit indicates that there is an interrupt from Queue 6. To reset this bit, the application must read the MTL_Q6_Interrupt_Control_Status register to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): Queue 6 Interrupt status not detected. 0x1 (ACTIVE): Queue 6 Interrupt status detected.
5	0h RO	**Queue 5 Interrupt status (Q5IS):** This bit indicates that there is an interrupt from Queue 5. To reset this bit, the application must read the MTL_Q5_Interrupt_Control_Status register to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): Queue 5 Interrupt status not detected. 0x1 (ACTIVE): Queue 5 Interrupt status detected.
4	0h RO	**Queue 4 Interrupt status (Q4IS):** This bit indicates that there is an interrupt from Queue 4. To reset this bit, the application must read the MTL_Q4_Interrupt_Control_Status register to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): Queue 4 Interrupt status not detected. 0x1 (ACTIVE): Queue 4 Interrupt status detected.
3	0h RO	**Queue 3 Interrupt status (Q3IS):** This bit indicates that there is an interrupt from Queue 3. To reset this bit, the application must read the MTL_Q3_Interrupt_Control_Status register to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): Queue 3 Interrupt status not detected. 0x1 (ACTIVE): Queue 3 Interrupt status detected.
2	0h RO	**Queue 2 Interrupt status (Q2IS):** This bit indicates that there is an interrupt from Queue 2. To reset this bit, the application must read the MTL_Q2_Interrupt_Control_Status register to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): Queue 2 Interrupt status not detected. 0x1 (ACTIVE): Queue 2 Interrupt status detected.
1	0h RO	**Queue 1 Interrupt status (Q1IS):** This bit indicates that there is an interrupt from Queue 1. To reset this bit, the application must read the MTL_Q1_Interrupt_Control_Status register to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): Queue 1 Interrupt status not detected. 0x1 (ACTIVE): Queue 1 Interrupt status detected.
0	0h RO	**Queue 0 Interrupt status (Q0IS):** This bit indicates that there is an interrupt from Queue 0. To reset this bit, the application must read Queue 0 Interrupt Control and Status register to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): Queue 0 Interrupt status not detected. 0x1 (ACTIVE): Queue 0 Interrupt status detected.

3.2.341 MTL_RXQ_DMA_MAP0 — Offset C30h

The Receive Queue and DMA Channel Mapping 0 register is reserved in EQOS-CORE and EQOS-MTL configurations.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**Queue 3 Enabled for Dynamic (per packet) DMA Channel Selection (Q3DDMACH):** When set, this bit indicates that the packets received in Queue 3 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 3 are routed to the DMA Channel programmed in the Q3MDMACH field (Bits[26:24]). 0x0 (DISABLE): Queue 3 disabled for DA-based DMA Channel Selection. 0x1 (ENABLE): Queue 3 enabled for DA-based DMA Channel Selection.
27	0h RO	**Reserved**
26:24	0h RW	**Queue 3 Mapped to DMA Channel (Q3MDMACH):** This field controls the routing of the received packet in Queue 3 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: DMA Channel 5 - 110: DMA Channel 6 - 111: DMA Channel 7 This field is valid when the Q3DDMACH field is reset. Note: The width of this field depends on the number of RX DMA channels and not all the values might be valid in some configurations. For example, if the number of RX DMA channels selected is 2, only 000 and 001 are valid, the others are reserved
23:21	0h RO	**Reserved**
20	0h RW	**Queue 2 Enabled for DA-based DMA Channel Selection (Q2DDMACH):** When set, this bit indicates that the packets received in Queue 2 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 2 are routed to the DMA Channel programmed in the Q2MDMACH field (Bits[18:16]). 0x0 (DISABLE): Queue 2 disabled for DA-based DMA Channel Selection. 0x1 (ENABLE): Queue 2 enabled for DA-based DMA Channel Selection.
19	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
18:16	0h RW	**Queue 2 Mapped to DMA Channel (Q2MDMACH):** This field controls the routing of the received packet in Queue 2 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: DMA Channel 5 - 110: DMA Channel 6 - 111: DMA Channel 7 This field is valid when the Q2DDMACH field is reset.
15:13	0h RO	**Reserved**
12	0h RW	**Queue 1 Enabled for DA-based DMA Channel Selection (Q1DDMACH):** When set, this bit indicates that the packets received in Queue 1 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 1 are routed to the DMA Channel programmed in the Q1MDMACH field (Bits[10:8]). 0x0 (DISABLE): Queue 1 disabled for DA-based DMA Channel Selection. 0x1 (ENABLE): Queue 1 enabled for DA-based DMA Channel Selection.
11	0h RO	**Reserved**
10:8	0h RW	**Queue 1 Mapped to DMA Channel (Q1MDMACH):** This field controls the routing of the received packet in Queue 1 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: DMA Channel 5 - 110: DMA Channel 6 - 111: DMA Channel 7 This field is valid when the Q1DDMACH field is reset. The width of this field depends on the number of RX DMA channels and not all the values might be valid in some configurations. For example, if the number of RX DMA channels selected is 2, only 000 and 001 are valid, the other bits are reserved.
7:5	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	**Queue 0 Enabled for DA-based DMA Channel Selection (Q0DDMACH):** When set, this bit indicates that the packets received in Queue 0 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 0 are routed to the DMA Channel programmed in the Q0MDMACH field. 0x0 (DISABLE): Queue 0 disabled for DA-based DMA Channel Selection. 0x1 (ENABLE): Queue 0 enabled for DA-based DMA Channel Selection.
3	0h RO	**Reserved**
2:0	0h RW	**Queue 0 Mapped to DMA Channel (Q0MDMACH):** This field controls the routing of the packet received in Queue 0 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: DMA Channel 5 - 110: DMA Channel 6 - 111: DMA Channel 7 This field is valid when the Q0DDMACH field is reset. The width of this field depends on the number of RX DMA channels and not all the values might be valid in some configurations. For example, if the number of RX DMA channels selected is 2, only 000 and 001 are valid, the other bits are reserved.

3.2.342 MTL_RXQ_DMA_MAP1 — Offset C34h

The Receive Queue and DMA Channel Mapping 1 register is reserved in EQOS-CORE and EQOS-MTL configurations.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C34h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**Queue 7 Enabled for DA-based DMA Channel Selection (Q7DDMACH):** When set, this bit indicates that the packets received in Queue 7 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 7 are routed to the DMA Channel programmed in the Q7MDMACH field. 0x0 (DISABLE): Queue 5 disabled for DA-based DMA Channel Selection. 0x1 (ENABLE): Queue 5 enabled for DA-based DMA Channel Selection.
27	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
26:24	0h RW	**Queue 7 Mapped to DMA Channel (Q7MDMACH):** This field controls the routing of the packet received in Queue 7 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: DMA Channel 5 - 110: DMA Channel 6 - 111: DMA Channel 7 This field is valid when the Q7DDMACH field is reset. The width of this field depends on the number of RX DMA channels and not all the values might be valid in some configurations. For example, if the number of RX DMA channels selected is 2, only 000 and 001 are valid, the other bits are reserved.
23:21	0h RO	**Reserved**
20	0h RW	**Queue 6 Enabled for DA-based DMA Channel Selection (Q6DDMACH):** When set, this bit indicates that the packets received in Queue 6 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 6 are routed to the DMA Channel programmed in the Q6MDMACH field. 0x0 (DISABLE): Queue 6 disabled for DA-based DMA Channel Selection. 0x1 (ENABLE): Queue 6 enabled for DA-based DMA Channel Selection.
19	0h RO	**Reserved**
18:16	0h RW	**Queue 6 Mapped to DMA Channel (Q6MDMACH):** This field controls the routing of the packet received in Queue 6 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: DMA Channel 5 - 110: DMA Channel 6 - 111: DMA Channel 7 This field is valid when the Q6DDMACH field is reset. The width of this field depends on the number of RX DMA channels and not all the values might be valid in some configurations. For example, if the number of RX DMA channels selected is 2, only 000 and 001 are valid, the other bits are reserved.
15:13	0h RO	**Reserved**
12	0h RW	**Queue 5 Enabled for DA-based DMA Channel Selection (Q5DDMACH):** When set, this bit indicates that the packets received in Queue 5 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 5 are routed to the DMA Channel programmed in the Q5MDMACH field. 0x0 (DISABLE): Queue 5 disabled for DA-based DMA Channel Selection. 0x1 (ENABLE): Queue 5 enabled for DA-based DMA Channel Selection.
11	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
10:8	0h RW	**Queue 5 Mapped to DMA Channel (Q5MDMACH):** This field controls the routing of the packets received in Queue 5 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: DMA Channel 5 - 110: DMA Channel 6 - 111: DMA Channel 7 This field is valid when the Q5DDMACH field is reset. The width of this field depends on the number of RX DMA channels and not all the values might be valid in some configurations. For example, if the number of RX DMA channels selected is 2, only 000 and 001 are valid, the other bits are reserved.
7:5	0h RO	**Reserved**
4	0h RW	**Queue 4 Enabled for DA-based DMA Channel Selection (Q4DDMACH):** When set, this bit indicates that the packets received in Queue 4 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 4 are routed to the DMA Channel programmed in the Q4MDMACH field. 0x0 (DISABLE): Queue 4 disabled for DA-based DMA Channel Selection. 0x1 (ENABLE): Queue 4 enabled for DA-based DMA Channel Selection.
3	0h RO	**Reserved**
2:0	0h RW	**Queue 4 Mapped to DMA Channel (Q4MDMACH):** This field controls the routing of the packet received in Queue 4 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: DMA Channel 5 - 110: DMA Channel 6 - 111: DMA Channel 7 This field is valid when the Q4DDMACH field is reset. The width of this field depends on the number of RX DMA channels and not all the values might be valid in some configurations. For example, if the number of RX DMA channels selected is 2, only 000 and 001 are valid, the other bits are reserved.

3.2.343 MTL_TBS_CTRL — Offset C40h

This register controls the operation of Time Based Scheduling.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C40h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RW	**Launch Expiry Offset (LEOS):** The value in units of 256 nanoseconds that has to be added to the Launch time to compute the Launch Expiry time. Value valid only when LEOV is set. Max value: 999,999,999 ns, additionally should be smaller than CTR-1 value when ESTM mode is set since this value is a modulo CTR value.
7	0h RO	**Reserved**
6:4	0h RW	**Launch Expiry GSN Offset (LEGOS):** The number GSN slots that has to be added to the Launch GSN to compute the Launch Expiry time. Value valid only when LEOV is set.
3:2	0h RO	**Reserved**
1	0h RW	**Launch Expiry Offset Valid (LEOV):** When set indicates the LEOS field is valid. When not set, indicates the Launch Expiry Offset is not valid and the MTL must not check for Launch expiry time. 0x0 (INVALID): LEOS field is invalid. 0x1 (VALID): LEOS field is valid.
0	0h RW	**EST offset Mode (ESTM):** When this bit is set, the Launch Time value used in Time Based Scheduling is interpreted as an EST offset value and is added to the Base Time Register (BTR) of the current list. When reset, the Launch Time value is used as an absolute value that should be compared with the System time [39:8]. 0x0 (DISABLE): EST offset Mode is disabled. 0x1 (ENABLE): EST offset Mode is enabled.

3.2.344 MTL_EST_CONTROL — Offset C50h

This register controls the operation of Enhancements to Scheduled Transmission (IEEE802.1Qbv).

Type	Size	Offset	Default
MMIO	32 bit	BAR + C50h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RW	**PTP Time Offset Value (PTOV):** The value of PTP Clock period multiplied by 6 in nanoseconds. This value is needed to avoid transmission overruns at the beginning of the installation of a new GCL.
23:12	000h RW	**Current Time Offset Value (CTOV):** Provides a 12 bit time offset value in nano second that is added to the current time to compensate for all the implementation pipeline delays such as the CDC sync delay, buffering delays, data path delays etc. This offset helps to ensure that the impact of gate controls is visible on the line exactly at the pre-determined schedule (or as close to the schedule as possible).
11	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
10:8	0h RW	**Time Interval Left Shift Amount (TILS):** This field provides the left shift amount for the programmed Time Interval values used in the Gate Control Lists. - 000: No left shift needed (equal to x1ns) - 001: Left shift TI by 1 bit (equal to x2ns) - 010: Left shift TI by 2 bits (equal to x4ns) - . - . - 100: Left shift TI by 7 bits (equal to x128ns) Based on the configuration one or more bits of this field should be treated as Reserved/Read-Only.
7:6	0h RW	**Loop Count to report Scheduling Error (LCSE):** Programmable number of GCL list iterations before reporting an HLBS error defined in EST_Status register. 0x0 (M_4_ITERNS): 4 iterations. 0x1 (M_8_ITERNS): 8 iterations. 0x2 (M_16_ITERNS): 16 iterations. 0x3 (M_32_ITERNS): 32 iterations.
5	0h RW	**Drop Frames causing Scheduling Error (DFBS):** When set frames reported to cause HOL Blocking due to not getting scheduled (HLBS field of EST_Status register) after 4,8,16,32 (based on LCSE field of this register) GCL iterations are dropped. 0x0 (DONT_DROP): Do not Drop Frames causing Scheduling Error. 0x1 (DROP): Drop Frames causing Scheduling Error.
4	0h RW	**Do not Drop frames during Frame Size Error (DDBF):** When set, frames are not be dropped during Head-of-Line blocking due to Frame Size Error (HLBF field of EST_Status register). 0x0 (DROP): Drop frames during Frame Size Error. 0x1 (DONT_DROP): Do not Drop frames during Frame Size Error.
3:2	0h RO	**Reserved**
1	0h RW	**Switch to S/W owned list (SSWL):** When set indicates that the software has programmed that list that it currently owns (SWOL) and the hardware should switch to the new list based on the new BTR. Hardware clears this bit when the switch to the SWOL happens to indicate the completion of the switch or when an BTR error (BTRE in Status register) is set. When BTRE is set this bit is cleared but SWOL is not updated as the switch was not successful. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Switch to S/W owned list is disabled. 0x1 (ENABLE): Switch to S/W owned list is enabled.
0	0h RW	**Enable EST (EEST):** When reset, the gate control list processing is halted and all gates are assumed to be in Open state. Should be set for the hardware to start processing the gate control lists. During the toggle from 0 to 1, the gate control list processing starts only after the SSWL bit it set. If any uncorrectable error is detected in the EST memory the hardware resets this bit and disables the EST function. 0x0 (DISABLE): EST is disabled. 0x1 (ENABLE): EST is enabled.

3.2.345 MTL_EST_STATUS — Offset C58h

This register provides Status related to Enhancements to Scheduled Transmission (IEEE802.1Qbv).

Type	Size	Offset	Default
MMIO	32 bit	BAR + C58h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19:16	0h RO	**Current GCL Slot Number (CGSN):** Indicates the slot number of the GCL list. Slot number is a modulo 16 count of the GCL List loops executed so far. Even if a new GCL list is installed, the count is incremental.
15:8	00h RO	**BTR Error Loop Count (BTRL):** Provides the minimum count (N) for which the equation Current Time =< New BTR + (N * New Cycle Time) becomes true. N = "11111111" indicates the iterations exceeded the value of 128 and the hardware was not able to update New BTR to be equal to or greater than Current Time. Software intervention is needed to update the New BTR. Value cleared when BTRE field of this register is cleared.
7	0h RO	**S/W owned list (SWOL):** When '0' indicates Gate control list number "0" is owned by software and when "1" indicates the Gate Control list "1" is owned by the software. Any reads/writes by the software (using indirect access via GCL_Control) is directed to the list indicated by this value by default. The inverse of this value is treated as HWOL. R/W operations performed by hardware are directed to the list pointed by HWOL by default. 0x0 (INACTIVE): Gate control list number "0" is owned by software. 0x1 (ACTIVE): Gate control list number "1" is owned by software.
6:5	0h RO	**Reserved**
4	0h RW	**Constant Gate Control Error (CGCE):** This error occurs when the list length (LLR) is 1 and the Cycle Time (CTR) is less than or equal to the programmed Time Interval (TI) value after the optional Left Shifting. The above programming implies Gates are either always Closed or always Open based on the Gate Control values; the same effect can be achieved by other simpler (non TSN) programming mechanisms. Since the implementation does not support such a programming an error is reported. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Constant Gate Control Error not detected. 0x1 (ACTIVE): Constant Gate Control Error detected.
3	0h RO	**Head-Of-Line Blocking due to Scheduling (HLBS):** Set when the frame is not able to win arbitration and get scheduled even after 4 iterations of the GCL. Indicates to software a potential programming error. The one hot encoded values of the Queue Numbers that are not able to make progress are indicated in the MTL_EST_Sch_Error register. Bit cleared when MTL_EST_Sch_Error register is all zeros. 0x0 (INACTIVE): Head-Of-Line Blocking due to Scheduling not detected. 0x1 (ACTIVE): Head-Of-Line Blocking due to Scheduling detected.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RO	**Head-Of-Line Blocking due to Frame Size (HLBF):** Set when HOL Blocking is noticed on one or more Queues as a result of none of the Time Intervals of gate open in the GCL being greater than or equal to the duration needed for frame size (or frame fragment size when preemption is enabled) transmission. The one hot encoded Queue numbers that are experiencing HLBF are indicated in the MTL_EST_Frm_Size_Error register. Additionally, the first Queue number that experienced HLBF along with the frame size is captured in MTL_EST_Frm_Size_Capture register. Bit cleared when MTL_EST_Frame_Size_ Error register is all zeros. 0x0 (INACTIVE): Head-Of-Line Blocking due to Frame Size not detected. 0x1 (ACTIVE): Head-Of-Line Blocking due to Frame Size detected.
1	0h RW	**BTR Error (BTRE):** When "1" indicates a programming error in the BTR of SWOL where the programmed value is less than current time. If the BTRL = "11111111", SWOL is not updated and Software should reprogram the BTR to a value greater than current time and then set SSWL to reinitiate the switch to SWOL. Else if the value of BTRL < "11111111", SWOL is updated and this field indicates the number of iterations (of + CycleTime) taken by hardware to update the BTR to a value greater than Current Time. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): BTR Error not detected. 0x1 (ACTIVE): BTR Error detected.
0	0h RW	**Switch to S/W owned list Complete (SWLC):** When "1" indicates the hardware has successfully switched to the SWOL, and the SWOL bit has been updated to that effect. Cleared when the SSWL of EST_Control register transitions from 0 to 1, or on a software write. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Switch to S/W owned list Complete not detected. 0x1 (ACTIVE): Switch to S/W owned list Complete detected.

3.2.346 MTL_EST_SCH_ERROR — Offset C60h

This register provides the One Hot encoded Queue Numbers that are having the Scheduling related error (timeout).

Type	Size	Offset	Default
MMIO	32 bit	BAR + C60h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Schedule Error Queue Number (SEQN):** The One Hot Encoded Queue Numbers that have experienced error/timeout described in HLBS field of status register. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect.

3.2.347 MTL_EST_FRM_SIZE_ERROR — Offset C64h

This register provides the One Hot encoded Queue Numbers that are having the Frame Size related error.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C64h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Frame Size Error Queue Number (FEQN):** The One Hot Encoded Queue Numbers that have experienced error described in HLBF field of status register. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect.

3.2.348 MTL_EST_FRM_SIZE_CAPTURE — Offset C68h

This register captures the Frame Size and Queue Number of the first occurrence of the Frame Size related error. Up on clearing it captures the data of immediate next occurrence of a similar error.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C68h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	**Reserved**
18:16	0h RO	**Queue Number of HLBF (HBFQ):** Captures the binary value of the of the first Queue (number) experiencing HLBF error (see HLBF field of status register). Value once written is not altered by any subsequent queue errors of similar nature. Once cleared the queue number of the next occurring HLBF error is captured. Width is based on the number of Tx Queues configured; remaining bits are Read-Only. Cleared when MTL_EST_Frm_Size_Error register is all zeros.
15	0h RO	**Reserved**
14:0	0000h RO	**Frame Size of HLBF (HBFS):** Captures the Frame Size of the dropped frame related to queue number indicated in HBFQ field of this register. Contents of this register should be considered invalid, if this field is zero. Cleared when MTL_EST_Frm_Size_Error register is all zeros.

3.2.349 MTL_EST_INTR_ENABLE — Offset C70h

This register implements the Interrupt Enable bits for the various events that generate an interrupt. Bit positions have a 1 to 1 correlation with the status bit positions in MTL_ETS_Status register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C70h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4	0h RW	**Interrupt Enable for CGCE (CGCE):** When set, generates interrupt when the Constant Gate Control Error occurs and is indicated in the status. When reset this event does not generate an interrupt 0x0 (DISABLE): Interrupt for CGCE is disabled. 0x1 (ENABLE): Interrupt for CGCE is enabled.
3	0h RW	**Interrupt Enable for HLBS (IEHS):** When set, generates interrupt when the Head-of-Line Blocking due to Scheduling issue and is indicated in the status. When reset this event does not generate an interrupt. 0x0 (DISABLE): Interrupt for HLBS is disabled. 0x1 (ENABLE): Interrupt for HLBS is enabled.
2	0h RW	**Interrupt Enable for HLBF (IEHF):** When set, generates interrupt when the Head-of-Line Blocking due to Frame Size error occurs and is indicated in the status. When reset this event does not generate an interrupt. 0x0 (DISABLE): Interrupt for HLBF is disabled. 0x1 (ENABLE): Interrupt for HLBF is enabled.
1	0h RW	**Interrupt Enable for BTR Error (IEBE):** When set, generates interrupt when the BTR Error occurs and is indicated in the status. When reset this event does not generate an interrupt. 0x0 (DISABLE): Interrupt for BTR Error is disabled. 0x1 (ENABLE): Interrupt for BTR Error is enabled.
0	0h RW	**Interrupt Enable for Switch List (IECC):** When set, generates interrupt when the configuration change is successful and the hardware has switched to the new list. When reset this event does not generate an interrupt. 0x0 (DISABLE): Interrupt for Switch List is disabled. 0x1 (ENABLE): Interrupt for Switch List is enabled.

3.2.350 MTL_EST_GCL_CONTROL — Offset C80h

This register provides the control information for reading/writing to the Gate Control lists.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C80h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:22	0h RW	**ECC Inject Error Control for EST Memory (ESTEIEC):** When EIEE bit of this register is set, following are the errors inserted based on the value encoded in this field. 0x0 (M_1BIT): Insert 1 bit error. 0x1 (M_2BIT): Insert 2 bit errors. 0x2 (M_3BIT): Insert 3 bit errors. 0x3 (M_1BIT_ADDR): Insert 1 bit error in address field.
21	0h RW	**EST ECC Inject Error Enable (ESTEIEE):** When set along with EEST bit of MTL_EST_Control register, enables the ECC error injection feature. When reset, disables the ECC error injection feature. 0x0 (DISABLE): EST ECC Inject Error is disabled. 0x1 (ENABLE): EST ECC Inject Error is enabled.
20:17	0h RO	**Reserved**
16:8	000h RW	**Gate Control List Address: (GCLA when GCRR is "0"). (ADDR):** Provides the address (row number) of the Gate Control List at which the R/W operation has to be performed. By default the Gate Control List pointed by SWOL of MTL_EST_Status is selected for R/W, however if the DBGM bit of this register is set, a debug mode access is given to R/W from DBGB. Gate Control list Related Registers Address: (GCRA when GCRR is "1"). By default the GCL related register set pointed by SWOL of MTL_EST_Status is selected for R/W, however if the DBGM bit of this register is set, a debug mode access is given to R/W from DBGB. Lower 3 bits are only used in this mode, higher order bits are treated as dont cares. - 000: BTR Low (31:0) - 001: BTR High (63:31) - 010: CTR Low (31:0) - 011: CTR High (39:32) - 100: TER (31:0) - 101: LLR (n:0) (where n is (log{512} / log2)) - Others: Reserved
7:6	0h RO	**Reserved**
5	0h RW	**Debug Mode Bank Select (DBGB):** When set to "0" indicates R/W in debug mode should be directed to Bank 0 (GCL0 and corresponding Time related registers). When set to "1" indicates R/W in debug mode should be directed to Bank 1 (GCL1 and corresponding Time related registers). This value is used when DBGM is set and overrides by value of SWOL which is normally used. 0x0 (BANK0): R/W in debug mode should be directed to Bank 0. 0x1 (BANK1): R/W in debug mode should be directed to Bank 1.
4	0h RW	**Debug Mode (DBGM):** When set to "1" indicates R/W in debug mode where the memory bank (for GCL and Time related registers) is explicitly provided by DBGB value, when set to "0" SWOL bit is used to determine which bank to use. 0x0 (DISABLE): Debug Mode is disabled. 0x1 (ENABLE): Debug Mode is enabled.
3	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Gate Control Related Registers (GCRR):** When set to "1" indicates the R/W access is for the GCL related registers (BTR, CTR, TER, LLR) whose address is provided by GCRA. When "0" indicates R/W should be directed to GCL from the address provided by GCLA. 0x0 (DISABLE): Gate Control Related Registers are disabled. 0x1 (ENABLE): Gate Control Related Registers are enabled.
1	0h RW	**Read '1', Write '0': (R1W0):** When set to '1': Read Operation When set to '0': Write Operation. 0x0 (WRITE): Write Operation. 0x1 (READ): Read Operation.
0	0h RW	**Start Read/Write Op (SRWO):** When set indicates a Read/Write Op has started and is in progress. When reset by hardware indicates the R/W Op has completed or an error has occurred (when bit 20 is set) Reads: Data can be read from MTL_EST_GCL_Data register after this bit is reset Writes: MTL_EST_GCL_Data should be programmed with write data before setting SRWO. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Start Read/Write Op disabled. 0x1 (ENABLE): Start Read/Write Op enabled.

3.2.351 MTL_EST_GCL_DATA — Offset C84h

This register holds the read data or write data in case of reads and writes respectively.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C84h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Gate Control Data (GCD):** The data corresponding to the address selected in the GCL_Control register. Used for both Read and Write operations.

3.2.352 MTL_FPE_CTRL_STS — Offset C90h

This register controls the operation of, and provides status for Frame Preemption (IEEE802.1Qbu/802.3br).

Type	Size	Offset	Default
MMIO	32 bit	BAR + C90h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RO	**HRS:** Hold/Release Status - 1: Indicates a Set-and-Hold-MAC operation was last executed and the pMAC is in Hold State. - 0: Indicates a Set-and-Release-MAC operation was last executed and the pMAC is in Release State. 0x0 (SET_REL): Indicates a Set-and-Release-MAC operation was last executed and the pMAC is in Release State. 0x1 (SET_HOLD): Indicates a Set-and-Hold-MAC operation was last executed and the pMAC is in Hold State.
27:16	0h RO	**Reserved**
15:8	00h RW	**Preemption Classification (PEC):** When set indicates the corresponding Queue must be classified as preemptable, when '0' Queue is classified as express. When both EST (Qbv) and Preemption are enabled, Queue-0 is always assumed to be preemptable. When EST (Qbv) is enabled Queues categorized as preemptable here are always assumed to be in "Open" state in the Gate Control List.
7:2	0h RO	**Reserved**
1:0	0h RW	**Additional Fragment Size (AFSZ):** used to indicate, in units of 64 bytes, the minimum number of bytes over 64 bytes required in non-final fragments of preempted frames. The minimum non-final fragment size is (AFSZ +1) * 64 bytes

3.2.353 MTL_FPE_ADVANCE — Offset C94h

This register holds the Hold and Release Advance time.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C94h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**Release Advance (RADV):** The maximum time in nanoseconds that can elapse between issuing a RELEASE to the MAC and the MAC being ready to resume transmission of preemptable frames, in the absence of there being any express frames available for transmission.
15:0	0000h RW	**Hold Advance (HADV):** The maximum time in nanoseconds that can elapse between issuing a HOLD to the MAC and the MAC ceasing to transmit any preemptable frame that is in the process of transmission or any preemptable frames that are queued for transmission.

3.2.354 MTL_RXP_CONTROL_STATUS — Offset CA0h

The MTL_RXP_Control_Status register establishes the operating mode of Rx Parser and provides some status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + CA0h	80FF00FFh

Bit Range	Default & Access	Field Name (ID): Description
31	1h RO	**RX Parser in Idle state (RXPI):** This status bit is set to 1 when the Rx parser is in Idle State and waiting for a new packet for processing. This bit is used as a handshake with software when parser gets disables. After disabling, when bit is set then software can update the Rx parser instruction table. 0x0 (INACTIVE): RX Parser not in Idle state. 0x1 (ACTIVE): RX Parser in Idle state.
30:24	0h RO	**Reserved**
23:16	FFh RW	**Number of parsable entries in the Instruction table (NPE):** This control indicates the number of parsable entries in the Instruction Memory. This is used in Rx parser logic to detect programming Error. In case number of parsed entries for a packet is more than this entry then NPEOVIS bit in the MTL_RXP_Interrupt_Control_Status register is set.
15:8	0h RO	**Reserved**
7:0	FFh RW	**Number of valid entry address/index in the Instruction table (NVE):** This control indicates the number of valid entries address/index in the Instruction Memory (i.e. when NVE field in register=31, the maximum valid entry address is NVE+1 i.e. addresses/indices=0 to 32, or 33 entries). This is used in Rx parser logic to detect any programming Error. In case while parsing Table address (memory address) found to be more than this maximum valid entry address then NVEOVIS bit in the MTL_RXP_Interrupt_Control_Status register is set. Note: The minimum value of this should be 2.

3.2.355 MTL_RXP_INTERRUPT_CONTROL_STATUS — Offset CA4h

The MTL_RXP_Interrupt_Control_Status registers provides enable control for the interrupts and provides interrupt status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + CA4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19	0h RW	**Packet Drop due to RF Interrupt Enable (PDRFIE):** When this bit is set, the PDRFIS interrupt is enabled. When this bit is reset, the PDRFIS interrupt is disabled. 0x0 (DISABLE): Packet Drop due to RF Interrupt is disabled. 0x1 (ENABLE): Packet Drop due to RF Interrupt is enabled.
18	0h RW	**Frame Offset Overflow Interrupt Enable (FOOVIE):** When this bit is set, the FOOVIS interrupt is enabled. When this bit is reset, the FOOVIS interrupt is disabled. 0x0 (DISABLE): Frame Offset Overflow Interrupt is disabled. 0x1 (ENABLE): Frame Offset Overflow Interrupt is enabled.
17	0h RW	**Number of Parsable Entries Overflow Interrupt Enable (NPEOVIE):** When this bit is set, the NPEOVIS interrupt is enabled. When this bit is reset, the NPEOVIS interrupt is disabled. 0x0 (DISABLE): Number of Parsable Entries Overflow Interrupt is disabled. 0x1 (ENABLE): Number of Parsable Entries Overflow Interrupt is enabled.
16	0h RW	**Number of Valid Entries Overflow Interrupt Enable (NVEOVIE):** When this bit is set, the NVEOVIS interrupt is enabled. When this bit is reset, the NVEOVIS interrupt is disabled. 0x0 (DISABLE): Number of Valid Entries Overflow Interrupt is disabled. 0x1 (ENABLE): Number of Valid Entries Overflow Interrupt is enabled.
15:4	0h RO	**Reserved**
3	0h RW	**Packet Dropped due to RF Interrupt Status (PDRFIS):** If the Rx Parser result says to drop the packet by setting RF=1 in the instruction memory, then this bit is set to 1. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Packet Dropped due to RF Interrupt Status not detected. 0x1 (ACTIVE): Packet Dropped due to RF Interrupt Status detected.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Frame Offset Overflow Interrupt Status (FOOVIS):** While parsing if the Instruction table entry's 'Frame Offset' found to be more than EOF offset, then then this bit is set. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Frame Offset Overflow Interrupt Status not detected. 0x1 (ACTIVE): Frame Offset Overflow Interrupt Status detected.
1	0h RW	**Number of Parsable Entries Overflow Interrupt Status (NPEOVIS):** While parsing a packet if the number of parsed entries found to be more than NPE[] (Number of Parseable Entries in MTL_RXP_Control register),then this bit is set to 1. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Number of Parsable Entries Overflow Interrupt Status not detected. 0x1 (ACTIVE): Number of Parsable Entries Overflow Interrupt Status detected.
0	0h RW	**Number of Valid Entry Address/Index Overflow Interrupt Status (NVEOVIS):** While parsing if the Instruction address found to be more than NVE (Number of Valid Entry Address/index in MTL_RXP_Control register), then this bit is set to 1. For example, when NVE field in register=31, the maximum valid entry address/index is NVE+1 i.e. 32 (addresses/indices=0 to 32, or 33 entries), so NVEOVIS is set when currently processed entry indicates next address is 33 or more i.e. 34th or later entries. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Number of Valid Entries Overflow Interrupt Status not detected. 0x1 (ACTIVE): Number of Valid Entries Overflow Interrupt Status detected.

3.2.356 MTL_RXP_DROP_CNT — Offset CA8h

The MTL_RXP_Drop_Cnt register provides the drop count of Rx Parser initiated drops.

Type	Size	Offset	Default
MMIO	32 bit	BAR + CA8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Rx Parser Drop Counter Overflow Bit (RXPDCOVF):** When set, this bit indicates that the MTL_RXP_Drop_cnt (RXPDC) Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Rx Parser Drop count overflow not occurred. 0x1 (ACTIVE): Rx Parser Drop count overflow occurred.
30:0	00000000h RO	**Rx Parser Drop count (RXPDC):** This 31-bit counter is implemented whenever a Rx Parser Drops a packet due to RF =1. The counter is cleared when the register is read.

3.2.357 MTL_RXP_ERROR_CNT — Offset CAChh

The MTL_RXP_Error_Cnt register provides the Rx Parser related error occurrence count.

Type	Size	Offset	Default
MMIO	32 bit	BAR + CACh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Rx Parser Error Counter Overflow Bit (RXPECOVF):** When set, this bit indicates that the MTL_RXP_Error_cnt (RXPEC) Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Rx Parser Error count overflow not occurred. 0x1 (ACTIVE): Rx Parser Error count overflow occurred.
30:0	00000000h RO	**Rx Parser Error count (RXPEC):** This 31-bit counter is implemented whenever a Rx Parser encounters following Error scenarios - Entry address >= NVE[] - Number Parsed Entries >= NPE[] - Entry address > EOF data entry address The counter is cleared when the register is read.

3.2.358 MTL_RXP_INDIRECT_ACC_CONTROL_STATUS — Offset CB0h

The MTL_RXP_Indirect_Acc_Control_Status register provides the Indirect Access control and status for Rx Parser memory.

Type	Size	Offset	Default
MMIO	32 bit	BAR + CB0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**FRP Instruction Table Access Busy (STARTBUSY):** When this bit is set to 1 by the software then it indicates to start the Read/Write operation from/to the Rx Parser Memory. Software should read this bit as 0 before issuing read or write request to access the Parser Memory Instructions. This bit when set to 1 indicates that hardware is busy until its gets cleared by hardware and software should not issue any read or write operation. 0x0 (INACTIVE): hardware not busy. 0x1 (ACTIVE): hardware is busy (Read/Write operation from/to the Rx Parser Memory).
30:23	0h RO	**Reserved**
22:21	0h RW	**ECC Inject Error Control for Rx Parser Memory (RXPEIEC):** When EIEE bit of this register is set, following are the errors inserted based on the value encoded in this field. 0x0 (M_1BIT): Insert 1 bit error. 0x1 (M_2BIT): Insert 2 bit errors. 0x2 (M_3BIT): Insert 3 bit errors. 0x3 (M_1BIT_ADDR): Insert 1 bit error in address field.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**ECC Inject Error Enable for Rx Parser Memory (RXPEIEE):** When set, enables the ECC error injection feature. When reset, disables the ECC error injection feature. 0x0 (DISABLE): ECC Inject Error for Rx Parser Memory is disabled. 0x1 (ENABLE): ECC Inject Error for Rx Parser Memory is enabled.
19:17	0h RO	**Reserved**
16	0h RW	**Read Write Control (WRRDN):** When this bit is set to 1 indicates the write operation to the Rx Parser Memory. When this bit is set to 0 indicates the read operation to the Rx Parser Memory. 0x0 (READ): Read operation to the Rx Parser Memory. 0x1 (WRITE): Write operation to the Rx Parser Memory.
15:10	0h RO	**Reserved**
9:0	000h RW	**FRP Instruction Table Offset Address (ADDR):** This field indicates the ADDR of the 32-bit entry in Rx parser instruction table. Each entry has 128-bit (4x32-bit words). There are 256 FRP entries. This must be written by the software before issuing any Read/Write command. The hardware does not support auto-increment of ADDR.

3.2.359 MTL_RXP_INDIRECT_ACC_DATA — Offset CB4h

The MTL_RXP_Indirect_Acc_Data registers holds the data associated to Indirect Access to Rx Parser memory.

Type	Size	Offset	Default
MMIO	32 bit	BAR + CB4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**FRP Instruction Table Write/Read Data (DATA):** Software should write this register before issuing any write command. The hardware provides the read data from the Rx Parser Memory for read operation when STARTBUSY =0 after read command.

3.2.360 MTL_ECC_CONTROL — Offset CC0h

The MTL_ECC_Control register establishes the operating mode of ECC related to MTL memories.

Type	Size	Offset	Default
MMIO	32 bit	BAR + CC0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved**
8	0h RW	**MTL ECC Error Address Status Over-ride (MEEAO):** When set, the following error address fields hold the last valid address where the error is detected. When reset, the following error address fields hold the first address where the error is detected. EUEAS/ECEAS of MTL_ECC_Err_Addr_Status register. 0x0 (DISABLE): MTL ECC Error Address Status Over-ride is disabled. 0x1 (ENABLE): MTL ECC Error Address Status Over-ride is enabled.
7:5	0h RO	**Reserved**
4	0h RW	**TSO memory ECC Enable (TSOEE):** When set to 1, enables the ECC feature for TSO memory in DMA. When set to zero, disables the ECC feature for TSO memory in DMA. 0x0 (DISABLE): TSO memory ECC is disabled. 0x1 (ENABLE): TSO memory ECC is enabled.
3	0h RW	**MTL Rx Parser ECC Enable (MRXPEE):** When set to 1, enables the ECC feature for Rx Parser memory. When set to zero, disables the ECC feature for Rx Parser memory. 0x0 (DISABLE): MTL Rx Parser ECC is disabled. 0x1 (ENABLE): MTL Rx Parser ECC is enabled.
2	0h RW	**MTL EST ECC Enable (MESTEE):** When set to 1, enables the ECC feature for EST memory. When set to zero, disables the ECC feature for EST memory. 0x0 (DISABLE): MTL EST ECC is disabled. 0x1 (ENABLE): MTL EST ECC is enabled.
1	0h RW	**MTL Rx FIFO ECC Enable (MRXEE):** When set to 1, enables the ECC feature for MTL Rx FIFO memory. When set to zero, disables the ECC feature for MTL Rx FIFO memory. 0x0 (DISABLE): MTL Rx FIFO ECC is disabled. 0x1 (ENABLE): MTL Rx FIFO ECC is enabled.
0	0h RW	**MTL Tx FIFO ECC Enable (MTXEE):** When set to 1, enables the ECC feature for MTL Tx FIFO memory. When set to zero, disables the ECC feature for MTL Tx FIFO memory. 0x0 (DISABLE): MTL Tx FIFO ECC is disabled. 0x1 (ENABLE): MTL Tx FIFO ECC is enabled.

3.2.361 MTL_SAFETY_INTERRUPT_STATUS — Offset CC4h

The MTL_Safety_Interrupt_Status registers provides Safety interrupt status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + CC4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1	0h RO	**MTL ECC Uncorrectable error Interrupt Status (MEUIS):** This bit indicates that an uncorrectable error interrupt event in the MTL ECC safety feature. To get the exact cause of the interrupt the application should read the MTL_ECC_Interrupt_Status register. 0x0 (INACTIVE): MTL ECC Uncorrectable error Interrupt Status not detected. 0x1 (ACTIVE): MTL ECC Uncorrectable error Interrupt Status detected.
0	0h RO	**MTL ECC Correctable error Interrupt Status (MECIS):** This bit indicates that a correctable error interrupt event in the MTL ECC safety feature. To get the exact cause of the interrupt the application should read the MTL_ECC_Interrupt_Status register. 0x0 (INACTIVE): MTL ECC Correctable error Interrupt Status not detected. 0x1 (ACTIVE): MTL ECC Correctable error Interrupt Status detected.

3.2.362 MTL_ECC_INTERRUPT_ENABLE — Offset CC8h

The MTL_ECC_Interrupt_Enable register provides enable bits for the ECC interrupts.

Type	Size	Offset	Default
MMIO	32 bit	BAR + CC8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	**Reserved**
12	0h RW	**Rx Parser memory Correctable Error Interrupt Enable (RPCEIE):** When set, generates an interrupt when an uncorrectable error is detected at the Rx Parser memory interface. It is indicated in RPCES status bit of MTL_ECC_Interrupt_Status register. When reset this event does not generates an interrupt. 0x0 (DISABLE): Rx Parser memory Correctable Error Interrupt is disabled. 0x1 (ENABLE): Rx Parser memory Correctable Error Interrupt is enabled.
11:9	0h RO	**Reserved**
8	0h RW	**EST memory Correctable Error Interrupt Enable (ECEIE):** When set, generates an interrupt when a correctable error is detected at the MTL EST memory interface. It is indicated in the ECES bit of MTL_ECC_Interrupt_Status register. When reset this event does not generates an interrupt. 0x0 (DISABLE): EST memory Correctable Error Interrupt is disabled. 0x1 (ENABLE): EST memory Correctable Error Interrupt is enabled.
7:5	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	**Rx memory Correctable Error Interrupt Enable (RXCEIE):** When set, generates an interrupt when a correctable error is detected at the MTL Rx memory interface. It is indicated in the RXCES bit of MTL_ECC_Interrupt_Status register. When reset this event does not generates an interrupt. 0x0 (DISABLE): Rx memory Correctable Error Interrupt is disabled. 0x1 (ENABLE): Rx memory Correctable Error Interrupt is enabled.
3:1	0h RO	**Reserved**
0	0h RW	**Tx memory Correctable Error Interrupt Enable (TXCEIE):** When set, generates an interrupt when a correctable error is detected at the MTL Tx memory interface. It is indicated in the TXCES bit of MTL_ECC_Interrupt_Status register. When reset this event does not generates an interrupt. 0x0 (DISABLE): Tx memory Correctable Error Interrupt is disabled. 0x1 (ENABLE): Tx memory Correctable Error Interrupt is enabled.

3.2.363 MTL_ECC_INTERRUPT_STATUS — Offset CCCh

The MTL_ECC_Interrupt_Status register provides MTL ECC Interrupt Status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + CCCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	**Reserved**
14	0h RW	**Rx Parser memory Uncorrectable Error Status (RPUES):** When set, indicates that an uncorrectable error is detected at Rx Parser memory interface. 0x0 (INACTIVE): Rx Parser memory Uncorrectable Error Status not detected. 0x1 (ACTIVE): Rx Parser memory Uncorrectable Error Status detected.
13	0h RW	**MTL Rx Parser memory Address Mismatch Status (RPAMS):** This bit when set indicates that address mismatch is found for address bus of Rx Parser memory. 0x0 (INACTIVE): MTL Rx Parser memory Address Mismatch Status not detected. 0x1 (ACTIVE): MTL Rx Parser memory Address Mismatch Status detected.
12	0h RW	**MTL Rx Parser memory Correctable Error Status (RPCES):** This bit when set indicates that correctable error is detected at RX Parser memory interface. 0x0 (INACTIVE): MTL Rx Parser memory Correctable Error Status not detected. 0x1 (ACTIVE): MTL Rx Parser memory Correctable Error Status detected.
11	0h RO	**Reserved**
10	0h RW	**MTL EST memory Uncorrectable Error Status (EUES):** When set, indicates that an uncorrectable error is detected at MTL EST memory interface. 0x0 (INACTIVE): MTL EST memory Uncorrectable Error Status not detected. 0x1 (ACTIVE): MTL EST memory Uncorrectable Error Status detected.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**MTL EST memory Address Mismatch Status (EAMS):** This bit when set indicates that address mismatch is found for address bus of MTL EST memory. 0x0 (INACTIVE): MTL EST memory Address Mismatch Status not detected. 0x1 (ACTIVE): MTL EST memory Address Mismatch Status detected.
8	0h RW	**MTL EST memory Correctable Error Status (ECES):** This bit when set indicates that correctable error is detected at the MTL EST memory. 0x0 (INACTIVE): MTL EST memory Correctable Error Status not detected. 0x1 (ACTIVE): MTL EST memory Correctable Error Status detected.
7	0h RO	**Reserved**
6	0h RW	**MTL Rx memory Uncorrectable Error Status (RXUES):** When set, indicates that an uncorrectable error is detected at the MTL Rx memory interface. 0x0 (INACTIVE): MTL Rx memory Uncorrectable Error Status not detected. 0x1 (ACTIVE): MTL Rx memory Uncorrectable Error Status detected.
5	0h RW	**MTL Rx memory Address Mismatch Status (RXAMS):** This bit when set indicates that address mismatch is found for address bus of the MTL Rx memory. 0x0 (INACTIVE): MTL Rx memory Address Mismatch Status not detected. 0x1 (ACTIVE): MTL Rx memory Address Mismatch Status detected.
4	0h RW	**MTL Rx memory Correctable Error Status (RXCES):** This bit when set indicates that correctable error is detected at the MTL Rx memory. 0x0 (INACTIVE): MTL Rx memory correctable Error Status not detected. 0x1 (ACTIVE): MTL Rx memory correctable Error Status detected.
3	0h RO	**Reserved**
2	0h RW	**MTL Tx memory Uncorrectable Error Status (TXUES):** When set, indicates that an uncorrectable error is detected at the MTL TX memory interface. 0x0 (INACTIVE): MTL Tx memory Uncorrectable Error Status not detected. 0x1 (ACTIVE): MTL Tx memory Uncorrectable Error Status detected.
1	0h RW	**MTL Tx memory Address Mismatch Status (TXAMS):** This bit when set indicates that address mismatch is found for address bus of the MTL Tx memory. 0x0 (INACTIVE): MTL Tx memory Address Mismatch Status not detected. 0x1 (ACTIVE): MTL Tx memory Address Mismatch Status detected.
0	0h RW	**MTL Tx memory Correctable Error Status (TXCES):** This bit when set indicates that a correctable error is detected at the MTL Tx memory. 0x0 (INACTIVE): MTL Tx memory Correctable Error Status not detected. 0x1 (ACTIVE): MTL Tx memory Correctable Error Status detected.

3.2.364 MTL_ECC_ERR_STS_RCTL — Offset CD0h

The MTL_ECC_Err_Sts_Rctl register establishes the control for ECC Error status capture.

Type	Size	Offset	Default
MMIO	32 bit	BAR + CD0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved**
5	0h RW	**Clear Uncorrectable Error Status (CUES):** When this bit is set along with EESRE bit of this register, based on the EMS field of this register, the respective memory's uncorrectable error address and uncorrectable error count values are cleared upon reading. Hardware resets this bit when all the error status values are cleared. 0x0 (INACTIVE): Clear Uncorrectable Error Status not detected. 0x1 (ACTIVE): Clear Uncorrectable Error Status detected.
4	0h RW	**Clear Correctable Error Status (CCES):** When this bit is set along with EESRE bit of this register, based on the EMS field of this register, the respective memory's correctable error address and correctable error count values are cleared upon reading. Hardware resets this bit when all the error status values are cleared. 0x0 (INACTIVE): Clear Correctable Error Status not detected. 0x1 (ACTIVE): Clear Correctable Error Status detected.
3:1	0h RW	**MTL ECC Memory Selection (EMS):** When EESRE bit of this register is set, this field indicates which memory's error status value to be read. The memory selection encoding is as described below. 0x0 (TX_MEM): MTL Tx memory. 0x1 (RX_MEM): MTL Rx memory. 0x2 (EST_MEM): MTL EST memory. 0x3 (RXP_MEM): MTL Rx Parser memory. 0x4 (TSO_MEM): DMA TSO memory.
0	0h RW	**MTL ECC Error Status Read Enable (EESRE):** When this bit is set, based on the EMS field of this register, the respective memory's error status values are captured as described: - The correctable and uncorrectable error count values are captured into MTL_ECC_Err_Cnt_Status register - The address location's of correctable and uncorrectable errors are captured into MTL_ECC_Err_Addr_Status register. Hardware resets this bit when all the status values are captured into the MTL_ECC_Err_Cnt_Status and MTL_ECC_Err_Addr_Status registers. 0x0 (DISABLE): MTL ECC Error Status Read is disabled. 0x1 (ENABLE): MTL ECC Error Status Read is enabled.

3.2.365 MTL_ECC_ERR_ADDR_STATUS — Offset CD4h

The MTL_ECC_Err_Addr_Status register provides the memory addresses for the correctable and uncorrectable errors.

Type	Size	Offset	Default
MMIO	32 bit	BAR + CD4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	**MTL ECC Uncorrectable Error Address Status (EUEAS):** Based on the EMS field of MTL_ECC_Err_Sts_Rctl register, this field holds the respective memory's address locations for which an uncorrectable error or address mismatch is detected. When MEEAO bit of MTL_ECC_Control register is set, this field holds the last valid address of memory for which either an uncorrectable error or an address mismatch is detected. When MEEAO bit of MTL_ECC_Control register is reset, this field holds the first address of the memory for which either an uncorrectable error or address mismatch is detected.
15:0	0000h RO	**MTL ECC Correctable Error Address Status (ECEAS):** Based on the EMS field of MTL_ECC_Err_Sts_Rctl register, this field holds the respective memory's address locations for which a correctable error is detected. When MEEAO bit of MTL_ECC_Control register is set, this field holds the last valid address of memory for which correctable error or address mismatch is detected. When MEEAO bit of MTL_ECC_Control register is reset, this field holds the first address of the memory for which correctable error is detected.

3.2.366 MTL_ECC_ERR_CNTR_STATUS — Offset CD8h

The MTL_ECC_Err_Cntr_Status register provides ECC Error count for Correctable and uncorrectable errors.

Type	Size	Offset	Default
MMIO	32 bit	BAR + CD8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19:16	0h RO	**MTL ECC Uncorrectable Error Counter Status (EUECS):** Based on the EMS field of MTL_ECC_Err_Cntr_Rctl register, this field holds the respective memory's uncorrectable error count value.
15:8	0h RO	**Reserved**
7:0	00h RO	**MTL ECC Correctable Error Counter Status (ECECS):** Based on the EMS field of MTL_ECC_Err_Cntr_Rctl register, this field holds the respective memory's correctable error count value.

3.2.367 MTL_DPP_CONTROL — Offset CE0h

The MTL_DPP_Control establishes the operating mode of Data Parity protection and error injection.

Type	Size	Offset	Default
MMIO	32 bit	BAR + CE0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13	0h RW	**Insert Parity error in CSR Read data parity generator (IPECW):** When set to 1, parity bit of first valid data generated by the CSR parity generator (or at PG10 as shown in AXI slave Interface Data path parity protection diagram) is flipped. Hardware clears this bit once respective parity bit is flipped. 0x0 (DISABLE): Insert Parity error in CSR Read data parity generator is disabled. 0x1 (ENABLE): Insert Parity error in CSR Read data parity generator is enabled.
12	0h RW	**Insert Parity error in AXI Slave Write data parity generator (IPEASW):** When set to 1, parity bit of first valid data generated by the AXI parity generator is (or at PG9 as shown in AXI slave Interface Data path parity protection diagram) flipped. Hardware clears this bit once respective parity bit is flipped. 0x0 (DISABLE): Insert Parity error in AXI Slave Write data parity generator is disabled. 0x1 (ENABLE): Insert Parity error in AXI Slave Write data parity generator is enabled.
11	0h RW	**Insert Parity error in Rx write-back Descriptor parity generator (IPERD):** When set to 1, parity bit of first valid data generated by the DMA Rx write-back descriptor parity generator(or at PG8 as shown in Receive data path parity protection diagram) is flipped. 0x0 (DISABLE): Insert Parity error in Rx write-back Descriptor parity generator is disabled. 0x1 (ENABLE): Insert Parity error in Rx write-back Descriptor parity generator is enabled.
10	0h RW	**Insert Parity error in Tx write-back Descriptor parity generator (IPETD):** When set to 1, parity bit of first valid data generated by the DMA Tx write-back descriptor parity generator(or at PG4 as shown in Transmit data path parity protection diagram) is flipped. Hardware clears this bit once respective parity bit is flipped. 0x0 (DISABLE): Insert Parity error in Tx write-back Descriptor parity generator is disabled. 0x1 (ENABLE): Insert Parity error in Tx write-back Descriptor parity generator is enabled.
9	0h RW	**Insert Parity Error in DMA TSO parity generator (IPETSO):** When set to 1, parity bit of first valid data generated by the DMA TSO parity generator is (or at PG3 as shown in Transmit data path parity protection diagram) flipped. Hardware clears this bit once respective parity bit is flipped. 0x0 (DISABLE): Insert Parity Error in DMA TSO parity generator is disabled. 0x1 (ENABLE): Insert Parity Error in DMA TSO parity generator is enabled.
8	0h RW	**Insert Parity Error in DMA DTX Control word parity generator (IPEDDC):** When set to 1, parity bit of first valid data generated by the DMA DTX Control word parity generator (or at PG2 as shown in Transmit data path parity protection diagram) is flipped. Hardware clears this bit once respective parity bit is flipped. 0x0 (DISABLE): Insert Parity Error in DMA DTX Control word parity generator is disabled. 0x1 (ENABLE): Insert Parity Error in DMA DTX Control word parity generator is enabled.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Insert Parity Error in MTL Rx FIFO read control parity generator (IPEMRF):** When set to 1, parity bit of first valid data generated by the MTL Rx FIFO read control parity generator (or at PG7 as shown in Receive data path parity protection diagram) is flipped. Hardware clears this bit once respective parity bit is flipped. 0x0 (DISABLE): Insert Parity Error in MTL Rx FIFO read control parity generator is disabled. 0x1 (ENABLE): Insert Parity Error in MTL Rx FIFO read control parity generator is enabled.
6	0h RW	**Insert Parity Error in MTL Tx Status parity generator (IPEMTS):** When set to 1, parity bit of first valid data generated by the MTL Tx Status parity generator (or at PG6 as shown in Transmit data path parity protection diagram) is flipped. Hardware clears this bit once respective parity bit is flipped. 0x0 (DISABLE): Insert Parity Error in MTL Tx Status parity generator is disabled. 0x1 (ENABLE): Insert Parity Error in MTL Tx Status parity generator is enabled.
5	0h RW	**Insert Parity Error in MTL checksum parity generator (IPEMC):** When set to 1, parity bit of first valid data generated by the MTL checksum parity generator (or at PG5 as shown in Transmit data path parity protection diagram) is flipped. Hardware clears this bit once the respective parity bit is flipped. 0x0 (DISABLE): Insert Parity Error in MTL checksum parity generator is disabled. 0x1 (ENABLE): Insert Parity Error in MTL checksum parity generator is enabled.
4	0h RW	**Insert Parity Error in Interface Data parity generator (IPEID):** When set to 1, parity bit of first valid input data generated by the Interface data parity generator (or at PG1 as shown in Transmit data path parity protection diagram) is flipped. Following are the input data bus on which parity bits are generated based on configuration selected In AHB Config, hrdata_i In AXI config, rdata_m_i In DMA Config, mdc_rdata_i In MTL Config, ati_data_i Hardware clears this bit once the respective parity bit is flipped. 0x0 (DISABLE): Insert Parity Error in Interface Data parity generator is disabled. 0x1 (ENABLE): Insert Parity Error in Interface Data parity generator is enabled.
3:2	0h RO	**Reserved**
1	0h RW	**Odd Parity Enable (OPE):** When set to 1, enables odd parity protection on all the external interfaces and when set to 0, enables even parity protection on all the external interfaces. 0x0 (DISABLE): Odd Parity is disabled. 0x1 (ENABLE): Odd Parity is enabled.
0	0h RW	**Enable Data path Parity Protection (EDPP):** When set to 1, enables the parity protection for EQOS datapath by generating and checking the parity on EQOS datapath. When set to 0, disables the parity protection for EQOS datapath. 0x0 (DISABLE): Data path Parity Protection is disabled. 0x1 (ENABLE): Data path Parity Protection is enabled.

3.2.368 MTL_TXQ0_OPERATION_MODE — Offset D00h

The Queue 0 Transmit Operation Mode register establishes the Transmit queue operating modes and commands.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D00h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:16	00h RW	**Transmit Queue Size (TQS):** This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. The TQS field is read-write only if the number of Tx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on, so user should be programming TQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (TQS+1)*256 bytes. When the number of Tx Queues is one, the field is read-only and the configured TX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Tx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
15:7	0h RO	**Reserved**
6:4	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
3:2	0h RW	**Transmit Queue Enable (TXQEN):** This field is used to enable/disable the transmit queue 0. - 2'b00: Not enabled - 2'b01: Reserved - 2'b10: Enabled - 2'b11: Reserved This field is Read Only in Single Queue configurations and Read Write in Multiple Queue configurations. Note: In multiple Tx queues configuration, all the queues are disabled by default. Enable the Tx queue by programming this field. 0x0 (DISABLE): Not enabled. 0x1 (EN_IF_AV): Enable in AV mode (Reserved in non-AV). 0x2 (ENABLE): Enabled. 0x3 (RSVD2): Reserved.
1	0h RW	**Transmit Store and Forward (TSF):** When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped. 0x0 (DISABLE): Transmit Store and Forward is disabled. 0x1 (ENABLE): Transmit Store and Forward is enabled. Note: This bit should always be set as we do not support cut through mode.
0	0h RW	**Flush Transmit Queue (FTQ):** When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the MTL_TxQ1_Operation_Mode register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission. Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (clk_tx_i) should be active. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Flush Transmit Queue is disabled. 0x1 (ENABLE): Flush Transmit Queue is enabled.

3.2.369 MTL_TXQ0_UNDERFLOW — Offset D04h

The Queue 0 Underflow Counter register contains the counter for packets aborted because of Transmit queue underflow and packets missed because of Receive queue packet flush

Type	Size	Offset	Default
MMIO	32 bit	BAR + D04h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RO	**Overflow Bit for Underflow Packet Counter (UFCNTOVF):** This bit is set every time the Tx queue Underflow Packet Counter field overflows, that is, it has crossed the maximum count. In such a scenario, the overflow packet counter is reset to all-zeros and this bit indicates that the rollover happened. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Overflow not detected for Underflow Packet Counter. 0x1 (ACTIVE): Overflow detected for Underflow Packet Counter.
10:0	000h RO	**Underflow Packet Counter (UFFRMCNT):** This field indicates the number of packets aborted by the controller because of Tx Queue Underflow. This counter is incremented each time the MAC aborts outgoing packet because of underflow. The counter is cleared when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

3.2.370 MTL_TXQ0_DEBUG — Offset D08h

The Queue 0 Transmit Debug register gives the debug status of various blocks related to the Transmit queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D08h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:20	0h RO	**Number of Status Words in Tx Status FIFO of Queue (STXSTSF):** This field indicates the current number of status in the Tx Status FIFO of this queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of status words in Tx Status FIFO.
19	0h RO	**Reserved**
18:16	0h RO	**Number of Packets in the Transmit Queue (PTXQ):** This field indicates the current number of packets in the Tx Queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of packets in the Transmit queue.
15:6	0h RO	**Reserved**
5	0h RO	**MTL Tx Status FIFO Full Status (TXSTSFSTS):** When high, this bit indicates that the MTL Tx Status FIFO is full. Therefore, the MTL cannot accept any more packets for transmission. 0x0 (INACTIVE): MTL Tx Status FIFO Full status is not detected. 0x1 (ACTIVE): MTL Tx Status FIFO Full status is detected.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO	**MTL Tx Queue Not Empty Status (TXQSTS):** When this bit is high, it indicates that the MTL Tx Queue is not empty and some data is left for transmission. 0x0 (INACTIVE): MTL Tx Queue Not Empty status is not detected. 0x1 (ACTIVE): MTL Tx Queue Not Empty status is detected.
3	0h RO	**MTL Tx Queue Write Controller Status (TWCSTS):** When high, this bit indicates that the MTL Tx Queue Write Controller is active, and it is transferring the data to the Tx Queue. 0x0 (INACTIVE): MTL Tx Queue Write Controller status is not detected. 0x1 (ACTIVE): MTL Tx Queue Write Controller status is detected.
2:1	0h RO	**MTL Tx Queue Read Controller Status (TRCSTS):** This field indicates the state of the Tx Queue Read Controller: 0x0 (IDLE): Idle state. 0x1 (READ): Read state (transferring data to the MAC transmitter). 0x2 (WAIT): Waiting for pending Tx Status from the MAC transmitter. 0x3 (FLUSH): Flushing the Tx queue because of the Packet Abort request from the MAC.
0	0h RO	**Transmit Queue in Pause (TXQPAUSED):** When this bit is high and the Rx flow control is enabled, it indicates that the Tx Queue is in the Pause condition (in the full-duplex only mode) because of the following: - Reception of the PFC packet for the priorities assigned to the Tx Queue when PFC is enabled - Reception of 802.3x Pause packet when PFC is disabled 0x0 (INACTIVE): Transmit Queue in Pause status is not detected. 0x1 (ACTIVE): Transmit Queue in Pause status is detected.

3.2.371 MTL_TXQ0_ETS_STATUS — Offset D14h

The Queue 0 ETS Status register provides the average traffic transmitted in Queue 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RO	**Average Bits per Slot (ABS):** This field contains the average transmitted bits per slot. When the DCB operation is enabled for Queue 0, this field is computed over every 10 million bit times slot (4 ms in 2500 Mbps; 10 ms in 1000 Mbps; 100 ms in 100 Mbps). The maximum value is 0x989680.

3.2.372 MTL_TXQ0_QUANTUM_WEIGHT — Offset D18h

The Queue 0 Quantum or Weights register contains the quantum value for Deficit Weighted Round Robin (DWRR), weights for the Weighted Round Robin (WRR), and Weighted Fair Queuing (WFQ) for Queue 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved**
20:0	000000h RW	**Quantum or Weights (ISCQW):** When the DCB operation is enabled with DWRR algorithm for Queue 0 traffic, this field contains the quantum value in bytes to be added to credit during every queue scanning cycle. The maximum value is 0x1312D0 bytes. When DCB operation is enabled with WFQ algorithm for Queue 0 traffic, this field contains the weight for this queue. The maximum value is 0x3FFF where weight of 0 indicates 100% bandwidth. Bits[20:14] must be written to zero. The higher the programmed weights lesser the bandwidth allocated for the particular Transmit Queue. This is because the weights are used to compute the packet finish time (weights*packet_size). Lesser the finish time, higher the probability of the packet getting scheduled first and using more bandwidth. When DCB operation or generic queuing operation is enabled with WRR algorithm for Queue 0 traffic, this field contains the weight for this queue. The maximum value is 0x64. Bits [20:7] must be written to zero.

3.2.373 MTL_Q0_INTERRUPT_CONTROL_STATUS — Offset D2Ch

This register contains the interrupt enable and status bits for the queue 0 interrupts.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**Receive Queue Overflow Interrupt Enable (RXOIE):** When this bit is set, the Receive Queue Overflow interrupt is enabled. When this bit is reset, the Receive Queue Overflow interrupt is disabled. 0x0 (DISABLE): Receive Queue Overflow Interrupt is disabled. 0x1 (ENABLE): Receive Queue Overflow Interrupt is enabled.
23:17	0h RO	**Reserved**
16	0h RW	**Receive Queue Overflow Interrupt Status (RXOVFIS):** This bit indicates that the Receive Queue had an overflow while receiving the packet. If a partial packet is transferred to the application, the overflow status is set in RDES3[21]. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Queue Overflow Interrupt Status not detected. 0x1 (ACTIVE): Receive Queue Overflow Interrupt Status detected.
15:10	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**Average Bits Per Slot Interrupt Enable (ABPSIE):** When this bit is set, the MAC asserts the sbd_intr_o or mci_intr_o interrupt when the average bits per slot status is updated. When this bit is cleared, the interrupt is not asserted for such an event. 0x0 (DISABLE): Average Bits Per Slot Interrupt is disabled. 0x1 (ENABLE): Average Bits Per Slot Interrupt is enabled.
8	0h RW	**Transmit Queue Underflow Interrupt Enable (TXUIE):** When this bit is set, the Transmit Queue Underflow interrupt is enabled. When this bit is reset, the Transmit Queue Underflow interrupt is disabled. 0x0 (DISABLE): Transmit Queue Underflow Interrupt Status is disabled. 0x1 (ENABLE): Transmit Queue Underflow Interrupt Status is enabled.
7:2	0h RO	**Reserved**
1	0h RW	**Average Bits Per Slot Interrupt Status (ABPSIS):** When set, this bit indicates that the MAC has updated the ABS value. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Average Bits Per Slot Interrupt Status not detected. 0x1 (ACTIVE): Average Bits Per Slot Interrupt Status detected.
0	0h RW	**Transmit Queue Underflow Interrupt Status (TXUNFIS):** This bit indicates that the Transmit Queue had an underflow while transmitting the packet. Transmission is suspended and an Underflow Error TDES3[2] is set. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Queue Underflow Interrupt Status not detected. 0x1 (ACTIVE): Transmit Queue Underflow Interrupt Status detected.

3.2.374 MTL_RXQ0_OPERATION_MODE — Offset D30h

The Queue 0 Receive Operation Mode register establishes the Receive queue operating modes and command.

The RFA and RFD fields are not backward compatible with the RFA and RFD fields of 4.00a release

Type	Size	Offset	Default
MMIO	32 bit	BAR + D30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved**
26:20	00h RW	**Receive Queue Size (RQS):** This field indicates the size of the allocated Receive queues in blocks of 256 bytes. The RQS field is read-write only if the number of Rx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on, so user should be programming RQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (RQS+1)*256 bytes. When the number of Rx Queues is one, the field is read-only and the configured RX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Rx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
19:14	00h RW	**Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) (RFD):** These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1.5 KB, that is, FULL 1.5 KB - 2: Full minus 2 KB, that is, FULL 2 KB - 3: Full minus 2.5 KB, that is, FULL 2.5 KB - ... - 62: Full minus 32 KB, that is, FULL 32 KB - 63: Full minus 32.5 KB, that is, FULL 32.5 KB The de-assertion is effective only after flow control is asserted. Note: The value must be programmed in such a way to make sure that the threshold is a positive number. When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register. The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13:8	00h RW	**Threshold for Activating Flow Control (in half-duplex and full-duplex (RFA):** These bits control the threshold (fill-level of Rx queue) at which the flow control is activated: For more information on encoding for this field, see RFD.
7	0h RW	**Enable Hardware Flow Control (EHFC):** When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. 0x0 (DISABLE): Hardware Flow Control is disabled. 0x1 (ENABLE): Hardware Flow Control is enabled.
6	0h RW	**Disable Dropping of TCP/IP Checksum Error Packets (DIS_TCP_EF):** When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC. When this bit is reset, all error packets are dropped if the FEP bit is reset. 0x0 (ENABLE): Dropping of TCP/IP Checksum Error Packets is enabled. 0x1 (DISABLE): Dropping of TCP/IP Checksum Error Packets is disabled.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**Receive Queue Store and Forward (RSF):** When this bit is set, the GbE Controller reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register. 0x0 (DISABLE): Receive Queue Store and Forward is disabled. 0x1 (ENABLE): Receive Queue Store and Forward is enabled.
4	0h RW	**Forward Error Packets (FEP):** When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped. When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet might be forwarded to the application or DMA. 0x0 (DISABLE): Forward Error Packets is disabled. 0x1 (ENABLE): Forward Error Packets is enabled.
3	0h RW	**Forward Undersized Good Packets (FUP):** When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. 0x0 (DISABLE): Forward Undersized Good Packets is disabled. 0x1 (ENABLE): Forward Undersized Good Packets is enabled.
2	0h RO	**Reserved**
1:0	0h RW	**Receive Queue Threshold Control (RTC):** These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred. This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1. 0x0 (M_64BYTE): 64. 0x1 (M_32BYTE): 32. 0x2 (M_96BYTE): 96. 0x3 (M_128BYTE): 128.

3.2.375 MTL_RXQ0_MISSED_PACKET_OVERFLOW_CNT — Offset D34h

The Queue 0 Missed Packet and Overflow Counter register contains the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D34h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27	0h RO	**Missed Packet Counter Overflow Bit (MISCNTOVF):** When set, this bit indicates that the Rx Queue Missed Packet Counter crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Missed Packet Counter overflow not detected. 0x1 (ACTIVE): Missed Packet Counter overflow detected.
26:16	000h RO	**Missed Packet Counter (MISPKTCNT):** This field indicates the number of packets missed by the GbE Controller because the application asserted ari_pkt_flush_i[] for this queue. This counter is reset when this register is read with mci_be_i[0] at 1b1. This counter is incremented by 1 when the DMA discards the packet because of buffer unavailability. Access restriction applies. Clears on read. Self-set to 1 on internal event.
15:12	0h RO	**Reserved**
11	0h RO	**Overflow Counter Overflow Bit (OVFCNTOVF):** When set, this bit indicates that the Rx Queue Overflow Packet Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Overflow Counter overflow not detected. 0x1 (ACTIVE): Overflow Counter overflow detected.
10:0	000h RO	**Overflow Packet Counter (OVFPKTCNT):** This field indicates the number of packets discarded by the GbE Controller because of Receive queue overflow. This counter is incremented each time the GbE Controller discards an incoming packet because of overflow. This counter is reset when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

3.2.376 MTL_RXQ0_DEBUG — Offset D38h

The Queue 0 Receive Debug register gives the debug status of various blocks related to the Receive queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D38h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:16	0000h RO	**Number of Packets in Receive Queue (PRXQ):** This field indicates the current number of packets in the Rx Queue. The theoretical maximum value for this field is 256KB/16B = 16K Packets, that is, Max_Queue_Size/ Min_Packet_Size.
15:6	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
5:4	0h RO	**MTL Rx Queue Fill-Level Status (RXQSTS):** This field gives the status of the fill-level of the Rx Queue: 0x0 (EMPTY): Rx Queue empty. 0x1 (BLW_THR): Rx Queue fill-level below flow-control deactivate threshold. 0x2 (ABV_THR): Rx Queue fill-level above flow-control activate threshold. 0x3 (FULL): Rx Queue full.
3	0h RO	**Reserved**
2:1	0h RO	**MTL Rx Queue Read Controller State (RRCSTS):** This field gives the state of the Rx queue Read controller: 0x0 (IDLE): Idle state. 0x1 (READ_DATA): Reading packet data. 0x2 (READ_STS): Reading packet status (or timestamp). 0x3 (FLUSH): Flushing the packet data and status.
0	0h RO	**MTL Rx Queue Write Controller Active Status (RWCSTS):** When high, this bit indicates that the MTL Rx queue Write controller is active, and it is transferring a received packet to the Rx Queue. 0x0 (INACTIVE): MTL Rx Queue Write Controller Active Status not detected. 0x1 (ACTIVE): MTL Rx Queue Write Controller Active Status detected.

3.2.377 MTL_RXQ0_CONTROL — Offset D3Ch

The Queue Receive Control register controls the receive arbitration and passing of received packets to the application.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D3Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**Receive Queue Packet Arbitration (RXQ_FRM_ARBIT):** When this bit is set, the GbE Controller drives the packet data to the ARI interface such that the entire packet data of currently-selected queue is transmitted before switching to other queue. When this bit is reset, the GbE Controller drives the packet data to the ARI interface such that the following amount of data of currently-selected queue is transmitted before switching to other queue: - PBL amount of data (indicated by ari_qN_pbl_i[]) or - Complete data of a packet The status and the timestamp are not a part of the PBL data. Therefore, the GbE Controller drives the complete status (including timestamp status) during first PBL request for the packet (in store-and-forward mode) or the last PBL request for the packet (in Threshold mode). 0x0 (DISABLE): Receive Queue Packet Arbitration is disabled. 0x1 (ENABLE): Receive Queue Packet Arbitration is enabled.
2:0	0h RW	**Receive Queue Weight (RXQ_WEGT):** This field indicates the weight assigned to the Rx Queue 0. This field needs to be programmed with one value less than the required weight, i.e. reset value of 0 indicates weight of 1, value of 1 indicates weight of 2, and so on. The weight is used as the number of continuous PBL or packets requests (depending on the RXQ_FRM_ARBIT) allocated to the queue in one arbitration cycle. Note: The change in value of RXQ_WEGT takes effect only after the completion of current service round or when there is change from RAA=SP to RAA=WSP algorithm. This approach is taken so that there is smooth transition. For the RXQ_WEGT value to take effect at the start, the MTL_RxQ(#i)_Control registers must be programmed before the MTL_Operation_Mode register.

3.2.378 MTL_TXQ1_OPERATION_MODE — Offset D40h

The Queue 1 Transmit Operation Mode register establishes the Transmit queue operating modes and commands.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D40h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:16	00h RW	**Transmit Queue Size (TQS):** This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. The TQS field is read-write only if the number of Tx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on, so user should be programming TQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (TQS+1)*256 bytes. When the number of Tx Queues is one, the field is read-only and the configured TX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Tx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
15:7	0h RO	**Reserved**
6:4	0h RO	**Reserved**
3:2	0h RW	**Transmit Queue Enable (TXQEN):** This field is used to enable/disable the transmit queue 0. - 2'b00: Not enabled - 2'b01: Enable in AV mode - 2'b10: Enabled - 2'b11: Reserved Note: In multiple Tx queues configuration, all the queues are disabled by default. Enable the Tx queue by programming this field. 0x0 (DISABLE): Not enabled. 0x1 (EN_IF_AV): Enable in AV mode (Reserved in non-AV). 0x2 (ENABLE): Enabled. 0x3 (RSVD2): Reserved.
1	0h RW	**Transmit Store and Forward (TSF):** When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped. 0x0 (DISABLE): Transmit Store and Forward is disabled. 0x1 (ENABLE): Transmit Store and Forward is enabled. Note: This bit should always be set as we do not support cut through mode.
0	0h RW	**Flush Transmit Queue (FTQ):** When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the MTL_TxQ1_Operation_Mode register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission. Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (clk_tx_i) should be active. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Flush Transmit Queue is disabled. 0x1 (ENABLE): Flush Transmit Queue is enabled.

3.2.379 MTL_TXQ1_UNDERFLOW — Offset D44h

The Queue 1 Underflow Counter register contains the counter for packets aborted because of Transmit queue underflow and packets missed because of Receive queue packet flush

Type	Size	Offset	Default
MMIO	32 bit	BAR + D44h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RO	**Overflow Bit for Underflow Packet Counter (UFCNTOVF):** This bit is set every time the Tx queue Underflow Packet Counter field overflows, that is, it has crossed the maximum count. In such a scenario, the overflow packet counter is reset to all-zeros and this bit indicates that the rollover happened. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Overflow not detected for Underflow Packet Counter. 0x1 (ACTIVE): Overflow detected for Underflow Packet Counter.
10:0	000h RO	**Underflow Packet Counter (UFFRMCNT):** This field indicates the number of packets aborted by the controller because of Tx Queue Underflow. This counter is incremented each time the MAC aborts outgoing packet because of underflow. The counter is cleared when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

3.2.380 MTL_TXQ1_DEBUG — Offset D48h

The Queue 1 Transmit Debug register gives the debug status of various blocks related to the Transmit queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D48h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:20	0h RO	**Number of Status Words in Tx Status FIFO of Queue (STXSTSF):** This field indicates the current number of status in the Tx Status FIFO of this queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of status words in Tx Status FIFO.
19	0h RO	**Reserved**
18:16	0h RO	**Number of Packets in the Transmit Queue (PTXQ):** This field indicates the current number of packets in the Tx Queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of packets in the Transmit queue.

Bit Range	Default & Access	Field Name (ID): Description
15:6	0h RO	**Reserved**
5	0h RO	**MTL Tx Status FIFO Full Status (TXSTSFSTS):** When high, this bit indicates that the MTL Tx Status FIFO is full. Therefore, the MTL cannot accept any more packets for transmission. 0x0 (INACTIVE): MTL Tx Status FIFO Full status is not detected. 0x1 (ACTIVE): MTL Tx Status FIFO Full status is detected.
4	0h RO	**MTL Tx Queue Not Empty Status (TXQSTS):** When this bit is high, it indicates that the MTL Tx Queue is not empty and some data is left for transmission. 0x0 (INACTIVE): MTL Tx Queue Not Empty status is not detected. 0x1 (ACTIVE): MTL Tx Queue Not Empty status is detected.
3	0h RO	**MTL Tx Queue Write Controller Status (TWCSTS):** When high, this bit indicates that the MTL Tx Queue Write Controller is active, and it is transferring the data to the Tx Queue. 0x0 (INACTIVE): MTL Tx Queue Write Controller status is not detected. 0x1 (ACTIVE): MTL Tx Queue Write Controller status is detected.
2:1	0h RO	**MTL Tx Queue Read Controller Status (TRCSTS):** This field indicates the state of the Tx Queue Read Controller: 0x0 (IDLE): Idle state. 0x1 (READ): Read state (transferring data to the MAC transmitter). 0x2 (WAIT): Waiting for pending Tx Status from the MAC transmitter. 0x3 (FLUSH): Flushing the Tx queue because of the Packet Abort request from the MAC.
0	0h RO	**Transmit Queue in Pause (TXQPAUSED):** When this bit is high and the Rx flow control is enabled, it indicates that the Tx Queue is in the Pause condition (in the full-duplex only mode) because of the following: - Reception of the PFC packet for the priorities assigned to the Tx Queue when PFC is enabled - Reception of 802.3x Pause packet when PFC is disabled 0x0 (INACTIVE): Transmit Queue in Pause status is not detected. 0x1 (ACTIVE): Transmit Queue in Pause status is detected.

3.2.381 MTL_TXQ1_ETS_CONTROL — Offset D50h

The Queue ETS Control register controls the enhanced transmission selection operation.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D50h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:4	0h RW	**Slot Count (SLC):** If the credit-based shaper algorithm is enabled, the software can program the number of slots (of duration programmed in DMA_CH(#i)_Slot_Interval register) over which the average transmitted bits per slot, provided in the MTL_TxQ(#i)_ETS_Status register, need to be computed for Queue. The encoding is as follows: 0x0 (M_1_SLOT): 1 slot. 0x1 (M_2_SLOT): 2 slots. 0x2 (M_4_SLOT): 4 slots. 0x3 (M_8_SLOT): 8 slots. 0x4 (M_16_SLOT): 16 slots. 0x5 (RSVD): Reserved.
3	0h RW	**Credit Control (CC):** When this bit is set, the accumulated credit parameter in the credit-based shaper algorithm logic is not reset to zero when there is positive credit and no packet to transmit in Channel 1. The credit accumulates even when there is no packet waiting in Channel 1 and another channel is transmitting. When this bit is reset, the accumulated credit parameter in the credit-based shaper algorithm logic is set to zero when there is positive credit and no packet to transmit in Channel 1. When there is no packet waiting in Channel 1 and other channel is transmitting, no credit is accumulated. 0x0 (DISABLE): Credit Control is disabled. 0x1 (ENABLE): Credit Control is enabled.
2	0h RW	**AV Algorithm (AVALG):** When Queue 1 is programmed for AV, this field configures the scheduling algorithm for this queue: This bit when set, indicates credit based shaper algorithm (CBS) is selected for Queue 1 traffic. When reset, strict priority is selected. 0x0 (DISABLE): CBS Algorithm is disabled. 0x1 (ENABLE): CBS Algorithm is enabled.
1:0	0h RO	**Reserved**

3.2.382 MTL_TXQ1_ETS_STATUS — Offset D54h

The Queue 1 ETS Status register provides the average traffic transmitted in Queue 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D54h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RO	**Average Bits per Slot (ABS):** This field contains the average transmitted bits per slot. If AV operation is enabled, this field is computed over number of slots, programmed in the SLC field of MTL_TxQ(#i)_ETS_CONTROL register. The maximum value of this field is 0x6_4000 in 100 Mbps, 0x3E_8000 in 1000 Mbps and 9C_4000 in 2500 Mbps mode respectively. When the DCB operation is enabled for Queue, this field is computed over every 10 million bit times slot (4 ms in 2500 Mbps; 10 ms in 1000 Mbps; 100 ms in 100 Mbps). The maximum value is 0x989680.

3.2.383 MTL_TXQ1_QUANTUM_WEIGHT — Offset D58h

The Queue 1 idleSlopeCredit, Quantum or Weights register provides the average traffic transmitted in Queue 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D58h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved**
20:0	000000h RW	**ISCQW:** idleSlopeCredit, Quantum or Weights - idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns for 100 Mbps; 8 ns for 1000 Mbps; 3.2 ns for 2500 Mbps) when the credit is increasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. Bits[20:14] must be written to zero. - Quantum When the DCB operation is enabled with DWRR algorithm for Queue 1 traffic, this field contains the quantum value in bytes to be added to credit during every queue scanning cycle. The maximum value is 0x1312D0 bytes. - Weights When DCB operation is enabled with WFQ algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x3FFF where weight of 0 indicates 100% bandwidth. Bits[20:14] must be written to zero. When DCB operation or generic queuing operation is enabled with WRR algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x64. Bits [20:7] must be written to zero. - Note 1: In multiple Queue configuration this field in respective per queue register must be programmed to some non-zero value when multiple queues are enabled or single queue other than Q0 is enabled. This field need not be programmed when only Q0 is enabled. In general, when WRR algorithm is selected a non-zero value must be programmed on both Receive and Transmit. In Receive, the register is MTL_Operation_Mode register. - Note 2: For WFQ algorithm, higher the programmed weights lesser the bandwidth allocated for that Transmit Queue. The finish time is not a function of particular packet alone but it is as per the formula: (previous_finish_time of particular Transmit Queue + (weights*packet_size)) - Note 3: The weights programmed do not correspond to the number of packets but the fraction of bandwidth or time allocated for particular queue w.r.t. total BW or time.

3.2.384 MTL_TXQ1_SENDSLOPECREDIT — Offset D5Ch

The sendSlopeCredit register contains the sendSlope credit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D5Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13:0	0000h RW	**sendSlopeCredit Value (SSC):** When AV operation is enabled, this field contains the sendSlopeCredit value required for credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns, 8 ns and 3.2 ns for 100 Mbps, 1000 Mbps and 2500 Mbps respectively) when the credit is decreasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. This field should be programmed with absolute sendSlopeCredit value. The credit-based shaper logic subtracts it from the accumulated credit when Channel 1 is selected for transmission.

3.2.385 MTL_TXQ1_HICREDIT — Offset D60h

The hiCredit register contains the hiCredit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D60h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:0	00000000h RW	**hiCredit Value (HC):** When the AV feature is enabled, this field contains the hiCredit value required for the credit-based shaper algorithm. This is the maximum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1,024. The maximum value is maxInterferenceSize, that is, best-effort maximum packet size (16,384 bytes or 131,072 bits). The value to be specified is 131,072 * 1,024 = 134,217,728 or 0x0800_0000.

3.2.386 MTL_TXQ1_LOCREDIT — Offset D64h

The loCredit register contains the loCredit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D64h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:0	00000000h RW	**loCredit Value (LC):** When AV operation is enabled, this field contains the loCredit value required for the credit-based shaper algorithm. This is the minimum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1,024. The maximum value to be programmed is corresponds to twice the maxFrameSize transmitted from this queue. If the maxFrameSize is 8192 bytes, then (8192*2) * 8 * 1024 = 134,217,728 or 0x0800_0000. Because it is a negative value, the programmed value is 2's complement of the value, that is, 0x1800_0000.

