# **Altivar 32** Variable Speed Drives Safety Functions Manual

08/2014

Schneider Electric The information provided in this documentation contains general descriptions and/or technical characteristics of the performance of the products contained herein. This documentation is not intended as a substitute for and is not to be used for determining suitability or reliability of these products for specific user applications. It is the duty of any such user or integrator to perform the appropriate and complete risk analysis, evaluation and testing of the products with respect to the relevant specific application or use thereof. Neither Schneider Electric nor any of its affiliates or subsidiaries shall be responsible or liable for misuse of the information contained herein. If you have any suggestions for improvements or amendments or have found errors in this publication, please notify us.

No part of this document may be reproduced in any form or by any means, electronic or mechanical, including photocopying, without express written permission of Schneider Electric.

All pertinent state, regional, and local safety regulations must be observed when installing and using this product. For reasons of safety and to help ensure compliance with documented system data, only the manufacturer should perform repairs to components.

When devices are used for applications with technical safety requirements, the relevant instructions must be followed.

Failure to use Schneider Electric software or approved software with our hardware products may result in injury, harm, or improper operating results.

Failure to observe this information can result in injury or equipment damage.

# **Safety Information**

### **Important Information**

#### NOTICE

Read these instructions carefully, and look at the equipment to become familiar with the device before trying to install, operate, or maintain it. The following special messages may appear throughout this documentation or on the equipment to warn of potential hazards or to call attention to information that clarifies or simplifies a procedure.

The addition of this symbol to a "Danger" or "Warning" safety label indicates that an electrical hazard exists which will result in personal injury if the instructions are not followed.

This is the safety alert symbol. It is used to alert you to potential personal injury hazards. Obey all safety messages that follow this symbol to avoid possible injury or death.

# A DANGER

**DANGER** indicates a hazardous situation which, if not avoided, will result in death or serious injury.

# A WARNING

**WARNING** indicates a hazardous situation which, if not avoided, **could result in** death or serious injury.

# 

**CAUTION** indicates a hazardous situation which, if not avoided, **could result** in minor or moderate injury.

# NOTICE

NOTICE is used to address practices not related to physical injury.

#### PLEASE NOTE

Electrical equipment should be installed, operated, serviced, and maintained only by qualified personnel. No responsibility is assumed by Schneider Electric for any consequences arising out of the use of this material.

A qualified person is one who has skills and knowledge related to the construction and operation of electrical equipment and its installation, and has received safety training to recognize and avoid the hazards involved.

# **About the Book**

#### At a Glance

#### **Document Scope**

The purpose of this document is to provide information about safety functions incorporated in Altivar 32. These functions allow you to develop applications oriented in the protection of man and machine.

FDT/DTM (field device tool / device type manager) is a new technology chosen by several companies in automation.

To install the Altivar 32 DTM, you can download and install our FDT: SoMove lite on www.schneiderelectric.com. It is including the Altivar 32 DTM.

The content of this manual is also accessible through the ATV32 DTM online help.

#### **Validity Note**

This documentation is valid for the Altivar 32 drive.

The technical characteristics of the devices described in this document also appear online. To access this information online:

Step	Action
1	Go to the Schneider Electric home page <u>www.schneider-electric.com</u> .
2	<ul> <li>In the Search box type the reference of a product or the name of a product range.</li> <li>Do not include blank spaces in the model number/product range.</li> <li>To get information on grouping similar modules, use asterisks (*).</li> </ul>
3	If you entered a reference, go to the <b>Product Datasheets</b> search results and click on the reference that interests you. If you entered the name of a product range, go to the <b>Product Ranges</b> search results and click on the product range that interests you.
4	If more than one reference appears in the <b>Products</b> search results, click on the reference that interests you.
5	Depending on the size of your screen, you may need to scroll down to see the data sheet.
6	To save or print a data sheet as a .pdf file, click <b>Download XXX product datasheet</b> .