3.2.387 MTL_Q1_INTERRUPT_CONTROL_STATUS — Offset D6Ch

This register contains the interrupt enable and status bits for the queue 1 interrupts.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D6Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**Receive Queue Overflow Interrupt Enable (RXOIE):** When this bit is set, the Receive Queue Overflow interrupt is enabled. When this bit is reset, the Receive Queue Overflow interrupt is disabled. 0x0 (DISABLE): Receive Queue Overflow Interrupt is disabled. 0x1 (ENABLE): Receive Queue Overflow Interrupt is enabled.
23:17	0h RO	**Reserved**
16	0h RW	**Receive Queue Overflow Interrupt Status (RXOVFIS):** This bit indicates that the Receive Queue had an overflow while receiving the packet. If a partial packet is transferred to the application, the overflow status is set in RDES3[21]. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Queue Overflow Interrupt Status not detected. 0x1 (ACTIVE): Receive Queue Overflow Interrupt Status detected.
15:10	0h RO	**Reserved**
9	0h RW	**Average Bits Per Slot Interrupt Enable (ABPSIE):** When this bit is set, the MAC asserts the sbd_intr_o or mci_intr_o interrupt when the average bits per slot status is updated. When this bit is cleared, the interrupt is not asserted for such an event. 0x0 (DISABLE): Average Bits Per Slot Interrupt is disabled. 0x1 (ENABLE): Average Bits Per Slot Interrupt is enabled.
8	0h RW	**Transmit Queue Underflow Interrupt Enable (TXUIE):** When this bit is set, the Transmit Queue Underflow interrupt is enabled. When this bit is reset, the Transmit Queue Underflow interrupt is disabled. 0x0 (DISABLE): Transmit Queue Underflow Interrupt Status is disabled. 0x1 (ENABLE): Transmit Queue Underflow Interrupt Status is enabled.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	**Reserved**
1	0h RW	**Average Bits Per Slot Interrupt Status (ABPSIS):** When set, this bit indicates that the MAC has updated the ABS value. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Average Bits Per Slot Interrupt Status not detected. 0x1 (ACTIVE): Average Bits Per Slot Interrupt Status detected.
0	0h RW	**Transmit Queue Underflow Interrupt Status (TXUNFIS):** This bit indicates that the Transmit Queue had an underflow while transmitting the packet. Transmission is suspended and an Underflow Error TDES3[2] is set. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Queue Underflow Interrupt Status not detected. 0x1 (ACTIVE): Transmit Queue Underflow Interrupt Status detected.

3.2.388 MTL_RXQ1_OPERATION_MODE — Offset D70h

The Queue 1 Receive Operation Mode register establishes the Receive queue operating modes and command.

The RFA and RFD fields are not backward compatible with the RFA and RFD fields of 4.00a release

Type	Size	Offset	Default
MMIO	32 bit	BAR + D70h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved**
26:20	00h RW	**Receive Queue Size (RQS):** This field indicates the size of the allocated Receive queues in blocks of 256 bytes. The RQS field is read-write only if the number of Rx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on, so user should be programming RQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (RQS+1)*256 bytes. When the number of Rx Queues is one, the field is read-only and the configured RX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Rx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
19:14	00h RW	**Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) (RFD):** These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1.5 KB, that is, FULL 1.5 KB - 2: Full minus 2 KB, that is, FULL 2 KB - 3: Full minus 2.5 KB, that is, FULL 2.5 KB - ... - 62: Full minus 32 KB, that is, FULL 32 KB - 63: Full minus 32.5 KB, that is, FULL 32.5 KB The de-assertion is effective only after flow control is asserted. Note: The value must be programmed in such a way to make sure that the threshold is a positive number. When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register. The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13:8	00h RW	**Threshold for Activating Flow Control (in half-duplex and full-duplex (RFA):** These bits control the threshold (fill-level of Rx queue) at which the flow control is activated: For more information on encoding for this field, see RFD.
7	0h RW	**Enable Hardware Flow Control (EHFC):** When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. 0x0 (DISABLE): Hardware Flow Control is disabled. 0x1 (ENABLE): Hardware Flow Control is enabled.
6	0h RW	**Disable Dropping of TCP/IP Checksum Error Packets (DIS_TCP_EF):** When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC. When this bit is reset, all error packets are dropped if the FEP bit is reset. 0x0 (ENABLE): Dropping of TCP/IP Checksum Error Packets is enabled. 0x1 (DISABLE): Dropping of TCP/IP Checksum Error Packets is disabled.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**Receive Queue Store and Forward (RSF):** When this bit is set, the GbE Controller reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register. 0x0 (DISABLE): Receive Queue Store and Forward is disabled. 0x1 (ENABLE): Receive Queue Store and Forward is enabled.
4	0h RW	**Forward Error Packets (FEP):** When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped. When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet might be forwarded to the application or DMA. 0x0 (DISABLE): Forward Error Packets is disabled. 0x1 (ENABLE): Forward Error Packets is enabled.
3	0h RW	**Forward Undersized Good Packets (FUP):** When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. 0x0 (DISABLE): Forward Undersized Good Packets is disabled. 0x1 (ENABLE): Forward Undersized Good Packets is enabled.
2	0h RO	**Reserved**
1:0	0h RW	**Receive Queue Threshold Control (RTC):** These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred. This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1. 0x0 (M_64BYTE): 64. 0x1 (M_32BYTE): 32. 0x2 (M_96BYTE): 96. 0x3 (M_128BYTE): 128.

3.2.389 MTL_RXQ1_MISSED_PACKET_OVERFLOW_CNT — Offset D74h

The Queue 1 Missed Packet and Overflow Counter register contains the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D74h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27	0h RO	**Missed Packet Counter Overflow Bit (MISCNTOVF):** When set, this bit indicates that the Rx Queue Missed Packet Counter crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Missed Packet Counter overflow not detected. 0x1 (ACTIVE): Missed Packet Counter overflow detected.
26:16	000h RO	**Missed Packet Counter (MISPKTCNT):** This field indicates the number of packets missed by the GbE Controller because the application asserted ari_pkt_flush_i[] for this queue. This counter is reset when this register is read with mci_be_i[0] at 1b1. This counter is incremented by 1 when the DMA discards the packet because of buffer unavailability. Access restriction applies. Clears on read. Self-set to 1 on internal event.
15:12	0h RO	**Reserved**
11	0h RO	**Overflow Counter Overflow Bit (OVFCNTOVF):** When set, this bit indicates that the Rx Queue Overflow Packet Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Overflow Counter overflow not detected. 0x1 (ACTIVE): Overflow Counter overflow detected.
10:0	000h RO	**Overflow Packet Counter (OVFPKTCNT):** This field indicates the number of packets discarded by the GbE Controller because of Receive queue overflow. This counter is incremented each time the GbE Controller discards an incoming packet because of overflow. This counter is reset when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

3.2.390 MTL_RXQ1_DEBUG — Offset D78h

The Queue 1 Receive Debug register gives the debug status of various blocks related to the Receive queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D78h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:16	0000h RO	**Number of Packets in Receive Queue (PRXQ):** This field indicates the current number of packets in the Rx Queue. The theoretical maximum value for this field is 256KB/16B = 16K Packets, that is, Max_Queue_Size/ Min_Packet_Size.
15:6	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
5:4	0h RO	**MTL Rx Queue Fill-Level Status (RXQSTS):** This field gives the status of the fill-level of the Rx Queue: 0x0 (EMPTY): Rx Queue empty. 0x1 (BLW_THR): Rx Queue fill-level below flow-control deactivate threshold. 0x2 (ABV_THR): Rx Queue fill-level above flow-control activate threshold. 0x3 (FULL): Rx Queue full.
3	0h RO	**Reserved**
2:1	0h RO	**MTL Rx Queue Read Controller State (RRCSTS):** This field gives the state of the Rx queue Read controller: 0x0 (IDLE): Idle state. 0x1 (READ_DATA): Reading packet data. 0x2 (READ_STS): Reading packet status (or timestamp). 0x3 (FLUSH): Flushing the packet data and status.
0	0h RO	**MTL Rx Queue Write Controller Active Status (RWCSTS):** When high, this bit indicates that the MTL Rx queue Write controller is active, and it is transferring a received packet to the Rx Queue. 0x0 (INACTIVE): MTL Rx Queue Write Controller Active Status not detected. 0x1 (ACTIVE): MTL Rx Queue Write Controller Active Status detected.

3.2.391 MTL_RXQ1_CONTROL — Offset D7Ch

The Queue Receive Control register controls the receive arbitration and passing of received packets to the application.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D7Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**Receive Queue Packet Arbitration (RXQ_FRM_ARBIT):** When this bit is set, the GbE Controller drives the packet data to the ARI interface such that the entire packet data of currently-selected queue is transmitted before switching to other queue. When this bit is reset, the GbE Controller drives the packet data to the ARI interface such that the following amount of data of currently-selected queue is transmitted before switching to other queue: - PBL amount of data (indicated by ari_qN_pbl_i[]) or - Complete data of a packet The status and the timestamp are not a part of the PBL data. Therefore, the GbE Controller drives the complete status (including timestamp status) during first PBL request for the packet (in store-and-forward mode) or the last PBL request for the packet (in Threshold mode). 0x0 (DISABLE): Receive Queue Packet Arbitration is disabled. 0x1 (ENABLE): Receive Queue Packet Arbitration is enabled.
2:0	0h RW	**Receive Queue Weight (RXQ_WEGT):** This field indicates the weight assigned to the Rx Queue 0. This field needs to be programmed with one value less than the required weight, i.e. reset value of 0 indicates weight of 1, value of 1 indicates weight of 2, and so on. The weight is used as the number of continuous PBL or packets requests (depending on the RXQ_FRM_ARBIT) allocated to the queue in one arbitration cycle. Note: The change in value of RXQ_WEGT takes effect only after the completion of current service round or when there is change from RAA=SP to RAA=WSP algorithm. This approach is taken so that there is smooth transition. For the RXQ_WEGT value to take effect at the start, the MTL_RxQ(#i)_Control registers must be programmed before the MTL_Operation_Mode register.

3.2.392 MTL_TXQ2_OPERATION_MODE — Offset D80h

The Queue 2 Transmit Operation Mode register establishes the Transmit queue operating modes and commands.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D80h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:16	00h RW	**Transmit Queue Size (TQS):** This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. The TQS field is read-write only if the number of Tx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on, so user should be programming TQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (TQS+1)*256 bytes. When the number of Tx Queues is one, the field is read-only and the configured TX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Tx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
15:7	0h RO	**Reserved**
6:4	0h RO	**Reserved**
3:2	0h RW	**Transmit Queue Enable (TXQEN):** This field is used to enable/disable the transmit queue 0. - 2'b00: Not enabled - 2'b01: Enable in AV mode - 2'b10: Enabled - 2'b11: Reserved Note: In multiple Tx queues configuration, all the queues are disabled by default. Enable the Tx queue by programming this field. 0x0 (DISABLE): Not enabled. 0x1 (EN_IF_AV): Enable in AV mode (Reserved in non-AV). 0x2 (ENABLE): Enabled. 0x3 (RSVD2): Reserved.
1	0h RW	**Transmit Store and Forward (TSF):** When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped. 0x0 (DISABLE): Transmit Store and Forward is disabled. 0x1 (ENABLE): Transmit Store and Forward is enabled. Note: This bit should always be set as we do not support cut through mode.
0	0h RW	**Flush Transmit Queue (FTQ):** When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the MTL_TxQ1_Operation_Mode register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission. Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (clk_tx_i) should be active. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Flush Transmit Queue is disabled. 0x1 (ENABLE): Flush Transmit Queue is enabled.

3.2.393 MTL_TXQ2_UNDERFLOW — Offset D84h

The Queue 2 Underflow Counter register contains the counter for packets aborted because of Transmit queue underflow and packets missed because of Receive queue packet flush

Type	Size	Offset	Default
MMIO	32 bit	BAR + D84h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RO	**Overflow Bit for Underflow Packet Counter (UFCNTOVF):** This bit is set every time the Tx queue Underflow Packet Counter field overflows, that is, it has crossed the maximum count. In such a scenario, the overflow packet counter is reset to all-zeros and this bit indicates that the rollover happened. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Overflow not detected for Underflow Packet Counter. 0x1 (ACTIVE): Overflow detected for Underflow Packet Counter.
10:0	000h RO	**Underflow Packet Counter (UFFRMCNT):** This field indicates the number of packets aborted by the controller because of Tx Queue Underflow. This counter is incremented each time the MAC aborts outgoing packet because of underflow. The counter is cleared when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

3.2.394 MTL_TXQ2_DEBUG — Offset D88h

The Queue 2 Transmit Debug register gives the debug status of various blocks related to the Transmit queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D88h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:20	0h RO	**Number of Status Words in Tx Status FIFO of Queue (STXSTSF):** This field indicates the current number of status in the Tx Status FIFO of this queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of status words in Tx Status FIFO.
19	0h RO	**Reserved**
18:16	0h RO	**Number of Packets in the Transmit Queue (PTXQ):** This field indicates the current number of packets in the Tx Queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of packets in the Transmit queue.

Bit Range	Default & Access	Field Name (ID): Description
15:6	0h RO	**Reserved**
5	0h RO	**MTL Tx Status FIFO Full Status (TXSTSFSTS):** When high, this bit indicates that the MTL Tx Status FIFO is full. Therefore, the MTL cannot accept any more packets for transmission. 0x0 (INACTIVE): MTL Tx Status FIFO Full status is not detected. 0x1 (ACTIVE): MTL Tx Status FIFO Full status is detected.
4	0h RO	**MTL Tx Queue Not Empty Status (TXQSTS):** When this bit is high, it indicates that the MTL Tx Queue is not empty and some data is left for transmission. 0x0 (INACTIVE): MTL Tx Queue Not Empty status is not detected. 0x1 (ACTIVE): MTL Tx Queue Not Empty status is detected.
3	0h RO	**MTL Tx Queue Write Controller Status (TWCSTS):** When high, this bit indicates that the MTL Tx Queue Write Controller is active, and it is transferring the data to the Tx Queue. 0x0 (INACTIVE): MTL Tx Queue Write Controller status is not detected. 0x1 (ACTIVE): MTL Tx Queue Write Controller status is detected.
2:1	0h RO	**MTL Tx Queue Read Controller Status (TRCSTS):** This field indicates the state of the Tx Queue Read Controller: 0x0 (IDLE): Idle state. 0x1 (READ): Read state (transferring data to the MAC transmitter). 0x2 (WAIT): Waiting for pending Tx Status from the MAC transmitter. 0x3 (FLUSH): Flushing the Tx queue because of the Packet Abort request from the MAC.
0	0h RO	**Transmit Queue in Pause (TXQPAUSED):** When this bit is high and the Rx flow control is enabled, it indicates that the Tx Queue is in the Pause condition (in the full-duplex only mode) because of the following: - Reception of the PFC packet for the priorities assigned to the Tx Queue when PFC is enabled - Reception of 802.3x Pause packet when PFC is disabled 0x0 (INACTIVE): Transmit Queue in Pause status is not detected. 0x1 (ACTIVE): Transmit Queue in Pause status is detected.

3.2.395 MTL_TXQ2_ETS_CONTROL — Offset D90h

The Queue ETS Control register controls the enhanced transmission selection operation.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D90h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:4	0h RW	**Slot Count (SLC):** If the credit-based shaper algorithm is enabled, the software can program the number of slots (of duration programmed in DMA_CH(#i)_Slot_Interval register) over which the average transmitted bits per slot, provided in the MTL_TxQ(#i)_ETS_Status register, need to be computed for Queue. The encoding is as follows: 0x0 (M_1_SLOT): 1 slot. 0x1 (M_2_SLOT): 2 slots. 0x2 (M_4_SLOT): 4 slots. 0x3 (M_8_SLOT): 8 slots. 0x4 (M_16_SLOT): 16 slots. 0x5 (RSVD): Reserved.
3	0h RW	**Credit Control (CC):** When this bit is set, the accumulated credit parameter in the credit-based shaper algorithm logic is not reset to zero when there is positive credit and no packet to transmit in Channel 1. The credit accumulates even when there is no packet waiting in Channel 1 and another channel is transmitting. When this bit is reset, the accumulated credit parameter in the credit-based shaper algorithm logic is set to zero when there is positive credit and no packet to transmit in Channel 1. When there is no packet waiting in Channel 1 and other channel is transmitting, no credit is accumulated. 0x0 (DISABLE): Credit Control is disabled. 0x1 (ENABLE): Credit Control is enabled.
2	0h RW	**AV Algorithm (AVALG):** When Queue 1 is programmed for AV, this field configures the scheduling algorithm for this queue: This bit when set, indicates credit based shaper algorithm (CBS) is selected for Queue 1 traffic. When reset, strict priority is selected. 0x0 (DISABLE): CBS Algorithm is disabled. 0x1 (ENABLE): CBS Algorithm is enabled.
1:0	0h RO	**Reserved**

3.2.396 MTL_TXQ2_ETS_STATUS — Offset D94h

The Queue 2 ETS Status register provides the average traffic transmitted in Queue 2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D94h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RO	**Average Bits per Slot (ABS):** This field contains the average transmitted bits per slot. If AV operation is enabled, this field is computed over number of slots, programmed in the SLC field of MTL_TxQ(#i)_ETS_CONTROL register. The maximum value of this field is 0x6_4000 in 100 Mbps, 0x3E_8000 in 1000 Mbps and 9C_4000 in 2500 Mbps mode respectively. When the DCB operation is enabled for Queue, this field is computed over every 10 million bit times slot (4 ms in 2500 Mbps; 10 ms in 1000 Mbps; 100 ms in 100 Mbps). The maximum value is 0x989680.

3.2.397 MTL_TXQ2_QUANTUM_WEIGHT — Offset D98h

The Queue 2 idleSlopeCredit, Quantum or Weights register provides the average traffic transmitted in Queue 2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved**
20:0	000000h RW	**ISCQW:** idleSlopeCredit, Quantum or Weights - idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns for 100 Mbps; 8 ns for 1000 Mbps; 3.2 ns for 2500 Mbps) when the credit is increasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. Bits[20:14] must be written to zero. - Quantum When the DCB operation is enabled with DWRR algorithm for Queue 1 traffic, this field contains the quantum value in bytes to be added to credit during every queue scanning cycle. The maximum value is 0x1312D0 bytes. - Weights When DCB operation is enabled with WFQ algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x3FFF where weight of 0 indicates 100% bandwidth. Bits[20:14] must be written to zero. When DCB operation or generic queuing operation is enabled with WRR algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x64. Bits [20:7] must be written to zero. - Note 1: In multiple Queue configuration this field in respective per queue register must be programmed to some non-zero value when multiple queues are enabled or single queue other than Q0 is enabled. This field need not be programmed when only Q0 is enabled. In general, when WRR algorithm is selected a non-zero value must be programmed on both Receive and Transmit. In Receive, the register is MTL_Operation_Mode register. - Note 2: For WFQ algorithm, higher the programmed weights lesser the bandwidth allocated for that Transmit Queue. The finish time is not a function of particular packet alone but it is as per the formula: (previous_finish_time of particular Transmit Queue + (weights*packet_size)) - Note 3: The weights programmed do not correspond to the number of packets but the fraction of bandwidth or time allocated for particular queue w.r.t. total BW or time.

3.2.398 MTL_TXQ2_SENDSLOPECREDIT — Offset D9Ch

The sendSlopeCredit register contains the sendSlope credit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13:0	0000h RW	**sendSlopeCredit Value (SSC):** When AV operation is enabled, this field contains the sendSlopeCredit value required for credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns, 8 ns and 3.2 ns for 100 Mbps, 1000 Mbps and 2500 Mbps respectively) when the credit is decreasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. This field should be programmed with absolute sendSlopeCredit value. The credit-based shaper logic subtracts it from the accumulated credit when Channel 1 is selected for transmission.

3.2.399 MTL_TXQ2_HICREDIT — Offset DA0h

The hiCredit register contains the hiCredit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DA0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:0	00000000h RW	**hiCredit Value (HC):** When the AV feature is enabled, this field contains the hiCredit value required for the credit-based shaper algorithm. This is the maximum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1,024. The maximum value is maxInterferenceSize, that is, best-effort maximum packet size (16,384 bytes or 131,072 bits). The value to be specified is 131,072 * 1,024 = 134,217,728 or 0x0800_0000.

3.2.400 MTL_TXQ2_LOCREDIT — Offset DA4h

The loCredit register contains the loCredit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DA4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:0	00000000h RW	**loCredit Value (LC):** When AV operation is enabled, this field contains the loCredit value required for the credit-based shaper algorithm. This is the minimum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1,024. The maximum value to be programmed is corresponds to twice the maxFrameSize transmitted from this queue. If the maxFrameSize is 8192 bytes, then (8192*2) * 8 * 1024 = 134,217,728 or 0x0800_0000. Because it is a negative value, the programmed value is 2's complement of the value, that is, 0x1800_0000.

3.2.401 MTL_Q2_INTERRUPT_CONTROL_STATUS — Offset DACh

This register contains the interrupt enable and status bits for the queue 2 interrupts.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DACh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**Receive Queue Overflow Interrupt Enable (RXOIE):** When this bit is set, the Receive Queue Overflow interrupt is enabled. When this bit is reset, the Receive Queue Overflow interrupt is disabled. 0x0 (DISABLE): Receive Queue Overflow Interrupt is disabled. 0x1 (ENABLE): Receive Queue Overflow Interrupt is enabled.
23:17	0h RO	**Reserved**
16	0h RW	**Receive Queue Overflow Interrupt Status (RXOVFIS):** This bit indicates that the Receive Queue had an overflow while receiving the packet. If a partial packet is transferred to the application, the overflow status is set in RDES3[21]. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Queue Overflow Interrupt Status not detected. 0x1 (ACTIVE): Receive Queue Overflow Interrupt Status detected.
15:10	0h RO	**Reserved**
9	0h RW	**Average Bits Per Slot Interrupt Enable (ABPSIE):** When this bit is set, the MAC asserts the sbd_intr_o or mci_intr_o interrupt when the average bits per slot status is updated. When this bit is cleared, the interrupt is not asserted for such an event. 0x0 (DISABLE): Average Bits Per Slot Interrupt is disabled. 0x1 (ENABLE): Average Bits Per Slot Interrupt is enabled.
8	0h RW	**Transmit Queue Underflow Interrupt Enable (TXUIE):** When this bit is set, the Transmit Queue Underflow interrupt is enabled. When this bit is reset, the Transmit Queue Underflow interrupt is disabled. 0x0 (DISABLE): Transmit Queue Underflow Interrupt Status is disabled. 0x1 (ENABLE): Transmit Queue Underflow Interrupt Status is enabled.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	**Reserved**
1	0h RW	**Average Bits Per Slot Interrupt Status (ABPSIS):** When set, this bit indicates that the MAC has updated the ABS value. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Average Bits Per Slot Interrupt Status not detected. 0x1 (ACTIVE): Average Bits Per Slot Interrupt Status detected.
0	0h RW	**Transmit Queue Underflow Interrupt Status (TXUNFIS):** This bit indicates that the Transmit Queue had an underflow while transmitting the packet. Transmission is suspended and an Underflow Error TDES3[2] is set. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Queue Underflow Interrupt Status not detected. 0x1 (ACTIVE): Transmit Queue Underflow Interrupt Status detected.

3.2.402 MTL_RXQ2_OPERATION_MODE — Offset DB0h

The Queue 2 Receive Operation Mode register establishes the Receive queue operating modes and command.

The RFA and RFD fields are not backward compatible with the RFA and RFD fields of 4.00a release

Type	Size	Offset	Default
MMIO	32 bit	BAR + DB0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved**
26:20	00h RW	**Receive Queue Size (RQS):** This field indicates the size of the allocated Receive queues in blocks of 256 bytes. The RQS field is read-write only if the number of Rx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on, so user should be programming RQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (RQS+1)*256 bytes. When the number of Rx Queues is one, the field is read-only and the configured RX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Rx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
19:14	00h RW	**Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) (RFD):** These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1.5 KB, that is, FULL 1.5 KB - 2: Full minus 2 KB, that is, FULL 2 KB - 3: Full minus 2.5 KB, that is, FULL 2.5 KB - ... - 62: Full minus 32 KB, that is, FULL 32 KB - 63: Full minus 32.5 KB, that is, FULL 32.5 KB The de-assertion is effective only after flow control is asserted. Note: The value must be programmed in such a way to make sure that the threshold is a positive number. When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register. The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13:8	00h RW	**Threshold for Activating Flow Control (in half-duplex and full-duplex (RFA):** These bits control the threshold (fill-level of Rx queue) at which the flow control is activated: For more information on encoding for this field, see RFD.
7	0h RW	**Enable Hardware Flow Control (EHFC):** When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. 0x0 (DISABLE): Hardware Flow Control is disabled. 0x1 (ENABLE): Hardware Flow Control is enabled.
6	0h RW	**Disable Dropping of TCP/IP Checksum Error Packets (DIS_TCP_EF):** When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC. When this bit is reset, all error packets are dropped if the FEP bit is reset. 0x0 (ENABLE): Dropping of TCP/IP Checksum Error Packets is enabled. 0x1 (DISABLE): Dropping of TCP/IP Checksum Error Packets is disabled.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**Receive Queue Store and Forward (RSF):** When this bit is set, the GbE Controller reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register. 0x0 (DISABLE): Receive Queue Store and Forward is disabled. 0x1 (ENABLE): Receive Queue Store and Forward is enabled.
4	0h RW	**Forward Error Packets (FEP):** When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped. When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet might be forwarded to the application or DMA. 0x0 (DISABLE): Forward Error Packets is disabled. 0x1 (ENABLE): Forward Error Packets is enabled.
3	0h RW	**Forward Undersized Good Packets (FUP):** When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. 0x0 (DISABLE): Forward Undersized Good Packets is disabled. 0x1 (ENABLE): Forward Undersized Good Packets is enabled.
2	0h RO	**Reserved**
1:0	0h RW	**Receive Queue Threshold Control (RTC):** These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred. This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1. 0x0 (M_64BYTE): 64. 0x1 (M_32BYTE): 32. 0x2 (M_96BYTE): 96. 0x3 (M_128BYTE): 128.

3.2.403 MTL_RXQ2_MISSED_PACKET_OVERFLOW_CNT — Offset DB4h

The Queue 2 Missed Packet and Overflow Counter register contains the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DB4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27	0h RO	**Missed Packet Counter Overflow Bit (MISCNTOVF):** When set, this bit indicates that the Rx Queue Missed Packet Counter crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Missed Packet Counter overflow not detected. 0x1 (ACTIVE): Missed Packet Counter overflow detected.
26:16	000h RO	**Missed Packet Counter (MISPKTCNT):** This field indicates the number of packets missed by the GbE Controller because the application asserted ari_pkt_flush_i[] for this queue. This counter is reset when this register is read with mci_be_i[0] at 1b1. This counter is incremented by 1 when the DMA discards the packet because of buffer unavailability. Access restriction applies. Clears on read. Self-set to 1 on internal event.
15:12	0h RO	**Reserved**
11	0h RO	**Overflow Counter Overflow Bit (OVFCNTOVF):** When set, this bit indicates that the Rx Queue Overflow Packet Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Overflow Counter overflow not detected. 0x1 (ACTIVE): Overflow Counter overflow detected.
10:0	000h RO	**Overflow Packet Counter (OVFPKTCNT):** This field indicates the number of packets discarded by the GbE Controller because of Receive queue overflow. This counter is incremented each time the GbE Controller discards an incoming packet because of overflow. This counter is reset when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

3.2.404 MTL_RXQ2_DEBUG — Offset DB8h

The Queue 2 Receive Debug register gives the debug status of various blocks related to the Receive queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DB8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:16	0000h RO	**Number of Packets in Receive Queue (PRXQ):** This field indicates the current number of packets in the Rx Queue. The theoretical maximum value for this field is 256KB/16B = 16K Packets, that is, Max_Queue_Size/ Min_Packet_Size.
15:6	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
5:4	0h RO	**MTL Rx Queue Fill-Level Status (RXQSTS):** This field gives the status of the fill-level of the Rx Queue: 0x0 (EMPTY): Rx Queue empty. 0x1 (BLW_THR): Rx Queue fill-level below flow-control deactivate threshold. 0x2 (ABV_THR): Rx Queue fill-level above flow-control activate threshold. 0x3 (FULL): Rx Queue full.
3	0h RO	**Reserved**
2:1	0h RO	**MTL Rx Queue Read Controller State (RRCSTS):** This field gives the state of the Rx queue Read controller: 0x0 (IDLE): Idle state. 0x1 (READ_DATA): Reading packet data. 0x2 (READ_STS): Reading packet status (or timestamp). 0x3 (FLUSH): Flushing the packet data and status.
0	0h RO	**MTL Rx Queue Write Controller Active Status (RWCSTS):** When high, this bit indicates that the MTL Rx queue Write controller is active, and it is transferring a received packet to the Rx Queue. 0x0 (INACTIVE): MTL Rx Queue Write Controller Active Status not detected. 0x1 (ACTIVE): MTL Rx Queue Write Controller Active Status detected.

3.2.405 MTL_RXQ2_CONTROL — Offset DBCh

The Queue Receive Control register controls the receive arbitration and passing of received packets to the application.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DBCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**Receive Queue Packet Arbitration (RXQ_FRM_ARBIT):** When this bit is set, the GbE Controller drives the packet data to the ARI interface such that the entire packet data of currently-selected queue is transmitted before switching to other queue. When this bit is reset, the GbE Controller drives the packet data to the ARI interface such that the following amount of data of currently-selected queue is transmitted before switching to other queue: - PBL amount of data (indicated by ari_qN_pbl_i[]) or - Complete data of a packet The status and the timestamp are not a part of the PBL data. Therefore, the GbE Controller drives the complete status (including timestamp status) during first PBL request for the packet (in store-and-forward mode) or the last PBL request for the packet (in Threshold mode). 0x0 (DISABLE): Receive Queue Packet Arbitration is disabled. 0x1 (ENABLE): Receive Queue Packet Arbitration is enabled.
2:0	0h RW	**Receive Queue Weight (RXQ_WEGT):** This field indicates the weight assigned to the Rx Queue 0. This field needs to be programmed with one value less than the required weight, i.e. reset value of 0 indicates weight of 1, value of 1 indicates weight of 2, and so on. The weight is used as the number of continuous PBL or packets requests (depending on the RXQ_FRM_ARBIT) allocated to the queue in one arbitration cycle. Note: The change in value of RXQ_WEGT takes effect only after the completion of current service round or when there is change from RAA=SP to RAA=WSP algorithm. This approach is taken so that there is smooth transition. For the RXQ_WEGT value to take effect at the start, the MTL_RxQ(#i)_Control registers must be programmed before the MTL_Operation_Mode register.

3.2.406 MTL_TXQ3_OPERATION_MODE — Offset DC0h

The Queue 3 Transmit Operation Mode register establishes the Transmit queue operating modes and commands.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DC0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:16	00h RW	**Transmit Queue Size (TQS):** This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. The TQS field is read-write only if the number of Tx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on, so user should be programming TQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (TQS+1)*256 bytes. When the number of Tx Queues is one, the field is read-only and the configured TX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Tx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
15:7	0h RO	**Reserved**
6:4	0h RO	**Reserved**
3:2	0h RW	**Transmit Queue Enable (TXQEN):** This field is used to enable/disable the transmit queue 0. - 2'b00: Not enabled - 2'b01: Enable in AV mode - 2'b10: Enabled - 2'b11: Reserved Note: In multiple Tx queues configuration, all the queues are disabled by default. Enable the Tx queue by programming this field. 0x0 (DISABLE): Not enabled. 0x1 (EN_IF_AV): Enable in AV mode (Reserved in non-AV). 0x2 (ENABLE): Enabled. 0x3 (RSVD2): Reserved.
1	0h RW	**Transmit Store and Forward (TSF):** When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped. 0x0 (DISABLE): Transmit Store and Forward is disabled. 0x1 (ENABLE): Transmit Store and Forward is enabled. Note: This bit should always be set as we do not support cut through mode.
0	0h RW	**Flush Transmit Queue (FTQ):** When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the MTL_TxQ1_Operation_Mode register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission. Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (clk_tx_i) should be active. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Flush Transmit Queue is disabled. 0x1 (ENABLE): Flush Transmit Queue is enabled.

3.2.407 MTL_TXQ3_UNDERFLOW — Offset DC4h

The Queue 3 Underflow Counter register contains the counter for packets aborted because of Transmit queue underflow and packets missed because of Receive queue packet flush

Type	Size	Offset	Default
MMIO	32 bit	BAR + DC4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RO	**Overflow Bit for Underflow Packet Counter (UFCNTOVF):** This bit is set every time the Tx queue Underflow Packet Counter field overflows, that is, it has crossed the maximum count. In such a scenario, the overflow packet counter is reset to all-zeros and this bit indicates that the rollover happened. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Overflow not detected for Underflow Packet Counter. 0x1 (ACTIVE): Overflow detected for Underflow Packet Counter.
10:0	000h RO	**Underflow Packet Counter (UFFRMCNT):** This field indicates the number of packets aborted by the controller because of Tx Queue Underflow. This counter is incremented each time the MAC aborts outgoing packet because of underflow. The counter is cleared when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

3.2.408 MTL_TXQ3_DEBUG — Offset DC8h

The Queue 3 Transmit Debug register gives the debug status of various blocks related to the Transmit queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DC8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:20	0h RO	**Number of Status Words in Tx Status FIFO of Queue (STXSTSF):** This field indicates the current number of status in the Tx Status FIFO of this queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of status words in Tx Status FIFO.
19	0h RO	**Reserved**
18:16	0h RO	**Number of Packets in the Transmit Queue (PTXQ):** This field indicates the current number of packets in the Tx Queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of packets in the Transmit queue.

Bit Range	Default & Access	Field Name (ID): Description
15:6	0h RO	**Reserved**
5	0h RO	**MTL Tx Status FIFO Full Status (TXSTSFSTS):** When high, this bit indicates that the MTL Tx Status FIFO is full. Therefore, the MTL cannot accept any more packets for transmission. 0x0 (INACTIVE): MTL Tx Status FIFO Full status is not detected. 0x1 (ACTIVE): MTL Tx Status FIFO Full status is detected.
4	0h RO	**MTL Tx Queue Not Empty Status (TXQSTS):** When this bit is high, it indicates that the MTL Tx Queue is not empty and some data is left for transmission. 0x0 (INACTIVE): MTL Tx Queue Not Empty status is not detected. 0x1 (ACTIVE): MTL Tx Queue Not Empty status is detected.
3	0h RO	**MTL Tx Queue Write Controller Status (TWCSTS):** When high, this bit indicates that the MTL Tx Queue Write Controller is active, and it is transferring the data to the Tx Queue. 0x0 (INACTIVE): MTL Tx Queue Write Controller status is not detected. 0x1 (ACTIVE): MTL Tx Queue Write Controller status is detected.
2:1	0h RO	**MTL Tx Queue Read Controller Status (TRCSTS):** This field indicates the state of the Tx Queue Read Controller: 0x0 (IDLE): Idle state. 0x1 (READ): Read state (transferring data to the MAC transmitter). 0x2 (WAIT): Waiting for pending Tx Status from the MAC transmitter. 0x3 (FLUSH): Flushing the Tx queue because of the Packet Abort request from the MAC.
0	0h RO	**Transmit Queue in Pause (TXQPAUSED):** When this bit is high and the Rx flow control is enabled, it indicates that the Tx Queue is in the Pause condition (in the full-duplex only mode) because of the following: - Reception of the PFC packet for the priorities assigned to the Tx Queue when PFC is enabled - Reception of 802.3x Pause packet when PFC is disabled 0x0 (INACTIVE): Transmit Queue in Pause status is not detected. 0x1 (ACTIVE): Transmit Queue in Pause status is detected.

3.2.409 MTL_TXQ3_ETS_CONTROL — Offset DD0h

The Queue ETS Control register controls the enhanced transmission selection operation.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DD0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:4	0h RW	**Slot Count (SLC):** If the credit-based shaper algorithm is enabled, the software can program the number of slots (of duration programmed in DMA_CH(#i)_Slot_Interval register) over which the average transmitted bits per slot, provided in the MTL_TxQ(#i)_ETS_Status register, need to be computed for Queue. The encoding is as follows: 0x0 (M_1_SLOT): 1 slot. 0x1 (M_2_SLOT): 2 slots. 0x2 (M_4_SLOT): 4 slots. 0x3 (M_8_SLOT): 8 slots. 0x4 (M_16_SLOT): 16 slots. 0x5 (RSVD): Reserved.
3	0h RW	**Credit Control (CC):** When this bit is set, the accumulated credit parameter in the credit-based shaper algorithm logic is not reset to zero when there is positive credit and no packet to transmit in Channel 1. The credit accumulates even when there is no packet waiting in Channel 1 and another channel is transmitting. When this bit is reset, the accumulated credit parameter in the credit-based shaper algorithm logic is set to zero when there is positive credit and no packet to transmit in Channel 1. When there is no packet waiting in Channel 1 and other channel is transmitting, no credit is accumulated. 0x0 (DISABLE): Credit Control is disabled. 0x1 (ENABLE): Credit Control is enabled.
2	0h RW	**AV Algorithm (AVALG):** When Queue 1 is programmed for AV, this field configures the scheduling algorithm for this queue: This bit when set, indicates credit based shaper algorithm (CBS) is selected for Queue 1 traffic. When reset, strict priority is selected. 0x0 (DISABLE): CBS Algorithm is disabled. 0x1 (ENABLE): CBS Algorithm is enabled.
1:0	0h RO	**Reserved**

3.2.410 MTL_TXQ3_ETS_STATUS — Offset DD4h

The Queue 3 ETS Status register provides the average traffic transmitted in Queue 3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DD4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RO	**Average Bits per Slot (ABS):** This field contains the average transmitted bits per slot. If AV operation is enabled, this field is computed over number of slots, programmed in the SLC field of MTL_TxQ(#i)_ETS_CONTROL register. The maximum value of this field is 0x6_4000 in 100 Mbps, 0x3E_8000 in 1000 Mbps and 9C_4000 in 2500 Mbps mode respectively. When the DCB operation is enabled for Queue, this field is computed over every 10 million bit times slot (4 ms in 2500 Mbps; 10 ms in 1000 Mbps; 100 ms in 100 Mbps). The maximum value is 0x989680.

3.2.411 MTL_TXQ3_QUANTUM_WEIGHT — Offset DD8h

The Queue 3 idleSlopeCredit, Quantum or Weights register provides the average traffic transmitted in Queue 3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DD8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved**
20:0	000000h RW	**ISCQW:** idleSlopeCredit, Quantum or Weights - idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns for 100 Mbps; 8 ns for 1000 Mbps; 3.2 ns for 2500 Mbps) when the credit is increasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. Bits[20:14] must be written to zero. - Quantum When the DCB operation is enabled with DWRR algorithm for Queue 1 traffic, this field contains the quantum value in bytes to be added to credit during every queue scanning cycle. The maximum value is 0x1312D0 bytes. - Weights When DCB operation is enabled with WFQ algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x3FFF where weight of 0 indicates 100% bandwidth. Bits[20:14] must be written to zero. When DCB operation or generic queuing operation is enabled with WRR algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x64. Bits [20:7] must be written to zero. - Note 1: In multiple Queue configuration this field in respective per queue register must be programmed to some non-zero value when multiple queues are enabled or single queue other than Q0 is enabled. This field need not be programmed when only Q0 is enabled. In general, when WRR algorithm is selected a non-zero value must be programmed on both Receive and Transmit. In Receive, the register is MTL_Operation_Mode register. - Note 2: For WFQ algorithm, higher the programmed weights lesser the bandwidth allocated for that Transmit Queue. The finish time is not a function of particular packet alone but it is as per the formula: (previous_finish_time of particular Transmit Queue + (weights*packet_size)) - Note 3: The weights programmed do not correspond to the number of packets but the fraction of bandwidth or time allocated for particular queue w.r.t. total BW or time.

3.2.412 MTL_TXQ3_SENDSLOPECREDIT — Offset DDCh

The sendSlopeCredit register contains the sendSlope credit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DDCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13:0	0000h RW	**sendSlopeCredit Value (SSC):** When AV operation is enabled, this field contains the sendSlopeCredit value required for credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns, 8 ns and 3.2 ns for 100 Mbps, 1000 Mbps and 2500 Mbps respectively) when the credit is decreasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. This field should be programmed with absolute sendSlopeCredit value. The credit-based shaper logic subtracts it from the accumulated credit when Channel 1 is selected for transmission.

3.2.413 MTL_TXQ3_HICREDIT — Offset DE0h

The hiCredit register contains the hiCredit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DE0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:0	00000000h RW	**hiCredit Value (HC):** When the AV feature is enabled, this field contains the hiCredit value required for the credit-based shaper algorithm. This is the maximum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1,024. The maximum value is maxInterferenceSize, that is, best-effort maximum packet size (16,384 bytes or 131,072 bits). The value to be specified is 131,072 * 1,024 = 134,217,728 or 0x0800_0000.

3.2.414 MTL_TXQ3_LOCREDIT — Offset DE4h

The loCredit register contains the loCredit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DE4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:0	00000000h RW	**loCredit Value (LC):** When AV operation is enabled, this field contains the loCredit value required for the credit-based shaper algorithm. This is the minimum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1,024. The maximum value to be programmed is corresponds to twice the maxFrameSize transmitted from this queue. If the maxFrameSize is 8192 bytes, then (8192*2) * 8 * 1024 = 134,217,728 or 0x0800_0000. Because it is a negative value, the programmed value is 2's complement of the value, that is, 0x1800_0000.

3.2.415 MTL_Q3_INTERRUPT_CONTROL_STATUS — Offset DECh

This register contains the interrupt enable and status bits for the queue 3 interrupts.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DECh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**Receive Queue Overflow Interrupt Enable (RXOIE):** When this bit is set, the Receive Queue Overflow interrupt is enabled. When this bit is reset, the Receive Queue Overflow interrupt is disabled. 0x0 (DISABLE): Receive Queue Overflow Interrupt is disabled. 0x1 (ENABLE): Receive Queue Overflow Interrupt is enabled.
23:17	0h RO	**Reserved**
16	0h RW	**Receive Queue Overflow Interrupt Status (RXOVFIS):** This bit indicates that the Receive Queue had an overflow while receiving the packet. If a partial packet is transferred to the application, the overflow status is set in RDES3[21]. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Queue Overflow Interrupt Status not detected. 0x1 (ACTIVE): Receive Queue Overflow Interrupt Status detected.
15:10	0h RO	**Reserved**
9	0h RW	**Average Bits Per Slot Interrupt Enable (ABPSIE):** When this bit is set, the MAC asserts the sbd_intr_o or mci_intr_o interrupt when the average bits per slot status is updated. When this bit is cleared, the interrupt is not asserted for such an event. 0x0 (DISABLE): Average Bits Per Slot Interrupt is disabled. 0x1 (ENABLE): Average Bits Per Slot Interrupt is enabled.
8	0h RW	**Transmit Queue Underflow Interrupt Enable (TXUIE):** When this bit is set, the Transmit Queue Underflow interrupt is enabled. When this bit is reset, the Transmit Queue Underflow interrupt is disabled. 0x0 (DISABLE): Transmit Queue Underflow Interrupt Status is disabled. 0x1 (ENABLE): Transmit Queue Underflow Interrupt Status is enabled.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	**Reserved**
1	0h RW	**Average Bits Per Slot Interrupt Status (ABPSIS):** When set, this bit indicates that the MAC has updated the ABS value. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Average Bits Per Slot Interrupt Status not detected. 0x1 (ACTIVE): Average Bits Per Slot Interrupt Status detected.
0	0h RW	**Transmit Queue Underflow Interrupt Status (TXUNFIS):** This bit indicates that the Transmit Queue had an underflow while transmitting the packet. Transmission is suspended and an Underflow Error TDES3[2] is set. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Queue Underflow Interrupt Status not detected. 0x1 (ACTIVE): Transmit Queue Underflow Interrupt Status detected.

3.2.416 MTL_RXQ3_OPERATION_MODE — Offset DF0h

The Queue 3 Receive Operation Mode register establishes the Receive queue operating modes and command.

The RFA and RFD fields are not backward compatible with the RFA and RFD fields of 4.00a release

Type	Size	Offset	Default
MMIO	32 bit	BAR + DF0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved**
26:20	00h RW	**Receive Queue Size (RQS):** This field indicates the size of the allocated Receive queues in blocks of 256 bytes. The RQS field is read-write only if the number of Rx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on, so user should be programming RQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (RQS+1)*256 bytes. When the number of Rx Queues is one, the field is read-only and the configured RX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Rx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
19:14	00h RW	**Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) (RFD):** These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1.5 KB, that is, FULL 1.5 KB - 2: Full minus 2 KB, that is, FULL 2 KB - 3: Full minus 2.5 KB, that is, FULL 2.5 KB - ... - 62: Full minus 32 KB, that is, FULL 32 KB - 63: Full minus 32.5 KB, that is, FULL 32.5 KB The de-assertion is effective only after flow control is asserted. Note: The value must be programmed in such a way to make sure that the threshold is a positive number. When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register. The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13:8	00h RW	**Threshold for Activating Flow Control (in half-duplex and full-duplex (RFA):** These bits control the threshold (fill-level of Rx queue) at which the flow control is activated: For more information on encoding for this field, see RFD.
7	0h RW	**Enable Hardware Flow Control (EHFC):** When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. 0x0 (DISABLE): Hardware Flow Control is disabled. 0x1 (ENABLE): Hardware Flow Control is enabled.
6	0h RW	**Disable Dropping of TCP/IP Checksum Error Packets (DIS_TCP_EF):** When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC. When this bit is reset, all error packets are dropped if the FEP bit is reset. 0x0 (ENABLE): Dropping of TCP/IP Checksum Error Packets is enabled. 0x1 (DISABLE): Dropping of TCP/IP Checksum Error Packets is disabled.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**Receive Queue Store and Forward (RSF):** When this bit is set, the GbE Controller reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register. 0x0 (DISABLE): Receive Queue Store and Forward is disabled. 0x1 (ENABLE): Receive Queue Store and Forward is enabled.
4	0h RW	**Forward Error Packets (FEP):** When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped. When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet might be forwarded to the application or DMA. 0x0 (DISABLE): Forward Error Packets is disabled. 0x1 (ENABLE): Forward Error Packets is enabled.
3	0h RW	**Forward Undersized Good Packets (FUP):** When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. 0x0 (DISABLE): Forward Undersized Good Packets is disabled. 0x1 (ENABLE): Forward Undersized Good Packets is enabled.
2	0h RO	**Reserved**
1:0	0h RW	**Receive Queue Threshold Control (RTC):** These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred. This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1. 0x0 (M_64BYTE): 64. 0x1 (M_32BYTE): 32. 0x2 (M_96BYTE): 96. 0x3 (M_128BYTE): 128.

3.2.417 MTL_RXQ3_MISSED_PACKET_OVERFLOW_CNT — Offset DF4h

The Queue 3 Missed Packet and Overflow Counter register contains the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DF4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27	0h RO	**Missed Packet Counter Overflow Bit (MISCNTOVF):** When set, this bit indicates that the Rx Queue Missed Packet Counter crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Missed Packet Counter overflow not detected. 0x1 (ACTIVE): Missed Packet Counter overflow detected.
26:16	000h RO	**Missed Packet Counter (MISPKTCNT):** This field indicates the number of packets missed by the GbE Controller because the application asserted ari_pkt_flush_i[] for this queue. This counter is reset when this register is read with mci_be_i[0] at 1b1. This counter is incremented by 1 when the DMA discards the packet because of buffer unavailability. Access restriction applies. Clears on read. Self-set to 1 on internal event.
15:12	0h RO	**Reserved**
11	0h RO	**Overflow Counter Overflow Bit (OVFCNTOVF):** When set, this bit indicates that the Rx Queue Overflow Packet Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Overflow Counter overflow not detected. 0x1 (ACTIVE): Overflow Counter overflow detected.
10:0	000h RO	**Overflow Packet Counter (OVFPKTCNT):** This field indicates the number of packets discarded by the GbE Controller because of Receive queue overflow. This counter is incremented each time the GbE Controller discards an incoming packet because of overflow. This counter is reset when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

3.2.418 MTL_RXQ3_DEBUG — Offset DF8h

The Queue 3 Receive Debug register gives the debug status of various blocks related to the Receive queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DF8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:16	0000h RO	**Number of Packets in Receive Queue (PRXQ):** This field indicates the current number of packets in the Rx Queue. The theoretical maximum value for this field is 256KB/16B = 16K Packets, that is, Max_Queue_Size/ Min_Packet_Size.
15:6	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
5:4	0h RO	**MTL Rx Queue Fill-Level Status (RXQSTS):** This field gives the status of the fill-level of the Rx Queue: 0x0 (EMPTY): Rx Queue empty. 0x1 (BLW_THR): Rx Queue fill-level below flow-control deactivate threshold. 0x2 (ABV_THR): Rx Queue fill-level above flow-control activate threshold. 0x3 (FULL): Rx Queue full.
3	0h RO	**Reserved**
2:1	0h RO	**MTL Rx Queue Read Controller State (RRCSTS):** This field gives the state of the Rx queue Read controller: 0x0 (IDLE): Idle state. 0x1 (READ_DATA): Reading packet data. 0x2 (READ_STS): Reading packet status (or timestamp). 0x3 (FLUSH): Flushing the packet data and status.
0	0h RO	**MTL Rx Queue Write Controller Active Status (RWCSTS):** When high, this bit indicates that the MTL Rx queue Write controller is active, and it is transferring a received packet to the Rx Queue. 0x0 (INACTIVE): MTL Rx Queue Write Controller Active Status not detected. 0x1 (ACTIVE): MTL Rx Queue Write Controller Active Status detected.

3.2.419 MTL_RXQ3_CONTROL — Offset DFCh

The Queue Receive Control register controls the receive arbitration and passing of received packets to the application.

Type	Size	Offset	Default
MMIO	32 bit	BAR + DFCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**Receive Queue Packet Arbitration (RXQ_FRM_ARBIT):** When this bit is set, the GbE Controller drives the packet data to the ARI interface such that the entire packet data of currently-selected queue is transmitted before switching to other queue. When this bit is reset, the GbE Controller drives the packet data to the ARI interface such that the following amount of data of currently-selected queue is transmitted before switching to other queue: - PBL amount of data (indicated by ari_qN_pbl_i[]) or - Complete data of a packet The status and the timestamp are not a part of the PBL data. Therefore, the GbE Controller drives the complete status (including timestamp status) during first PBL request for the packet (in store-and-forward mode) or the last PBL request for the packet (in Threshold mode). 0x0 (DISABLE): Receive Queue Packet Arbitration is disabled. 0x1 (ENABLE): Receive Queue Packet Arbitration is enabled.
2:0	0h RW	**Receive Queue Weight (RXQ_WEGT):** This field indicates the weight assigned to the Rx Queue 0. This field needs to be programmed with one value less than the required weight, i.e. reset value of 0 indicates weight of 1, value of 1 indicates weight of 2, and so on. The weight is used as the number of continuous PBL or packets requests (depending on the RXQ_FRM_ARBIT) allocated to the queue in one arbitration cycle. Note: The change in value of RXQ_WEGT takes effect only after the completion of current service round or when there is change from RAA=SP to RAA=WSP algorithm. This approach is taken so that there is smooth transition. For the RXQ_WEGT value to take effect at the start, the MTL_RxQ(#i)_Control registers must be programmed before the MTL_Operation_Mode register.

3.2.420 MTL_TXQ4_OPERATION_MODE — Offset E00h

The Queue 4 Transmit Operation Mode register establishes the Transmit queue operating modes and commands.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E00h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:16	00h RW	**Transmit Queue Size (TQS):** This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. The TQS field is read-write only if the number of Tx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on, so user should be programming TQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (TQS+1)*256 bytes. When the number of Tx Queues is one, the field is read-only and the configured TX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Tx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
15:7	0h RO	**Reserved**
6:4	0h RO	**Reserved**
3:2	0h RW	**Transmit Queue Enable (TXQEN):** This field is used to enable/disable the transmit queue 0. - 2'b00: Not enabled - 2'b01: Enable in AV mode - 2'b10: Enabled - 2'b11: Reserved Note: In multiple Tx queues configuration, all the queues are disabled by default. Enable the Tx queue by programming this field. 0x0 (DISABLE): Not enabled. 0x1 (EN_IF_AV): Enable in AV mode (Reserved in non-AV). 0x2 (ENABLE): Enabled. 0x3 (RSVD2): Reserved.
1	0h RW	**Transmit Store and Forward (TSF):** When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped. 0x0 (DISABLE): Transmit Store and Forward is disabled. 0x1 (ENABLE): Transmit Store and Forward is enabled. Note: This bit should always be set as we do not support cut through mode.
0	0h RW	**Flush Transmit Queue (FTQ):** When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the MTL_TxQ1_Operation_Mode register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission. Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (clk_tx_i) should be active. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Flush Transmit Queue is disabled. 0x1 (ENABLE): Flush Transmit Queue is enabled.

3.2.421 MTL_TXQ4_UNDERFLOW — Offset E04h

The Queue 4 Underflow Counter register contains the counter for packets aborted because of Transmit queue underflow and packets missed because of Receive queue packet flush

Type	Size	Offset	Default
MMIO	32 bit	BAR + E04h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RO	**Overflow Bit for Underflow Packet Counter (UFCNTOVF):** This bit is set every time the Tx queue Underflow Packet Counter field overflows, that is, it has crossed the maximum count. In such a scenario, the overflow packet counter is reset to all-zeros and this bit indicates that the rollover happened. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Overflow not detected for Underflow Packet Counter. 0x1 (ACTIVE): Overflow detected for Underflow Packet Counter.
10:0	000h RO	**Underflow Packet Counter (UFFRMCNT):** This field indicates the number of packets aborted by the controller because of Tx Queue Underflow. This counter is incremented each time the MAC aborts outgoing packet because of underflow. The counter is cleared when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

3.2.422 MTL_TXQ4_DEBUG — Offset E08h

The Queue 4 Transmit Debug register gives the debug status of various blocks related to the Transmit queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E08h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:20	0h RO	**Number of Status Words in Tx Status FIFO of Queue (STXSTSF):** This field indicates the current number of status in the Tx Status FIFO of this queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of status words in Tx Status FIFO.
19	0h RO	**Reserved**
18:16	0h RO	**Number of Packets in the Transmit Queue (PTXQ):** This field indicates the current number of packets in the Tx Queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of packets in the Transmit queue.

Bit Range	Default & Access	Field Name (ID): Description
15:6	0h RO	**Reserved**
5	0h RO	**MTL Tx Status FIFO Full Status (TXSTSFSTS):** When high, this bit indicates that the MTL Tx Status FIFO is full. Therefore, the MTL cannot accept any more packets for transmission. 0x0 (INACTIVE): MTL Tx Status FIFO Full status is not detected. 0x1 (ACTIVE): MTL Tx Status FIFO Full status is detected.
4	0h RO	**MTL Tx Queue Not Empty Status (TXQSTS):** When this bit is high, it indicates that the MTL Tx Queue is not empty and some data is left for transmission. 0x0 (INACTIVE): MTL Tx Queue Not Empty status is not detected. 0x1 (ACTIVE): MTL Tx Queue Not Empty status is detected.
3	0h RO	**MTL Tx Queue Write Controller Status (TWCSTS):** When high, this bit indicates that the MTL Tx Queue Write Controller is active, and it is transferring the data to the Tx Queue. 0x0 (INACTIVE): MTL Tx Queue Write Controller status is not detected. 0x1 (ACTIVE): MTL Tx Queue Write Controller status is detected.
2:1	0h RO	**MTL Tx Queue Read Controller Status (TRCSTS):** This field indicates the state of the Tx Queue Read Controller: 0x0 (IDLE): Idle state. 0x1 (READ): Read state (transferring data to the MAC transmitter). 0x2 (WAIT): Waiting for pending Tx Status from the MAC transmitter. 0x3 (FLUSH): Flushing the Tx queue because of the Packet Abort request from the MAC.
0	0h RO	**Transmit Queue in Pause (TXQPAUSED):** When this bit is high and the Rx flow control is enabled, it indicates that the Tx Queue is in the Pause condition (in the full-duplex only mode) because of the following: - Reception of the PFC packet for the priorities assigned to the Tx Queue when PFC is enabled - Reception of 802.3x Pause packet when PFC is disabled 0x0 (INACTIVE): Transmit Queue in Pause status is not detected. 0x1 (ACTIVE): Transmit Queue in Pause status is detected.

3.2.423 MTL_TXQ4_ETS_CONTROL — Offset E10h

The Queue ETS Control register controls the enhanced transmission selection operation.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:4	0h RW	**Slot Count (SLC):** If the credit-based shaper algorithm is enabled, the software can program the number of slots (of duration programmed in DMA_CH(#i)_Slot_Interval register) over which the average transmitted bits per slot, provided in the MTL_TxQ(#i)_ETS_Status register, need to be computed for Queue. The encoding is as follows: 0x0 (M_1_SLOT): 1 slot. 0x1 (M_2_SLOT): 2 slots. 0x2 (M_4_SLOT): 4 slots. 0x3 (M_8_SLOT): 8 slots. 0x4 (M_16_SLOT): 16 slots. 0x5 (RSVD): Reserved.
3	0h RW	**Credit Control (CC):** When this bit is set, the accumulated credit parameter in the credit-based shaper algorithm logic is not reset to zero when there is positive credit and no packet to transmit in Channel 1. The credit accumulates even when there is no packet waiting in Channel 1 and another channel is transmitting. When this bit is reset, the accumulated credit parameter in the credit-based shaper algorithm logic is set to zero when there is positive credit and no packet to transmit in Channel 1. When there is no packet waiting in Channel 1 and other channel is transmitting, no credit is accumulated. 0x0 (DISABLE): Credit Control is disabled. 0x1 (ENABLE): Credit Control is enabled.
2	0h RW	**AV Algorithm (AVALG):** When Queue 1 is programmed for AV, this field configures the scheduling algorithm for this queue: This bit when set, indicates credit based shaper algorithm (CBS) is selected for Queue 1 traffic. When reset, strict priority is selected. 0x0 (DISABLE): CBS Algorithm is disabled. 0x1 (ENABLE): CBS Algorithm is enabled.
1:0	0h RO	**Reserved**

3.2.424 MTL_TXQ4_ETS_STATUS — Offset E14h

The Queue 4 ETS Status register provides the average traffic transmitted in Queue 4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RO	**Average Bits per Slot (ABS):** This field contains the average transmitted bits per slot. If AV operation is enabled, this field is computed over number of slots, programmed in the SLC field of MTL_TxQ(#i)_ETS_CONTROL register. The maximum value of this field is 0x6_4000 in 100 Mbps, 0x3E_8000 in 1000 Mbps and 9C_4000 in 2500 Mbps mode respectively. When the DCB operation is enabled for Queue, this field is computed over every 10 million bit times slot (4 ms in 2500 Mbps; 10 ms in 1000 Mbps; 100 ms in 100 Mbps). The maximum value is 0x989680.

3.2.425 MTL_TXQ4_QUANTUM_WEIGHT — Offset E18h

The Queue 4 idleSlopeCredit, Quantum or Weights register provides the average traffic transmitted in Queue 4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved**
20:0	000000h RW	**ISCQW:** idleSlopeCredit, Quantum or Weights - idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns for 100 Mbps; 8 ns for 1000 Mbps; 3.2 ns for 2500 Mbps) when the credit is increasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. Bits[20:14] must be written to zero. - Quantum When the DCB operation is enabled with DWRR algorithm for Queue 1 traffic, this field contains the quantum value in bytes to be added to credit during every queue scanning cycle. The maximum value is 0x1312D0 bytes. - Weights When DCB operation is enabled with WFQ algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x3FFF where weight of 0 indicates 100% bandwidth. Bits[20:14] must be written to zero. When DCB operation or generic queuing operation is enabled with WRR algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x64. Bits [20:7] must be written to zero. - Note 1: In multiple Queue configuration this field in respective per queue register must be programmed to some non-zero value when multiple queues are enabled or single queue other than Q0 is enabled. This field need not be programmed when only Q0 is enabled. In general, when WRR algorithm is selected a non-zero value must be programmed on both Receive and Transmit. In Receive, the register is MTL_Operation_Mode register. - Note 2: For WFQ algorithm, higher the programmed weights lesser the bandwidth allocated for that Transmit Queue. The finish time is not a function of particular packet alone but it is as per the formula: (previous_finish_time of particular Transmit Queue + (weights*packet_size)) - Note 3: The weights programmed do not correspond to the number of packets but the fraction of bandwidth or time allocated for particular queue w.r.t. total BW or time.

3.2.426 MTL_TXQ4_SENDSLOPECREDIT — Offset E1Ch

The sendSlopeCredit register contains the sendSlope credit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13:0	0000h RW	**sendSlopeCredit Value (SSC):** When AV operation is enabled, this field contains the sendSlopeCredit value required for credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns, 8 ns and 3.2 ns for 100 Mbps, 1000 Mbps and 2500 Mbps respectively) when the credit is decreasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. This field should be programmed with absolute sendSlopeCredit value. The credit-based shaper logic subtracts it from the accumulated credit when Channel 1 is selected for transmission.

3.2.427 MTL_TXQ4_HICREDIT — Offset E20h

The hiCredit register contains the hiCredit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E20h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:0	00000000h RW	**hiCredit Value (HC):** When the AV feature is enabled, this field contains the hiCredit value required for the credit-based shaper algorithm. This is the maximum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1,024. The maximum value is maxInterferenceSize, that is, best-effort maximum packet size (16,384 bytes or 131,072 bits). The value to be specified is 131,072 * 1,024 = 134,217,728 or 0x0800_0000.

3.2.428 MTL_TXQ4_LOCREDIT — Offset E24h

The loCredit register contains the loCredit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E24h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:0	00000000h RW	**loCredit Value (LC):** When AV operation is enabled, this field contains the loCredit value required for the credit-based shaper algorithm. This is the minimum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1,024. The maximum value to be programmed is corresponds to twice the maxFrameSize transmitted from this queue. If the maxFrameSize is 8192 bytes, then (8192*2) * 8 * 1024 = 134,217,728 or 0x0800_0000. Because it is a negative value, the programmed value is 2's complement of the value, that is, 0x1800_0000.

3.2.429 MTL_Q4_INTERRUPT_CONTROL_STATUS — Offset E2Ch

This register contains the interrupt enable and status bits for the queue 4 interrupts.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**Receive Queue Overflow Interrupt Enable (RXOIE):** When this bit is set, the Receive Queue Overflow interrupt is enabled. When this bit is reset, the Receive Queue Overflow interrupt is disabled. 0x0 (DISABLE): Receive Queue Overflow Interrupt is disabled. 0x1 (ENABLE): Receive Queue Overflow Interrupt is enabled.
23:17	0h RO	**Reserved**
16	0h RW	**Receive Queue Overflow Interrupt Status (RXOVFIS):** This bit indicates that the Receive Queue had an overflow while receiving the packet. If a partial packet is transferred to the application, the overflow status is set in RDES3[21]. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Queue Overflow Interrupt Status not detected. 0x1 (ACTIVE): Receive Queue Overflow Interrupt Status detected.
15:10	0h RO	**Reserved**
9	0h RW	**Average Bits Per Slot Interrupt Enable (ABPSIE):** When this bit is set, the MAC asserts the sbd_intr_o or mci_intr_o interrupt when the average bits per slot status is updated. When this bit is cleared, the interrupt is not asserted for such an event. 0x0 (DISABLE): Average Bits Per Slot Interrupt is disabled. 0x1 (ENABLE): Average Bits Per Slot Interrupt is enabled.
8	0h RW	**Transmit Queue Underflow Interrupt Enable (TXUIE):** When this bit is set, the Transmit Queue Underflow interrupt is enabled. When this bit is reset, the Transmit Queue Underflow interrupt is disabled. 0x0 (DISABLE): Transmit Queue Underflow Interrupt Status is disabled. 0x1 (ENABLE): Transmit Queue Underflow Interrupt Status is enabled.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	**Reserved**
1	0h RW	**Average Bits Per Slot Interrupt Status (ABPSIS):** When set, this bit indicates that the MAC has updated the ABS value. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Average Bits Per Slot Interrupt Status not detected. 0x1 (ACTIVE): Average Bits Per Slot Interrupt Status detected.
0	0h RW	**Transmit Queue Underflow Interrupt Status (TXUNFIS):** This bit indicates that the Transmit Queue had an underflow while transmitting the packet. Transmission is suspended and an Underflow Error TDES3[2] is set. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Queue Underflow Interrupt Status not detected. 0x1 (ACTIVE): Transmit Queue Underflow Interrupt Status detected.

3.2.430 MTL_RXQ4_OPERATION_MODE — Offset E30h

The Queue 4 Receive Operation Mode register establishes the Receive queue operating modes and command.

The RFA and RFD fields are not backward compatible with the RFA and RFD fields of 4.00a release

Type	Size	Offset	Default
MMIO	32 bit	BAR + E30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved**
26:20	00h RW	**Receive Queue Size (RQS):** This field indicates the size of the allocated Receive queues in blocks of 256 bytes. The RQS field is read-write only if the number of Rx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on, so user should be programming RQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (RQS+1)*256 bytes. When the number of Rx Queues is one, the field is read-only and the configured RX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Rx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
19:14	00h RW	**Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) (RFD):** These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1.5 KB, that is, FULL 1.5 KB - 2: Full minus 2 KB, that is, FULL 2 KB - 3: Full minus 2.5 KB, that is, FULL 2.5 KB - ... - 62: Full minus 32 KB, that is, FULL 32 KB - 63: Full minus 32.5 KB, that is, FULL 32.5 KB The de-assertion is effective only after flow control is asserted. Note: The value must be programmed in such a way to make sure that the threshold is a positive number. When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register. The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13:8	00h RW	**Threshold for Activating Flow Control (in half-duplex and full-duplex (RFA):** These bits control the threshold (fill-level of Rx queue) at which the flow control is activated: For more information on encoding for this field, see RFD.
7	0h RW	**Enable Hardware Flow Control (EHFC):** When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. 0x0 (DISABLE): Hardware Flow Control is disabled. 0x1 (ENABLE): Hardware Flow Control is enabled.
6	0h RW	**Disable Dropping of TCP/IP Checksum Error Packets (DIS_TCP_EF):** When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC. When this bit is reset, all error packets are dropped if the FEP bit is reset. 0x0 (ENABLE): Dropping of TCP/IP Checksum Error Packets is enabled. 0x1 (DISABLE): Dropping of TCP/IP Checksum Error Packets is disabled.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**Receive Queue Store and Forward (RSF):** When this bit is set, the GbE Controller reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register. 0x0 (DISABLE): Receive Queue Store and Forward is disabled. 0x1 (ENABLE): Receive Queue Store and Forward is enabled.
4	0h RW	**Forward Error Packets (FEP):** When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped. When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet might be forwarded to the application or DMA. 0x0 (DISABLE): Forward Error Packets is disabled. 0x1 (ENABLE): Forward Error Packets is enabled.
3	0h RW	**Forward Undersized Good Packets (FUP):** When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. 0x0 (DISABLE): Forward Undersized Good Packets is disabled. 0x1 (ENABLE): Forward Undersized Good Packets is enabled.
2	0h RO	**Reserved**
1:0	0h RW	**Receive Queue Threshold Control (RTC):** These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred. This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1. 0x0 (M_64BYTE): 64. 0x1 (M_32BYTE): 32. 0x2 (M_96BYTE): 96. 0x3 (M_128BYTE): 128.

3.2.431 MTL_RXQ4_MISSED_PACKET_OVERFLOW_CNT — Offset E34h

The Queue 4 Missed Packet and Overflow Counter register contains the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E34h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27	0h RO	**Missed Packet Counter Overflow Bit (MISCNTOVF):** When set, this bit indicates that the Rx Queue Missed Packet Counter crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Missed Packet Counter overflow not detected. 0x1 (ACTIVE): Missed Packet Counter overflow detected.
26:16	000h RO	**Missed Packet Counter (MISPKTCNT):** This field indicates the number of packets missed by the GbE Controller because the application asserted ari_pkt_flush_i[] for this queue. This counter is reset when this register is read with mci_be_i[0] at 1b1. This counter is incremented by 1 when the DMA discards the packet because of buffer unavailability. Access restriction applies. Clears on read. Self-set to 1 on internal event.
15:12	0h RO	**Reserved**
11	0h RO	**Overflow Counter Overflow Bit (OVFCNTOVF):** When set, this bit indicates that the Rx Queue Overflow Packet Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Overflow Counter overflow not detected. 0x1 (ACTIVE): Overflow Counter overflow detected.
10:0	000h RO	**Overflow Packet Counter (OVFPKTCNT):** This field indicates the number of packets discarded by the GbE Controller because of Receive queue overflow. This counter is incremented each time the GbE Controller discards an incoming packet because of overflow. This counter is reset when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

3.2.432 MTL_RXQ4_DEBUG — Offset E38h

The Queue 4 Receive Debug register gives the debug status of various blocks related to the Receive queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E38h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:16	0000h RO	**Number of Packets in Receive Queue (PRXQ):** This field indicates the current number of packets in the Rx Queue. The theoretical maximum value for this field is 256KB/16B = 16K Packets, that is, Max_Queue_Size/ Min_Packet_Size.
15:6	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
5:4	0h RO	**MTL Rx Queue Fill-Level Status (RXQSTS):** This field gives the status of the fill-level of the Rx Queue: 0x0 (EMPTY): Rx Queue empty. 0x1 (BLW_THR): Rx Queue fill-level below flow-control deactivate threshold. 0x2 (ABV_THR): Rx Queue fill-level above flow-control activate threshold. 0x3 (FULL): Rx Queue full.
3	0h RO	**Reserved**
2:1	0h RO	**MTL Rx Queue Read Controller State (RRCSTS):** This field gives the state of the Rx queue Read controller: 0x0 (IDLE): Idle state. 0x1 (READ_DATA): Reading packet data. 0x2 (READ_STS): Reading packet status (or timestamp). 0x3 (FLUSH): Flushing the packet data and status.
0	0h RO	**MTL Rx Queue Write Controller Active Status (RWCSTS):** When high, this bit indicates that the MTL Rx queue Write controller is active, and it is transferring a received packet to the Rx Queue. 0x0 (INACTIVE): MTL Rx Queue Write Controller Active Status not detected. 0x1 (ACTIVE): MTL Rx Queue Write Controller Active Status detected.

3.2.433 MTL_RXQ4_CONTROL — Offset E3Ch

The Queue Receive Control register controls the receive arbitration and passing of received packets to the application.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E3Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**Receive Queue Packet Arbitration (RXQ_FRM_ARBIT):** When this bit is set, the GbE Controller drives the packet data to the ARI interface such that the entire packet data of currently-selected queue is transmitted before switching to other queue. When this bit is reset, the GbE Controller drives the packet data to the ARI interface such that the following amount of data of currently-selected queue is transmitted before switching to other queue: - PBL amount of data (indicated by ari_qN_pbl_i[]) or - Complete data of a packet The status and the timestamp are not a part of the PBL data. Therefore, the GbE Controller drives the complete status (including timestamp status) during first PBL request for the packet (in store-and-forward mode) or the last PBL request for the packet (in Threshold mode). 0x0 (DISABLE): Receive Queue Packet Arbitration is disabled. 0x1 (ENABLE): Receive Queue Packet Arbitration is enabled.
2:0	0h RW	**Receive Queue Weight (RXQ_WEGT):** This field indicates the weight assigned to the Rx Queue 0. This field needs to be programmed with one value less than the required weight, i.e. reset value of 0 indicates weight of 1, value of 1 indicates weight of 2, and so on. The weight is used as the number of continuous PBL or packets requests (depending on the RXQ_FRM_ARBIT) allocated to the queue in one arbitration cycle. Note: The change in value of RXQ_WEGT takes effect only after the completion of current service round or when there is change from RAA=SP to RAA=WSP algorithm. This approach is taken so that there is smooth transition. For the RXQ_WEGT value to take effect at the start, the MTL_RxQ(#i)_Control registers must be programmed before the MTL_Operation_Mode register.

3.2.434 MTL_TXQ5_OPERATION_MODE — Offset E40h

The Queue 5 Transmit Operation Mode register establishes the Transmit queue operating modes and commands.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E40h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:16	00h RW	**Transmit Queue Size (TQS):** This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. The TQS field is read-write only if the number of Tx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on, so user should be programming TQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (TQS+1)*256 bytes. When the number of Tx Queues is one, the field is read-only and the configured TX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Tx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
15:7	0h RO	**Reserved**
6:4	0h RO	**Reserved**
3:2	0h RW	**Transmit Queue Enable (TXQEN):** This field is used to enable/disable the transmit queue 0. - 2'b00: Not enabled - 2'b01: Enable in AV mode - 2'b10: Enabled - 2'b11: Reserved Note: In multiple Tx queues configuration, all the queues are disabled by default. Enable the Tx queue by programming this field. 0x0 (DISABLE): Not enabled. 0x1 (EN_IF_AV): Enable in AV mode (Reserved in non-AV). 0x2 (ENABLE): Enabled. 0x3 (RSVD2): Reserved.
1	0h RW	**Transmit Store and Forward (TSF):** When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped. 0x0 (DISABLE): Transmit Store and Forward is disabled. 0x1 (ENABLE): Transmit Store and Forward is enabled. Note: This bit should always be set as we do not support cut through mode.
0	0h RW	**Flush Transmit Queue (FTQ):** When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the MTL_TxQ1_Operation_Mode register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission. Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (clk_tx_i) should be active. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Flush Transmit Queue is disabled. 0x1 (ENABLE): Flush Transmit Queue is enabled.

3.2.435 MTL_TXQ5_UNDERFLOW — Offset E44h

The Queue 5 Underflow Counter register contains the counter for packets aborted because of Transmit queue underflow and packets missed because of Receive queue packet flush

Type	Size	Offset	Default
MMIO	32 bit	BAR + E44h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RO	**Overflow Bit for Underflow Packet Counter (UFCNTOVF):** This bit is set every time the Tx queue Underflow Packet Counter field overflows, that is, it has crossed the maximum count. In such a scenario, the overflow packet counter is reset to all-zeros and this bit indicates that the rollover happened. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Overflow not detected for Underflow Packet Counter. 0x1 (ACTIVE): Overflow detected for Underflow Packet Counter.
10:0	000h RO	**Underflow Packet Counter (UFFRMCNT):** This field indicates the number of packets aborted by the controller because of Tx Queue Underflow. This counter is incremented each time the MAC aborts outgoing packet because of underflow. The counter is cleared when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

3.2.436 MTL_TXQ5_DEBUG — Offset E48h

The Queue 5 Transmit Debug register gives the debug status of various blocks related to the Transmit queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E48h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:20	0h RO	**Number of Status Words in Tx Status FIFO of Queue (STXSTSF):** This field indicates the current number of status in the Tx Status FIFO of this queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of status words in Tx Status FIFO.
19	0h RO	**Reserved**
18:16	0h RO	**Number of Packets in the Transmit Queue (PTXQ):** This field indicates the current number of packets in the Tx Queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of packets in the Transmit queue.

Bit Range	Default & Access	Field Name (ID): Description
15:6	0h RO	**Reserved**
5	0h RO	**MTL Tx Status FIFO Full Status (TXSTSFSTS):** When high, this bit indicates that the MTL Tx Status FIFO is full. Therefore, the MTL cannot accept any more packets for transmission. 0x0 (INACTIVE): MTL Tx Status FIFO Full status is not detected. 0x1 (ACTIVE): MTL Tx Status FIFO Full status is detected.
4	0h RO	**MTL Tx Queue Not Empty Status (TXQSTS):** When this bit is high, it indicates that the MTL Tx Queue is not empty and some data is left for transmission. 0x0 (INACTIVE): MTL Tx Queue Not Empty status is not detected. 0x1 (ACTIVE): MTL Tx Queue Not Empty status is detected.
3	0h RO	**MTL Tx Queue Write Controller Status (TWCSTS):** When high, this bit indicates that the MTL Tx Queue Write Controller is active, and it is transferring the data to the Tx Queue. 0x0 (INACTIVE): MTL Tx Queue Write Controller status is not detected. 0x1 (ACTIVE): MTL Tx Queue Write Controller status is detected.
2:1	0h RO	**MTL Tx Queue Read Controller Status (TRCSTS):** This field indicates the state of the Tx Queue Read Controller: 0x0 (IDLE): Idle state. 0x1 (READ): Read state (transferring data to the MAC transmitter). 0x2 (WAIT): Waiting for pending Tx Status from the MAC transmitter. 0x3 (FLUSH): Flushing the Tx queue because of the Packet Abort request from the MAC.
0	0h RO	**Transmit Queue in Pause (TXQPAUSED):** When this bit is high and the Rx flow control is enabled, it indicates that the Tx Queue is in the Pause condition (in the full-duplex only mode) because of the following: - Reception of the PFC packet for the priorities assigned to the Tx Queue when PFC is enabled - Reception of 802.3x Pause packet when PFC is disabled 0x0 (INACTIVE): Transmit Queue in Pause status is not detected. 0x1 (ACTIVE): Transmit Queue in Pause status is detected.

3.2.437 MTL_TXQ5_ETS_CONTROL — Offset E50h

The Queue ETS Control register controls the enhanced transmission selection operation.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E50h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:4	0h RW	**Slot Count (SLC):** If the credit-based shaper algorithm is enabled, the software can program the number of slots (of duration programmed in DMA_CH(#i)_Slot_Interval register) over which the average transmitted bits per slot, provided in the MTL_TxQ(#i)_ETS_Status register, need to be computed for Queue. The encoding is as follows: 0x0 (M_1_SLOT): 1 slot. 0x1 (M_2_SLOT): 2 slots. 0x2 (M_4_SLOT): 4 slots. 0x3 (M_8_SLOT): 8 slots. 0x4 (M_16_SLOT): 16 slots. 0x5 (RSVD): Reserved.
3	0h RW	**Credit Control (CC):** When this bit is set, the accumulated credit parameter in the credit-based shaper algorithm logic is not reset to zero when there is positive credit and no packet to transmit in Channel 1. The credit accumulates even when there is no packet waiting in Channel 1 and another channel is transmitting. When this bit is reset, the accumulated credit parameter in the credit-based shaper algorithm logic is set to zero when there is positive credit and no packet to transmit in Channel 1. When there is no packet waiting in Channel 1 and other channel is transmitting, no credit is accumulated. 0x0 (DISABLE): Credit Control is disabled. 0x1 (ENABLE): Credit Control is enabled.
2	0h RW	**AV Algorithm (AVALG):** When Queue 1 is programmed for AV, this field configures the scheduling algorithm for this queue: This bit when set, indicates credit based shaper algorithm (CBS) is selected for Queue 1 traffic. When reset, strict priority is selected. 0x0 (DISABLE): CBS Algorithm is disabled. 0x1 (ENABLE): CBS Algorithm is enabled.
1:0	0h RO	**Reserved**

3.2.438 MTL_TXQ5_ETS_STATUS — Offset E54h

The Queue 5 ETS Status register provides the average traffic transmitted in Queue 5.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E54h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RO	**Average Bits per Slot (ABS):** This field contains the average transmitted bits per slot. If AV operation is enabled, this field is computed over number of slots, programmed in the SLC field of MTL_TxQ(#i)_ETS_CONTROL register. The maximum value of this field is 0x6_4000 in 100 Mbps, 0x3E_8000 in 1000 Mbps and 9C_4000 in 2500 Mbps mode respectively. When the DCB operation is enabled for Queue, this field is computed over every 10 million bit times slot (4 ms in 2500 Mbps; 10 ms in 1000 Mbps; 100 ms in 100 Mbps). The maximum value is 0x989680.

3.2.439 MTL_TXQ5_QUANTUM_WEIGHT — Offset E58h

The Queue 5 idleSlopeCredit, Quantum or Weights register provides the average traffic transmitted in Queue 5.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E58h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved**
20:0	000000h RW	**ISCQW:** idleSlopeCredit, Quantum or Weights - idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns for 100 Mbps; 8 ns for 1000 Mbps; 3.2 ns for 2500 Mbps) when the credit is increasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. Bits[20:14] must be written to zero. - Quantum When the DCB operation is enabled with DWRR algorithm for Queue 1 traffic, this field contains the quantum value in bytes to be added to credit during every queue scanning cycle. The maximum value is 0x1312D0 bytes. - Weights When DCB operation is enabled with WFQ algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x3FFF where weight of 0 indicates 100% bandwidth. Bits[20:14] must be written to zero. When DCB operation or generic queuing operation is enabled with WRR algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x64. Bits [20:7] must be written to zero. - Note 1: In multiple Queue configuration this field in respective per queue register must be programmed to some non-zero value when multiple queues are enabled or single queue other than Q0 is enabled. This field need not be programmed when only Q0 is enabled. In general, when WRR algorithm is selected a non-zero value must be programmed on both Receive and Transmit. In Receive, the register is MTL_Operation_Mode register. - Note 2: For WFQ algorithm, higher the programmed weights lesser the bandwidth allocated for that Transmit Queue. The finish time is not a function of particular packet alone but it is as per the formula: (previous_finish_time of particular Transmit Queue + (weights*packet_size)) - Note 3: The weights programmed do not correspond to the number of packets but the fraction of bandwidth or time allocated for particular queue w.r.t. total BW or time.

3.2.440 MTL_TXQ5_SENDSLOPECREDIT — Offset E5Ch

The sendSlopeCredit register contains the sendSlope credit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E5Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13:0	0000h RW	**sendSlopeCredit Value (SSC):** When AV operation is enabled, this field contains the sendSlopeCredit value required for credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns, 8 ns and 3.2 ns for 100 Mbps, 1000 Mbps and 2500 Mbps respectively) when the credit is decreasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. This field should be programmed with absolute sendSlopeCredit value. The credit-based shaper logic subtracts it from the accumulated credit when Channel 1 is selected for transmission.

3.2.441 MTL_TXQ5_HICREDIT — Offset E60h

The hiCredit register contains the hiCredit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E60h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:0	00000000h RW	**hiCredit Value (HC):** When the AV feature is enabled, this field contains the hiCredit value required for the credit-based shaper algorithm. This is the maximum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1,024. The maximum value is maxInterferenceSize, that is, best-effort maximum packet size (16,384 bytes or 131,072 bits). The value to be specified is 131,072 * 1,024 = 134,217,728 or 0x0800_0000.

3.2.442 MTL_TXQ5_LOCREDIT — Offset E64h

The loCredit register contains the loCredit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E64h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:0	00000000h RW	**loCredit Value (LC):** When AV operation is enabled, this field contains the loCredit value required for the credit-based shaper algorithm. This is the minimum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1,024. The maximum value to be programmed is corresponds to twice the maxFrameSize transmitted from this queue. If the maxFrameSize is 8192 bytes, then (8192*2) * 8 * 1024 = 134,217,728 or 0x0800_0000. Because it is a negative value, the programmed value is 2's complement of the value, that is, 0x1800_0000.

3.2.443 MTL_Q5_INTERRUPT_CONTROL_STATUS — Offset E6Ch

This register contains the interrupt enable and status bits for the queue 5 interrupts.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E6Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**Receive Queue Overflow Interrupt Enable (RXOIE):** When this bit is set, the Receive Queue Overflow interrupt is enabled. When this bit is reset, the Receive Queue Overflow interrupt is disabled. 0x0 (DISABLE): Receive Queue Overflow Interrupt is disabled. 0x1 (ENABLE): Receive Queue Overflow Interrupt is enabled.
23:17	0h RO	**Reserved**
16	0h RW	**Receive Queue Overflow Interrupt Status (RXOVFIS):** This bit indicates that the Receive Queue had an overflow while receiving the packet. If a partial packet is transferred to the application, the overflow status is set in RDES3[21]. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Queue Overflow Interrupt Status not detected. 0x1 (ACTIVE): Receive Queue Overflow Interrupt Status detected.
15:10	0h RO	**Reserved**
9	0h RW	**Average Bits Per Slot Interrupt Enable (ABPSIE):** When this bit is set, the MAC asserts the sbd_intr_o or mci_intr_o interrupt when the average bits per slot status is updated. When this bit is cleared, the interrupt is not asserted for such an event. 0x0 (DISABLE): Average Bits Per Slot Interrupt is disabled. 0x1 (ENABLE): Average Bits Per Slot Interrupt is enabled.
8	0h RW	**Transmit Queue Underflow Interrupt Enable (TXUIE):** When this bit is set, the Transmit Queue Underflow interrupt is enabled. When this bit is reset, the Transmit Queue Underflow interrupt is disabled. 0x0 (DISABLE): Transmit Queue Underflow Interrupt Status is disabled. 0x1 (ENABLE): Transmit Queue Underflow Interrupt Status is enabled.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	**Reserved**
1	0h RW	**Average Bits Per Slot Interrupt Status (ABPSIS):** When set, this bit indicates that the MAC has updated the ABS value. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Average Bits Per Slot Interrupt Status not detected. 0x1 (ACTIVE): Average Bits Per Slot Interrupt Status detected.
0	0h RW	**Transmit Queue Underflow Interrupt Status (TXUNFIS):** This bit indicates that the Transmit Queue had an underflow while transmitting the packet. Transmission is suspended and an Underflow Error TDES3[2] is set. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Queue Underflow Interrupt Status not detected. 0x1 (ACTIVE): Transmit Queue Underflow Interrupt Status detected.

3.2.444 MTL_RXQ5_OPERATION_MODE — Offset E70h

The Queue 5 Receive Operation Mode register establishes the Receive queue operating modes and command.

The RFA and RFD fields are not backward compatible with the RFA and RFD fields of 4.00a release

Type	Size	Offset	Default
MMIO	32 bit	BAR + E70h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved**
26:20	00h RW	**Receive Queue Size (RQS):** This field indicates the size of the allocated Receive queues in blocks of 256 bytes. The RQS field is read-write only if the number of Rx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on, so user should be programming RQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (RQS+1)*256 bytes. When the number of Rx Queues is one, the field is read-only and the configured RX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Rx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
19:14	00h RW	**Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) (RFD):** These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1.5 KB, that is, FULL 1.5 KB - 2: Full minus 2 KB, that is, FULL 2 KB - 3: Full minus 2.5 KB, that is, FULL 2.5 KB - ... - 62: Full minus 32 KB, that is, FULL 32 KB - 63: Full minus 32.5 KB, that is, FULL 32.5 KB The de-assertion is effective only after flow control is asserted. Note: The value must be programmed in such a way to make sure that the threshold is a positive number. When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register. The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13:8	00h RW	**Threshold for Activating Flow Control (in half-duplex and full-duplex (RFA):** These bits control the threshold (fill-level of Rx queue) at which the flow control is activated: For more information on encoding for this field, see RFD.
7	0h RW	**Enable Hardware Flow Control (EHFC):** When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. 0x0 (DISABLE): Hardware Flow Control is disabled. 0x1 (ENABLE): Hardware Flow Control is enabled.
6	0h RW	**Disable Dropping of TCP/IP Checksum Error Packets (DIS_TCP_EF):** When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC. When this bit is reset, all error packets are dropped if the FEP bit is reset. 0x0 (ENABLE): Dropping of TCP/IP Checksum Error Packets is enabled. 0x1 (DISABLE): Dropping of TCP/IP Checksum Error Packets is disabled.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**Receive Queue Store and Forward (RSF):** When this bit is set, the GbE Controller reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register. 0x0 (DISABLE): Receive Queue Store and Forward is disabled. 0x1 (ENABLE): Receive Queue Store and Forward is enabled.
4	0h RW	**Forward Error Packets (FEP):** When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped. When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet might be forwarded to the application or DMA. 0x0 (DISABLE): Forward Error Packets is disabled. 0x1 (ENABLE): Forward Error Packets is enabled.
3	0h RW	**Forward Undersized Good Packets (FUP):** When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. 0x0 (DISABLE): Forward Undersized Good Packets is disabled. 0x1 (ENABLE): Forward Undersized Good Packets is enabled.
2	0h RO	**Reserved**
1:0	0h RW	**Receive Queue Threshold Control (RTC):** These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred. This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1. 0x0 (M_64BYTE): 64. 0x1 (M_32BYTE): 32. 0x2 (M_96BYTE): 96. 0x3 (M_128BYTE): 128.

3.2.445 MTL_RXQ5_MISSED_PACKET_OVERFLOW_CNT — Offset E74h

The Queue 5 Missed Packet and Overflow Counter register contains the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E74h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27	0h RO	**Missed Packet Counter Overflow Bit (MISCNTOVF):** When set, this bit indicates that the Rx Queue Missed Packet Counter crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Missed Packet Counter overflow not detected. 0x1 (ACTIVE): Missed Packet Counter overflow detected.
26:16	000h RO	**Missed Packet Counter (MISPKTCNT):** This field indicates the number of packets missed by the GbE Controller because the application asserted ari_pkt_flush_i[] for this queue. This counter is reset when this register is read with mci_be_i[0] at 1b1. This counter is incremented by 1 when the DMA discards the packet because of buffer unavailability. Access restriction applies. Clears on read. Self-set to 1 on internal event.
15:12	0h RO	**Reserved**
11	0h RO	**Overflow Counter Overflow Bit (OVFCNTOVF):** When set, this bit indicates that the Rx Queue Overflow Packet Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Overflow Counter overflow not detected. 0x1 (ACTIVE): Overflow Counter overflow detected.
10:0	000h RO	**Overflow Packet Counter (OVFPKTCNT):** This field indicates the number of packets discarded by the GbE Controller because of Receive queue overflow. This counter is incremented each time the GbE Controller discards an incoming packet because of overflow. This counter is reset when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

3.2.446 MTL_RXQ5_DEBUG — Offset E78h

The Queue 5 Receive Debug register gives the debug status of various blocks related to the Receive queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E78h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:16	0000h RO	**Number of Packets in Receive Queue (PRXQ):** This field indicates the current number of packets in the Rx Queue. The theoretical maximum value for this field is 256KB/16B = 16K Packets, that is, Max_Queue_Size/ Min_Packet_Size.
15:6	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
5:4	0h RO	**MTL Rx Queue Fill-Level Status (RXQSTS):** This field gives the status of the fill-level of the Rx Queue: 0x0 (EMPTY): Rx Queue empty. 0x1 (BLW_THR): Rx Queue fill-level below flow-control deactivate threshold. 0x2 (ABV_THR): Rx Queue fill-level above flow-control activate threshold. 0x3 (FULL): Rx Queue full.
3	0h RO	**Reserved**
2:1	0h RO	**MTL Rx Queue Read Controller State (RRCSTS):** This field gives the state of the Rx queue Read controller: 0x0 (IDLE): Idle state. 0x1 (READ_DATA): Reading packet data. 0x2 (READ_STS): Reading packet status (or timestamp). 0x3 (FLUSH): Flushing the packet data and status.
0	0h RO	**MTL Rx Queue Write Controller Active Status (RWCSTS):** When high, this bit indicates that the MTL Rx queue Write controller is active, and it is transferring a received packet to the Rx Queue. 0x0 (INACTIVE): MTL Rx Queue Write Controller Active Status not detected. 0x1 (ACTIVE): MTL Rx Queue Write Controller Active Status detected.

3.2.447 MTL_RXQ5_CONTROL — Offset E7Ch

The Queue Receive Control register controls the receive arbitration and passing of received packets to the application.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E7Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**Receive Queue Packet Arbitration (RXQ_FRM_ARBIT):** When this bit is set, the GbE Controller drives the packet data to the ARI interface such that the entire packet data of currently-selected queue is transmitted before switching to other queue. When this bit is reset, the GbE Controller drives the packet data to the ARI interface such that the following amount of data of currently-selected queue is transmitted before switching to other queue: - PBL amount of data (indicated by ari_qN_pbl_i[]) or - Complete data of a packet The status and the timestamp are not a part of the PBL data. Therefore, the GbE Controller drives the complete status (including timestamp status) during first PBL request for the packet (in store-and-forward mode) or the last PBL request for the packet (in Threshold mode). 0x0 (DISABLE): Receive Queue Packet Arbitration is disabled. 0x1 (ENABLE): Receive Queue Packet Arbitration is enabled.
2:0	0h RW	**Receive Queue Weight (RXQ_WEGT):** This field indicates the weight assigned to the Rx Queue 0. This field needs to be programmed with one value less than the required weight, i.e. reset value of 0 indicates weight of 1, value of 1 indicates weight of 2, and so on. The weight is used as the number of continuous PBL or packets requests (depending on the RXQ_FRM_ARBIT) allocated to the queue in one arbitration cycle. Note: The change in value of RXQ_WEGT takes effect only after the completion of current service round or when there is change from RAA=SP to RAA=WSP algorithm. This approach is taken so that there is smooth transition. For the RXQ_WEGT value to take effect at the start, the MTL_RxQ(#i)_Control registers must be programmed before the MTL_Operation_Mode register.

3.2.448 MTL_TXQ6_OPERATION_MODE — Offset E80h

The Queue 6 Transmit Operation Mode register establishes the Transmit queue operating modes and commands.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E80h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:16	00h RW	**Transmit Queue Size (TQS):** This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. The TQS field is read-write only if the number of Tx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on, so user should be programming TQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (TQS+1)*256 bytes. When the number of Tx Queues is one, the field is read-only and the configured TX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Tx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
15:7	0h RO	**Reserved**
6:4	0h RW	**Reserved**
3:2	0h RW	**Transmit Queue Enable (TXQEN):** This field is used to enable/disable the transmit queue 0. - 2'b00: Not enabled - 2'b01: Enable in AV mode - 2'b10: Enabled - 2'b11: Reserved Note: In multiple Tx queues configuration, all the queues are disabled by default. Enable the Tx queue by programming this field. 0x0 (DISABLE): Not enabled. 0x1 (EN_IF_AV): Enable in AV mode (Reserved in non-AV). 0x2 (ENABLE): Enabled. 0x3 (RSVD2): Reserved.
1	0h RW	**Transmit Store and Forward (TSF):** When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped. 0x0 (DISABLE): Transmit Store and Forward is disabled. 0x1 (ENABLE): Transmit Store and Forward is enabled. Note: This bit should be always be set as we do not support cut through mode.
0	0h RW	**Flush Transmit Queue (FTQ):** When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the MTL_TxQ1_Operation_Mode register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission. Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (clk_tx_i) should be active. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Flush Transmit Queue is disabled. 0x1 (ENABLE): Flush Transmit Queue is enabled.

3.2.449 MTL_TXQ6_UNDERFLOW — Offset E84h

The Queue 6 Underflow Counter register contains the counter for packets aborted because of Transmit queue underflow and packets missed because of Receive queue packet flush

Type	Size	Offset	Default
MMIO	32 bit	BAR + E84h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RO	**Overflow Bit for Underflow Packet Counter (UFCNTOVF):** This bit is set every time the Tx queue Underflow Packet Counter field overflows, that is, it has crossed the maximum count. In such a scenario, the overflow packet counter is reset to all-zeros and this bit indicates that the rollover happened. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Overflow not detected for Underflow Packet Counter. 0x1 (ACTIVE): Overflow detected for Underflow Packet Counter.
10:0	000h RO	**Underflow Packet Counter (UFFRMCNT):** This field indicates the number of packets aborted by the controller because of Tx Queue Underflow. This counter is incremented each time the MAC aborts outgoing packet because of underflow. The counter is cleared when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

3.2.450 MTL_TXQ6_DEBUG — Offset E88h

The Queue 6 Transmit Debug register gives the debug status of various blocks related to the Transmit queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E88h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:20	0h RO	**Number of Status Words in Tx Status FIFO of Queue (STXSTSF):** This field indicates the current number of status in the Tx Status FIFO of this queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of status words in Tx Status FIFO.
19	0h RO	**Reserved**
18:16	0h RO	**Number of Packets in the Transmit Queue (PTXQ):** This field indicates the current number of packets in the Tx Queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of packets in the Transmit queue.

Bit Range	Default & Access	Field Name (ID): Description
15:6	0h RO	**Reserved**
5	0h RO	**MTL Tx Status FIFO Full Status (TXSTSFSTS):** When high, this bit indicates that the MTL Tx Status FIFO is full. Therefore, the MTL cannot accept any more packets for transmission. 0x0 (INACTIVE): MTL Tx Status FIFO Full status is not detected. 0x1 (ACTIVE): MTL Tx Status FIFO Full status is detected.
4	0h RO	**MTL Tx Queue Not Empty Status (TXQSTS):** When this bit is high, it indicates that the MTL Tx Queue is not empty and some data is left for transmission. 0x0 (INACTIVE): MTL Tx Queue Not Empty status is not detected. 0x1 (ACTIVE): MTL Tx Queue Not Empty status is detected.
3	0h RO	**MTL Tx Queue Write Controller Status (TWCSTS):** When high, this bit indicates that the MTL Tx Queue Write Controller is active, and it is transferring the data to the Tx Queue. 0x0 (INACTIVE): MTL Tx Queue Write Controller status is not detected. 0x1 (ACTIVE): MTL Tx Queue Write Controller status is detected.
2:1	0h RO	**MTL Tx Queue Read Controller Status (TRCSTS):** This field indicates the state of the Tx Queue Read Controller: 0x0 (IDLE): Idle state. 0x1 (READ): Read state (transferring data to the MAC transmitter). 0x2 (WAIT): Waiting for pending Tx Status from the MAC transmitter. 0x3 (FLUSH): Flushing the Tx queue because of the Packet Abort request from the MAC.
0	0h RO	**Transmit Queue in Pause (TXQPAUSED):** When this bit is high and the Rx flow control is enabled, it indicates that the Tx Queue is in the Pause condition (in the full-duplex only mode) because of the following: - Reception of the PFC packet for the priorities assigned to the Tx Queue when PFC is enabled - Reception of 802.3x Pause packet when PFC is disabled 0x0 (INACTIVE): Transmit Queue in Pause status is not detected. 0x1 (ACTIVE): Transmit Queue in Pause status is detected.

3.2.451 MTL_TXQ6_ETS_CONTROL — Offset E90h

The Queue ETS Control register controls the enhanced transmission selection operation.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E90h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:4	0h RW	**Slot Count (SLC):** If the credit-based shaper algorithm is enabled, the software can program the number of slots (of duration programmed in DMA_CH(#i)_Slot_Interval register) over which the average transmitted bits per slot, provided in the MTL_TxQ(#i)_ETS_Status register, need to be computed for Queue. The encoding is as follows: 0x0 (M_1_SLOT): 1 slot. 0x1 (M_2_SLOT): 2 slots. 0x2 (M_4_SLOT): 4 slots. 0x3 (M_8_SLOT): 8 slots. 0x4 (M_16_SLOT): 16 slots. 0x5 (RSVD): Reserved.
3	0h RW	**Credit Control (CC):** When this bit is set, the accumulated credit parameter in the credit-based shaper algorithm logic is not reset to zero when there is positive credit and no packet to transmit in Channel 1. The credit accumulates even when there is no packet waiting in Channel 1 and another channel is transmitting. When this bit is reset, the accumulated credit parameter in the credit-based shaper algorithm logic is set to zero when there is positive credit and no packet to transmit in Channel 1. When there is no packet waiting in Channel 1 and other channel is transmitting, no credit is accumulated. 0x0 (DISABLE): Credit Control is disabled. 0x1 (ENABLE): Credit Control is enabled.
2	0h RW	**AV Algorithm (AVALG):** When Queue 1 is programmed for AV, this field configures the scheduling algorithm for this queue: This bit when set, indicates credit based shaper algorithm (CBS) is selected for Queue 1 traffic. When reset, strict priority is selected. 0x0 (DISABLE): CBS Algorithm is disabled. 0x1 (ENABLE): CBS Algorithm is enabled.
1:0	0h RO	**Reserved**

3.2.452 MTL_TXQ6_ETS_STATUS — Offset E94h

The Queue 6 ETS Status register provides the average traffic transmitted in Queue 6.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E94h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RO	**Average Bits per Slot (ABS):** This field contains the average transmitted bits per slot. If AV operation is enabled, this field is computed over number of slots, programmed in the SLC field of MTL_TxQ(#i)_ETS_CONTROL register. The maximum value of this field is 0x6_4000 in 100 Mbps, 0x3E_8000 in 1000 Mbps and 9C_4000 in 2500 Mbps mode respectively. When the DCB operation is enabled for Queue, this field is computed over every 10 million bit times slot (4 ms in 2500 Mbps; 10 ms in 1000 Mbps; 100 ms in 100 Mbps). The maximum value is 0x989680.

3.2.453 MTL_TXQ6_QUANTUM_WEIGHT — Offset E98h

The Queue 6 idleSlopeCredit, Quantum or Weights register provides the average traffic transmitted in Queue 6.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved**
20:0	000000h RW	**ISCQW:** idleSlopeCredit, Quantum or Weights - idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns for 100 Mbps; 8 ns for 1000 Mbps; 3.2 ns for 2500 Mbps) when the credit is increasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. Bits[20:14] must be written to zero. - Quantum When the DCB operation is enabled with DWRR algorithm for Queue 1 traffic, this field contains the quantum value in bytes to be added to credit during every queue scanning cycle. The maximum value is 0x1312D0 bytes. - Weights When DCB operation is enabled with WFQ algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x3FFF where weight of 0 indicates 100% bandwidth. Bits[20:14] must be written to zero. When DCB operation or generic queuing operation is enabled with WRR algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x64. Bits [20:7] must be written to zero. - Note 1: In multiple Queue configuration this field in respective per queue register must be programmed to some non-zero value when multiple queues are enabled or single queue other than Q0 is enabled. This field need not be programmed when only Q0 is enabled. In general, when WRR algorithm is selected a non-zero value must be programmed on both Receive and Transmit. In Receive, the register is MTL_Operation_Mode register. - Note 2: For WFQ algorithm, higher the programmed weights lesser the bandwidth allocated for that Transmit Queue. The finish time is not a function of particular packet alone but it is as per the formula: (previous_finish_time of particular Transmit Queue + (weights*packet_size)) - Note 3: The weights programmed do not correspond to the number of packets but the fraction of bandwidth or time allocated for particular queue w.r.t. total BW or time.

3.2.454 MTL_TXQ6_SENDSLOPECREDIT — Offset E9Ch

The sendSlopeCredit register contains the sendSlope credit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13:0	0000h RW	**sendSlopeCredit Value (SSC):** When AV operation is enabled, this field contains the sendSlopeCredit value required for credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns, 8 ns and 3.2 ns for 100 Mbps, 1000 Mbps and 2500 Mbps respectively) when the credit is decreasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. This field should be programmed with absolute sendSlopeCredit value. The credit-based shaper logic subtracts it from the accumulated credit when Channel 1 is selected for transmission.

3.2.455 MTL_TXQ6_HICREDIT — Offset EA0h

The hiCredit register contains the hiCredit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + EA0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:0	00000000h RW	**hiCredit Value (HC):** When the AV feature is enabled, this field contains the hiCredit value required for the credit-based shaper algorithm. This is the maximum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1,024. The maximum value is maxInterferenceSize, that is, best-effort maximum packet size (16,384 bytes or 131,072 bits). The value to be specified is 131,072 * 1,024 = 134,217,728 or 0x0800_0000.

3.2.456 MTL_TXQ6_LOCREDIT — Offset EA4h

The loCredit register contains the loCredit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + EA4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:0	00000000h RW	**loCredit Value (LC):** When AV operation is enabled, this field contains the loCredit value required for the credit-based shaper algorithm. This is the minimum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1,024. The maximum value to be programmed is corresponds to twice the maxFrameSize transmitted from this queue. If the maxFrameSize is 8192 bytes, then (8192*2) * 8 * 1024 = 134,217,728 or 0x0800_0000. Because it is a negative value, the programmed value is 2's complement of the value, that is, 0x1800_0000.

3.2.457 MTL_Q6_INTERRUPT_CONTROL_STATUS — Offset EACh

This register contains the interrupt enable and status bits for the queue 6 interrupts.

Type	Size	Offset	Default
MMIO	32 bit	BAR + EACh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**Receive Queue Overflow Interrupt Enable (RXOIE):** When this bit is set, the Receive Queue Overflow interrupt is enabled. When this bit is reset, the Receive Queue Overflow interrupt is disabled. 0x0 (DISABLE): Receive Queue Overflow Interrupt is disabled. 0x1 (ENABLE): Receive Queue Overflow Interrupt is enabled.
23:17	0h RO	**Reserved**
16	0h RW	**Receive Queue Overflow Interrupt Status (RXOVFIS):** This bit indicates that the Receive Queue had an overflow while receiving the packet. If a partial packet is transferred to the application, the overflow status is set in RDES3[21]. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Queue Overflow Interrupt Status not detected. 0x1 (ACTIVE): Receive Queue Overflow Interrupt Status detected.
15:10	0h RO	**Reserved**
9	0h RW	**Average Bits Per Slot Interrupt Enable (ABPSIE):** When this bit is set, the MAC asserts the sbd_intr_o or mci_intr_o interrupt when the average bits per slot status is updated. When this bit is cleared, the interrupt is not asserted for such an event. 0x0 (DISABLE): Average Bits Per Slot Interrupt is disabled. 0x1 (ENABLE): Average Bits Per Slot Interrupt is enabled.
8	0h RW	**Transmit Queue Underflow Interrupt Enable (TXUIE):** When this bit is set, the Transmit Queue Underflow interrupt is enabled. When this bit is reset, the Transmit Queue Underflow interrupt is disabled. 0x0 (DISABLE): Transmit Queue Underflow Interrupt Status is disabled. 0x1 (ENABLE): Transmit Queue Underflow Interrupt Status is enabled.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	**Reserved**
1	0h RW	**Average Bits Per Slot Interrupt Status (ABPSIS):** When set, this bit indicates that the MAC has updated the ABS value. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Average Bits Per Slot Interrupt Status not detected. 0x1 (ACTIVE): Average Bits Per Slot Interrupt Status detected.
0	0h RW	**Transmit Queue Underflow Interrupt Status (TXUNFIS):** This bit indicates that the Transmit Queue had an underflow while transmitting the packet. Transmission is suspended and an Underflow Error TDES3[2] is set. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Queue Underflow Interrupt Status not detected. 0x1 (ACTIVE): Transmit Queue Underflow Interrupt Status detected.

3.2.458 MTL_RXQ6_OPERATION_MODE — Offset EB0h

The Queue 6 Receive Operation Mode register establishes the Receive queue operating modes and command.

The RFA and RFD fields are not backward compatible with the RFA and RFD fields of 4.00a release

Type	Size	Offset	Default
MMIO	32 bit	BAR + EB0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved**
26:20	00h RW	**Receive Queue Size (RQS):** This field indicates the size of the allocated Receive queues in blocks of 256 bytes. The RQS field is read-write only if the number of Rx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on, so user should be programming RQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (RQS+1)*256 bytes. When the number of Rx Queues is one, the field is read-only and the configured RX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Rx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
19:14	00h RW	**Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) (RFD):** These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1.5 KB, that is, FULL 1.5 KB - 2: Full minus 2 KB, that is, FULL 2 KB - 3: Full minus 2.5 KB, that is, FULL 2.5 KB - ... - 62: Full minus 32 KB, that is, FULL 32 KB - 63: Full minus 32.5 KB, that is, FULL 32.5 KB The de-assertion is effective only after flow control is asserted. Note: The value must be programmed in such a way to make sure that the threshold is a positive number. When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register. The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13:8	00h RW	**Threshold for Activating Flow Control (in half-duplex and full-duplex (RFA):** These bits control the threshold (fill-level of Rx queue) at which the flow control is activated: For more information on encoding for this field, see RFD.
7	0h RW	**Enable Hardware Flow Control (EHFC):** When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. 0x0 (DISABLE): Hardware Flow Control is disabled. 0x1 (ENABLE): Hardware Flow Control is enabled.
6	0h RW	**Disable Dropping of TCP/IP Checksum Error Packets (DIS_TCP_EF):** When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC. When this bit is reset, all error packets are dropped if the FEP bit is reset. 0x0 (ENABLE): Dropping of TCP/IP Checksum Error Packets is enabled. 0x1 (DISABLE): Dropping of TCP/IP Checksum Error Packets is disabled.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**Receive Queue Store and Forward (RSF):** When this bit is set, the GbE Controller reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register. 0x0 (DISABLE): Receive Queue Store and Forward is disabled. 0x1 (ENABLE): Receive Queue Store and Forward is enabled.
4	0h RW	**Forward Error Packets (FEP):** When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped. When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet might be forwarded to the application or DMA. 0x0 (DISABLE): Forward Error Packets is disabled. 0x1 (ENABLE): Forward Error Packets is enabled.
3	0h RW	**Forward Undersized Good Packets (FUP):** When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. 0x0 (DISABLE): Forward Undersized Good Packets is disabled. 0x1 (ENABLE): Forward Undersized Good Packets is enabled.
2	0h RO	**Reserved**
1:0	0h RW	**Receive Queue Threshold Control (RTC):** These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred. This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1. 0x0 (M_64BYTE): 64. 0x1 (M_32BYTE): 32. 0x2 (M_96BYTE): 96. 0x3 (M_128BYTE): 128.

3.2.459 MTL_RXQ6_MISSED_PACKET_OVERFLOW_CNT — Offset EB4h

The Queue 6 Missed Packet and Overflow Counter register contains the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow.

Type	Size	Offset	Default
MMIO	32 bit	BAR + EB4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27	0h RO	**Missed Packet Counter Overflow Bit (MISCNTOVF):** When set, this bit indicates that the Rx Queue Missed Packet Counter crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Missed Packet Counter overflow not detected. 0x1 (ACTIVE): Missed Packet Counter overflow detected.
26:16	000h RO	**Missed Packet Counter (MISPKTCNT):** This field indicates the number of packets missed by the GbE Controller because the application asserted ari_pkt_flush_i[] for this queue. This counter is reset when this register is read with mci_be_i[0] at 1b1. This counter is incremented by 1 when the DMA discards the packet because of buffer unavailability. Access restriction applies. Clears on read. Self-set to 1 on internal event.
15:12	0h RO	**Reserved**
11	0h RO	**Overflow Counter Overflow Bit (OVFCNTOVF):** When set, this bit indicates that the Rx Queue Overflow Packet Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Overflow Counter overflow not detected. 0x1 (ACTIVE): Overflow Counter overflow detected.
10:0	000h RO	**Overflow Packet Counter (OVFPKTCNT):** This field indicates the number of packets discarded by the GbE Controller because of Receive queue overflow. This counter is incremented each time the GbE Controller discards an incoming packet because of overflow. This counter is reset when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

3.2.460 MTL_RXQ6_DEBUG — Offset EB8h

The Queue 6 Receive Debug register gives the debug status of various blocks related to the Receive queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + EB8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:16	0000h RO	**Number of Packets in Receive Queue (PRXQ):** This field indicates the current number of packets in the Rx Queue. The theoretical maximum value for this field is 256KB/16B = 16K Packets, that is, Max_Queue_Size/ Min_Packet_Size.
15:6	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
5:4	0h RO	**MTL Rx Queue Fill-Level Status (RXQSTS):** This field gives the status of the fill-level of the Rx Queue: 0x0 (EMPTY): Rx Queue empty. 0x1 (BLW_THR): Rx Queue fill-level below flow-control deactivate threshold. 0x2 (ABV_THR): Rx Queue fill-level above flow-control activate threshold. 0x3 (FULL): Rx Queue full.
3	0h RO	**Reserved**
2:1	0h RO	**MTL Rx Queue Read Controller State (RRCSTS):** This field gives the state of the Rx queue Read controller: 0x0 (IDLE): Idle state. 0x1 (READ_DATA): Reading packet data. 0x2 (READ_STS): Reading packet status (or timestamp). 0x3 (FLUSH): Flushing the packet data and status.
0	0h RO	**MTL Rx Queue Write Controller Active Status (RWCSTS):** When high, this bit indicates that the MTL Rx queue Write controller is active, and it is transferring a received packet to the Rx Queue. 0x0 (INACTIVE): MTL Rx Queue Write Controller Active Status not detected. 0x1 (ACTIVE): MTL Rx Queue Write Controller Active Status detected.

3.2.461 MTL_RXQ6_CONTROL — Offset EBCh

The Queue Receive Control register controls the receive arbitration and passing of received packets to the application.

Type	Size	Offset	Default
MMIO	32 bit	BAR + EBCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**Receive Queue Packet Arbitration (RXQ_FRM_ARBIT):** When this bit is set, the GbE Controller drives the packet data to the ARI interface such that the entire packet data of currently-selected queue is transmitted before switching to other queue. When this bit is reset, the GbE Controller drives the packet data to the ARI interface such that the following amount of data of currently-selected queue is transmitted before switching to other queue: - PBL amount of data (indicated by ari_qN_pbl_i[]) or - Complete data of a packet The status and the timestamp are not a part of the PBL data. Therefore, the GbE Controller drives the complete status (including timestamp status) during first PBL request for the packet (in store-and-forward mode) or the last PBL request for the packet (in Threshold mode). 0x0 (DISABLE): Receive Queue Packet Arbitration is disabled. 0x1 (ENABLE): Receive Queue Packet Arbitration is enabled.
2:0	0h RW	**Receive Queue Weight (RXQ_WEGT):** This field indicates the weight assigned to the Rx Queue 0. This field needs to be programmed with one value less than the required weight, i.e. reset value of 0 indicates weight of 1, value of 1 indicates weight of 2, and so on. The weight is used as the number of continuous PBL or packets requests (depending on the RXQ_FRM_ARBIT) allocated to the queue in one arbitration cycle. Note: The change in value of RXQ_WEGT takes effect only after the completion of current service round or when there is change from RAA=SP to RAA=WSP algorithm. This approach is taken so that there is smooth transition. For the RXQ_WEGT value to take effect at the start, the MTL_RxQ(#i)_Control registers must be programmed before the MTL_Operation_Mode register.

3.2.462 MTL_TXQ7_OPERATION_MODE — Offset EC0h

The Queue 7 Transmit Operation Mode register establishes the Transmit queue operating modes and commands.

Type	Size	Offset	Default
MMIO	32 bit	BAR + EC0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:16	00h RW	**Transmit Queue Size (TQS):** This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. The TQS field is read-write only if the number of Tx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on, so user should be programming TQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (TQS+1)*256 bytes. When the number of Tx Queues is one, the field is read-only and the configured TX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Tx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
15:7	0h RO	**Reserved**
6:4	0h RO	**Reserved**
3:2	0h RW	**Transmit Queue Enable (TXQEN):** This field is used to enable/disable the transmit queue 0. - 2'b00: Not enabled - 2'b01: Enable in AV mode - 2'b10: Enabled - 2'b11: Reserved Note: In multiple Tx queues configuration, all the queues are disabled by default. Enable the Tx queue by programming this field. 0x0 (DISABLE): Not enabled. 0x1 (EN_IF_AV): Enable in AV mode (Reserved in non-AV). 0x2 (ENABLE): Enabled. 0x3 (RSVD2): Reserved.
1	0h RW	**Transmit Store and Forward (TSF):** When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped. 0x0 (DISABLE): Transmit Store and Forward is disabled. 0x1 (ENABLE): Transmit Store and Forward is enabled. Note: This bit should always be set as we do not support cut through mode.
0	0h RW	**Flush Transmit Queue (FTQ):** When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the MTL_TxQ1_Operation_Mode register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission. Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (clk_tx_i) should be active. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Flush Transmit Queue is disabled. 0x1 (ENABLE): Flush Transmit Queue is enabled.

3.2.463 MTL_TXQ7_UNDERFLOW — Offset EC4h

The Queue 7 Underflow Counter register contains the counter for packets aborted because of Transmit queue underflow and packets missed because of Receive queue packet flush

Type	Size	Offset	Default
MMIO	32 bit	BAR + EC4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RO	**Overflow Bit for Underflow Packet Counter (UFCNTOVF):** This bit is set every time the Tx queue Underflow Packet Counter field overflows, that is, it has crossed the maximum count. In such a scenario, the overflow packet counter is reset to all-zeros and this bit indicates that the rollover happened. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Overflow not detected for Underflow Packet Counter. 0x1 (ACTIVE): Overflow detected for Underflow Packet Counter.
10:0	000h RO	**Underflow Packet Counter (UFFRMCNT):** This field indicates the number of packets aborted by the controller because of Tx Queue Underflow. This counter is incremented each time the MAC aborts outgoing packet because of underflow. The counter is cleared when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

3.2.464 MTL_TXQ7_DEBUG — Offset EC8h

The Queue 7 Transmit Debug register gives the debug status of various blocks related to the Transmit queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + EC8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved**
22:20	0h RO	**Number of Status Words in Tx Status FIFO of Queue (STXSTSF):** This field indicates the current number of status in the Tx Status FIFO of this queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of status words in Tx Status FIFO.
19	0h RO	**Reserved**
18:16	0h RO	**Number of Packets in the Transmit Queue (PTXQ):** This field indicates the current number of packets in the Tx Queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of packets in the Transmit queue.

Bit Range	Default & Access	Field Name (ID): Description
15:6	0h RO	**Reserved**
5	0h RO	**MTL Tx Status FIFO Full Status (TXSTSFSTS):** When high, this bit indicates that the MTL Tx Status FIFO is full. Therefore, the MTL cannot accept any more packets for transmission. 0x0 (INACTIVE): MTL Tx Status FIFO Full status is not detected. 0x1 (ACTIVE): MTL Tx Status FIFO Full status is detected.
4	0h RO	**MTL Tx Queue Not Empty Status (TXQSTS):** When this bit is high, it indicates that the MTL Tx Queue is not empty and some data is left for transmission. 0x0 (INACTIVE): MTL Tx Queue Not Empty status is not detected. 0x1 (ACTIVE): MTL Tx Queue Not Empty status is detected.
3	0h RO	**MTL Tx Queue Write Controller Status (TWCSTS):** When high, this bit indicates that the MTL Tx Queue Write Controller is active, and it is transferring the data to the Tx Queue. 0x0 (INACTIVE): MTL Tx Queue Write Controller status is not detected. 0x1 (ACTIVE): MTL Tx Queue Write Controller status is detected.
2:1	0h RO	**MTL Tx Queue Read Controller Status (TRCSTS):** This field indicates the state of the Tx Queue Read Controller: 0x0 (IDLE): Idle state. 0x1 (READ): Read state (transferring data to the MAC transmitter). 0x2 (WAIT): Waiting for pending Tx Status from the MAC transmitter. 0x3 (FLUSH): Flushing the Tx queue because of the Packet Abort request from the MAC.
0	0h RO	**Transmit Queue in Pause (TXQPAUSED):** When this bit is high and the Rx flow control is enabled, it indicates that the Tx Queue is in the Pause condition (in the full-duplex only mode) because of the following: - Reception of the PFC packet for the priorities assigned to the Tx Queue when PFC is enabled - Reception of 802.3x Pause packet when PFC is disabled 0x0 (INACTIVE): Transmit Queue in Pause status is not detected. 0x1 (ACTIVE): Transmit Queue in Pause status is detected.

3.2.465 MTL_TXQ7_ETS_CONTROL — Offset ED0h

The Queue ETS Control register controls the enhanced transmission selection operation.

Type	Size	Offset	Default
MMIO	32 bit	BAR + ED0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved**
6:4	0h RW	**Slot Count (SLC):** If the credit-based shaper algorithm is enabled, the software can program the number of slots (of duration programmed in DMA_CH(#i)_Slot_Interval register) over which the average transmitted bits per slot, provided in the MTL_TxQ(#i)_ETS_Status register, need to be computed for Queue. The encoding is as follows: 0x0 (M_1_SLOT): 1 slot. 0x1 (M_2_SLOT): 2 slots. 0x2 (M_4_SLOT): 4 slots. 0x3 (M_8_SLOT): 8 slots. 0x4 (M_16_SLOT): 16 slots. 0x5 (RSVD): Reserved.
3	0h RW	**Credit Control (CC):** When this bit is set, the accumulated credit parameter in the credit-based shaper algorithm logic is not reset to zero when there is positive credit and no packet to transmit in Channel 1. The credit accumulates even when there is no packet waiting in Channel 1 and another channel is transmitting. When this bit is reset, the accumulated credit parameter in the credit-based shaper algorithm logic is set to zero when there is positive credit and no packet to transmit in Channel 1. When there is no packet waiting in Channel 1 and other channel is transmitting, no credit is accumulated. 0x0 (DISABLE): Credit Control is disabled. 0x1 (ENABLE): Credit Control is enabled.
2	0h RW	**AV Algorithm (AVALG):** When Queue 1 is programmed for AV, this field configures the scheduling algorithm for this queue: This bit when set, indicates credit based shaper algorithm (CBS) is selected for Queue 1 traffic. When reset, strict priority is selected. 0x0 (DISABLE): CBS Algorithm is disabled. 0x1 (ENABLE): CBS Algorithm is enabled.
1:0	0h RO	**Reserved**

3.2.466 MTL_TXQ7_ETS_STATUS — Offset ED4h

The Queue 7 ETS Status register provides the average traffic transmitted in Queue 7.

Type	Size	Offset	Default
MMIO	32 bit	BAR + ED4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:0	000000h RO	**Average Bits per Slot (ABS):** This field contains the average transmitted bits per slot. If AV operation is enabled, this field is computed over number of slots, programmed in the SLC field of MTL_TxQ(#i)_ETS_CONTROL register. The maximum value of this field is 0x6_4000 in 100 Mbps, 0x3E_8000 in 1000 Mbps and 9C_4000 in 2500 Mbps mode respectively. When the DCB operation is enabled for Queue, this field is computed over every 10 million bit times slot (4 ms in 2500 Mbps; 10 ms in 1000 Mbps; 100 ms in 100 Mbps). The maximum value is 0x989680.

3.2.467 MTL_TXQ7_QUANTUM_WEIGHT — Offset ED8h

The Queue 7 idleSlopeCredit, Quantum or Weights register provides the average traffic transmitted in Queue 7.

Type	Size	Offset	Default
MMIO	32 bit	BAR + ED8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved**
20:0	000000h RW	**ISCQW:** idleSlopeCredit, Quantum or Weights - idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns for 100 Mbps; 8 ns for 1000 Mbps; 3.2 ns for 2500 Mbps) when the credit is increasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. Bits[20:14] must be written to zero. - Quantum When the DCB operation is enabled with DWRR algorithm for Queue 1 traffic, this field contains the quantum value in bytes to be added to credit during every queue scanning cycle. The maximum value is 0x1312D0 bytes. - Weights When DCB operation is enabled with WFQ algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x3FFF where weight of 0 indicates 100% bandwidth. Bits[20:14] must be written to zero. When DCB operation or generic queuing operation is enabled with WRR algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x64. Bits [20:7] must be written to zero. - Note 1: In multiple Queue configuration this field in respective per queue register must be programmed to some non-zero value when multiple queues are enabled or single queue other than Q0 is enabled. This field need not be programmed when only Q0 is enabled. In general, when WRR algorithm is selected a non-zero value must be programmed on both Receive and Transmit. In Receive, the register is MTL_Operation_Mode register. - Note 2: For WFQ algorithm, higher the programmed weights lesser the bandwidth allocated for that Transmit Queue. The finish time is not a function of particular packet alone but it is as per the formula: (previous_finish_time of particular Transmit Queue + (weights*packet_size)) - Note 3: The weights programmed do not correspond to the number of packets but the fraction of bandwidth or time allocated for particular queue w.r.t. total BW or time.

3.2.468 MTL_TXQ7_SENDSLOPECREDIT — Offset EDCh

The sendSlopeCredit register contains the sendSlope credit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + EDCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13:0	0000h RW	**sendSlopeCredit Value (SSC):** When AV operation is enabled, this field contains the sendSlopeCredit value required for credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns, 8 ns and 3.2 ns for 100 Mbps, 1000 Mbps and 2500 Mbps respectively) when the credit is decreasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. This field should be programmed with absolute sendSlopeCredit value. The credit-based shaper logic subtracts it from the accumulated credit when Channel 1 is selected for transmission.

3.2.469 MTL_TXQ7_HICREDIT — Offset EE0h

The hiCredit register contains the hiCredit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + EE0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:0	00000000h RW	**hiCredit Value (HC):** When the AV feature is enabled, this field contains the hiCredit value required for the credit-based shaper algorithm. This is the maximum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1,024. The maximum value is maxInterferenceSize, that is, best-effort maximum packet size (16,384 bytes or 131,072 bits). The value to be specified is 131,072 * 1,024 = 134,217,728 or 0x0800_0000.

3.2.470 MTL_TXQ7_LOCREDIT — Offset EE4h

The loCredit register contains the loCredit value required for the credit-based shaper algorithm for the Queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + EE4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:0	00000000h RW	**loCredit Value (LC):** When AV operation is enabled, this field contains the loCredit value required for the credit-based shaper algorithm. This is the minimum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1,024. The maximum value to be programmed is corresponds to twice the maxFrameSize transmitted from this queue. If the maxFrameSize is 8192 bytes, then (8192*2) * 8 * 1024 = 134,217,728 or 0x0800_0000. Because it is a negative value, the programmed value is 2's complement of the value, that is, 0x1800_0000.

3.2.471 MTL_Q7_INTERRUPT_CONTROL_STATUS — Offset EECh

This register contains the interrupt enable and status bits for the queue 7 interrupts.

Type	Size	Offset	Default
MMIO	32 bit	BAR + EECh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**Receive Queue Overflow Interrupt Enable (RXOIE):** When this bit is set, the Receive Queue Overflow interrupt is enabled. When this bit is reset, the Receive Queue Overflow interrupt is disabled. 0x0 (DISABLE): Receive Queue Overflow Interrupt is disabled. 0x1 (ENABLE): Receive Queue Overflow Interrupt is enabled.
23:17	0h RO	**Reserved**
16	0h RW	**Receive Queue Overflow Interrupt Status (RXOVFIS):** This bit indicates that the Receive Queue had an overflow while receiving the packet. If a partial packet is transferred to the application, the overflow status is set in RDES3[21]. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Queue Overflow Interrupt Status not detected. 0x1 (ACTIVE): Receive Queue Overflow Interrupt Status detected.
15:10	0h RO	**Reserved**
9	0h RW	**Average Bits Per Slot Interrupt Enable (ABPSIE):** When this bit is set, the MAC asserts the sbd_intr_o or mci_intr_o interrupt when the average bits per slot status is updated. When this bit is cleared, the interrupt is not asserted for such an event. 0x0 (DISABLE): Average Bits Per Slot Interrupt is disabled. 0x1 (ENABLE): Average Bits Per Slot Interrupt is enabled.
8	0h RW	**Transmit Queue Underflow Interrupt Enable (TXUIE):** When this bit is set, the Transmit Queue Underflow interrupt is enabled. When this bit is reset, the Transmit Queue Underflow interrupt is disabled. 0x0 (DISABLE): Transmit Queue Underflow Interrupt Status is disabled. 0x1 (ENABLE): Transmit Queue Underflow Interrupt Status is enabled.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	**Reserved**
1	0h RW	**Average Bits Per Slot Interrupt Status (ABPSIS):** When set, this bit indicates that the MAC has updated the ABS value. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Average Bits Per Slot Interrupt Status not detected. 0x1 (ACTIVE): Average Bits Per Slot Interrupt Status detected.
0	0h RW	**Transmit Queue Underflow Interrupt Status (TXUNFIS):** This bit indicates that the Transmit Queue had an underflow while transmitting the packet. Transmission is suspended and an Underflow Error TDES3[2] is set. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Queue Underflow Interrupt Status not detected. 0x1 (ACTIVE): Transmit Queue Underflow Interrupt Status detected.

3.2.472 MTL_RXQ7_OPERATION_MODE — Offset EF0h

The Queue 7 Receive Operation Mode register establishes the Receive queue operating modes and command.

The RFA and RFD fields are not backward compatible with the RFA and RFD fields of 4.00a release

Type	Size	Offset	Default
MMIO	32 bit	BAR + EF0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved**
26:20	00h RW	**Receive Queue Size (RQS):** This field indicates the size of the allocated Receive queues in blocks of 256 bytes. The RQS field is read-write only if the number of Rx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on, so user should be programming RQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (RQS+1)*256 bytes. When the number of Rx Queues is one, the field is read-only and the configured RX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Rx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
19:14	00h RW	**Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) (RFD):** These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1.5 KB, that is, FULL 1.5 KB - 2: Full minus 2 KB, that is, FULL 2 KB - 3: Full minus 2.5 KB, that is, FULL 2.5 KB - ... - 62: Full minus 32 KB, that is, FULL 32 KB - 63: Full minus 32.5 KB, that is, FULL 32.5 KB The de-assertion is effective only after flow control is asserted. Note: The value must be programmed in such a way to make sure that the threshold is a positive number. When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register. The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13:8	00h RW	**Threshold for Activating Flow Control (in half-duplex and full-duplex (RFA):** These bits control the threshold (fill-level of Rx queue) at which the flow control is activated: For more information on encoding for this field, see RFD.
7	0h RW	**Enable Hardware Flow Control (EHFC):** When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. 0x0 (DISABLE): Hardware Flow Control is disabled. 0x1 (ENABLE): Hardware Flow Control is enabled.
6	0h RW	**Disable Dropping of TCP/IP Checksum Error Packets (DIS_TCP_EF):** When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC. When this bit is reset, all error packets are dropped if the FEP bit is reset. 0x0 (ENABLE): Dropping of TCP/IP Checksum Error Packets is enabled. 0x1 (DISABLE): Dropping of TCP/IP Checksum Error Packets is disabled.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**Receive Queue Store and Forward (RSF):** When this bit is set, the GbE Controller reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register. 0x0 (DISABLE): Receive Queue Store and Forward is disabled. 0x1 (ENABLE): Receive Queue Store and Forward is enabled.
4	0h RW	**Forward Error Packets (FEP):** When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped. When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet might be forwarded to the application or DMA. 0x0 (DISABLE): Forward Error Packets is disabled. 0x1 (ENABLE): Forward Error Packets is enabled.
3	0h RW	**Forward Undersized Good Packets (FUP):** When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. 0x0 (DISABLE): Forward Undersized Good Packets is disabled. 0x1 (ENABLE): Forward Undersized Good Packets is enabled.
2	0h RO	**Reserved**
1:0	0h RW	**Receive Queue Threshold Control (RTC):** These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred. This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1. 0x0 (M_64BYTE): 64. 0x1 (M_32BYTE): 32. 0x2 (M_96BYTE): 96. 0x3 (M_128BYTE): 128.

3.2.473 MTL_RXQ7_MISSED_PACKET_OVERFLOW_CNT — Offset EF4h

The Queue 7 Missed Packet and Overflow Counter register contains the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow.

Type	Size	Offset	Default
MMIO	32 bit	BAR + EF4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved**
27	0h RO	**Missed Packet Counter Overflow Bit (MISCNTOVF):** When set, this bit indicates that the Rx Queue Missed Packet Counter crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Missed Packet Counter overflow not detected. 0x1 (ACTIVE): Missed Packet Counter overflow detected.
26:16	000h RO	**Missed Packet Counter (MISPKTCNT):** This field indicates the number of packets missed by the GbE Controller because the application asserted ari_pkt_flush_i[] for this queue. This counter is reset when this register is read with mci_be_i[0] at 1b1. This counter is incremented by 1 when the DMA discards the packet because of buffer unavailability. Access restriction applies. Clears on read. Self-set to 1 on internal event.
15:12	0h RO	**Reserved**
11	0h RO	**Overflow Counter Overflow Bit (OVFCNTOVF):** When set, this bit indicates that the Rx Queue Overflow Packet Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Overflow Counter overflow not detected. 0x1 (ACTIVE): Overflow Counter overflow detected.
10:0	000h RO	**Overflow Packet Counter (OVFPKTCNT):** This field indicates the number of packets discarded by the GbE Controller because of Receive queue overflow. This counter is incremented each time the GbE Controller discards an incoming packet because of overflow. This counter is reset when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

3.2.474 MTL_RXQ7_DEBUG — Offset EF8h

The Queue 7 Receive Debug register gives the debug status of various blocks related to the Receive queue.

Type	Size	Offset	Default
MMIO	32 bit	BAR + EF8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:16	0000h RO	**Number of Packets in Receive Queue (PRXQ):** This field indicates the current number of packets in the Rx Queue. The theoretical maximum value for this field is 256KB/16B = 16K Packets, that is, Max_Queue_Size/ Min_Packet_Size.
15:6	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
5:4	0h RO	**MTL Rx Queue Fill-Level Status (RXQSTS):** This field gives the status of the fill-level of the Rx Queue: 0x0 (EMPTY): Rx Queue empty. 0x1 (BLW_THR): Rx Queue fill-level below flow-control deactivate threshold. 0x2 (ABV_THR): Rx Queue fill-level above flow-control activate threshold. 0x3 (FULL): Rx Queue full.
3	0h RO	**Reserved**
2:1	0h RO	**MTL Rx Queue Read Controller State (RRCSTS):** This field gives the state of the Rx queue Read controller: 0x0 (IDLE): Idle state. 0x1 (READ_DATA): Reading packet data. 0x2 (READ_STS): Reading packet status (or timestamp). 0x3 (FLUSH): Flushing the packet data and status.
0	0h RO	**MTL Rx Queue Write Controller Active Status (RWCSTS):** When high, this bit indicates that the MTL Rx queue Write controller is active, and it is transferring a received packet to the Rx Queue. 0x0 (INACTIVE): MTL Rx Queue Write Controller Active Status not detected. 0x1 (ACTIVE): MTL Rx Queue Write Controller Active Status detected.

3.2.475 MTL_RXQ7_CONTROL — Offset EFCh

The Queue Receive Control register controls the receive arbitration and passing of received packets to the application.

Type	Size	Offset	Default
MMIO	32 bit	BAR + EFCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**Receive Queue Packet Arbitration (RXQ_FRM_ARBIT):** When this bit is set, the GbE Controller drives the packet data to the ARI interface such that the entire packet data of currently-selected queue is transmitted before switching to other queue. When this bit is reset, the GbE Controller drives the packet data to the ARI interface such that the following amount of data of currently-selected queue is transmitted before switching to other queue: - PBL amount of data (indicated by ari_qN_pbl_i[]) or - Complete data of a packet The status and the timestamp are not a part of the PBL data. Therefore, the GbE Controller drives the complete status (including timestamp status) during first PBL request for the packet (in store-and-forward mode) or the last PBL request for the packet (in Threshold mode). 0x0 (DISABLE): Receive Queue Packet Arbitration is disabled. 0x1 (ENABLE): Receive Queue Packet Arbitration is enabled.
2:0	0h RW	**Receive Queue Weight (RXQ_WEGT):** This field indicates the weight assigned to the Rx Queue 0. This field needs to be programmed with one value less than the required weight, i.e. reset value of 0 indicates weight of 1, value of 1 indicates weight of 2, and so on. The weight is used as the number of continuous PBL or packets requests (depending on the RXQ_FRM_ARBIT) allocated to the queue in one arbitration cycle. Note: The change in value of RXQ_WEGT takes effect only after the completion of current service round or when there is change from RAA=SP to RAA=WSP algorithm. This approach is taken so that there is smooth transition. For the RXQ_WEGT value to take effect at the start, the MTL_RxQ(#i)_Control registers must be programmed before the MTL_Operation_Mode register.

3.2.476 DMA_MODE — Offset 1000h

The Bus Mode register establishes the bus operating modes for the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1000h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:22	0h RW	**Rx DMA's Maximum Number of Descriptors to be fetched in a burst (RNDF):** 0x0 (MODE0): 16 0x1 (MODE1): 8 0x2 (MODE2): 4 0x3 (MODE3): 2
21:20	0h RW	**Tx DMA's Maximum Number of Descriptors to be fetched in a burst (TNDF):** 0x0 (MODE0): 16 0x1 (MODE1): 8 0x2 (MODE2): 4 0x3 (MODE3): 2

Bit Range	Default & Access	Field Name (ID): Description
19	0h RW	**Descriptor Cache Enable (DCHE):** When set enables prefetching of descriptors to the Descriptor Cache. When reset descriptor cache feature is disabled. 0x0 (DISABLE): Descriptor Cache Support is disabled. 0x1 (ENABLE): Descriptor Cache Support is enabled.
18	0h RO	**Reserved**
17:16	0h RW	**Interrupt Mode (INTM):** This field defines the interrupt mode of GbE Controller. The behavior of the following outputs changes depending on the following settings: - sbd_perch_tx_intr_o[] (Transmit Per Channel Interrupt) - sbd_perch_rx_intr_o[] (Receive Per Channel Interrupt) - sbd_intr_o (Common Interrupt) It also changes the behavior of the RI/TI bits in the DMA_CH0_Status. - 00: sbd_perch_* are pulse signals for each TX/RX packet transfer completion events (irrespective of whether corresponding interrupts are enabled) for which IOC bits are enabled in descriptor. sbd_intr_o is also asserted when corresponding interrupts are enabled and cleared only when software clears the corresponding RI/TI status bits. - 01: sbd_perch_* are level signals asserted on TX/RX packet transfer completion event when corresponding interrupts are enabled and de-asserted when the software clears the corresponding RI/TI status bits. The sbd_intr_o is not asserted for these TX/RX packet transfer completion events. - 10: sbd_perch_* are level signals asserted on TX/RX packet transfer completion event when corresponding interrupts are enabled and de-asserted when the software clears the corresponding RI/TI status bits. However, the signal is asserted again if the same event occurred again before it was cleared. The sbd_intr_o is not asserted for these TX/RX packet transfer completion events. - 11: Reserved 0x0 (MODE0): See above description. 0x1 (MODE1): See above description. 0x2 (MODE2): See above description. 0x3 (RSVD): Reserved.
15:11	0h RO	**Reserved**
10	0h RW	**Reserved**
9	0h RO	**Reserved**
8	0h RW	**Descriptor Posted Write (DSPW):** When this bit is set to 0, the descriptor writes are always non-posted. When this bit is set to 1, the descriptor writes are non-posted only when IOC (Interrupt on completion) is set in last descriptor, otherwise the descriptor writes are always posted. 0x0 (DISABLE): Descriptor Posted Write is disabled. 0x1 (ENABLE): Descriptor Posted Write is enabled.
7:5	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
4:2	0h RW	**Transmit Arbitration Algorithm (TAA):** This field is used to select the arbitration algorithm for the Transmit side when multiple Tx DMAs are selected. 0x0 (FP): Fixed priority (Channel 0 has the lowest priority and the last channel has the highest priority). 0x1 (WSP): Weighted Strict Priority (WSP). 0x2 (WRR): Weighted Round-Robin (WRR). 0x3 (RSVD): Reserved (for 3'b011 to 3'b111).
1	0h RO	**Reserved**
0	0h RW	**Software Reset (SWR):** When this bit is set, the MAC and the DMA controller reset the logic and all internal registers of the DMA, MTL, and MAC. This bit is automatically cleared after the reset operation is complete in all GbE Controller clock domains. Before reprogramming any GbE Controller register, a value of zero should be read in this bit. This bit must be read at least 4 CSR clock cycles after it is written to 1. Note: The reset operation is complete only when all resets in all active clock domains are de-asserted. Therefore, it is essential that all PHY inputs clocks (applicable for the selected PHY interface) are present for software reset completion. The time to complete the software reset operation depends on the frequency of the slowest active clock. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0x0 (DISABLE): Software Reset is disabled. 0x1 (ENABLE): Software Reset is enabled.

3.2.477 DMA_SYSBUS_MODE — Offset 1004h

The System Bus mode register controls the behavior of the AHB or AXI master. It mainly controls burst splitting and number of outstanding requests.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1004h	01010000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable Low Power Interface (LPI) (EN_LPI):** When set to 1, this bit enables the LPI mode supported by the EQOS-AXI configuration and accepts the LPI request from the AXI System Clock controller. When set to 0, this bit disables the LPI mode and always denies the LPI request from the AXI System Clock controller. 0x0 (DISABLE): Low Power Interface (LPI) is disabled. 0x1 (ENABLE): Low Power Interface (LPI) is enabled.
30	0h RW	**Unlock on Magic Packet or Remote Wake-Up Packet (LPI_XIT_PKT):** When set to 1, this bit enables the AXI master to come out of the LPI mode only when the magic packet or remote wake-up packet is received. When set to 0, this bit enables the AXI master to come out of the LPI mode when any packet is received. 0x0 (DISABLE): Unlock on Magic Packet or Remote Wake-Up Packet is disabled. 0x1 (ENABLE): Unlock on Magic Packet or Remote Wake-Up Packet is enabled.
29:28	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
27:24	1h RW	**AXI Maximum Write Outstanding Request Limit (WR_OSR_LMT):** This value limits the maximum outstanding request on the AXI write interface. Maximum outstanding requests = WR_OSR_LMT + 1
23:20	0h RO	**Reserved**
19:16	1h RW	**AXI Maximum Read Outstanding Request Limit (RD_OSR_LMT):** This value limits the maximum outstanding request on the AXI read interface. Maximum outstanding requests = RD_OSR_LMT + 1
15:14	0h RO	**Reserved**
13	0h RW	**1 KB Boundary Crossing Enable for the EQOS-AXI Master (ONEKBBE):** When set, the burst transfers performed by the EQOS-AXI master do not cross 1 KB boundary. When reset, the burst transfers performed by the EQOS-AXI master do not cross 4 KB boundary. 0x0 (DISABLE): 1 KB Boundary Crossing for the EQOS-AXI Master Beats is disabled. 0x1 (ENABLE): 1 KB Boundary Crossing for the EQOS-AXI Master Beats is enabled.
12	0h RW	**Address-Aligned Beats (AAL):** When this bit is set to 1, the EQOS-AXI or EQOS-AHB master performs address-aligned burst transfers on Read and Write channels. 0x0 (DISABLE): Address-Aligned Beats is disabled. 0x1 (ENABLE): Address-Aligned Beats is enabled.
11	0h RW	**Enhanced Address Mode Enable. (EAME):** When this bit is set to 1, the DMA master enables the enhanced address mode (40-bit or 48-bit addressing mode). In this mode, the DMA engine uses either the 40- or 48-bit address, depending on the configuration. 0x0 (DISABLE): Enhanced Address Mode is disabled. 0x1 (ENABLE): Enhanced Address Mode is enabled.
10	0h RW	**Automatic AXI LPI enable (AALE):** When set to 1, enables the AXI master to enter into LPI state when there is no activity in the GbE Controller for number of system clock cycles programmed in the LPIEI field of AXI_LPI_Entry_Interval register. 0x0 (DISABLE): Automatic AXI LPI is disabled. 0x1 (ENABLE): Automatic AXI LPI is enabled.
9:8	0h RO	**Reserved**
7	0h RW	**AXI Burst Length 256 (BLEN256):** When this bit is set to 1, the EQOS-AXI master can select a burst length of 256 on the AXI interface. 0x0 (DISABLE): No effect. 0x1 (ENABLE): AXI Burst Length 256.
6	0h RW	**AXI Burst Length 128 (BLEN128):** When this bit is set to 1, the EQOS-AXI master can select a burst length of 128 on the AXI interface. 0x0 (DISABLE): No effect. 0x1 (ENABLE): AXI Burst Length 128.
5	0h RW	**AXI Burst Length 64 (BLEN64):** When this bit is set to 1, the EQOS-AXI master can select a burst length of 64 on the AXI interface. 0x0 (DISABLE): No effect. 0x1 (ENABLE): AXI Burst Length 64.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	**AXI Burst Length 32 (BLEN32):** When this bit is set to 1, the EQOS-AXI master can select a burst length of 32 on the AXI interface. 0x0 (DISABLE): No effect. 0x1 (ENABLE): AXI Burst Length 32.
3	0h RW	**AXI Burst Length 16 (BLEN16):** When this bit is set to 1 or the FB bit is set to 0, the EQOS-AXI master can select a burst length of 16 on the AXI interface. When the FB bit is set to 0, setting this bit has no effect. 0x0 (DISABLE): No effect. 0x1 (ENABLE): AXI Burst Length 16.
2	0h RW	**AXI Burst Length 8 (BLEN8):** When this bit is set to 1 or the FB bit is set to 0, the EQOS-AXI master can select a burst length of 8 on the AXI interface. When the FB bit is set to 0, setting this bit has no effect. 0x0 (DISABLE): No effect. 0x1 (ENABLE): AXI Burst Length 8.
1	0h RW	**AXI Burst Length 4 (BLEN4):** When this bit is set to 1 or the FB bit is set to 0, the EQOS-AXI master can select a burst length of 4 on the AXI interface. When the FB bit is set to 0, setting this bit has no effect. 0x0 (DISABLE): No effect. 0x1 (ENABLE): AXI Burst Length 4.
0	0h RW	**FB:** Fixed Burst Length When this bit is set to 1, the EQOS-AXI master initiates burst transfers of specified lengths as given below. - Burst transfers of fixed burst lengths as indicated by the BLEN256, BLEN128, BLEN64, BLEN32, BLEN16, BLEN8, or BLEN4 field - Burst transfers of length 1 When this bit is set to 0, the EQOS-AXI master initiates burst transfers that are equal to or less than the maximum allowed burst length programmed in Bits[7:1]. 0x0 (DISABLE): Fixed Burst Length is disabled. 0x1 (ENABLE): Fixed Burst Length is enabled.

3.2.478 DMA_INTERRUPT_STATUS — Offset 1008h

The application reads this Interrupt Status register during interrupt service routine or polling to determine the interrupt status of DMA channels, MTL queues, and the MAC.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1008h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17	0h RO	**MAC Interrupt Status (MACIS):** This bit indicates an interrupt event in the MAC. To reset this bit to 1'b0, the software must read the corresponding register in the MAC to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): MAC Interrupt Status not detected. 0x1 (ACTIVE): MAC Interrupt Status detected.
16	0h RO	**MTL Interrupt Status (MTLIS):** This bit indicates an interrupt event in the MTL. To reset this bit to 1'b0, the software must read the corresponding register in the MTL to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): MTL Interrupt Status not detected. 0x1 (ACTIVE): MTL Interrupt Status detected.
15:8	0h RO	**Reserved**
7	0h RO	**DMA Channel 7 Interrupt Status (DC7IS):** This bit indicates an interrupt event in DMA Channel 7. To reset this bit to 1'b0, the software must read the corresponding register in DMA Channel 7 to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): DMA Channel 7 Interrupt Status not detected. 0x1 (ACTIVE): DMA Channel 7 Interrupt Status detected.
6	0h RO	**DMA Channel 6 Interrupt Status (DC6IS):** This bit indicates an interrupt event in DMA Channel 6. To reset this bit to 1'b0, the software must read the corresponding register in DMA Channel 6 to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): DMA Channel 6 Interrupt Status not detected. 0x1 (ACTIVE): DMA Channel 6 Interrupt Status detected.
5	0h RO	**DMA Channel 5 Interrupt Status (DC5IS):** This bit indicates an interrupt event in DMA Channel 5. To reset this bit to 1'b0, the software must read the corresponding register in DMA Channel 5 to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): DMA Channel 5 Interrupt Status not detected. 0x1 (ACTIVE): DMA Channel 5 Interrupt Status detected.
4	0h RO	**DMA Channel 4 Interrupt Status (DC4IS):** This bit indicates an interrupt event in DMA Channel 4. To reset this bit to 1'b0, the software must read the corresponding register in DMA Channel 4 to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): DMA Channel 4 Interrupt Status not detected. 0x1 (ACTIVE): DMA Channel 4 Interrupt Status detected.
3	0h RO	**DMA Channel 3 Interrupt Status (DC3IS):** This bit indicates an interrupt event in DMA Channel 3. To reset this bit to 1'b0, the software must read the corresponding register in DMA Channel 3 to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): DMA Channel 3 Interrupt Status not detected. 0x1 (ACTIVE): DMA Channel 3 Interrupt Status detected.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RO	**DMA Channel 2 Interrupt Status (DC2IS):** This bit indicates an interrupt event in DMA Channel 2. To reset this bit to 1'b0, the software must read the corresponding register in DMA Channel 2 to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): DMA Channel 2 Interrupt Status not detected. 0x1 (ACTIVE): DMA Channel 2 Interrupt Status detected.
1	0h RO	**DMA Channel 1 Interrupt Status (DC1IS):** This bit indicates an interrupt event in DMA Channel 1. To reset this bit to 1'b0, the software must read the corresponding register in DMA Channel 1 to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): DMA Channel 1 Interrupt Status not detected. 0x1 (ACTIVE): DMA Channel 1 Interrupt Status detected.
0	0h RO	**DMA Channel 0 Interrupt Status (DC0IS):** This bit indicates an interrupt event in DMA Channel 0. To reset this bit to 1'b0, the software must read the corresponding register in DMA Channel 0 to get the exact cause of the interrupt and clear its source. 0x0 (INACTIVE): DMA Channel 0 Interrupt Status not detected. 0x1 (ACTIVE): DMA Channel 0 Interrupt Status detected.

3.2.479 DMA_DEBUG_STATUS0 — Offset 100Ch

The Debug Status 0 register gives the Receive and Transmit process status for DMA Channel 0-Channel 2 for debugging purpose.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 100Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**DMA Channel 2 Transmit Process State (TPS2):** This field indicates the Tx DMA FSM state for Channel 2. The MSB of this field always returns 0. This field does not generate an interrupt. 0x0 (STOP): Stopped (Reset or Stop Transmit Command issued). 0x1 (RUN_FTTD): Running (Fetching Tx Transfer Descriptor). 0x2 (RUN_WS): Running (Waiting for status). 0x3 (RUN_RDS): Running (Reading Data from system memory buffer and queuing it to the Tx buffer (Tx FIFO)). 0x4 (TSTMP_WS): Timestamp write state. 0x5 (RSVD): Reserved for future use. 0x6 (SUSPND): Suspended (Tx Descriptor Unavailable or Tx Buffer Underflow). 0x7 (RUN_CTD): Running (Closing Tx Descriptor).
27:24	0h RO	**DMA Channel 2 Receive Process State (RPS2):** This field indicates the Rx DMA FSM state for Channel 2. The MSB of this field always returns 0. This field does not generate an interrupt. 0x0 (STOP): Stopped (Reset or Stop Receive Command issued). 0x1 (RUN_FRTD): Running (Fetching Rx Transfer Descriptor). 0x2 (RSVD): Reserved for future use. 0x3 (RUN_WRP): Running (Waiting for Rx packet). 0x4 (SUSPND): Suspended (Rx Descriptor Unavailable). 0x5 (RUN_CRD): Running (Closing the Rx Descriptor). 0x6 (TSTMP): Timestamp write state. 0x7 (RUN_TRP): Running (Transferring the received packet data from the Rx buffer to the system memory).
23:20	0h RO	**DMA Channel 1 Transmit Process State (TPS1):** This field indicates the Tx DMA FSM state for Channel 1. The MSB of this field always returns 0. This field does not generate an interrupt. 0x0 (STOP): Stopped (Reset or Stop Transmit Command issued). 0x1 (RUN_FTTD): Running (Fetching Tx Transfer Descriptor). 0x2 (RUN_WS): Running (Waiting for status). 0x3 (RUN_RDS): Running (Reading Data from system memory buffer and queuing it to the Tx buffer (Tx FIFO)). 0x4 (TSTMP_WS): Timestamp write state. 0x5 (RSVD): Reserved for future use. 0x6 (SUSPND): Suspended (Tx Descriptor Unavailable or Tx Buffer Underflow). 0x7 (RUN_CTD): Running (Closing Tx Descriptor).
19:16	0h RO	**DMA Channel 1 Receive Process State (RPS1):** This field indicates the Rx DMA FSM state for Channel 1. The MSB of this field always returns 0. This field does not generate an interrupt. 0x0 (STOP): Stopped (Reset or Stop Receive Command issued). 0x1 (RUN_FRTD): Running (Fetching Rx Transfer Descriptor). 0x2 (RSVD): Reserved for future use. 0x3 (RUN_WRP): Running (Waiting for Rx packet). 0x4 (SUSPND): Suspended (Rx Descriptor Unavailable). 0x5 (RUN_CRD): Running (Closing the Rx Descriptor). 0x6 (TSTMP): Timestamp write state. 0x7 (RUN_TRP): Running (Transferring the received packet data from the Rx buffer to the system memory).

Bit Range	Default & Access	Field Name (ID): Description
15:12	0h RO	**DMA Channel 0 Transmit Process State (TPS0):** This field indicates the Tx DMA FSM state for Channel 0. The MSB of this field always returns 0. This field does not generate an interrupt. 0x0 (STOP): Stopped (Reset or Stop Transmit Command issued). 0x1 (RUN_FTTD): Running (Fetching Tx Transfer Descriptor). 0x2 (RUN_WS): Running (Waiting for status). 0x3 (RUN_RDS): Running (Reading Data from system memory buffer and queuing it to the Tx buffer (Tx FIFO)). 0x4 (TSTMP_WS): Timestamp write state. 0x5 (RSVD): Reserved for future use. 0x6 (SUSPND): Suspended (Tx Descriptor Unavailable or Tx Buffer Underflow). 0x7 (RUN_CTD): Running (Closing Tx Descriptor).
11:8	0h RO	**DMA Channel 0 Receive Process State (RPS0):** This field indicates the Rx DMA FSM state for Channel 0. The MSB of this field always returns 0. This field does not generate an interrupt. 0x0 (STOP): Stopped (Reset or Stop Receive Command issued). 0x1 (RUN_FRTD): Running (Fetching Rx Transfer Descriptor). 0x2 (RSVD): Reserved for future use. 0x3 (RUN_WRP): Running (Waiting for Rx packet). 0x4 (SUSPND): Suspended (Rx Descriptor Unavailable). 0x5 (RUN_CRD): Running (Closing the Rx Descriptor). 0x6 (TSTMP): Timestamp write state. 0x7 (RUN_TRP): Running (Transferring the received packet data from the Rx buffer to the system memory).
7:2	0h RO	**Reserved**
1	0h RO	**AXI Master Read Channel Status (AXRHSTS):** When high, this bit indicates that the read channel of the AXI master is active, and it is transferring the data. 0x0 (INACTIVE): AXI Master Read Channel Status not detected. 0x1 (ACTIVE): AXI Master Read Channel Status detected.
0	0h RO	**AXI Master Write Channel (AXWHSTS):** When high, this bit indicates that the write channel of the AXI master is active, and it is transferring data. 0x0 (INACTIVE): AXI Master Write Channel or AHB Master Status not detected. 0x1 (ACTIVE): AXI Master Write Channel or AHB Master Status detected.

3.2.480 DMA_DEBUG_STATUS1 — Offset 1010h

The Debug Status1 register gives the Receive and Transmit process status for DMA Channel 3-Channel 6.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1010h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**DMA Channel 6 Transmit Process State (TPS6):** This field indicates the Tx DMA FSM state for Channel 6. The MSB of this field always returns 0. This field does not generate an interrupt. 0x0 (STOP): Stopped (Reset or Stop Transmit Command issued). 0x1 (RUN_FTTD): Running (Fetching Tx Transfer Descriptor). 0x2 (RUN_WS): Running (Waiting for status). 0x3 (RUN_RDS): Running (Reading Data from system memory buffer and queuing it to the Tx buffer (Tx FIFO)). 0x4 (TSTMP_WS): Timestamp write state. 0x5 (RSVD): Reserved for future use. 0x6 (SUSPND): Suspended (Tx Descriptor Unavailable or Tx Buffer Underflow). 0x7 (RUN_CTD): Running (Closing Tx Descriptor).
27:24	0h RO	**DMA Channel 6 Receive Process State (RPS6):** This field indicates the Rx DMA FSM state for Channel 6. The MSB of this field always returns 0. This field does not generate an interrupt. 0x0 (STOP): Stopped (Reset or Stop Receive Command issued). 0x1 (RUN_FRTD): Running (Fetching Rx Transfer Descriptor). 0x2 (RSVD): Reserved for future use. 0x3 (RUN_WRP): Running (Waiting for Rx packet). 0x4 (SUSPND): Suspended (Rx Descriptor Unavailable). 0x5 (RUN_CRD): Running (Closing the Rx Descriptor). 0x6 (TSTMP): Timestamp write state. 0x7 (RUN_TRP): Running (Transferring the received packet data from the Rx buffer to the system memory).
23:20	0h RO	**DMA Channel 5 Transmit Process State (TPS5):** This field indicates the Tx DMA FSM state for Channel 5. The MSB of this field always returns 0. This field does not generate an interrupt. 0x0 (STOP): Stopped (Reset or Stop Transmit Command issued). 0x1 (RUN_FTTD): Running (Fetching Tx Transfer Descriptor). 0x2 (RUN_WS): Running (Waiting for status). 0x3 (RUN_RDS): Running (Reading Data from system memory buffer and queuing it to the Tx buffer (Tx FIFO)). 0x4 (TSTMP_WS): Timestamp write state. 0x5 (RSVD): Reserved for future use. 0x6 (SUSPND): Suspended (Tx Descriptor Unavailable or Tx Buffer Underflow). 0x7 (RUN_CTD): Running (Closing Tx Descriptor).
19:16	0h RO	**DMA Channel 5 Receive Process State (RPS5):** This field indicates the Rx DMA FSM state for Channel 5. The MSB of this field always returns 0. This field does not generate an interrupt. 0x0 (STOP): Stopped (Reset or Stop Receive Command issued). 0x1 (RUN_FRTD): Running (Fetching Rx Transfer Descriptor). 0x2 (RSVD): Reserved for future use. 0x3 (RUN_WRP): Running (Waiting for Rx packet). 0x4 (SUSPND): Suspended (Rx Descriptor Unavailable). 0x5 (RUN_CRD): Running (Closing the Rx Descriptor). 0x6 (TSTMP): Timestamp write state. 0x7 (RUN_TRP): Running (Transferring the received packet data from the Rx buffer to the system memory).

Bit Range	Default & Access	Field Name (ID): Description
15:12	0h RO	**DMA Channel 4 Transmit Process State (TPS4):** This field indicates the Tx DMA FSM state for Channel 4. The MSB of this field always returns 0. This field does not generate an interrupt. 0x0 (STOP): Stopped (Reset or Stop Transmit Command issued). 0x1 (RUN_FTTD): Running (Fetching Tx Transfer Descriptor). 0x2 (RUN_WS): Running (Waiting for status). 0x3 (RUN_RDS): Running (Reading Data from system memory buffer and queuing it to the Tx buffer (Tx FIFO)). 0x4 (TSTMP_WS): Timestamp write state. 0x5 (RSVD): Reserved for future use. 0x6 (SUSPND): Suspended (Tx Descriptor Unavailable or Tx Buffer Underflow). 0x7 (RUN_CTD): Running (Closing Tx Descriptor).
11:8	0h RO	**DMA Channel 4 Receive Process State (RPS4):** This field indicates the Rx DMA FSM state for Channel 4. The MSB of this field always returns 0. This field does not generate an interrupt. 0x0 (STOP): Stopped (Reset or Stop Receive Command issued). 0x1 (RUN_FRTD): Running (Fetching Rx Transfer Descriptor). 0x2 (RSVD): Reserved for future use. 0x3 (RUN_WRP): Running (Waiting for Rx packet). 0x4 (SUSPND): Suspended (Rx Descriptor Unavailable). 0x5 (RUN_CRD): Running (Closing the Rx Descriptor). 0x6 (TSTMP): Timestamp write state. 0x7 (RUN_TRP): Running (Transferring the received packet data from the Rx buffer to the system memory).
7:4	0h RO	**DMA Channel 3 Transmit Process State (TPS3):** This field indicates the Tx DMA FSM state for Channel 3. The MSB of this field always returns 0. This field does not generate an interrupt. 0x0 (STOP): Stopped (Reset or Stop Transmit Command issued). 0x1 (RUN_FTTD): Running (Fetching Tx Transfer Descriptor). 0x2 (RUN_WS): Running (Waiting for status). 0x3 (RUN_RDS): Running (Reading Data from system memory buffer and queuing it to the Tx buffer (Tx FIFO)). 0x4 (TSTMP_WS): Timestamp write state. 0x5 (RSVD): Reserved for future use. 0x6 (SUSPND): Suspended (Tx Descriptor Unavailable or Tx Buffer Underflow). 0x7 (RUN_CTD): Running (Closing Tx Descriptor).
3:0	0h RO	**DMA Channel 3 Receive Process State (RPS3):** This field indicates the Rx DMA FSM state for Channel 3. The MSB of this field always returns 0. This field does not generate an interrupt. 0x0 (STOP): Stopped (Reset or Stop Receive Command issued). 0x1 (RUN_FRTD): Running (Fetching Rx Transfer Descriptor). 0x2 (RSVD): Reserved for future use. 0x3 (RUN_WRP): Running (Waiting for Rx packet). 0x4 (SUSPND): Suspended (Rx Descriptor Unavailable). 0x5 (RUN_CRD): Running (Closing the Rx Descriptor). 0x6 (TSTMP): Timestamp write state. 0x7 (RUN_TRP): Running (Transferring the received packet data from the Rx buffer to the system memory).

3.2.481 DMA_DEBUG_STATUS2 — Offset 1014h

The Debug Status Register 2 gives the Receive and Transmit process status for DMA Channel 7.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1014h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:4	0h RO	**DMA Channel 7 Transmit Process State (TPS7):** This field indicates the Tx DMA FSM state for Channel 7. The MSB of this field always returns 0. This field does not generate an interrupt. 0x0 (STOP): Stopped (Reset or Stop Transmit Command issued). 0x1 (RUN_FTTD): Running (Fetching Tx Transfer Descriptor). 0x2 (RUN_WS): Running (Waiting for status). 0x3 (RUN_RDS): Running (Reading Data from system memory buffer and queuing it to the Tx buffer (Tx FIFO)). 0x4 (TSTMP_WS): Timestamp write state. 0x5 (RSVD): Reserved for future use. 0x6 (SUSPND): Suspended (Tx Descriptor Unavailable or Tx Buffer Underflow). 0x7 (RUN_CTD): Running (Closing Tx Descriptor).
3:0	0h RO	**DMA Channel 7 Receive Process State (RPS7):** This field indicates the Rx DMA FSM state for Channel 7. The MSB of this field always returns 0. This field does not generate an interrupt. 0x0 (STOP): Stopped (Reset or Stop Receive Command issued). 0x1 (RUN_FRTD): Running (Fetching Rx Transfer Descriptor). 0x2 (RSVD): Reserved for future use. 0x3 (RUN_WRP): Running (Waiting for Rx packet). 0x4 (SUSPND): Suspended (Rx Descriptor Unavailable). 0x5 (RUN_CRD): Running (Closing the Rx Descriptor). 0x6 (TSTMP): Timestamp write state. 0x7 (RUN_TRP): Running (Transferring the received packet data from the Rx buffer to the system memory).

3.2.482 AXI4_TX_AR_ACE_CONTROL — Offset 1020h

This register is used to control the AXI4 Cache Coherency Signals for read transactions by all the Transmit DMA channels. The following signals of the AXI4 interface are driven with different values as programmed

for corresponding type (descriptor, buffer1, buffer2) of access.

- arcache_m_o[3:0]

- ardomain_m_o[1:0]

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1020h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21:20	0h RW	**Transmit DMA First Packet Buffer or TSO Header Domain Control (THD):** When TSO is NOT enabled, This field is used to drive ardomain_o[1:0] signal when Transmit DMA is accessing First Buffer of the Packet (First valid buffer with FD being set in the TDES3 of the Descriptor). When TSO is enabled, This field is used to drive ardomain_o[1:0] signal when the Transmit DMA is accessing the TSO Header data.
19:16	0h RW	**Transmit DMA First Packet Buffer or TSO Header Cache Control (THC):** When TSO is NOT enabled, This field is used to drive arcache_o[3:0] signal when Transmit DMA is accessing First Buffer of the Packet (First valid buffer with FD being set in the TDES3 of the Descriptor).. When TSO is enabled, This field is used to drive arcache_o[3:0] signal when the Transmit DMA is accessing the TSO Header data.
15:14	0h RO	**Reserved**
13:12	0h RW	**Transmit DMA Extended Packet Buffer or TSO Payload Domain Control (TED):** When TSO is NOT enabled, This field is used to drive ardomain_o[1:0] signal when Transmit DMA is accessing the extended buffers (when packet is distributed across multiple buffers). When TSO is enabled, This field is used to drive ardomain_o[1:0] signal when the Transmit DMA is accessing the TSO payload data.
11:8	0h RW	**Transmit DMA Extended Packet Buffer or TSO Payload Cache Control (TEC):** When TSO is NOT enabled, This field is used to drive arcache_o[3:0] signal when Transmit DMA is accessing the extended buffers (when packet is distributed across multiple buffers). When TSO is enabled, This field is used to drive arcache_o[3:0] signal when the Transmit DMA is accessing the TSO payload data.
7:6	0h RO	**Reserved**
5:4	0h RW	**Transmit DMA Read Descriptor Domain Control (TDRD):** This field is used to drive ardomain_o[1:0] signal when Transmit DMA engines access the Descriptor.
3:0	0h RW	**Transmit DMA Read Descriptor Cache Control (TDRC):** This field is used to drive arcache_o[3:0] signal when Transmit DMA engines access the Descriptor.

3.2.483 AXI4_RX_AW_ACE_CONTROL — Offset 1024h

This register is used to control the AXI4 Cache Coherency Signals for write transactions by all the Receive DMA channels. The following signals of the AXI4 interface are driven with different values as programmed

for corresponding type (descriptor, buffer1, buffer2) of access.

- awcache_m_o[3:0]

- awdomain_m_o[1:0]

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1024h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:28	0h RW	**Receive DMA Buffer Domain Control (RDD):** This field is used to drive the awdomain_o[1:0] signal when Receive DMA is accessing the Buffer when Header and payload are NOT separated.
27:24	0h RW	**Receive DMA Buffer Cache Control (RDC):** This field is used to drive awcache_o[3:0] signal when Receive DMA is accessing the Buffer when Header and payload are NOT separated.
23:22	0h RO	**Reserved**

18:16	0h RW	**DMA Read Protection control (RDP):** This field is used to drive arprot_m_o[2:0] signal during all read requests.
15:14	0h RO	**Reserved**
13:12	0h RW	**Receive DMA Read Descriptor Domain control (RDRD):** This field is used to drive ardomain_o[1:0] signal when Receive DMA engines read the Descriptor.
11:8	0h RW	**Receive DMA Read Descriptor Cache control (RDRC):** This field is used to drive arcache_o[3:0] signal when Receive DMA engines read the Descriptor.
7:6	0h RO	**Reserved**
5:4	0h RW	**Transmit DMA Write Descriptor Domain control (TDWD):** This field is used to drive awdomain_o[1:0] signal when Transmit DMA write to the Descriptor.
3:0	0h RW	**Transmit DMA Write Descriptor Cache control (TDWC):** This field is used to drive awcache_o[3:0] signal when Transmit DMA writes to the Descriptor.

3.2.485 AXI_LPI_ENTRY_INTERVAL — Offset 1040h

This register is used to control the AXI LPI entry interval.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1040h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3:0	0h RW	**LPI Entry Interval (LPIEI):** Contains the number of system clock cycles, multiplied by 64, to wait for an activity in the GbE Controller to enter into the AXI low power state 0 indicates 64 clock cycles

3.2.486 DMA_TBS_CTRL0 — Offset 1050h

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1050h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**Fetch Time Offset (FTOS):** The value in units of 256 nanoseconds, that has to be deducted from the Launch time to compute the Fetch Time. Max value: 999,999,999 ns, additionally should be smaller than CTR-1 value when ESTM mode is set since this value is a modulo CTR value.
7	0h RO	**Reserved**
6:4	0h RW	**Fetch GSN Offset (FGOS):** The number GSN slots that must be deducted from the Launch GSN to compute the Fetch GSN. Value valid only when FTOV is set.
3:1	0h RO	**Reserved**
0	0h RW	**Fetch Time Offset Valid (FTOV):** Valid When set indicates the FTOS field is valid. When not set, indicates the Fetch Offset is not valid and the DMA engine can fetch the frames from host memory without any time restrictions. 0x0 (INVALID): Fetch Time Offset is invalid. 0x1 (VALID): Fetch Time Offset is valid.