The characteristics that are presented in this manual should be the same as those characteristics that appear online. In line with our policy of constant improvement, we may revise content over time to improve clarity and accuracy. If you see a difference between the manual and online information, use the online information as your reference.

#### **Product Related Information**

The information provided in this manual supplements the product manuals.

Carefully read the product manuals before using the product.

Read and understand these instructions before performing any procedure with this drive.

# A A DANGER

#### HAZARD OF ELECTRIC SHOCK, EXPLOSION, OR ARC FLASH

- Only appropriately trained persons who are familiar with and understand the contents of this manual and all other pertinent product documentation and who have received safety training to recognize and avoid hazards involved are authorized to work on and with this drive system. Installation, adjustment, repair, and maintenance must be performed by qualified personnel.
- The system integrator is responsible for compliance with all local and national electrical code requirements as well as all other applicable regulations with respect to grounding of all equipment.
- Many components of the product, including the printed circuit boards, operate with mains voltage. Do
  not touch. Use only electrically insulated tools.
- Do not touch unshielded components or terminals with voltage present.
- Motors can generate voltage when the shaft is rotated. Before performing any type of work on the drive system, block the motor shaft to prevent rotation.
- AC voltage can couple voltage to unused conductors in the motor cable. Insulate both ends of unused conductors of the motor cable.
- Do not short across the DC bus terminals or the DC bus capacitors or the braking resistor terminals.
- Before performing work on the drive system:
  - Disconnect all power, including external control power that may be present.
  - Place a "Do Not Turn On" label on all power switches.
  - Lock all power switches in the open position.
  - Wait 15minutes to allow the DC bus capacitors to discharge. The DC bus LED is not an indicator of the absence of DC bus voltage that can exceed 800 Vdc.
  - Measure the voltage on the DC bus between the DC bus terminals using a properly rated voltmeter to verify that the voltage is < 42Vdc.</li>
  - If the DC bus capacitors do not discharge properly, contact your local Schneider Electric representative.
- Install and close all covers before applying voltage.

Failure to follow these instructions will result in death or serious injury.

# 

#### UNINTENDED EQUIPMENT OPERATION

- Read and understand this manual before installing or operating the drive.
- Any changes made to the parameter settings must be performed by qualified personnel.

Failure to follow these instructions will result in death or serious injury.

# **WARNING**

#### DAMAGED DRIVE EQUIPMENT

Do not operate or install any drive or drive accessory that appears damaged.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

# 

### LOSS OF CONTROL

- The designer of any control scheme must consider the potential failure modes of control paths and, for critical control functions, provide a means to achieve a safe state during and after a path failure. Examples of critical control functions are emergency stop, overtravel stop, power outage, and restart.
- Separate or redundant control paths must be provided for critical control functions.System control
  paths may include communication links. Consideration must be given to the implications of
  unanticipated transmission delays or failures of the link.
- System control paths may include communication links. Consideration must be given to the implications of unanticipated transmission delays or failures of the link.
- Observe all accident prevention regulations and local safety guidelines.(1)
- Each implementation of the product must be individually and thoroughly tested for proper operation before being placed into service.

#### Failure to follow these instructions can result in death, serious injury, or equipment damage.

 For USA: Additional information, refer to NEMA ICS 1.1 (latest edition), "Safety guidelines for the application, installation, and maintenance of solid-State control" and to NEMA ICS 7.1 (latest edition), "Safety standards for construction and guide for selection, installation, and operation of adjustable speed drive systems."

# 

#### INCOMPATIBLE LINE VOLTAGE

Before turning on and configuring the drive, ensure that the line voltage is compatible with the supply voltage range shown on the drive nameplate. The drive may be damaged if the line voltage is not compatible.

Failure to follow these instructions can result in injury or equipment damage.

# NOTICE

#### **RISK OF DERATED PERFORMANCE DUE TO CAPACITOR AGING**

The product capacitor performances after a long time storage above 2 years can be degraded. In that case, before using the product, apply the following procedure:

- Use a variable AC supply connected between L1 and L2 (even for ATV •••••N4 references).
- Increase AC supply voltage to have:
  - 80% of rated voltage during 30 min
  - 100% of rated voltage for another 30 min

Failure to follow these instructions can result in equipment damage.

#### **Qualification of personnel**

Only appropriately trained persons who are familiar with and understand the contents of this manual and all other pertinent product documentation are authorized to work on and with this product. In addition, these persons must have received safety training to recognize and avoid hazards involved. These persons must have sufficient technical training, knowledge and experience and be able to foresee and detect potential hazards that may be caused by using the product, by changing the settings and by the mechanical, electrical and electronic equipment of the entire system in which the product is used.

All persons working on and with the product must be fully familiar with all applicable standards, directives, and accident prevention regulations when performing such work.

#### Intended use

The functions described in this manual are only intended for use with the basic product; you must read and understand the appropriate product manual. The product may only be used in compliance with all applicable safety regulations and directives, the specified requirements and the technical data. Prior to using the product, you must perform a risk assessment in view of the planned application. Based on the results, the appropriate safety measures must be implemented. Since the product is used as a component in an entire system, you must ensure the safety of persons by means of the design of this entire system (for example, machine design).

Operate the product only with the specified cables and accessories. Use only genuine accessories and spare parts. Any use other than the use explicitly permitted is prohibited and can result in hazards. Electrical equipment should be installed, operated, serviced, and maintained only by qualified personnel. The product must NEVER be operated in explosive atmospheres (hazardous locations, Ex areas).

### What Is in This Chapter?

This chapter contains the following topics:

Торіс	
Introduction	12
Standards and Terminology	13
Basics	14

### Introduction

#### **Overview**

The safety functions incorporated in Altivar 32 are intended to maintain the safe condition of the installation or prevent hazardous conditions arising at the installation. In some cases, further safety-related systems external to the drive (for example a mechanical brake) may be necessary to maintain the safe condition when electrical power is removed.

The safety functions are configured with SoMove software.

Integrated safety functions provide the following benefits:

- Additional standards-compliant safety functions
- No need for external safety-related devices
- Reduced wiring effort and space requirements
- Reduced costs

The Altivar 32 drives are compliant with the requirements of the standards in terms of implementation of safety functions.

#### Safety Functions as Defined by IEC 61800-5-2

Definitions

Acronym	Description	
STO	Safe Torque Off No power that could cause torque or force is supplied to the motor.	
SLS	Safely-Limited Speed The SLS function prevents the motor from exceeding the specified speed limit. If the motor speed exceed the specified speed limit value, safety function STO is triggered.	
SS1         Safe Stop 1           • initiates and monitors the motor deceleration rate within set limits to stop the motor           • initiates the Safe Operating Stop function when the motor speed is below the specified limits to stop the specified		

### 

ELECTRIC SHOCK CAUSED BY INCORRECT USE

The safety function 5 *L*  $\_$  (**[Safe Torque Off]**) does not cause electric isolation. The DC bus voltage is still present.

• Turn off the main voltage using an appropriate switch to achieve a voltage-free condition.

Failure to follow these instructions will result in death or serious injury.

#### Notation

The graphic display terminal (to be ordered separately - reference VW3A1101) menus are shown in square brackets.

The integrated 7-segment display terminal menus are shown in round brackets.

Parameter names are displayed on the graphic display terminal in square brackets.

Parameter codes are displayed on the integrated 7-segment display terminal in round brackets.

### **Standards and Terminology**

#### **Overview**

The technical terms, terminology, and the corresponding descriptions in this manual normally use the terms or definitions in the relevant standards.

In the area of drive systems this includes, but is not limited to, terms such as **safety function**, **safe state**, **fault**, **fault reset**, **failure**, **error**, **error message**, **warning**, **warning message**, and so on.