3.2.487 DMA_TBS_CTRL1 — Offset 1054h

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1054h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**Fetch Time Offset (FTOS):** The value in units of 256 nanoseconds, that has to be deducted from the Launch time to compute the Fetch Time. Max value: 999,999,999 ns, additionally should be smaller than CTR-1 value when ESTM mode is set since this value is a modulo CTR value.
7	0h RO	**Reserved**
6:4	0h RW	**Fetch GSN Offset (FGOS):** The number GSN slots that must be deducted from the Launch GSN to compute the Fetch GSN. Value valid only when FTOV is set.
3:1	0h RO	**Reserved**
0	0h RW	**Fetch Time Offset Valid (FTOV):** Valid When set indicates the FTOS field is valid. When not set, indicates the Fetch Offset is not valid and the DMA engine can fetch the frames from host memory without any time restrictions. 0x0 (INVALID): Fetch Time Offset is invalid. 0x1 (VALID): Fetch Time Offset is valid.

3.2.488 DMA_TBS_CTRL2 — Offset 1058h

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1058h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**Fetch Time Offset (FTOS):** The value in units of 256 nanoseconds, that has to be deducted from the Launch time to compute the Fetch Time. Max value: 999,999,999 ns, additionally should be smaller than CTR-1 value when ESTM mode is set since this value is a modulo CTR value.
7	0h RO	**Reserved**
6:4	0h RW	**Fetch GSN Offset (FGOS):** The number GSN slots that must be deducted from the Launch GSN to compute the Fetch GSN. Value valid only when FTOV is set.
3:1	0h RO	**Reserved**
0	0h RW	**Fetch Time Offset Valid (FTOV):** Valid When set indicates the FTOS field is valid. When not set, indicates the Fetch Offset is not valid and the DMA engine can fetch the frames from host memory without any time restrictions. 0x0 (INVALID): Fetch Time Offset is invalid. 0x1 (VALID): Fetch Time Offset is valid.

3.2.489 DMA_TBS_CTRL3 — Offset 105Ch

Type	Size	Offset	Default
MMIO	32 bit	BAR + 105Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**Fetch Time Offset (FTOS):** The value in units of 256 nanoseconds, that has to be deducted from the Launch time to compute the Fetch Time. Max value: 999,999,999 ns, additionally should be smaller than CTR-1 value when ESTM mode is set since this value is a modulo CTR value.
7	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
6:4	0h RW	**Fetch GSN Offset (FGOS):** The number GSN slots that must be deducted from the Launch GSN to compute the Fetch GSN. Value valid only when FTOV is set.
3:1	0h RO	**Reserved**
0	0h RW	**Fetch Time Offset Valid (FTOV):** Valid When set indicates the FTOS field is valid. When not set, indicates the Fetch Offset is not valid and the DMA engine can fetch the frames from host memory without any time restrictions. 0x0 (INVALID): Fetch Time Offset is invalid. 0x1 (VALID): Fetch Time Offset is valid.

3.2.490 DMA_SAFETY_INTERRUPT_STATUS — Offset 1080h

This register indicates summary (whether error occured in DMA/MTL/MAC and correctable/uncorrectable) of the Automotive Safety related error interrupts.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1080h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**MAC Safety Uncorrectable Interrupt Status (MCSIS):** Indicates a uncorrectable Safety related Interrupt is set in the MAC module. MAC_DPP_FSM_Interrupt_Status register should be read when this bit is set, to get the cause of the Safety Interrupt in MAC. 0x0 (INACTIVE): MAC Safety Uncorrectable Interrupt Status not detected. 0x1 (ACTIVE): MAC Safety Uncorrectable Interrupt Status detected.
30	0h RO	**Reserved**
29	0h RO	**MTL Safety Uncorrectable error Interrupt Status (MSUIS):** This bit indicates an uncorrectable error interrupt event in MTL. To get exact cause of the interrupt the software should read the MTL_Safety_Interrupt_Status register. 0x0 (INACTIVE): MTL Safety Uncorrectable error Interrupt Status not detected. 0x1 (ACTIVE): MTL Safety Uncorrectable error Interrupt Status detected.
28	0h RO	**MTL Safety Correctable error Interrupt Status (MSCIS):** This bit indicates a correctable error interrupt event in MTL. To get exact cause of the interrupt the software should read the MTL_Safety_Interrupt_Status register. 0x0 (INACTIVE): MTL Safety Correctable error Interrupt Status not detected. 0x1 (ACTIVE): MTL Safety Correctable error Interrupt Status detected.

Bit Range	Default & Access	Field Name (ID): Description
27:2	0h RO	**Reserved**
1	0h RO	**DMA ECC Uncorrectable error Interrupt Status (DEUIS):** This bit indicates an interrupt event in the DMA ECC safety feature. To get the exact cause of the interrupt the application should read the DMA_ECC_Interrupt_Status register. 0x0 (INACTIVE): DMA ECC Uncorrectable error Interrupt Status not detected. 0x1 (ACTIVE): DMA ECC Uncorrectable error Interrupt Status detected.
0	0h RO	**DMA ECC Correctable error Interrupt Status (DECIS):** This bit indicates an interrupt event in the DMA ECC safety feature. To get the exact cause of the interrupt the application should read the DMA_ECC_Interrupt_Status register. 0x0 (INACTIVE): DMA ECC Correctable error Interrupt Status not detected. 0x1 (ACTIVE): DMA ECC Correctable error Interrupt Status detected.

3.2.491 DMA_ECC_INTERRUPT_ENABLE — Offset 1084h

This register is used to enable the Automotive Safety related TSO memory ECC error interrupt.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1084h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**TSO memory Correctable Error Interrupt Enable (TCEIE):** When set, generates an interrupt when a correctable error is detected at the DMA TSO memory interface. It is indicated in the TCES bit of DMA_ECC_Interrupt_Status register. When reset this event does not generates an interrupt. 0x0 (DISABLE): TSO memory Correctable Error Interrupt is disabled. 0x1 (ENABLE): TSO memory Correctable Error Interrupt is enabled.

3.2.492 DMA_ECC_INTERRUPT_STATUS — Offset 1088h

This register indicates the Automotive Safety related TSO memory ECC error interrupt status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1088h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2	0h RW	**DMA TSO memory Uncorrectable Error status (TUES):** When set, indicates that an uncorrectable error is detected at DMA TSO memory interface. 0x0 (INACTIVE): DMA TSO memory Uncorrectable Error status not detected. 0x1 (ACTIVE): DMA TSO memory Uncorrectable Error status detected.
1	0h RW	**DMA TSO memory Address Mismatch status (TAMS):** This bit when set indicates that address mismatch is found for address bus of DMA TSO memory. 0x0 (INACTIVE): DMA TSO memory Address Mismatch status not detected. 0x1 (ACTIVE): DMA TSO memory Address Mismatch status detected.
0	0h RW	**DMA TSO memory Correctable Error status (TCES):** This bit when set indicates that correctable error is detected at DMA TSO memory interface. 0x0 (INACTIVE): DMA TSO memory Correctable Error status not detected. 0x1 (ACTIVE): DMA TSO memory Correctable Error status detected.

3.2.493 DMA_CH0_CONTROL — Offset 1100h

The DMA Channeli Control register specifies the MSS value for segmentation, length to skip between two descriptors, and also the features such as header splitting and 8xPBL mode.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1100h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**Split Headers (SPH):** When this bit is set, the DMA splits the header and payload in the Receive path. The DMA writes the header to the Buffer Address1 of RDES0. The DMA writes the payload to the buffer to which the Buffer Address2 is pointing. The software must ensure that the header fits into the Receive buffers. If the header length exceeds the receive buffer size, the DMA does not split the header and payload. This bit is available only if Enable Split Header Structure option is selected. 0x0 (DISABLE): Split Headers feature is disabled. 0x1 (ENABLE): Split Headers feature is enabled.
23:21	0h RO	**Reserved**
20:18	0h RW	**Descriptor Skip Length (DSL):** This bit specifies the Word, Dword, or Lword number (depending on the 32-bit, 64-bit, or 128-bit bus) to skip between two unchained descriptors. The address skipping starts from the end of the current descriptor to the start of the next descriptor. When the DSL value is equal to zero, the DMA takes the descriptor table as contiguous.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**Reserved**
16	0h RW	**8xPBL mode (PBLX8):** When this bit is set, the PBL value programmed in Bits[21:16] in DMA_CH(#i)_Tx_Control and Bits[21:16] in DMA_CH(#i)_Rx_Control is multiplied by eight times. Therefore, the DMA transfers the data in 8, 16, 32, 64, 128, and 256 beats depending on the PBL value. 0x0 (DISABLE): 8xPBL mode is disabled. 0x1 (ENABLE): 8xPBL mode is enabled.
15:14	0h RO	**Reserved**
13:0	0000h RW	**Maximum Segment Size (MSS):** This field specifies the maximum segment size that should be used while segmenting the packet. This field is valid only if the TSE bit of DMA_CH0_Tx_Control register is set. The value programmed in this field must be more than the configured Datawidth in bytes. It is recommended to use a MSS value of 64 bytes or more.

3.2.494 DMA_CH0_TX_CONTROL — Offset 1104h

The DMA Channeli Transmit Control register controls the Tx features such as PBL, TCP segmentation, and Tx Channel weights.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1104h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:29	0h RW	**Time Select (TFSEL):** Select bits for one of the four DMA_TBS_CTRL register fields (FTOS, FGSN, FTOV) for the channel. 0x0: DMA_TBS_CTRL0 selected. 0x1: DMA_TBS_CTRL1 selected. 0x2: DMA_TBS_CTRL2 selected. 0x3: DMA_TBS_CTRL3 selected.
28	0h RW	**Enhanced Descriptor Enable (EDSE):** When this bit is set, the corresponding channel uses Enhanced Descriptors that are 32 Bytes for both Normal and Context Descriptors. When reset, the corresponding channel uses the descriptors that are 16 Bytes. 0x0 (DISABLE): Enhanced Descriptor is disabled. 0x1 (ENABLE): Enhanced Descriptor is enabled.
27:24	0h RW	**Transmit QOS. (TQOS):** This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Tx Channel0.
23:22	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
21:16	00h RW	**Transmit Programmable Burst Length (TXPBL):** These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in DMA_CH0_Control register. 2. Set the TxPBL. Note: The maximum value of TxPBL must be less than or equal to half the Tx Queue size (TQS field of MTL_TxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. For example, in 64-bit data width configurations the total locations in Tx Queue of size 512 bytes is 64, TxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	0h RW	**Ignore PBL Requirement (IPBL):** When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. If space is not available, the MTL might use handshaking to slow the DMA. Note: This bit/mode must not be used when multiple Transmit DMA Channels are enabled as it might block other Transmit and Receive DMA Channels from accessing the Read Data Channel of AXI bus until space is available in Transmit Queue for current transfer. 0x0 (DISABLE): Ignore PBL Requirement is disabled. 0x1 (ENABLE): Ignore PBL Requirement is enabled.
14:13	0h RW	**TSE_MODE:** TSE Mode - 00: TSO/USO (segmentation functionality is enabled). In this mode, the setting of TSE bit enables the TSO/USO segmentation. - 01: UFO with Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality with Checksum for all the UDP packets. - 10: UFO without Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality without Checksum for all the UDP packets. - 11: Reserved 0x0 (TSO_USO): TSO/USO. 0x1 (UFOWC): UFO with Checksum. 0x2 (UFOWOC): UFO without Checksum. 0x3 (RSVD): Reserved.
12	0h RW	**TCP Segmentation Enabled (TSE):** When this bit is set, the DMA performs the TCP segmentation or UDP Segmentation/ Fragmentation for packets in this channel. The TCP segmentation or UDP packet's segmentation/Fragmentation is done only for those packets for which the TSE bit (TDES0[19]) is set in the Tx Normal descriptor.When this bit is set, the TxPBL value must be greater than 4. 0x0 (DISABLE): TCP Segmentation is disabled. 0x1 (ENABLE): TCP Segmentation is enabled.
11:5	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	**Operate on Second Packet (OSF):** When this bit is set, it instructs the DMA to process the second packet of the Transmit data even before the status for the first packet is obtained. 0x0 (DISABLE): Operate on Second Packet disabled. 0x1 (ENABLE): Operate on Second Packet enabled.
3:1	0h RW	**Transmit Channel Weight (TCW):** This field indicates the weight assigned to the corresponding Transmit channel. When reset is complete, this field is set to 0 for all channels by default, resulting in equal weights to all channels.
0	0h RW	**Start or Stop Transmission Command (ST):** When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the base address of the Transmit list set by the DMA_CH0_TxDesc_List_Address register. - The position at which the transmission was previously stopped If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the DMA_CH0_Status register is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the DMA_CH0_TxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program DMA_CH0_TxDesc_List_Address register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state. 0x0 (STOP): Stop Transmission Command. 0x1 (START): Start Transmission Command.

3.2.495 DMA_CH0_RX_CONTROL — Offset 1108h

The DMA Channeli Receive Control register controls the Rx features such as PBL, buffer size, and extended status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1108h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Rx Packet Flush. (RPF):** When this bit is set to 1, then GbE Controller automatically flushes the packet from the Rx Queues destined to this DMA Rx Channel, when it is stopped. When this bit remains set and the DMA is re-started by the software driver, the packets residing in the Rx Queues that were received when this RxDMA was stopped, get flushed out. The packets that are received by the MAC after the RxDMA is re-started are routed to the RxDMA. The flushing happens on the Read side of the Rx Queue. When this bit is set to 0, the GbE Controller not flush the packet in the Rx Queue destined to this RxDMA Channel when it is STOP state. This might in turn cause head-of-line blocking in the corresponding RxQueue. Note: The stopping of packet flow from a Rx DMA Channel to the application by setting RPF works only when there is one-to-one mapping of Rx Queue to Rx DMA channels. In Dynamic mapping mode, setting RPF bit in any DMA_CH(#i)_Rx_Control register might flush packets from unintended Rx Queues which are destined to the stopped Rx DMA Channel. 0x0 (DISABLE): Rx Packet Flush is disabled. 0x1 (ENABLE): Rx Packet Flush is enabled.
30:28	0h RO	**Reserved**
27:24	0h RW	**Rx AXI4 QOS. (RQOS):** This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Rx Channel0.
23:22	0h RO	**Reserved**
21:16	00h RW	**Receive Programmable Burst Length (RXPBL):** These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in the DMA_CH0_Control register. 2. Set the RxPBL. Note: The maximum value of RxPBL must be less than or equal to half the Rx Queue size (RQS field of MTL_RxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the Rx DMA is transferring a block of data. For example, in 64-bit data width configurations the total locations in Rx Queue of size 512 bytes is 64, so RxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
14:4	000h RW	**Receive Buffer size High (RBSZ_13_Y):** RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. The RBSZ[13:0] field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when split headers are enabled. Note: The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the value of buffer address pointer is not aligned to data bus width. Hence the lower RBSZ_x_0 bits are read-only and the value is considered as all-zero. Thus the RBSZ_13_y indicates the buffer size in terms of locations (with the width same as bus-width).
3:1	0h RO	**Receive Buffer size Low (RBSZ_X_0):** RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. The RBSZ_x_0 is the lower field whose width is based on data bus width of the configuration. This field is of width 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).
0	0h RW	**Start or Stop Receive (SR):** When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the address set by the DMA_CH0_RxDesc_List_Address register. - The position at which the Rx process was previously stopped If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the DMA_CH0_Status register is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the DMA_CH0_RxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state. 0x0 (STOP): Stop Receive. 0x1 (START): Start Receive.

3.2.496 DMA_CH0_TXDESC_LIST_HADDRESS — Offset 1110h

The Channeli Tx Descriptor List HAddress register has the higher 8 or 16 bits of the start address of the Transmit descriptor list.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CHi_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier. This register must be programmed with desired the higher address before programming the DMA_CHi_TxDesc_List_Address register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1110h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Start of Transmit List (TDESHA):** This field contains the most-significant 8 or 16 bits of the 40- or 48-bit base address of the first descriptor in the Transmit descriptor list.

3.2.497 DMA_CH0_TXDESC_LIST_ADDRESS — Offset 1114h

The Channeli Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LSB to low.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CH0_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1114h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Start of Transmit List (TDESLA):** This field contains the base address of the first descriptor in the Transmit descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

3.2.498 DMA_CH0_RXDESC_LIST_HADDRESS — Offset 1118h

The Channeli Rx Descriptor List HAddress register has the higher 8 or 16 bits of the start address of the Receive descriptor list.

Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in the DMA_CHi_RxDesc_List_Address register

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1118h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Start of Receive List (RDESHA):** This field contains the most-significant 8 or 16 bits of the 40-bit or 48-bit base address of the first descriptor in the Rx Descriptor list.

3.2.499 DMA_CH0_RXDESC_LIST_ADDRESS — Offset 111Ch

The Channeli Rx Descriptor List Address register points the DMA to the start of Receive descriptor list.

This register points to the start of the Receive Descriptor List. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in DMA_CH0_Rx_Control register. When stopped, this register can be written with a new descriptor list address.

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Type	Size	Offset	Default

3.2.502 DMA_CH0_TXDESC_RING_LENGTH — Offset 112Ch

The Tx Descriptor Ring Length register contains the length of the Transmit descriptor ring.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 112Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:0	000h RW	**Transmit Descriptor Ring Length (TDRL):** This field sets the maximum number of Tx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. Intel recommends a minimum ring descriptor length of 4. For example, You can program any value up to 0x3FF in this field. This field is 10 bits wide, if you program 0x3FF, you can have 1024 descriptors. If you want to have 10 descriptors, program it to a value of 0x9.

3.2.503 DMA_CH0_RXDESC_RING_LENGTH — Offset 1130h

The Channeli Rx Descriptor Ring Length register contains the length of the Receive descriptor circular ring.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1130h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:0	000h RW	**Receive Descriptor Ring Length (RDRL):** This register sets the maximum number of Rx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. For example, You can program any value up to 0x3FF in this field. This field is 10 bits wide, if you program 0x3FF, you can have 1024 descriptors. If you want to have 10 descriptors, program it to a value of 0x9.

3.2.504 DMA_CH0_INTERRUPT_ENABLE — Offset 1134h

The Channeli Interrupt Enable register enables the interrupts reported by the Status register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1134h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW	**Normal Interrupt Summary Enable (NIE):** When this bit is set, the normal interrupt summary is enabled. This bit enables the following interrupts in the DMA_CH0_Status register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt When this bit is reset, the normal interrupt summary is disabled. 0x0 (DISABLE): Normal Interrupt Summary is disabled. 0x1 (ENABLE): Normal Interrupt Summary is enabled.
14	0h RW	**Abnormal Interrupt Summary Enable (AIE):** When this bit is set, the abnormal interrupt summary is enabled. This bit enables the following interrupts in the DMA_CH0_Status register: - Bit 1: Transmit Process Stopped - Bit 7: Rx Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 9: Receive Watchdog Timeout - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error When this bit is reset, the abnormal interrupt summary is disabled. 0x0 (DISABLE): Abnormal Interrupt Summary is disabled. 0x1 (ENABLE): Abnormal Interrupt Summary is enabled.
13	0h RW	**Context Descriptor Error Enable (CDEE):** When this bit is set along with the AIE bit, the Descriptor error interrupt is enabled. When this bit is reset, the Descriptor error interrupt is disabled. 0x0 (DISABLE): Context Descriptor Error is disabled. 0x1 (ENABLE): Context Descriptor Error is enabled.
12	0h RW	**Fatal Bus Error Enable (FBEE):** When this bit is set along with the AIE bit, the Fatal Bus error interrupt is enabled. When this bit is reset, the Fatal Bus Error error interrupt is disabled. 0x0 (DISABLE): Fatal Bus Error is disabled. 0x1 (ENABLE): Fatal Bus Error is enabled.
11	0h RW	**Early Receive Interrupt Enable (ERIE):** When this bit is set along with the NIE bit, the Early Receive interrupt is enabled. When this bit is reset, the Early Receive interrupt is disabled. 0x0 (DISABLE): Early Receive Interrupt is disabled. 0x1 (ENABLE): Early Receive Interrupt is enabled.
10	0h RW	**Early Transmit Interrupt Enable (ETIE):** When this bit is set along with the AIE bit, the Early Transmit interrupt is enabled. When this bit is reset, the Early Transmit interrupt is disabled. 0x0 (DISABLE): Early Transmit Interrupt is disabled. 0x1 (ENABLE): Early Transmit Interrupt is enabled.
9	0h RW	**Receive Watchdog Timeout Enable (RWTE):** When this bit is set along with the AIE bit, the Receive Watchdog Timeout interrupt is enabled. When this bit is reset, the Receive Watchdog Timeout interrupt is disabled. 0x0 (DISABLE): Receive Watchdog Timeout is disabled. 0x1 (ENABLE): Receive Watchdog Timeout is enabled.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**Receive Stopped Enable (RSE):** When this bit is set along with the AIE bit, the Receive Stopped Interrupt is enabled. When this bit is reset, the Receive Stopped interrupt is disabled. 0x0 (DISABLE): Receive Stopped is disabled. 0x1 (ENABLE): Receive Stopped is enabled.
7	0h RW	**Receive Buffer Unavailable Enable (RBUE):** When this bit is set along with the AIE bit, the Receive Buffer Unavailable interrupt is enabled. When this bit is reset, the Receive Buffer Unavailable interrupt is disabled. 0x0 (DISABLE): Receive Buffer Unavailable is disabled. 0x1 (ENABLE): Receive Buffer Unavailable is enabled.
6	0h RW	**Receive Interrupt Enable (RIE):** When this bit is set along with the NIE bit, the Receive Interrupt is enabled. When this bit is reset, the Receive Interrupt is disabled. 0x0 (DISABLE): Receive Interrupt is disabled. 0x1 (ENABLE): Receive Interrupt is enabled.
5:3	0h RO	**Reserved**
2	0h RW	**Transmit Buffer Unavailable Enable (TBUE):** When this bit is set along with the NIE bit, the Transmit Buffer Unavailable interrupt is enabled. When this bit is reset, the Transmit Buffer Unavailable interrupt is disabled. 0x0 (DISABLE): Transmit Buffer Unavailable is disabled. 0x1 (ENABLE): Transmit Buffer Unavailable is enabled.
1	0h RW	**Transmit Stopped Enable (TXSE):** When this bit is set along with the AIE bit, the Transmission Stopped interrupt is enabled. When this bit is reset, the Transmission Stopped interrupt is disabled. 0x0 (DISABLE): Transmit Stopped is disabled. 0x1 (ENABLE): Transmit Stopped is enabled.
0	0h RW	**Transmit Interrupt Enable (TIE):** When this bit is set along with the NIE bit, the Transmit Interrupt is enabled. When this bit is reset, the Transmit Interrupt is disabled. 0x0 (DISABLE): Transmit Interrupt is disabled. 0x1 (ENABLE): Transmit Interrupt is enabled.

3.2.505 DMA_CH0_RX_INTERRUPT_WATCHDOG_TIMER — Offset 1138h

The Receive Interrupt Watchdog Timer register indicates the watchdog timeout for Receive Interrupt (RI) from the DMA. When this register is written with a non-zero value, it enables the watchdog timer for the RI bit of the DMA_CHi_Status register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1138h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17:16	0h RW	**Receive Interrupt Watchdog Timer Count Units (RWTU):** This fields indicates the number of system clock cycles corresponding to one unit in RWT field. - 2'b00: 256 - 2'b01: 512 - 2'b10: 1024 - 2'b11: 2048 For example, when RWT=2 and RWTU=1, the watchdog timer is set for 2*512=1024 system clock cycles.
15:8	0h RO	**Reserved**
7:0	00h RW	**Receive Interrupt Watchdog Timer Count (RWT):** This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. The watchdog timer is triggered with the programmed value after the Rx DMA completes the transfer of a packet for which the RI bit is not set in the DMA_CH(#i)_Status register, because of the setting of Interrupt Enable bit in the corresponding descriptor RDES3[30]. When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per the Interrupt Enable bit RDES3[30] of any received packet.

3.2.506 DMA_CH0_SLOT_FUNCTION_CONTROL_STATUS — Offset 113Ch

The Slot Function Control and Status register contains the control bits for slot function and the status for Transmit path.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 113Ch	000007C0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19:16	0h RO	**Reference Slot Number (RSN):** This field gives the current value of the reference slot number in the DMA. It is used for slot comparison.
15:4	07Ch RW	**Slot Interval Value (SIV):** This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. A value of 0 specifies the slot interval of 1 us while the maximum value 4095 specifies the slot interval of 4096us. The default/reset value is 0x07C which corresponds to slot interval of 125us

Bit Range	Default & Access	Field Name (ID): Description
3:2	0h RO	**Reserved**
1	0h RW	**Advance Slot Check (ASC):** When set, this bit enables the DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the Tx descriptor is - equal to the reference slot number given in the RSN field or - ahead of the reference slot number by up to two slots This bit is applicable only when the ESC bit is set. 0x0 (DISABLE): Advance Slot Check is disabled. 0x1 (ENABLE): Advance Slot Check is enabled.
0	0h RW	**Enable Slot Comparison (ESC):** When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. The DMA fetches the data from the corresponding buffer only when the slot number is - equal to the reference slot number or - ahead of the reference slot number by one slot When reset, this bit disables the checking of the slot numbers. The DMA fetches the data immediately after the descriptor is processed. Note: The UFO (UDP Fragmentation over IPv4)/TSO/USO should not be enabled along with TBS/AVB Slot number check. The UFO/TSO/USO involves multiple packets/segments/fragments transmission for single packet received from application and the slot number check are applicable for fetching of only first segment/fragment. As a result it might be difficult for software to specify slot number for subsequent packets. 0x0 (DISABLE): Slot Comparison is disabled. 0x1 (ENABLE): Slot Comparison is enabled.

3.2.507 DMA_CH0_CURRENT_APP_TXDESC — Offset 1144h

The Channeli Current Application Transmit Descriptor register points to the current Transmit descriptor read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1144h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Transmit Descriptor Address Pointer (CURTDESAPTR):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

3.2.508 DMA_CH0_CURRENT_APP_RXDESC — Offset 114Ch

The Channeli Current Application Receive Descriptor register points to the current Receive descriptor read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 114Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Receive Descriptor Address Pointer (CURRDESAPTR):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

3.2.509 DMA_CH0_CURRENT_APP_TXBUFFER_H — Offset 1150h

The Channeli Current Application Transmit Buffer Address High register has the higher 8 or 16 bits of the current address of the Transmit buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1150h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**

3.2.510 DMA_CH0_CURRENT_APP_TXBUFFER — Offset 1154h

The Channeli Current Application Transmit Buffer Address register points to the current Tx buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1154h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Transmit Buffer Address Pointer (CURTBUFAPTR):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

3.2.511 DMA_CH0_CURRENT_APP_RXBUFFER_H — Offset 1158h

The Channeli Current Application Receive Buffer Address High register has the higher 8 or 16 bits of the current address of the Receive buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1158h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO	**Application Receive Buffer Address Pointer (CURRBUFAPTRH):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

3.2.512 DMA_CH0_CURRENT_APP_RXBUFFER — Offset 115Ch

The Channel 0 Current Application Receive Buffer Address register points to the current Rx buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 115Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Receive Buffer Address Pointer (CURRBUFAPTR):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

3.2.513 DMA_CH0_STATUS — Offset 1160h

The software driver (application) reads the Status register during interrupt service routine or polling to determine the status of the DMA.

Note: The number of DMA_CH(#i)_Status register in the configuration is the higher of number of Rx DMA Channels and Tx DMA Channels.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1160h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21:19	0h RO	**Rx DMA Error Bits (REB):** This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 21 -- 1'b1: Error during data transfer by Rx DMA -- 1'b0: No Error during data transfer by Rx DMA - Bit 20 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 19 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
18:16	0h RO	**Tx DMA Error Bits (TEB):** This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 18 -- 1'b1: Error during data transfer by Tx DMA -- 1'b0: No Error during data transfer by Tx DMA - Bit 17 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 16 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
15	0h RW	**Normal Interrupt Summary (NIS):** Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in DMA_CH0_Interrupt_Enable register) affect the Normal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit which causes NIS to be set is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Normal Interrupt Summary status not detected. 0x1 (ACTIVE): Normal Interrupt Summary status detected.

Bit Range	Default & Access	Field Name (ID): Description
14	0h RW	**Abnormal Interrupt Summary (AIS):** Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Abnormal Interrupt Summary status not detected. 0x1 (ACTIVE): Abnormal Interrupt Summary status detected.
13	0h RW	**Context Descriptor Error (CDE):** This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Context Descriptor Error status not detected. 0x1 (ACTIVE): Context Descriptor Error status detected.
12	0h RW	**Fatal Bus Error (FBE):** This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Fatal Bus Error status not detected. 0x1 (ACTIVE): Fatal Bus Error status detected.
11	0h RW	**Early Receive Interrupt (ERI):** This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. In configs supporting ERIC, When ERIC=0, this bit is set only after the Rx DMA has filled up a complete receive buffer with packet data. When ERIC=1, this bit is set after every burst transfer of data from the Rx DMA to the buffer. The setting of RI bit automatically clears this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Receive Interrupt status not detected. 0x1 (ACTIVE): Early Receive Interrupt status detected.
10	0h RW	**Early Transmit Interrupt (ETI):** This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. In configs supporting ERIC: When ETIC=0, this bit is set only after the Tx DMA has transferred a complete packet to MTL. When ETIC=1, this bit is set after completion of (partial) packet data transfer from buffers in the Transmit descriptor in which IOC=1. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Transmit Interrupt status not detected. 0x1 (ACTIVE): Early Transmit Interrupt status detected.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**Receive Watchdog Timeout (RWT):** This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received. 0x0 (INACTIVE): Receive Watchdog Timeout status not detected. 0x1 (ACTIVE): Receive Watchdog Timeout status detected.
8	0h RW	**Receive Process Stopped (RPS):** This bit is asserted when the Rx process enters the Stopped state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Process Stopped status not detected. 0x1 (ACTIVE): Receive Process Stopped status detected.
7	0h RW	**Receive Buffer Unavailable (RBU):** This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode, the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Buffer Unavailable status not detected. 0x1 (ACTIVE): Receive Buffer Unavailable status detected.
6	0h RW	**Receive Interrupt (RI):** This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. The reception remains in the Running state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Interrupt status not detected. 0x1 (ACTIVE): Receive Interrupt status detected.
5:3	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Transmit Buffer Unavailable (TBU):** This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPS0 field of the DMA_Debug_Status0 register explains the Transmit Process state transitions. To resume processing the Transmit descriptors, the application should do the following: 1. Change the ownership of the descriptor by setting Bit 31 of TDES3. 2. Issue a Transmit Poll Demand command. For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Buffer Unavailable status not detected. 0x1 (ACTIVE): Transmit Buffer Unavailable status detected.
1	0h RW	**Transmit Process Stopped (TPS):** This bit is set when the transmission is stopped. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Process Stopped status not detected. 0x1 (ACTIVE): Transmit Process Stopped status detected.
0	0h RW	**Transmit Interrupt (TI):** This bit indicates that the packet transmission is complete. When transmission is complete, Bit 31 of TDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Interrupt status not detected. 0x1 (ACTIVE): Transmit Interrupt status detected.

3.2.514 DMA_CH0_MISS_FRAME_CNT — Offset 1164h

This register has the number of packet counter that got dropped by the DMA either due to Bus Error or due to programming RPF field in DMA_CH${i}_Rx_Control register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1164h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Overflow status of the MFC Counter (MFCO):** When this bit is set then the MFC counter does not get incremented further. The bit gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Miss Frame Counter overflow not occurred. 0x1 (ACTIVE): Miss Frame Counter overflow occurred.
14:11	0h RO	**Reserved**
10:0	000h RO	**Dropped Packet Counters (MFC):** This counter indicates the number of packet counters that are dropped by the DMA either because of bus error or because of programing RPF field in DMA_CH${i}_Rx_Control register. The counter gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event.

3.2.515 DMA_CH0_RXP_ACCEPT_CNT — Offset 1168h

The DMA_CH(#i)_RXP_Accept_Cnt registers provides the count of the number of frames accepted by Rx Parser.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1168h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Rx Parser Accept Counter Overflow Bit (RXPACOF):** When set, this bit indicates that the RXPAC Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Rx Parser Accept Counter overflow not occurred. 0x1 (ACTIVE): Rx Parser Accept Counter overflow occurred.
30:0	00000000h RO	**Rx Parser Accept Counter (RXPAC):** This 31-bit counter is implemented whenever a Rx Parser Accept a packet due to AF =1. The counter is cleared when the register is read.

3.2.516 DMA_CH0_RX_ERI_CNT — Offset 116Ch

The DMA_CH(#i)_RX_ERI_Cnt registers provides the count of the number of times ERI was asserted.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 116Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11:0	000h RO	**ERI Counter (ECNT):** When ERIC bit of DMA_CH(#i)_RX_Control register is set, this counter increments for burst transfer completed by the Rx DMA from the start of packet transfer. This counter is reset at the start of new packet.

3.2.517 DMA_CH1_CONTROL — Offset 1180h

The DMA Channeli Control register specifies the MSS value for segmentation, length to skip between two descriptors, and also the features such as header splitting and 8xPBL mode.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1180h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**Split Headers (SPH):** When this bit is set, the DMA splits the header and payload in the Receive path. The DMA writes the header to the Buffer Address1 of RDES0. The DMA writes the payload to the buffer to which the Buffer Address2 is pointing. The software must ensure that the header fits into the Receive buffers. If the header length exceeds the receive buffer size, the DMA does not split the header and payload. This bit is available only if Enable Split Header Structure option is selected. 0x0 (DISABLE): Split Headers feature is disabled. 0x1 (ENABLE): Split Headers feature is enabled.
23:21	0h RO	**Reserved**
20:18	0h RW	**Descriptor Skip Length (DSL):** This bit specifies the Word, Dword, or Lword number (depending on the 32-bit, 64-bit, or 128-bit bus) to skip between two unchained descriptors. The address skipping starts from the end of the current descriptor to the start of the next descriptor. When the DSL value is equal to zero, the DMA takes the descriptor table as contiguous.
17	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**8xPBL mode (PBLX8):** When this bit is set, the PBL value programmed in Bits[21:16] in DMA_CH(#i)_Tx_Control and Bits[21:16] in DMA_CH(#i)_Rx_Control is multiplied by eight times. Therefore, the DMA transfers the data in 8, 16, 32, 64, 128, and 256 beats depending on the PBL value. 0x0 (DISABLE): 8xPBL mode is disabled. 0x1 (ENABLE): 8xPBL mode is enabled.
15:14	0h RO	**Reserved**
13:0	0000h RW	**Maximum Segment Size (MSS):** This field specifies the maximum segment size that should be used while segmenting the packet. This field is valid only if the TSE bit of DMA_CH0_Tx_Control register is set. The value programmed in this field must be more than the configured Datawidth in bytes. It is recommended to use a MSS value of 64 bytes or more.

3.2.518 DMA_CH1_TX_CONTROL — Offset 1184h

The DMA Channeli Transmit Control register controls the Tx features such as PBL, TCP segmentation, and Tx Channel weights.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1184h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:29	0h RW	**Time Select (TFSEL):** Select bits for one of the four DMA_TBS_CTRL register fields (FTOS, FGSN, FTOV) for the channel. 0x0: DMA_TBS_CTRL0 selected. 0x1: DMA_TBS_CTRL1 selected. 0x2: DMA_TBS_CTRL2 selected. 0x3: DMA_TBS_CTRL3 selected.
28	0h RW	**Enhanced Descriptor Enable (EDSE):** When this bit is set, the corresponding channel uses Enhanced Descriptors that are 32 Bytes for both Normal and Context Descriptors. When reset, the corresponding channel uses the descriptors that are 16 Bytes. 0x0 (DISABLE): Enhanced Descriptor is disabled. 0x1 (ENABLE): Enhanced Descriptor is enabled.
27:24	0h RW	**Transmit QOS. (TQOS):** This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Tx Channel0.
23:22	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
21:16	00h RW	**Transmit Programmable Burst Length (TXPBL):** These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in DMA_CH0_Control register. 2. Set the TxPBL. Note: The maximum value of TxPBL must be less than or equal to half the Tx Queue size (TQS field of MTL_TxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. For example, in 64-bit data width configurations the total locations in Tx Queue of size 512 bytes is 64, TxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	0h RW	**Ignore PBL Requirement (IPBL):** When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. If space is not available, the MTL might use handshaking to slow the DMA. Note: This bit/mode must not be used when multiple Transmit DMA Channels are enabled as it might block other Transmit and Receive DMA Channels from accessing the Read Data Channel of AXI bus until space is available in Transmit Queue for current transfer. 0x0 (DISABLE): Ignore PBL Requirement is disabled. 0x1 (ENABLE): Ignore PBL Requirement is enabled.
14:13	0h RW	**TSE_MODE:** TSE Mode - 00: TSO/USO (segmentation functionality is enabled). In this mode, the setting of TSE bit enables the TSO/USO segmentation. - 01: UFO with Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality with Checksum for all the UDP packets. - 10: UFO without Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality without Checksum for all the UDP packets. - 11: Reserved 0x0 (TSO_USO): TSO/USO. 0x1 (UFOWC): UFO with Checksum. 0x2 (UFOWOC): UFO without Checksum. 0x3 (RSVD): Reserved.
12	0h RW	**TCP Segmentation Enabled (TSE):** When this bit is set, the DMA performs the TCP segmentation or UDP Segmentation/ Fragmentation for packets in this channel. The TCP segmentation or UDP packet's segmentation/Fragmentation is done only for those packets for which the TSE bit (TDES0[19]) is set in the Tx Normal descriptor.When this bit is set, the TxPBL value must be greater than 4. 0x0 (DISABLE): TCP Segmentation is disabled. 0x1 (ENABLE): TCP Segmentation is enabled.
11:5	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	**Operate on Second Packet (OSF):** When this bit is set, it instructs the DMA to process the second packet of the Transmit data even before the status for the first packet is obtained. 0x0 (DISABLE): Operate on Second Packet disabled. 0x1 (ENABLE): Operate on Second Packet enabled.
3:1	0h RW	**Transmit Channel Weight (TCW):** This field indicates the weight assigned to the corresponding Transmit channel. When reset is complete, this field is set to 0 for all channels by default, resulting in equal weights to all channels.
0	0h RW	**Start or Stop Transmission Command (ST):** When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the base address of the Transmit list set by the DMA_CH0_TxDesc_List_Address register. - The position at which the transmission was previously stopped If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the DMA_CH0_Status register is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the DMA_CH0_TxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program DMA_CH0_TxDesc_List_Address register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state. 0x0 (STOP): Stop Transmission Command. 0x1 (START): Start Transmission Command.

3.2.519 DMA_CH1_RX_CONTROL — Offset 1188h

The DMA Channeli Receive Control register controls the Rx features such as PBL, buffer size, and extended status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1188h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Rx Packet Flush. (RPF):** When this bit is set to 1, then GbE Controller automatically flushes the packet from the Rx Queues destined to this DMA Rx Channel, when it is stopped. When this bit remains set and the DMA is re-started by the software driver, the packets residing in the Rx Queues that were received when this RxDMA was stopped, get flushed out. The packets that are received by the MAC after the RxDMA is re-started are routed to the RxDMA. The flushing happens on the Read side of the Rx Queue. When this bit is set to 0, the GbE Controller not flush the packet in the Rx Queue destined to this RxDMA Channel when it is STOP state. This might in turn cause head-of-line blocking in the corresponding RxQueue. Note: The stopping of packet flow from a Rx DMA Channel to the application by setting RPF works only when there is one-to-one mapping of Rx Queue to Rx DMA channels. In Dynamic mapping mode, setting RPF bit in any DMA_CH(#i)_Rx_Control register might flush packets from unintended Rx Queues which are destined to the stopped Rx DMA Channel. 0x0 (DISABLE): Rx Packet Flush is disabled. 0x1 (ENABLE): Rx Packet Flush is enabled.
30:28	0h RO	**Reserved**
27:24	0h RW	**Rx AXI4 QOS. (RQOS):** This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Rx Channel0.
23:22	0h RO	**Reserved**
21:16	00h RW	**Receive Programmable Burst Length (RXPBL):** These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in the DMA_CH0_Control register. 2. Set the RxPBL. Note: The maximum value of RxPBL must be less than or equal to half the Rx Queue size (RQS field of MTL_RxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the Rx DMA is transferring a block of data. For example, in 64-bit data width configurations the total locations in Rx Queue of size 512 bytes is 64, so RxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
14:4	000h RW	**Receive Buffer size High (RBSZ_13_Y):** RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. The RBSZ[13:0] field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when split headers are enabled. Note: The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the value of buffer address pointer is not aligned to data bus width. Hence the lower RBSZ_x_0 bits are read-only and the value is considered as all-zero. Thus the RBSZ_13_y indicates the buffer size in terms of locations (with the width same as bus-width).
3:1	0h RO	**Receive Buffer size Low (RBSZ_X_0):** RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. The RBSZ_x_0 is the lower field whose width is based on data bus width of the configuration. This field is of width 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).
0	0h RW	**Start or Stop Receive (SR):** When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the address set by the DMA_CH0_RxDesc_List_Address register. - The position at which the Rx process was previously stopped If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the DMA_CH0_Status register is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the DMA_CH0_RxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state. 0x0 (STOP): Stop Receive. 0x1 (START): Start Receive.

3.2.520 DMA_CH1_TXDESC_LIST_HADDRESS — Offset 1190h

The Channeli Tx Descriptor List HAddress register has the higher 8 or 16 bits of the start address of the Transmit descriptor list.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CHi_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier. This register must be programmed with desired the higher address before programming the DMA_CHi_TxDesc_List_Address register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1190h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Start of Transmit List (TDESHA):** This field contains the most-significant 8 or 16 bits of the 40- or 48-bit base address of the first descriptor in the Transmit descriptor list.

3.2.521 DMA_CH1_TXDESC_LIST_ADDRESS — Offset 1194h

The Channeli Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LSB to low.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CH0_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1194h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Start of Transmit List (TDESLA):** This field contains the base address of the first descriptor in the Transmit descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

3.2.522 DMA_CH1_RXDESC_LIST_HADDRESS — Offset 1198h

The Channeli Rx Descriptor List HAddress register has the higher 8 or 16 bits of the start address of the Receive descriptor list.

Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in the DMA_CHi_RxDesc_List_Address register

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1198h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Start of Receive List (RDESHA):** This field contains the most-significant 8 or 16 bits of the 40-bit or 48-bit base address of the first descriptor in the Rx Descriptor list.

3.2.523 DMA_CH1_RXDESC_LIST_ADDRESS — Offset 119Ch

The Channeli Rx Descriptor List Address register points the DMA to the start of Receive descriptor list.

This register points to the start of the Receive Descriptor List. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in DMA_CH0_Rx_Control register. When stopped, this register can be written with a new descriptor list address.

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 119Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Start of Receive List (RDESLA):** This field contains the base address of the first descriptor in the Rx Descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

3.2.524 DMA_CH1_TXDESC_TAIL_POINTER — Offset 11A0h

The Channeli Tx Descriptor Tail Pointer register points to an offset from the base and indicates the location of the last valid descriptor.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11A0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Transmit Descriptor Tail Pointer (TDTP):** This field contains the tail pointer for the Tx descriptor ring. The software writes the tail pointer to add more descriptors to the Tx channel. The hardware tries to transmit all packets referenced by the descriptors between the head and the tail pointer registers. The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

3.2.525 DMA_CH1_RXDESC_TAIL_POINTER — Offset 11A8h

The Channeli Rx Descriptor Tail Pointer Points to an offset from the base and indicates the location of the last valid descriptor.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11A8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Receive Descriptor Tail Pointer (RDTP):** This field contains the tail pointer for the Rx descriptor ring. The software writes the tail pointer to add more descriptors to the Rx channel. The hardware tries to write all received packets to the descriptors referenced between the head and the tail pointer registers. The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

3.2.526 DMA_CH1_TXDESC_RING_LENGTH — Offset 11ACh

The Tx Descriptor Ring Length register contains the length of the Transmit descriptor ring.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11ACh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:0	000h RW	**Transmit Descriptor Ring Length (TDRL):** This field sets the maximum number of Tx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. Intel recommends a minimum ring descriptor length of 4. For example, You can program any value up to 0x3FF in this field. This field is 10 bits wide, if you program 0x3FF, you can have 1024 descriptors. If you want to have 10 descriptors, program it to a value of 0x9.

3.2.527 DMA_CH1_RXDESC_RING_LENGTH — Offset 11B0h

The Channeli Rx Descriptor Ring Length register contains the length of the Receive descriptor circular ring.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:0	000h RW	**Receive Descriptor Ring Length (RDRL):** This register sets the maximum number of Rx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. For example, You can program any value up to 0x3FF in this field. This field is 10 bits wide, if you program 0x3FF, you can have 1024 descriptors. If you want to have 10 descriptors, program it to a value of 0x9.

3.2.528 DMA_CH1_INTERRUPT_ENABLE — Offset 11B4h

The Channeli Interrupt Enable register enables the interrupts reported by the Status register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11B4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW	**Normal Interrupt Summary Enable (NIE):** When this bit is set, the normal interrupt summary is enabled. This bit enables the following interrupts in the DMA_CH0_Status register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt When this bit is reset, the normal interrupt summary is disabled. 0x0 (DISABLE): Normal Interrupt Summary is disabled. 0x1 (ENABLE): Normal Interrupt Summary is enabled.
14	0h RW	**Abnormal Interrupt Summary Enable (AIE):** When this bit is set, the abnormal interrupt summary is enabled. This bit enables the following interrupts in the DMA_CH0_Status register: - Bit 1: Transmit Process Stopped - Bit 7: Rx Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 9: Receive Watchdog Timeout - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error When this bit is reset, the abnormal interrupt summary is disabled. 0x0 (DISABLE): Abnormal Interrupt Summary is disabled. 0x1 (ENABLE): Abnormal Interrupt Summary is enabled.
13	0h RW	**Context Descriptor Error Enable (CDEE):** When this bit is set along with the AIE bit, the Descriptor error interrupt is enabled. When this bit is reset, the Descriptor error interrupt is disabled. 0x0 (DISABLE): Context Descriptor Error is disabled. 0x1 (ENABLE): Context Descriptor Error is enabled.
12	0h RW	**Fatal Bus Error Enable (FBEE):** When this bit is set along with the AIE bit, the Fatal Bus error interrupt is enabled. When this bit is reset, the Fatal Bus Error error interrupt is disabled. 0x0 (DISABLE): Fatal Bus Error is disabled. 0x1 (ENABLE): Fatal Bus Error is enabled.
11	0h RW	**Early Receive Interrupt Enable (ERIE):** When this bit is set along with the NIE bit, the Early Receive interrupt is enabled. When this bit is reset, the Early Receive interrupt is disabled. 0x0 (DISABLE): Early Receive Interrupt is disabled. 0x1 (ENABLE): Early Receive Interrupt is enabled.
10	0h RW	**Early Transmit Interrupt Enable (ETIE):** When this bit is set along with the AIE bit, the Early Transmit interrupt is enabled. When this bit is reset, the Early Transmit interrupt is disabled. 0x0 (DISABLE): Early Transmit Interrupt is disabled. 0x1 (ENABLE): Early Transmit Interrupt is enabled.
9	0h RW	**Receive Watchdog Timeout Enable (RWTE):** When this bit is set along with the AIE bit, the Receive Watchdog Timeout interrupt is enabled. When this bit is reset, the Receive Watchdog Timeout interrupt is disabled. 0x0 (DISABLE): Receive Watchdog Timeout is disabled. 0x1 (ENABLE): Receive Watchdog Timeout is enabled.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**Receive Stopped Enable (RSE):** When this bit is set along with the AIE bit, the Receive Stopped Interrupt is enabled. When this bit is reset, the Receive Stopped interrupt is disabled. 0x0 (DISABLE): Receive Stopped is disabled. 0x1 (ENABLE): Receive Stopped is enabled.
7	0h RW	**Receive Buffer Unavailable Enable (RBUE):** When this bit is set along with the AIE bit, the Receive Buffer Unavailable interrupt is enabled. When this bit is reset, the Receive Buffer Unavailable interrupt is disabled. 0x0 (DISABLE): Receive Buffer Unavailable is disabled. 0x1 (ENABLE): Receive Buffer Unavailable is enabled.
6	0h RW	**Receive Interrupt Enable (RIE):** When this bit is set along with the NIE bit, the Receive Interrupt is enabled. When this bit is reset, the Receive Interrupt is disabled. 0x0 (DISABLE): Receive Interrupt is disabled. 0x1 (ENABLE): Receive Interrupt is enabled.
5:3	0h RO	**Reserved**
2	0h RW	**Transmit Buffer Unavailable Enable (TBUE):** When this bit is set along with the NIE bit, the Transmit Buffer Unavailable interrupt is enabled. When this bit is reset, the Transmit Buffer Unavailable interrupt is disabled. 0x0 (DISABLE): Transmit Buffer Unavailable is disabled. 0x1 (ENABLE): Transmit Buffer Unavailable is enabled.
1	0h RW	**Transmit Stopped Enable (TXSE):** When this bit is set along with the AIE bit, the Transmission Stopped interrupt is enabled. When this bit is reset, the Transmission Stopped interrupt is disabled. 0x0 (DISABLE): Transmit Stopped is disabled. 0x1 (ENABLE): Transmit Stopped is enabled.
0	0h RW	**Transmit Interrupt Enable (TIE):** When this bit is set along with the NIE bit, the Transmit Interrupt is enabled. When this bit is reset, the Transmit Interrupt is disabled. 0x0 (DISABLE): Transmit Interrupt is disabled. 0x1 (ENABLE): Transmit Interrupt is enabled.

3.2.529 DMA_CH1_RX_INTERRUPT_WATCHDOG_TIMER — Offset 11B8h

The Receive Interrupt Watchdog Timer register indicates the watchdog timeout for Receive Interrupt (RI) from the DMA. When this register is written with a non-zero value, it enables the watchdog timer for the RI bit of the DMA_CHi_Status register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11B8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17:16	0h RW	**Receive Interrupt Watchdog Timer Count Units (RWTU):** This fields indicates the number of system clock cycles corresponding to one unit in RWT field. - 2'b00: 256 - 2'b01: 512 - 2'b10: 1024 - 2'b11: 2048 For example, when RWT=2 and RWTU=1, the watchdog timer is set for 2*512=1024 system clock cycles.
15:8	0h RO	**Reserved**
7:0	00h RW	**Receive Interrupt Watchdog Timer Count (RWT):** This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. The watchdog timer is triggered with the programmed value after the Rx DMA completes the transfer of a packet for which the RI bit is not set in the DMA_CH(#i)_Status register, because of the setting of Interrupt Enable bit in the corresponding descriptor RDES3[30]. When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per the Interrupt Enable bit RDES3[30] of any received packet.

3.2.530 DMA_CH1_SLOT_FUNCTION_CONTROL_STATUS — Offset 11BCh

The Slot Function Control and Status register contains the control bits for slot function and the status for Transmit path.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11BCh	000007C0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19:16	0h RO	**Reference Slot Number (RSN):** This field gives the current value of the reference slot number in the DMA. It is used for slot comparison.
15:4	07Ch RW	**Slot Interval Value (SIV):** This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. A value of 0 specifies the slot interval of 1 us while the maximum value 4095 specifies the slot interval of 4096us. The default/reset value is 0x07C which corresponds to slot interval of 125us

Bit Range	Default & Access	Field Name (ID): Description
3:2	0h RO	**Reserved**
1	0h RW	**Advance Slot Check (ASC):** When set, this bit enables the DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the Tx descriptor is - equal to the reference slot number given in the RSN field or - ahead of the reference slot number by up to two slots This bit is applicable only when the ESC bit is set. 0x0 (DISABLE): Advance Slot Check is disabled. 0x1 (ENABLE): Advance Slot Check is enabled.
0	0h RW	**Enable Slot Comparison (ESC):** When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. The DMA fetches the data from the corresponding buffer only when the slot number is - equal to the reference slot number or - ahead of the reference slot number by one slot When reset, this bit disables the checking of the slot numbers. The DMA fetches the data immediately after the descriptor is processed. Note: The UFO (UDP Fragmentation over IPv4)/TSO/USO should not be enabled along with TBS/AVB Slot number check. The UFO/TSO/USO involves multiple packets/segments/fragments transmission for single packet received from application and the slot number check are applicable for fetching of only first segment/fragment. As a result it might be difficult for software to specify slot number for subsequent packets. 0x0 (DISABLE): Slot Comparison is disabled. 0x1 (ENABLE): Slot Comparison is enabled.

3.2.531 DMA_CH1_CURRENT_APP_TXDESC — Offset 11C4h

The Channeli Current Application Transmit Descriptor register points to the current Transmit descriptor read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11C4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Transmit Descriptor Address Pointer (CURTDESAPTR):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

3.2.532 DMA_CH1_CURRENT_APP_RXDESC — Offset 11CCh

The Channeli Current Application Receive Descriptor register points to the current Receive descriptor read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11CCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Receive Descriptor Address Pointer (CURRDESAPTR):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

3.2.533 DMA_CH1_CURRENT_APP_TXBUFFER_H — Offset 11D0h

The Channeli Current Application Transmit Buffer Address High register has the higher 8 or 16 bits of the current address of the Transmit buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11D0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO	**Application Transmit Buffer Address Pointer (CURTBUFAPTRH):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

3.2.534 DMA_CH1_CURRENT_APP_TXBUFFER — Offset 11D4h

The Channeli Current Application Transmit Buffer Address register points to the current Tx buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Transmit Buffer Address Pointer (CURTBUFAPTR):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

3.2.535 DMA_CH1_CURRENT_APP_RXBUFFER_H — Offset 11D8h

The Channeli Current Application Receive Buffer Address High register has the higher 8 or 16 bits of the current address of the Receive buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO	**Application Receive Buffer Address Pointer (CURRBUFAPTRH):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

3.2.536 DMA_CH1_CURRENT_APP_RXBUFFER — Offset 11DCh

The Channel 0 Current Application Receive Buffer Address register points to the current Rx buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11DCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Receive Buffer Address Pointer (CURRBUFAPTR):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

3.2.537 DMA_CH1_STATUS — Offset 11E0h

The software driver (application) reads the Status register during interrupt service routine or polling to determine the status of the DMA.

Note: The number of DMA_CH(#i)_Status register in the configuration is the higher of number of Rx DMA Channels and Tx DMA Channels.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11E0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21:19	0h RO	**Rx DMA Error Bits (REB):** This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 21 -- 1'b1: Error during data transfer by Rx DMA -- 1'b0: No Error during data transfer by Rx DMA - Bit 20 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 19 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
18:16	0h RO	**Tx DMA Error Bits (TEB):** This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 18 -- 1'b1: Error during data transfer by Tx DMA -- 1'b0: No Error during data transfer by Tx DMA - Bit 17 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 16 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
15	0h RW	**Normal Interrupt Summary (NIS):** Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in DMA_CH0_Interrupt_Enable register) affect the Normal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit which causes NIS to be set is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Normal Interrupt Summary status not detected. 0x1 (ACTIVE): Normal Interrupt Summary status detected.

Bit Range	Default & Access	Field Name (ID): Description
14	0h RW	**Abnormal Interrupt Summary (AIS):** Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Abnormal Interrupt Summary status not detected. 0x1 (ACTIVE): Abnormal Interrupt Summary status detected.
13	0h RW	**Context Descriptor Error (CDE):** This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Context Descriptor Error status not detected. 0x1 (ACTIVE): Context Descriptor Error status detected.
12	0h RW	**Fatal Bus Error (FBE):** This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Fatal Bus Error status not detected. 0x1 (ACTIVE): Fatal Bus Error status detected.
11	0h RW	**Early Receive Interrupt (ERI):** This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. In configs supporting ERIC, When ERIC=0, this bit is set only after the Rx DMA has filled up a complete receive buffer with packet data. When ERIC=1, this bit is set after every burst transfer of data from the Rx DMA to the buffer. The setting of RI bit automatically clears this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Receive Interrupt status not detected. 0x1 (ACTIVE): Early Receive Interrupt status detected.
10	0h RW	**Early Transmit Interrupt (ETI):** This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. In configs supporting ERIC: When ETIC=0, this bit is set only after the Tx DMA has transferred a complete packet to MTL. When ETIC=1, this bit is set after completion of (partial) packet data transfer from buffers in the Transmit descriptor in which IOC=1. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Transmit Interrupt status not detected. 0x1 (ACTIVE): Early Transmit Interrupt status detected.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**Receive Watchdog Timeout (RWT):** This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received. 0x0 (INACTIVE): Receive Watchdog Timeout status not detected. 0x1 (ACTIVE): Receive Watchdog Timeout status detected.
8	0h RW	**Receive Process Stopped (RPS):** This bit is asserted when the Rx process enters the Stopped state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Process Stopped status not detected. 0x1 (ACTIVE): Receive Process Stopped status detected.
7	0h RW	**Receive Buffer Unavailable (RBU):** This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode, the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Buffer Unavailable status not detected. 0x1 (ACTIVE): Receive Buffer Unavailable status detected.
6	0h RW	**Receive Interrupt (RI):** This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. The reception remains in the Running state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Interrupt status not detected. 0x1 (ACTIVE): Receive Interrupt status detected.
5:3	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Transmit Buffer Unavailable (TBU):** This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPS0 field of the DMA_Debug_Status0 register explains the Transmit Process state transitions. To resume processing the Transmit descriptors, the application should do the following: 1. Change the ownership of the descriptor by setting Bit 31 of TDES3. 2. Issue a Transmit Poll Demand command. For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Buffer Unavailable status not detected. 0x1 (ACTIVE): Transmit Buffer Unavailable status detected.
1	0h RW	**Transmit Process Stopped (TPS):** This bit is set when the transmission is stopped. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Process Stopped status not detected. 0x1 (ACTIVE): Transmit Process Stopped status detected.
0	0h RW	**Transmit Interrupt (TI):** This bit indicates that the packet transmission is complete. When transmission is complete, Bit 31 of TDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Interrupt status not detected. 0x1 (ACTIVE): Transmit Interrupt status detected.

3.2.538 DMA_CH1_MISS_FRAME_CNT — Offset 11E4h

This register has the number of packet counter that got dropped by the DMA either due to Bus Error or due to programming RPF field in DMA_CH${i}_Rx_Control register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Overflow status of the MFC Counter (MFCO):** When this bit is set then the MFC counter does not get incremented further. The bit gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Miss Frame Counter overflow not occurred. 0x1 (ACTIVE): Miss Frame Counter overflow occurred.
14:11	0h RO	**Reserved**
10:0	000h RO	**Dropped Packet Counters (MFC):** This counter indicates the number of packet counters that are dropped by the DMA either because of bus error or because of programing RPF field in DMA_CH${i}_Rx_Control register. The counter gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event.

3.2.539 DMA_CH1_RXP_ACCEPT_CNT — Offset 11E8h

The DMA_CH(#i)_RXP_Accept_Cnt registers provides the count of the number of frames accepted by Rx Parser.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11E8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Rx Parser Accept Counter Overflow Bit (RXPACOF):** When set, this bit indicates that the RXPAC Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Rx Parser Accept Counter overflow not occurred. 0x1 (ACTIVE): Rx Parser Accept Counter overflow occurred.
30:0	00000000h RO	**Rx Parser Accept Counter (RXPAC):** This 31-bit counter is implemented whenever a Rx Parser Accept a packet due to AF =1. The counter is cleared when the register is read.

3.2.540 DMA_CH1_RX_ERI_CNT — Offset 11ECh

The DMA_CH(#i)_RX_ERI_Cnt registers provides the count of the number of times ERI was asserted.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 11ECh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11:0	000h RO	**ERI Counter (ECNT):** When ERIC bit of DMA_CH(#i)_RX_Control register is set, this counter increments for burst transfer completed by the Rx DMA from the start of packet transfer. This counter is reset at the start of new packet.

3.2.541 DMA_CH2_CONTROL — Offset 1200h

The DMA Channeli Control register specifies the MSS value for segmentation, length to skip between two descriptors, and also the features such as header splitting and 8xPBL mode.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1200h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**Split Headers (SPH):** When this bit is set, the DMA splits the header and payload in the Receive path. The DMA writes the header to the Buffer Address1 of RDES0. The DMA writes the payload to the buffer to which the Buffer Address2 is pointing. The software must ensure that the header fits into the Receive buffers. If the header length exceeds the receive buffer size, the DMA does not split the header and payload. This bit is available only if Enable Split Header Structure option is selected. 0x0 (DISABLE): Split Headers feature is disabled. 0x1 (ENABLE): Split Headers feature is enabled.
23:21	0h RO	**Reserved**
20:18	0h RW	**Descriptor Skip Length (DSL):** This bit specifies the Word, Dword, or Lword number (depending on the 32-bit, 64-bit, or 128-bit bus) to skip between two unchained descriptors. The address skipping starts from the end of the current descriptor to the start of the next descriptor. When the DSL value is equal to zero, the DMA takes the descriptor table as contiguous.
17	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**8xPBL mode (PBLX8):** When this bit is set, the PBL value programmed in Bits[21:16] in DMA_CH(#i)_Tx_Control and Bits[21:16] in DMA_CH(#i)_Rx_Control is multiplied by eight times. Therefore, the DMA transfers the data in 8, 16, 32, 64, 128, and 256 beats depending on the PBL value. 0x0 (DISABLE): 8xPBL mode is disabled. 0x1 (ENABLE): 8xPBL mode is enabled.
15:14	0h RO	**Reserved**
13:0	0000h RW	**Maximum Segment Size (MSS):** This field specifies the maximum segment size that should be used while segmenting the packet. This field is valid only if the TSE bit of DMA_CH0_Tx_Control register is set. The value programmed in this field must be more than the configured Datawidth in bytes. It is recommended to use a MSS value of 64 bytes or more.

3.2.542 DMA_CH2_TX_CONTROL — Offset 1204h

The DMA Channeli Transmit Control register controls the Tx features such as PBL, TCP segmentation, and Tx Channel weights.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1204h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:29	0h RW	**Time Select (TFSEL):** Select bits for one of the four DMA_TBS_CTRL register fields (FTOS, FGSN, FTOV) for the channel. 0x0: DMA_TBS_CTRL0 selected. 0x1: DMA_TBS_CTRL1 selected. 0x2: DMA_TBS_CTRL2 selected. 0x3: DMA_TBS_CTRL3 selected.
28	0h RW	**Enhanced Descriptor Enable (EDSE):** When this bit is set, the corresponding channel uses Enhanced Descriptors that are 32 Bytes for both Normal and Context Descriptors. When reset, the corresponding channel uses the descriptors that are 16 Bytes. 0x0 (DISABLE): Enhanced Descriptor is disabled. 0x1 (ENABLE): Enhanced Descriptor is enabled.
27:24	0h RW	**Transmit QOS. (TQOS):** This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Tx Channel0.
23:22	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
21:16	00h RW	**Transmit Programmable Burst Length (TXPBL):** These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in DMA_CH0_Control register. 2. Set the TxPBL. Note: The maximum value of TxPBL must be less than or equal to half the Tx Queue size (TQS field of MTL_TxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. For example, in 64-bit data width configurations the total locations in Tx Queue of size 512 bytes is 64, TxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	0h RW	**Ignore PBL Requirement (IPBL):** When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. If space is not available, the MTL might use handshaking to slow the DMA. Note: This bit/mode must not be used when multiple Transmit DMA Channels are enabled as it might block other Transmit and Receive DMA Channels from accessing the Read Data Channel of AXI bus until space is available in Transmit Queue for current transfer. 0x0 (DISABLE): Ignore PBL Requirement is disabled. 0x1 (ENABLE): Ignore PBL Requirement is enabled.
14:13	0h RW	**TSE_MODE:** TSE Mode - 00: TSO/USO (segmentation functionality is enabled). In this mode, the setting of TSE bit enables the TSO/USO segmentation. - 01: UFO with Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality with Checksum for all the UDP packets. - 10: UFO without Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality without Checksum for all the UDP packets. - 11: Reserved 0x0 (TSO_USO): TSO/USO. 0x1 (UFOWC): UFO with Checksum. 0x2 (UFOWOC): UFO without Checksum. 0x3 (RSVD): Reserved.
12	0h RW	**TCP Segmentation Enabled (TSE):** When this bit is set, the DMA performs the TCP segmentation or UDP Segmentation/ Fragmentation for packets in this channel. The TCP segmentation or UDP packet's segmentation/Fragmentation is done only for those packets for which the TSE bit (TDES0[19]) is set in the Tx Normal descriptor.When this bit is set, the TxPBL value must be greater than 4. 0x0 (DISABLE): TCP Segmentation is disabled. 0x1 (ENABLE): TCP Segmentation is enabled.
11:5	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	**Operate on Second Packet (OSF):** When this bit is set, it instructs the DMA to process the second packet of the Transmit data even before the status for the first packet is obtained. 0x0 (DISABLE): Operate on Second Packet disabled. 0x1 (ENABLE): Operate on Second Packet enabled.
3:1	0h RW	**Transmit Channel Weight (TCW):** This field indicates the weight assigned to the corresponding Transmit channel. When reset is complete, this field is set to 0 for all channels by default, resulting in equal weights to all channels.
0	0h RW	**Start or Stop Transmission Command (ST):** When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the base address of the Transmit list set by the DMA_CH0_TxDesc_List_Address register. - The position at which the transmission was previously stopped If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the DMA_CH0_Status register is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the DMA_CH0_TxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program DMA_CH0_TxDesc_List_Address register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state. 0x0 (STOP): Stop Transmission Command. 0x1 (START): Start Transmission Command.

3.2.543 DMA_CH2_RX_CONTROL — Offset 1208h

The DMA Channeli Receive Control register controls the Rx features such as PBL, buffer size, and extended status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1208h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Rx Packet Flush. (RPF):** When this bit is set to 1, then GbE Controller automatically flushes the packet from the Rx Queues destined to this DMA Rx Channel, when it is stopped. When this bit remains set and the DMA is re-started by the software driver, the packets residing in the Rx Queues that were received when this RxDMA was stopped, get flushed out. The packets that are received by the MAC after the RxDMA is re-started are routed to the RxDMA. The flushing happens on the Read side of the Rx Queue. When this bit is set to 0, the GbE Controller not flush the packet in the Rx Queue destined to this RxDMA Channel when it is STOP state. This might in turn cause head-of-line blocking in the corresponding RxQueue. Note: The stopping of packet flow from a Rx DMA Channel to the application by setting RPF works only when there is one-to-one mapping of Rx Queue to Rx DMA channels. In Dynamic mapping mode, setting RPF bit in any DMA_CH(#i)_Rx_Control register might flush packets from unintended Rx Queues which are destined to the stopped Rx DMA Channel. 0x0 (DISABLE): Rx Packet Flush is disabled. 0x1 (ENABLE): Rx Packet Flush is enabled.
30:28	0h RO	**Reserved**
27:24	0h RW	**Rx AXI4 QOS. (RQOS):** This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Rx Channel0.
23:22	0h RO	**Reserved**
21:16	00h RW	**Receive Programmable Burst Length (RXPBL):** These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in the DMA_CH0_Control register. 2. Set the RxPBL. Note: The maximum value of RxPBL must be less than or equal to half the Rx Queue size (RQS field of MTL_RxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the Rx DMA is transferring a block of data. For example, in 64-bit data width configurations the total locations in Rx Queue of size 512 bytes is 64, so RxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
14:4	000h RW	**Receive Buffer size High (RBSZ_13_Y):** RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. The RBSZ[13:0] field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when split headers are enabled. Note: The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the value of buffer address pointer is not aligned to data bus width. Hence the lower RBSZ_x_0 bits are read-only and the value is considered as all-zero. Thus the RBSZ_13_y indicates the buffer size in terms of locations (with the width same as bus-width).
3:1	0h RO	**Receive Buffer size Low (RBSZ_X_0):** RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. The RBSZ_x_0 is the lower field whose width is based on data bus width of the configuration. This field is of width 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).
0	0h RW	**Start or Stop Receive (SR):** When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the address set by the DMA_CH0_RxDesc_List_Address register. - The position at which the Rx process was previously stopped If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the DMA_CH0_Status register is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the DMA_CH0_RxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state. 0x0 (STOP): Stop Receive. 0x1 (START): Start Receive.

3.2.544 DMA_CH2_TXDESC_LIST_HADDRESS — Offset 1210h

The Channeli Tx Descriptor List HAddress register has the higher 8 or 16 bits of the start address of the Transmit descriptor list.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CHi_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier. This register must be programmed with desired the higher address before programming the DMA_CHi_TxDesc_List_Address register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1210h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Start of Transmit List (TDESHA):** This field contains the most-significant 8 or 16 bits of the 40- or 48-bit base address of the first descriptor in the Transmit descriptor list.

3.2.545 DMA_CH2_TXDESC_LIST_ADDRESS — Offset 1214h

The Channeli Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LSB to low.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CH0_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1214h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Start of Transmit List (TDESLA):** This field contains the base address of the first descriptor in the Transmit descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

3.2.546 DMA_CH2_RXDESC_LIST_HADDRESS — Offset 1218h

The Channeli Rx Descriptor List HAddress register has the higher 8 or 16 bits of the start address of the Receive descriptor list.

Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in the DMA_CHi_RxDesc_List_Address register

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1218h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Start of Receive List (RDESHA):** This field contains the most-significant 8 or 16 bits of the 40-bit or 48-bit base address of the first descriptor in the Rx Descriptor list.

3.2.547 DMA_CH2_RXDESC_LIST_ADDRESS — Offset 121Ch

The Channeli Rx Descriptor List Address register points the DMA to the start of Receive descriptor list.

This register points to the start of the Receive Descriptor List. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in DMA_CH0_Rx_Control register. When stopped, this register can be written with a new descriptor list address.

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 121Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Start of Receive List (RDESLA):** This field contains the base address of the first descriptor in the Rx Descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). 0	0h RW	**Transmit Interrupt Enable (TIE):** When this bit is set along with the NIE bit, the Transmit Interrupt is enabled. When this bit is reset, the Transmit Interrupt is disabled. 0x0 (DISABLE): Transmit Interrupt is disabled. 0x1 (ENABLE): Transmit Interrupt is enabled.

3.2.553 DMA_CH2_RX_INTERRUPT_WATCHDOG_TIMER — Offset 1238h

The Receive Interrupt Watchdog Timer register indicates the watchdog timeout for Receive Interrupt (RI) from the DMA. When this register is written with a non-zero value, it enables the watchdog timer for the RI bit of the DMA_CHi_Status register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1238h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17:16	0h RW	**Receive Interrupt Watchdog Timer Count Units (RWTU):** This fields indicates the number of system clock cycles corresponding to one unit in RWT field. - 2'b00: 256 - 2'b01: 512 - 2'b10: 1024 - 2'b11: 2048 For example, when RWT=2 and RWTU=1, the watchdog timer is set for 2*512=1024 system clock cycles.
15:8	0h RO	**Reserved**
7:0	00h RW	**Receive Interrupt Watchdog Timer Count (RWT):** This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. The watchdog timer is triggered with the programmed value after the Rx DMA completes the transfer of a packet for which the RI bit is not set in the DMA_CH(#i)_Status register, because of the setting of Interrupt Enable bit in the corresponding descriptor RDES3[30]. When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per the Interrupt Enable bit RDES3[30] of any received packet.

3.2.554 DMA_CH2_SLOT_FUNCTION_CONTROL_STATUS — Offset 123Ch

The Slot Function Control and Status register contains the control bits for slot function and the status for Transmit path.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 123Ch	000007C0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19:16	0h RO	**Reference Slot Number (RSN):** This field gives the current value of the reference slot number in the DMA. It is used for slot comparison.
15:4	07Ch RW	**Slot Interval Value (SIV):** This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. A value of 0 specifies the slot interval of 1 us while the maximum value 4095 specifies the slot interval of 4096us. The default/reset value is 0x07C which corresponds to slot interval of 125us

Bit Range	Default & Access	Field Name (ID): Description
3:2	0h RO	**Reserved**
1	0h RW	**Advance Slot Check (ASC):** When set, this bit enables the DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the Tx descriptor is - equal to the reference slot number given in the RSN field or - ahead of the reference slot number by up to two slots This bit is applicable only when the ESC bit is set. 0x0 (DISABLE): Advance Slot Check is disabled. 0x1 (ENABLE): Advance Slot Check is enabled.
0	0h RW	**Enable Slot Comparison (ESC):** When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. The DMA fetches the data from the corresponding buffer only when the slot number is - equal to the reference slot number or - ahead of the reference slot number by one slot When reset, this bit disables the checking of the slot numbers. The DMA fetches the data immediately after the descriptor is processed. Note: The UFO (UDP Fragmentation over IPv4)/TSO/USO should not be enabled along with TBS/AVB Slot number check. The UFO/TSO/USO involves multiple packets/segments/fragments transmission for single packet received from application and the slot number check are applicable for fetching of only first segment/fragment. As a result it might be difficult for software to specify slot number for subsequent packets. 0x0 (DISABLE): Slot Comparison is disabled. 0x1 (ENABLE): Slot Comparison is enabled.

3.2.555 DMA_CH2_CURRENT_APP_TXDESC — Offset 1244h

The Channeli Current Application Transmit Descriptor register points to the current Transmit descriptor read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1244h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Transmit Descriptor Address Pointer (CURTDESAPTR):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

3.2.556 DMA_CH2_CURRENT_APP_RXDESC — Offset 124Ch

The Channeli Current Application Receive Descriptor register points to the current Receive descriptor read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 124Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Receive Descriptor Address Pointer (CURRDESAPTR):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

3.2.557 DMA_CH2_CURRENT_APP_TXBUFFER_H — Offset 1250h

The Channeli Current Application Transmit Buffer Address High register has the higher 8 or 16 bits of the current address of the Transmit buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1250h	00000000h

Bit Range	Default & Access	Field Name (ID): Description

3.2.558 DMA_CH2_CURRENT_APP_TXBUFFER — Offset 1254h

The Channeli Current Application Transmit Buffer Address register points to the current Tx buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1254h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Transmit Buffer Address Pointer (CURTBUFAPTR):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

3.2.559 DMA_CH2_CURRENT_APP_RXBUFFER_H — Offset 1258h

The Channeli Current Application Receive Buffer Address High register has the higher 8 or 16 bits of the current address of the Receive buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1258h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO	**Application Receive Buffer Address Pointer (CURRBUFAPTRH):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

3.2.560 DMA_CH2_CURRENT_APP_RXBUFFER — Offset 125Ch

The Channel 0 Current Application Receive Buffer Address register points to the current Rx buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 125Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Receive Buffer Address Pointer (CURRBUFAPTR):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

3.2.561 DMA_CH2_STATUS — Offset 1260h

The software driver (application) reads the Status register during interrupt service routine or polling to determine the status of the DMA.

Note: The number of DMA_CH(#i)_Status register in the configuration is the higher of number of Rx DMA Channels and Tx DMA Channels.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1260h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21:19	0h RO	**Rx DMA Error Bits (REB):** This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 21 -- 1'b1: Error during data transfer by Rx DMA -- 1'b0: No Error during data transfer by Rx DMA - Bit 20 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 19 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
18:16	0h RO	**Tx DMA Error Bits (TEB):** This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 18 -- 1'b1: Error during data transfer by Tx DMA -- 1'b0: No Error during data transfer by Tx DMA - Bit 17 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 16 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
15	0h RW	**Normal Interrupt Summary (NIS):** Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in DMA_CH0_Interrupt_Enable register) affect the Normal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit which causes NIS to be set is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Normal Interrupt Summary status not detected. 0x1 (ACTIVE): Normal Interrupt Summary status detected.

Bit Range	Default & Access	Field Name (ID): Description
14	0h RW	**Abnormal Interrupt Summary (AIS):** Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Abnormal Interrupt Summary status not detected. 0x1 (ACTIVE): Abnormal Interrupt Summary status detected.
13	0h RW	**Context Descriptor Error (CDE):** This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Context Descriptor Error status not detected. 0x1 (ACTIVE): Context Descriptor Error status detected.
12	0h RW	**Fatal Bus Error (FBE):** This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Fatal Bus Error status not detected. 0x1 (ACTIVE): Fatal Bus Error status detected.
11	0h RW	**Early Receive Interrupt (ERI):** This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. In configs supporting ERIC, When ERIC=0, this bit is set only after the Rx DMA has filled up a complete receive buffer with packet data. When ERIC=1, this bit is set after every burst transfer of data from the Rx DMA to the buffer. The setting of RI bit automatically clears this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Receive Interrupt status not detected. 0x1 (ACTIVE): Early Receive Interrupt status detected.
10	0h RW	**Early Transmit Interrupt (ETI):** This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. In configs supporting ERIC: When ETIC=0, this bit is set only after the Tx DMA has transferred a complete packet to MTL. When ETIC=1, this bit is set after completion of (partial) packet data transfer from buffers in the Transmit descriptor in which IOC=1. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Transmit Interrupt status not detected. 0x1 (ACTIVE): Early Transmit Interrupt status detected.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**Receive Watchdog Timeout (RWT):** This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received. 0x0 (INACTIVE): Receive Watchdog Timeout status not detected. 0x1 (ACTIVE): Receive Watchdog Timeout status detected.
8	0h RW	**Receive Process Stopped (RPS):** This bit is asserted when the Rx process enters the Stopped state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Process Stopped status not detected. 0x1 (ACTIVE): Receive Process Stopped status detected.
7	0h RW	**Receive Buffer Unavailable (RBU):** This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode, the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Buffer Unavailable status not detected. 0x1 (ACTIVE): Receive Buffer Unavailable status detected.
6	0h RW	**Receive Interrupt (RI):** This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. The reception remains in the Running state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Interrupt status not detected. 0x1 (ACTIVE): Receive Interrupt status detected.
5:3	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Transmit Buffer Unavailable (TBU):** This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPS0 field of the DMA_Debug_Status0 register explains the Transmit Process state transitions. To resume processing the Transmit descriptors, the application should do the following: 1. Change the ownership of the descriptor by setting Bit 31 of TDES3. 2. Issue a Transmit Poll Demand command. For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Buffer Unavailable status not detected. 0x1 (ACTIVE): Transmit Buffer Unavailable status detected.
1	0h RW	**Transmit Process Stopped (TPS):** This bit is set when the transmission is stopped. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Process Stopped status not detected. 0x1 (ACTIVE): Transmit Process Stopped status detected.
0	0h RW	**Transmit Interrupt (TI):** This bit indicates that the packet transmission is complete. When transmission is complete, Bit 31 of TDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Interrupt status not detected. 0x1 (ACTIVE): Transmit Interrupt status detected.

3.2.562 DMA_CH2_MISS_FRAME_CNT — Offset 1264h

This register has the number of packet counter that got dropped by the DMA either due to Bus Error or due to programming RPF field in DMA_CH${i}_Rx_Control register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1264h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Overflow status of the MFC Counter (MFCO):** When this bit is set then the MFC counter does not get incremented further. The bit gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Miss Frame Counter overflow not occurred. 0x1 (ACTIVE): Miss Frame Counter overflow occurred.
14:11	0h RO	**Reserved**
10:0	000h RO	**Dropped Packet Counters (MFC):** This counter indicates the number of packet counters that are dropped by the DMA either because of bus error or because of programing RPF field in DMA_CH${i}_Rx_Control register. The counter gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event.

3.2.563 DMA_CH2_RXP_ACCEPT_CNT — Offset 1268h

The DMA_CH(#i)_RXP_Accept_Cnt registers provides the count of the number of frames accepted by Rx Parser.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1268h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Rx Parser Accept Counter Overflow Bit (RXPACOF):** When set, this bit indicates that the RXPAC Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Rx Parser Accept Counter overflow not occurred. 0x1 (ACTIVE): Rx Parser Accept Counter overflow occurred.
30:0	00000000h RO	**Rx Parser Accept Counter (RXPAC):** This 31-bit counter is implemented whenever a Rx Parser Accept a packet due to AF =1. The counter is cleared when the register is read.

3.2.564 DMA_CH2_RX_ERI_CNT — Offset 126Ch

The DMA_CH(#i)_RX_ERI_Cnt registers provides the count of the number of times ERI was asserted.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 126Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11:0	000h RO	**ERI Counter (ECNT):** When ERIC bit of DMA_CH(#i)_RX_Control register is set, this counter increments for burst transfer completed by the Rx DMA from the start of packet transfer. This counter is reset at the start of new packet.

3.2.565 DMA_CH3_CONTROL — Offset 1280h

The DMA Channeli Control register specifies the MSS value for segmentation, length to skip between two descriptors, and also the features such as header splitting and 8xPBL mode.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1280h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**Split Headers (SPH):** When this bit is set, the DMA splits the header and payload in the Receive path. The DMA writes the header to the Buffer Address1 of RDES0. The DMA writes the payload to the buffer to which the Buffer Address2 is pointing. The software must ensure that the header fits into the Receive buffers. If the header length exceeds the receive buffer size, the DMA does not split the header and payload. This bit is available only if Enable Split Header Structure option is selected. 0x0 (DISABLE): Split Headers feature is disabled. 0x1 (ENABLE): Split Headers feature is enabled.
23:21	0h RO	**Reserved**
20:18	0h RW	**Descriptor Skip Length (DSL):** This bit specifies the Word, Dword, or Lword number (depending on the 32-bit, 64-bit, or 128-bit bus) to skip between two unchained descriptors. The address skipping starts from the end of the current descriptor to the start of the next descriptor. When the DSL value is equal to zero, the DMA takes the descriptor table as contiguous.
17	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**8xPBL mode (PBLX8):** When this bit is set, the PBL value programmed in Bits[21:16] in DMA_CH(#i)_Tx_Control and Bits[21:16] in DMA_CH(#i)_Rx_Control is multiplied by eight times. Therefore, the DMA transfers the data in 8, 16, 32, 64, 128, and 256 beats depending on the PBL value. 0x0 (DISABLE): 8xPBL mode is disabled. 0x1 (ENABLE): 8xPBL mode is enabled.
15:14	0h RO	**Reserved**
13:0	0000h RW	**Maximum Segment Size (MSS):** This field specifies the maximum segment size that should be used while segmenting the packet. This field is valid only if the TSE bit of DMA_CH0_Tx_Control register is set. The value programmed in this field must be more than the configured Datawidth in bytes. It is recommended to use a MSS value of 64 bytes or more.