Among others, these standards include:

- IEC 61800 series: Adjustable speed electrical power drive systems
- IEC 61508 Ed.2 series: Functional safety of electrical/electronic/programmable electronic safety-related systems
- EN 954-1 Safety of machinery Safety related parts of control systems
- EN ISO 13849-1 & 2 Safety of machinery Safety related parts of control systems
- IEC 61158 series: Industrial communication networks Fieldbus specifications
- IEC 61784 series: Industrial communication networks Profiles
- IEC 60204-1: Safety of machinery Electrical equipment of machines Part 1: General requirements

#### **EC Declaration of Conformity**

The EC Declaration of Conformity for the EMC Directive can be obtained on www.schneider-electric.com.

#### **ATEX Certification**

The ATEX certificate can be obtained on www.schneider-electric.com.

#### **Functional Safety Certification**

The integrated safety functions are compatible and certified according to IEC 61800-5-2 Ed.1 Adjustable speed electrical power drive systems - Part 5-2: Safety requirements - Functional.

IEC 61800-5-2, as a product standard, sets out safety-related considerations of Power Drive System Safety Related PDS (SR)s in terms of the framework of the IEC 61508 Ed.2 series of standards.

Compliance with the IEC 61800-5-2 standard, for the safety functions described below, will facilitate incorporation of a PDS (SR) (Power Drive System suitable for use in safety-related applications) into a safety-related control system using the principles of IEC 61508, or ISO 13849, as well as IEC 62061 for process systems and machinery.

The defined safety functions are:

- SIL2 and SIL3 capability in compliance with IEC 61800-5-2 and the IEC 61508 Ed.2 series.
- Performance Level d and e in compliance with ISO 13849-1.
- Compliant with Category 3 and 4 of European standard ISO 13849-1 (EN 954-1).

Also refer to safety function Capability.

The safety demand operating mode is considered to be high demand or continuous mode of operation according to the IEC 61800-5-2 standard.

The functional safety certificate is accessible on www.schneider-electric.com.

#### **Basics**

#### **Functional Safety**

Automation and safety engineering are two areas that were completely separate in the past but have recently become more and more integrated.

The engineering and installation of complex automation solutions are greatly simplified by integrated safety functions.

Usually, the safety engineering requirements depend on the application.

The level of requirements results from the risk and the hazard potential arising from the specific application.

#### IEC 61508 Standard

The standard IEC 61508 Functional safety of electrical/electronic/programmable electronic safety-related systems covers the safety-related function.

Instead of a single component, an entire function chain (for example, from a sensor through the logical processing units to the actuator) is considered as a unit.

This function chain must meet the requirements of the specific safety integrity level as a whole.

Systems and components that can be used in various applications for safety tasks with comparable risk levels can be developed on this basis.

#### SIL - Safety Integrity Level

The standard IEC 61508 defines 4 safety integrity levels (SIL) for safety functions.

SIL1 is the lowest level and SIL4 is the highest level.

A hazard and risk analysis serves as a basis for determining the required safety integrity level.

This is used to decide whether the relevant function chain is to be considered as a safety function and which hazard potential it must cover.

#### PFH - Probability of a Dangerous Hardware Failure Per Hour

To maintain the safety function, the IEC 61508 standard requires various levels of measures for avoiding and controlling detected faults, depending on the required SIL.

All components of a safety function must be subjected to a probability assessment to evaluate the effectiveness of the measures implemented for controlling detected faults.

This assessment determined the PFH (Probability of a dangerous Failure per Hour) for a safety system.

This is the probability per hour that a safety system fails in a hazardous manner and the safety function cannot be correctly executed.

Depending on the SIL, the PFH must not exceed certain values for the entire safety system.

The individual PFH values of a function chain are added. The result must not exceed the maximum value specified in the standard.

Performance level	Probability of a dangerous Failure per Hour (PFH) at high demand or continuous demand
4	$\geq 10^{-9} < 10^{-8}$
3	$\geq 10^{-8} < 10^{-7}$
2	≥ 10 <sup>-7</sup> < 10 <sup>-6</sup>
1	$\geq 10^{-6} < 10^{-5}$

#### PL - Performance Level

The standard IEC 13849-1 defines 5 Performance levels (PL) for safety functions.

a is the lowest level and e is the highest level.

Five levels (a, b, c, d, and e) correspond to different values of average probability of dangerous failure per hour.

Performance level	Probability of a dangerous Hardware Failure per Hour
е	$\geq 10^{-8} < 10^{-7}$
d	$\geq 10^{-7} < 10^{-6}$
С	$\geq 10^{-6} < 3 * 10^{-6}$
b	$\geq 3 * 10^{-6} \dots < 10^{-5}$
а	$\geq 10^{-5} < 10^{-4}$

#### HFT - Hardware Fault Tolerance and SFF - Safe Failure Fraction

Depending on the SIL for the safety system, the IEC 61508 standard requires a specific hardware fault tolerance HFT in connection with a specific proportion of safe failures SFF (Safe Failure Fraction).

The hardware fault tolerance is the ability of a system to execute the required safety function in spite of the presence of one or more hardware faults.

The SFF of a system is defined as the ratio of the rate of safe failures to the total failure rate of the system.

According to IEC 61508, the maximum achievable SIL of a system is partly determined by the hardware fault tolerance HFT and the safe failure fraction SFF of the system.

IEC 61508 distinguishes two types of subsystem (type A subsystem, type B subsystem).

These types are specified on the basis of criteria which the standard defines for the safety-relevant components.

SFF	HFT type A subsystem			HFT type B subsystem		
	0	1	2	0	1	2
< 60%	SIL1	SIL2	SIL3		SIL1	SIL2
60%< 90%	SIL2	SIL3	SIL4	SIL1	SIL2	SIL3
60%< 99%	SIL3	SIL4	SIL4	SIL2	SIL3	SIL4
≥ 60%	SIL3	SIL4	SIL4	SIL3	SIL4	SIL4

#### PFD - Probability of Failure on Demand

The standard IEC 61508 defines SIL using requirements grouped into two broad categories: hardware safety integrity and systematic safety integrity. A device or system must meet the requirements for both categories to achieve a given SIL.

The SIL requirements for hardware safety integrity are based on a probabilistic analysis of the device. To achieve a given SIL, the device must meet targets for the maximum probability of dangerous failure and a minimum Safe Failure Fraction. The concept of 'dangerous failure' must be rigorously defined for the system in question, normally in the form of requirement constraints whose integrity is verified throughout system development. The actual targets required vary depending on the likelihood of a demand, the complexity of the device(s), and types of redundancy used.

The PFD (Probability of Failure on Demand) and RRF (Risk Reduction Factor) of low demand operation for different SILs are defined in IEC 61508 are as follows:

SIL	PFD	PFD (power	RRF
1	0.1 - 0.01	10 <sup>-1</sup> - 10 <sup>-2</sup>	10 - 100
2	0.01 - 0.001	10 <sup>-2</sup> - 10 <sup>-3</sup>	100 - 1000
3	0.001 - 0.0001	10 <sup>-3</sup> - 10 <sup>-4</sup>	1000 - 10,000
4	0.0001 - 0.00001	10 <sup>-4</sup> - 10 <sup>-5</sup>	10,000 - 100,000

In continuous operation, these changes to the following:

SIL	PFD	PFD (power	RRF
1	0.00001 - 0.000001	10 <sup>-5</sup> - 10 <sup>-6</sup>	100,000 - 1,000,000
2	0.000001 - 0.0000001	10 <sup>-6</sup> - 10 <sup>-7</sup>	1,000,000 - 10,000,000
3	0.0000001 - 0.00000001	10 <sup>-7</sup> - 10 <sup>-8</sup>	1000 - 10,000
4	0.00000001 - 0.000000001	10 <sup>-8</sup> - 10 <sup>-9</sup>	100,000,000 - 1,000,0000,000

The hazards of a control system must be identified then analyzed in a risk analysis. These risks are gradually mitigated until their overall contribution to the hazard is deemed to be acceptable. The tolerable level of these risks is specified as a safety requirement in the form of a target probability of a dangerous failure over a given period, stated as a discrete SIL level.