3.2.566 DMA_CH3_TX_CONTROL — Offset 1284h

The DMA Channeli Transmit Control register controls the Tx features such as PBL, TCP segmentation, and Tx Channel weights.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1284h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:29	0h RW	**Time Select (TFSEL):** Select bits for one of the four DMA_TBS_CTRL register fields (FTOS, FGSN, FTOV) for the channel. 0x0: DMA_TBS_CTRL0 selected. 0x1: DMA_TBS_CTRL1 selected. 0x2: DMA_TBS_CTRL2 selected. 0x3: DMA_TBS_CTRL3 selected.
28	0h RW	**Enhanced Descriptor Enable (EDSE):** When this bit is set, the corresponding channel uses Enhanced Descriptors that are 32 Bytes for both Normal and Context Descriptors. When reset, the corresponding channel uses the descriptors that are 16 Bytes. 0x0 (DISABLE): Enhanced Descriptor is disabled. 0x1 (ENABLE): Enhanced Descriptor is enabled.
27:24	0h RW	**Transmit QOS. (TQOS):** This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Tx Channel0.
23:22	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
21:16	00h RW	**Transmit Programmable Burst Length (TXPBL):** These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in DMA_CH0_Control register. 2. Set the TxPBL. Note: The maximum value of TxPBL must be less than or equal to half the Tx Queue size (TQS field of MTL_TxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. For example, in 64-bit data width configurations the total locations in Tx Queue of size 512 bytes is 64, TxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	0h RW	**Ignore PBL Requirement (IPBL):** When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. If space is not available, the MTL might use handshaking to slow the DMA. Note: This bit/mode must not be used when multiple Transmit DMA Channels are enabled as it might block other Transmit and Receive DMA Channels from accessing the Read Data Channel of AXI bus until space is available in Transmit Queue for current transfer. 0x0 (DISABLE): Ignore PBL Requirement is disabled. 0x1 (ENABLE): Ignore PBL Requirement is enabled.
14:13	0h RW	**TSE_MODE:** TSE Mode - 00: TSO/USO (segmentation functionality is enabled). In this mode, the setting of TSE bit enables the TSO/USO segmentation. - 01: UFO with Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality with Checksum for all the UDP packets. - 10: UFO without Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality without Checksum for all the UDP packets. - 11: Reserved 0x0 (TSO_USO): TSO/USO. 0x1 (UFOWC): UFO with Checksum. 0x2 (UFOWOC): UFO without Checksum. 0x3 (RSVD): Reserved.
12	0h RW	**TCP Segmentation Enabled (TSE):** When this bit is set, the DMA performs the TCP segmentation or UDP Segmentation/ Fragmentation for packets in this channel. The TCP segmentation or UDP packet's segmentation/Fragmentation is done only for those packets for which the TSE bit (TDES0[19]) is set in the Tx Normal descriptor.When this bit is set, the TxPBL value must be greater than 4. 0x0 (DISABLE): TCP Segmentation is disabled. 0x1 (ENABLE): TCP Segmentation is enabled.
11:5	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	**Operate on Second Packet (OSF):** When this bit is set, it instructs the DMA to process the second packet of the Transmit data even before the status for the first packet is obtained. 0x0 (DISABLE): Operate on Second Packet disabled. 0x1 (ENABLE): Operate on Second Packet enabled.
3:1	0h RW	**Transmit Channel Weight (TCW):** This field indicates the weight assigned to the corresponding Transmit channel. When reset is complete, this field is set to 0 for all channels by default, resulting in equal weights to all channels.
0	0h RW	**Start or Stop Transmission Command (ST):** When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the base address of the Transmit list set by the DMA_CH0_TxDesc_List_Address register. - The position at which the transmission was previously stopped If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the DMA_CH0_Status register is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the DMA_CH0_TxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program DMA_CH0_TxDesc_List_Address register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state. 0x0 (STOP): Stop Transmission Command. 0x1 (START): Start Transmission Command.

3.2.567 DMA_CH3_RX_CONTROL — Offset 1288h

The DMA Channeli Receive Control register controls the Rx features such as PBL, buffer size, and extended status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1288h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Rx Packet Flush. (RPF):** When this bit is set to 1, then GbE Controller automatically flushes the packet from the Rx Queues destined to this DMA Rx Channel, when it is stopped. When this bit remains set and the DMA is re-started by the software driver, the packets residing in the Rx Queues that were received when this RxDMA was stopped, get flushed out. The packets that are received by the MAC after the RxDMA is re-started are routed to the RxDMA. The flushing happens on the Read side of the Rx Queue. When this bit is set to 0, the GbE Controller not flush the packet in the Rx Queue destined to this RxDMA Channel when it is STOP state. This might in turn cause head-of-line blocking in the corresponding RxQueue. Note: The stopping of packet flow from a Rx DMA Channel to the application by setting RPF works only when there is one-to-one mapping of Rx Queue to Rx DMA channels. In Dynamic mapping mode, setting RPF bit in any DMA_CH(#i)_Rx_Control register might flush packets from unintended Rx Queues which are destined to the stopped Rx DMA Channel. 0x0 (DISABLE): Rx Packet Flush is disabled. 0x1 (ENABLE): Rx Packet Flush is enabled.
30:28	0h RO	**Reserved**
27:24	0h RW	**Rx AXI4 QOS. (RQOS):** This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Rx Channel0.
23:22	0h RO	**Reserved**
21:16	00h RW	**Receive Programmable Burst Length (RXPBL):** These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in the DMA_CH0_Control register. 2. Set the RxPBL. Note: The maximum value of RxPBL must be less than or equal to half the Rx Queue size (RQS field of MTL_RxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the Rx DMA is transferring a block of data. For example, in 64-bit data width configurations the total locations in Rx Queue of size 512 bytes is 64, so RxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
14:4	000h RW	**Receive Buffer size High (RBSZ_13_Y):** RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. The RBSZ[13:0] field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when split headers are enabled. Note: The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the value of buffer address pointer is not aligned to data bus width. Hence the lower RBSZ_x_0 bits are read-only and the value is considered as all-zero. Thus the RBSZ_13_y indicates the buffer size in terms of locations (with the width same as bus-width).
3:1	0h RO	**Receive Buffer size Low (RBSZ_X_0):** RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. The RBSZ_x_0 is the lower field whose width is based on data bus width of the configuration. This field is of width 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).
0	0h RW	**Start or Stop Receive (SR):** When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the address set by the DMA_CH0_RxDesc_List_Address register. - The position at which the Rx process was previously stopped If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the DMA_CH0_Status register is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the DMA_CH0_RxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state. 0x0 (STOP): Stop Receive. 0x1 (START): Start Receive.

3.2.568 DMA_CH3_TXDESC_LIST_HADDRESS — Offset 1290h

The Channeli Tx Descriptor List HAddress register has the higher 8 or 16 bits of the start address of the Transmit descriptor list.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CHi_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier. This register must be programmed with desired the higher address before programming the DMA_CHi_TxDesc_List_Address register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1290h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Start of Transmit List (TDESHA):** This field contains the most-significant 8 or 16 bits of the 40- or 48-bit base address of the first descriptor in the Transmit descriptor list.

3.2.569 DMA_CH3_TXDESC_LIST_ADDRESS — Offset 1294h

The Channeli Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LSB to low.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CH0_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1294h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Start of Transmit List (TDESLA):** This field contains the base address of the first descriptor in the Transmit descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

3.2.570 DMA_CH3_RXDESC_LIST_HADDRESS — Offset 1298h

The Channeli Rx Descriptor List HAddress register has the higher 8 or 16 bits of the start address of the Receive descriptor list.

Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in the DMA_CHi_RxDesc_List_Address register

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1298h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Start of Receive List (RDESHA):** This field contains the most-significant 8 or 16 bits of the 40-bit or 48-bit base address of the first descriptor in the Rx Descriptor list.

3.2.571 DMA_CH3_RXDESC_LIST_ADDRESS — Offset 129Ch

The Channeli Rx Descriptor List Address register points the DMA to the start of Receive descriptor list.

This register points to the start of the Receive Descriptor List. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in DMA_CH0_Rx_Control register. When stopped, this register can be written with a new descriptor list address.

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 129Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Start of Receive List (RDESLA):** This field contains the base address of the first descriptor in the Rx Descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

3.2.572 DMA_CH3_TXDESC_TAIL_POINTER — Offset 12A0h

The Channeli Tx Descriptor Tail Pointer register points to an offset from the base and indicates the location of the last valid descriptor.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12A0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Transmit Descriptor Tail Pointer (TDTP):** This field contains the tail pointer for the Tx descriptor ring. The software writes the tail pointer to add more descriptors to the Tx channel. The hardware tries to transmit all packets referenced by the descriptors between the head and the tail pointer registers. The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

3.2.573 DMA_CH3_RXDESC_TAIL_POINTER — Offset 12A8h

The Channeli Rx Descriptor Tail Pointer Points to an offset from the base and indicates the location of the last valid descriptor.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12A8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Receive Descriptor Tail Pointer (RDTP):** This field contains the tail pointer for the Rx descriptor ring. The software writes the tail pointer to add more descriptors to the Rx channel. The hardware tries to write all received packets to the descriptors referenced between the head and the tail pointer registers. The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

3.2.574 DMA_CH3_TXDESC_RING_LENGTH — Offset 12ACh

The Tx Descriptor Ring Length register contains the length of the Transmit descriptor ring.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12ACh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:0	000h RW	**Transmit Descriptor Ring Length (TDRL):** This field sets the maximum number of Tx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. Intel recommends a minimum ring descriptor length of 4. For example, You can program any value up to 0x3FF in this field. This field is 10 bits wide, if you program 0x3FF, you can have 1024 descriptors. If you want to have 10 descriptors, program it to a value of 0x9.

3.2.575 DMA_CH3_RXDESC_RING_LENGTH — Offset 12B0h

The Channeli Rx Descriptor Ring Length register contains the length of the Receive descriptor circular ring.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:0	000h RW	**Receive Descriptor Ring Length (RDRL):** This register sets the maximum number of Rx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. For example, You can program any value up to 0x3FF in this field. This field is 10 bits wide, if you program 0x3FF, you can have 1024 descriptors. If you want to have 10 descriptors, program it to a value of 0x9.

3.2.576 DMA_CH3_INTERRUPT_ENABLE — Offset 12B4h

The Channeli Interrupt Enable register enables the interrupts reported by the Status register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12B4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW	**Normal Interrupt Summary Enable (NIE):** When this bit is set, the normal interrupt summary is enabled. This bit enables the following interrupts in the DMA_CH0_Status register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt When this bit is reset, the normal interrupt summary is disabled. 0x0 (DISABLE): Normal Interrupt Summary is disabled. 0x1 (ENABLE): Normal Interrupt Summary is enabled.
14	0h RW	**Abnormal Interrupt Summary Enable (AIE):** When this bit is set, the abnormal interrupt summary is enabled. This bit enables the following interrupts in the DMA_CH0_Status register: - Bit 1: Transmit Process Stopped - Bit 7: Rx Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 9: Receive Watchdog Timeout - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error When this bit is reset, the abnormal interrupt summary is disabled. 0x0 (DISABLE): Abnormal Interrupt Summary is disabled. 0x1 (ENABLE): Abnormal Interrupt Summary is enabled.
13	0h RW	**Context Descriptor Error Enable (CDEE):** When this bit is set along with the AIE bit, the Descriptor error interrupt is enabled. When this bit is reset, the Descriptor error interrupt is disabled. 0x0 (DISABLE): Context Descriptor Error is disabled. 0x1 (ENABLE): Context Descriptor Error is enabled.
12	0h RW	**Fatal Bus Error Enable (FBEE):** When this bit is set along with the AIE bit, the Fatal Bus error interrupt is enabled. When this bit is reset, the Fatal Bus Error error interrupt is disabled. 0x0 (DISABLE): Fatal Bus Error is disabled. 0x1 (ENABLE): Fatal Bus Error is enabled.
11	0h RW	**Early Receive Interrupt Enable (ERIE):** When this bit is set along with the NIE bit, the Early Receive interrupt is enabled. When this bit is reset, the Early Receive interrupt is disabled. 0x0 (DISABLE): Early Receive Interrupt is disabled. 0x1 (ENABLE): Early Receive Interrupt is enabled.
10	0h RW	**Early Transmit Interrupt Enable (ETIE):** When this bit is set along with the AIE bit, the Early Transmit interrupt is enabled. When this bit is reset, the Early Transmit interrupt is disabled. 0x0 (DISABLE): Early Transmit Interrupt is disabled. 0x1 (ENABLE): Early Transmit Interrupt is enabled.
9	0h RW	**Receive Watchdog Timeout Enable (RWTE):** When this bit is set along with the AIE bit, the Receive Watchdog Timeout interrupt is enabled. When this bit is reset, the Receive Watchdog Timeout interrupt is disabled. 0x0 (DISABLE): Receive Watchdog Timeout is disabled. 0x1 (ENABLE): Receive Watchdog Timeout is enabled.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**Receive Stopped Enable (RSE):** When this bit is set along with the AIE bit, the Receive Stopped Interrupt is enabled. When this bit is reset, the Receive Stopped interrupt is disabled. 0x0 (DISABLE): Receive Stopped is disabled. 0x1 (ENABLE): Receive Stopped is enabled.
7	0h RW	**Receive Buffer Unavailable Enable (RBUE):** When this bit is set along with the AIE bit, the Receive Buffer Unavailable interrupt is enabled. When this bit is reset, the Receive Buffer Unavailable interrupt is disabled. 0x0 (DISABLE): Receive Buffer Unavailable is disabled. 0x1 (ENABLE): Receive Buffer Unavailable is enabled.
6	0h RW	**Receive Interrupt Enable (RIE):** When this bit is set along with the NIE bit, the Receive Interrupt is enabled. When this bit is reset, the Receive Interrupt is disabled. 0x0 (DISABLE): Receive Interrupt is disabled. 0x1 (ENABLE): Receive Interrupt is enabled.
5:3	0h RO	**Reserved**
2	0h RW	**Transmit Buffer Unavailable Enable (TBUE):** When this bit is set along with the NIE bit, the Transmit Buffer Unavailable interrupt is enabled. When this bit is reset, the Transmit Buffer Unavailable interrupt is disabled. 0x0 (DISABLE): Transmit Buffer Unavailable is disabled. 0x1 (ENABLE): Transmit Buffer Unavailable is enabled.
1	0h RW	**Transmit Stopped Enable (TXSE):** When this bit is set along with the AIE bit, the Transmission Stopped interrupt is enabled. When this bit is reset, the Transmission Stopped interrupt is disabled. 0x0 (DISABLE): Transmit Stopped is disabled. 0x1 (ENABLE): Transmit Stopped is enabled.
0	0h RW	**Transmit Interrupt Enable (TIE):** When this bit is set along with the NIE bit, the Transmit Interrupt is enabled. When this bit is reset, the Transmit Interrupt is disabled. 0x0 (DISABLE): Transmit Interrupt is disabled. 0x1 (ENABLE): Transmit Interrupt is enabled.

3.2.577 DMA_CH3_RX_INTERRUPT_WATCHDOG_TIMER — Offset 12B8h

The Receive Interrupt Watchdog Timer register indicates the watchdog timeout for Receive Interrupt (RI) from the DMA. When this register is written with a non-zero value, it enables the watchdog timer for the RI bit of the DMA_CHi_Status register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12B8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17:16	0h RW	**Receive Interrupt Watchdog Timer Count Units (RWTU):** This fields indicates the number of system clock cycles corresponding to one unit in RWT field. - 2'b00: 256 - 2'b01: 512 - 2'b10: 1024 - 2'b11: 2048 For example, when RWT=2 and RWTU=1, the watchdog timer is set for 2*512=1024 system clock cycles.
15:8	0h RO	**Reserved**
7:0	00h RW	**Receive Interrupt Watchdog Timer Count (RWT):** This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. The watchdog timer is triggered with the programmed value after the Rx DMA completes the transfer of a packet for which the RI bit is not set in the DMA_CH(#i)_Status register, because of the setting of Interrupt Enable bit in the corresponding descriptor RDES3[30]. When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per the Interrupt Enable bit RDES3[30] of any received packet.

3.2.578 DMA_CH3_SLOT_FUNCTION_CONTROL_STATUS — Offset 12BCh

The Slot Function Control and Status register contains the control bits for slot function and the status for Transmit path.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12BCh	000007C0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19:16	0h RO	**Reference Slot Number (RSN):** This field gives the current value of the reference slot number in the DMA. It is used for slot comparison.
15:4	07Ch RW	**Slot Interval Value (SIV):** This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. A value of 0 specifies the slot interval of 1 us while the maximum value 4095 specifies the slot interval of 4096us. The default/reset value is 0x07C which corresponds to slot interval of 125us

Bit Range	Default & Access	Field Name (ID): Description
3:2	0h RO	**Reserved**
1	0h RW	**Advance Slot Check (ASC):** When set, this bit enables the DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the Tx descriptor is - equal to the reference slot number given in the RSN field or - ahead of the reference slot number by up to two slots This bit is applicable only when the ESC bit is set. 0x0 (DISABLE): Advance Slot Check is disabled. 0x1 (ENABLE): Advance Slot Check is enabled.
0	0h RW	**Enable Slot Comparison (ESC):** When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. The DMA fetches the data from the corresponding buffer only when the slot number is - equal to the reference slot number or - ahead of the reference slot number by one slot When reset, this bit disables the checking of the slot numbers. The DMA fetches the data immediately after the descriptor is processed. Note: The UFO (UDP Fragmentation over IPv4)/TSO/USO should not be enabled along with TBS/AVB Slot number check. The UFO/TSO/USO involves multiple packets/segments/fragments transmission for single packet received from application and the slot number check are applicable for fetching of only first segment/fragment. As a result it might be difficult for software to specify slot number for subsequent packets. 0x0 (DISABLE): Slot Comparison is disabled. 0x1 (ENABLE): Slot Comparison is enabled.

3.2.579 DMA_CH3_CURRENT_APP_TXDESC — Offset 12C4h

The Channeli Current Application Transmit Descriptor register points to the current Transmit descriptor read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12C4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Transmit Descriptor Address Pointer (CURTDESAPTR):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

3.2.580 DMA_CH3_CURRENT_APP_RXDESC — Offset 12CCh

The Channeli Current Application Receive Descriptor register points to the current Receive descriptor read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12CCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Receive Descriptor Address Pointer (CURRDESAPTR):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

3.2.581 DMA_CH3_CURRENT_APP_TXBUFFER_H — Offset 12D0h

The Channeli Current Application Transmit Buffer Address High register has the higher 8 or 16 bits of the current address of the Transmit buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12D0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO	**Application Transmit Buffer Address Pointer (CURTBUFAPTRH):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

3.2.582 DMA_CH3_CURRENT_APP_TXBUFFER — Offset 12D4h

The Channeli Current Application Transmit Buffer Address register points to the current Tx buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Transmit Buffer Address Pointer (CURTBUFAPTR):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

3.2.583 DMA_CH3_CURRENT_APP_RXBUFFER_H — Offset 12D8h

The Channeli Current Application Receive Buffer Address High register has the higher 8 or 16 bits of the current address of the Receive buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO	**Application Receive Buffer Address Pointer (CURRBUFAPTRH):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

3.2.584 DMA_CH3_CURRENT_APP_RXBUFFER — Offset 12DCh

The Channel 0 Current Application Receive Buffer Address register points to the current Rx buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12DCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Receive Buffer Address Pointer (CURRBUFAPTR):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

3.2.585 DMA_CH3_STATUS — Offset 12E0h

The software driver (application) reads the Status register during interrupt service routine or polling to determine the status of the DMA.

Note: The number of DMA_CH(#i)_Status register in the configuration is the higher of number of Rx DMA Channels and Tx DMA Channels.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12E0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21:19	0h RO	**Rx DMA Error Bits (REB):** This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 21 -- 1'b1: Error during data transfer by Rx DMA -- 1'b0: No Error during data transfer by Rx DMA - Bit 20 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 19 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
18:16	0h RO	**Tx DMA Error Bits (TEB):** This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 18 -- 1'b1: Error during data transfer by Tx DMA -- 1'b0: No Error during data transfer by Tx DMA - Bit 17 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 16 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
15	0h RW	**Normal Interrupt Summary (NIS):** Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in DMA_CH0_Interrupt_Enable register) affect the Normal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit which causes NIS to be set is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Normal Interrupt Summary status not detected. 0x1 (ACTIVE): Normal Interrupt Summary status detected.

Bit Range	Default & Access	Field Name (ID): Description
14	0h RW	**Abnormal Interrupt Summary (AIS):** Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Abnormal Interrupt Summary status not detected. 0x1 (ACTIVE): Abnormal Interrupt Summary status detected.
13	0h RW	**Context Descriptor Error (CDE):** This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Context Descriptor Error status not detected. 0x1 (ACTIVE): Context Descriptor Error status detected.
12	0h RW	**Fatal Bus Error (FBE):** This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Fatal Bus Error status not detected. 0x1 (ACTIVE): Fatal Bus Error status detected.
11	0h RW	**Early Receive Interrupt (ERI):** This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. In configs supporting ERIC, When ERIC=0, this bit is set only after the Rx DMA has filled up a complete receive buffer with packet data. When ERIC=1, this bit is set after every burst transfer of data from the Rx DMA to the buffer. The setting of RI bit automatically clears this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Receive Interrupt status not detected. 0x1 (ACTIVE): Early Receive Interrupt status detected.
10	0h RW	**Early Transmit Interrupt (ETI):** This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. In configs supporting ERIC: When ETIC=0, this bit is set only after the Tx DMA has transferred a complete packet to MTL. When ETIC=1, this bit is set after completion of (partial) packet data transfer from buffers in the Transmit descriptor in which IOC=1. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Transmit Interrupt status not detected. 0x1 (ACTIVE): Early Transmit Interrupt status detected.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**Receive Watchdog Timeout (RWT):** This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received. 0x0 (INACTIVE): Receive Watchdog Timeout status not detected. 0x1 (ACTIVE): Receive Watchdog Timeout status detected.
8	0h RW	**Receive Process Stopped (RPS):** This bit is asserted when the Rx process enters the Stopped state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Process Stopped status not detected. 0x1 (ACTIVE): Receive Process Stopped status detected.
7	0h RW	**Receive Buffer Unavailable (RBU):** This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode, the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Buffer Unavailable status not detected. 0x1 (ACTIVE): Receive Buffer Unavailable status detected.
6	0h RW	**Receive Interrupt (RI):** This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. The reception remains in the Running state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Interrupt status not detected. 0x1 (ACTIVE): Receive Interrupt status detected.
5:3	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Transmit Buffer Unavailable (TBU):** This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPS0 field of the DMA_Debug_Status0 register explains the Transmit Process state transitions. To resume processing the Transmit descriptors, the application should do the following: 1. Change the ownership of the descriptor by setting Bit 31 of TDES3. 2. Issue a Transmit Poll Demand command. For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Buffer Unavailable status not detected. 0x1 (ACTIVE): Transmit Buffer Unavailable status detected.
1	0h RW	**Transmit Process Stopped (TPS):** This bit is set when the transmission is stopped. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Process Stopped status not detected. 0x1 (ACTIVE): Transmit Process Stopped status detected.
0	0h RW	**Transmit Interrupt (TI):** This bit indicates that the packet transmission is complete. When transmission is complete, Bit 31 of TDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Interrupt status not detected. 0x1 (ACTIVE): Transmit Interrupt status detected.

3.2.586 DMA_CH3_MISS_FRAME_CNT — Offset 12E4h

This register has the number of packet counter that got dropped by the DMA either due to Bus Error or due to programming RPF field in DMA_CH${i}_Rx_Control register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Overflow status of the MFC Counter (MFCO):** When this bit is set then the MFC counter does not get incremented further. The bit gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Miss Frame Counter overflow not occurred. 0x1 (ACTIVE): Miss Frame Counter overflow occurred.
14:11	0h RO	**Reserved**
10:0	000h RO	**Dropped Packet Counters (MFC):** This counter indicates the number of packet counters that are dropped by the DMA either because of bus error or because of programing RPF field in DMA_CH${i}_Rx_Control register. The counter gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event.

3.2.587 DMA_CH3_RXP_ACCEPT_CNT — Offset 12E8h

The DMA_CH(#i)_RXP_Accept_Cnt registers provides the count of the number of frames accepted by Rx Parser.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12E8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Rx Parser Accept Counter Overflow Bit (RXPACOF):** When set, this bit indicates that the RXPAC Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Rx Parser Accept Counter overflow not occurred. 0x1 (ACTIVE): Rx Parser Accept Counter overflow occurred.
30:0	00000000h RO	**Rx Parser Accept Counter (RXPAC):** This 31-bit counter is implemented whenever a Rx Parser Accept a packet due to AF =1. The counter is cleared when the register is read.

3.2.588 DMA_CH3_RX_ERI_CNT — Offset 12ECh

The DMA_CH(#i)_RX_ERI_Cnt registers provides the count of the number of times ERI was asserted.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 12ECh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11:0	000h RO	**ERI Counter (ECNT):** When ERIC bit of DMA_CH(#i)_RX_Control register is set, this counter increments for burst transfer completed by the Rx DMA from the start of packet transfer. This counter is reset at the start of new packet.

3.2.589 DMA_CH4_CONTROL — Offset 1300h

The DMA Channeli Control register specifies the MSS value for segmentation, length to skip between two descriptors, and also the features such as header splitting and 8xPBL mode.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1300h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**Split Headers (SPH):** When this bit is set, the DMA splits the header and payload in the Receive path. The DMA writes the header to the Buffer Address1 of RDES0. The DMA writes the payload to the buffer to which the Buffer Address2 is pointing. The software must ensure that the header fits into the Receive buffers. If the header length exceeds the receive buffer size, the DMA does not split the header and payload. This bit is available only if Enable Split Header Structure option is selected. 0x0 (DISABLE): Split Headers feature is disabled. 0x1 (ENABLE): Split Headers feature is enabled.
23:21	0h RO	**Reserved**
20:18	0h RW	**Descriptor Skip Length (DSL):** This bit specifies the Word, Dword, or Lword number (depending on the 32-bit, 64-bit, or 128-bit bus) to skip between two unchained descriptors. The address skipping starts from the end of the current descriptor to the start of the next descriptor. When the DSL value is equal to zero, the DMA takes the descriptor table as contiguous.
17	0h RO	**Reserved**
16	0h RW	**8xPBL mode (PBLX8):** When this bit is set, the PBL value programmed in Bits[21:16] in DMA_CH(#i)_Tx_Control and Bits[21:16] in DMA_CH(#i)_Rx_Control is multiplied by eight times. Therefore, the DMA transfers the data in 8, 16, 32, 64, 128, and 256 beats depending on the PBL value. 0x0 (DISABLE): 8xPBL mode is disabled. 0x1 (ENABLE): 8xPBL mode is enabled.
15:0	0h RO	**Reserved**

3.2.590 DMA_CH4_TX_CONTROL — Offset 1304h

The DMA Channeli Transmit Control register controls the Tx features such as PBL, TCP segmentation, and Tx Channel weights.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1304h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:29	0h RW	**Time Select (TFSEL):** Select bits for one of the four DMA_TBS_CTRL register fields (FTOS, FGSN, FTOV) for the channel. 0x0: DMA_TBS_CTRL0 selected. 0x1: DMA_TBS_CTRL1 selected. 0x2: DMA_TBS_CTRL2 selected. 0x3: DMA_TBS_CTRL3 selected.
28	0h RW	**Enhanced Descriptor Enable (EDSE):** When this bit is set, the corresponding channel uses Enhanced Descriptors that are 32 Bytes for both Normal and Context Descriptors. When reset, the corresponding channel uses the descriptors that are 16 Bytes. 0x0 (DISABLE): Enhanced Descriptor is disabled. 0x1 (ENABLE): Enhanced Descriptor is enabled.
27:24	0h RW	**Transmit QOS. (TQOS):** This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Tx Channel0.
23:22	0h RO	**Reserved**
21:16	00h RW	**Transmit Programmable Burst Length (TXPBL):** These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in DMA_CH0_Control register. 2. Set the TxPBL. Note: The maximum value of TxPBL must be less than or equal to half the Tx Queue size (TQS field of MTL_TxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. For example, in 64-bit data width configurations the total locations in Tx Queue of size 512 bytes is 64, TxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	0h RW	**Ignore PBL Requirement (IPBL):** When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. If space is not available, the MTL might use handshaking to slow the DMA. Note: This bit/mode must not be used when multiple Transmit DMA Channels are enabled as it might block other Transmit and Receive DMA Channels from accessing the Read Data Channel of AXI bus until space is available in Transmit Queue for current transfer. 0x0 (DISABLE): Ignore PBL Requirement is disabled. 0x1 (ENABLE): Ignore PBL Requirement is enabled.

Bit Range	Default & Access	Field Name (ID): Description
14:13	0h RW	**TSE_MODE:** TSE Mode - 00: TSO/USO (segmentation functionality is enabled). In this mode, the setting of TSE bit enables the TSO/USO segmentation. - 01: UFO with Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality with Checksum for all the UDP packets. - 10: UFO without Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality without Checksum for all the UDP packets. - 11: Reserved 0x0 (TSO_USO): TSO/USO. 0x1 (UFOWC): UFO with Checksum. 0x2 (UFOWOC): UFO without Checksum. 0x3 (RSVD): Reserved.
12	0h RW	**TCP Segmentation Enabled (TSE):** When this bit is set, the DMA performs the TCP segmentation or UDP Segmentation/ Fragmentation for packets in this channel. The TCP segmentation or UDP packet's segmentation/Fragmentation is done only for those packets for which the TSE bit (TDES0[19]) is set in the Tx Normal descriptor.When this bit is set, the TxPBL value must be greater than 4. 0x0 (DISABLE): TCP Segmentation is disabled. 0x1 (ENABLE): TCP Segmentation is enabled.
11:5	0h RO	**Reserved**
4	0h RW	**Operate on Second Packet (OSF):** When this bit is set, it instructs the DMA to process the second packet of the Transmit data even before the status for the first packet is obtained. 0x0 (DISABLE): Operate on Second Packet disabled. 0x1 (ENABLE): Operate on Second Packet enabled.
3:1	0h RW	**Transmit Channel Weight (TCW):** This field indicates the weight assigned to the corresponding Transmit channel. When reset is complete, this field is set to 0 for all channels by default, resulting in equal weights to all channels.
0	0h RW	**Start or Stop Transmission Command (ST):** When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the base address of the Transmit list set by the DMA_CH0_TxDesc_List_Address register. - The position at which the transmission was previously stopped If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the DMA_CH0_Status register is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the DMA_CH0_TxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program DMA_CH0_TxDesc_List_Address register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state. 0x0 (STOP): Stop Transmission Command. 0x1 (START): Start Transmission Command.

3.2.591 DMA_CH4_RX_CONTROL — Offset 1308h

The DMA Channeli Receive Control register controls the Rx features such as PBL, buffer size, and extended status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1308h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Rx Packet Flush. (RPF):** When this bit is set to 1, then GbE Controller automatically flushes the packet from the Rx Queues destined to this DMA Rx Channel, when it is stopped. When this bit remains set and the DMA is re-started by the software driver, the packets residing in the Rx Queues that were received when this RxDMA was stopped, get flushed out. The packets that are received by the MAC after the RxDMA is re-started are routed to the RxDMA. The flushing happens on the Read side of the Rx Queue. When this bit is set to 0, the GbE Controller not flush the packet in the Rx Queue destined to this RxDMA Channel when it is STOP state. This might in turn cause head-of-line blocking in the corresponding RxQueue. Note: The stopping of packet flow from a Rx DMA Channel to the application by setting RPF works only when there is one-to-one mapping of Rx Queue to Rx DMA channels. In Dynamic mapping mode, setting RPF bit in any DMA_CH(#i)_Rx_Control register might flush packets from unintended Rx Queues which are destined to the stopped Rx DMA Channel. 0x0 (DISABLE): Rx Packet Flush is disabled. 0x1 (ENABLE): Rx Packet Flush is enabled.
30:28	0h RO	**Reserved**
27:24	0h RW	**Rx AXI4 QOS. (RQOS):** This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Rx Channel0.
23:22	0h RO	**Reserved**
21:16	00h RW	**Receive Programmable Burst Length (RXPBL):** These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in the DMA_CH0_Control register. 2. Set the RxPBL. Note: The maximum value of RxPBL must be less than or equal to half the Rx Queue size (RQS field of MTL_RxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the Rx DMA is transferring a block of data. For example, in 64-bit data width configurations the total locations in Rx Queue of size 512 bytes is 64, so RxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
14:4	000h RW	**Receive Buffer size High (RBSZ_13_Y):** RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. The RBSZ[13:0] field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when split headers are enabled. Note: The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the value of buffer address pointer is not aligned to data bus width. Hence the lower RBSZ_x_0 bits are read-only and the value is considered as all-zero. Thus the RBSZ_13_y indicates the buffer size in terms of locations (with the width same as bus-width).
3:1	0h RO	**Receive Buffer size Low (RBSZ_X_0):** RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. The RBSZ_x_0 is the lower field whose width is based on data bus width of the configuration. This field is of width 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).
0	0h RW	**Start or Stop Receive (SR):** When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the address set by the DMA_CH0_RxDesc_List_Address register. - The position at which the Rx process was previously stopped If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the DMA_CH0_Status register is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the DMA_CH0_RxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state. 0x0 (STOP): Stop Receive. 0x1 (START): Start Receive.

3.2.592 DMA_CH4_TXDESC_LIST_HADDRESS — Offset 1310h

The Channeli Tx Descriptor List HAddress register has the higher 8 or 16 bits of the start address of the Transmit descriptor list.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CHi_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier. This register must be programmed with desired the higher address before programming the DMA_CHi_TxDesc_List_Address register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1310h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Start of Transmit List (TDESHA):** This field contains the most-significant 8 or 16 bits of the 40- or 48-bit base address of the first descriptor in the Transmit descriptor list.

3.2.593 DMA_CH4_TXDESC_LIST_ADDRESS — Offset 1314h

The Channeli Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LSB to low.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CH0_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1314h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Start of Transmit List (TDESLA):** This field contains the base address of the first descriptor in the Transmit descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

3.2.594 DMA_CH4_RXDESC_LIST_HADDRESS — Offset 1318h

The Channeli Rx Descriptor List HAddress register has the higher 8 or 16 bits of the start address of the Receive descriptor list.

Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in the DMA_CHi_RxDesc_List_Address register

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1318h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Start of Receive List (RDESHA):** This field contains the most-significant 8 or 16 bits of the 40-bit or 48-bit base address of the first descriptor in the Rx Descriptor list.

3.2.595 DMA_CH4_RXDESC_LIST_ADDRESS — Offset 131Ch

The Channeli Rx Descriptor List Address register points the DMA to the start of Receive descriptor list.

This register points to the start of the Receive Descriptor List. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in DMA_CH0_Rx_Control register. When stopped, this register can be written with a new descriptor list address.

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 131Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Start of Receive List (RDESLA):** This field contains the base address of the first descriptor in the Rx Descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). 2	0h RW	**Transmit Buffer Unavailable Enable (TBUE):** When this bit is set along with the NIE bit, the Transmit Buffer Unavailable interrupt is enabled. When this bit is reset, the Transmit Buffer Unavailable interrupt is disabled. 0x0 (DISABLE): Transmit Buffer Unavailable is disabled. 0x1 (ENABLE): Transmit Buffer Unavailable is enabled.
1	0h RW	**Transmit Stopped Enable (TXSE):** When this bit is set along with the AIE bit, the Transmission Stopped interrupt is enabled. When this bit is reset, the Transmission Stopped interrupt is disabled. 0x0 (DISABLE): Transmit Stopped is disabled. 0x1 (ENABLE): Transmit Stopped is enabled.
0	0h RW	**Transmit Interrupt Enable (TIE):** When this bit is set along with the NIE bit, the Transmit Interrupt is enabled. When this bit is reset, the Transmit Interrupt is disabled. 0x0 (DISABLE): Transmit Interrupt is disabled. 0x1 (ENABLE): Transmit Interrupt is enabled.

3.2.601 DMA_CH4_RX_INTERRUPT_WATCHDOG_TIMER — Offset 1338h

The Receive Interrupt Watchdog Timer register indicates the watchdog timeout for Receive Interrupt (RI) from the DMA. When this register is written with a non-zero value, it enables the watchdog timer for the RI bit of the DMA_CHi_Status register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1338h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17:16	0h RW	**Receive Interrupt Watchdog Timer Count Units (RWTU):** This fields indicates the number of system clock cycles corresponding to one unit in RWT field. - 2'b00: 256 - 2'b01: 512 - 2'b10: 1024 - 2'b11: 2048 For example, when RWT=2 and RWTU=1, the watchdog timer is set for 2*512=1024 system clock cycles.
15:8	0h RO	**Reserved**
7:0	00h RW	**Receive Interrupt Watchdog Timer Count (RWT):** This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. The watchdog timer is triggered with the programmed value after the Rx DMA completes the transfer of a packet for which the RI bit is not set in the DMA_CH(#i)_Status register, because of the setting of Interrupt Enable bit in the corresponding descriptor RDES3[30]. When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per the Interrupt Enable bit RDES3[30] of any received packet.

3.2.602 DMA_CH4_SLOT_FUNCTION_CONTROL_STATUS — Offset 133Ch

The Slot Function Control and Status register contains the control bits for slot function and the status for Transmit path.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 133Ch	000007C0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19:16	0h RO	**Reference Slot Number (RSN):** This field gives the current value of the reference slot number in the DMA. It is used for slot comparison.
15:4	07Ch RW	**Slot Interval Value (SIV):** This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. A value of 0 specifies the slot interval of 1 us while the maximum value 4095 specifies the slot interval of 4096us. The default/reset value is 0x07C which corresponds to slot interval of 125us

Bit Range	Default & Access	Field Name (ID): Description
3:2	0h RO	**Reserved**
1	0h RW	**Advance Slot Check (ASC):** When set, this bit enables the DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the Tx descriptor is - equal to the reference slot number given in the RSN field or - ahead of the reference slot number by up to two slots This bit is applicable only when the ESC bit is set. 0x0 (DISABLE): Advance Slot Check is disabled. 0x1 (ENABLE): Advance Slot Check is enabled.
0	0h RW	**Enable Slot Comparison (ESC):** When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. The DMA fetches the data from the corresponding buffer only when the slot number is - equal to the reference slot number or - ahead of the reference slot number by one slot When reset, this bit disables the checking of the slot numbers. The DMA fetches the data immediately after the descriptor is processed. Note: The UFO (UDP Fragmentation over IPv4)/TSO/USO should not be enabled along with TBS/AVB Slot number check. The UFO/TSO/USO involves multiple packets/segments/fragments transmission for single packet received from application and the slot number check are applicable for fetching of only first segment/fragment. As a result it might be difficult for software to specify slot number for subsequent packets. 0x0 (DISABLE): Slot Comparison is disabled. 0x1 (ENABLE): Slot Comparison is enabled.

3.2.603 DMA_CH4_CURRENT_APP_TXDESC — Offset 1344h

The Channeli Current Application Transmit Descriptor register points to the current Transmit descriptor read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1344h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Transmit Descriptor Address Pointer (CURTDESAPTR):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

3.2.604 DMA_CH4_CURRENT_APP_RXDESC — Offset 134Ch

The Channeli Current Application Receive Descriptor register points to the current Receive descriptor read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 134Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Receive Descriptor Address Pointer (CURRDESAPTR):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

3.2.605 DMA_CH4_CURRENT_APP_TXBUFFER_H — Offset 1350h

The Channeli Current Application Transmit Buffer Address High register has the higher 8 or 16 bits of the current address of the Transmit buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1350h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO	**Application Transmit Buffer Address Pointer (CURTBUFAPTRH):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

3.2.606 DMA_CH4_CURRENT_APP_TXBUFFER — Offset 1354h

The Channeli Current Application Transmit Buffer Address register points to the current Tx buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1354h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Transmit Buffer Address Pointer (CURTBUFAPTR):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

3.2.607 DMA_CH4_CURRENT_APP_RXBUFFER_H — Offset 1358h

The Channeli Current Application Receive Buffer Address High register has the higher 8 or 16 bits of the current address of the Receive buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1358h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO	**Application Receive Buffer Address Pointer (CURRBUFAPTRH):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

3.2.608 DMA_CH4_CURRENT_APP_RXBUFFER — Offset 135Ch

The Channel 0 Current Application Receive Buffer Address register points to the current Rx buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 135Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Receive Buffer Address Pointer (CURRBUFAPTR):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

3.2.609 DMA_CH4_STATUS — Offset 1360h

The software driver (application) reads the Status register during interrupt service routine or polling to determine the status of the DMA.

Note: The number of DMA_CH(#i)_Status register in the configuration is the higher of number of Rx DMA Channels and Tx DMA Channels.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1360h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21:19	0h RO	**Rx DMA Error Bits (REB):** This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 21 -- 1'b1: Error during data transfer by Rx DMA -- 1'b0: No Error during data transfer by Rx DMA - Bit 20 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 19 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
18:16	0h RO	**Tx DMA Error Bits (TEB):** This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 18 -- 1'b1: Error during data transfer by Tx DMA -- 1'b0: No Error during data transfer by Tx DMA - Bit 17 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 16 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
15	0h RW	**Normal Interrupt Summary (NIS):** Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in DMA_CH0_Interrupt_Enable register) affect the Normal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit which causes NIS to be set is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Normal Interrupt Summary status not detected. 0x1 (ACTIVE): Normal Interrupt Summary status detected.

Bit Range	Default & Access	Field Name (ID): Description
14	0h RW	**Abnormal Interrupt Summary (AIS):** Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Abnormal Interrupt Summary status not detected. 0x1 (ACTIVE): Abnormal Interrupt Summary status detected.
13	0h RW	**Context Descriptor Error (CDE):** This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Context Descriptor Error status not detected. 0x1 (ACTIVE): Context Descriptor Error status detected.
12	0h RW	**Fatal Bus Error (FBE):** This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Fatal Bus Error status not detected. 0x1 (ACTIVE): Fatal Bus Error status detected.
11	0h RW	**Early Receive Interrupt (ERI):** This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. In configs supporting ERIC, When ERIC=0, this bit is set only after the Rx DMA has filled up a complete receive buffer with packet data. When ERIC=1, this bit is set after every burst transfer of data from the Rx DMA to the buffer. The setting of RI bit automatically clears this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Receive Interrupt status not detected. 0x1 (ACTIVE): Early Receive Interrupt status detected.
10	0h RW	**Early Transmit Interrupt (ETI):** This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. In configs supporting ERIC: When ETIC=0, this bit is set only after the Tx DMA has transferred a complete packet to MTL. When ETIC=1, this bit is set after completion of (partial) packet data transfer from buffers in the Transmit descriptor in which IOC=1. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Transmit Interrupt status not detected. 0x1 (ACTIVE): Early Transmit Interrupt status detected.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**Receive Watchdog Timeout (RWT):** This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received. 0x0 (INACTIVE): Receive Watchdog Timeout status not detected. 0x1 (ACTIVE): Receive Watchdog Timeout status detected.
8	0h RW	**Receive Process Stopped (RPS):** This bit is asserted when the Rx process enters the Stopped state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Process Stopped status not detected. 0x1 (ACTIVE): Receive Process Stopped status detected.
7	0h RW	**Receive Buffer Unavailable (RBU):** This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode, the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Buffer Unavailable status not detected. 0x1 (ACTIVE): Receive Buffer Unavailable status detected.
6	0h RW	**Receive Interrupt (RI):** This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. The reception remains in the Running state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Interrupt status not detected. 0x1 (ACTIVE): Receive Interrupt status detected.
5:3	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Transmit Buffer Unavailable (TBU):** This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPS0 field of the DMA_Debug_Status0 register explains the Transmit Process state transitions. To resume processing the Transmit descriptors, the application should do the following: 1. Change the ownership of the descriptor by setting Bit 31 of TDES3. 2. Issue a Transmit Poll Demand command. For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Buffer Unavailable status not detected. 0x1 (ACTIVE): Transmit Buffer Unavailable status detected.
1	0h RW	**Transmit Process Stopped (TPS):** This bit is set when the transmission is stopped. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Process Stopped status not detected. 0x1 (ACTIVE): Transmit Process Stopped status detected.
0	0h RW	**Transmit Interrupt (TI):** This bit indicates that the packet transmission is complete. When transmission is complete, Bit 31 of TDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Interrupt status not detected. 0x1 (ACTIVE): Transmit Interrupt status detected.

3.2.610 DMA_CH4_MISS_FRAME_CNT — Offset 1364h

This register has the number of packet counter that got dropped by the DMA either due to Bus Error or due to programming RPF field in DMA_CH${i}_Rx_Control register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1364h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Overflow status of the MFC Counter (MFCO):** When this bit is set then the MFC counter does not get incremented further. The bit gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Miss Frame Counter overflow not occurred. 0x1 (ACTIVE): Miss Frame Counter overflow occurred.
14:11	0h RO	**Reserved**
10:0	000h RO	**Dropped Packet Counters (MFC):** This counter indicates the number of packet counters that are dropped by the DMA either because of bus error or because of programing RPF field in DMA_CH${i}_Rx_Control register. The counter gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event.

3.2.611 DMA_CH4_RXP_ACCEPT_CNT — Offset 1368h

The DMA_CH(#i)_RXP_Accept_Cnt registers provides the count of the number of frames accepted by Rx Parser.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1368h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Rx Parser Accept Counter Overflow Bit (RXPACOF):** When set, this bit indicates that the RXPAC Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Rx Parser Accept Counter overflow not occurred. 0x1 (ACTIVE): Rx Parser Accept Counter overflow occurred.
30:0	00000000h RO	**Rx Parser Accept Counter (RXPAC):** This 31-bit counter is implemented whenever a Rx Parser Accept a packet due to AF =1. The counter is cleared when the register is read.

3.2.612 DMA_CH4_RX_ERI_CNT — Offset 136Ch

The DMA_CH(#i)_RX_ERI_Cnt registers provides the count of the number of times ERI was asserted.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 136Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11:0	000h RO	**ERI Counter (ECNT):** When ERIC bit of DMA_CH(#i)_RX_Control register is set, this counter increments for burst transfer completed by the Rx DMA from the start of packet transfer. This counter is reset at the start of new packet.

3.2.613 DMA_CH5_CONTROL — Offset 1380h

The DMA Channeli Control register specifies the MSS value for segmentation, length to skip between two descriptors, and also the features such as header splitting and 8xPBL mode.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1380h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**Split Headers (SPH):** When this bit is set, the DMA splits the header and payload in the Receive path. The DMA writes the header to the Buffer Address1 of RDES0. The DMA writes the payload to the buffer to which the Buffer Address2 is pointing. The software must ensure that the header fits into the Receive buffers. If the header length exceeds the receive buffer size, the DMA does not split the header and payload. This bit is available only if Enable Split Header Structure option is selected. 0x0 (DISABLE): Split Headers feature is disabled. 0x1 (ENABLE): Split Headers feature is enabled.
23:21	0h RO	**Reserved**
20:18	0h RW	**Descriptor Skip Length (DSL):** This bit specifies the Word, Dword, or Lword number (depending on the 32-bit, 64-bit, or 128-bit bus) to skip between two unchained descriptors. The address skipping starts from the end of the current descriptor to the start of the next descriptor. When the DSL value is equal to zero, the DMA takes the descriptor table as contiguous.
17	0h RO	**Reserved**
16	0h RW	**8xPBL mode (PBLX8):** When this bit is set, the PBL value programmed in Bits[21:16] in DMA_CH(#i)_Tx_Control and Bits[21:16] in DMA_CH(#i)_Rx_Control is multiplied by eight times. Therefore, the DMA transfers the data in 8, 16, 32, 64, 128, and 256 beats depending on the PBL value. 0x0 (DISABLE): 8xPBL mode is disabled. 0x1 (ENABLE): 8xPBL mode is enabled.
15:0	0h RO	**Reserved**

3.2.614 DMA_CH5_TX_CONTROL — Offset 1384h

The DMA Channeli Transmit Control register controls the Tx features such as PBL, TCP segmentation, and Tx Channel weights.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1384h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:29	0h RW	**Time Select (TFSEL):** Select bits for one of the four DMA_TBS_CTRL register fields (FTOS, FGSN, FTOV) for the channel. 0x0: DMA_TBS_CTRL0 selected. 0x1: DMA_TBS_CTRL1 selected. 0x2: DMA_TBS_CTRL2 selected. 0x3: DMA_TBS_CTRL3 selected.
28	0h RW	**Enhanced Descriptor Enable (EDSE):** When this bit is set, the corresponding channel uses Enhanced Descriptors that are 32 Bytes for both Normal and Context Descriptors. When reset, the corresponding channel uses the descriptors that are 16 Bytes. 0x0 (DISABLE): Enhanced Descriptor is disabled. 0x1 (ENABLE): Enhanced Descriptor is enabled.
27:24	0h RW	**Transmit QOS. (TQOS):** This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Tx Channel0.
23:22	0h RO	**Reserved**
21:16	00h RW	**Transmit Programmable Burst Length (TXPBL):** These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in DMA_CH0_Control register. 2. Set the TxPBL. Note: The maximum value of TxPBL must be less than or equal to half the Tx Queue size (TQS field of MTL_TxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. For example, in 64-bit data width configurations the total locations in Tx Queue of size 512 bytes is 64, TxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	0h RW	**Ignore PBL Requirement (IPBL):** When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. If space is not available, the MTL might use handshaking to slow the DMA. Note: This bit/mode must not be used when multiple Transmit DMA Channels are enabled as it might block other Transmit and Receive DMA Channels from accessing the Read Data Channel of AXI bus until space is available in Transmit Queue for current transfer. 0x0 (DISABLE): Ignore PBL Requirement is disabled. 0x1 (ENABLE): Ignore PBL Requirement is enabled.

Bit Range	Default & Access	Field Name (ID): Description
14:13	0h RW	**TSE_MODE:** TSE Mode - 00: TSO/USO (segmentation functionality is enabled). In this mode, the setting of TSE bit enables the TSO/USO segmentation. - 01: UFO with Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality with Checksum for all the UDP packets. - 10: UFO without Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality without Checksum for all the UDP packets. - 11: Reserved 0x0 (TSO_USO): TSO/USO. 0x1 (UFOWC): UFO with Checksum. 0x2 (UFOWOC): UFO without Checksum. 0x3 (RSVD): Reserved.
12	0h RW	**TCP Segmentation Enabled (TSE):** When this bit is set, the DMA performs the TCP segmentation or UDP Segmentation/ Fragmentation for packets in this channel. The TCP segmentation or UDP packet's segmentation/Fragmentation is done only for those packets for which the TSE bit (TDES0[19]) is set in the Tx Normal descriptor.When this bit is set, the TxPBL value must be greater than 4. 0x0 (DISABLE): TCP Segmentation is disabled. 0x1 (ENABLE): TCP Segmentation is enabled.
11:5	0h RO	**Reserved**
4	0h RW	**Operate on Second Packet (OSF):** When this bit is set, it instructs the DMA to process the second packet of the Transmit data even before the status for the first packet is obtained. 0x0 (DISABLE): Operate on Second Packet disabled. 0x1 (ENABLE): Operate on Second Packet enabled.
3:1	0h RW	**Transmit Channel Weight (TCW):** This field indicates the weight assigned to the corresponding Transmit channel. When reset is complete, this field is set to 0 for all channels by default, resulting in equal weights to all channels.
0	0h RW	**Start or Stop Transmission Command (ST):** When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the base address of the Transmit list set by the DMA_CH0_TxDesc_List_Address register. - The position at which the transmission was previously stopped If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the DMA_CH0_Status register is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the DMA_CH0_TxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program DMA_CH0_TxDesc_List_Address register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state. 0x0 (STOP): Stop Transmission Command. 0x1 (START): Start Transmission Command.

3.2.615 DMA_CH5_RX_CONTROL — Offset 1388h

The DMA Channeli Receive Control register controls the Rx features such as PBL, buffer size, and extended status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1388h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Rx Packet Flush. (RPF):** When this bit is set to 1, then GbE Controller automatically flushes the packet from the Rx Queues destined to this DMA Rx Channel, when it is stopped. When this bit remains set and the DMA is re-started by the software driver, the packets residing in the Rx Queues that were received when this RxDMA was stopped, get flushed out. The packets that are received by the MAC after the RxDMA is re-started are routed to the RxDMA. The flushing happens on the Read side of the Rx Queue. When this bit is set to 0, the GbE Controller not flush the packet in the Rx Queue destined to this RxDMA Channel when it is STOP state. This might in turn cause head-of-line blocking in the corresponding RxQueue. Note: The stopping of packet flow from a Rx DMA Channel to the application by setting RPF works only when there is one-to-one mapping of Rx Queue to Rx DMA channels. In Dynamic mapping mode, setting RPF bit in any DMA_CH(#i)_Rx_Control register might flush packets from unintended Rx Queues which are destined to the stopped Rx DMA Channel. 0x0 (DISABLE): Rx Packet Flush is disabled. 0x1 (ENABLE): Rx Packet Flush is enabled.
30:28	0h RO	**Reserved**
27:24	0h RW	**Rx AXI4 QOS. (RQOS):** This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Rx Channel0.
23:22	0h RO	**Reserved**
21:16	00h RW	**Receive Programmable Burst Length (RXPBL):** These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in the DMA_CH0_Control register. 2. Set the RxPBL. Note: The maximum value of RxPBL must be less than or equal to half the Rx Queue size (RQS field of MTL_RxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the Rx DMA is transferring a block of data. For example, in 64-bit data width configurations the total locations in Rx Queue of size 512 bytes is 64, so RxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
14:4	000h RW	**Receive Buffer size High (RBSZ_13_Y):** RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. The RBSZ[13:0] field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when split headers are enabled. Note: The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the value of buffer address pointer is not aligned to data bus width. Hence the lower RBSZ_x_0 bits are read-only and the value is considered as all-zero. Thus the RBSZ_13_y indicates the buffer size in terms of locations (with the width same as bus-width).
3:1	0h RO	**Receive Buffer size Low (RBSZ_X_0):** RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. The RBSZ_x_0 is the lower field whose width is based on data bus width of the configuration. This field is of width 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).
0	0h RW	**Start or Stop Receive (SR):** When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the address set by the DMA_CH0_RxDesc_List_Address register. - The position at which the Rx process was previously stopped If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the DMA_CH0_Status register is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the DMA_CH0_RxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state. 0x0 (STOP): Stop Receive. 0x1 (START): Start Receive.

3.2.616 DMA_CH5_TXDESC_LIST_HADDRESS — Offset 1390h

The Channeli Tx Descriptor List HAddress register has the higher 8 or 16 bits of the start address of the Transmit descriptor list.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CHi_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier. This register must be programmed with desired the higher address before programming the DMA_CHi_TxDesc_List_Address register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1390h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Start of Transmit List (TDESHA):** This field contains the most-significant 8 or 16 bits of the 40- or 48-bit base address of the first descriptor in the Transmit descriptor list.

3.2.617 DMA_CH5_TXDESC_LIST_ADDRESS — Offset 1394h

The Channeli Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LSB to low.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CH0_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1394h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Start of Transmit List (TDESLA):** This field contains the base address of the first descriptor in the Transmit descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

3.2.618 DMA_CH5_RXDESC_LIST_HADDRESS — Offset 1398h

The Channeli Rx Descriptor List HAddress register has the higher 8 or 16 bits of the start address of the Receive descriptor list.

Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in the DMA_CHi_RxDesc_List_Address register

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1398h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Start of Receive List (RDESHA):** This field contains the most-significant 8 or 16 bits of the 40-bit or 48-bit base address of the first descriptor in the Rx Descriptor list.

3.2.619 DMA_CH5_RXDESC_LIST_ADDRESS — Offset 139Ch

The Channeli Rx Descriptor List Address register points the DMA to the start of Receive descriptor list.

This register points to the start of the Receive Descriptor List. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in DMA_CH0_Rx_Control register. When stopped, this register can be written with a new descriptor list address.

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 139Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Start of Receive List (RDESLA):** This field contains the base address of the first descriptor in the Rx Descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

3.2.622 DMA_CH5_TXDESC_RING_LENGTH — Offset 13ACh

The Tx Descriptor Ring Length register contains the length of the Transmit descriptor ring.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13ACh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:0	000h RW	**Transmit Descriptor Ring Length (TDRL):** This field sets the maximum number of Tx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. Intel recommends a minimum ring descriptor length of 4. For example, You can program any value up to 0x3FF in this field. This field is 10 bits wide, if you program 0x3FF, you can have 1024 descriptors. If you want to have 10 descriptors, program it to a value of 0x9.

3.2.623 DMA_CH5_RXDESC_RING_LENGTH — Offset 13B0h

The Channeli Rx Descriptor Ring Length register contains the length of the Receive descriptor circular ring.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:0	000h RW	**Receive Descriptor Ring Length (RDRL):** This register sets the maximum number of Rx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. For example, You can program any value up to 0x3FF in this field. This field is 10 bits wide, if you program 0x3FF, you can have 1024 descriptors. If you want to have 10 descriptors, program it to a value of 0x9.

3.2.624 DMA_CH5_INTERRUPT_ENABLE — Offset 13B4h

The Channeli Interrupt Enable register enables the interrupts reported by the Status register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13B4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW	**Normal Interrupt Summary Enable (NIE):** When this bit is set, the normal interrupt summary is enabled. This bit enables the following interrupts in the DMA_CH0_Status register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt When this bit is reset, the normal interrupt summary is disabled. 0x0 (DISABLE): Normal Interrupt Summary is disabled. 0x1 (ENABLE): Normal Interrupt Summary is enabled.
14	0h RW	**Abnormal Interrupt Summary Enable (AIE):** When this bit is set, the abnormal interrupt summary is enabled. This bit enables the following interrupts in the DMA_CH0_Status register: - Bit 1: Transmit Process Stopped - Bit 7: Rx Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 9: Receive Watchdog Timeout - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error When this bit is reset, the abnormal interrupt summary is disabled. 0x0 (DISABLE): Abnormal Interrupt Summary is disabled. 0x1 (ENABLE): Abnormal Interrupt Summary is enabled.
13	0h RW	**Context Descriptor Error Enable (CDEE):** When this bit is set along with the AIE bit, the Descriptor error interrupt is enabled. When this bit is reset, the Descriptor error interrupt is disabled. 0x0 (DISABLE): Context Descriptor Error is disabled. 0x1 (ENABLE): Context Descriptor Error is enabled.
12	0h RW	**Fatal Bus Error Enable (FBEE):** When this bit is set along with the AIE bit, the Fatal Bus error interrupt is enabled. When this bit is reset, the Fatal Bus Error error interrupt is disabled. 0x0 (DISABLE): Fatal Bus Error is disabled. 0x1 (ENABLE): Fatal Bus Error is enabled.
11	0h RW	**Early Receive Interrupt Enable (ERIE):** When this bit is set along with the NIE bit, the Early Receive interrupt is enabled. When this bit is reset, the Early Receive interrupt is disabled. 0x0 (DISABLE): Early Receive Interrupt is disabled. 0x1 (ENABLE): Early Receive Interrupt is enabled.
10	0h RW	**Early Transmit Interrupt Enable (ETIE):** When this bit is set along with the AIE bit, the Early Transmit interrupt is enabled. When this bit is reset, the Early Transmit interrupt is disabled. 0x0 (DISABLE): Early Transmit Interrupt is disabled. 0x1 (ENABLE): Early Transmit Interrupt is enabled.
9	0h RW	**Receive Watchdog Timeout Enable (RWTE):** When this bit is set along with the AIE bit, the Receive Watchdog Timeout interrupt is enabled. When this bit is reset, the Receive Watchdog Timeout interrupt is disabled. 0x0 (DISABLE): Receive Watchdog Timeout is disabled. 0x1 (ENABLE): Receive Watchdog Timeout is enabled.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**Receive Stopped Enable (RSE):** When this bit is set along with the AIE bit, the Receive Stopped Interrupt is enabled. When this bit is reset, the Receive Stopped interrupt is disabled. 0x0 (DISABLE): Receive Stopped is disabled. 0x1 (ENABLE): Receive Stopped is enabled.
7	0h RW	**Receive Buffer Unavailable Enable (RBUE):** When this bit is set along with the AIE bit, the Receive Buffer Unavailable interrupt is enabled. When this bit is reset, the Receive Buffer Unavailable interrupt is disabled. 0x0 (DISABLE): Receive Buffer Unavailable is disabled. 0x1 (ENABLE): Receive Buffer Unavailable is enabled.
6	0h RW	**Receive Interrupt Enable (RIE):** When this bit is set along with the NIE bit, the Receive Interrupt is enabled. When this bit is reset, the Receive Interrupt is disabled. 0x0 (DISABLE): Receive Interrupt is disabled. 0x1 (ENABLE): Receive Interrupt is enabled.
5:3	0h RO	**Reserved**
2	0h RW	**Transmit Buffer Unavailable Enable (TBUE):** When this bit is set along with the NIE bit, the Transmit Buffer Unavailable interrupt is enabled. When this bit is reset, the Transmit Buffer Unavailable interrupt is disabled. 0x0 (DISABLE): Transmit Buffer Unavailable is disabled. 0x1 (ENABLE): Transmit Buffer Unavailable is enabled.
1	0h RW	**Transmit Stopped Enable (TXSE):** When this bit is set along with the AIE bit, the Transmission Stopped interrupt is enabled. When this bit is reset, the Transmission Stopped interrupt is disabled. 0x0 (DISABLE): Transmit Stopped is disabled. 0x1 (ENABLE): Transmit Stopped is enabled.
0	0h RW	**Transmit Interrupt Enable (TIE):** When this bit is set along with the NIE bit, the Transmit Interrupt is enabled. When this bit is reset, the Transmit Interrupt is disabled. 0x0 (DISABLE): Transmit Interrupt is disabled. 0x1 (ENABLE): Transmit Interrupt is enabled.

3.2.625 DMA_CH5_RX_INTERRUPT_WATCHDOG_TIMER — Offset 13B8h

The Receive Interrupt Watchdog Timer register indicates the watchdog timeout for Receive Interrupt (RI) from the DMA. When this register is written with a non-zero value, it enables the watchdog timer for the RI bit of the DMA_CHi_Status register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13B8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17:16	0h RW	**Receive Interrupt Watchdog Timer Count Units (RWTU):** This fields indicates the number of system clock cycles corresponding to one unit in RWT field. - 2'b00: 256 - 2'b01: 512 - 2'b10: 1024 - 2'b11: 2048 For example, when RWT=2 and RWTU=1, the watchdog timer is set for 2*512=1024 system clock cycles.
15:8	0h RO	**Reserved**
7:0	00h RW	**Receive Interrupt Watchdog Timer Count (RWT):** This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. The watchdog timer is triggered with the programmed value after the Rx DMA completes the transfer of a packet for which the RI bit is not set in the DMA_CH(#i)_Status register, because of the setting of Interrupt Enable bit in the corresponding descriptor RDES3[30]. When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per the Interrupt Enable bit RDES3[30] of any received packet.

3.2.626 DMA_CH5_SLOT_FUNCTION_CONTROL_STATUS — Offset 13BCh

The Slot Function Control and Status register contains the control bits for slot function and the status for Transmit path.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13BCh	000007C0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19:16	0h RO	**Reference Slot Number (RSN):** This field gives the current value of the reference slot number in the DMA. It is used for slot comparison.
15:4	07Ch RW	**Slot Interval Value (SIV):** This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. A value of 0 specifies the slot interval of 1 us while the maximum value 4095 specifies the slot interval of 4096us. The default/reset value is 0x07C which corresponds to slot interval of 125us

Bit Range	Default & Access	Field Name (ID): Description
3:2	0h RO	**Reserved**
1	0h RW	**Advance Slot Check (ASC):** When set, this bit enables the DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the Tx descriptor is - equal to the reference slot number given in the RSN field or - ahead of the reference slot number by up to two slots This bit is applicable only when the ESC bit is set. 0x0 (DISABLE): Advance Slot Check is disabled. 0x1 (ENABLE): Advance Slot Check is enabled.
0	0h RW	**Enable Slot Comparison (ESC):** When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. The DMA fetches the data from the corresponding buffer only when the slot number is - equal to the reference slot number or - ahead of the reference slot number by one slot When reset, this bit disables the checking of the slot numbers. The DMA fetches the data immediately after the descriptor is processed. Note: The UFO (UDP Fragmentation over IPv4)/TSO/USO should not be enabled along with TBS/AVB Slot number check. The UFO/TSO/USO involves multiple packets/segments/fragments transmission for single packet received from application and the slot number check are applicable for fetching of only first segment/fragment. As a result it might be difficult for software to specify slot number for subsequent packets. 0x0 (DISABLE): Slot Comparison is disabled. 0x1 (ENABLE): Slot Comparison is enabled.

3.2.627 DMA_CH5_CURRENT_APP_TXDESC — Offset 13C4h

The Channeli Current Application Transmit Descriptor register points to the current Transmit descriptor read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13C4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Transmit Descriptor Address Pointer (CURTDESAPTR):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

3.2.628 DMA_CH5_CURRENT_APP_RXDESC — Offset 13CCh

The Channeli Current Application Receive Descriptor register points to the current Receive descriptor read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13CCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Receive Descriptor Address Pointer (CURRDESAPTR):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

3.2.629 DMA_CH5_CURRENT_APP_TXBUFFER_H — Offset 13D0h

The Channeli Current Application Transmit Buffer Address High register has the higher 8 or 16 bits of the current address of the Transmit buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13D0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO	**Application Transmit Buffer Address Pointer (CURTBUFAPTRH):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

3.2.630 DMA_CH5_CURRENT_APP_TXBUFFER — Offset 13D4h

The Channeli Current Application Transmit Buffer Address register points to the current Tx buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Transmit Buffer Address Pointer (CURTBUFAPTR):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

3.2.631 DMA_CH5_CURRENT_APP_RXBUFFER_H — Offset 13D8h

The Channeli Current Application Receive Buffer Address High register has the higher 8 or 16 bits of the current address of the Receive buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO	**Application Receive Buffer Address Pointer (CURRBUFAPTRH):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

3.2.632 DMA_CH5_CURRENT_APP_RXBUFFER — Offset 13DCh

The Channel 0 Current Application Receive Buffer Address register points to the current Rx buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13DCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Receive Buffer Address Pointer (CURRBUFAPTR):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

3.2.633 DMA_CH5_STATUS — Offset 13E0h

The software driver (application) reads the Status register during interrupt service routine or polling to determine the status of the DMA.

Note: The number of DMA_CH(#i)_Status register in the configuration is the higher of number of Rx DMA Channels and Tx DMA Channels.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13E0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21:19	0h RO	**Rx DMA Error Bits (REB):** This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 21 -- 1'b1: Error during data transfer by Rx DMA -- 1'b0: No Error during data transfer by Rx DMA - Bit 20 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 19 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
18:16	0h RO	**Tx DMA Error Bits (TEB):** This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 18 -- 1'b1: Error during data transfer by Tx DMA -- 1'b0: No Error during data transfer by Tx DMA - Bit 17 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 16 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
15	0h RW	**Normal Interrupt Summary (NIS):** Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in DMA_CH0_Interrupt_Enable register) affect the Normal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit which causes NIS to be set is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Normal Interrupt Summary status not detected. 0x1 (ACTIVE): Normal Interrupt Summary status detected.

Bit Range	Default & Access	Field Name (ID): Description
14	0h RW	**Abnormal Interrupt Summary (AIS):** Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Abnormal Interrupt Summary status not detected. 0x1 (ACTIVE): Abnormal Interrupt Summary status detected.
13	0h RW	**Context Descriptor Error (CDE):** This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Context Descriptor Error status not detected. 0x1 (ACTIVE): Context Descriptor Error status detected.
12	0h RW	**Fatal Bus Error (FBE):** This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Fatal Bus Error status not detected. 0x1 (ACTIVE): Fatal Bus Error status detected.
11	0h RW	**Early Receive Interrupt (ERI):** This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. In configs supporting ERIC, When ERIC=0, this bit is set only after the Rx DMA has filled up a complete receive buffer with packet data. When ERIC=1, this bit is set after every burst transfer of data from the Rx DMA to the buffer. The setting of RI bit automatically clears this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Receive Interrupt status not detected. 0x1 (ACTIVE): Early Receive Interrupt status detected.
10	0h RW	**Early Transmit Interrupt (ETI):** This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. In configs supporting ERIC: When ETIC=0, this bit is set only after the Tx DMA has transferred a complete packet to MTL. When ETIC=1, this bit is set after completion of (partial) packet data transfer from buffers in the Transmit descriptor in which IOC=1. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Transmit Interrupt status not detected. 0x1 (ACTIVE): Early Transmit Interrupt status detected.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**Receive Watchdog Timeout (RWT):** This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received. 0x0 (INACTIVE): Receive Watchdog Timeout status not detected. 0x1 (ACTIVE): Receive Watchdog Timeout status detected.
8	0h RW	**Receive Process Stopped (RPS):** This bit is asserted when the Rx process enters the Stopped state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Process Stopped status not detected. 0x1 (ACTIVE): Receive Process Stopped status detected.
7	0h RW	**Receive Buffer Unavailable (RBU):** This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode, the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Buffer Unavailable status not detected. 0x1 (ACTIVE): Receive Buffer Unavailable status detected.
6	0h RW	**Receive Interrupt (RI):** This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. The reception remains in the Running state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Interrupt status not detected. 0x1 (ACTIVE): Receive Interrupt status detected.
5:3	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Transmit Buffer Unavailable (TBU):** This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPS0 field of the DMA_Debug_Status0 register explains the Transmit Process state transitions. To resume processing the Transmit descriptors, the application should do the following: 1. Change the ownership of the descriptor by setting Bit 31 of TDES3. 2. Issue a Transmit Poll Demand command. For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Buffer Unavailable status not detected. 0x1 (ACTIVE): Transmit Buffer Unavailable status detected.
1	0h RW	**Transmit Process Stopped (TPS):** This bit is set when the transmission is stopped. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Process Stopped status not detected. 0x1 (ACTIVE): Transmit Process Stopped status detected.
0	0h RW	**Transmit Interrupt (TI):** This bit indicates that the packet transmission is complete. When transmission is complete, Bit 31 of TDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Interrupt status not detected. 0x1 (ACTIVE): Transmit Interrupt status detected.

3.2.634 DMA_CH5_MISS_FRAME_CNT — Offset 13E4h

This register has the number of packet counter that got dropped by the DMA either due to Bus Error or due to programming RPF field in DMA_CH${i}_Rx_Control register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Overflow status of the MFC Counter (MFCO):** When this bit is set then the MFC counter does not get incremented further. The bit gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Miss Frame Counter overflow not occurred. 0x1 (ACTIVE): Miss Frame Counter overflow occurred.
14:11	0h RO	**Reserved**
10:0	000h RO	**Dropped Packet Counters (MFC):** This counter indicates the number of packet counters that are dropped by the DMA either because of bus error or because of programing RPF field in DMA_CH${i}_Rx_Control register. The counter gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event.

3.2.635 DMA_CH5_RXP_ACCEPT_CNT — Offset 13E8h

The DMA_CH(#i)_RXP_Accept_Cnt registers provides the count of the number of frames accepted by Rx Parser.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13E8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Rx Parser Accept Counter Overflow Bit (RXPACOF):** When set, this bit indicates that the RXPAC Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Rx Parser Accept Counter overflow not occurred. 0x1 (ACTIVE): Rx Parser Accept Counter overflow occurred.
30:0	00000000h RO	**Rx Parser Accept Counter (RXPAC):** This 31-bit counter is implemented whenever a Rx Parser Accept a packet due to AF =1. The counter is cleared when the register is read.

3.2.636 DMA_CH5_RX_ERI_CNT — Offset 13ECh

The DMA_CH(#i)_RX_ERI_Cnt registers provides the count of the number of times ERI was asserted.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 13ECh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11:0	000h RO	**ERI Counter (ECNT):** When ERIC bit of DMA_CH(#i)_RX_Control register is set, this counter increments for burst transfer completed by the Rx DMA from the start of packet transfer. This counter is reset at the start of new packet.

3.2.637 DMA_CH6_CONTROL — Offset 1400h

The DMA Channeli Control register specifies the MSS value for segmentation, length to skip between two descriptors, and also the features such as header splitting and 8xPBL mode.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1400h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**Split Headers (SPH):** When this bit is set, the DMA splits the header and payload in the Receive path. The DMA writes the header to the Buffer Address1 of RDES0. The DMA writes the payload to the buffer to which the Buffer Address2 is pointing. The software must ensure that the header fits into the Receive buffers. If the header length exceeds the receive buffer size, the DMA does not split the header and payload. This bit is available only if Enable Split Header Structure option is selected. 0x0 (DISABLE): Split Headers feature is disabled. 0x1 (ENABLE): Split Headers feature is enabled.
23:21	0h RO	**Reserved**
20:18	0h RW	**Descriptor Skip Length (DSL):** This bit specifies the Word, Dword, or Lword number (depending on the 32-bit, 64-bit, or 128-bit bus) to skip between two unchained descriptors. The address skipping starts from the end of the current descriptor to the start of the next descriptor. When the DSL value is equal to zero, the DMA takes the descriptor table as contiguous.
17	0h RO	**Reserved**
16	0h RW	**8xPBL mode (PBLX8):** When this bit is set, the PBL value programmed in Bits[21:16] in DMA_CH(#i)_Tx_Control and Bits[21:16] in DMA_CH(#i)_Rx_Control is multiplied by eight times. Therefore, the DMA transfers the data in 8, 16, 32, 64, 128, and 256 beats depending on the PBL value. 0x0 (DISABLE): 8xPBL mode is disabled. 0x1 (ENABLE): 8xPBL mode is enabled.
15:0	0h RO	**Reserved**

3.2.638 DMA_CH6_TX_CONTROL — Offset 1404h

The DMA Channeli Transmit Control register controls the Tx features such as PBL, TCP segmentation, and Tx Channel weights.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1404h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:29	0h RW	**Time Select (TFSEL):** Select bits for one of the four DMA_TBS_CTRL register fields (FTOS, FGSN, FTOV) for the channel. 0x0: DMA_TBS_CTRL0 selected. 0x1: DMA_TBS_CTRL1 selected. 0x2: DMA_TBS_CTRL2 selected. 0x3: DMA_TBS_CTRL3 selected.
28	0h RW	**Enhanced Descriptor Enable (EDSE):** When this bit is set, the corresponding channel uses Enhanced Descriptors that are 32 Bytes for both Normal and Context Descriptors. When reset, the corresponding channel uses the descriptors that are 16 Bytes. 0x0 (DISABLE): Enhanced Descriptor is disabled. 0x1 (ENABLE): Enhanced Descriptor is enabled.
27:24	0h RW	**Transmit QOS. (TQOS):** This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Tx Channel0.
23:22	0h RO	**Reserved**
21:16	00h RW	**Transmit Programmable Burst Length (TXPBL):** These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in DMA_CH0_Control register. 2. Set the TxPBL. Note: The maximum value of TxPBL must be less than or equal to half the Tx Queue size (TQS field of MTL_TxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. For example, in 64-bit data width configurations the total locations in Tx Queue of size 512 bytes is 64, TxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	0h RW	**Ignore PBL Requirement (IPBL):** When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. If space is not available, the MTL might use handshaking to slow the DMA. Note: This bit/mode must not be used when multiple Transmit DMA Channels are enabled as it might block other Transmit and Receive DMA Channels from accessing the Read Data Channel of AXI bus until space is available in Transmit Queue for current transfer. 0x0 (DISABLE): Ignore PBL Requirement is disabled. 0x1 (ENABLE): Ignore PBL Requirement is enabled.

Bit Range	Default & Access	Field Name (ID): Description
14:13	0h RW	**TSE_MODE:** TSE Mode - 00: TSO/USO (segmentation functionality is enabled). In this mode, the setting of TSE bit enables the TSO/USO segmentation. - 01: UFO with Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality with Checksum for all the UDP packets. - 10: UFO without Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality without Checksum for all the UDP packets. - 11: Reserved 0x0 (TSO_USO): TSO/USO. 0x1 (UFOWC): UFO with Checksum. 0x2 (UFOWOC): UFO without Checksum. 0x3 (RSVD): Reserved.
12	0h RW	**TCP Segmentation Enabled (TSE):** When this bit is set, the DMA performs the TCP segmentation or UDP Segmentation/ Fragmentation for packets in this channel. The TCP segmentation or UDP packet's segmentation/Fragmentation is done only for those packets for which the TSE bit (TDES0[19]) is set in the Tx Normal descriptor.When this bit is set, the TxPBL value must be greater than 4. 0x0 (DISABLE): TCP Segmentation is disabled. 0x1 (ENABLE): TCP Segmentation is enabled.
11:5	0h RO	**Reserved**
4	0h RW	**Operate on Second Packet (OSF):** When this bit is set, it instructs the DMA to process the second packet of the Transmit data even before the status for the first packet is obtained. 0x0 (DISABLE): Operate on Second Packet disabled. 0x1 (ENABLE): Operate on Second Packet enabled.
3:1	0h RW	**Transmit Channel Weight (TCW):** This field indicates the weight assigned to the corresponding Transmit channel. When reset is complete, this field is set to 0 for all channels by default, resulting in equal weights to all channels.
0	0h RW	**Start or Stop Transmission Command (ST):** When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the base address of the Transmit list set by the DMA_CH0_TxDesc_List_Address register. - The position at which the transmission was previously stopped If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the DMA_CH0_Status register is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the DMA_CH0_TxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program DMA_CH0_TxDesc_List_Address register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state. 0x0 (STOP): Stop Transmission Command. 0x1 (START): Start Transmission Command.

3.2.639 DMA_CH6_RX_CONTROL — Offset 1408h

The DMA Channeli Receive Control register controls the Rx features such as PBL, buffer size, and extended status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1408h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Rx Packet Flush. (RPF):** When this bit is set to 1, then GbE Controller automatically flushes the packet from the Rx Queues destined to this DMA Rx Channel, when it is stopped. When this bit remains set and the DMA is re-started by the software driver, the packets residing in the Rx Queues that were received when this RxDMA was stopped, get flushed out. The packets that are received by the MAC after the RxDMA is re-started are routed to the RxDMA. The flushing happens on the Read side of the Rx Queue. When this bit is set to 0, the GbE Controller not flush the packet in the Rx Queue destined to this RxDMA Channel when it is STOP state. This might in turn cause head-of-line blocking in the corresponding RxQueue. Note: The stopping of packet flow from a Rx DMA Channel to the application by setting RPF works only when there is one-to-one mapping of Rx Queue to Rx DMA channels. In Dynamic mapping mode, setting RPF bit in any DMA_CH(#i)_Rx_Control register might flush packets from unintended Rx Queues which are destined to the stopped Rx DMA Channel. 0x0 (DISABLE): Rx Packet Flush is disabled. 0x1 (ENABLE): Rx Packet Flush is enabled.
30:28	0h RO	**Reserved**
27:24	0h RW	**Rx AXI4 QOS. (RQOS):** This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Rx Channel0.
23:22	0h RO	**Reserved**
21:16	00h RW	**Receive Programmable Burst Length (RXPBL):** These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in the DMA_CH0_Control register. 2. Set the RxPBL. Note: The maximum value of RxPBL must be less than or equal to half the Rx Queue size (RQS field of MTL_RxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the Rx DMA is transferring a block of data. For example, in 64-bit data width configurations the total locations in Rx Queue of size 512 bytes is 64, so RxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
14:4	000h RW	**Receive Buffer size High (RBSZ_13_Y):** RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. The RBSZ[13:0] field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when split headers are enabled. Note: The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the value of buffer address pointer is not aligned to data bus width. Hence the lower RBSZ_x_0 bits are read-only and the value is considered as all-zero. Thus the RBSZ_13_y indicates the buffer size in terms of locations (with the width same as bus-width).
3:1	0h RO	**Receive Buffer size Low (RBSZ_X_0):** RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. The RBSZ_x_0 is the lower field whose width is based on data bus width of the configuration. This field is of width 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).
0	0h RW	**Start or Stop Receive (SR):** When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the address set by the DMA_CH0_RxDesc_List_Address register. - The position at which the Rx process was previously stopped If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the DMA_CH0_Status register is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the DMA_CH0_RxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state. 0x0 (STOP): Stop Receive. 0x1 (START): Start Receive.

3.2.640 DMA_CH6_TXDESC_LIST_HADDRESS — Offset 1410h

The Channeli Tx Descriptor List HAddress register has the higher 8 or 16 bits of the start address of the Transmit descriptor list.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CHi_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier. This register must be programmed with desired the higher address before programming the DMA_CHi_TxDesc_List_Address register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1410h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Start of Transmit List (TDESHA):** This field contains the most-significant 8 or 16 bits of the 40- or 48-bit base address of the first descriptor in the Transmit descriptor list.

3.2.641 DMA_CH6_TXDESC_LIST_ADDRESS — Offset 1414h

The Channeli Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LSB to low.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CH0_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1414h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Start of Transmit List (TDESLA):** This field contains the base address of the first descriptor in the Transmit descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

3.2.642 DMA_CH6_RXDESC_LIST_HADDRESS — Offset 1418h

The Channeli Rx Descriptor List HAddress register has the higher 8 or 16 bits of the start address of the Receive descriptor list.

Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in the DMA_CHi_RxDesc_List_Address register

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1418h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Start of Receive List (RDESHA):** This field contains the most-significant 8 or 16 bits of the 40-bit or 48-bit base address of the first descriptor in the Rx Descriptor list.

3.2.643 DMA_CH6_RXDESC_LIST_ADDRESS — Offset 141Ch

The Channeli Rx Descriptor List Address register points the DMA to the start of Receive descriptor list.

This register points to the start of the Receive Descriptor List. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in DMA_CH0_Rx_Control register. When stopped, this register can be written with a new descriptor list address.

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 141Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Start of Receive List (RDESLA):** This field contains the base address of the first descriptor in the Rx Descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). When this bit is reset, the Transmit Buffer Unavailable interrupt is disabled. 0x0 (DISABLE): Transmit Buffer Unavailable is disabled. 0x1 (ENABLE): Transmit Buffer Unavailable is enabled.
1	0h RW	**Transmit Stopped Enable (TXSE):** When this bit is set along with the AIE bit, the Transmission Stopped interrupt is enabled. When this bit is reset, the Transmission Stopped interrupt is disabled. 0x0 (DISABLE): Transmit Stopped is disabled. 0x1 (ENABLE): Transmit Stopped is enabled.
0	0h RW	**Transmit Interrupt Enable (TIE):** When this bit is set along with the NIE bit, the Transmit Interrupt is enabled. When this bit is reset, the Transmit Interrupt is disabled. 0x0 (DISABLE): Transmit Interrupt is disabled. 0x1 (ENABLE): Transmit Interrupt is enabled.

3.2.649 DMA_CH6_RX_INTERRUPT_WATCHDOG_TIMER — Offset 1438h

The Receive Interrupt Watchdog Timer register indicates the watchdog timeout for Receive Interrupt (RI) from the DMA. When this register is written with a non-zero value, it enables the watchdog timer for the RI bit of the DMA_CHi_Status register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1438h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17:16	0h RW	**Receive Interrupt Watchdog Timer Count Units (RWTU):** This fields indicates the number of system clock cycles corresponding to one unit in RWT field. - 2'b00: 256 - 2'b01: 512 - 2'b10: 1024 - 2'b11: 2048 For example, when RWT=2 and RWTU=1, the watchdog timer is set for 2*512=1024 system clock cycles.
15:8	0h RO	**Reserved**
7:0	00h RW	**Receive Interrupt Watchdog Timer Count (RWT):** This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. The watchdog timer is triggered with the programmed value after the Rx DMA completes the transfer of a packet for which the RI bit is not set in the DMA_CH(#i)_Status register, because of the setting of Interrupt Enable bit in the corresponding descriptor RDES3[30]. When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per the Interrupt Enable bit RDES3[30] of any received packet.

3.2.650 DMA_CH6_SLOT_FUNCTION_CONTROL_STATUS — Offset 143Ch

The Slot Function Control and Status register contains the control bits for slot function and the status for Transmit path.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 143Ch	000007C0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19:16	0h RO	**Reference Slot Number (RSN):** This field gives the current value of the reference slot number in the DMA. It is used for slot comparison.
15:4	07Ch RW	**Slot Interval Value (SIV):** This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. A value of 0 specifies the slot interval of 1 us while the maximum value 4095 specifies the slot interval of 4096us. The default/reset value is 0x07C which corresponds to slot interval of 125us

Bit Range	Default & Access	Field Name (ID): Description
3:2	0h RO	**Reserved**
1	0h RW	**Advance Slot Check (ASC):** When set, this bit enables the DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the Tx descriptor is - equal to the reference slot number given in the RSN field or - ahead of the reference slot number by up to two slots This bit is applicable only when the ESC bit is set. 0x0 (DISABLE): Advance Slot Check is disabled. 0x1 (ENABLE): Advance Slot Check is enabled.
0	0h RW	**Enable Slot Comparison (ESC):** When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. The DMA fetches the data from the corresponding buffer only when the slot number is - equal to the reference slot number or - ahead of the reference slot number by one slot When reset, this bit disables the checking of the slot numbers. The DMA fetches the data immediately after the descriptor is processed. Note: The UFO (UDP Fragmentation over IPv4)/TSO/USO should not be enabled along with TBS/AVB Slot number check. The UFO/TSO/USO involves multiple packets/segments/fragments transmission for single packet received from application and the slot number check are applicable for fetching of only first segment/fragment. As a result it might be difficult for software to specify slot number for subsequent packets. 0x0 (DISABLE): Slot Comparison is disabled. 0x1 (ENABLE): Slot Comparison is enabled.