#### **Fault Avoidance Measures**

Systematic errors in the specifications, in the hardware and the software, usage faults and maintenance faults in the safety system must be avoided to the maximum degree possible. To meet these requirements, IEC 61508 specifies a number of measures for fault avoidance that must be implemented depending on the required SIL. These measures for fault avoidance must cover the entire life cycle of the safety system, i.e. from design to decommissioning of the system.

### What Is in This Chapter?

This chapter contains the following topics:

Торіс	
Safety Function STO (Safe Torque Off)	18
Safety Function SS1 (Safe Stop 1)	
Safety Function SLS (Safely-Limited Speed)	

### Safety Function STO (Safe Torque Off)

#### **Overview**

# A DANGER

#### ELECTRIC SHOCK CAUSED BY INCORRECT USE

The safety function STO (Safe Torque Off) does not cause electric isolation. The DC bus voltage is still present.

• Turn off the mains voltage using an appropriate switch to achieve a voltage-free condition.

Failure to follow these instructions will result in death or serious injury.

This function brings the machine safely into a no-torque state and / or prevents it from starting accidentally.

The safe torque-off (safety function STO) function can be used to effectively implement the prevention of unexpected start-up functionality, thus making stops safe by preventing the power only to the motor, while still maintaining power to the main drive control circuits.

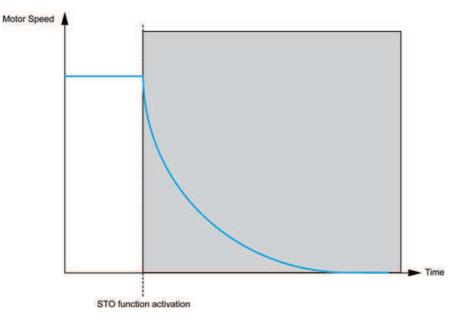

The principles and requirements of the prevention of unexpected start-up are described in the standard EN 1037:1995+A1.

The logic input STO is assigned to this safety function and cannot be modified.

If a paired terminal line in 2 channels is required to trigger safety function STO, the function can also be enabled by the safety-related logic inputs.

The safety function STO is configured with the commissioning software.

The safety function STO status can be displayed using the HMI of the drive or using the commissioning software.

#### Safety Function STO Standard Reference

The safety function STO is defined in section 4.2.2.2 of standard IEC 61800-5-2 (edition 1.0 2007.07):

Power, that can cause rotation (or motion in the case of a linear motor), is not applied to the motor. The PDS(SR) (power drive system suitable for use in safety-related applications) will not provide energy to the motor which can generate torque (or force in the case of a linear motor).

- NOTE 1: This safety function corresponds to an uncontrolled stop in accordance with stop category 0 of IEC 60204-1.
- NOTE 2: This safety function may be used where power removal is required to prevent an unexpected start-up.
- NOTE 3: In circumstances where external influences (for example, falling of suspended loads) are
  present, additional measures (for example, mechanical brakes) may be necessary to prevent any
  hazard.
- NOTE 4: Electronic equipment and contactors do not provide adequate protection against electric shock, and additional insulation measures may be necessary.

#### Safety Function (SF) Level Capability for Safety Function STO

Configuration	SIL Safety Integrity Level according to IEC 61-508	PL Performance Level according to ISO-13849
STO with or without safety module	SIL 2	PL d
STO & LI3 with or without safety module	SIL 3	PL e
LI3 and LI4	SIL 2	PL d
LI5 and LI6	SIL 2	PL d

#### **Emergency Operations**

Standard IEC 60204-1 introduces 2 emergency operations:

- Emergency switching-off:
  - This function requires external switching components, and cannot be accomplished with drive based functions such as safe torque-off (STO).
- Emergency stop:

An emergency stop must operate in such a way that, when it is activated, the hazardous movement of the machinery is stopped and the machine is unable to start under any circumstances, even after the emergency stop is released.