3.2.651 DMA_CH6_CURRENT_APP_TXDESC — Offset 1444h

The Channeli Current Application Transmit Descriptor register points to the current Transmit descriptor read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1444h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Transmit Descriptor Address Pointer (CURTDESAPTR):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

3.2.652 DMA_CH6_CURRENT_APP_RXDESC — Offset 144Ch

The Channeli Current Application Receive Descriptor register points to the current Receive descriptor read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 144Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Receive Descriptor Address Pointer (CURRDESAPTR):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

3.2.653 DMA_CH6_CURRENT_APP_TXBUFFER_H — Offset 1450h

The Channeli Current Application Transmit Buffer Address High register has the higher 8 or 16 bits of the current address of the Transmit buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1450h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO	**Application Transmit Buffer Address Pointer (CURTBUFAPTRH):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

3.2.654 DMA_CH6_CURRENT_APP_TXBUFFER — Offset 1454h

The Channeli Current Application Transmit Buffer Address register points to the current Tx buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1454h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Transmit Buffer Address Pointer (CURTBUFAPTR):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

3.2.655 DMA_CH6_CURRENT_APP_RXBUFFER_H — Offset 1458h

The Channeli Current Application Receive Buffer Address High register has the higher 8 or 16 bits of the current address of the Receive buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1458h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO	**Application Receive Buffer Address Pointer (CURRBUFAPTRH):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

3.2.656 DMA_CH6_CURRENT_APP_RXBUFFER — Offset 145Ch

The Channel 0 Current Application Receive Buffer Address register points to the current Rx buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 145Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Receive Buffer Address Pointer (CURRBUFAPTR):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

3.2.657 DMA_CH6_STATUS — Offset 1460h

The software driver (application) reads the Status register during interrupt service routine or polling to determine the status of the DMA.

Note: The number of DMA_CH(#i)_Status register in the configuration is the higher of number of Rx DMA Channels and Tx DMA Channels.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1460h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21:19	0h RO	**Rx DMA Error Bits (REB):** This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 21 -- 1'b1: Error during data transfer by Rx DMA -- 1'b0: No Error during data transfer by Rx DMA - Bit 20 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 19 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
18:16	0h RO	**Tx DMA Error Bits (TEB):** This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 18 -- 1'b1: Error during data transfer by Tx DMA -- 1'b0: No Error during data transfer by Tx DMA - Bit 17 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 16 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
15	0h RW	**Normal Interrupt Summary (NIS):** Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in DMA_CH0_Interrupt_Enable register) affect the Normal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit which causes NIS to be set is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Normal Interrupt Summary status not detected. 0x1 (ACTIVE): Normal Interrupt Summary status detected.

Bit Range	Default & Access	Field Name (ID): Description
14	0h RW	**Abnormal Interrupt Summary (AIS):** Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Abnormal Interrupt Summary status not detected. 0x1 (ACTIVE): Abnormal Interrupt Summary status detected.
13	0h RW	**Context Descriptor Error (CDE):** This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Context Descriptor Error status not detected. 0x1 (ACTIVE): Context Descriptor Error status detected.
12	0h RW	**Fatal Bus Error (FBE):** This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Fatal Bus Error status not detected. 0x1 (ACTIVE): Fatal Bus Error status detected.
11	0h RW	**Early Receive Interrupt (ERI):** This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. In configs supporting ERIC, When ERIC=0, this bit is set only after the Rx DMA has filled up a complete receive buffer with packet data. When ERIC=1, this bit is set after every burst transfer of data from the Rx DMA to the buffer. The setting of RI bit automatically clears this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Receive Interrupt status not detected. 0x1 (ACTIVE): Early Receive Interrupt status detected.
10	0h RW	**Early Transmit Interrupt (ETI):** This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. In configs supporting ERIC: When ETIC=0, this bit is set only after the Tx DMA has transferred a complete packet to MTL. When ETIC=1, this bit is set after completion of (partial) packet data transfer from buffers in the Transmit descriptor in which IOC=1. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Transmit Interrupt status not detected. 0x1 (ACTIVE): Early Transmit Interrupt status detected.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**Receive Watchdog Timeout (RWT):** This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received. 0x0 (INACTIVE): Receive Watchdog Timeout status not detected. 0x1 (ACTIVE): Receive Watchdog Timeout status detected.
8	0h RW	**Receive Process Stopped (RPS):** This bit is asserted when the Rx process enters the Stopped state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Process Stopped status not detected. 0x1 (ACTIVE): Receive Process Stopped status detected.
7	0h RW	**Receive Buffer Unavailable (RBU):** This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode, the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Buffer Unavailable status not detected. 0x1 (ACTIVE): Receive Buffer Unavailable status detected.
6	0h RW	**Receive Interrupt (RI):** This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. The reception remains in the Running state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Interrupt status not detected. 0x1 (ACTIVE): Receive Interrupt status detected.
5:3	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Transmit Buffer Unavailable (TBU):** This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPS0 field of the DMA_Debug_Status0 register explains the Transmit Process state transitions. To resume processing the Transmit descriptors, the application should do the following: 1. Change the ownership of the descriptor by setting Bit 31 of TDES3. 2. Issue a Transmit Poll Demand command. For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Buffer Unavailable status not detected. 0x1 (ACTIVE): Transmit Buffer Unavailable status detected.
1	0h RW	**Transmit Process Stopped (TPS):** This bit is set when the transmission is stopped. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Process Stopped status not detected. 0x1 (ACTIVE): Transmit Process Stopped status detected.
0	0h RW	**Transmit Interrupt (TI):** This bit indicates that the packet transmission is complete. When transmission is complete, Bit 31 of TDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Interrupt status not detected. 0x1 (ACTIVE): Transmit Interrupt status detected.

3.2.658 DMA_CH6_MISS_FRAME_CNT — Offset 1464h

This register has the number of packet counter that got dropped by the DMA either due to Bus Error or due to programming RPF field in DMA_CH${i}_Rx_Control register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1464h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Overflow status of the MFC Counter (MFCO):** When this bit is set then the MFC counter does not get incremented further. The bit gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Miss Frame Counter overflow not occurred. 0x1 (ACTIVE): Miss Frame Counter overflow occurred.
14:11	0h RO	**Reserved**
10:0	000h RO	**Dropped Packet Counters (MFC):** This counter indicates the number of packet counters that are dropped by the DMA either because of bus error or because of programing RPF field in DMA_CH${i}_Rx_Control register. The counter gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event.

3.2.659 DMA_CH6_RXP_ACCEPT_CNT — Offset 1468h

The DMA_CH(#i)_RXP_Accept_Cnt registers provides the count of the number of frames accepted by Rx Parser.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1468h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Rx Parser Accept Counter Overflow Bit (RXPACOF):** When set, this bit indicates that the RXPAC Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Rx Parser Accept Counter overflow not occurred. 0x1 (ACTIVE): Rx Parser Accept Counter overflow occurred.
30:0	00000000h RO	**Rx Parser Accept Counter (RXPAC):** This 31-bit counter is implemented whenever a Rx Parser Accept a packet due to AF =1. The counter is cleared when the register is read.

3.2.660 DMA_CH6_RX_ERI_CNT — Offset 146Ch

The DMA_CH(#i)_RX_ERI_Cnt registers provides the count of the number of times ERI was asserted.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 146Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11:0	000h RO	**ERI Counter (ECNT):** When ERIC bit of DMA_CH(#i)_RX_Control register is set, this counter increments for burst transfer completed by the Rx DMA from the start of packet transfer. This counter is reset at the start of new packet.

3.2.661 DMA_CH7_CONTROL — Offset 1480h

The DMA Channeli Control register specifies the MSS value for segmentation, length to skip between two descriptors, and also the features such as header splitting and 8xPBL mode.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1480h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RW	**Split Headers (SPH):** When this bit is set, the DMA splits the header and payload in the Receive path. The DMA writes the header to the Buffer Address1 of RDES0. The DMA writes the payload to the buffer to which the Buffer Address2 is pointing. The software must ensure that the header fits into the Receive buffers. If the header length exceeds the receive buffer size, the DMA does not split the header and payload. This bit is available only if Enable Split Header Structure option is selected. 0x0 (DISABLE): Split Headers feature is disabled. 0x1 (ENABLE): Split Headers feature is enabled.
23:21	0h RO	**Reserved**
20:18	0h RW	**Descriptor Skip Length (DSL):** This bit specifies the Word, Dword, or Lword number (depending on the 32-bit, 64-bit, or 128-bit bus) to skip between two unchained descriptors. The address skipping starts from the end of the current descriptor to the start of the next descriptor. When the DSL value is equal to zero, the DMA takes the descriptor table as contiguous.
17	0h RO	**Reserved**
16	0h RW	**8xPBL mode (PBLX8):** When this bit is set, the PBL value programmed in Bits[21:16] in DMA_CH(#i)_Tx_Control and Bits[21:16] in DMA_CH(#i)_Rx_Control is multiplied by eight times. Therefore, the DMA transfers the data in 8, 16, 32, 64, 128, and 256 beats depending on the PBL value. 0x0 (DISABLE): 8xPBL mode is disabled. 0x1 (ENABLE): 8xPBL mode is enabled.
15:0	0h RO	**Reserved**

3.2.662 DMA_CH7_TX_CONTROL — Offset 1484h

The DMA Channel Transmit Control register controls the Tx features such as PBL, TCP segmentation, and Tx Channel weights.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1484h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved**
30:29	0h RW	**TFSEL:**
28	0h RW	**Enhanced Descriptor Enable (EDSE):** When this bit is set, the corresponding channel uses Enhanced Descriptors that are 32 Bytes for both Normal and Context Descriptors. When reset, the corresponding channel uses the descriptors that are 16 Bytes. 0x0 (DISABLE): Enhanced Descriptor is disabled. 0x1 (ENABLE): Enhanced Descriptor is enabled.
27:24	0h RW	**Transmit QOS. (TQOS):** This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Tx Channel0.
23:22	0h RO	**Reserved**
21:16	00h RW	**Transmit Programmable Burst Length (TXPBL):** These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in DMA_CH0_Control register. 2. Set the TxPBL. Note: The maximum value of TxPBL must be less than or equal to half the Tx Queue size (TQS field of MTL_TxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. For example, in 64-bit data width configurations the total locations in Tx Queue of size 512 bytes is 64, TxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	0h RW	**Ignore PBL Requirement (IPBL):** When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. If space is not available, the MTL might use handshaking to slow the DMA. Note: This bit/mode must not be used when multiple Transmit DMA Channels are enabled as it might block other Transmit and Receive DMA Channels from accessing the Read Data Channel of AXI bus until space is available in Transmit Queue for current transfer. 0x0 (DISABLE): Ignore PBL Requirement is disabled. 0x1 (ENABLE): Ignore PBL Requirement is enabled.

Bit Range	Default & Access	Field Name (ID): Description
14:13	0h RW	**TSE_MODE:** TSE Mode - 00: TSO/USO (segmentation functionality is enabled). In this mode, the setting of TSE bit enables the TSO/USO segmentation. - 01: UFO with Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality with Checksum for all the UDP packets. - 10: UFO without Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality without Checksum for all the UDP packets. - 11: Reserved 0x0 (TSO_USO): TSO/USO. 0x1 (UFOWC): UFO with Checksum. 0x2 (UFOWOC): UFO without Checksum. 0x3 (RSVD): Reserved.
12	0h RW	**TCP Segmentation Enabled (TSE):** When this bit is set, the DMA performs the TCP segmentation or UDP Segmentation/ Fragmentation for packets in this channel. The TCP segmentation or UDP packet's segmentation/Fragmentation is done only for those packets for which the TSE bit (TDES0[19]) is set in the Tx Normal descriptor.When this bit is set, the TxPBL value must be greater than 4. 0x0 (DISABLE): TCP Segmentation is disabled. 0x1 (ENABLE): TCP Segmentation is enabled.
11:5	0h RO	**Reserved**
4	0h RW	**Operate on Second Packet (OSF):** When this bit is set, it instructs the DMA to process the second packet of the Transmit data even before the status for the first packet is obtained. 0x0 (DISABLE): Operate on Second Packet disabled. 0x1 (ENABLE): Operate on Second Packet enabled.
3:1	0h RW	**Transmit Channel Weight (TCW):** This field indicates the weight assigned to the corresponding Transmit channel. When reset is complete, this field is set to 0 for all channels by default, resulting in equal weights to all channels.
0	0h RW	**Start or Stop Transmission Command (ST):** When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the base address of the Transmit list set by the DMA_CH0_TxDesc_List_Address register. - The position at which the transmission was previously stopped If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the DMA_CH0_Status register is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the DMA_CH0_TxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program DMA_CH0_TxDesc_List_Address register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state. 0x0 (STOP): Stop Transmission Command. 0x1 (START): Start Transmission Command.

3.2.663 DMA_CH7_RX_CONTROL — Offset 1488h

The DMA Channeli Receive Control register controls the Rx features such as PBL, buffer size, and extended status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1488h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Rx Packet Flush. (RPF):** When this bit is set to 1, then GbE Controller automatically flushes the packet from the Rx Queues destined to this DMA Rx Channel, when it is stopped. When this bit remains set and the DMA is re-started by the software driver, the packets residing in the Rx Queues that were received when this RxDMA was stopped, get flushed out. The packets that are received by the MAC after the RxDMA is re-started are routed to the RxDMA. The flushing happens on the Read side of the Rx Queue. When this bit is set to 0, the GbE Controller not flush the packet in the Rx Queue destined to this RxDMA Channel when it is STOP state. This might in turn cause head-of-line blocking in the corresponding RxQueue. Note: The stopping of packet flow from a Rx DMA Channel to the application by setting RPF works only when there is one-to-one mapping of Rx Queue to Rx DMA channels. In Dynamic mapping mode, setting RPF bit in any DMA_CH(#i)_Rx_Control register might flush packets from unintended Rx Queues which are destined to the stopped Rx DMA Channel. 0x0 (DISABLE): Rx Packet Flush is disabled. 0x1 (ENABLE): Rx Packet Flush is enabled.
30:28	0h RO	**Reserved**
27:24	0h RW	**Rx AXI4 QOS. (RQOS):** This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Rx Channel0.
23:22	0h RO	**Reserved**
21:16	00h RW	**Receive Programmable Burst Length (RXPBL):** These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in the DMA_CH0_Control register. 2. Set the RxPBL. Note: The maximum value of RxPBL must be less than or equal to half the Rx Queue size (RQS field of MTL_RxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the Rx DMA is transferring a block of data. For example, in 64-bit data width configurations the total locations in Rx Queue of size 512 bytes is 64, so RxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
14:4	000h RW	**Receive Buffer size High (RBSZ_13_Y):** RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. The RBSZ[13:0] field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when split headers are enabled. Note: The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the value of buffer address pointer is not aligned to data bus width. Hence the lower RBSZ_x_0 bits are read-only and the value is considered as all-zero. Thus the RBSZ_13_y indicates the buffer size in terms of locations (with the width same as bus-width).
3:1	0h RO	**Receive Buffer size Low (RBSZ_X_0):** RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. The RBSZ_x_0 is the lower field whose width is based on data bus width of the configuration. This field is of width 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).
0	0h RW	**Start or Stop Receive (SR):** When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the address set by the DMA_CH0_RxDesc_List_Address register. - The position at which the Rx process was previously stopped If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the DMA_CH0_Status register is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the DMA_CH0_RxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state. 0x0 (STOP): Stop Receive. 0x1 (START): Start Receive.

3.2.664 DMA_CH7_TXDESC_LIST_HADDRESS — Offset 1490h

The Channeli Tx Descriptor List HAddress register has the higher 8 or 16 bits of the start address of the Transmit descriptor list.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CHi_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier. This register must be programmed with desired the higher address before programming the DMA_CHi_TxDesc_List_Address register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1490h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RW	**Start of Transmit List (TDESHA):** This field contains the most-significant 8 or 16 bits of the 40- or 48-bit base address of the first descriptor in the Transmit descriptor list.

3.2.665 DMA_CH7_TXDESC_LIST_ADDRESS — Offset 1494h

The Channeli Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LSB to low.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CH0_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1494h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RW	**Start of Transmit List (TDESLA):** This field contains the base address of the first descriptor in the Transmit descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2:0	0h RO	**Reserved**

3.2.666 DMA_CH7_RXDESC_LIST_HADDRESS — Offset 1498h

The Channeli Rx Descriptor List HAddress register has the higher 8 or 16 bits of the start address of the Receive descriptor list.

Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in the DMA_CHi_RxDesc_List_Address register

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1498h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**

3.2.667 DMA_CH7_RXDESC_LIST_ADDRESS — Offset 149Ch

The Channeli Rx Descriptor List Address register points the DMA to the start of Receive descriptor list.

This register points to the start of the Receive Descriptor List. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in DMA_CH0_Rx_Control register. When stopped, this register can be written with a new descriptor list address.

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Type	Size	Offset	Default

3.2.673 DMA_CH7_RX_INTERRUPT_WATCHDOG_TIMER — Offset 14B8h

The Receive Interrupt Watchdog Timer register indicates the watchdog timeout for Receive Interrupt (RI) from the DMA. When this register is written with a non-zero value, it enables the watchdog timer for the RI bit of the DMA_CHi_Status register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14B8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved**
17:16	0h RW	**Receive Interrupt Watchdog Timer Count Units (RWTU):** This fields indicates the number of system clock cycles corresponding to one unit in RWT field. - 2'b00: 256 - 2'b01: 512 - 2'b10: 1024 - 2'b11: 2048 For example, when RWT=2 and RWTU=1, the watchdog timer is set for 2*512=1024 system clock cycles.
15:8	0h RO	**Reserved**
7:0	00h RW	**Receive Interrupt Watchdog Timer Count (RWT):** This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. The watchdog timer is triggered with the programmed value after the Rx DMA completes the transfer of a packet for which the RI bit is not set in the DMA_CH(#i)_Status register, because of the setting of Interrupt Enable bit in the corresponding descriptor RDES3[30]. When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per the Interrupt Enable bit RDES3[30] of any received packet.

3.2.674 DMA_CH7_SLOT_FUNCTION_CONTROL_STATUS — Offset 14BCh

The Slot Function Control and Status register contains the control bits for slot function and the status for Transmit path.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14BCh	000007C0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19:16	0h RO	**Reference Slot Number (RSN):** This field gives the current value of the reference slot number in the DMA. It is used for slot comparison.
15:4	07Ch RW	**Slot Interval Value (SIV):** This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. A value of 0 specifies the slot interval of 1 us while the maximum value 4095 specifies the slot interval of 4096us. The default/reset value is 0x07C which corresponds to slot interval of 125us

Bit Range	Default & Access	Field Name (ID): Description
3:2	0h RO	**Reserved**
1	0h RW	**Advance Slot Check (ASC):** When set, this bit enables the DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the Tx descriptor is - equal to the reference slot number given in the RSN field or - ahead of the reference slot number by up to two slots This bit is applicable only when the ESC bit is set. 0x0 (DISABLE): Advance Slot Check is disabled. 0x1 (ENABLE): Advance Slot Check is enabled.
0	0h RW	**Enable Slot Comparison (ESC):** When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. The DMA fetches the data from the corresponding buffer only when the slot number is - equal to the reference slot number or - ahead of the reference slot number by one slot When reset, this bit disables the checking of the slot numbers. The DMA fetches the data immediately after the descriptor is processed. Note: The UFO (UDP Fragmentation over IPv4)/TSO/USO should not be enabled along with TBS/AVB Slot number check. The UFO/TSO/USO involves multiple packets/segments/fragments transmission for single packet received from application and the slot number check are applicable for fetching of only first segment/fragment. As a result it might be difficult for software to specify slot number for subsequent packets. 0x0 (DISABLE): Slot Comparison is disabled. 0x1 (ENABLE): Slot Comparison is enabled.

3.2.675 DMA_CH7_CURRENT_APP_TXDESC — Offset 14C4h

The Channeli Current Application Transmit Descriptor register points to the current Transmit descriptor read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14C4h	00000000h

3.2.678 DMA_CH7_CURRENT_APP_TXBUFFER — Offset 14D4h

The Channeli Current Application Transmit Buffer Address register points to the current Tx buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Transmit Buffer Address Pointer (CURTBUFAPTR):** The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

3.2.679 DMA_CH7_CURRENT_APP_RXBUFFER_H — Offset 14D8h

The Channeli Current Application Receive Buffer Address High register has the higher 8 or 16 bits of the current address of the Receive buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO	**Application Receive Buffer Address Pointer (CURRBUFAPTRH):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

3.2.680 DMA_CH7_CURRENT_APP_RXBUFFER — Offset 14DCh

The Channel 0 Current Application Receive Buffer Address register points to the current Rx buffer address read by the DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14DCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Application Receive Buffer Address Pointer (CURRBUFAPTR):** The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

3.2.681 DMA_CH7_STATUS — Offset 14E0h

The software driver (application) reads the Status register during interrupt service routine or polling to determine the status of the DMA.

Note: The number of DMA_CH(#i)_Status register in the configuration is the higher of number of Rx DMA Channels and Tx DMA Channels.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14E0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21:19	0h RO	**Rx DMA Error Bits (REB):** This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 21 -- 1'b1: Error during data transfer by Rx DMA -- 1'b0: No Error during data transfer by Rx DMA - Bit 20 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 19 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
18:16	0h RO	**Tx DMA Error Bits (TEB):** This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 18 -- 1'b1: Error during data transfer by Tx DMA -- 1'b0: No Error during data transfer by Tx DMA - Bit 17 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 16 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
15	0h RW	**Normal Interrupt Summary (NIS):** Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in DMA_CH0_Interrupt_Enable register) affect the Normal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit which causes NIS to be set is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Normal Interrupt Summary status not detected. 0x1 (ACTIVE): Normal Interrupt Summary status detected.

Bit Range	Default & Access	Field Name (ID): Description
14	0h RW	**Abnormal Interrupt Summary (AIS):** Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Abnormal Interrupt Summary status not detected. 0x1 (ACTIVE): Abnormal Interrupt Summary status detected.
13	0h RW	**Context Descriptor Error (CDE):** This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Context Descriptor Error status not detected. 0x1 (ACTIVE): Context Descriptor Error status detected.
12	0h RW	**Fatal Bus Error (FBE):** This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Fatal Bus Error status not detected. 0x1 (ACTIVE): Fatal Bus Error status detected.
11	0h RW	**Early Receive Interrupt (ERI):** This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. In configs supporting ERIC, When ERIC=0, this bit is set only after the Rx DMA has filled up a complete receive buffer with packet data. When ERIC=1, this bit is set after every burst transfer of data from the Rx DMA to the buffer. The setting of RI bit automatically clears this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Receive Interrupt status not detected. 0x1 (ACTIVE): Early Receive Interrupt status detected.
10	0h RW	**Early Transmit Interrupt (ETI):** This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. In configs supporting ERIC: When ETIC=0, this bit is set only after the Tx DMA has transferred a complete packet to MTL. When ETIC=1, this bit is set after completion of (partial) packet data transfer from buffers in the Transmit descriptor in which IOC=1. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Transmit Interrupt status not detected. 0x1 (ACTIVE): Early Transmit Interrupt status detected.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**Receive Watchdog Timeout (RWT):** This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received. 0x0 (INACTIVE): Receive Watchdog Timeout status not detected. 0x1 (ACTIVE): Receive Watchdog Timeout status detected.
8	0h RW	**Receive Process Stopped (RPS):** This bit is asserted when the Rx process enters the Stopped state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Process Stopped status not detected. 0x1 (ACTIVE): Receive Process Stopped status detected.
7	0h RW	**Receive Buffer Unavailable (RBU):** This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode, the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Buffer Unavailable status not detected. 0x1 (ACTIVE): Receive Buffer Unavailable status detected.
6	0h RW	**Receive Interrupt (RI):** This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. The reception remains in the Running state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Interrupt status not detected. 0x1 (ACTIVE): Receive Interrupt status detected.
5:3	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Transmit Buffer Unavailable (TBU):** This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPS0 field of the DMA_Debug_Status0 register explains the Transmit Process state transitions. To resume processing the Transmit descriptors, the application should do the following: 1. Change the ownership of the descriptor by setting Bit 31 of TDES3. 2. Issue a Transmit Poll Demand command. For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Buffer Unavailable status not detected. 0x1 (ACTIVE): Transmit Buffer Unavailable status detected.
1	0h RW	**Transmit Process Stopped (TPS):** This bit is set when the transmission is stopped. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Process Stopped status not detected. 0x1 (ACTIVE): Transmit Process Stopped status detected.
0	0h RW	**Transmit Interrupt (TI):** This bit indicates that the packet transmission is complete. When transmission is complete, Bit 31 of TDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Interrupt status not detected. 0x1 (ACTIVE): Transmit Interrupt status detected.

3.2.682 DMA_CH7_MISS_FRAME_CNT — Offset 14E4h

This register has the number of packet counter that got dropped by the DMA either due to Bus Error or due to programming RPF field in DMA_CH${i}_Rx_Control register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Overflow status of the MFC Counter (MFCO):** When this bit is set then the MFC counter does not get incremented further. The bit gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Miss Frame Counter overflow not occurred. 0x1 (ACTIVE): Miss Frame Counter overflow occurred.
14:11	0h RO	**Reserved**
10:0	000h RO	**Dropped Packet Counters (MFC):** This counter indicates the number of packet counters that are dropped by the DMA either because of bus error or because of programing RPF field in DMA_CH${i}_Rx_Control register. The counter gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event.

3.2.683 DMA_CH7_RXP_ACCEPT_CNT — Offset 14E8h

The DMA_CH(#i)_RXP_Accept_Cnt registers provides the count of the number of frames accepted by Rx Parser.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14E8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Rx Parser Accept Counter Overflow Bit (RXPACOF):** When set, this bit indicates that the RXPAC Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Rx Parser Accept Counter overflow not occurred. 0x1 (ACTIVE): Rx Parser Accept Counter overflow occurred.
30:0	00000000h RO	**Rx Parser Accept Counter (RXPAC):** This 31-bit counter is implemented whenever a Rx Parser Accept a packet due to AF =1. The counter is cleared when the register is read.

3.2.684 DMA_CH7_RX_ERI_CNT — Offset 14ECh

The DMA_CH(#i)_RX_ERI_Cnt registers provides the count of the number of times ERI was asserted.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14ECh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11:0	000h RO	**ERI Counter (ECNT):** When ERIC bit of DMA_CH(#i)_RX_Control register is set, this counter increments for burst transfer completed by the Rx DMA from the start of packet transfer. This counter is reset at the start of new packet.

3.3 PHY Sublayer Registers Accessible via the MDIO Interface Controller

The Management Data Input/Output (MDIO) Interface is defined in IEEE Standard 802.3-2018:

Clause 22 – Chapter 22.2.4 of the IEEE standard specifies the MDIO interface and registers. The MAC device controlling the MDIO is called the Station Management (STA) entity. The STA issues MDIO frames that have the 2-bit, start-of-frame Symbol Time (ST) code of 01 to access registers. See Table below for the Clause 22 frame format and terminology.

Clause 45 – See Chapter 45 of the IEEE standard. This MDIO interface and register format are extensions to the two-signal MDIO Interface specified in Clause 22. For Clause 45, additional registers are added to the address space by defining MDIO frames that use a start-of-frame Symbol Time (ST) code of 00. See Table below for the Clause 45 frame format and terminology.

The TSN-GbE Controller supports both formats. The C45E bit (bit 1) of the MAC_MDIO_Address register at MMIO offset 200h can be programmed to select the Clause 22 or Clause 45 mode of operation of the STA for the particular MDIO frame. The C45E bit must be programmed to support the capability of the PHY that is connected to MDIO.

The PHY sublayer, or grouping of sublayers, is an individually manageable entity referred to as an MDIO Manageable Device (MMD).

Table 3-3. MDIO Clause 22 Management Frame Format

Operation	32-bit Preamble (1's)	Start of Frame (ST)	Operation Code (OP)	PHY Address (PHYAD)	PHY Register Address (REGAD)	2-Bit Turn-around (TA) Time	Data (16 bits)	High-Z (Idle)
Write	1111...1	01	01	AAAAA	RRRRR	10	16-bit Data to be written to the register	Z
Read	1111...1	01	10	AAAAA	RRRRR	Z0	16-bit Data read from the register	Z

For the Clause 22 frame, the PHY Address (PHYAD) selects one of 32 PHYs attached to the MDIO interface. The PHY Register Address (REGAD) selects one of 32 16-bit registers within each MMD.

Table 3-4. MDIO Clause 45 Management Frame Format

Operation	32-bit Preamble (1's)	Start of Frame (ST)	Operation Code (OP)	Port Address (PRTAD)	Device Address (DEVAD)	2-Bit Turn-around (TA) Time	Address /Data (16 bits)	High-Z (Idle)
Address	1111...1	00	00	PPPPP	EEEEE	Z0	16-bit Address of the register to be accessed on the next cycle	Z
Write	1111...1	00	01	PPPPP	EEEEE	Z0	16-bit Data to be written to the register	Z
Post-Read-Increment Address	1111...1	00	10	PPPPP	EEEEE	Z0	16-bit Data read from the register	Z
Read	1111...1	00	11	PPPPP	EEEEE	Z0	16-bit Data read from the register	Z

For the Clause 45 frame, the Port Address (PRTAD) selects one of 32 Ports attached to the MDIO interface. The Device Address (DEVAD) selects one of 32 unique MDDs per Port. Notice that the register address and register data are separate MDIO frames.

3.3.1 MDIO – PCS PHY Sublayer Registers – PHY Port Address 16h

The MAC uses the GMII as the data interface to the PHY sublayers of the Ethernet LAN Controller including the Physical Coding Sublayer (PCS). The MAC uses the MDIO as the configuration and management interface to the PHY sublayers. This section describes the PCS MDIO registers which follow the IEEE 802.3 standard register sets for the different MMIO Management Devices (MMD).

The PCS PHY sublayer is an IEEE Std 802.3 Clause-45-capable MDIO entity with the following IEEE 802.3 MDIO frame fields:

- Start-of-Frame Symbol Time (ST) 2-bit code: 00b – Indicates a Clause 45 MDIO frame.
- Port Address (PRTAD) 5-bit ID: 10110b (16h) – This Port contains two MMDs:

- MMD (DEVAD) 5-bit ID: 11110b (1Eh) – Vendor-Specific MMD with 65,535 addressable 16-bit registers. The valid register addresses range from 0000h though 000Fh. This MMD is named Vendor-Specific 1 (Control MMD). The registers are used to control the other MMDs of the LAN Controller.
- MMD (DEVAD) 5-bit ID: 11111b (1Fh) – Vendor-Specific MMD with 65,535 addressable 16-bit registers. The valid register addresses range from 0000h though 0E2h. This MMD is named Vendor-Specific MII MMD (VR MII MMD).

Table 3-5. Summary of PCS MDIO Registers, PRTAD = 16h, DEVAD = 1Eh

Register Address (Hex)	Data Size (Bits)	Register Name (Register Symbol)	Default Value [15:0]
0000	16	SR Control MMD PMA Device Identifier Register 1 (SR_VSMMD_PMA_ID1)	0000h
0001	16	SR Control MMD PMA Device Identifier Register 2 (SR_VSMMD_PMA_ID2)	0000h
0002	16	SR Control MMD Device Identifier Register 1 (SR_VSMMD_DEV_ID1)	0000h
0003	16	SR Control MMD Device Identifier Register 2 (SR_VSMMD_DEV_ID2)	000h
0004	16	SR Control MMD PCS Device Identifier Register 1 (SR_VSMMD_PCS_ID1)	7996h
0005	16	SR Control MMD PCS Device Identifier Register 2 (SR_VSMMD_PCS_ID2)	CED0h
0006	16	SR Control MMD AN Device Identifier Register 1 (SR_VSMMD_AN_ID1)	0000h
0007	16	SR Control MMD AN Device Identifier Register 2 (SR_VSMMD_AN_ID2)	0000h
0008	16	SR Control MMD Status Register (SR_VSMMD_STS)	8000h
0009	16	SR Control MMD Control Register (SR_VSMMD_CTRL)	0004h
000E	16	SR Control MMD Package Identifier Register 1 (SR_VSMMD_PKGID1)	0000h
000F	16	SR Control MMD Package Identifier Register 2 (SR_VSMMD_PKGID2)	0000h

Table 3-6. Summary of PCS MDIO Registers, PRTAD = 16h, DEVAD = 1Fh

Register Address (Hex)	Data Size (Bits)	Register Name (Register Symbol)	Default Value [15:0]
0000	16	SR MII MMD Control Register (SR_MII_CTRL)	1140h
0001	16	SR MII MMD Status Register (SR_MII_STS)	0189h
0002	16	SR MII MMD Device Identifier Register 1 (SR_MII_DEV_ID1)	7996h
0003	16	SR MII MMD Device Identifier Register 2 (SR_MII_DEV_ID2)	CED0h
0004	16	SR MII MMD AN Advertisement Register (SR_MII_AN_ADV)	0020h
0005	16	SR MII MMD AN Link Partner Base Ability Register (SR_MII_LP_BABL)	0000h

Table 3-6. Summary of PCS MDIO Registers, PRTAD = 16h, DEVAD = 1Fh

Register Address (Hex)	Data Size (Bits)	Register Name (Register Symbol)	Default Value [15:0]
0006	16	SR MII MMD AN Expansion Register (SR_MII_AN_EXPN)	0000h
000F	16	SR MII MMD Extended Status Register (SR_MII_EXT_STS)	C000h
0708	16	SR MII MMD Time Sync Capability Register (SR_MII_TIME_SYNC_ABL)	0003h
0709	16	SR MII MMD Time Sync Tx Max Delay Lower Register (SR_MII_TIME_SYNC_TX_MAX_DLY_LWR)	0038h
070A	16	SR MII MMD Time Sync Tx Max Delay Upper Register (SR_MII_TIME_SYNC_TX_MAX_DLY_UPR)	0000h
070B	16	SR MII MMD Time Sync Tx Min Delay Lower Register (SR_MII_TIME_SYNC_TX_MIN_DLY_LWR)	0038h
070C	16	SR MII MMD Time Sync Tx Min Delay Upper Register (SR_MII_TIME_SYNC_TX_MIN_DLY_UPR)	0000h
070D	16	SR MII MMD Time Sync Rx Max Delay Lower Register (SR_MII_TIME_SYNC_RX_MAX_DLY_LWR)	00B8h
070E	16	SR MII MMD Time Sync Rx Max Delay Upper Register (SR_MII_TIME_SYNC_RX_MAX_DLY_UPR)	0000h
070F	16	SR MII MMD Time Sync Rx Min Delay Lower Register (SR_MII_TIME_SYNC_RX_MIN_DLY_LWR)	0088h
0710	16	SR MII MMD Time Sync Rx Min Delay Upper Register (SR_MII_TIME_SYNC_RX_MIN_DLY_UPR)	0000h
8000	16	VR MII MMD Digital Control1 Register (VR_MII_DIG_CTRL1)	2400h
8001	16	VR MII MMD AN Control Register (VR_MII_AN_CTRL)	0000h
8002	16	VR MII MMD AN Interrupt and Status Register (VR_MII_AN_INTR_STS)	000Ah
8003	16	VR MII MMD Test Control Register (VR_MII_TC)	0000h
8005	16	VR MII MMD Debug Control Register (VR_MII_DBG_CTRL)	0000h
8006	16	VR MII MMD EEE Mode Control Register (VR_MII_EEE_MCTRL0)	899Ch
8008	16	VR MII MMD EEE Tx Timer Register (VR_MII_EEE_TXTIMER)	0000h
8009	16	VR MII MMD EEE Rx Timer Register (VR_MII_EEE_RXTIMER)	0000h
800A	16	VVR MII MMD Link Timer Control Register (VR_MII_LINK_TIMER_CTRL)	0000h
800B	16	VR MII MMD EEE Mode Control 1 Register (VR_MII_EEE_MCTRL1)	0000h
8010	16	VR MII MMD Digital Status Register (VR_MII_DIG_STS)	0000h
8011	16	VR MII MMD Invalid Code Group Error Count1 Register (VR_MII_ICG_ERRCNT1)	0000h
8018	16	VR MII MMD Miscellaneous Status Register (VR_MII_MISC_STS)	0000h
8020	16	VR MII PHY Rx Lane Status Register (VR_MII_RX_LSTS)	0000h
80E1	16	VR MII MMD Digital Control2 Register (VR_MII_DIG_CTRL2)	0000h
80E2	16	VR MII MMD Digital Error Count Select Register (VR_MII_DIG_ERRCNT_SEL)	0000h

3.3.1.1 SR Control MMD PMA Device Identifier Register 1 (SR_VSMMD_PMA_ID1) - 1Eh, Address 0000h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Eh** **Register Address: 0000h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RO	0000h	Reserved

3.3.1.2 SR Control MMD PMA Device Identifier Register 2 (SR_VSMMD_PMA_ID2) - 1Eh, Address 0001h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Eh** **Register Address: 0001h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RO	0000h	Reserved

3.3.1.3 SR Control MMD Device Identifier Register 1(SR_VSMMD_DEV_ID1) - 1Eh, Address 0002h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Eh** **Register Address: 0002h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RW	0000h	Organizationally Unique Identifier [3:18] for Vendor-Specific MMD1 (VSDOUI_3_18): Bits 18:3 of the 24-bit Device Organizationally Unique Identifier (OUI) for the vendor-specific MMD1 for identifying the device manufacturer.

3.3.1.4 SR Control MMD Device Identifier Register 2 (SR_VSMMD_DEV_ID2) - 1Eh, Address 0003h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Eh** **Register Address: 0003h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:10	RW	00h	Organizationally Unique Identifier[19:24] for Vendor-Specific MMD1 (VSDOUI_19_24): Bits 24:19 of the 24-bit Device Organizationally Unique Identifier (OUI) for the vendor-specific MMD1 for identifying the device manufacturer.
9:4	RW	00h	Model Number for Vendor-Specific MMD1 (VSDMMN_5_0): 6-bit Model number of the vendor-specific MMD1.
3:0	RW	0h	Revision Number for Vendor-Specific MMD1 (VSDRN_3_0): 4-bit Revision number of the vendor-specific MMD1.

3.3.1.5 SR Control MMD PCS Device Identifier Register 1 (SR_VSMMD_PCS_ID1) - 1Eh, Address 0004h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Eh** **Register Address: 0004h**

Default: 7996h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RW	7996h	Organizationally Unique Identifier[3:18] for PCS MMD (PCSDOUI_3_18): Bits 18:3 of the 24-bit Device Organizationally Unique Identifier (OUI) for the vendor-specific PCS MMD for identifying the device manufacturer.

3.3.1.6 SR Control MMD PCS Device Identifier Register 2 (SR_VSMMD_PCS_ID2) - 1Eh, Address 0005h

This register is RW by software via the MDIO interface. The 24-bit Device Organizationally Unique Identifier (OUI) is default-set to CDA679h. The Model Number default value is 2Dh and the Revision Number default is 0.SR Control MMD AN Device.

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Eh** **Register Address: 0005h**

Default: CED0h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:10	RW	33h	Organizationally Unique Identifier[19:24] for PCS MMD (PCSDOUI_19_24): Bits 24:19 of the 24-bit Device Organizationally Unique Identifier (OUI) for the vendor-specific PCS MMD for identifying the device manufacturer.
9:4	RW	2Dh	Model Number for PCS MMD (PCSDMMN_5_0): 6-bit Model number of the vendor-specific PCS MMD.
3:0	RW	0h	Revision Number for PCS MMD (PCSDRN_3_0): 4-bit Revision number of the vendor-specific PCS MMD.

3.3.1.7 SR Control MMD AN Device Identifier Register 1 (SR_VSMMD_AN_ID1) - 1Eh, Address 0006h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Eh** **Register Address: 0006h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RW	0000h	Organizationally Unique Identifier [3:18] for Vendor-Specific MMD1 (VSDOUI_3_18): Bits 18:3 of the 24-bit Device Organizationally Unique Identifier (OUI) for the vendor-specific MMD1 for identifying the device manufacturer.

3.3.1.8 SR Control MMD AN Device Identifier Register 2 (SR_VSMMD_AN_ID2) - 1Eh, Address 0007h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Eh** **Register Address: 0007h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RO	0000h	Reserved

3.3.1.9 SR Control MMD Status Register (SR_VSMMD_STS) - 1Eh, Address 0008h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Eh** **Register Address: 0008h**

Default: 8000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:14	RO/V	10b	Control MMD Device Present (VSDP): This field indicates if the control MMD device is present and responding to this address: 10: Device responding at this address 11, 01, or 00: No device responding at this address
13:0	RO	0000h	Reserved

3.3.1.10 SR Control MMD Control Register (SR_VSMMD_CTRL) - 1Eh, Address 0009hSR Control MMD

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Eh** **Register Address: 0009h**

Default: 0004h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:6	RO	0000h	Reserved
5	RW	0b	Power Down Control (PD_CTRL): This bit is used to control the output port 'xpcs_pdown_o'. If this bit is set, xpcs_pdown_o port will NOT be asserted when LPM (Low Power Enable) bit is programmed to 1. If this bit is low, xpcs_down_o port will be asserted when LPM (Low Power Enable) bit is programmed to 1.
4	RW	0b	Fast Simulation Enable (FASTSIM): When set, this bit indicates that the Fast simulation is enabled. When this bit is set to 1, all IEEE Std 802.3 defined long timers that are implemented are reduced to shorter time period in order to reduce the simulation time. The long timers are implemented in Clause 73 and Clause 37 auto-negotiation modules and also EEE Tx and Rx modules.
3	RO	0b	Reserved
2	RW	1b	VS MMD Enable (MII_MMD_EN): When set, this bit indicates that the vendor-specific MMD1 device is accessible. When reset, this bit indicates that the vendor-specific MMD2 (MII MMD) device is not accessible.
1:0	RO	00b	Reserved

3.3.1.11 SR Control MMD Package Identifier Register 1 (SR_VSMMD_PKGID1) - 1Eh, Address 000Eh

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Eh** **Register Address: 000Eh**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RO	00h	Reserved

3.3.1.12 SR Control MMD Package Identifier Register 2 (SR_VSMMD_PKGID2) - 1Eh, Address 000Fh

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Eh** **Register Address: 000Fh**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RO	00h	Reserved

3.3.1.13 SR MII MMD Control Register (SR_MII_CTRL) - 1Fh, Address 0000h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 0000h**

Default: 1140h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15	RW	0b	Soft Reset (RST): When the host sets this bit, it triggers the software reset process in which all internal blocks of the PCS are reset, except the Management Interface block. The registers are reset to their default values. When this bit is set, it also resets the PHY. This bit is Self-Cleared by the PCS after 1 MDC clock period of the MDIO interface.
14	RW	0b	Loopback Enable (LBE): This register bit is not used by the design.
13	RW	0b	Speed Selection - LSB (SS13): This bit, along with SS6 (bit 6) of this register, indicates the SGMII speed: SS6 SS13 SGMII Speed 1 0 1000 Mbps 0 1 100 Mbps 0 0 10 Mbps
12	RW	1b	Enable Auto-Negotiation (AN_ENABLE): When set to 1, this bit enables the Clause 37 auto-negotiation process. Default setting is 1.
11	RW	0b	Power-Down Mode (LPM): This bit controls the power-down mode of the PCS. When 0, the PCS operates as normal. When 1, the PCS goes to the Power-Down Mode and clearing this bit resumes PCS normal operation.
10	RO	0b	Reserved
9	RW	0b	Restart Auto-Negotiation (RESTART_AN): When the host writes this bit, the PCS initiates the Auto-Negotiation process. This bit is used to restart the Auto-Negotiation which is already initiated by setting AN_ENABLE (bit 12). The PCS clears this bit after restarting the Auto-Negotiation.
8	RW	1b	Duplex Mode (DUPLEX_MODE): This bit specifies the duplex mode of the PCS. Programming to 0 indicates Half Duplex and 1 (the default value) indicates Full Duplex. For the PHY Link Duplex Mode: If AN_ENABLE (bit 12) is set to 0, this bit determines the PHY Link Duplex Mode. If AN_ENABLE is set to 1, then the PHY Link Duplex Mode is independent of this bit (although the host can write any value) and is determined by the outcome of the Clause 37 Auto-Negotiation process.
7	RO	0b	Reserved
6	RW	1b	Speed Selection – MSB (SS6): This bit, along with SS13 (bit 23) of this register, indicates the SGMII speed. Default value is 1. See SS13 description.
5:0	RO	000000b	Reserved

3.3.1.14 SR MII MMD Status Register (SR_MII_STS) - 1Fh, Address 0001h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 0001h**

Default: 0189h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15	RO	0b	100BASE-T4 Ability (ABL100T4): Not supported. Hardwired to 0.
14	RO	0b	100BASE-X Full-Duplex Ability (FD100ABL): Not supported. Hardwired to 0.
13	RO	0b	100BASE-X Half-Duplex Ability (HD100ABL): Not supported. Hardwired to 0.
12	RO	0b	10 Mbps Full-Duplex Ability (FD10ABL): Not supported. Hardwired to 0.
11	RO	0b	10 Mbps Half-Duplex Ability (HD10ABL): Not supported. Hardwired to 0.
10	RO	0b	100BASE-T2 Full-Duplex Ability (FD100T): Not supported. Hardwired to 0.
9	RO	0b	100BASE-T2 Half-Duplex Ability (HD100T): Not supported. Hardwired to 0.
8	RO/V	1b	Extended Status Information (EXT_STS_ABL): Hardwired to 1 indicating that Extended Status information is present at register address 16'h000F of this MMD device (DEVAD 1Fh).
7	RO	1b	Unidirectional Ability (UN_DIR_ABL): Hardwired to 1 indicating that the PCS is able to transmit GMII irrespective of whether the device has determined the valid link or not.
6	RO	0b	MF Preamble Suppression (MF_PRE_SUP): Hardwired to 0 indicating that The PCS does not accept the MDIO frames with the preamble suppressed.
5	RO	0b	Auto-negotiation Complete (AN_CMPL): When this bit is set to 1, the contents of the AN MMD Advertisement, AN MMD Link partner Ability, and AN MMD Expansion registers are valid. This bit returns 0 if AN_ENABLE is set to 0.
4	RO	0b	Remote Fault (RF): When set to 1, this bit indicates that the PCS detected that the receive link of the link partner is down. This bit is set based on the auto-negotiated (1000BASE-X Auto-Negotiation) information from the link partner. When 0, this bit indicates that the PCS did not detect a Remote Fault.
3	RO	1b	Auto-negotiation Ability (AN_ABL): The PCS always returns this bit as 1 indicating that the PCS is able to perform Auto-Negotiation.
2	RO	0b	Link Status (LINK_STS): When the PCS sets this bit to 1, it indicates that the Rx link is up. If the link goes down, as indicated by 0, this bit is latched by the PCS until the host performs the read operation to this register.
1	RO	0b	Reserved
0	RO	1b	Extended Register Capability (EXT_REG_CAP): The PCS always returns this bit as 1 indicating that the Extended Register Capability exists.

3.3.1.15 SR MII MMD Device Identifier Register 1 (SR_MII_DEV_ID1) - 1Fh, Address 0002h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 0002h**

Default: 7996h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RO/V	7996h	Organizationally Unique Identifier[3:18] for PCS MMD (VS_MII_DEV_OUI_3_18): Bits 18:3 of the 24-bit Device Organizationally Unique Identifier (OUI) of the device manufacturer. Writing to bits 15:0 of the vendor-specific PCS MMD Device Identifier Register 1 (SR_VSMMD_PCS_ID1) modifies the content of this register.

3.3.1.16 SR MII MMD Device Identifier Register 2 (SR_MII_DEV_ID2) - 1Fh, Address 0003h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 0003h**

Default: CED0h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:10	RO/V	33h	Organizationally Unique Identifier [19:24] (VS_MMD_DEV_OUI_19_24): Bits 24:19 of the 24-bit Device Organizationally Unique Identifier (OUI) of the device manufacturer. Writing to bits 15:0 of the vendor-specific PCS MMD Device Identifier Register 2 (SR_VSMMD_PCS_ID2) modifies the content of this register.
9:4	RO/V	2Dh	Model Number (VS_MMD_DEV_MMN_5_0): 6-bit Model number of the vendor-specific PCS MMD. Writing to bits 9:4 of the vendor-specific PCS MMD Device Identifier Register 2 (SR_VSMMD_PCS_ID2) modifies the content of this register.
3:0	RO/V	0h	Revision Number (VS_MMD_DEV_RN_3_0): 4-bit Revision number of the vendor-specific PCS MMD. Writing to bits 3:0 of the vendor-specific PCS MMD Device Identifier Register 2 (SR_VSMMD_PCS_ID2) modifies the content of this register.

3.3.1.17 SR MII MMD AN Advertisement Register (SR_MII_AN_ADV) - 1Fh, Address 0004h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 0004h**

Default: 0020h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15	RO/V	0b	Next Page (NP): Not supported. Hardwired to 0.
14	RO	0b	Reserved
13:12	RW	00b	Remote Fault (RF): This field indicates the fault signaling of the local device to be communicated to the link partner. 00: No Error 01: Offline 10: Link Failure 11: Auto-negotiation Error
11:9	RO	000b	Reserved
8:7	RW	00b	Pause Ability (PAUSE): This field indicates the Pause ability of the device: 00: No Pause 01: Asymmetric Pause towards the link partner 10: Symmetric Pause 11: Symmetric Pause and Asymmetric Pause towards the local device. Software can program suitable values based on the capability of the MAC.
6	RW	0b	Half Duplex (HD): When this bit is set, it indicates that the device can operate in the half-duplex mode.
5	RW	1b	Full Duplex (FD): When this bit is set, it indicates that the device can operate in the full-duplex mode.
4:0	R0	00000b	Reserved

3.3.1.18 SR MII MMD AN Link Partner Base Ability Register (SR_MII_LP_BABL) - 1Fh, Address 0005h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 0005h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15	RO/V	0b	Next Page (LP_NP): This bit indicates that the link partner can handle Next Page. Note: To exchange information through Next Page, both devices (local and remote) should have the capability to handle Next Page. The PCS does not support Next Page. Therefore, the Next Page exchange does not happen.
14	RO/V	0b	ACK bit from the Link Partner (LP_ACK): This bit indicates that the link partner has successfully received the page sent by the local device.
13:12	RO/V	00b	Remote Fault (LP_RF): This field indicates the fault signaling of the link partner: 00: No Error 01: Offline 10: Link Failure 11: Auto-negotiation Error
11:9	RO	000b	Reserved
8:7	RO/V	00b	Pause Ability (LP_PAUSE): This field indicates the Pause ability of the link partner: 00: No Pause 01: Asymmetric Pause towards the link partner 10: Symmetric Pause 11: Both Symmetric Pause and Asymmetric Pause towards the local device
6	RO/V	0b	Half Duplex (LP_HD): When this bit is set, it indicates that the link partner is capable of operating in the half-duplex mode.
5	RO/V	0b	Full Duplex (LP_FD): When this bit is set, it indicates that the link partner is capable of operating in the full-duplex mode.
4:0	RO	00000b	Reserved

3.3.1.19 SR MII MMD AN Expansion Register (SR_MII_AN_EXPN) - 1Fh, Address 0006h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 0006h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:3	RO	00h	Reserved
2	RO/V	00h	Local Device NP Able (LD_NP_ABL): The local device (the PCS) always returns this bit as 0 because it does not support Next Page.
1	RO/V	00h	Page Received (PG_RCVD): This bit indicates that the local device (the PCS) received a page from the link partner. 1: The local device received a new page 0: The local device did not receive a new page
0	RO	00h	Reserved

3.3.1.20 SR MII MMD Extended Status Register (SR_MII_EXT_STS) - 1Fh, Address 000Fh

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 000Fh**

Default: C000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15	RO/V	1b	1000BASE-X Full-Duplex Capable (CAP_1G_X_FD): The PCS always returns 1 because it supports this feature.
14	RO/V	1b	1000BASE-X Half-Duplex Capable (CAP_1G_X_HD): The PCS always returns 1 because it supports this feature.
13	RO/V	0b	1000BASE-T Full-Duplex Capable (CAP_1G_T_FD): The PCS always returns 0 because it does not supports this feature.
12	RO/V	0b	1000BASE-T Half-Duplex Capable (CAP_1G_T_HD): The PCS always returns 0 because it does not supports this feature.
11:0	RO	000h	Reserved

3.3.1.21 SR MII MMD Time Sync Capability Register (SR_MII_TIME_SYNC_ABL) - 1Fh, Address 0708h

Type: MDIO Register PRTAD: 16h DEVAD: 1Fh Register Address: 0708h

Default: 0003h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:2	RO	00h	Reserved
1	RO/V	1b	1000BASE-X Half-Duplex Capable (CAP_1G_X_HD): The PCS always returns 1 because it supports this feature.
0	RO/V	1b	1000BASE-T Full-Duplex Capable (CAP_1G_T_FD): The PCS always returns 0 because it does not supports this feature.

3.3.1.22 SR MII MMD Time Sync Tx Max Delay Lower Register (SR_MII_TIME_SYNC_TX_MAX_DLY_LWR) - 1Fh, Address 0709h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 0709h**

Default: 0038h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RO/V	38h	Transmit Path Maximum Data Delay, Lower (MII_TX_MAX_DLY_LWR): This field indicates the lower 16-bit of the 32-bit value which indicates the Maximum Data Delay in the Transmit Path of the XPCS in nanoseconds.

3.3.1.23 SR MII MMD Time Sync Tx Max Delay Upper Register (SR_MII_TIME_SYNC_TX_MAX_DLY_UPR) - 1Fh, Address 070Ah

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 070Ah**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RO/V	00h	Transmit Path Maximum Data Delay, Upper (MII_TX_MAX_DLY_UPR): This field indicates the upper 16-bit of the 32-bit value which indicates the Maximum Data Delay in the Transmit Path of the XPCS in nanoseconds.

3.3.1.24 SR MII MMD Time Sync Tx Min Delay Lower Register (SR_MII_TIME_SYNC_TX_MIN_DLY_LWR) - 1Fh, Address 070Bh

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 070Bh**

Default: 0038h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RO/V	38h	Transmit Path Minimum Data Delay, Lower (MII_TX_MIN_DLY_LWR): This field indicates the lower 16-bit of the 32-bit value which indicates the Minimum Data Delay in the Transmit Path of the XPCS in nanoseconds.

3.3.1.25 SR MII MMD Time Sync Tx Min Delay Upper Register (SR_MII_TIME_SYNC_TX_MIN_DLY_UPR) - 1Fh, Address 070Ch

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 070Ch**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RO/V	00h	Transmit Path Minimum Data Delay, Upper (MII_TX_MIN_DLY_UPR): This field indicates the upper 16-bit of the 32-bit value which indicates the Minimum Data Delay in the Transmit Path of the XPCS in nanoseconds.

3.3.1.26 SR MII MMD Time Sync Rx Max Delay Lower Register (SR_MII_TIME_SYNC_RX_MAX_DLY_LWR) - 1Fh, Address 070Dh

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 070Dh**

Default: 00B8h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RO/V	B8h	Receive Path Maximum Data Delay, Lower (MII_RX_MAX_DLY_LWR): This field indicates the lower 16-bit of the 32-bit value which indicates the Maximum Data Delay in the Receive Path of the XPCS in nanoseconds.

3.3.1.27 SR MII MMD Time Sync Rx Max Delay Upper Register (SR_MII_TIME_SYNC_RX_MAX_DLY_UPR) - 1Fh, Address 070Eh

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 070Eh**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RO/V	00h	Receive Path Maximum Data Delay, Upper (MII_RX_MAX_DLY_UPR): This field indicates the upper 16-bit of the 32-bit value which indicates the Maximum Data Delay in the Receive Path of the XPCS in nanoseconds.

3.3.1.28 SR MII MMD Time Sync Rx Min Delay Lower Register (SR_MII_TIME_SYNC_RX_MIN_DLY_LWR) - 1Fh, Address 070Fh

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 070Fh**

Default: 0088h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RO/V	88h	Receive Path Minimum Data Delay, Lower (MII_RX_MIN_DLY_LWR): This field indicates the lower 16-bit of the 32-bit value which indicates the Minimum Data Delay in the Receive Path of the XPCS in nanoseconds.

3.3.1.29 SR MII MMD Time Sync Rx Min Delay Upper Register (SR_MII_TIME_SYNC_RX_MIN_DLY_UPR) - 1Fh, Address 0710h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 0710h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RO/V	00h	Receive Path Minimum Data Delay, Upper (MII_RX_MIN_DLY_UPR): This field indicates the upper 16-bit of the 32-bit value which indicates the Minimum Data Delay in the Receive Path of the XPCS in nanoseconds.

3.3.1.30 VR MII MMD Digital Control1 Register (VR_MII_DIG_CTRL1) - 1Fh, Address 8000h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 8000h**

Default: 2400h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15	RW	0b	Vendor-Specific Soft Reset (VR_RST): When the host sets this bit, it triggers a vendor-specific software reset process in which all internal blocks of the PCS, except the Management Interface block and CSR block, are reset. When this bit is set, it also resets the PHY. This bit is Self-Cleared by the PCS after 1 MDC clock period for the MDIO interface.
14	RW	0b	Rx to Tx Loopback Enable (R2TLBE): This bit controls the loopback path from the GMII Rx to the GMII Tx at the GMII interface. 0: Loopback path is disabled 1: Loopback path is enabled
13	RW	1b	Enable Vendor-Specific MMD1 (EN_VSMMD1): When this bit is set to 1 (default value), the vendor-specific MMD1 (VSMMD1) is enabled. When this bit is set to zero, VSMMD1 is disabled.
12	RO/V	0b	Enable Clause 37 AN in Backplane Configuration (CL37_BP): Does not apply.
11	RO	0b	Reserved

Bits	Access Type	Default	Field Name and Description
10	RW	1b	Clock Stop Enable (CS_EN): This bit should be programmed based on the capability of the MAC during Rx LPI mode. Programming this bit to 1 allows the PHY to stop the clock during LPI mode. Programming to 0, the clock cannot be stopped during LPI mode.
9	RW	0b	Automatic Speed Mode Change after CL37 AN (MAC_AUTO_SW): When this field is set to 1, the PCS automatically switches to the negotiated SGMII after the completion of CL37 AN. This mode is valid only when the PCS is configured as MAC-side SGMII and should be set only when Auto-Negotiation is enabled (AN_ENABLE bit is set to 1). If this bit is set to 0, the PCS will operate at the speed/duplex mode as per the values programmed to SR MII MMD Control Register. After the completion of CL37 AN, the application has to read the negotiated Speed/Duplex Mode from VR MII MMD AN Interrupt and Status Register and then program SR MII MMD Control Register appropriately. Note: This bit should be set only when the PCS is configured as SGMII MAC, i.e., TX_CONFIG=0.
8	RW	0b	Datapath Initialization Control (INIT): This bit can be set to flush/initialize the various FIFOs implemented inside the PCS. This is Self-Clear bit. After writing 1 to this bit, software should poll this bit continuously. Only after reading this bit as 0 should software proceed to any other operation. When this bit is programmed to 1, RXFIFO_OVF/RXFIFO_UNF bits of the VR MII MMD Digital Status Register might get set incorrectly. Hence, read these register bits (RXFIFO_OVF and RXFIFO_UNF) so that they get cleared. Thereafter, RXFIOF_UNF and RXFIFO_UNF bits would be reliable.
7	RO/V	0b	Mask Running Disparity Error (MSK_RD_ERR): When this bit is set, running disparity errors are ignored by XPCS receiver in evaluating the validity of received code-groups.
6	RW	0b	Pre-emption Packet Enable (PRE_EMP): When this bit is set, it allows the XPCS to properly receive/transmit IEEE Std 802.3br pre-emption packets in SGMII 10M/100M Modes.
5	RO	0b	Reserved
4	RW	0b	Tx Lane 0 Disable (DTXLANED_0): When this bit is set, the PCS disables the Tx Lane 0 of the PHY. When reset, the PCS enables the Tx Lane 0 of the PHY.
3	RW	0b	Over-Ride Control for CL37 Link Timer (CL37_TMR_OVR_RIDE): This bit can be set to over-ride the default value of Clause 37 link timer used by the PCS for auto-negotiation. If this bit is set, the value programmed to the VR MII MMD Link Timer Control Register will be used to compute the duration of Link Timer. This bit should be set only after programming the appropriate value to the VR MII MMD Link Timer Control Register.

Bits	Access Type	Default	Field Name and Description
2	RW	0b	Enable 2.5G GMII Mode (EN_2_5G_MODE): Setting this bit 1 enables the 2.5G GMII Mode of operation. This bit drives the hardware pertaining to 2.5 Gbps SGMII operation.
1	RO	0b	Reserved
0	RW	0b	SGMII PHY Mode Control (PHY_MODE_CTRL): This bit controls the CL37_AN when operating in SGMII (Port 0) PHY mode. When this bit is set to 1, the PCS advertises the values of input ports xpcs_sgmii_link_sts_i, xpcs_sgmii_link_speed_i and xpcs_sgmii_full_duplex_i during SGMII (Port 0) Auto-Negotiation. When this bit is set to 0, SGMII (Port0) Auto-Negotiation will advertise the values programmed to all of these: SGMII_LINK_STS (bit 4) of the VR MII MMD AN Control Register SS13 (bit 13) and SS6 (bit 6) of the SR MII MMD Control Register FD (bit 5) of the SR MII MMD AN Advertisement Register Note: This bit should be set only when the PCS is configured as SGMII PHY, i.e., TX_CONFIG (bit 3 of the VR_MII_AN_CTRL register) = 1.

3.3.1.31 VR MII MMD AN Control Register (VR_MII_AN_CTRL) - 1Fh, Address 8001h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 8001h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:9	RO	00h	Reserved
8	RO/V	0b	MII Control (MII_CTRL): This bit controls the width of the MAC interface when operating at SGMII speed modes of 10 Mbps or 100 Mbps. 0: 4-bit MII 1: 8-bit MII
7:5	RO	000b	Reserved
4	RW	0b	SGMII Link Status (SGMII_LINK_STS): This bit is used in Bit 15 of the Config_Reg during IEEE 802.3 Clause 37 Auto-Negotiation when the TX_CONFIG bit of this register is set to 1 in the SGMII/QSGMII/USXGMII mode and when the PHY_MODE_CTRL bit of VR MII MMD Digital Control 1 Register is 0. 0: Link Down 1: Link Up

Bits	Access Type	Default	Field Name and Description
3	RW	0b	Transmit Configuration (TX_CONFIG): This bit controls the Config_Reg value to be used during the IEEE 802.3 Clause 37 Auto-Negotiation in the SGMII/QSGMII/USXGMII mode. 1: Configures the PCS as the PHY side SGMII/QSGMII/USXGMII 0: Configures the PCS as the MAC side SGMII/QSGMII/USXGMII
2:1	RW	00b	PCS Mode (PCS_MODE): This field controls the auto-negotiation (and operating) mode. 00: 1000BASE-X mode (Clause 37 Auto-Negotiation is as per 1000BASEX). 10: SGMII mode (Clause 37 Auto-Negotiation is as per SGMII). 11: QSGMII mode (Clause 37 Auto-Negotiation conforms to QSGMII). Note: The default value is 00. Must be programmed to 10 for SGMII-mode Auto-Negotiation.
0	RW	0b	Clause 37 AN Complete Interrupt Enable (MII_AN_INTR_EN): When set to 1, this bit enables the generation of the IEEE 802.3 Clause 37 Auto-Negotiation Complete interrupt output. When set to 0, it disables the generation of Clause 37 Auto-Negotiation Complete interrupt.

3.3.1.32 VR MII MMD AN Interrupt and Status Register (VR_MII_AN_INTR_STS) - 1Fh, Address 8002h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 8002h**

Default: 000Ah Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:5	RO	000h	Reserved
4:1	RO/V	5h	Clause 37 AN SGMII Status/QSGMII Port 0 Status (CL37_ANSGM_STS): This field is valid only when the PCS_MODE[1:0] is set to the SGMII/QSGMII mode and the auto-negotiation is complete. It indicates the status received from remote link after the SGMII/QSGMII (Port 0) Auto-Negotiation is complete. CL37_ANSGM_STS[0] 0: Half Duplex 1: Full Duplex (default value) CL37_ANSGM_STS[2:1] 00: 10 Mbps speed link 01: 100 Mbps speed link 10: 1000 Mbps speed link (default value) CL37_ANSGM_STS[3] 0: Link is Down (default value) 1: Link is Up
0	RW	0b	Clause 37 AN Complete Interrupt (CL37_ANCMPLT_INTR): The PCS sets this bit when IEEE 802.3 Clause 37 Auto-Negotiation is complete. The host must clear this bit by writing 0 to it.

3.3.1.33 VR MII MMD Test Control Register (VR_MII_TC) - 1Fh, Address 8003h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 8003h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:3	RO	0000h	Reserved
2	RW	0b	Test Pattern Enable Lanes (TPE): This bit indicates that a test pattern can be enabled in the Tx path after the current normal frame transmission is complete. 0: Test pattern disabled 1: Test pattern enabled The specific test pattern that is generated is based on bits 1:0 of this register.
1:0	RW	2'b00	Test Pattern Select (TP): This field indicates the pattern type that is enabled with Bit 2 of this register. The following are the supported test patterns: 00: High Frequency Test Pattern (default value) 01: Low Frequency Test Pattern 10: Mixed Frequency Test Pattern 11: Reserved The definitions of these test patterns are specified in Annex 48A of IEEE 802.3.

3.3.1.34 VR MII MMD Debug Control Register (VR_MII_DBG_CTRL) - 1Fh, Address 8005h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 8005h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:9	RO	7'h0	Reserved
8	RW	1'h0	Transmit Preamble Control (TX_PMBL_CTL): This bit can be set to 1 to prevent possible preamble truncation in the PCS transmitter when operating in 1000BASE-X Mode or 2.5G Mode over GMII. As per IEEE spec, it is permissible for a compliant 1000BASE-X PCS transmit process to truncate the first byte of preamble in order to align the start of the packet on the EVEN boundary. If this bit is set to 1, the XPCS does not delete any preamble bytes (received from GMII Tx interface) and passes on the same number of preamble bytes to its output. The XPCS out this operation by adjusting the IPG. This mode is a deviation from Clause 36 of IEEE Std 802.3, but it can prove useful when operating at 2.5G Mode (over clocked SGMII Mode) and the far-end device is compliant to IEEE Std 802.3bz/cb.
7	RO	1'h0	Reserved
6	RO	1'h0	Reserved

Bits	Access Type	Default	Field Name and Description
5	RW	1'h0	Suppress EEE Loss of Signal Detection (SUPRESS_EEE_LOS_DET): When this field is set to 1, Loss of Signal indicated by the PHY is ignored by the PCS while evaluating the Receive link when operating in EEE mode. Receive link will be purely evaluated based the on data received by the PCS from the PHY. When this field is set to 0, Loss of signal indicated by the PHY will be considered by the PCS while evaluating the Receive link status in EEE mode.
4	RW	1'h0	Suppress Loss of Signal Detection (SUPRESS_LOS_DET): When this field is set to 1, Loss of Signal indicated by the PHY is ignored by the PCS while evaluating the Receive link. Receive link will be purely evaluated based the Rx data received on the port of the PCS. When this field is set to 0, Loss of signal indicated by the PHY will be considered by the PCS while evaluating the Receive link status.
3:1	RO	3'h0	Reserved
0	RW	1'h0	Restart Synchronization (RESTAR_SYNC_0): When set to 1, this bit restarts the Rx Synchronization State machine on Lane 0. The host must clear this bit to 0 before setting it to 1 next time.

3.3.1.35 VR MII MMD EEE Mode Control Register (VR_MII_EEE_MCTRL0)- 1Fh, Address 8006h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 8006h**

Default: 899Ch Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:12	RW	4'h8	Clock Stop (CLKSTOP): This field holds the count value after which the Rx clock to the MAC can be stopped. The default value is 8. The host should program this value depending on the capability of the MAC.
11:8	RW	4'h9	100 ns Clock Tic Multiplying Factor (MULT_FACT_100NS): This bit is the multiplying factor to the clk_eee_i clock time period to make it closer to 100 ns. For example, if the clk_eee_i clock time period (clk_eee_i_time_period) is 10 ns, the value of this field is 9, that is, 1 less than 10. This value should be programmed such that the clk_eee_i_time_period * (MULT_FACT_100NS + 1) should be within 80 ns to 120 ns. The default value of this register is 9, assuming that the default clk_eee_i time period to be 10 ns.
7	RW	1'h1	Rx Control Enable (RX_EN_CTRL): This bit controls the generation of the xpcs_rx_en_o{lane} signal. When this bit is set to 1, the xpcs_rx_en_o{lane} signal is deasserted when the EEE receive controller reaches the Quiet state. When this bit set to 0, the xpcs_rx_en_o{lane} signal is not deasserted when the EEE transmit controller reaches the Quiet state.
6	RW	1'h0	Effective 100ns Tic Value (SIGN_BIT): The host should use this bit to fine-tune the EEE timing requirement. The host should set this bit to 0 when the clk_eee_i_time_period * (MULT_FACT_100NS + 1) value is more than 100 ns. The host should set this bit to 1 when the clk_eee_i clock period * MULT_FACT_100NS + 1) value is less than or equal to 100ns.
5	RO	1'h0	Reserved

Bits	Access Type	Default	Field Name and Description
4	RW	1'h1	Tx Control Enable (TX_EN_CTRL): This bit controls the generation of the signals xpcs_tx_en_o {lane}. When this bit is set to 1, the xgxs_tx{lane}_en_o or xpcs_tx_en_o{lane} signal is de-asserted when the EEE transmit controller reaches the Quiet state. When this bit set to 0, the xgxs_tx{lane}_en_o or xpcs_tx_en_o{lane} signal is not deasserted when the EEE transmit controller reaches the Quiet state.
3	RW	1'h1	Rx Quiet Enable (RX_QUIET_EN): This bit controls the generation of the xpcs_lpitx_quiet_o output. When this bit is set to 1, the xpcs_lpitx_quiet_o output is set to 1 when the EEE receive controller reaches the Quiet state. When this bit set to 0, the xpcs_lpitx_quiet_o output is not set to 1.
2	RW	1'h1	Tx Quiet Enable (TX_QUIET_EN): This bit controls the generation of the xpcs_lpitx_quiet_o output. When this bit is set to 1, the xpcs_lpitx_quiet_o output is set to 1 when the EEE transmit controller reaches the Quiet state. When this bit set to 0, the xpcs_lpitx_quiet_o output is not set to 1.
1	RW	1'h0	LPI Rx Enable (LRX_EN): When set to 1, this bit enables the Energy Efficient Ethernet support in the PCS receive path. When set to 0, it disables the support for Energy Efficient Ethernet in the PCS receive path.
0	RW	1'h0	LPI Tx Enable (LTX_EN): When set to 1, this bit enables the Energy Efficient Ethernet support in the PCS Transmit path. When set to 0, it disables the support for Energy Efficient Ethernet in the PCS Transmit path.

3.3.1.36 VR MII MMD EEE Tx Timer Register (VR_MII_EEE_TXTIMER) - 1Fh, Address 8008h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 8008h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:6	RO	10'h000	Reserved
5:0	RW	6'h00	TSL Resolution (TSL_RES): This field stores the resolution value for the Local Sleep Time (TSL) timer. When the generated 100ns tic timer is not exactly 100ns, this field is programmed with the required value. The programmed value is equivalent to the number of more (SIGN_BIT is low) or less (SIGN_BIT is high) counts than the ideal count to meet the range of the TSL timer. The PCS maintains the default value of the TSL timer as 199, assuming clk_eee_i_time_period * (MULT_FACT_100NS + 1) is equal to 100ns to produce 19900ns (19.9 us) as per the TSL requirement in the IEEE standard. If clk_eee_i_time_period * (MULT_FACT_100NS + 1) is 90, the default TSL timer produces 17910ns (17.91 us) which is lesser than the standard 19.9 us. To make it 19.9 us, you should program this register such that (199 +/- TSL_RES) * ((MULT_FACT_100NS + 1) * clk_eee_i_time_period) is greater than 19.9 us and less than 20.1 us (max limit), that is, (199 + TSL_RES)*90 = 19.9 us. TWL_RES = 23 meets the requirement which produces 19.98 us. The SIGN_BIT should be programmed as 1.

3.3.1.37 VR MII MMD EEE Rx Timer Register (VR_MII_EEE_RXTIMER) - 1Fh, Address 8009h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 8009h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:14	RO	2'h0	Reserved
13:8	RW	6'h00	TWR Resolution (TWR_RES): This field stores the resolution value for the TWR timer. When the generated 100ns tic timer is not exactly 100ns, this field is programmed with the required value. The programmed value is equivalent to the number of more (SIGN_BIT is low) or less (SIGN_BIT is high) counts than the ideal count to meet the range of the TWR timer. The default value is 11 us for the PCS in this design. This value is as per the requirements specified in the standard assuming that clk_eee_i_time_period * (MULT_FACT_100NS + 1) produces 100ns tick.
7:0	RW	8'h00	100 us Resolution (RES_100U): This field stores the resolution value for the 100 us timer. If the generated 100ns tic timer is not exactly 100ns, this field is programmed with the required value. The programmed value is equivalent to the number of more (SIGN_BIT is low) or less (SIGN_BIT is high) counts than the ideal count to meet the range of the 100 us timer. This field is used to control the generation of 100 us time tick using the clk_eee_i clock and MULT_FACT_100NS field. By default, the 100 us timer is generated assuming clk_eee_i_time_period * (MULT_FACT_100NS + 1) is equal to 100ns. Therefore, the PCS maintains the default value of the 100 us timer as 1000 to achieve 100000ns (100 us). You should use this field if clk_eee_i_time_period * (MULT_FACT_100NS + 1) is not equal to 100ns. To program this field, use the following equation: (1000 +/- RES_100US)* ((MULT_FACT_100NS + 1) * clk_eee_i_time_period) = 100 us. The SIGN_BIT should be programmed as 1 for (+) and 0 for (-).

3.3.1.38 VR MII MMD Link Timer Control Register (VR_MII_LINK_TIMER_CTRL) - 1Fh, Address 800Ah

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 800Ah**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:0	RW	16'h0000	Programmable Link Timer Value for Clause 37 Auto-Negotiation (CL37_LINK_TIME): This field can be programmed to desired value if application wishes to over-ride the standard specified values for Link Timer used during CL37 Auto negotiation. The PCS has a 24-bit timer that runs at the frequency of clk_xgxs_rx0_i clock. The value programmed to this field will be used as the upper 16-bit of the value to be loaded to this timer. The lower 8-bits are hardcoded as 8'h7D After programming this register, application should perform either of the following two steps, so that the new values takes effect: Set CL37_TMR_OVR_RIDE bit (bit 3) of the VR MII MMD Digital Control 1 Register to 1. FAST_SIM bit of SR Control MMD Control Register should be cleared (if already set) and then set back to 1.

3.3.1.39 VR MII MMD EEE Mode Control 1 Register (VR_MII_EEE_MCTRL1) - 1Fh, Address 800Bh

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 800Bh**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:1	RO	15'h0000	Reserved
0	RW	1'h0	Transparent Tx LPI Mode Enable (TRN_LPI): When set to 1 (along with LTX_EN=1), transparent LPI mode gets activated in the XPCS Transmit path. In this mode the transmit LPI state-machine doesn't move to the TX_QUIET state. On detecting Lower-Power Idle on the GMII Tx interface, the XPCS goes to the TX_SLEEP state and remains in this state until the MAC stops sending LPI. In this mode, the XPCS merely sends the encoded LPI pattern to the serdes. This mode does not involve gating-off of any of the clocks to the XPCS. In addition, the serdes transmitter is not disabled. The MAC should ensure that it does not gate-off the GMII Tx clock to the XPCS during this mode of operation.

3.3.1.40 VR MII MMD Digital Status Register (VR_MII_DIG_STS) - 1Fh, Address 8010h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 8010h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:13	RO/V	3'h0	LPI Transmit State (LTX_STATE): This field indicates the current state of the LPI Transmit state Machine: 000: LTX_ACTIVE 001: LTX_SLEEP 010: LTX_QUIET 011: LTX_REF_WAKE 100: LTX_ALERT (does not apply to the PCS design) 101: LTX_SCR_BYP (does not apply to the PCS design)
12:10	RO/V	3'h0	LPI Receive State (LRX_STATE): This field indicates the current state of the LPI Receive State Machine: 000: LRX_ACTIVE (default) 001: LRX_SLEEP 010: LRX_QUIET 011: LRX_WAKE 100: LRX_WTF 101: LRX_LINK_FAIL 110: LRX_LPI_K
9:7	RO	3'h0	Reserved
6	RO/V	1'h0	Rx FIFO Overflow (RXFIFO_OVF): This bit indicates the clock rate compensation FIFO overflow. 0 indicates normal operation and 1 indicates FIFO overflow.
5	RO/V	1'h0	Rx FIFO Underflow (RXFIFO_UNDF): This bit indicates the clock rate compensation FIFO underflow. 0 indicates normal operation and 1 indicates FIFO underflow.
4:0	RO	5'h0	Reserved

3.3.1.41 VR MII MMD Invalid Code Group Error Count1 Register (VR_MII_ICG_ERRCNT1) - 1Fh, Address 8011h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 8011h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:8	RO	8'h00	Reserved
7:0	RO/V	8'h00	Invalid Code Group Count Lane 0 (EC0): This field gives the invalid code group count in Lane 0 when bit 4 of VR MII MMD Digital Error Count Select Register is set to 1.

3.3.1.42 VR MII MMD Miscellaneous Status Register (VR_MII_MISC_STS) - 1Fh, Address 8018h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 8018h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:4	RO	12'h000	Reserved
7:0	RO/V	4'h0	Bit Shift (BIT_SFT): This field indicates the number of bit-shifts carried-out by the comma-detect logic so as to align the incoming 10-bit XGXS Rx data. The default value of this field can be any value, depending on the status of comma-detect logic.

3.3.1.43 VR MII PHY Rx Lane Status Register (VR_MII_RX_LSTS) - 1Fh, Address 8020h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 8020h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:13	RO/V	3'h0	DPLL Lock Status for Lanes [3:1] (RX_VALID_3_1): This field indicates that the DPLL in the PHY is locked on the serial data in the corresponding lane. xx1: Lane 1 DPLL bit locked x1x: Lane 2 DPLL bit locked 1xx: Lane 3 DPLL bit locked (x indicates don't care)
12	RO/V	1'h0	DPLL Lock Status for Lane 0 (RX_VALID_0): This field indicates that the DPLL in the PHY is locked on the serial data in Lane 0. The value 1'b1 indicates that Lane 0 DPLL bit is locked.
11:5	RO	2'h0	Reserved
4	RO/V	1'h0	Rx Signal Detect for Lane 0 (SIG_DET_0): This bit indicates that the Rx detected the signal on Lane 0. This bit is the complement value of the signals input from the PHY on Lane 0. The value 1'b1 indicates that Lane 0 signal is detected.
3:0	RO	4'h0	Reserved

3.3.1.44 VR MII MMD Digital Control2 Register (VR_MII_DIG_CTRL2) - 1Fh, Address 80E1h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 80E1h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:5	RO	11'h000	Reserved
4	RW	1'h0	Tx Polarity Invert on Lane 0 (TX_POL_INV_0): When set to 1, this bit reverses the data polarity on the Tx differential lines of Lane 0.
3:1	RO	3'h0	Reserved
0	RW	1'h0	Rx Polarity Invert on Lane 0 (ABL100T4): When set, the bits within this field indicate that the data received on Rx serial line is inverted on Lane 0. This reverses the polarity on the data received from the PHY core. The value 1 indicates that Rx data on Lane 0 is inverted.

3.3.1.45 VR MII MMD Digital Error Count Select Register (VR_MII_DIG_ERRCNT_SEL) - 1Fh, Address 80E2h

Type: MDIO Register **PRTAD: 16h** **DEVAD: 1Fh** **Register Address: 80E2h**

Default: 0000h Size: 16 bits MDIO Clause: 45

Bits	Access Type	Default	Field Name and Description
15:5	RO	11'h000	Reserved
4	RW	1'h0	Invalid Code Group Error Counter Enable (INV_EC_EN): When this bit is set, the counting of invalid code group errors is enabled. 0: The counting of errors is disabled 1: The counting of errors is enabled For information about the fields containing the number of errors counted, see VR MII MMD Invalid Code Group Error Count1 Register.
3:1	RO	3'h0	Reserved
0	RW	1'h0	Clear on Read (COR): When this bit is set and the host reads any error counter, that counter is cleared after the read cycle. 0: Normal operation 1: Clear any error counter that is read

3.3.2 MDIO – Adhoc PHY Sublayer Registers – PHY Address 15h

The Adhoc Registers are accessible as an IEEE Std 802.3 Clause 22 capable PHY MDIO Manageable Device (MMD). Its 5-bit PHY Address (PHYAD) is 15h. Its 32 16-bit data registers are accessible using the 5-bit PHY Register Address (REGAD).

The Adhoc Registers consist of a PHY Global Configuration Register (GCR), one captured 64-bit Always Running Timer (ART) Time Stamp, one six-byte, unique MAC Address provided by the Intel product customer via the system Flash Device, and various status registers and configuration registers related to the PCH internal PHY sublayer circuitry and debug circuity.

Table 3-7. Summary of Adhoc MDIO Registers, PHYAD = 15h

Register Address (Hex)	Data Size (Bits)	Register Name (Register Symbol)	Default Value [15:0]
00h	16	Global Configuration Register (GCR)	0826h
01h	16	PMC ART Time Capture Register 0 (PMC_ART0)	0000h
02h	16	PMC ART Time Capture Register 1 (PMC_ART1)	0000h
03h	16	PMC ART Time Capture Register 2 (PMC_ART2)	0000h
04h	16	PMC ART Time Capture Register 3 (PMC_ART3)	0000h
05h	16	General Purpose Status Register 0 (GPSR0)	0000h
06h	16	General Purpose Status Register 1 (GPSR1)	0000h
07h	16	General Purpose Status Register 2 (GPSR2)	0000h
08h	16	General Purpose Status Register 3 (GPSR3)	0000h
09h	16	General Purpose Status Register 4 (GPSR4)	0000h
0Ah	16	General Purpose Status Register 5 (GPSR5)	0000h
0Bh	16	General Purpose Configuration Register 0 (GPCR0)	1020h
0Ch	16	General Purpose Configuration Register 1 (GPCR1)	0001h
0Dh	16	General Purpose Configuration Register 2 (GPCR2)	0050h
0Eh	16	General Purpose Configuration Register 3 (GPCR3)	0000h
0Fh	16	General Purpose Configuration Register 4 (GPCR4)	0000h
10h	16	General Purpose Configuration Register 5 (GPCR5)	0000h
11h	16	General Purpose Configuration Register 6 (GPCR6)	0000h
12h	16	General Purpose Configuration Register 7 (GPCR7)	0000h
13h	16	MAC Address Strap Value 0 (MACADDR0)	0000h
14h	16	MAC Address Strap Value 1 (MACADDR1)	0000h
15h	16	MAC Address Strap Value 2 (MACADDR2)	0000h
16h	16	MGBE Hammock Harbor Status (MGBE_HH_STATUS)	0000h
17h	16	MGBE RGMII DLL Status (MGBE_STATUS1)	0000h
18h	16	MGBE STATUS Register2 (MGBE_STATUS2)	0000h
19h	16	MGBE STATUS Register3 (MGBE_STATUS3)	0000h
1Ah	16	MGBE RGMII DLL Configuration Register 1 (MGBE_CONFIG1)	0000h
1Bh	16	MGBE RGMII DLL Configuration Register 2 (MGBE_CONFIG2)	0000h
1Ch	16	MGBE CONFIG Register3 (MGBE_CONFIG3)	0000h

Table 3-7. Summary of Adhoc MDIO Registers, PHYAD = 15h

Register Address (Hex)	Data Size (Bits)	Register Name (Register Symbol)	Default Value [15:0]
1Dh	16	MGBE CONFIG Register4 (MGBE_CONFIG4)	0000h
1Eh	16	MGBE CONFIG Register5 (MGBE_CONFIG5)	0000h
1Fh	16	MGBE CONFIG Register6 (MGBE_CONFIG6)	0000h

3.3.2.1 Global Configuration Register (GCR) - Address 00h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 00h**

Default: 0826h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:12	RW	4'h0	Reserved
11:8	RW	4'h8	Always Running Timer Capture Skew (ART_SKEW): The skew is provided as a number of clock cycles. Default value is 8 cycles for the 19.2-MHz ART Clock.
7	RW	1'b0	Reserved
6	RW	1'b0	PHY to MAC Interrupt Polarity (PHY2MAC_INTR_POL): When programmed to 1, the polarity of the interrupt signal that comes from an external PHY is inverted.
5	RW	1'b1	MAC Function Level Reset Enable (MAC_FLR_ENABLE): When programmed to 1, the Function Level Reset (FLR) mechanism is enabled. When programmed to 0, the FLR mechanism is disabled.
4	RW	1'b0	PHY Interface Mode Override (PHYIF_STRAPOVR): Overrides the PHY interface mode established by Soft Straps or system Fuses: 0: Override is disabled 1: Override is enabled
3	RW	1'b0	PHY Interface Mode (PHYIF_MODE): When the PHYIF_STRAPOVR bit of this register is 1, these bits determine the PHY Interface Mode as follows: 0: RGMII Mode 1: SGMII mode
2:1	RW	2'b11	Link Speed Mode (LINK_MODE): This field configures the Link-Speed Mode when the AUTONEG_DISABLE bit of this register is 1: 11: 2.5 Gbps (this is applicable only in SGMII Mode) 10: 1 Gbps 01: 100 Mbps 00: 10 Mbps
0	RW	1'b0	Auto-Negotiation Disable (AUTONEG_DISABLE): When this bit is 1, the Link Speed is determined by the LINK_MODE bits of this register instead of the PCS Auto-Negotiation value.

3.3.2.2 PMC ART Time Capture Register 0 (PMC_ART0) - Address 01h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 01h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RO/V	16'h0000	PMC ART Value 0 (PMC_ART0_FLD): Bits 15:0 of the captured 64-bit Always Running Timer (ART) from the PCH Power Management Controller.

3.3.2.3 PMC ART Time Capture Register 1 (PMC_ART1) - Address 02h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 02h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RO/V	16'h0000	PMC ART Value 1 (PMC_ART1_FLD): Bits 31:16 of the captured 64-bit Always Running Timer (ART) from the PCH Power Management Controller.

3.3.2.4 PMC ART Time Capture Register 2 (PMC_ART2) - Address 03h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 03h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RO/V	16'h0000	PMC ART Value 2 (PMC_ART2_FLD): Bits 47:32 of the captured 64-bit Always Running Timer (ART) from the PCH Power Management Controller.

3.3.2.5 PMC ART Time Capture Register 3 (PMC_ART3) - Address 04h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 04h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RO/V	16'h0000	PMC ART Value 3 (PMC_ART3_FLD): Bits 63:48 of the captured 64-bit Always Running Timer (ART) from the PCH Power Management Controller.

3.3.2.6 General Purpose Status Register 0 (GPSR0) - Address 05h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 05h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15	RO	1'b0	Reserved
14	RO/V	1'b0	RXSTANDBY_STATUS_FLD (RXSTANDBY_STATUS_FLD): Indicates the value of the fia_tsn_rxstandbystatus signal.
13	RO	1'b0	Reserved
12	RO/V	1'b0	RXELECIDLE_SUS_FLD (RXELECIDLE_SUS_FLD): Indicates the value of the fia_tsn_rxelecidle_sus signal.
11	RO/V	1'b0	PCLKIN_CHG_OK_FLD (PCLKIN_CHG_OK_FLD): Indicates the value of the fia_tsn_pclkin_chg_ok signal.
10:7	RO	3'b000	Reserved
6:4	RO/V	3'b000	POWERDOWN_SUS_FLD (POWERDOWN_SUS_FLD): Indicates the value of the tsn_fia_powerdown_sus_reg[2:0] signals.
3	RO	1'b0	Reserved
2	RO/V	1'b0	PHY_POWER_STATE_FLD (PHY_POWER_STATE_FLD): When this bit is 1, PHY is out of reset state
1	RO	1'b0	Reserved
0	RO/V	1'b0	PLL_CLK_VLD_FLD (PLL_CLK_VLD_FLD): When this bit is 1, it indicates that the PLL Clock to be used by the GBE-TSN is valid. This can either be the MODPHY SATA PLL Clock or the MIPI PLL Clock depending on the FIA lane on which the GBE-TSN is implemented.

3.3.2.7 General Purpose Status Register 1 (GPSR1) - Address 06h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 06h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RO	16'h0000	Reserved

3.3.2.8 General Purpose Status Register 2 (GPSR2) - Address 07h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 07h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RO	16'h0000	Reserved

3.3.2.9 General Purpose Status Register 3 (GPSR3) - Address 08h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 08h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RO	16'h0000	Reserved

3.3.2.10 General Purpose Status Register 4 (GPSR4) - Address 09h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 09h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:8	RO/V	8'h00	FIA_STATUS_SEL2_FLD MGBE_MDIO (FIA_STATUS_SEL2_FLD): Various signals are multiplexed into status bits based on the bits GPCR4[13:8].
7:0	RO/V	8'h00	FIA_STATUS_SEL1_FLD MGBE_MDIO (FIA_STATUS_SEL1_FLD): Various signals are multiplexed into status bits based on the bits GPCR4[5:0].

3.3.2.11 General Purpose Status Register 5 (GPSR5) - Address 0Ah

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 0Ah**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RO	16'h0000	Reserved

3.3.2.12 General Purpose Configuration Register 0 (GPCR0) - Address 0Bh

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 0Bh**

Default: 1020h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15	RO	1'b0	Reserved
14:12	RW	3'b001	MODPHY_PCLK_RATE_FLD MGBE_MDIO (MODPHY_PCLK_RATE_FLD): Destination is MODPHY signals i_pclkrate[2:0]. This determines the rate of PCLK being sent to the PHY. Used by PHY to determine PCLK:DATA Rate for TX/RX Data valid signaling. When MODPHY is in SATA Mode: 000: 37.5 MHz 001: 75 MHz (default) 010: 150 MHz 011: 300 MHz 100: 600 MHz
11	RW	1'b0	PCLKIN_CHG_ACK_FLD MGBE_MDIO (PCLKIN_CHG_ACK_FLD): Destination is MODPHY signal fia_pclkin_chg_ack.
10	RO	1'b0	Reserved
9:8	RW	2'b00	MODPHY_RATE_FLD MGBE_MDIO (MODPHY_RATE_FLD): Destination is MODPHY signals i_rate[1:0]. For SerDes Mode, the choices are: 00: PCI Express Gen 1 01: PCI Express Gen 2 10: PCI Express Gen 3 11: KX Mode, half rate for GbE (default)
7	RO	1'b0	Reserved

Bits	Access Type	Default	Field Name and Description
6:4	RW	3'b010	MODPHY_POWERDOWN_SIGNL_FLD MGBE_MDIO (MODPHY_POWERDOWN_SIGNL_FLD): Destination is MODPHY signals i_powerdown_sus[2:0]. These signals control the power management state of the MODPHY. The MODPHY Power States: 000: P0 - PHY TX is transmitting data. MAC is providing data bytes to be sent every clock cycle. PHY RX may or may not be receiving data. 001: P1 - PHY TX is not transmitting data and is in electrical idle. PHY behavior is undefined if tx_elecidle is deasserted in this state. PHY RX may or may not be receiving data. 010: P2 - PHY does a receiver detection operation. PHY behavior is undefined if tx_elecidle is deasserted in this state. 011: P3 – (default) PHY is in low power state and is in electrical idle. TX is High-Z state. 100: P4 - PHY is in low power state and is in electrical idle. TX pads sit in common mode. 101: P5 - PHY is in low power state and is in electrical idle. TX pad is in strong pull down. 110: P6 - PHY is in low power state and is in electrical idle. TX pads are in common mode with clock hub bias on. 111: Reserved.
3	RO	1'b0	Reserved
2	RW	1'b0	MODPHY_RST_DATAPATH_INT_FLD MGBE_MDIO (MODPHY_RST_DATAPATH_INT_FLD): Destination is MODPHY signal i_reset_l. Active-low reset signal for both the PIPE and SerDes interface. This signal is equivalent to a lane disable signal.
1	RW	1'b0	PHY Rx Clock Enable: Un-gate PHY Rx Clock CDC.
0	RW	1'b0	PLL_CLK_REQUEST_FLD MGBE_MDIO (PLL_CLK_REQUEST_FLD): Depending on the PLL configuration, MIPI PLL or SATA PLL, this bit provides a signal much like mgbe_mii_refclkreq.

3.3.2.13 General Purpose Configuration Register 1 (GPCR1) - Address 0Ch

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 0Ch**

Default: 0001h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:13	RO	7'h00	Reserved
12	RW	1'b0	MODPHY_TX_DATA_SEL_FLD MGBE_MDIO (TX_DATA_SEL_FLD): Used as mux select for selecting tsn_fia_txdata[9:0], directly or bit reserved.
11	RW	1'b0	MODPHY_STATUSREG1_BIT_SEL_FLD MGBE_MDIO (STATUSREG1_BIT_SEL_FLD): Used as mux select for selecting bits of status register 1, directly or synchronized.
10:9	RO	2'b00	Reserved

Bits	Access Type	Default	Field Name and Description
8	RW	1'b0	MODPHY_TX_DET_RX_LPBK_FLD MGBE_MDIO (MODPHY_TX_DET_RX_LPBK_FLD): Destination is MODPHY signal i_txdetrxlpbk_sus. Used to tell the PHY to begin a RX detect operation or loopback to signal LFPS during MODPHY power state P0 for USB polling state. Function of this pin depends on the power state and the i_txelecidle signal.
7	RO	1'b0	Reserved
6:4	RW	3'b000	MODPHY_TX_MRGN_FLD MGBE_MDIO (MODPHY_TX_MRGN_FLD): Destination is MODPHY signals i_txmargin[2:0]. Selects the transmitter voltage levels. 000: TxMargin value 0 = ~1Vdiffp2p (Normal operating range).
3	RW	1'b0	MODPHY_TX_SWING_FLD MGBE_MDIO (TX_SWING_FLD): Drives an output signal fia_tx_swing.
2	RO	1'b0	Reserved
1:0	RW	2'b01	MODPHY_TX_DE_EMP_FLD MGBE_MDIO (MODPHY_TX_DE_EMP_FLD): General Purpose Configuration Register2[15:0]. 00: the de-emphasis is -6dB 01: the de-emphasis -3.5 dB 10: the de-emphasis 0dB 11: the de-emphasis -9.5dB

3.3.2.14 General Purpose Configuration Register 2 (GPCR2) - Address 0Dh

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 0Dh**

Default: 0050h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:9	RO	7'h00	Reserved
8	RW	1'b0	MODPHY_HALT_PHY_RDY_FLD MGBE_MDIO (HALT_PHY_RDY_FLD): additional output signal to halt xpcs_phy_rdy, in addition to powerdown state machine.
7	RO	1'b0	Reserved
6	RW	1'b1	MODPHY_RX_INTFLTREN_FLD MGBE_MDIO (RX_INTFLTREN_FLD): Drives an output signal tsn_fia_rxintfltren_l.
5	RO	1'b0	Reserved
4	RW	1'b1	MODPHY_RXTERMEN_H_AON_FLD MGBE_MDIO (MODPHY_RXTERMEN_H_AON_FLD): Destination is MODPHY signal i_rxtermen_h_aon. This signal controls the presence of the RX termination resistors. 1: Terminations are present 0: Terminations are removed from the circuit
3	RO	1'b0	Reserved

Bits	Access Type	Default	Field Name and Description
2	RW	1'b0	MODPHY_RX_SQUELCH_EN_FLD MGBE_MDIO (MODPHY_RX_SQUELCH_EN_FLD): Destination is MODPHY signal i_rxsquelchen. Used in PCIE P2/USB3 P3/ SATA Slumber power states to cycle the squelch and monitor for activity.
1	RO	1'b0	Reserved
0	RW	1'b0	MODPHY_RX_POLARITY_FLD MGBE_MDIO (MODPHY_RX_POLARITY_FLD): Destination is MODPHY signal i_rxpolarity. Configures the PHY to perform polarity inversion on the received data. 0: PHY does no polarity inversion 1: PHY does polarity inversion

3.3.2.15 General Purpose Configuration Register 3 (GPCR3) - Address 0Eh

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 0Eh**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RW	16'h0000	Reserved

3.3.2.16 General Purpose Configuration Register 4 (GPCR4) - Address 0Fh

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 0Fh**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:14	RO	2'b00	Reserved
13:8	RW	6'b000000	MODPHY_STATUS_SIGNL_SEL2_FLD MGBE_MDIO (MODPHY_STATUS_SIGNL_SEL2_FLD): Based on these bits various FIA signals are multiplexed into the GPSR4[15:8].
7:6	RO	2'b00	Reserved
5:0	RW	6'b000000	MODPHY_STATUS_SIGNL_SEL1_FLD MGBE_MDIO (MODPHY_STATUS_SIGNL_SEL1_FLD): Based on these bits various FIA signals are multiplexed into the GPSR4[7:0].

3.3.2.17 General Purpose Configuration Register 5 (GPCR5) - Address 10h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 10h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RW	16'h0000	Reserved

3.3.2.18 General Purpose Configuration Register 6 (GPCR6) - Address 11h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 11h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:6	RW	10'h000	MODPHY_FIA_OUTPUT_SEL_FLD MGBE_MDIO (MODPHY_FIA_OUTPUT_SEL_FLD): Used to replace various FIA output signals based on GPCR6[5:0] and GPCR7[5:0] bits.
5:0	RW	6'h00	MODPHY_CONFIG_SIGNL_SEL1_FLD MGBE_MDIO (MODPHY_CONFIG_SIGNL_SEL1_FLD): Selects one of 49 sets of internal signal values to be sent to the FIA and Used as MUX select for selecting values for various output FIA signals.

3.3.2.19 General Purpose Configuration Register 7 (GPCR7) - Address 12h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 12h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:6	RW	10'h000	MODPHY_TX_DATA_FLD MGBE_MDIO (TX_DATA_FLD): Used for replacing FIA Tx data, and some other FIA signals too, based on GPCR7[5:0] configuration.
5:0	RW	6'h00	MODPHY_CONFIG_SIGNL_SEL2_FLD MGBE_MDIO (MODPHY_CONFIG_SIGNL_SEL2_FLD): Used as MUX select for selecting values for various output FIA signals.

3.3.2.20 MAC Address Strap Value 0 (MACADDR0) - Address 13h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 13h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RO/V	16'h0000	MAC_ADDR_STRAP0_FLD MGBE_MDIO (MAC_ADDR_STRAP0_FLD): MAC address strap values [15:0] This is a write-only-once register, and the value is loaded on iosf2axi_fuse_valid low to high transition.

3.3.2.21 MAC Address Strap Value 1 (MACADDR1) - Address 14h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 14h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RO/V	16'h0000	MAC_ADDR_STRAP0_FLD MGBE_MDIO (MAC_ADDR_STRAP0_FLD): MAC address strap values [31:16] This is a write-only-once register, and the value is loaded on iosf2axi_fuse_valid low to high transition.

3.3.2.22 MAC Address Strap Value 2 (MACADDR2) - Address 15h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 15h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RO/V	16'h0000	MAC_ADDR_STRAP0_FLD MGBE_MDIO (MAC_ADDR_STRAP0_FLD): MAC address strap values [47:32] This is a write-only-once register, and the value is loaded on iosf2axi_fuse_valid low to high transition.

3.3.2.23 MGBE Hammock Harbor Status (MGBE_HH_STATUS) - Address 16h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 16h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:4	RO	12'h000	Reserved
3	RW	1'b0	MMGBE_SBD_SFTY_UE (MGBE_SBD_SFTY_UE): MAC Safety Uncorrectable error status: This bit is set on ac_sbd_ue_intr and cleared by software.
2	RW	1'b0	MGBE_SBD_SFTY_CE (MGBE_SBD_SFTY_CE): MAC Safety Correctable error status: This bit is set on mac_sbd_ce_intr and cleared by software.
1	RW	1'b0	MGBE_TSW_ERR (MGBE_TSW_ERROR): Timestamp error status: Iosf2axi_hh_tsw_status output from bridge latched on avail.
0	RW	1'b0	MGBE_SNAPSHOT_DONE (MGBE_SNAPSHOT_DONE): Snapshot done bit: Set when MGBE received LocalSync for tsw sync timestamp from iosf2axibr (opcode = 51). Cleared when new request gpo1 is initiated.

3.3.2.24 MGBE RGMII DLL Status (MGBE_STATUS1) - Address 17h

This Read-Only Status Register is available to subsystems that are configured to provide the RGMII rather than the PCS module as the external interface. It provides information concerning the Master/Slave DLL module used for RGMII.

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 17h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15	RO/V	1'b0	Master DLL Lock (MDLL_LOCK): Indicates that the Master DDL for RGMII is locked.
14:8	RO	7'h00	Reserved
7:4	RO/V	4'h0	Master DLL Coarse Tuning Value (MDLL_COARSE_TUNE): Indicates the value used for the Master DLL Coarse Tuning for RGMII.
3:0	RO/V	4'h0	Master DLL Fine Tuning Value (MDLL_FINE_TUNE): Indicates the value used for the Master DLL Fine Tuning for RGMII.

3.3.2.25 MGBE STATUS Register2 (MGBE_STATUS2) - Address 18h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 18h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RO	16'h0000	Reserved

3.3.2.26 MGBE STATUS Register3 (MGBE_STATUS3) - Address 19h

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 19h**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RO	16'h0000	Reserved

3.3.2.27 MGBE RGMII DLL Configuration Register 1 (MGBE_CONFIG1) - Address 1Ah

This Read-Write Configuration Register is used to configure the Master/Slave DLL module used for RGMII.

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 1Ah**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15	RW	1'b0	Override Master DLL Tuning Values (SW_OVR): 1 -> SW override is enabled. When set, the coarse and fine values to the slave DLLs will be jammed by configA register values. The master DLL coarse and fine values will be bypassed.
14	RW	1'b0	Software Reset (SW_RESETB): Active-low software reset. Resets the master DLL when asserted low.
13	RW	1'b0	MGBE_DLLRX_BYPASS (MGBE_DLLRX_BYPASS): DLL Bypass option for RGMII RX Clock.
12	RW	1'b0	MGBE_DLLTX_BYPASS (MGBE_DLLTX_BYPASS): DLL Bypass option for RGMII TX Clock.
11	RO	1'b0	Reserved
10:8	RW	3'b000	Observe Master DLL Values (MDLL_DFT): DFT inputs for observing various master DLL values.
7:4	RW	4'h0	Override Slave DLL Coarse Tuning Delay (SDLL_COARSE_OVER): Slave DLL coarse tuning delay override value used when the SW_OVR bit of this register is one.
3:0	RW	4'h0	Override Slave DLL Fine Tuning Delay (SDLL_FINE_OVER): Slave DLL fine tuning delay override value used when the SW_OVR bit of this register is one.

3.3.2.28 MGBE RGMII DLL Configuration Register 2 (MGBE_CONFIG2) - Address 1Bh

This Read-Write Configuration Register is used to configure the Master/Slave DLL module used for RGMII.

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 1Bh**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:14	RO	2'b00	Reserved
13:8	RW	6'h00	RX Slave DLL Tap Value (RX_SLAVE_TAP_VALUE): The taps are binary coded. Each tap gives 125 ps resolution. Valid values are: 6'b00_0000 -> 0 ns 6'b00_0001 -> 125 ps through… 6'b10_1000 -> 10 ns All other values are reserved.
7:6	RO	2'b00	Reserved
5:0	RW	6'h00	TX Slave DLL Tap Value (TX_SLAVE_TAP_VALUE): The taps are binary coded. Each tap gives 125 ps resolution. For example: 6'b00_0000 -> 0 ns 6'b00_0001 -> 125 ps through… 6'b10_1000 -> 10 ns All other values are reserved.

3.3.2.29 MGBE CONFIG Register3 (MGBE_CONFIG3) - Address 1Ch

This Read-Write Configuration Register is for VC1 mapping.

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 1Ch**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RW	16'h0000	VC1 Mapping Register (MGBE_CONFIG3_FLD): VC1 mapping register for 8 Tx and 8 Rx DMA channels.

3.3.2.30 MGBE CONFIG Register4 (MGBE_CONFIG4) - Address 1Dh

This Read-Write Configuration Register is reserved by Intel for possible future use.

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 1Dh**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RW	16'h0000	Reserved

3.3.2.31 MGBE CONFIG Register5 (MGBE_CONFIG5) - Address 1Eh

This Read-Write Configuration Register is reserved by Intel for possible future use.

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 1Eh**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RW	16'h0000	Reserved

3.3.2.32 MGBE CONFIG Register6 (MGBE_CONFIG6) - Address 1Fh

This Read-Write Configuration Register is reserved by Intel for possible future use.

Type: MDIO Register **PHYAD: 15h** **Register Address (REGAD): 1Fh**

Default: 0000h Size: 16 bits MDIO Clause: 22

Bits	Access Type	Default	Field Name and Description
15:0	RW	16'h0000	Reserved

3.3.3 MDIO – External PHY Sublayer Registers

The MDIO Controller provides the MDIO interface to PHY components that are external to the PCH component. Both Clause 22 capable and Clause 45 capable PHY components are supported. See IEEE Std 802.3-2015 for the MDIO interface and electrical specifications.

4 Direct Memory Access (DMA) Interface

4.1 DMA Configuration Registers Summary

This registers of the Intel® PSE devices. This contains multiple Intel® PSE Direct Memory Access (DMA) Controller devices:

- Intel® PSE DMA Controller #0 - Bus: 0, Device: 29, Function: 3
- Intel® PSE DMA Controller #1 - Bus: 0, Device: 29, Function: 4
- Intel® PSE DMA Controller #2 - Bus: 0, Device: 29, Function: 5

DID Values:

- Intel® PSE DMA Controller #0 - D9: F3 - 4BB4h
- Intel® PSE DMA Controller #1 - D9: F4 - 4BB5h
- Intel® PSE DMA Controller #2 - D9: F5 - 4BB6h

Table 4-1. Summary of Bus: 0, Device: 29, Function: 1 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	Device ID And Vendor ID Register (DEVVENDID) - Offset 0h	4BB40000h
4h	4	Status And Command (STATUSCOMMAND) - Offset 4h	00100000h
8h	4	Revision ID And Class Code (REVCLASSCODE) - Offset 8h	00000000h
Ch	4	Cache Line Latency Header And BIST (CLLATHEADERBIST) - Offset Ch	00000000h
10h	4	Base Address Register (BAR) - Offset 10h	00000000h
14h	4	Base Address Register High (BAR_HIGH) - Offset 14h	00000000h
18h	4	Base Address Register1 (BAR1) - Offset 18h	00000000h
1Ch	4	Base Address Register1 (BAR1) - Offset 18h	00000000h
2Ch	4	Subsystem Vendor and Subsystem ID (SUBSYSTEMID) - Offset 2Ch	00000000h
30h	4	Expansion ROM Base Address (EXPANSION_ROM_BASEADDR) - Offset 30h	00000000h
34h	4	Capabilities Pointer (CAPABILITYPTR) - Offset 34h	00000080h
3Ch	4	Interrupt Register (INTERRUPTREG) - Offset 3Ch	00000100h
80h	4	Power Management Capability ID (POWERCAPID) - Offset 80h	48030001h
84h	4	Power Management Control And Status Register (PMECTRLSTATUS) - Offset 84h	00000008h
90h	4	PCI Device Idle Vendor Capability Register (PCIDEVIDLE_CAP_RECORD) - Offset 90h	F0140009h
94h	4	Vendor Specific Extended Capability Register (DEVID_VEND_SPECIFIC_REG) - Offset 94h	01400010h

Table 4-1. Summary of Bus: 0, Device: 29, Function: 1 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
98h	4	Software LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG) - Offset 98h	00000000h
9Ch	4	Device Idle Pointer Register (DEVICE_IDLE_POINTER_REG) - Offset 9Ch	00000000h
A0h	4	D0i3 and Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG) - Offset A0h	00000800h
B0h	4	General Purpose Read Write Register1 (GEN_PCI_REGRW1) - Offset B0h	00000000h
C0h	4	General Purpose Input Register (GEN_INPUT_REG) - Offset C0h	00000000h
D0h	4	MSI Capability Register (MSI_CAP_REG) - Offset D0h	01800005h
D4h	4	MSI Message Low Address (MSI_ADDR_LOW) - Offset D4h	00000000h
D8h	4	MSI Message High Address (MSI_ADDR_HIGH) - Offset D8h	00000000h
DCh	4	MSI Message Data (MSI_MSG_DATA) - Offset DCh	00000000h
E0h	4	MSI Mask Register (MSI_MASK) - Offset E0h	00000000h
E4h	4	MSI Pending Register (MSI_PENDING) - Offset E4h	00000000h
F8h	4	Manufacturers ID (MANID) - Offset F8h	00000000h

4.1.1 Device ID And Vendor ID Register (DEVVENDID) - Offset 0h

Device ID and Vendor ID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 0h	4BB40000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	4BB4h RO/P	**Device ID Field (DEVICEID):** Device ID identifies the particular PCI device
15:0	0000h RO	**Vendor ID Field (VENDORID):** Vendor ID is a unique ID provided by the PCI SIG which identifies the manufacturer of the device

4.1.2 Status And Command (STATUSCOMMAND) - Offset 4h

Status and Command

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 4h	00100000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C	**Detected Parity Error (DPE):** Detected Parity Error
30	0h RW/1C	**Signaled System Error (SSE):** Signaled System Error
29	0h RW/1C	**RMA Field (RMA):** Received Master Abort
28	0h RW/1C	**RTA Field (RTA):** Received Target Abort
27:25	0h RO	**Reserved**
24	0h RW/1C	**Master Data Parity Error (MDPE):** Master Data Parity Error
23:21	0h RO	**Reserved**
20	1h RO	**Cap List Field (CAPLIST):** Capabilities List: Indicates that the controller contains a capabilities pointer list
19	0h RO	**Interrupt Status Field (INTR_STATUS):** Interrupt Status: This bit reflects state of interrupt in the device
18:11	0h RO	**Reserved**
10	0h RW	**Interrupt Disable Field (INTR_DISABLE):** Interrupt Disable
9	0h RO	**Reserved**
8	0h RW	**SERR Enable Field (SERR_ENABLE):** SERR Enable Not implemented
7	0h RO	**Reserved**
6	0h RW	**Parity Error Response Enable (PERE):** Parity Error Response Enable
5:3	0h RO	**Reserved**
2	0h RW	**BME Field (BME):** Bus Master Enable
1	0h RW	**MSE Field (MSE):** Memory Space Enable
0	0h RO	**Reserved**

4.1.3 Revision ID And Class Code (REVCLASSCODE) - Offset 8h

Revision ID and Class Code

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	**Revision ID Field (CLASS_CODES):** Class Code register is read-only and is used to identify the generic function of the device and in some cases a specific register-level programming interface
7:0	00h RO/P	**Class Code Field (RID):** Revision ID identifies the revision of particular PCI device

4.1.4 Cache Line Latency Header And BIST (CLLATHEADERBIST) - Offset Ch

Cache Line size as RW with def 0 Latency Timer, RW with def 0 Header Type with Type 0 configuration header and Reserved BIST Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	0h RO	**Multifunction Device Field (MULFNDEV):** Multi-Function Device
22:16	00h RO	**Header Type Field (HEADERTYPE):** Header Type: Implements Type 0 Configuration header
15:8	00h RO	**Latency Timer Field (LATTIMER):** Latency Timer:. This register is implemented as R/W with default as 0
7:0	00h RW/P	**Cache Line Size Field (CACHELINE_SIZE):** Cache Line Size

4.1.5 Base Address Register (BAR) - Offset 10h

Base Address Register Low [31:2] type [2:1] in 32bit or 64bit address range and memory space indicator [0]

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR):** Base Address Register Low Base address of the AXI fabric memory space. Taken from Strap values as ones
11:4	00h RO	**Size Field (SIZEINDICATOR):** Size Indicator RO Always returns 0 The size of this register depends on the size of the memory space
3	0h RO	**Prefetchable Field (PREFETCHABLE):** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**Type Field (TYPE0):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE):** Memory Space Indicator: 0 indicates this BAR is present in the memory space

4.1.6 Base Address Register High (BAR_HIGH) - Offset 14h

Base Address Register High enabled if [2:1] of BAR_HIGH is 10

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR_HIGH):** Base Address High - MSB

4.1.7 Base Address Register1 (BAR1) - Offset 18h

Base Address Register1 accesses to PCI configuration space and is always 4K type in [2:1] and memory space indicator in [0]

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR1):** Base Address1 This field is present if BAR1 is enabled through private configuration space
11:4	00h RO	**Size Field (SIZEINDICATOR1):** Always is 0 as minimum size is 4K

Bit Range	Default & Access	Field Name (ID): Description
3	0h RO	**Prefetchable Field (PREFETCHABLE1):** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**Type Field (TYPE1):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE1):** Memory Space Indicator: 0 Indicates this BAR is present in the memory space

4.1.8 Base Address Register1 High (BAR1_HIGH) - Offset 1Ch

Base Address Register1 High enabled only if [2:1] of BAR1_HIGH register is 10

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR1_HIGH):** Base Address: Base address of the AXI fabric memory space. Taken from Strap values as ones

4.1.9 Subsystem Vendor and Subsystem ID (SUBSYSTEMID) - Offset 2Ch

SVID Register along with SID Register is to distinguish subsystem from another

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O/P	**Subsystem ID Field (SUBSYSTEMID):** Subsystem ID: This register is implemented for any function that can be instantiated more than once in a given system
15:0	0000h RW/O/P	**Subsystem Vendor Field (SUBSYSTEMVENDORID):** Subsystem Vendor ID: This register must be implemented for any function that can be instantiated more than once in a given system

4.1.10 Expansion ROM Base Address (EXPANSION_ROM_BASEADDR) - Offset 30h

Expansion ROM Base Address Register is a RO indicates support for expansion ROMs

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Expansion Rom Base Address Field (EXPANSION_ROM_BASE):** Expansion ROM Base Address: Value of all zeros indicates no support for Expansion ROM

4.1.11 Capabilities Pointer (CAPABILITYPTR) - Offset 34h

Capabilities Pointer Register indicates what the next capability is

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 34h	00000080h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	80h RO	**Capabilities Pointer Field (CAPPTR_POWER):** Capabilities Pointer: Indicates what the next capability is

4.1.12 Interrupt Register (INTERRUPTREG) - Offset 3Ch

Interrupt Line Register is not use in Bridge directly. Interrupt Pin Register reflects the IPIN value in private configuration space. MIN_GNT register indicating the requirements of latency timers and MAX_LAT register for max latency

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 3Ch	00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Max Latency Field (MAX_LAT):** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	00h RO	**Min GNT Field (MIN_GNT):** Value of 0 indicates device has no major requirements for the settings of latency timers // Re-Check Desc Padma

Bit Range	Default & Access	Field Name (ID): Description
15:12	0h RO	**Reserved**
11:8	1h RO	**Interrupt Pin Field (INTPIN):** Interrupt Pin: Value in this register is reflected from the IPIN value in the private configuration space
7:0	00h RW/P	**Interrupt Line Field (INTLINE):** Interrupt Line: It is used to communicate to software the interrupt line to which the interrupt pin is connected

4.1.13 Power Management Capability ID (POWERCAPID) - Offset 80h

Power Management Capability ID Register points to next capability structure and Power Management Capability with Power Management Capabilities Register for PME support and version

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 80h	48030001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	09h RO	**PME Support Field (PMESUPPORT):** This 5-bit field indicates the power states in which the function can assert the PME#
26:19	0h RO	**Reserved**
18:16	3h RO	**Version Field (VERSION):** Indicates support for Revision 1.2 of the PCI Power Management Specification
15:8	00h RO	**Next Cap Field (NXTCAP):** Next Capability: Points to the next capability structure
7:0	01h RO	**Power Capability ID Field (POWER_CAP):** Power Management Capability: Indicates this is power management capability

4.1.14 Power Management Control And Status Register (PMECTRLSTATUS) - Offset 84h

Power Management Control and Status Register to set and read PME Status, PME Enable, No Soft reset and Power State

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 84h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW/1C/P	**PME Status Field (PMESTATUS):** PME Status
14:9	0h RO	**Reserved**
8	0h RW/P	**PME Enable Field (PMEENABLE):** PME Enable
7:4	0h RO	**Reserved**
3	1h RO	**No Soft Reset Field (NO_SOFT_RESET):** This bit indicates that devices transitioning from D3hot to D0 because of Power State commands do not perform an internal reset
2	0h RO	**Reserved**
1:0	0h RW	**Power State Field (POWERSTATE):** Power State: This field is used both to determine the current Power State and to set a new Power State

4.1.15 PCI Device Idle Vendor Capability Register (PCIDEVIDLE_CAP_RECORD) - Offset 90h

PCI Device Vendor Specific Capability Register defines Vendor Specific Capability ID, Revision Length, Next Capability and CAPID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 90h	F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**Vendor Cap Field (VEND_CAP):** Vendor Specific Capability ID
27:24	0h RO	**Revision ID Field (REVID):** Revision ID of capability structure
23:16	14h RO	**Cap Length Field (CAP_LENGTH):** Vendor Specific Capability Length
15:8	00h RO	**Next Capability Field (NEXT_CAP):** Next Capability
7:0	09h RO	**Capability ID Field (CAPID):** Capability ID

4.1.16 Vendor Specific Extended Capability Register (DEVID_VEND_SPECIFIC_REG) - Offset 94h

Extended Vendor Capability Register for VSEC Length, Revision and ID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 94h	01400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	014h RO	**Vendor Specific ID Field (VSEC_LENGTH):** Vendor Specific Extended Capability Length
19:16	0h RO	**Vendor Specific Revision Field (VSEC_REV):** Vendor Specific Extended Capability Revision
15:0	0010h RO	**Vendor Specific Length Field (VSECID):** Vendor Specific Extended Capability ID

4.1.17 Software LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG) - Offset 98h

Software Location Pointer in MMIO space as an offset specified by BAR

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RO	**SW LTR Dword Offset Field (SW_LAT_DWORD_OFFSET):** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**SW LTR Bar Number Field (SW_LAT_BAR_NUM):** Indicates that the SW LTR update MMIO location is always at BAR0
0	0h RO	**SW LTR Valid Field (SW_LAT_VALID):** This value is reflected from the SW LTR valid strap at the top level

4.1.18 Device Idle Pointer Register (DEVICE_IDLE_POINTER_REG) - Offset 9Ch

Device Idle Pointer Register giving details on Device MMIO Offset Location, BAR NUM and D0i3 Valid Strap

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RO	**D0i3 Dword Offset Field (DWORD_OFFSET):** Contains the location pointer to the SW LTR register in MMIO space as an offset from the specified BAR
3:1	0h RO	**BAR NUM Field (BAR_NUM):** BAR Num: Indicates that the D0i3 MMIO location is always at BAR0
0	0h RO	**D0i3 Valid Field (VALID):** Valid: This value is reflected from the D0i3 valid strap at the top level

4.1.19 D0i3 and Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG) - Offset A0h

D0idle_Max_Power_On_Latency Register set at boot and power control enable register to enable communication with the PGCB block below the Bridge

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + A0h	00000800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21	0h RW/P	**HAE:** Hardware Autonomous Enable
20	0h RO	**Reserved**
19	0h RW/P	**Sleep Enable Field (SLEEP_EN):** Sleep Enable
18	0h RW/P	**D3 Hen Field (D3HEN):** DEVIDLE Enable (DEVIDLEN): If '1' then the function will power gate when idle and the DevIdle register (DevIdleC[2] = '1') is set
17	0h RW/P	**Device Idle En Field (DEVIDLEN):** PMCRE: PMC Request Enable
16	0h RW/P	**PMC Request Enable Field (PMCRE):** D3-Hot Enable (D3HEN): If '1' then function will power gate when idle and the PMCSR[1:0] register in the function ='11' (D3)
15:13	0h RO	**Reserved**
12:10	2h RW/O/P	**Power Latency Scale Field (POW_LAT_SCALE):** Power On Latency Scale
9:0	000h RW/O/P	**Power Latency Value Field (POW_LAT_VALUE):** Power On Latency Value

4.1.20 General Purpose Read Write Register1 (GEN_PCI_REGRW1) - Offset B0h

General Purpose PCI Read Write Register1

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Read Write Field (GEN_PCI_REG_RW1):** General Purpose PCI Register: This register value is brought out as GEN_PCI_REG_RW1

4.1.21 General Purpose Input Register (GEN_INPUT_REG) - Offset C0h

General Purpose Input Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**General Purpose Input Field (GEN_REG_INPUT_RW):** General Purpose Input Register: This register value reflects the value of GEN_REG_INPUT_RW

4.1.22 MSI Capability Register (MSI_CAP_REG) - Offset D0h

MSI Capability Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + D0h	01800005h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	1h RO	**Per Vector Masking Capability Field (PER_VECTOR_MSK_CAP):** Per Vector Masking Capability
23	1h RO	**MSI Capability Field (MSI_CAP_64B):** 64 bit message address capability
22:20	0h RW	**Multi Message En Field (MUL_MSG_EN):** Multiple Message Enable
19:17	0h RO	**Multi Message Cap Field (MUL_MSG_CAP):** Multiple Message Capable

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**MSI Enable Field (MSG_MSI_ENABLE):** MSI Enable
15:8	00h RO	**Next Pointer Field (MSG_NXT_PTR):** Next Capability Pointer
7:0	05h RO	**MSI Capability Field (MSG_CAP_ID):** MSI Capability ID

4.1.23 MSI Message Low Address (MSI_ADDR_LOW) - Offset D4h

MSI Message Low Address

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RW	**MSI Message Low Address Field (MSI_ADDR_LOW):** MSI Message Low Address
1:0	0h RO	**Reserved**

4.1.24 MSI Message High Address (MSI_ADDR_HIGH) - Offset D8h

MSI Message High Address

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSI Message High Address Field (MSI_ADDR_HIGH):** MSI Message High Address

4.1.25 MSI Message Data (MSI_MSG_DATA) - Offset DCh

MSI Message Data

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + DCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0000h RW	**MSI Message Data Field (MSI_MSG_DATA):** MSI Message Data

4.1.26 MSI Mask Register (MSI_MASK) - Offset E0h

MSI Mask bits

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + E0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSI Mask Field (MSI_MASK):** MSI Mask bits

4.1.27 MSI Pending Register (MSI_PENDING) - Offset E4h

MSI Pending bits

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**MSI Pending Field (MSI_PENDING):** MSI Pending bits

4.1.28 Manufacturers ID (MANID) - Offset F8h

Manufacturers ID Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + F8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/P	**Manufacturers ID Field (MANID):** Manufacturer ID: Default value comes from straps

4.2 DMA MMIO Registers Summary

Table 4-2. Summary of Bus: 0, Device: 29, Function: 3 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	SAR0	00000000h
8h	4	DAR0	00000000h
10h	4	LLP0	00000000h
18h	4	CTL_LO0	00000000h
1Ch	4	CTL_HI0	00000000h
20h	4	SSTAT0	00000000h
28h	4	DSTAT0	00000000h
30h	4	SSTATAR0	00000000h

4.2.1 SAR0 - Offset 0h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer.

While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register (Decrementing addresses are not supported). It's important to notice the following: * Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one in an OCP tracker. * If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. * If the last DMA read was a burst read (i.e. burst length > 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. * If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. * Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) * Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. * The read-back behavior of the SAR/DAR registers can be overridden if the default setting of the EXACT_SAR_DAR_RDBACK parameter is changed from (0) to (1), and if of the GLOBAL_CFG. ENABLE_EXACT_SAR_DAR bit default is changed from (0) to (1). By modifying these 2 settings, the read-back behavior can be changed to the following: 1. Once an OCP command (Read/Write) is sent, and its response comes back, the SAR/DAR values will be updated. 2. If a channel is enabled, the SAR/DAR read-back values will indicate the latest updated byte address in INCR mode, while they reflect the programmed fixed values in FIXED mode. 3. If a channel is disabled, the read-back values of SAR/DAR will reflect whatever is physically programmed into these registers (whether through direct programming or through linked-list descriptor fetches). 4. Before the very first read or write take place, the SAR/DAR read-back values will be zeros. 5. Even though this behavior is far more accurate than the default behavior, there is an associated gate count increase. Enabling this feature (through setting the EXACT_SAR_DAR_RDBACK parameter), adds the following number of flops to the design: a. ((OUTSTANDING_READS + OUTSTANDING_WRITES) * (ADDR_WIDTH + 1)) + (2 * N_CHNLS * ADD_WIDTH) b. For N_CHNLS=8, ADDR_WIDTH=32, OUTSTANDING_READS=8 and OUTSTANDING_WRITES=2, this will result in 832 extra flops added to the design.

4.2.2 DAR0 - Offset 8h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register (Decrementing addresses are not supported). It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length > 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one.

4.2.3 LLP0 - Offset 10h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. The method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0h RO	**Reserved**

4.2.4 CTL_LO0 - Offset 18h

This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0h RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	00h RW	**SCRATCH_PAD:** This field will have all bits with R/W attribute to be used for future use. DO NOT change the zero default settings.
21:20	0h RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0h RO	**Reserved**
18	0h RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0h RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0h RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source.
13:11	0h RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination.

Bit Range	Default & Access	Field Name (ID): Description
10	0h RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0h RO	**Reserved**
8	0h RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0h RO	**Reserved**
6:4	0h RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width < 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0h RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width < 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0h RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

4.2.5 CTL_HI0 - Offset 1Ch

This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled. If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior.
28:18	000h RW	**CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions: 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0h RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	00000h RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

4.2.6 SSTAT0 - Offset 20h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block.

Note: This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 20h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

4.2.7 DSTAT0 - Offset 28h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI.

Note: This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 28h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

4.2.8 SSTATAR0 - Offset 30h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

4.2.9 DSTATAR0 - Offset 38h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 38h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

4.2.10 CFG_LO0 - Offset 40h

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Type	Size	Offset	Default
MMIO	32 bit	BAR + 40h	00000203h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0h RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0h RO	**Reserved**
21	0h RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 <= BL <= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled
20	0h RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 <= BL <= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled

Bit Range	Default & Access	Field Name (ID): Description
19	0h RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0h RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0h RW	**WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values
16	0h RW	**WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values
15	0h RW	**RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values
14	0h RW	**RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors
13	0h RW	**WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port
12	0h RW	**RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port
11	0h RO	**Reserved**
10	0h RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	1h RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0h RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0h RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0h RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0h RO	**Reserved**
3	0h RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0h RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	1h RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary
0	1h RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

4.2.11 CFG_HI0 - Offset 44h

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Type	Size	Offset	Default
MMIO	32 bit	BAR + 44h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes {DST_PER_EXT[1:0], DST_PER[3:0]} which covers the (0-63) range.
29:28	0h RW	**SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes {SRC_PER_EXT[1:0], SRC_PER[3:0]} which covers the (0-63) range.
27:18	000h RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	000h RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.
7:4	0h RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. ***NOTE:*** For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface.
3:0	0h RW	**SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. ***NOTE:*** For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface.

4.2.12 SAR1 - Offset 58h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 58h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register (Decrementing addresses are not supported). It's important to notice the following: * Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. * If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. * If the last DMA read was a burst read (i.e. burst length > 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. * If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. * Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) * Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. * The read-back behavior of the SAR/DAR registers can be overridden if the default setting of the EXACT_SAR_DAR_RDBACK parameter is changed from (0) to (1), and if of the GLOBAL_CFG. ENABLE_EXACT_SAR_DAR bit default is changed from (0) to (1). By modifying these 2 settings, the read-back behavior can be changed to the following: 1. Once an OCP command (Read/Write) is sent, and its response comes back, the SAR/DAR values will be updated. 2. If a channel is enabled, the SAR/DAR read-back values will indicate the latest updated byte address in INCR mode, while they reflect the programmed fixed values in FIXED mode. 3. If a channel is disabled, the read-back values of SAR/DAR will reflect whatever is physically programmed into these registers (whether through direct programming or through linked-list descriptor fetches). 4. Before the very first read or write take place, the SAR/DAR read-back values will be zeros. 5. Even though this behavior is far more accurate than the default behavior, there is an associated gate count increase. Enabling this feature (through setting the EXACT_SAR_DAR_RDBACK parameter), adds the following number of flops to the design: a. ((OUTSTANDING_READS + OUTSTANDING_WRITES) * (ADDR_WIDTH + 1)) + (2 * N_CHNLS * ADD_WIDTH) b. For N_CHNLS=8, ADDR_WIDTH=32, OUTSTANDING_READS=8 and OUTSTANDING_WRITES=2, this will result in 832 extra flops added to the design.

4.2.13 DAR1 - Offset 60h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 60h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register (Decrementing addresses are not supported). It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length > 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one.

4.2.14 LLP1 - Offset 68h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. The method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 68h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0h RO	**Reserved**

4.2.15 CTL_LO1 - Offset 70h

This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 70h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0h RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	00h RW	**SCRATCH_PAD:** This field will have all bits with R/W attribute to be used for future use. DO NOT change the zero default settings.
21:20	0h RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0h RO	**Reserved**
18	0h RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0h RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source.
13:11	0h RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination.
10	0h RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0h RO	**Reserved**
8	0h RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0h RO	**Reserved**
6:4	0h RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width < 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0h RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width < 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0h RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

4.2.16 CTL_HI1 - Offset 74h

This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled. If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 74h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior.

Bit Range	Default & Access	Field Name (ID): Description
28:18	000h RW	**CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0h RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	00000h RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

4.2.17 SSTAT1 - Offs et 78h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block.

Note: This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be

retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 78h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

4.2.18 DSTAT1 - Offset 80h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI.

Note: This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 80h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

4.2.19 SSTATAR1 - Offset 88h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 88h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

4.2.20 DSTATAR1 - Offset 90h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 90h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

4.2.21 CFG_LO1 - Offset 98h

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Type	Size	Offset	Default
MMIO	32 bit	BAR + 98h	00000203h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0h RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
21	0h RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 <= BL <= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled
20	0h RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 <= BL <= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0h RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0h RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0h RW	**WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values
16	0h RW	**WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values
15	0h RW	**RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values
14	0h RW	**RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors
13	0h RW	**WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port
12	0h RW	**RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port
11	0h RO	**Reserved**
10	0h RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	1h RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0h RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0h RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0h RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0h RO	**Reserved**
3	0h RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0h RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	1h RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary
0	1h RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

4.2.22 CFG_HI1 - Offset 9Ch

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Type	Size	Offset	Default
MMIO	32 bit	BAR + 9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsis limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes {DST_PER_EXT[1:0], DST_PER[3:0]} which covers the (0-63) range.
29:28	0h RW	**SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsis limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes {SRC_PER_EXT[1:0], SRC_PER[3:0]} which covers the (0-63) range.
27:18	000h RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	000h RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.
7:4	0h RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. ***Note:*** For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface.
3:0	0h RW	**SRC_PER:** Source Peripheral ID: Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. ***Note:*** For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface.

4.2.23 SAR2 - Offset B0h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register (Decrementing addresses are not supported). It's important to notice the following: * Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. * If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. * If the last DMA read was a burst read (i.e. burst length > 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. * If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. * Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) * Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. * The read-back behavior of the SAR/DAR registers can be overridden if the default setting of the EXACT_SAR_DAR_RDBACK parameter is changed from (0) to (1), and if of the GLOBAL_CFG. ENABLE_EXACT_SAR_DAR bit default is changed from (0) to (1). By modifying these 2 settings, the read-back behavior can be changed to the following: 1. Once an OCP command (Read/Write) is sent, and its response comes back, the SAR/DAR values will be updated. 2. If a channel is enabled, the SAR/DAR read-back values will indicate the latest updated byte address in INCR mode, while they reflect the programmed fixed values in FIXED mode. 3. If a channel is disabled, the read-back values of SAR/DAR will reflect whatever is physically programmed into these registers (whether through direct programming or through linked-list descriptor fetches). 4. Before the very first read or write take place, the SAR/DAR read-back values will be zeros. 5. Even though this behavior is far more accurate than the default behavior, there is an associated gate count increase. Enabling this feature (through setting the EXACT_SAR_DAR_RDBACK parameter), adds the following number of flops to the design: a. ((OUTSTANDING_READS + OUTSTANDING_WRITES) * (ADDR_WIDTH + 1)) + (2 * N_CHNLS * ADD_WIDTH) b. For N_CHNLS=8, ADDR_WIDTH=32, OUTSTANDING_READS=8 and OUTSTANDING_WRITES=2, this will result in 832 extra flops added to the design.

4.2.24 DAR2 - Offset B8h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Type	Size	Offset	Default
MMIO	32 bit	BAR + B8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register (Decrementing addresses are not supported). It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length > 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one.

4.2.25 LLP2 - Offset C0h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. The method of updating the channel registers is a function of LLP.LOC!= 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC!= 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0h RO	**Reserved**

4.2.26 CTL_LO2 - Offset C8h

This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Type	Size	Offset	Default
MMIO	32 bit	BAR + C8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0h RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	00h RW	**SCRATCH_PAD:** This field will have all bits with R/W attribute to be used for future use. DO NOT change the zero default settings.
21:20	0h RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0h RO	**Reserved**
18	0h RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0h RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source.
13:11	0h RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination.
10	0h RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0h RO	**Reserved**
8	0h RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0h RO	**Reserved**
6:4	0h RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width < 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0h RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width < 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0h RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

4.2.27 CTL_HI2 - Offset CCh

This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Type	Size	Offset	Default
MMIO	32 bit	BAR + CCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior.

Bit Range	Default & Access	Field Name (ID): Description
28:18	000h RW	**CH_WEIGHT:** Channel Weight: Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0h RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	00000h RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesn't mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

4.2.28 SSTAT2 - Offset D0h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block.

Note: This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

4.2.29 DSTAT2 - Offset D8h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI.

Note: This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Type	Size	Offset	Default
MMIO	32 bit	BAR + D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

4.2.30 SSTATAR2 - Offset E0h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

4.2.31 DSTATAR2 - Offset E8h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + E8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

4.2.32 CFG_LO2 - Offset F0h

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Type	Size	Offset	Default
MMIO	32 bit	BAR + F0h	00000203h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0h RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
21	0h RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 <= BL <= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled
20	0h RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 <= BL <= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0h RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0h RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0h RW	**WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values
16	0h RW	**WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values
15	0h RW	**RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values
14	0h RW	**RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors
13	0h RW	**WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port
12	0h RW	**RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port
11	0h RO	**Reserved**
10	0h RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	1h RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0h RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0h RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0h RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0h RO	**Reserved**
3	0h RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0h RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	1h RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary
0	1h RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

4.2.33 CFG_HI2 - Offset F4h

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Type	Size	Offset	Default
MMIO	32 bit	BAR + F4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsis limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes {DST_PER_EXT[1:0], DST_PER[3:0]} which covers the (0-63) range.
29:28	0h RW	**SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsis limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes {SRC_PER_EXT[1:0], SRC_PER[3:0]} which covers the (0-63) range.
27:18	000h RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	000h RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.
7:4	0h RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. ***Note:*** For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface.
3:0	0h RW	**SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. ***Note:*** For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface.

4.2.34 SAR3 - Offset 108h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer.

While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 108h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register (Decrementing addresses are not supported). It's important to notice the following: * Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. * If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. * If the last DMA read was a burst read (i.e. burst length > 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. * If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. * Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) * Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. * The read-back behavior of the SAR/DAR registers can be overridden if the default setting of the EXACT_SAR_DAR_RDBACK parameter is changed from (0) to (1), and if of the GLOBAL_CFG. ENABLE_EXACT_SAR_DAR bit default is changed from (0) to (1). By modifying these 2 settings, the read-back behavior can be changed to the following: 1. Once an OCP command (Read/Write) is sent, and its response comes back, the SAR/DAR values will be updated. 2. If a channel is enabled, the SAR/DAR read-back values will indicate the latest updated byte address in INCR mode, while they reflect the programmed fixed values in FIXED mode. 3. If a channel is disabled, the read-back values of SAR/DAR will reflect whatever is physically programmed into these registers (whether through direct programming or through linked-list descriptor fetches). 4. Before the very first read or write take place, the SAR/DAR read-back values will be zeros. 5. Even though this behavior is far more accurate than the default behavior, there is an associated gate count increase. Enabling this feature (through setting the EXACT_SAR_DAR_RDBACK parameter), adds the following number of flops to the design: a. ((OUTSTANDING_READS + OUTSTANDING_WRITES) * (ADDR_WIDTH + 1)) + (2 * N_CHNLS * ADD_WIDTH) b. For N_CHNLS=8, ADDR_WIDTH=32, OUTSTANDING_READS=8 and OUTSTANDING_WRITES=2, this will result in 832 extra flops added to the design.

4.2.35 DAR3 - Offset 110h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 110h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register (Decrementing addresses are not supported). It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length > 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one.

4.2.36 LLP3 - Offset 118h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC!= 0 is used to set up the type of DMA transfer-single or multi-block. The method of updating the channel registers is a function of LLP.LOC!= 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC!= 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 118h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0h RO	**Reserved**

4.2.37 CTL_LO3 - Offset 120h

This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 120h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0h RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	00h RW	**SCRATCH_PAD:** This field will have all bits with R/W attribute to be used for future use. DO NOT change the zero default settings.
21:20	0h RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0h RO	**Reserved**
18	0h RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0h RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source.
13:11	0h RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination.
10	0h RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0h RO	**Reserved**
8	0h RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0h RO	**Reserved**
6:4	0h RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width < 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0h RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width < 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0h RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

4.2.38 CTL_HI3 - Offset 124h

This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 124h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior.

Bit Range	Default & Access	Field Name (ID): Description
28:18	000h RW	**CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions: 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0h RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	00000h RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

4.2.39 SSTAT3 - Offset 128h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block.

Note: This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be

retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 128h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

4.2.40 DSTAT3 - Offset 130h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI.

Note: This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 130h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

4.2.41 SSTATAR3 - Offset 138h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 138h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

4.2.42 DSTATAR3 - Offset 140h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 140h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

4.2.43 CFG_LO3 - Offset 148h

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Type	Size	Offset	Default
MMIO	32 bit	BAR + 148h	00000203h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0h RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
21	0h RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 <= BL <= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled
20	0h RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 <= BL <= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0h RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0h RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0h RW	**WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values
16	0h RW	**WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values
15	0h RW	**RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values
14	0h RW	**RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors
13	0h RW	**WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port
12	0h RW	**RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port
11	0h RO	**Reserved**
10	0h RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	1h RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0h RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0h RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0h RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0h RO	**Reserved**
3	0h RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0h RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	1h RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary
0	1h RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

4.2.44 CFG_HI3 - Offset 14Ch

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsis limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes {DST_PER_EXT[1:0], DST_PER[3:0]} which covers the (0-63) range.
29:28	0h RW	**SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsis limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes {SRC_PER_EXT[1:0], SRC_PER[3:0]} which covers the (0-63) range.
27:18	000h RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	000h RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.
7:4	0h RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. ***Note***: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface.
3:0	0h RW	**SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. ***Note***: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface.

4.2.45 SAR4 - Offset 160h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 160h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register (Decrementing addresses are not supported). It's important to notice the following: * Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. * If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. * If the last DMA read was a burst read (i.e. burst length > 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. * If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. * Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) * Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. * The read-back behavior of the SAR/DAR registers can be overridden if the default setting of the EXACT_SAR_DAR_RDBACK parameter is changed from (0) to (1), and if of the GLOBAL_CFG. ENABLE_EXACT_SAR_DAR bit default is changed from (0) to (1). By modifying these 2 settings, the read-back behavior can be changed to the following: 1. Once an OCP command (Read/Write) is sent, and its response comes back, the SAR/DAR values will be updated. 2. If a channel is enabled, the SAR/DAR read-back values will indicate the latest updated byte address in INCR mode, while they reflect the programmed fixed values in FIXED mode. 3. If a channel is disabled, the read-back values of SAR/DAR will reflect whatever is physically programmed into these registers (whether through direct programming or through linked-list descriptor fetches). 4. Before the very first read or write take place, the SAR/DAR read-back values will be zeros. 5. Even though this behavior is far more accurate than the default behavior, there is an associated gate count increase. Enabling this feature (through setting the EXACT_SAR_DAR_RDBACK parameter), adds the following number of flops to the design: a. ((OUTSTANDING_READS + OUTSTANDING_WRITES) * (ADDR_WIDTH + 1)) + (2 * N_CHNLS * ADD_WIDTH) b. For N_CHNLS=8, ADDR_WIDTH=32, OUTSTANDING_READS=8 and OUTSTANDING_WRITES=2, this will result in 832 extra flops added to the design.

4.2.46 DAR4 - Offset 168h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 168h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register (Decrementing addresses are not supported). It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length > 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one.

4.2.47 LLP4 - Offset 170h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC!= 0 is used to set up the type of DMA transfer-single or multi-block. The method of updating the channel registers is a function of LLP.LOC!= 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC!= 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 170h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0h RO	**Reserved**

4.2.48 CTL_LO4 - Offset 178h

This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 178h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0h RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	00h RW	**SCRATCH_PAD:** This field will have all bits with R/W attribute to be used for future use. DO NOT change the zero default settings.
21:20	0h RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0h RO	**Reserved**
18	0h RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0h RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source.
13:11	0h RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination.
10	0h RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0h RO	**Reserved**
8	0h RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0h RO	**Reserved**
6:4	0h RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width < 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0h RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width < 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0h RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

4.2.49 CTL_HI4 - Offset 17Ch

This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 17Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior.

Bit Range	Default & Access	Field Name (ID): Description
28:18	000h RW	**CH_WEIGHT:** Channel Weight: Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions: 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0h RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	00000h RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesn't mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

4.2.50 SSTAT4 - Offset 180h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block.

Note: This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 180h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

4.2.51 DSTAT4 - Offset 188h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI.

Note: This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 188h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

4.2.52 SSTATAR4 - Offset 190h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 190h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

4.2.53 DSTATAR4 - Offset 198h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 198h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

4.2.54 CFG_LO4 - Offset 1A0h

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1A0h	00000203h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0h RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
21	0h RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 <= BL <= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled
20	0h RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 <= BL <= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0h RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0h RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0h RW	**WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values
16	0h RW	**WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values
15	0h RW	**RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values
14	0h RW	**RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors
13	0h RW	**WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port
12	0h RW	**RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port
11	0h RO	**Reserved**
10	0h RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	1h RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0h RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0h RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0h RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0h RO	**Reserved**
3	0h RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0h RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	1h RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary
0	1h RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

4.2.55 CFG_HI4 - Offset 1A4h

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1A4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsis limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes {DST_PER_EXT[1:0], DST_PER[3:0]} which covers the (0-63) range.
29:28	0h RW	**SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsis limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes {SRC_PER_EXT[1:0], SRC_PER[3:0]} which covers the (0-63) range.
27:18	000h RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	000h RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.
7:4	0h RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. ***Note***: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface.
3:0	0h RW	**SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. ***Note***: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface.

4.2.56 SAR5 - Offset 1B8h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1B8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register (Decrementing addresses are not supported). It's important to notice the following: * Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. * If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. * If the last DMA read was a burst read (i.e. burst length > 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. * If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. * Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) * Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. * The read-back behavior of the SAR/DAR registers can be overridden if the default setting of the EXACT_SAR_DAR_RDBACK parameter is changed from (0) to (1), and if of the GLOBAL_CFG. ENABLE_EXACT_SAR_DAR bit default is changed from (0) to (1). By modifying these 2 settings, the read-back behavior can be changed to the following: 1. Once an OCP command (Read/Write) is sent, and its response comes back, the SAR/DAR values will be updated. 2. If a channel is enabled, the SAR/DAR read-back values will indicate the latest updated byte address in INCR mode, while they reflect the programmed fixed values in FIXED mode. 3. If a channel is disabled, the read-back values of SAR/DAR will reflect whatever is physically programmed into these registers (whether through direct programming or through linked-list descriptor fetches). 4. Before the very first read or write take place, the SAR/DAR read-back values will be zeros. 5. Even though this behavior is far more accurate than the default behavior, there is an associated gate count increase. Enabling this feature (through setting the EXACT_SAR_DAR_RDBACK parameter), adds the following number of flops to the design: a. ((OUTSTANDING_READS + OUTSTANDING_WRITES) * (ADDR_WIDTH + 1)) + (2 * N_CHNLS * ADD_WIDTH) b. For N_CHNLS=8, ADDR_WIDTH=32, OUTSTANDING_READS=8 and OUTSTANDING_WRITES=2, this will result in 832 extra flops added to the design.

4.2.57 DAR5 - Offset 1C0h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register (Decrementing addresses are not supported). It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length > 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one.

4.2.58 LLP5 - Offset 1C8h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC!= 0 is used to set up the type of DMA transfer-single or multi-block. The method of updating the channel registers is a function of LLP.LOC!= 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC!= 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1C8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0h RO	**Reserved**

4.2.59 CTL_LO5 - Offset 1D0h

This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1D0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0h RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	00h RW	**SCRATCH_PAD:** This field will have all bits with R/W attribute to be used for future use. DO NOT change the zero default settings.
21:20	0h RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0h RO	**Reserved**
18	0h RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0h RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source.
13:11	0h RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination.
10	0h RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0h RO	**Reserved**
8	0h RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0h RO	**Reserved**
6:4	0h RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width < 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0h RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width < 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0h RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

4.2.60 CTL_HI5 - Offset 1D4h

This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior.

Bit Range	Default & Access	Field Name (ID): Description
28:18	000h RW	**CH_WEIGHT:** Channel Weight: Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions: 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0h RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	00000h RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

4.2.61 SSTAT5 - Offset 1D8h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block.

Note: This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

4.2.62 DSTAT5 - Offset 1E0h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI.

Note: This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1E0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

4.2.63 SSTATAR5 - Offset 1E8h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1E8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

4.2.64 DSTATAR5 - Offset 1F0h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1F0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

4.2.65 CFG_LO5 - Offset 1F8h

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1F8h	00000203h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0h RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
21	0h RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 <= BL <= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled
20	0h RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 <= BL <= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0h RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0h RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0h RW	**WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values
16	0h RW	**WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values
15	0h RW	**RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values
14	0h RW	**RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors
13	0h RW	**WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port
12	0h RW	**RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port
11	0h RO	**Reserved**
10	0h RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	1h RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0h RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0h RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0h RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0h RO	**Reserved**
3	0h RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0h RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	1h RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary
0	1h RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

4.2.66 CFG_HI5 - Offset 1FCh

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1FCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsis limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes {DST_PER_EXT[1:0], DST_PER[3:0]} which covers the (0-63) range.
29:28	0h RW	**SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsis limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes {SRC_PER_EXT[1:0], SRC_PER[3:0]} which covers the (0-63) range.
27:18	000h RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	000h RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.
7:4	0h RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. ***Note***: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface.
3:0	0h RW	**SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. ***Note***: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface.

4.2.67 SAR6 - Offset 210h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 210h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register (Decrementing addresses are not supported). It's important to notice the following: * Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. * If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. * If the last DMA read was a burst read (i.e. burst length > 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. * If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. * Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) * Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. * The read-back behavior of the SAR/DAR registers can be overridden if the default setting of the EXACT_SAR_DAR_RDBACK parameter is changed from (0) to (1), and if of the GLOBAL_CFG. ENABLE_EXACT_SAR_DAR bit default is changed from (0) to (1). By modifying these 2 settings, the read-back behavior can be changed to the following: 1. Once an OCP command (Read/Write) is sent, and its response comes back, the SAR/DAR values will be updated. 2. If a channel is enabled, the SAR/DAR read-back values will indicate the latest updated byte address in INCR mode, while they reflect the programmed fixed values in FIXED mode. 3. If a channel is disabled, the read-back values of SAR/DAR will reflect whatever is physically programmed into these registers (whether through direct programming or through linked-list descriptor fetches). 4. Before the very first read or write take place, the SAR/DAR read-back values will be zeros. 5. Even though this behavior is far more accurate than the default behavior, there is an associated gate count increase. Enabling this feature (through setting the EXACT_SAR_DAR_RDBACK parameter), adds the following number of flops to the design: a. ((OUTSTANDING_READS + OUTSTANDING_WRITES) * (ADDR_WIDTH + 1)) + (2 * N_CHNLS * ADD_WIDTH) b. For N_CHNLS=8, ADDR_WIDTH=32, OUTSTANDING_READS=8 and OUTSTANDING_WRITES=2, this will result in 832 extra flops added to the design.

4.2.68 DAR6 - Offset 218h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 218h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register (Decrementing addresses are not supported). It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length > 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one.

4.2.69 LLP6 - Offset 220h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC!= 0 is used to set up the type of DMA transfer-single or multi-block. The method of updating the channel registers is a function of LLP.LOC!= 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC!= 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 220h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0h RO	**Reserved**

4.2.70 CTL_LO6 - Offset 228h

This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 228h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0h RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	00h RW	**SCRATCH_PAD:** This field will have all bits with R/W attribute to be used for future use. DO NOT change the zero default settings.
21:20	0h RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0h RO	**Reserved**
18	0h RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0h RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source.
13:11	0h RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination.
10	0h RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0h RO	**Reserved**
8	0h RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0h RO	**Reserved**
6:4	0h RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width < 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0h RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width < 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0h RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

4.2.71 CTL_HI6 - Offset 22Ch

This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled. If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 22Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior.

Bit Range	Default & Access	Field Name (ID): Description
28:18	000h RW	**CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0h RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	00000h RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

4.2.72 SSTAT6 - Offset 230h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block.

Note: This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 230h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

4.2.73 DSTAT6 - Offset 238h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI.

Note: This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 238h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

4.2.74 SSTATAR6 - Offset 240h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 240h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

4.2.75 DSTATAR6 - Offset 248h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 248h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

4.2.76 CFG_LO6 - Offset 250h

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Type	Size	Offset	Default
MMIO	32 bit	BAR + 250h	00000203h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0h RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
21	0h RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 <= BL <= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled
20	0h RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 <= BL <= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0h RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0h RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0h RW	**WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values
16	0h RW	**WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values
15	0h RW	**RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values
14	0h RW	**RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors
13	0h RW	**WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port
12	0h RW	**RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port
11	0h RO	**Reserved**
10	0h RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	1h RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0h RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0h RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0h RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0h RO	**Reserved**
3	0h RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0h RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	1h RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary
0	1h RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

4.2.77 CFG_HI6 - Offset 254h

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Type	Size	Offset	Default
MMIO	32 bit	BAR + 254h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsis limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes {DST_PER_EXT[1:0], DST_PER[3:0]} which covers the (0-63) range.
29:28	0h RW	**SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsis limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes {SRC_PER_EXT[1:0], SRC_PER[3:0]} which covers the (0-63) range.
27:18	000h RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	000h RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.
7:4	0h RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. ***Note***: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface.
3:0	0h RW	**SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. ***Note***: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface.

4.2.78 SAR7 - Offset 268h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 268h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register (Decrementing addresses are not supported). It's important to notice the following: * Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one in an OCP tracker. * If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. * If the last DMA read was a burst read (i.e. burst length > 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. * If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. * Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) * Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. * The read-back behavior of the SAR/DAR registers can be overridden if the default setting of the EXACT_SAR_DAR_RDBACK parameter is changed from (0) to (1), and if of the GLOBAL_CFG. ENABLE_EXACT_SAR_DAR bit default is changed from (0) to (1). By modifying these 2 settings, the read-back behavior can be changed to the following: 1. Once an OCP command (Read/Write) is sent, and its response comes back, the SAR/DAR values will be updated. 2. If a channel is enabled, the SAR/DAR read-back values will indicate the latest updated byte address in INCR mode, while they reflect the programmed fixed values in FIXED mode. 3. If a channel is disabled, the read-back values of SAR/DAR will reflect whatever is physically programmed into these registers (whether through direct programming or through linked-list descriptor fetches). 4. Before the very first read or write take place, the SAR/DAR read-back values will be zeros. 5. Even though this behavior is far more accurate than the default behavior, there is an associated gate count increase. Enabling this feature (through setting the EXACT_SAR_DAR_RDBACK parameter), adds the following number of flops to the design: a. ((OUTSTANDING_READS + OUTSTANDING_WRITES) * (ADDR_WIDTH + 1)) + (2 * N_CHNLS * ADD_WIDTH) b. For N_CHNLS=8, ADDR_WIDTH=32, OUTSTANDING_READS=8 and OUTSTANDING_WRITES=2, this will result in 832 extra flops added to the design.

4.2.79 DAR7 - Offset 270h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 270h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register (Decrementing addresses are not supported). It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length > 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one.

4.2.80 LLP7 - Offset 278h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC!= 0 is used to set up the type of DMA transfer-single or multi-block. The method of updating the channel registers is a function of LLP.LOC!= 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC!= 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 278h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0h RO	**Reserved**

4.2.81 CTL_LO7 - Offset 280h

This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 280h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	0h RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0h RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	00h RW	**SCRATCH_PAD:** This field will have all bits with R/W attribute to be used for future use. DO NOT change the zero default settings.
21:20	0h RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0h RO	**Reserved**
18	0h RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0h RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0h RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source.
13:11	0h RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination.

Bit Range	Default & Access	Field Name (ID): Description
10	0h RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0h RO	**Reserved**
8	0h RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0h RO	**Reserved**
6:4	0h RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width < 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0h RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width < 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0h RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

4.2.82 CTL_HI7 - Offset 284h

This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 284h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior.
28:18	000h RW	**CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0h RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	00000h RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

4.2.83 SSTAT7 - Offset 288h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block.

Note: This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 288h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

4.2.84 DSTAT7 - Offset 290h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI.

Note: This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 290h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

4.2.85 SSTATAR7 - Offset 298h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 298h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

4.2.86 DSTATAR7 - Offset 2A0h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 2A0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

4.2.87 CFG_LO7 - Offset 2A8h

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 2A8h	00000203h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0h RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0h RO	**Reserved**
21	0h RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 <= BL <= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled
20	0h RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 <= BL <= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0h RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0h RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0h RW	**WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values
16	0h RW	**WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values
15	0h RW	**RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values
14	0h RW	**RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors
13	0h RW	**WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port
12	0h RW	**RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port
11	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
10	0h RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	1h RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0h RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0h RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0h RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0h RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0h RO	**Reserved**
3	0h RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0h RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	1h RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary
0	1h RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

4.2.88 CFG_HI7 - Offset 2ACh

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 2ACh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsis limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes {DST_PER_EXT[1:0], DST_PER[3:0]} which covers the (0-63) range.
29:28	0h RW	**SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsis limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes {SRC_PER_EXT[1:0], SRC_PER[3:0]} which covers the (0-63) range.
27:18	000h RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	000h RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.
7:4	0h RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. ***Note***: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface.
3:0	0h RW	**SRC_PER:** Source Peripheral ID: Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. ***Note***: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface.

4.2.89 RAWTFR - Offset 2C0h

Interrupt events are stored in these Raw Interrupt Status registers before masking: RawBlock, RawDstTran, RawErr, RawSrcTran, and RawTfr. Each Raw Interrupt Status register has a bit allocated per channel, for example, RawTfr(2) is the Channel 2 raw transfer complete interrupt. Each bit in these registers is cleared by writing a 1 to the corresponding location in the ClearTfr, ClearBlock, ClearSrcTran, ClearDstTran, ClearErr registers.

The following RAW registers are available in the DMA

RawTfr - Raw Status for Transfer Interrupts

RawBlock - Raw Status for Block Interrupts Register

RawSrcTran - Raw Status for Source Transaction Interrupts Register

RawDstTran - Raw Status for Destination Transaction Interrupts Register

RawErr - Raw Status for Error Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 2C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO	**RAW:** Raw interrupt status

4.2.90 RAWBLOCK - Offset 2C8h

Interrupt events are stored in these Raw Interrupt Status registers before masking: RawBlock, RawDstTran, RawErr, RawSrcTran, and RawTfr. Each Raw Interrupt Status register has a bit allocated per channel, for example, RawTfr(2) is the Channel 2 raw transfer complete interrupt. Each bit in these registers is cleared by writing a 1 to the corresponding location in the ClearTfr, ClearBlock, ClearSrcTran, ClearDstTran, ClearErr registers.

The following RAW registers are available in the DMA

RawTfr - Raw Status for Transfer Interrupts

RawBlock - Raw Status for Block Interrupts Register

RawSrcTran - Raw Status for Source Transaction Interrupts Register

RawDstTran - Raw Status for Destination Transaction Interrupts Register

RawErr - Raw Status for Error Interrupts Register

Type	Size	Offset	Default
MMIO	32 bit	BAR + 2C8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO	**RAW:** Raw interrupt status

4.2.91 RAWSRCTRAN - Offset 2D0h

Interrupt events are stored in these Raw Interrupt Status registers before masking: RawBlock, RawDstTran, RawErr, RawSrcTran, and RawTfr. Each Raw Interrupt Status register has a bit allocated per channel, for example, RawTfr(2) is the Channel 2 raw transfer complete interrupt. Each bit in these registers is cleared by writing a 1 to the corresponding location in the ClearTfr, ClearBlock, ClearSrcTran, ClearDstTran, ClearErr registers.

The following RAW registers are available in the DMA

RawTfr - Raw Status for Transfer Interrupts

RawBlock - Raw Status for Block Interrupts Register

RawSrcTran - Raw Status for Source Transaction Interrupts Register

RawDstTran - Raw Status for Destination Transaction Interrupts Register

RawErr - Raw Status for Error Interrupts Register

4.2.96 STATUSSRCTRAN - Offset 2F8h

All interrupt events from all channels are stored in these Interrupt Status registers after masking: statusBlock, StatusDstTran, StatusErr, StatusSrcTran, and StatusTfr. Each Interrupt Status register has a bit allocated per channel, for example, StatusTfr(2) is the Channel 2 status transfer complete interrupt. The contents of these registers are used to generate the interrupt signals (int or int_n bus, depending on interrupt polarity) leaving the DMA.

31:8	0h RO	**Reserved**
7:0	00h RO	**STATUS:** Interrupt status

4.2.99 MASKTFR - Offset 310h

The contents of the Raw Status registers are masked with the contents of the Mask registers: MaskBlock, MaskDstTran, MaskErr, MaskSrcTran, and MaskTfr. Each Interrupt Mask register has a bit allocated per channel, for example, MaskTfr(2) is the mask bit for the Channel 2 transfer complete interrupt. When the source peripheral of DMA channel i is memory, then the source transaction complete interrupt, MaskSrcTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined signal. Similarly, when the destination peripheral of DMA channel i is memory, then the destination transaction complete interrupt, MaskDstTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined(_n) signal. A channel INT_MASK bit will be written only if the corresponding mask write enable bit in the INT_MASK_WE field is asserted on the same OCP write transfer. This allows software to set a mask bit without performing a read-modified write operation. For example, writing hex 01x1 to the MaskTfr register writes a 1 into MaskTfr(0), while MaskTfr(7:1) remains unchanged. Writing hex 00xx leaves MaskTfr(7:0) unchanged. Writing a 1 to any bit in these registers unmasks the corresponding interrupt, thus allowing the DMA to set the appropriate bit in the Status registers and int_* port signals.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 310h	00000000h

1	0h RO	**BLOCK:** OR of the contents of StatusBlock register.
0	0h RO	**TFR:** OR of the contents of StatusTfr register.

4.2.110 DMACFGREG - Offset 398h

This register is used to enable the DMA, which must be done before any channel activity can begin. If the global channel enable bit is cleared while any channel is still active, then DmaCfgReg.DMA_EN still returns 1 to indicate that there are channels still active until hardware has terminated all activity on all channels, at which point the DmaCfgReg.DMA_EN bit returns 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 398h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**DMA_EN:** DMA Enable bit. 0 = DMA Disabled 1 = DMA Enabled

4.2.111 CHENREG - Offset 3A0h

This is the DMA Channel Enable Register. If software needs to set up a new channel, then it can read this register in order to find out which channels are currently inactive, it can then enable an inactive channel with the required priority. All bits of this register are cleared to 0 when the global DMA channel enable bit, DmaCfgReg(0), is 0. When the global channel enable bit is 0, then a write to the ChEnReg register is ignored and a read will always read back 0. The channel enable bit, ChEnReg.CH_EN, is written only if the corresponding channel write enable bit, ChEnReg.CH_EN_WE, is asserted on the same OCP write transfer. For example, writing hex 01x1 writes a 1 into ChEnReg(0), while ChEnReg(7:1) remains unchanged. Writing hex 00xx leaves ChEnReg(7:0) unchanged. Note that a read-modified write is not required.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 3A0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:8	00h WO	**CH_EN_WE:** Channel enable write enable.
7:0	00h RW	**CH_EN:** Enables/Disables the channel. Setting this bit enables a channel, clearing this bit disables the channel. 0 = Disable the Channel 1 = Enable the Channel The ChEnReg.CH_EN bit is automatically cleared by hardware to disable the channel after the last OCP transfer of the DMA transfer to the destination has completed. Software can therefore poll this bit to determine when this channel is free for a new DMA transfer.

4.2.112 CLASSPRIORITY0_LO - Offset 3B8h

4:3	0h RW	**Read Root Space (RD_RS):** Root Space attribute for DMA channel0 reads on IOSF. The read value of these bits will be 00 when the DMA is host owned.
2	0h RO	**Reserved**
1:0	0h RW	**DMA Transfer Mode (TRANSFER_MODE):** Indicates mode of transfer for DMA channel0. Four modes are possible: 11 - DRAM to DRAM mode (external, read from DRAM and write to DRAM), 10 - DRAM to SRAM (read from DRAM and write to SRAM), 01 - SRAM to DRAM (read from SRAM and write to DRAM), 00 - SRAM to SRAM (internal, read from SRAM and write to SRAM).

4.2.123 DMA Control Channel1 (DMA_CTL_CH1) - Offset 1004h

DMA Control register channel1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1004h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RW	**Vc0/1 WR (IOSF_WR_VC01):** When set, enables VC1 transaction on IOSF AXI Write port. When reset, enables VC0 transaction on IOSF AXI Write port. When RT_Disable fuse is active, this bit is internally tied to '0'.
10	0h RW	**Vc0/1 RD (IOSF_RD_VC01):** When set, enables VC1 transaction on IOSF AXI Read port. When reset, enables VC0 transaction on IOSF AXI Read port. When RT_Disable fuse is active, this bit is internally tied to '0'.
9	0h RW	**Write Non Snoop Attribute (WR_NON_SNOOP):** If asserted indicates the transaction from DMA channel0 on IOSF write port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
8	0h RW	**Read Non Snoop Attribute (RD_NON_SNOOP):** If asserted indicates the transaction from DMA channel0 on IOSF read port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
7	0h RO	**Reserved**
6:5	0h RW	**Write Root Space (WR_RS):** Root Space attribute for DMA channel1 writes on IOSF. The read value of these bits will be 00 when the DMA is host owned.
4:3	0h RW	**Read Root Space (RD_RS):** Root Space attribute for DMA channel1 reads on IOSF. The read value of these bits will be 00 when the DMA is host owned.
2	0h RO	**Reserved**
1:0	0h RW	**DMA Transfer Mode (TRANSFER_MODE):** Indicates mode of transfer for DMA channel1. Four modes are possible: 11 - DRAM to DRAM mode (external, read from DRAM and write to DRAM), 10 - DRAM to SRAM (read from DRAM and write to SRAM), 01 - SRAM to DRAM (read from SRAM and write to DRAM), 00 - SRAM to SRAM (internal, read from SRAM and write to SRAM).

4.2.124 DMA Control Channel2 (DMA_CTL_CH2) - Offset 1008h

DMA Control register channel2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1008h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RW	**Vc0/1 WR (IOSF_WR_VC01):** When set, enables VC1 transaction on IOSF AXI Write port. When reset, enables VC0 transaction on IOSF AXI Write port. When RT_Disable fuse is active, this bit is internally tied to '0'.
10	0h RW	**Vc0/1 RD (IOSF_RD_VC01):** When set, enables VC1 transaction on IOSF AXI Read port. When reset, enables VC0 transaction on IOSF AXI Read port. When RT_Disable fuse is active, this bit is internally tied to '0'.
9	0h RW	**Write Non Snoop Attribute (WR_NON_SNOOP):** If asserted indicates the transaction from DMA channel0 on IOSF write port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
8	0h RW	**Read Non Snoop Attribute (RD_NON_SNOOP):** If asserted indicates the transaction from DMA channel0 on IOSF read port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
7	0h RO	**Reserved**
6:5	0h RW	**Write Root Space (WR_RS):** Root Space attribute for DMA channel2 writes on IOSF. The read value of these bits will be 00 when the DMA is host owned.
4:3	0h RW	**Read Root Space (RD_RS):** Root Space attribute for DMA channel2 reads on IOSF. The read value of these bits will be 00 when the DMA is host owned.
2	0h RO	**Reserved**
1:0	0h RW	**DMA Transfer Mode (TRANSFER_MODE):** Indicates mode of transfer for DMA channel2. Four modes are possible: 11 - DRAM to DRAM mode (external, read from DRAM and write to DRAM), 10 - DRAM to SRAM (read from DRAM and write to SRAM), 01 - SRAM to DRAM (read from SRAM and write to DRAM), 00 - SRAM to SRAM (internal, read from SRAM and write to SRAM).

4.2.125 DMA Control Channel3 (DMA_CTL_CH3) - Offset 100Ch

DMA Control register channel3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 100Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RW	**Vc0/1 WR (IOSF_WR_VC01):** When set, enables VC1 transaction on IOSF AXI Write port. When reset, enables VC0 transaction on IOSF AXI Write port. When RT_Disable fuse is active, this bit is internally tied to '0'.
10	0h RW	**Vc0/1 RD (IOSF_RD_VC01):** When set, enables VC1 transaction on IOSF AXI Read port. When reset, enables VC0 transaction on IOSF AXI Read port. When RT_Disable fuse is active, this bit is internally tied to '0'.
9	0h RW	**Write Non Snoop Attribute (WR_NON_SNOOP):** If asserted indicates the transaction from DMA channel0 on IOSF write port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
8	0h RW	**Read Non Snoop Attribute (RD_NON_SNOOP):** If asserted indicates the transaction from DMA channel0 on IOSF read port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
7	0h RO	**Reserved**
6:5	0h RW	**Write Root Space (WR_RS):** Root Space attribute for DMA channel3 writes on IOSF. The read value of these bits will be 00 when the DMA is host owned.
4:3	0h RW	**Read Root Space (RD_RS):** Root Space attribute for DMA channel3 reads on IOSF. The read value of these bits will be 00 when the DMA is host owned.
2	0h RO	**Reserved**
1:0	0h RW	**DMA Transfer Mode (TRANSFER_MODE):** Indicates mode of transfer for DMA channel3. Four modes are possible: 11 - DRAM to DRAM mode (external, read from DRAM and write to DRAM), 10 - DRAM to SRAM (read from DRAM and write to SRAM), 01 - SRAM to DRAM (read from SRAM and write to DRAM), 00 - SRAM to SRAM (internal, read from SRAM and write to SRAM).