An emergency stop shall function either as a stop category 0 or as a stop category 1. Stop category 0 means that the power to the motor is turned off immediately. Stop category 0 is equivalent to the safe torque-off (STO) function, as defined by standard EN 61800-5-2. In addition to the requirements for stop (see 9.2.5.3 of IEC 60204-1), the emergency stop function has the following requirements:

- it shall override all other functions and operations in all modes.
- This reset shall be possible only by a manual action at that location where the command has been initiated. The reset of the command shall not restart the machinery but only permit restarting.
- For the machine environment (IEC 60204-1 and machinery directive), when safety function STO is used to manage an emergency stop category 0, the motor must not restart automatically when safety function STO has been triggered and deactivated (with or without a power cycle). This is the reason why an additional safety module is required if the machine restarts automatically after the safety function STO has been deactivated.

### Safety Function SS1 (Safe Stop 1)

#### **Overview**

The safety function SS1 (Safe Stop 1) monitors the deceleration according to a dedicated deceleration ramp and safely shuts off the torque once standstill has been achieved.

When the safety function SS1 is triggered, it overrides all other functions (except STO function that has priority) and operations in all modes.

The unit of the SS1 deceleration ramp is in Hz/s. The setting of the ramp is done with two parameters:

[SS1 ramp unit] 5 5 r u (Hz/s) to give the unit of the ramp in 1 Hz/s, 10 Hz/s, and 100 Hz/s

[SS1RampValue] 5 5 r L (0.1) to set the value of the ramp

#### Ramp calculation:

Ramp = SSrU\*SSrt

Example: If SSrU = 10 Hz/s and SSrt = 5.0 the deceleration ramp is 50 Hz/s.

The safety function SS1 is configured with the commissioning software, for more information see Commissioning (see page 75).

The safety function SS1 status can be displayed using the HMI of the drive or using the commissioning software.

#### **Behavior on Activation of the SS1 Function**

When SS1 function is triggered, it monitors the deceleration of the motor according to the specified monitoring ramp until standstill is reached and verifies if the motor speed is not above a monitored limit value depending on the specified monitoring ramp and the parameter **[SS1 trip threshold]** 5 5 E E.

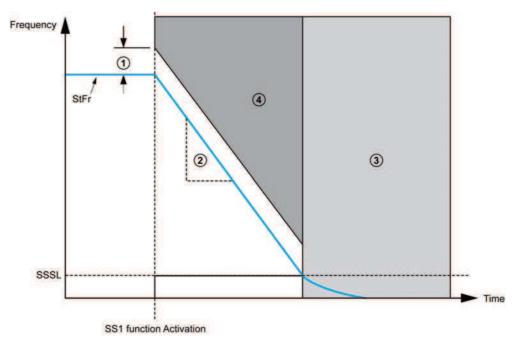

If the monitored limit value is exceeded:

- An error is triggered and the error code [Safety function fault] 5 R F F is displayed.
- Safety function STO is triggered.

After the [Standstill level] 5 5 5 L has been reached, the safety function STO is triggered.

SS1 function continues to be active if the request has been removed before the standstill has been reached.

NOTE: The error detection depends on [Stator Frequency] 5 L F r.

(1): SS1 trip threshold, (2): SS1 deceleration ramp (dV/dT), (3): STO function triggered, (4): Error and STO function triggered

#### Behavior on Deactivation of the SS1 Function

After an SS1 stop, send a new run command (even if the run command is set on level command).