4.2.126 DMA ControlChannel4 (DMA_CTL_CH4) - Offset 1010h

DMA Control register channel4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1010h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RW	**Vc0/1 WR (IOSF_WR_VC01):** When set, enables VC1 transaction on IOSF AXI Write port. When reset, enables VC0 transaction on IOSF AXI Write port. When RT_Disable fuse is active, this bit is internally tied to '0'.
10	0h RW	**Vc0/1 RD (IOSF_RD_VC01):** When set, enables VC1 transaction on IOSF AXI Read port. When reset, enables VC0 transaction on IOSF AXI Read port. When RT_Disable fuse is active, this bit is internally tied to '0'.
9	0h RW	**Write Non Snoop Attribute (WR_NON_SNOOP):** If asserted indicates the transaction from DMA channel0 on IOSF write port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
8	0h RW	**Read Non Snoop Attribute (RD_NON_SNOOP):** If asserted indicates the transaction from DMA channel0 on IOSF read port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
7	0h RO	**Reserved**
6:5	0h RW	**Write Root Space (WR_RS):** Root Space attribute for DMA channel4 writes on IOSF. The read value of these bits will be 00 when the DMA is host owned.
4:3	0h RW	**Read Root Space (RD_RS):** Root Space attribute for DMA channel4 reads on IOSF. The read value of these bits will be 00 when the DMA is host owned.
2	0h RO	**Reserved**
1:0	0h RW	**DMA Transfer Mode (TRANSFER_MODE):** Indicates mode of transfer for DMA channel4. Four modes are possible: 11 - DRAM to DRAM mode (external, read from DRAM and write to DRAM), 10 - DRAM to SRAM (read from DRAM and write to SRAM), 01 - SRAM to DRAM (read from SRAM and write to DRAM), 00 - SRAM to SRAM (internal, read from SRAM and write to SRAM).

4.2.127 DMA Control Channel5 (DMA_CTL_CH5) - Offset 1014h

DMA Control register channel5.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1014h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RW	**Vc0/1 WR (IOSF_WR_VC01):** When set, enables VC1 transaction on IOSF AXI Write port. When reset, enables VC0 transaction on IOSF AXI Write port. When RT_Disable fuse is active, this bit is internally tied to '0'.
10	0h RW	**Vc0/1 RD (IOSF_RD_VC01):** When set, enables VC1 transaction on IOSF AXI Read port. When reset, enables VC0 transaction on IOSF AXI Read port. When RT_Disable fuse is active, this bit is internally tied to '0'.
9	0h RW	**Write Non Snoop Attribute (WR_NON_SNOOP):** If asserted indicates the transaction from DMA channel0 on IOSF write port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
8	0h RW	**Read Non Snoop Attribute (RD_NON_SNOOP):** If asserted indicates the transaction from DMA channel0 on IOSF read port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
7	0h RO	**Reserved**
6:5	0h RW	**Write Root Space (WR_RS):** Root Space attribute for DMA channel5 writes on IOSF. The read value of these bits will be 00 when the DMA is host owned.
4:3	0h RW	**Read Root Space (RD_RS):** Root Space attribute for DMA channel5 reads on IOSF. The read value of these bits will be 00 when the DMA is host owned.
2	0h RO	**Reserved**
1:0	0h RW	**DMA Transfer Mode (TRANSFER_MODE):** Indicates mode of transfer for DMA channel5. Four modes are possible: 11 - DRAM to DRAM mode (external, read from DRAM and write to DRAM), 10 - DRAM to SRAM (read from DRAM and write to SRAM), 01 - SRAM to DRAM (read from SRAM and write to DRAM), 00 - SRAM to SRAM (internal, read from SRAM and write to SRAM).

4.2.128 DMA Control Channel6 (DMA_CTL_CH6) - Offset 1018h

DMA Control register channel6.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1018h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RW	**Vc0/1 WR (IOSF_WR_VC01):** When set, enables VC1 transaction on IOSF AXI Write port. When reset, enables VC0 transaction on IOSF AXI Write port. When RT_Disable fuse is active, this bit is internally tied to '0'.
10	0h RW	**Vc0/1 RD (IOSF_RD_VC01):** When set, enables VC1 transaction on IOSF AXI Read port. When reset, enables VC0 transaction on IOSF AXI Read port. When RT_Disable fuse is active, this bit is internally tied to '0'.
9	0h RW	**Write Non Snoop Attribute (WR_NON_SNOOP):** If asserted indicates the transaction from DMA channel0 on IOSF write port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
8	0h RW	**Read Non Snoop Attribute (RD_NON_SNOOP):** If asserted indicates the transaction from DMA channel0 on IOSF read port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
7	0h RO	**Reserved**
6:5	0h RW	**Write Root Space (WR_RS):** Root Space attribute for DMA channel6 writes on IOSF. The read value of these bits will be 00 when the DMA is host owned.
4:3	0h RW	**Read Root Space (RD_RS):** Root Space attribute for DMA channel6 reads on IOSF. The read value of these bits will be 00 when the DMA is host owned.
2	0h RO	**Reserved**
1:0	0h RW	**DMA Transfer Mode (TRANSFER_MODE):** Indicates mode of transfer for DMA channel6. Four modes are possible: 11 - DRAM to DRAM mode (external, read from DRAM and write to DRAM), 10 - DRAM to SRAM (read from DRAM and write to SRAM), 01 - SRAM to DRAM (read from SRAM and write to DRAM), 00 - SRAM to SRAM (internal, read from SRAM and write to SRAM).

4.2.129 DMA Control Channel7 (DMA_CTL_CH7) - Offset 101Ch

DMA Control register channel7.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 101Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved**
11	0h RW	**Vc0/1 WR (IOSF_WR_VC01):** When set, enables VC1 transaction on IOSF AXI Write port. When reset, enables VC0 transaction on IOSF AXI Write port. When RT_Disable fuse is active, this bit is internally tied to '0'.
10	0h RW	**Vc0/1 RD (IOSF_RD_VC01):** When set, enables VC1 transaction on IOSF AXI Read port. When reset, enables VC0 transaction on IOSF AXI Read port. When RT_Disable fuse is active, this bit is internally tied to '0'.
9	0h RW	**Write Non Snoop Attribute (WR_NON_SNOOP):** If asserted indicates the transaction from DMA channel0 on IOSF write port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
8	0h RW	**Read Non Snoop Attribute (RD_NON_SNOOP):** If asserted indicates the transaction from DMA channel0 on IOSF read port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
7	0h RO	**Reserved**
6:5	0h RW	**Write Root Space (WR_RS):** Root Space attribute for DMA channel7 writes on IOSF. The read value of these bits will be 00 when the DMA is host owned.
4:3	0h RW	**Read Root Space (RD_RS):** Root Space attribute for DMA channel7 reads on IOSF. The read value of these bits will be 00 when the DMA is host owned.
2	0h RO	**Reserved**
1:0	0h RW	**DMA Transfer Mode (TRANSFER_MODE):** Indicates mode of transfer for DMA channel7. Four modes are possible: 11 - DRAM to DRAM mode (external, read from DRAM and write to DRAM), 10 - DRAM to SRAM (read from DRAM and write to SRAM), 01 - SRAM to DRAM (read from SRAM and write to DRAM), 00 - SRAM to SRAM (internal, read from SRAM and write to SRAM).

4.2.130 DMA CH0 Read Address Fillin (IOSF_ADDR_FILLIN_DMA_CH0) - Offset 1100h

This register defines the upper MSB bits of maddress port to drive on the IOSF maddr for reads.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1100h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Maddr MSB (ADDR_FILLIN):** MSB bits of maddr to drive on IOSF.

4.2.131 DMA CH1 Read Address Fillin (IOSF_ADDR_FILLIN_DMA_CH1) - Offset 1104h

This register defines the upper MSB bits of maddress port to drive on the IOSF maddr for reads.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1104h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Maddr MSB (ADDR_FILLIN):** MSB bits of maddr to drive on IOSF.

4.2.132 DMA CH2 Read Address Fillin (IOSF_ADDR_FILLIN_DMA_CH2) - Offset 1108h

This register defines the upper MSB bits of maddress port to drive on the IOSF maddr for reads.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1108h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Maddr MSB (ADDR_FILLIN):** MSB bits of maddr to drive on IOSF.

4.2.133 DMA CH3 Read Address Fillin (IOSF_ADDR_FILLIN_DMA_CH3) - Offset 110Ch

This register defines the upper MSB bits of maddress port to drive on the IOSF maddr for reads.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 110Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Maddr MSB (ADDR_FILLIN):** MSB bits of maddr to drive on IOSF.

4.2.134 DMA CH4 Read Address Fillin (IOSF_ADDR_FILLIN_DMA_CH4) - Offset 1110h

This register defines the upper MSB bits of maddress port to drive on the IOSF maddr for reads.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1110h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Maddr MSB (ADDR_FILLIN):** MSB bits of maddr to drive on IOSF.

4.2.135 DMA CH5 Read Address Fillin (IOSF_ADDR_FILLIN_DMA_CH5) - Offset 1114h

This register defines the upper MSB bits of maddress port to drive on the IOSF maddr for reads.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1114h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Maddr MSB (ADDR_FILLIN):** MSB bits of maddr to drive on IOSF.

4.2.136 DMA CH6 Read Address Fillin (IOSF_ADDR_FILLIN_DMA_CH6) - Offset 1118h

This register defines the upper MSB bits of maddress port to drive on the IOSF maddr for reads.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1118h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Maddr MSB (ADDR_FILLIN):** MSB bits of maddr to drive on IOSF.

4.2.137 DMA CH7 Read Address Fillin (IOSF_ADDR_FILLIN_DMA_CH7) - Offset 111Ch

This register defines the upper MSB bits of maddress port to drive on the IOSF maddr for reads.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 111Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Maddr MSB (ADDR_FILLIN):** MSB bits of maddr to drive on IOSF.

4.2.138 DMA CH0 Write Address Fillin (IOSF_DEST_ADDR_FILLIN_DMA_CH0) - Offset 1200h

This register defines the upper MSB bits to drive on the IOSF maddr for writes.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1200h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Maddr MSB (ADDR_FILLIN):** MSB bits of maddr to drive on IOSF.

4.2.139 DMA CH1 Write Address Fillin (IOSF_DEST_ADDR_FILLIN_DMA_CH1) - Offset 1204h

This register defines the upper MSB bits to drive on the IOSF maddr for writes.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1204h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Maddr MSB (ADDR_FILLIN):** MSB bits of maddr to drive on IOSF.

4.2.140 DMA CH2 Write Address Fillin (IOSF_DEST_ADDR_FILLIN_DMA_CH2) - Offset 1208h

This register defines the upper MSB bits to drive on the IOSF maddr for writes.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1208h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Maddr MSB (ADDR_FILLIN):** MSB bits of maddr to drive on IOSF.

4.2.141 DMA CH3 Write Address Fillin (IOSF_DEST_ADDR_FILLIN_DMA_CH3) - Offset 120Ch

This register defines the upper MSB bits to drive on the IOSF maddr for writes.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 120Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Maddr MSB (ADDR_FILLIN):** MSB bits of maddr to drive on IOSF.

4.2.142 DMA CH4 Write Address Fillin (IOSF_DEST_ADDR_FILLIN_DMA_CH4) - Offset 1210h

This register defines the upper MSB bits to drive on the IOSF maddr for writes.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1210h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Maddr MSB (ADDR_FILLIN):** MSB bits of maddr to drive on IOSF.

4.2.143 DMA CH5 Write Address Fillin (IOSF_DEST_ADDR_FILLIN_DMA_CH5) - Offset 1214h

This register defines the upper MSB bits to drive on the IOSF maddr for writes.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1214h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Maddr MSB (ADDR_FILLIN):** MSB bits of maddr to drive on IOSF.

4.2.144 DMA CH6 Write Address Fillin (IOSF_DEST_ADDR_FILLIN_DMA_CH6) - Offset 1218h

This register defines the upper MSB bits to drive on the IOSF maddr for writes.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1218h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Maddr MSB (ADDR_FILLIN):** MSB bits of maddr to drive on IOSF.

4.2.145 DMA CH7 Write Address Fillin (IOSF_DEST_ADDR_FILLIN_DMA_CH7) - Offset 121Ch

This register defines the upper MSB bits to drive on the IOSF maddr for writes.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 121Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Maddr MSB (ADDR_FILLIN):** MSB bits of maddr to drive on IOSF.

4.2.146 DMA Crossbar HW Handshake Interface Select Channel 0 (DMA_XBAR_SEL0) - Offset 1300h

This register is used to program the DMA Hardware Handshake crossbar to route the peripheral lines to DMA channel 0.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1300h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	**Reserved**
16	0h RW	**RX TX Mode (RX_TX):** 0 Selects Peripheral RX HW Handshake interface, 1 Selects Peripheral TX HW Handshake interface.
15:0	0000h RW	**Device ID (DEVID):** Device ID of Peripheral to be selected for HW Handshake.

4.2.147 DMA Crossbar HW Handshake Interface Select Channel 1 (DMA_XBAR_SEL1) - Offset 1304h

This register is used to program the DMA Hardware Handshake crossbar to route the peripheral lines to DMA channel 1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1304h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	**Reserved**
16	0h RW	**RX TX Mode (RX_TX):** 0 Selects Peripheral RX HW Handshake interface, 1 Selects Peripheral TX HW Handshake interface.
15:0	0000h RW	**Device ID (DEVID):** Device ID of Peripheral to be selected for HW Handshake.

4.2.148 DMA Crossbar HW Handshake Interface Select Channel 2 (DMA_XBAR_SEL2) - Offset 1308h

This register is used to program the DMA Hardware Handshake crossbar to route the peripheral lines to DMA channel 2.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1308h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	**Reserved**
16	0h RW	**RX TX Mode (RX_TX):** 0 Selects Peripheral RX HW Handshake interface, 1 Selects Peripheral TX HW Handshake interface.
15:0	0000h RW	**Device ID (DEVID):** Device ID of Peripheral to be selected for HW Handshake.

4.2.149 DMA Crossbar HW Handshake Interface Select Channel 3 (DMA_XBAR_SEL3) - Offset 130Ch

This register is used to program the DMA Hardware Handshake crossbar to route the peripheral lines to DMA channel 3.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 130Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	**Reserved**
16	0h RW	**RX TX Mode (RX_TX):** 0 Selects Peripheral RX HW Handshake interface, 1 Selects Peripheral TX HW Handshake interface.
15:0	0000h RW	**Device ID (DEVID):** Device ID of Peripheral to be selected for HW Handshake.

4.2.150 DMA Crossbar HW Handshake Interface Select Channel 4 (DMA_XBAR_SEL4) - Offset 1310h

This register is used to program the DMA Hardware Handshake crossbar to route the peripheral lines to DMA channel 4.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1310h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	**Reserved**
16	0h RW	**RX TX Mode (RX_TX):** 0 Selects Peripheral RX HW Handshake interface, 1 Selects Peripheral TX HW Handshake interface.
15:0	0000h RW	**Device ID (DEVID):** Device ID of Peripheral to be selected for HW Handshake.

4.2.151 DMA Crossbar HW Handshake Interface Select Channel 5 (DMA_XBAR_SEL5) - Offset 1314h

This register is used to program the DMA Hardware Handshake crossbar to route the peripheral lines to DMA channel 5.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1314h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	**Reserved**
16	0h RW	**RX TX Mode (RX_TX):** 0 Selects Peripheral RX HW Handshake interface, 1 Selects Peripheral TX HW Handshake interface.
15:0	0000h RW	**Device ID (DEVID):** Device ID of Peripheral to be selected for HW Handshake.

4.2.152 DMA Crossbar HW Handshake Interface Select Channel 6 (DMA_XBAR_SEL6) - Offset 1318h

This register is used to program the DMA Hardware Handshake crossbar to route the peripheral lines to DMA channel 6.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1318h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	**Reserved**
16	0h RW	**RX TX Mode (RX_TX):** 0 Selects Peripheral RX HW Handshake interface, 1 Selects Peripheral TX HW Handshake interface.
15:0	0000h RW	**Device ID (DEVID):** Device ID of Peripheral to be selected for HW Handshake.

4.2.153 DMA Crossbar HW Handshake Interface Select Channel 7 (DMA_XBAR_SEL7) - Offset 131Ch

This register is used to program the DMA Hardware Handshake crossbar to route the peripheral lines to DMA channel 7.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 131Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	**Reserved**
16	0h RW	**RX TX Mode (RX_TX):** 0 Selects Peripheral RX HW Handshake interface, 1 Selects Peripheral TX HW Handshake interface.
15:0	0000h RW	**Device ID (DEVID):** Device ID of Peripheral to be selected for HW Handshake.

4.2.154 DMA Channel ID Configuration (DMA_REGACCESS_CHID_CFG) - Offset 1400h

This register is used to program the Mreq info the DMA channel to be programmed next by FW.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1400h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved**
2:0	0h RW	**CHID_CFG:** Register access MREQINFO DMA channel id configuration.

4.2.155 DMA ECC Error Sresp Error Logging Reg (DMA_ECC_ERR_SRESP) - Offset 1404h

Sresp register for SRAM_base/OCP logic selection at DMA.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1404h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21:1	000000h RW/1C	**Peripheral BAR Remap Error Status (PER_BAR_REMAP_ERR):** This Error status bit is set on the peripheral BAR remap error and cleared when '1' is written to it. Bit 1-8 of this register indicate BAR remap error for the peripherals I2C0-7, Bits 9-14 indicate for UART0-5, bits 15-18 indicate for SPI0-3, Bits 19-20 indicate for I2S0-1 resp. and Bit 21 is reserved.
0	0h RW/1C	**Sresp Error Status Bit (ECC_ERR_SRESP):** This Error status bit is set on the RD/WR Sresp error on the DMA Rd/Wr ports and cleared when '1' is written to it.

4.2.156 D0i3 Control (D0I3C) - Offset 1410h

This register is will be used for D0i3 SW flow. This will be mapped to a different MMIO address from the other IPC registers. (MMIO and OCP address value are yet to be done) The description below also includes the type of access expected for the ISH FW for each configuration bit:
1. The Restore Required (RR) bit(bit [3]) should be RW for the ISH FW which can determine when to set and/or clear these bits depending on when the ISH FW determines whether restore is required although for ISH restore is never required since the power is never lost.
2. The D0i3 (i3) bit(bit [2]) should be RO for ISH FW as it needs to be written only by host SW. The ISH FW can determine to go to a low power state based on this bit.
3. The Interrupt Required (IR) bit(bit [1]) can be RO register for ISH FW and ISH FW can send an interrupt to Host by writing to the ish2host IPC doorbell register when this bit is set by SW.
4. The Command in Progress (CIP) register bit (bit [0]) is HW set and need to be cleared by ISH FW.
A simple edge detect logic can be used for the setting of this bit in HW. The CIP register bit will be tied to a RTE entry in the IOAPIC as an interrupt source. Hence ISH FW will get an interrupt when the In addition to the registers, the IOSF2OCP Bridge should be parameterized for the following:
1. The device idle capability parameter (ENABLE_PCI_IDLE_CAP) need to be connected to a soft strap for ISH with a value of 1.
2. The STRAP for the MMIO address (strap_d0i3_offset) of D0i3 register (IPC offset address: h6D0) and the d0i3 valid (strap_d0i3_valid) bit needs should be appropriately tied.
3. The PCE register is made RO register by setting the appropriate parameter (Bridge top level strap: set_device_pg_config_type[5:0] is set to all 0s). This registers reset and clock domain will be in the OCP domain.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1410h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4	0h RO	**Interrupt Request Capable (IRC):** Set to 1 by HW if it is capable of generating an interrupt on command completion, else 0. For ISH this bit will be tied to 0.
3	1h RW/1C	**Restore Required (RR):** When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up.
2	0h RW	**D0I3:** SW sets this bit to 1 to move the IP into the D0i3 state. Writing this bit to 0 will return the IP to the fully active D0 state (D0i0).
1	0h RW	**Interrupt Required (IR):** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this on each write to this register.
0	0h RW/1C	**Command In Progress (CIP):** HW sets this bit on a 1->0 or 0->1 transition of bit [2]. While set, the other bits in this register are not valid and it is illegal for SW to write to any bit in this register. When clear all the other bits in the register are valid and SW may write to any bit.

4.2.157 Clock Gating And Soft Reset (CGSR) - Offset 1414h

This register is used to Clock gate or soft reset an IP by Host/Remote Host. Also register field of this register can be used for device idle status.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1414h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Idle Indication To Host (IDLE):** IP IDLE indication.
30:17	0h RO	**Reserved**
16	0h RW	**Clock Gate Enable (CG):** Setting this field to 1 clock gates the IP.
15:1	0h RO	**Reserved**
0	0h RW	**Soft Reset (SR):** Setting this bit to 1 resets the IP.

4.2.158 DMA Interrupt Enable (DMA_INT_EN) - Offset 1418h

This register is used to enable the DMA combined interrupt for VC0/VC1.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1418h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**DMA Combined Interrupt For VC0/1 (DMA_COMB_INT_EN):** When set, enables the DMA combined interrupt to be generated on VC1 lines to MSI gen. When reset , enables the DMA Combined interrupt to be generated on VC0 lines to MSI gen.

4.2.159 DMA VMM Mask (DMA_VMM_MASK) - Offset 2000h

This register is used to program the VMM Mask for each peripheral.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 2000h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved**
20:0	000000h RW	**Peripheral VMM Mask (PER_VMM_MASK):** When set, enables the VMM Mask for the peripheral. When reset, disables the VMM Mask for the peripheral. Bit 0-7 correspond to I2C0-7, Bits 8-13 correspond to UART0-5, bits 14-17 correspond to SPI0-3, Bits 18-19 correspond to I2S0-1 resp. and Bit 20 is reserved.

5 Pulse Width Modulation (PWM) Interface

5.1 PWM Configuration Registers Summary

This registers in Bus: 0, Device 29, Function 6.

Table 5-1. Summary of Bus: 0, Device: 29, Function: 6 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	Device ID And Vendor ID Register (DEVVENDID) - Offset 0h	4BB70000h
4h	4	Status And Command (STATUSCOMMAND) - Offset 4h	00100000h
8h	4	Revision ID And Class Code (REVCLASSCODE) - Offset 8h	00000000h
Ch	4	Cache Line Latency Header And BIST (CLLATHEADERBIST) - Offset Ch	00000000h
10h	4	Base Address Register (BAR) - Offset 10h	00000000h
14h	4	Base Address Register High (BAR_HIGH) - Offset 14h	00000000h
18h	4	Base Address Register1 (BAR1) - Offset 18h	00000000h
1Ch	4	Base Address Register1 High (BAR1_HIGH) - Offset 1Ch	00000000h
2Ch	4	Subsystem Vendor and Subsystem ID (SUBSYSTEMID) - Offset 2Ch	00000000h
30h	4	Expansion ROM Base Address (EXPANSION_ROM_BASEADDR) - Offset 30h	00000000h
34h	4	Capabilities Pointer (CAPABILITYPTR) - Offset 34h	00000080h
3Ch	4	Interrupt Register (INTERRUPTREG) - Offset 3Ch	00000100h
80h	4	Power Management Capability ID (POWERCAPID) - Offset 80h	48030001h
84h	4	Power Management Control And Status Register (PMECTRLSTATUS) - Offset 84h	00000008h
90h	4	PCI Device Idle Vendor Capability Register (PCIDEVIDLE_CAP_RECORD) - Offset 90h	F0140009h
94h	4	Vendor Specific Extended Capability Register (DEVID_VEND_SPECIFIC_REG) - Offset 94h	01400010h
98h	4	Software LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG) - Offset 98h	00000000h
9Ch	4	Device Idle Pointer Register (DEVICE_IDLE_POINTER_REG) - Offset 9Ch	00000000h
A0h	4	D0i3 and Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG) - Offset A0h	00000800h
B0h	4	General Purpose Read Write Register1 (GEN_PCI_REGRW1) - Offset B0h	00000000h
C0h	4	General Purpose Input Register (GEN_INPUT_REG) - Offset C0h	00000000h
D0h	4	MSI Capability Register (MSI_CAP_REG) - Offset D0h	01800005h
D4h	4	MSI Message Low Address (MSI_ADDR_LOW) - Offset D4h	00000000h

Table 5-1. Summary of Bus: 0, Device: 29, Function: 6 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
D8h	4	MSI Message High Address (MSI_ADDR_HIGH) - Offset D8h	00000000h
DCh	4	MSI Message Data (MSI_MSG_DATA) - Offset DCh	00000000h
E0h	4	MSI Mask Register (MSI_MASK) - Offset E0h	00000000h
E4h	4	MSI Pending Register (MSI_PENDING) - Offset E4h	00000000h
F8h	4	Manufacturers ID (MANID) - Offset F8h	00000000h

5.1.1 Device ID And Vendor ID Register (DEVVENDID) - Offset 0h

Device ID and Vendor ID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 0h	4BB70000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	4BB7h RO/P	**Device ID Field (DEVICEID):** Device ID identifies the particular PCI device
15:0	0000h RO	**Vendor ID Field (VENDORID):** Vendor ID is a unique ID provided by the PCI SIG which identifies the manufacturer of the device

5.1.2 Status And Command (STATUSCOMMAND) - Offset 4h

Status and Command

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 4h	00100000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C	**Detected Parity Error (DPE):** Detected Parity Error
30	0h RW/1C	**Signaled System Error (SSE):** Signaled System Error
29	0h RW/1C	**RMA Field (RMA):** Received Master Abort
28	0h RW/1C	**RTA Field (RTA):** Received Target Abort
27:25	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW/1C	**Master Data Parity Error (MDPE):** Master Data Parity Error
23:21	0h RO	**Reserved**
20	1h RO	**Cap List Field (CAPLIST):** Capabilities List: Indicates that the controller contains a capabilities pointer list
19	0h RO	**Interrupt Status Field (INTR_STATUS):** Interrupt Status: This bit reflects state of interrupt in the device
18:11	0h RO	**Reserved**
10	0h RW	**Interrupt Disable Field (INTR_DISABLE):** Interrupt Disable
9	0h RO	**Reserved**
8	0h RW	**SERR Enable Field (SERR_ENABLE):** SERR Enable Not implemented
7	0h RO	**Reserved**
6	0h RW	**Parity Error Response Enable (PERE):** Parity Error Response Enable
5:3	0h RO	**Reserved**
2	0h RW	**BME Field (BME):** Bus Master Enable
1	0h RW	**MSE Field (MSE):** Memory Space Enable
0	0h RO	**Reserved**

5.1.3 Revision ID And Class Code (REVCLASSCODE) - Offset 8h

Revision ID and Class Code

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	**Revision ID Field (CLASS_CODES):** Class Code register is read-only and is used to identify the generic function of the device and in some cases a specific register-level programming interface
7:0	00h RO/P	**Class Code Field (RID):** Revision ID identifies the revision of particular PCI device

5.1.4 Cache Line Latency Header And BIST (CLLATHEADERBIST) - Offset Ch

Cache Line size as RW with def 0 Latency Timer, RW with def 0 Header Type with Type 0 configuration header and Reserved BIST Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	0h RO	**Multifunction Device Field (MULFNDEV):** Multi-Function Device
22:16	00h RO	**Header Type Field (HEADERTYPE):** Header Type: Implements Type 0 Configuration header
15:8	00h RO	**Latency Timer Field (LATTIMER):** Latency Timer:. This register is implemented as R/W with default as 0
7:0	00h RW/P	**Cache Line Size Field (CACHELINE_SIZE):** Cache Line Size

5.1.5 Base Address Register (BAR) - Offset 10h

Base Address Register Low [31:2] type [2:1] in 32bit or 64bit address range and memory space indicator [0]

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR):** Base Address Register Low Base address of the AXI fabric memory space. Taken from Strap values as ones
11:4	00h RO	**Size Field (SIZEINDICATOR):** Size Indicator RO Always returns 0 The size of this register depends on the size of the memory space
3	0h RO	**Prefetchable Field (PREFETCHABLE):** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**Type Field (TYPE0):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE):** Memory Space Indicator: 0 indicates this BAR is present in the memory space

5.1.6 Base Address Register High (BAR_HIGH) - Offset 14h

Base Address Register High enabled if [2:1] of BAR_HIGH is 10

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR_HIGH):** Base Address High - MSB

5.1.7 Base Address Register1 (BAR1) - Offset 18h

Base Address Register1 accesses to PCI configuration space and is always 4K type in [2:1] and memory space indicator in [0]

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 18h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Field (BASEADDR1):** Base Address1 This field is present if BAR1 is enabled through private configuration space
11:4	00h RO	**Size Field (SIZEINDICATOR1):** Always is 0 as minimum size is 4K
3	0h RO	**Prefetchable Field (PREFETCHABLE1):** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**Type Field (TYPE1):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE1):** Memory Space Indicator: 0 Indicates this BAR is present in the memory space

5.1.8 Base Address Register1 High (BAR1_HIGH) - Offset 1Ch

Base Address Register1 High enabled only if [2:1] of BAR1_HIGH register is 10

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Base Address High Field (BASEADDR1_HIGH):** Base Address: Base address of the AXI fabric memory space. Taken from Strap values as ones

5.1.9 Subsystem Vendor and Subsystem ID (SUBSYSTEMID) - Offset 2Ch

SVID Register along with SID Register is to distinguish subsystem from another

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O/P	**Subsystem ID Field (SUBSYSTEMID):** Subsystem ID: This register is implemented for any function that can be instantiated more than once in a given system
15:0	0000h RW/O/P	**Subsystem Vendor Field (SUBSYSTEMVENDORID):** Subsystem Vendor ID: This register must be implemented for any function that can be instantiated more than once in a given system

5.1.10 Expansion ROM Base Address (EXPANSION_ROM_BASEADDR) - Offset 30h

Expansion ROM Base Address Register is a RO indicates support for expansion ROMs

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Expansion Rom Base Address Field (EXPANSION_ROM_BASE):** Expansion ROM Base Address: Value of all zeros indicates no support for Expansion ROM

5.1.11 Capabilities Pointer (CAPABILITYPTR) - Offset 34h

Capabilities Pointer Register indicates what the next capability is

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 34h	00000080h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	80h RO	**Capabilities Pointer Field (CAPPTR_POWER):** Capabilities Pointer: Indicates what the next capability is

5.1.12 Interrupt Register (INTERRUPTREG) - Offset 3Ch

Interrupt Line Register is not use in Bridge directly. Interrupt Pin Register reflects the IPIN value in private configuration space. MIN_GNT register indicating the requirements of latency timers and MAX_LAT register for max latency

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 3Ch	00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Max Latency Field (MAX_LAT):** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	00h RO	**Min GNT Field (MIN_GNT):** Value of 0 indicates device has no major requirements for the settings of latency timers // Re-Check Desc Padma
15:12	0h RO	**Reserved**
11:8	1h RO	**Interrupt Pin Field (INTPIN):** Interrupt Pin: Value in this register is reflected from the IPIN value in the private configuration space
7:0	00h RW/P	**Interrupt Line Field (INTLINE):** Interrupt Line: It is used to communicate to software the interrupt line to which the interrupt pin is connected

5.1.13 Power Management Capability ID (POWERCAPID) - Offset 80h

Power Management Capability ID Register points to next capability structure and Power Management Capability with Power Management Capabilities Register for PME support and version

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 80h	48030001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	09h RO	**PME Support Field (PMESUPPORT):** This 5-bit field indicates the power states in which the function can assert the PME#
26:19	0h RO	**Reserved**
18:16	3h RO	**Version Field (VERSION):** Indicates support for Revision 1.2 of the PCI Power Management Specification
15:8	00h RO	**Next Cap Field (NXTCAP):** Next Capability: Points to the next capability structure
7:0	01h RO	**Power Capability ID Field (POWER_CAP):** Power Management Capability: Indicates this is power management capability

5.1.14 Power Management Control And Status Register (PMECTRLSTATUS) - Offset 84h

Power Management Control and Status Register to set and read PME Status, PME Enable, No Soft reset and Power State

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 84h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW/1C/P	**PME Status Field (PMESTATUS):** PME Status
14:9	0h RO	**Reserved**
8	0h RW/P	**PME Enable Field (PMEENABLE):** PME Enable
7:4	0h RO	**Reserved**
3	1h RO	**No Soft Reset Field (NO_SOFT_RESET):** This bit indicates that devices transitioning from D3hot to D0 because of Power State commands do not perform an internal reset
2	0h RO	**Reserved**
1:0	0h RW	**Power State Field (POWERSTATE):** Power State: This field is used both to determine the current Power State and to set a new Power State

5.1.15 PCI Device Idle Vendor Capability Register (PCIDEVIDLE_CAP_RECORD) - Offset 90h

PCI Device Vendor Specific Capability Register defines Vendor Specific Capability ID, Revision Length, Next Capability and CAPID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 90h	F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**Vendor Cap Field (VEND_CAP):** Vendor Specific Capability ID
27:24	0h RO	**Revision ID Field (REVID):** Revision ID of capability structure
23:16	14h RO	**Cap Length Field (CAP_LENGTH):** Vendor Specific Capability Length
15:8	00h RO	**Next Capability Field (NEXT_CAP):** Next Capability
7:0	09h RO	**Capability ID Field (CAPID):** Capability ID

5.1.16 Vendor Specific Extended Capability Register (DEVID_VEND_SPECIFIC_REG) - Offset 94h

Extended Vendor Capability Register for VSEC Length, Revision and ID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 94h	01400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	014h RO	**Vendor Specific ID Field (VSEC_LENGTH):** Vendor Specific Extended Capability Length
19:16	0h RO	**Vendor Specific Revision Field (VSEC_REV):** Vendor Specific Extended Capability Revision
15:0	0010h RO	**Vendor Specific Length Field (VSECID):** Vendor Specific Extended Capability ID

5.1.17 Software LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG) - Offset 98h

Software Location Pointer in MMIO space as an offset specified by BAR

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RO	**SW LTR Dword Offset Field (SW_LAT_DWORD_OFFSET):** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**SW LTR Bar Number Field (SW_LAT_BAR_NUM):** Indicates that the SW LTR update MMIO location is always at BAR0
0	0h RO	**SW LTR Valid Field (SW_LAT_VALID):** This value is reflected from the SW LTR valid strap at the top level

5.1.18 Device Idle Pointer Register (DEVICE_IDLE_POINTER_REG) - Offset 9Ch

Device Idle Pointer Register giving details on Device MMIO Offset Location, BAR NUM and D0i3 Valid Strap

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + 9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RO	**D0i3 Dword Offset Field (DWORD_OFFSET):** Contains the location pointer to the SW LTR register in MMIO space as an offset from the specified BAR
3:1	0h RO	**BAR NUM Field (BAR_NUM):** BAR Num: Indicates that the D0i3 MMIO location is always at BAR0
0	0h RO	**D0i3 Valid Field (VALID):** Valid: This value is reflected from the D0i3 valid strap at the top level

5.1.19 D0i3 and Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG) - Offset A0h

D0idle_Max_Power_On_Latency Register set at boot and power control enable register to enable communication with the PGCB block below the Bridge

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + A0h	00000800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21	0h RW/P	**HAE:** Hardware Autonomous Enable
20	0h RO	**Reserved**
19	0h RW/P	**Sleep Enable Field (SLEEP_EN):** Sleep Enable
18	0h RW/P	**D3 Hen Field (D3HEN):** DEVIDLE Enable (DEVIDLEN): If '1' then the function will power gate when idle and the DevIdle register (DevIdleC[2] = '1') is set
17	0h RW/P	**Device Idle En Field (DEVIDLEN):** PMCRE: PMC Request Enable
16	0h RW/P	**PMC Request Enable Field (PMCRE):** D3-Hot Enable (D3HEN): If '1' then function will power gate when idle and the PMCSR[1:0] register in the function ='11' (D3)

9:0	000h RW/O/P	**Power Latency Value Field (POW_LAT_VALUE):** Power On Latency Value

5.1.20 General Purpose Read Write Register1 (GEN_PCI_REGRW1) - Offset B0h

General Purpose PCI Read Write Register1

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**General Purpose Read Write Field (GEN_PCI_REG_RW1):** General Purpose PCI Register: This register value is brought out as GEN_PCI_REG_RW1

5.1.21 General Purpose Input Register (GEN_INPUT_REG) - Offset C0h

General Purpose Input Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**General Purpose Input Field (GEN_REG_INPUT_RW):** General Purpose Input Register: This register value reflects the value of GEN_REG_INPUT_RW

5.1.22 MSI Capability Register (MSI_CAP_REG) - Offset D0h

MSI Capability Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + D0h	01800005h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	1h RO	**Per Vector Masking Capability Field (PER_VECTOR_MSK_CAP):** Per Vector Masking Capability
23	1h RO	**MSI Capability Field (MSI_CAP_64B):** 64 bit message address capability
22:20	0h RW	**Multi Message En Field (MUL_MSG_EN):** Multiple Message Enable
19:17	0h RO	**Multi Message Cap Field (MUL_MSG_CAP):** Multiple Message Capable
16	0h RW	**MSI Enable Field (MSG_MSI_ENABLE):** MSI Enable
15:8	00h RO	**Next Pointer Field (MSG_NXT_PTR):** Next Capability Pointer
7:0	05h RO	**MSI Capability Field (MSG_CAP_ID):** MSI Capability ID

5.1.23 MSI Message Low Address (MSI_ADDR_LOW) - Offset D4h

MSI Message Low Address

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + D4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RW	**MSI Message Low Address Field (MSI_ADDR_LOW):** MSI Message Low Address
1:0	0h RO	**Reserved**

5.1.24 MSI Message High Address (MSI_ADDR_HIGH) - Offset D8h

MSI Message High Address

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + D8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSI Message High Address Field (MSI_ADDR_HIGH):** MSI Message High Address

5.1.25 MSI Message Data (MSI_MSG_DATA) - Offset DCh

MSI Message Data

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + DCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0000h RW	**MSI Message Data Field (MSI_MSG_DATA):** MSI Message Data

5.1.26 MSI Mask Register (MSI_MASK) - Offset E0h

MSI Mask bits

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + E0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**MSI Mask Field (MSI_MASK):** MSI Mask bits

5.1.27 MSI Pending Register (MSI_PENDING) - Offset E4h

MSI Pending bits

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + E4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	**MSI Pending Field (MSI_PENDING):** MSI Pending bits

5.1.28 Manufacturers ID (MANID) - Offset F8h

Manufacturers ID Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:29, F:0] + F8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/P	**Manufacturers ID Field (MANID):** Manufacturer ID: Default value comes from straps

5.2 PWM MMIO Registers Summary

Table 5-2. Summary of Bus: 0, Device: 29, Function: 6 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	TIMER1LOADCOUNT	00000000h
4h	4	TIMER1CURRENTVAL	80000000h
8h	4	TIMER1CONTROLREG	00000000h

2004h	4	Clock Gating And Soft Reset (CGSR)	00000000h

5.2.1 TIMER1LOADCOUNT - Offset 0h

Timer1 Load Count Register - Name: Timer1 Load Count Register Size: 8-32 bits Address Offset: 0x00 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + 0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TIMER1LOADCOUNT:** Value to be loaded into Timer1. This is the value from which counting commences. Any value written to this register is loaded into the associated timer.

5.2.2 TIMER1CURRENTVAL - Offset 4h

Name: Timer1 Current Value Size: 8-32 bits Address Offset: 4 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4h	80000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	80000000h RO/V	**TIMER1CURRENTVAL:** Current Value of Timer1. This register is supported only when timer_1_clk is synchronous to pclk. Reading this register when using independent clocks results in an undefined value.

5.2.3 TIMER1CONTROLREG - Offset 8h

Timer1 Control Register - Name: Timer1 Control Register Size: 4 bits Address Offset: 8 Read/Write Access: Read/Write This register controls enabling, operating mode (free-running or defined-count), and interrupt mask of Timer1. You can program each Timer1ControlReg to enable or disable a specific timer and to control its mode of operation.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**TIMER_PWM:** Pulse Width Modulation of timer_1_toggle output. 0: Disabled 1: Enabled This field is only present when TIM_NEWMODE is enabled
2	0h RW	**TIMER_INTERRUPT_MASK:** Timer interrupt mask for Timer1. 0: not masked 1: masked
1	0h RW	**TIMER_MODE:** Timer mode for Timer1. 0: free_running mode 1: user_defined count mode. ***Note***: You must set the Timer1LoadCount register to all 1s before enabling the timer in free-running mode.
0	0h RW	**TIMER_ENABLE:** Timer enable bit for Timer1. 0: disable 1: enable

5.2.4 TIMER1EOI - Offset Ch

Timer1 End-of-Interrupt Register - Name: Timer1 End-of-Interrupt Register Size: 1 bit Address Offset: 12 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TIMER1EOI:** Reading from this register returns all zeros (0) and clears the interrupt from Timer1.

5.2.5 TIMER1INTSTAT - Offset 10h

Timer1 Interrupt Status Register - Name: Timer1 Interrupt Status Register Size: 1 bit Address Offset: 16 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TIMER1INTSTAT:** Contains the interrupt status for Timer1.

5.2.6 TIMER2LOADCOUNT - Offset 14h

Timer2 Load Count Register - Name: Timer2 Load Count Register Size: 8-32 bits Address Offset: 20 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TIMER2LOADCOUNT:** Value to be loaded into Timer2. This is the value from which counting commences. Any value written to this register is loaded into the associated timer.

5.2.7 TIMER2CURRENTVAL - Offset 18h

Timer2 Current Value - Name: Timer2 Current Value Size: 8-32 bits Address Offset: 24 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 18h	80000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	80000000h RO/V	**TIMER2CURRENTVAL:** Current Value of Timer2. This register is supported only when timer_2_clk is synchronous to pclk. Reading this register when using independent clocks results in an undefined value.

5.2.8 TIMER2CONTROLREG - Offset 1Ch

Timer2 Control Register - Name: Timer2 Control Register Size: 3 bits Address Offset: 28 Read/Write Access: Read/Write This register controls enabling, operating mode (free-running or defined-count), and interrupt mask of Timer2. You can program each Timer2ControlReg to enable or disable a specific timer and to control its mode of operation.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**TIMER_PWM:** Pulse Width Modulation of timer_2_toggle output. 0: Disabled 1: Enabled This field is only present when TIM_NEWMODE is enabled
2	0h RW	**TIMER_INTERRUPT_MASK:** Timer interrupt mask for Timer2. 0: not masked 1: masked
1	0h RW	**TIMER_MODE:** Timer mode for Timer2. 0: free-running mode 1: user-defined count mode. ***Note***: You must set the Timer2LoadCount register to all 1s before enabling the timer in free-running mode.
0	0h RW	**TIMER_ENABLE:** Timer enable bit for Timer2. 0: disable 1: enable

5.2.9 TIMER2EOI - Offset 20h

Timer2 End-of-Interrupt Register - Name: Timer2 End-of-Interrupt Register Size: 1 bit Address Offset: 32 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 20h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TIMER2EOI:** Reading from this register returns all zeros (0) and clears the interrupt from Timer2.

5.2.10 TIMER2INTSTAT - Offset 24h

Timer2 Interrupt Status Register - Name: Timer2 Interrupt Status Register Size: 1 bit Address Offset: 36 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 24h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TIMER2INTSTAT:** Contains the interrupt status for Timer2.

5.2.11 TIMER3LOADCOUNT - Offset 28h

Timer1 Load Count Register - Name: Timer3 Load Count Register Size: 8-32 bits Address Offset: 40 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + 28h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TIMER3LOADCOUNT:** Value to be loaded into Timer3. This is the value from which counting commences. Any value written to this register is loaded into the associated timer.

5.2.12 TIMER3CURRENTVAL - Offset 2Ch

Timer3 Current Value - Name: Timer3 Current Value Size: 8-32 bits Address Offset: 44 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 2Ch	80000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	80000000h RO/V	**TIMER3CURRENTVAL:** Current Value of Timer3. This register is supported only when timer_3_clk is synchronous to pclk. Reading this register when using independent clocks results in an undefined value.

5.2.13 TIMER3CONTROLREG - Offset 30h

Timer3 Control Register - Name: Timer3 Control Register Size: 4 bits Address Offset: 48 Read/Write Access: Read/Write This register controls enabling, operating mode (free-running or defined-count), and interrupt mask of Timer3. You can program each Timer3ControlReg to enable or disable a specific timer and to control its mode of operation.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**TIMER_PWM:** Pulse Width Modulation of timer_3_toggle output. 0: Disabled 1: Enabled This field is only present when TIM_NEWMODE is enabled
2	0h RW	**TIMER_INTERRUPT_MASK:** Timer interrupt mask for Timer3. 0: not masked 1: masked
1	0h RW	**TIMER_MODE:** Timer mode for Timer3. 0: free-running mode 1: user-defined count mode. ***Note***: You must set the Timer3LoadCount register to all 1s before enabling the timer in free-running mode.
0	0h RW	**TIMER_ENABLE:** Timer enable bit for Timer3. 0: disable 1: enable

5.2.14 TIMER3EOI - Offset 34h

Timer3 End-of-Interrupt Register - Name: Timer3 End-of-Interrupt Register Size: 1 bit Address Offset: 52 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 34h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TIMER3EOI:** Reading from this register returns all zeroes (0) and clears the interrupt from Timer3.

5.2.15 TIMER3INTSTAT - Offset 38h

Timer3 Interrupt Status Register - Name: Timer3 Interrupt Status Register Size: 1 bit Address Offset: 56 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 38h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TIMER3INTSTAT:** Contains the interrupt status for Timer3.

5.2.16 TIMER4LOADCOUNT - Offset 3Ch

Timer4 Load Count Register - Name: Timer4 Load Count Register Size: 8-32 bits Address Offset: 60 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + 3Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TIMER4LOADCOUNT:** Value to be loaded into Timer4. This is the value from which counting commences. Any value written to this register is loaded into the associated timer.

5.2.17 TIMER4CURRENTVAL - Offset 40h

Timer4 Current Value Register - Name: Timer4 Current Value Size: 8-32 bits Address Offset: 64 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 40h	80000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	80000000h RO/V	**TIMER4CURRENTVAL:** Current Value of Timer4. This register is supported only when timer_4_clk is synchronous to pclk. Reading this register when using independent clocks results in an undefined value.

5.2.18 TIMER4CONTROLREG - Offset 44h

Timer4 Control Register - Name: Timer4 Control Register Size: 4 bits Address Offset: 68 Read/Write Access: Read/Write This register controls enabling, operating mode (free-running or defined-count), and interrupt mask of Timer4. You can program each Timer4ControlReg to enable or disable a specific timer and to control its mode of operation.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 44h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**TIMER_PWM:** Pulse Width Modulation of timer_4_toggle output. 0: Disabled 1: Enabled This field is only present when TIM_NEWMODE is enabled
2	0h RW	**TIMER_INTERRUPT_MASK:** Timer interrupt mask for Timer4. 0: not masked 1: masked
1	0h RW	**TIMER_MODE:** Timer mode for Timer4. 0: free-running mode 1: user-defined count mode. ***Note***: You must set the Timer4LoadCount register to all 1s before enabling the timer in free-running mode.
0	0h RW	**TIMER_ENABLE:** Timer enable bit for Timer4. 0: disable 1: enable

5.2.19 TIMER4EOI - Offset 48h

Timer4 End-of-Interrupt Register - Name: Timer4 End-of-Interrupt Register Size: 1 bit Address Offset: 72 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 48h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TIMER4EOI:** Reading from this register returns all zeroes (0) and clears the interrupt from Timer4.

5.2.20 TIMER4INTSTAT - Offset 4Ch

Timer4 Interrupt Status Register - Name: Timer4 Interrupt Status Register Size: 1 bit Address Offset: 76 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TIMER4INTSTAT:** Contains the interrupt status for Timer4.

5.2.21 TIMER5LOADCOUNT - Offset 50h

Timer5 Load Count Register - Name: Timer5 Load Count Register Size: 8-32 bits Address Offset: 80 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + 50h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TIMER5LOADCOUNT:** Value to be loaded into Timer5. This is the value from which counting commences. Any value written to this register is loaded into the associated timer.

5.2.22 TIMER5CURRENTVAL - Offset 54h

Timer5 Current Value - Name: Timer5 Current Value Size: 8-32 bits Address Offset: 84 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 54h	80000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	80000000h RO/V	**TIMER5CURRENTVAL:** Current Value of Timer5. This register is supported only when timer_5_clk is synchronous to pclk. Reading this register when using independent clocks results in an undefined value.

5.2.23 TIMER5CONTROLREG - Offset 58h

Timer5 Control Register - Name: Timer5 Control Register Size: 4 bits Address Offset: 88 Read/Write Access: Read/Write This register controls enabling, operating mode (free-running or defined-count), and interrupt mask of Timer5. You can program each Timer5ControlReg to enable or disable a specific timer and to control its mode of operation.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 58h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**TIMER_PWM:** Pulse Width Modulation of timer_5_toggle output. 0: Disabled 1: Enabled This field is only present when TIM_NEWMODE is enabled
2	0h RW	**TIMER_INTERRUPT_MASK:** Timer interrupt mask for Timer5. 0: not masked 1: masked
1	0h RW	**TIMER_MODE:** Timer mode for Timer5. 0: free-running mode 1: user-defined count mode. ***Note***: You must set the Timer5LoadCount register to all 1s before enabling the timer in free-running mode.
0	0h RW	**TIMER_ENABLE:** Timer enable bit for Timer5. 0: disable 1: enable

5.2.24 TIMER5EOI - Offset 5Ch

Timer5 End-of-Interrupt Register - Name: Timer5 End-of-Interrupt Register Size: 1 bit Address Offset: 92 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 5Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TIMER5EOI:** Reading from this register returns all zeroes (0) and clears the interrupt from Timer5.

5.2.25 TIMER5INTSTAT - Offset 60h

Timer5 Interrupt Status Register - Name: Timer5 Interrupt Status Register Size: 1 bit Address Offset: 96 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 60h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TIMER5INTSTAT:** Contains the interrupt status for Timer5.

5.2.26 TIMER6LOADCOUNT - Offset 64h

Timer6 Load Count Register - Name: Timer6 Load Count Register Size: 8-32 bits Address Offset: 100 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + 64h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TIMER6LOADCOUNT:** Value to be loaded into Timer6. This is the value from which counting commences. Any value written to this register is loaded into the associated timer.

5.2.27 TIMER6CURRENTVAL - Offset 68h

Timer6 Current Value Register - Name: Timer6 Current Value Size: 8-32 bits Address Offset: 104 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 68h	80000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	80000000h RO/V	**TIMER6CURRENTVAL:** Current Value of Timer6. This register is supported only when timer_6_clk is synchronous to pclk. Reading this register when using independent clocks results in an undefined value.

5.2.28 TIMER6CONTROLREG - Offset 6Ch

Timer6 Control Register - Name: Timer6 Control Register Size: 4 bits Address Offset: 108 Read/Write Access: Read/Write This register controls enabling, operating mode (free-running or defined-count), and interrupt mask of Timer6. You can program each Timer6ControlReg to enable or disable a specific timer and to control its mode of operation.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 6Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**TIMER_PWM:** Pulse Width Modulation of timer_6_toggle output. 0: Disabled 1: Enabled This field is only present when TIM_NEWMODE is enabled
2	0h RW	**TIMER_INTERRUPT_MASK:** Timer interrupt mask for Timer6. 0: not masked 1: masked
1	0h RW	**TIMER_MODE:** Timer mode for Timer6. 0: free-running mode 1: user-defined count mode. ***Note***: You must set the Timer6LoadCount register to all 1s before enabling the timer in free-running mode.
0	0h RW	**TIMER_ENABLE:** Timer enable bit for Timer6. 0: disable 1: enable

5.2.29 TIMER6EOI - Offset 70h

Timer6 End-of-Interrupt Register - Name: Timer6 End-of-Interrupt Register Size: 1 bit Address Offset: 112 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 70h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TIMER6EOI:** Reading from this register returns all zeroes (0) and clears the interrupt from Timer6.

5.2.30 TIMER6INTSTAT - Offset 74h

Timer6 Interrupt Status Register - Name: Timer6 Interrupt Status Register Size: 1 bit Address Offset: 116 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 74h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TIMER6INTSTAT:** Contains the interrupt status for Timer6.

5.2.31 TIMER7LOADCOUNT - Offset 78h

Timer7 Load Count Register - Name: Timer7 Load Count Register Size: 8-32 bits Address Offset: 120 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + 78h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TIMER7LOADCOUNT:** Value to be loaded into Timer7. This is the value from which counting commences. Any value written to this register is loaded into the associated timer.

5.2.32 TIMER7CURRENTVAL - Offset 7Ch

Timer7 Current Register - Name: Timer7 Current Value Size: 8-32 bits Address Offset: 124 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 7Ch	80000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	80000000h RO/V	**TIMER7CURRENTVAL:** Current Value of Timer7. This register is supported only when timer_7_clk is synchronous to pclk. Reading this register when using independent clocks results in an undefined value.

5.2.33 TIMER7CONTROLREG - Offset 80h

Timer7 Control Register - Name: Timer7 Control Register Size: 4 bits Address Offset: 128 Read/Write Access: Read/Write This register controls enabling, operating mode (free-running or defined-count), and interrupt mask of Timer7. You can program each Timer7ControlReg to enable or disable a specific timer and to control its mode of operation.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 80h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**TIMER_PWM:** Pulse Width Modulation of timer_7_toggle output. 0: Disabled 1: Enabled This field is only present when TIM_NEWMODE is enabled
2	0h RW	**TIMER_INTERRUPT_MASK:** Timer interrupt mask for Timer7. 0: not masked 1: masked
1	0h RW	**TIMER_MODE:** Timer mode for Timer7. 0: free-running mode 1: user-defined count mode. ***Note***: You must set the Timer7LoadCount register to all 1s before enabling the timer in free-running mode.
0	0h RW	**TIMER_ENABLE:** Timer enable bit for Timer7. 0: disable 1: enable

5.2.34 TIMER7EOI - Offset 84h

Timer7 End-of-Interrupt Register - Name: Timer7 End-of-Interrupt Register Size: 1 bit Address Offset: 132 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 84h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TIMER7EOI:** Reading from this register returns all zeros (0) and clears the interrupt from Timer7.

5.2.35 TIMER7INTSTAT - Offset 88h

Timer7 Interrupt Status Register - Name: Timer7 Interrupt Status Register Size: 1 bit Address Offset: 136 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 88h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TIMER7INTSTAT:** Contains the interrupt status for Timer7.

5.2.36 TIMER8LOADCOUNT - Offset 8Ch

Timer8 Load Count Register - Name: Timer8 Load Count Register Size: 8-32 bits Address Offset: 140 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + 8Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TIMER8LOADCOUNT:** Value to be loaded into Timer8. This is the value from which counting commences. Any value written to this register is loaded into the associated timer.

5.2.37 TIMER8CURRENTVAL - Offset 90h

Timer8 Current Value - Name: Timer8 Current Value Size: 8-32 bits Address Offset: 144 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 90h	80000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	80000000h RO/V	**TIMER8CURRENTVAL:** Current Value of Timer8. This register is supported only when timer_8_clk is synchronous to pclk. Reading this register when using independent clocks results in an undefined value.

5.2.38 TIMER8CONTROLREG - Offset 94h

Timer8 Control Register - Name: Timer8 Control Register Size: 4 bits Address Offset: 148 Read/Write Access: Read/Write This register controls enabling, operating mode (free-running or defined-count), and interrupt mask of Timer8. You can program each Timer8ControlReg to enable or disable a specific timer and to control its mode of operation.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 94h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**TIMER_PWM:** Pulse Width Modulation of timer_8_toggle output. 0: Disabled 1: Enabled This field is only present when TIM_NEWMODE is enabled
2	0h RW	**TIMER_INTERRUPT_MASK:** Timer interrupt mask for Timer8. 0: not masked 1: masked
1	0h RW	**TIMER_MODE:** Timer mode for Timer8. 0: free-running mode 1: user-defined count mode. ***Note***: You must set the Timer8LoadCount register to all 1s before enabling the timer in free-running mode.
0	0h RW	**TIMER_ENABLE:** Timer enable bit for Timer8. 0: disable 1: enable

5.2.39 TIMER8EOI - Offset 98h

Timer8 End-of-Interrupt Register - Name: Timer8 End-of-Interrupt Register Size: 1 bit Address Offset: 152 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 98h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TIMER8EOI:** Reading from this register returns all zeroes (0) and clears the interrupt from Timer8.

5.2.40 TIMER8INTSTAT - Offset 9Ch

Timer8 Interrupt Status Register - Name: Timer8 Interrupt Status Register Size: 1 bit Address Offset: 156 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 9Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TIMER8INTSTAT:** Contains the interrupt status for Timer8.

5.2.41 TIMERSINTSTAT - Offset A0h

Timers Interrupt Status Register - Name: Timers Interrupt Status Register Size: 1-8 bits Address Offset: 0xa0 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + A0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO/V	**TIMERSINTSTAT:** Contains the interrupt status of all timers in the component. If a bit of this register is 0, then the corresponding timer interrupt is not active and the corresponding interrupt could be on either the timer_intr bus or the timer_intr_n bus, depending on the interrupt polarity you have chosen. Similarly, if a bit of this register is 1, then the corresponding interrupt bit has been set in the relevant interrupt bus. In both cases, the status reported is the status after the interrupt mask has been applied. Reading from this register does not clear any active interrupts: 0 = either timer_intr or timer_intr_n is not active after masking 1 = either timer_intr or timer_intr_n is active after masking.

5.2.42 TIMERSEOI - Offset A4h

Timers End-of-Interrupt Register - Name: Timers End-of-Interrupt Register Size: 1-8 bits Address Offset: 0xa4 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + A4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO/V	**TIMERSEOI:** Reading this register returns all zeros (0) and clears all active interrupts.

5.2.43 TIMERSRAWINTSTAT - Offset A8h

Timers Raw Interrupt Status Register - Name: Timers Raw Interrupt Status Register Size: 1-8 bits Address Offset: 0xa8 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + A8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO/V	**TIMERSRAWINTSTAT:** The register contains the unmasked interrupt status of all timers in the component. 0 = either timer_intr or timer_intr_n is not active prior to masking 1 = either timer_intr or timer_intr_n is active prior to masking.

5.2.44 TIMERSCOMPVERSION - Offset ACh

Timers Component Version - Name: Timers Component Version Size: 32 bits Address Offset: 0xac Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + ACh	3231302Ah

Bit Range	Default & Access	Field Name (ID): Description
31:0	3231302Ah RO/V	**TIMERSCOMPVERSION:** Current revision number of the DW_apb_timers component.

5.2.45 TIMER1LOADCOUNT2 - Offset B0h

Timer1 Load Count2 Register - Name: Timer1 Load Count2 Register Size: 8-32 bits Address Offset: 0xb0 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TIMER1LOADCOUNT2:** Value to be loaded into Timer1 when timer_1_toggle output changes from 0 to 1. This value determines the width of the HIGH period of the timer_1_toggle output.

5.2.46 TIMER2LOADCOUNT2 - Offset B4h

Timer2 Load Count2 Register - Name: Timer2 Load Count2 Register Size: 8-32 bits Address Offset: 180 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + B4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TIMER2LOADCOUNT2:** Value to be loaded into Timer2 when timer_2_toggle output changes from 0 to 1. This value determines the width of the HIGH period of the timer_2_toggle output.

5.2.47 TIMER3LOADCOUNT2 - Offset B8h

Timer3 Load Count2 Register - Name: Timer3 Load Count2 Register Size: 8-32 bits Address Offset: 184 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + B8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TIMER3LOADCOUNT2:** Value to be loaded into Timer3 when timer_3_toggle output changes from 0 to 1. This value determines the width of the HIGH period of the timer_3_toggle output.

5.2.48 TIMER4LOADCOUNT2 - Offset BCh

Timer4 Load Count2 Register - Name: Timer4 Load Count2 Register Size: 8-32 bits Address Offset: 188 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + BCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TIMER4LOADCOUNT2:** Value to be loaded into Timer4 when timer_4_toggle output changes from 0 to 1. This value determines the width of the HIGH period of the timer_4_toggle output.

5.2.49 TIMER5LOADCOUNT2 - Offset C0h

Timer5 Load Count2 Register - Name: Timer5 Load Count2 Register Size: 8-32 bits Address Offset: 192 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TIMER5LOADCOUNT2:** Value to be loaded into Timer5 when timer_5_toggle output changes from 0 to 1. This value determines the width of the HIGH period of the timer_5_toggle output.

5.2.50 TIMER6LOADCOUNT2 - Offset C4h

Timer6 Load Count2 Register - Name: Timer6 Load Count2 Register Size: 8-32 bits Address Offset: 196 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + C4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TIMER6LOADCOUNT2:** Value to be loaded into Timer6 when timer_6_toggle output changes from 0 to 1. This value determines the width of the HIGH period of the timer_6_toggle output.

5.2.51 TIMER7LOADCOUNT2 - Offset C8h

Timer7 Load Count2 Register - Name: Timer7 Load Count2 Register Size: 8-32 bits Address Offset: 200 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + C8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TIMER7LOADCOUNT2:** Value to be loaded into Timer7 when timer_7_toggle output changes from 0 to 1. This value determines the width of the HIGH period of the timer_7_toggle output.

5.2.52 TIMER8LOADCOUNT2 - Offset CCh

Timer8 Load Count2 Register - Name: Timer8 Load Count2 Register Size: 8-32 bits Address Offset: 204 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + CCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TIMER8LOADCOUNT2:** Value to be loaded into Timer8 when timer_8_toggle output changes from 0 to 1. This value determines the width of the HIGH period of the timer_8_toggle output.

5.2.53 TIMER1LOADCOUNT - Offset 1000h

Timer1 Load Count Register - Name: Timer1 Load Count Register Size: 8-32 bits Address Offset: 0x00 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1000h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TIMER1LOADCOUNT:** Value to be loaded into Timer1. This is the value from which counting commences. Any value written to this register is loaded into the associated timer.

5.2.54 TIMER1CURRENTVAL - Offset 1004h

Name: Timer1 Current Value Size: 8-32 bits Address Offset: 4 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1004h	80000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	80000000h RO/V	**TIMER1CURRENTVAL:** Current Value of Timer1. This register is supported only when timer_1_clk is synchronous to pclk. Reading this register when using independent clocks results in an undefined value.

5.2.55 TIMER1CONTROLREG - Offset 1008h

Timer1 Control Register - Name: Timer1 Control Register Size: 4 bits Address Offset: 8 Read/Write Access: Read/Write This register controls enabling, operating mode (free-running or defined-count), and interrupt mask of Timer1. You can program each Timer1ControlReg to enable or disable a specific timer and to control its mode of operation.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1008h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**TIMER_PWM:** Pulse Width Modulation of timer_1_toggle output. 0: Disabled 1: Enabled This field is only present when TIM_NEWMODE is enabled
2	0h RW	**TIMER_INTERRUPT_MASK:** Timer interrupt mask for Timer1. 0: not masked 1: masked
1	0h RW	**TIMER_MODE** Timer mode for Timer1. 0: free_running mode 1: user_defined count mode. ***Note***: You must set the Timer1LoadCount register to all 1s before enabling the timer in free-running mode.
0	0h RW	**TIMER_ENABLE:** Timer enable bit for Timer1. 0: disable 1: enable

5.2.56 TIMER1EOI - Offset 100Ch

Timer1 End-of-Interrupt Register - Name: Timer1 End-of-Interrupt Register Size: 1 bit Address Offset: 12 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 100Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TIMER1EOI:** Reading from this register returns all zeroes (0) and clears the interrupt from Timer1.

5.2.57 TIMER1INTSTAT - Offset 1010h

Timer1 Interrupt Status Register - Name: Timer1 Interrupt Status Register Size: 1 bit Address Offset: 16 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1010h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TIMER1INTSTAT:** Contains the interrupt status for Timer1.

5.2.58 TIMER2LOADCOUNT - Offset 1014h

Timer2 Load Count Register - Name: Timer2 Load Count Register Size: 8-32 bits Address Offset: 20 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1014h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TIMER2LOADCOUNT:** Value to be loaded into Timer2. This is the value from which counting commences. Any value written to this register is loaded into the associated timer.

5.2.59 TIMER2CURRENTVAL - Offset 1018h

Timer2 Current Value - Name: Timer2 Current Value Size: 8-32 bits Address Offset: 24 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1018h	80000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	80000000h RO/V	**TIMER2CURRENTVAL:** Current Value of Timer2. This register is supported only when timer_2_clk is synchronous to pclk. Reading this register when using independent clocks results in an undefined value.

5.2.60 TIMER2CONTROLREG - Offset 101Ch

Timer2 Control Register - Name: Timer2 Control Register Size: 3 bits Address Offset: 28 Read/Write Access: Read/Write This register controls enabling, operating mode (free-running or defined-count), and interrupt mask of Timer2. You can program each Timer2ControlReg to enable or disable a specific timer and to control its mode of operation.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 101Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**TIMER_PWM:** Pulse Width Modulation of timer_2_toggle output. 0: Disabled 1: Enabled This field is only present when TIM_NEWMODE is enabled
2	0h RW	**TIMER_INTERRUPT_MASK:** Timer interrupt mask for Timer2. 0: not masked 1: masked
1	0h RW	**TIMER_MODE:** Timer mode for Timer2. 0: free-running mode 1: user-defined count mode. ***Note***: You must set the Timer2LoadCount register to all 1s before enabling the timer in free-running mode.
0	0h RW	**TIMER_ENABLE:** Timer enable bit for Timer2. 0: disable 1: enable

5.2.61 TIMER2EOI - Offset 1020h

Timer2 End-of-Interrupt Register - Name: Timer2 End-of-Interrupt Register Size: 1 bit Address Offset: 32 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1020h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TIMER2EOI:** Reading from this register returns all zeroes (0) and clears the interrupt from Timer2.

5.2.62 TIMER2INTSTAT - Offset 1024h

Timer2 Interrupt Status Register - Name: Timer2 Interrupt Status Register Size: 1 bit Address Offset: 36 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1024h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TIMER2INTSTAT:** Contains the interrupt status for Timer2.

5.2.63 TIMER3LOADCOUNT - Offset 1028h

Timer1 Load Count Register - Name: Timer3 Load Count Register Size: 8-32 bits Address Offset: 40 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1028h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TIMER3LOADCOUNT:** Value to be loaded into Timer3. This is the value from which counting commences. Any value written to this register is loaded into the associated timer.

5.2.64 TIMER3CURRENTVAL - Offset 102Ch

Timer3 Current Value - Name: Timer3 Current Value Size: 8-32 bits Address Offset: 44 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 102Ch	80000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	80000000h RO/V	**TIMER3CURRENTVAL:** Current Value of Timer3. This register is supported only when timer_3_clk is synchronous to pclk. Reading this register when using independent clocks results in an undefined value.

5.2.65 TIMER3CONTROLREG - Offset 1030h

Timer3 Control Register - Name: Timer3 Control Register Size: 4 bits Address Offset: 48 Read/Write Access: Read/Write This register controls enabling, operating mode (free-running or defined-count), and interrupt mask of Timer3. You can program each Timer3ControlReg to enable or disable a specific timer and to control its mode of operation.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1030h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**TIMER_PWM:** Pulse Width Modulation of timer_3_toggle output. 0: Disabled 1: Enabled This field is only present when TIM_NEWMODE is enabled
2	0h RW	**TIMER_INTERRUPT_MASK:** Timer interrupt mask for Timer3. 0: not masked 1: masked
1	0h RW	**TIMER_MODE:** Timer mode for Timer3. 0: free-running mode 1: user-defined count mode. ***Note***: You must set the Timer3LoadCount register to all 1s before enabling the timer in free-running mode.
0	0h RW	**TIMER_ENABLE:** Timer enable bit for Timer3. 0: disable 1: enable

5.2.66 TIMER3EOI - Offset 1034h

Timer3 End-of-Interrupt Register - Name: Timer3 End-of-Interrupt Register Size: 1 bit Address Offset: 52 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1034h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TIMER3EOI:** Reading from this register returns all zeroes (0) and clears the interrupt from Timer3.

5.2.67 TIMER3INTSTAT - Offset 1038h

Timer3 Interrupt Status Register - Name: Timer3 Interrupt Status Register Size: 1 bit Address Offset: 56 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1038h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TIMER3INTSTAT:** Contains the interrupt status for Timer3.

5.2.68 TIMER4LOADCOUNT - Offset 103Ch

Timer4 Load Count Register - Name: Timer4 Load Count Register Size: 8-32 bits Address Offset: 60 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + 103Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TIMER4LOADCOUNT:** Value to be loaded into Timer4. This is the value from which counting commences. Any value written to this register is loaded into the associated timer.

5.2.69 TIMER4CURRENTVAL - Offset 1040h

Timer4 Current Value Register - Name: Timer4 Current Value Size: 8-32 bits Address Offset: 64 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1040h	80000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	80000000h RO/V	**TIMER4CURRENTVAL:** Current Value of Timer4. This register is supported only when timer_4_clk is synchronous to pclk. Reading this register when using independent clocks results in an undefined value.

5.2.70 TIMER4CONTROLREG - Offset 1044h

Timer4 Control Register - Name: Timer4 Control Register Size: 4 bits Address Offset: 68 Read/Write Access: Read/Write This register controls enabling, operating mode (free-running or defined-count), and interrupt mask of Timer4. You can program each Timer4ControlReg to enable or disable a specific timer and to control its mode of operation.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1044h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**TIMER_PWM:** Pulse Width Modulation of timer_4_toggle output. 0: Disabled 1: Enabled This field is only present when TIM_NEWMODE is enabled
2	0h RW	**TIMER_INTERRUPT_MASK:** Timer interrupt mask for Timer4. 0: not masked 1: masked
1	0h RW	**TIMER_MODE:** Timer mode for Timer4. 0: free-running mode 1: user-defined count mode. ***Note***: You must set the Timer4LoadCount register to all 1s before enabling the timer in free-running mode.
0	0h RW	**TIMER_ENABLE:** Timer enable bit for Timer4. 0: disable 1: enable

5.2.71 TIMER4EOI - Offset 1048h

Timer4 End-of-Interrupt Register - Name: Timer4 End-of-Interrupt Register Size: 1 bit Address Offset: 72 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1048h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TIMER4EOI:** Reading from this register returns all zeroes (0) and clears the interrupt from Timer4.

5.2.72 TIMER4INTSTAT - Offset 104Ch

Timer4 Interrupt Status Register - Name: Timer4 Interrupt Status Register Size: 1 bit Address Offset: 76 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 104Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TIMER4INTSTAT:** Contains the interrupt status for Timer4.

5.2.73 TIMER5LOADCOUNT - Offset 1050h

Timer5 Load Count Register - Name: Timer5 Load Count Register Size: 8-32 bits Address Offset: 80 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1050h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TIMER5LOADCOUNT:** Value to be loaded into Timer5. This is the value from which counting commences. Any value written to this register is loaded into the associated timer.

5.2.74 TIMER5CURRENTVAL - Offset 1054h

Timer5 Current Value - Name: Timer5 Current Value Size: 8-32 bits Address Offset: 84 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1054h	80000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	80000000h RO/V	**TIMER5CURRENTVAL:** Current Value of Timer5. This register is supported only when timer_5_clk is synchronous to pclk. Reading this register when using independent clocks results in an undefined value.

5.2.75 TIMER5CONTROLREG - Offset 1058h

Timer5 Control Register - Name: Timer5 Control Register Size: 4 bits Address Offset: 88 Read/Write Access: Read/Write This register controls enabling, operating mode (free-running or defined-count), and interrupt mask of Timer5. You can program each Timer5ControlReg to enable or disable a specific timer and to control its mode of operation.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1058h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**TIMER_PWM:** Pulse Width Modulation of timer_5_toggle output. 0: Disabled 1: Enabled This field is only present when TIM_NEWMODE is enabled
2	0h RW	**TIMER_INTERRUPT_MASK:** Timer interrupt mask for Timer5. 0: not masked 1: masked
1	0h RW	**TIMER_MODE:** Timer mode for Timer5. 0: free-running mode 1: user-defined count mode. ***Note***: You must set the Timer5LoadCount register to all 1s before enabling the timer in free-running mode.
0	0h RW	**TIMER_ENABLE:** Timer enable bit for Timer5. 0: disable 1: enable

5.2.76 TIMER5EOI - Offset 105Ch

Timer5 End-of-Interrupt Register - Name: Timer5 End-of-Interrupt Register Size: 1 bit Address Offset: 92 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 105Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TIMER5EOI:** Reading from this register returns all zeroes (0) and clears the interrupt from Timer5.

5.2.77 TIMER5INTSTAT - Offset 1060h

Timer5 Interrupt Status Register - Name: Timer5 Interrupt Status Register Size: 1 bit Address Offset: 96 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1060h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TIMER5INTSTAT:** Contains the interrupt status for Timer5.

5.2.78 TIMER6LOADCOUNT - Offset 1064h

Timer6 Load Count Register - Name: Timer6 Load Count Register Size: 8-32 bits Address Offset: 100 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1064h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TIMER6LOADCOUNT:** Value to be loaded into Timer6. This is the value from which counting commences. Any value written to this register is loaded into the associated timer.

5.2.79 TIMER6CURRENTVAL - Offset 1068h

Timer6 Current Value Register - Name: Timer6 Current Value Size: 8-32 bits Address Offset: 104 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1068h	80000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	80000000h RO/V	**TIMER6CURRENTVAL:** Current Value of Timer6. This register is supported only when timer_6_clk is synchronous to pclk. Reading this register when using independent clocks results in an undefined value.

5.2.80 TIMER6CONTROLREG - Offset 106Ch

Timer6 Control Register - Name: Timer6 Control Register Size: 4 bits Address Offset: 108 Read/Write Access: Read/Write This register controls enabling, operating mode (free-running or defined-count), and interrupt mask of Timer6. You can program each Timer6ControlReg to enable or disable a specific timer and to control its mode of operation.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 106Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**TIMER_PWM:** Pulse Width Modulation of timer_6_toggle output. 0: Disabled 1: Enabled This field is only present when TIM_NEWMODE is enabled
2	0h RW	**TIMER_INTERRUPT_MASK:** Timer interrupt mask for Timer6. 0: not masked 1: masked
1	0h RW	**TIMER_MODE:** Timer mode for Timer6. 0: free-running mode 1: user-defined count mode. ***Note***: You must set the Timer6LoadCount register to all 1s before enabling the timer in free-running mode.
0	0h RW	**TIMER_ENABLE:** Timer enable bit for Timer6. 0: disable 1: enable

5.2.81 TIMER6EOI - Offset 1070h

Timer6 End-of-Interrupt Register - Name: Timer6 End-of-Interrupt Register Size: 1 bit Address Offset: 112 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1070h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TIMER6EOI:** Reading from this register returns all zeroes (0) and clears the interrupt from Timer6.

5.2.82 TIMER6INTSTAT - Offset 1074h

Timer6 Interrupt Status Register - Name: Timer6 Interrupt Status Register Size: 1 bit Address Offset: 116 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1074h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TIMER6INTSTAT:** Contains the interrupt status for Timer6.

5.2.83 TIMER7LOADCOUNT - Offset 1078h

Timer7 Load Count Register - Name: Timer7 Load Count Register Size: 8-32 bits Address Offset: 120 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1078h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TIMER7LOADCOUNT:** Value to be loaded into Timer7. This is the value from which counting commences. Any value written to this register is loaded into the associated timer.

5.2.84 TIMER7CURRENTVAL - Offset 107Ch

Timer7 Current Register - Name: Timer7 Current Value Size: 8-32 bits Address Offset: 124 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 107Ch	80000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	80000000h RO/V	**TIMER7CURRENTVAL:** Current Value of Timer7. This register is supported only when timer_7_clk is synchronous to pclk. Reading this register when using independent clocks results in an undefined value.

5.2.85 TIMER7CONTROLREG - Offset 1080h

Timer7 Control Register - Name: Timer7 Control Register Size: 4 bits Address Offset: 128 Read/Write Access: Read/Write This register controls enabling, operating mode (free-running or defined-count), and interrupt mask of Timer7. You can program each Timer7ControlReg to enable or disable a specific timer and to control its mode of operation.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1080h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**TIMER_PWM:** Pulse Width Modulation of timer_7_toggle output. 0: Disabled 1: Enabled This field is only present when TIM_NEWMODE is enabled
2	0h RW	**TIMER_INTERRUPT_MASK:** Timer interrupt mask for Timer7. 0: not masked 1: masked
1	0h RW	**TIMER_MODE:** Timer mode for Timer7. 0: free-running mode 1: user-defined count mode. ***Note***: You must set the Timer7LoadCount register to all 1s before enabling the timer in free-running mode.
0	0h RW	**TIMER_ENABLE:** Timer enable bit for Timer7. 0: disable 1: enable

5.2.86 TIMER7EOI - Offset 1084h

Timer7 End-of-Interrupt Register - Name: Timer7 End-of-Interrupt Register Size: 1 bit Address Offset: 132 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1084h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TIMER7EOI:** Reading from this register returns all zeroes (0) and clears the interrupt from Timer7.

5.2.87 TIMER7INTSTAT - Offset 1088h

Timer7 Interrupt Status Register - Name: Timer7 Interrupt Status Register Size: 1 bit Address Offset: 136 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1088h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TIMER7INTSTAT:** Contains the interrupt status for Timer7.

5.2.88 TIMER8LOADCOUNT - Offset 108Ch

Timer8 Load Count Register - Name: Timer8 Load Count Register Size: 8-32 bits Address Offset: 140 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + 108Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TIMER8LOADCOUNT:** Value to be loaded into Timer8. This is the value from which counting commences. Any value written to this register is loaded into the associated timer.

5.2.89 TIMER8CURRENTVAL - Offset 1090h

Timer8 Current Value - Name: Timer8 Current Value Size: 8-32 bits Address Offset: 144 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1090h	80000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	80000000h RO/V	**TIMER8CURRENTVAL:** Current Value of Timer8. This register is supported only when timer_8_clk is synchronous to pclk. Reading this register when using independent clocks results in an undefined value.

5.2.90 TIMER8CONTROLREG - Offset 1094h

Timer8 Control Register - Name: Timer8 Control Register Size: 4 bits Address Offset: 148 Read/Write Access: Read/Write This register controls enabling, operating mode (free-running or defined-count), and interrupt mask of Timer8. You can program each Timer8ControlReg to enable or disable a specific timer and to control its mode of operation.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1094h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW	**TIMER_PWM:** Pulse Width Modulation of timer_8_toggle output. 0: Disabled 1: Enabled This field is only present when TIM_NEWMODE is enabled
2	0h RW	**TIMER_INTERRUPT_MASK:** Timer interrupt mask for Timer8. 0: not masked 1: masked
1	0h RW	**TIMER_MODE:** Timer mode for Timer8. 0: free-running mode 1: user-defined count mode. ***Note***: You must set the Timer8LoadCount register to all 1s before enabling the timer in free-running mode.
0	0h RW	**TIMER_ENABLE:** Timer enable bit for Timer8. 0: disable 1: enable

5.2.91 TIMER8EOI - Offset 1098h

Timer8 End-of-Interrupt Register - Name: Timer8 End-of-Interrupt Register Size: 1 bit Address Offset: 152 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 1098h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TIMER8EOI:** Reading from this register returns all zeroes (0) and clears the interrupt from Timer8.

5.2.92 TIMER8INTSTAT - Offset 109Ch

Timer8 Interrupt Status Register - Name: Timer8 Interrupt Status Register Size: 1 bit Address Offset: 156 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 109Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO/V	**TIMER8INTSTAT:** Contains the interrupt status for Timer8.

5.2.93 TIMERSINTSTAT - Offset 10A0h

Timers Interrupt Status Register - Name: Timers Interrupt Status Register Size: 1-8 bits Address Offset: 0xa0 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10A0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO/V	**TIMERSINTSTAT:** Contains the interrupt status of all timers in the component. If a bit of this register is 0, then the corresponding timer interrupt is not active and the corresponding interrupt could be on either the timer_intr bus or the timer_intr_n bus, depending on the interrupt polarity you have chosen. Similarly, if a bit of this register is 1, then the corresponding interrupt bit has been set in the relevant interrupt bus. In both cases, the status reported is the status after the interrupt mask has been applied. Reading from this register does not clear any active interrupts: 0 = either timer_intr or timer_intr_n is not active after masking 1 = either timer_intr or timer_intr_n is active after masking.

5.2.94 TIMERSEOI - Offset 10A4h

Timers End-of-Interrupt Register - Name: Timers End-of-Interrupt Register Size: 1-8 bits Address Offset: 0xa4 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10A4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO/V	**TIMERSEOI:** Reading this register returns all zeroes (0) and clears all active interrupts.

5.2.95 TIMERSRAWINTSTAT - Offset 10A8h

Timers Raw Interrupt Status Register - Name: Timers Raw Interrupt Status Register Size: 1-8 bits Address Offset: 0xa8 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10A8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	00h RO/V	**TIMERSRAWINTSTAT:** The register contains the unmasked interrupt status of all timers in the component. 0 = either timer_intr or timer_intr_n is not active prior to masking 1 = either timer_intr or timer_intr_n is active prior to masking.

5.2.96 TIMERSCOMPVERSION - Offset 10ACh

Timers Component Version - Name: Timers Component Version Size: 32 bits Address Offset: 0xac Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10ACh	3231302Ah

Bit Range	Default & Access	Field Name (ID): Description
31:0	3231302Ah RO/V	**TIMERSCOMPVERSION:** Current revision number of the DW_apb_timers component.

5.2.97 TIMER1LOADCOUNT2 - Offset 10B0h

Timer1 Load Count2 Register - Name: Timer1 Load Count2 Register Size: 8-32 bits Address Offset: 0xb0 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TIMER1LOADCOUNT2:** Value to be loaded into Timer1 when timer_1_toggle output changes from 0 to 1. This value determines the width of the HIGH period of the timer_1_toggle output.

5.2.98 TIMER2LOADCOUNT2 - Offset 10B4h

Timer2 Load Count2 Register - Name: Timer2 Load Count2 Register Size: 8-32 bits Address Offset: 180 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10B4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TIMER2LOADCOUNT2:** Value to be loaded into Timer2 when timer_2_toggle output changes from 0 to 1. This value determines the width of the HIGH period of the timer_2_toggle output.

5.2.99 TIMER3LOADCOUNT2 - Offset 10B8h

Timer3 Load Count2 Register - Name: Timer3 Load Count2 Register Size: 8-32 bits Address Offset: 184 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10B8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TIMER3LOADCOUNT2:** Value to be loaded into Timer3 when timer_3_toggle output changes from 0 to 1. This value determines the width of the HIGH period of the timer_3_toggle output.

5.2.100 TIMER4LOADCOUNT2 - Offset 10BCh

Timer4 Load Count2 Register - Name: Timer4 Load Count2 Register Size: 8-32 bits Address Offset: 188 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10BCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TIMER4LOADCOUNT2:** Value to be loaded into Timer4 when timer_4_toggle output changes from 0 to 1. This value determines the width of the HIGH period of the timer_4_toggle output.

5.2.101 TIMER5LOADCOUNT2 - Offset 10C0h

Timer5 Load Count2 Register - Name: Timer5 Load Count2 Register Size: 8-32 bits Address Offset: 192 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TIMER5LOADCOUNT2:** Value to be loaded into Timer5 when timer_5_toggle output changes from 0 to 1. This value determines the width of the HIGH period of the timer_5_toggle output.

5.2.102 TIMER6LOADCOUNT2 - Offset 10C4h

Timer6 Load Count2 Register - Name: Timer6 Load Count2 Register Size: 8-32 bits Address Offset: 196 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10C4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TIMER6LOADCOUNT2:** Value to be loaded into Timer6 when timer_6_toggle output changes from 0 to 1. This value determines the width of the HIGH period of the timer_6_toggle output.

5.2.103 TIMER7LOADCOUNT2 - Offset 10C8h

Timer7 Load Count2 Register - Name: Timer7 Load Count2 Register Size: 8-32 bits Address Offset: 200 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10C8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TIMER7LOADCOUNT2:** Value to be loaded into Timer7 when timer_7_toggle output changes from 0 to 1. This value determines the width of the HIGH period of the timer_7_toggle output.

5.2.104 TIMER8LOADCOUNT2 - Offset 10CCh

Timer8 Load Count2 Register - Name: Timer8 Load Count2 Register Size: 8-32 bits Address Offset: 204 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	BAR + 10CCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**TIMER8LOADCOUNT2:** Value to be loaded into Timer8 when timer_8_toggle output changes from 0 to 1. This value determines the width of the HIGH period of the timer_8_toggle output.

5.2.105 D0i3 Control (D0I3C) - Offset 2000h