#### **SS1 Standard Reference**

The SS1 function is defined in section 4.2.2.2 of standard IEC 61800-5-2:

The PDS(SR) (Power drive system suitable for use in safety-related applications) either:

- Initiates and controls the motor deceleration rate within set limits to stop the motor and initiates the STO function (see 4.2.2.2) when the motor speed is below a specified limit; or
- Initiates and monitors the motor deceleration rate within set limits to stop the motor and initiates the STO function when the motor speed is below a specified limit; or
- Initiates the motor deceleration and initiates the STO function after an application-specific time delay.

**NOTE:** This safety function corresponds to a controlled stop in accordance with stop category 1 of IEC 60204-1.

#### Safety Function (SF) Level Capability for Safety Function SS1

Function	Configuration	SIL Safety Integrity Level According to IEC 61-508	PL Performance Level According to ISO-13849
SS1 type C	STO with Preventa module	SIL2	PL d
	STO and LI3 with Preventa module	SIL 3	PLe
SS1 type B	LI3 and LI4	SIL 2	PL d
	LI5 and LI6	SIL 2	PL d

#### **Emergency Stop Category 1**

An emergency stop must operate in such a way that, when it is activated, the hazardous movement of the machinery is stopped and the machine is unable to start under any circumstances, even after the emergency stop is released.

An emergency stop shall function either as a stop category 0 or as a stop category 1.

Stop category 1 is a controlled shut-down, whereby the energy supply to the motor is maintained to perform the shut-down, and the energy supply is only interrupted when the shut-down has been completed.

Stop category 1 is equivalent to the [Safe Stop 1] 5 5 / function, as defined by standard EN 61800-5-2.

In addition to the requirements for stop (see 9.2.5.3 of IEC 60204-1), the emergency stop function has the following requirements:

- it shall override all other functions and operations in all modes.
- This reset shall be possible only by a manual action at that location where the command has been initiated. The reset of the command shall not restart the machinery but only permit restarting.

For the machine environment (IEC 60204-1 and machinery directive), when safety function SS1 is used to manage an emergency stop category 1, the motor must not restart automatically when safety function SS1 has been triggered and deactivated (with or without a power cycle). This is the reason why an additional safety module is required if the machine restarts automatically after the safety function SS1 has been deactivated.

### Safety Function SLS (Safely-Limited Speed)

#### **Overview**

This function is used to limit the speed of a motor.

There are 6 types of SLS function:

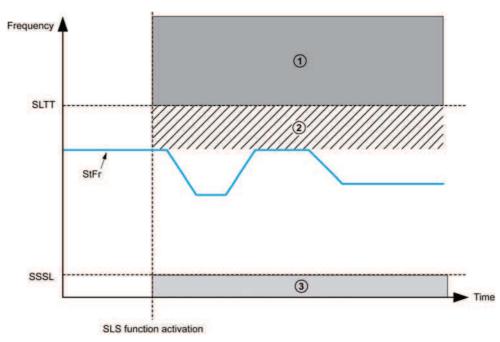

- SLS type 1: Limits the motor speed to the actual motor speed.
- SLS type 2: Limits the motor speed to a value set using a parameter.
- SLS type 3: Same as type 2 with specific behavior if the motor speed is above threshold value set using a parameter.
- SLS type 4: Limits the motor speed to a value set using a parameter. The direction of rotation can be changed while the safety function is active.
- SLS type 5: Same as type 4 with the specific behavior if the motor speed is above threshold value set using a parameter.
- SLS type 6: Same as type 4 with specific behavior if the motor speed is above threshold value set using a parameter.

**NOTE:** SLS types 2 and 3 use (SLwt) **[SLS Wait time]** parameter to allow the motor to run under the **[standstill level]** 5 5 5 *L* for a given time after the safety function SLS has been activated.

The safety function SLS is configured with the commissioning software, for more information see commissioning (see page 75).

The status of the safety function SLS can be displayed using the HMI of the drive or using the commissioning software.

#### Behavior on Activation of the Safety Function SLS Type 1

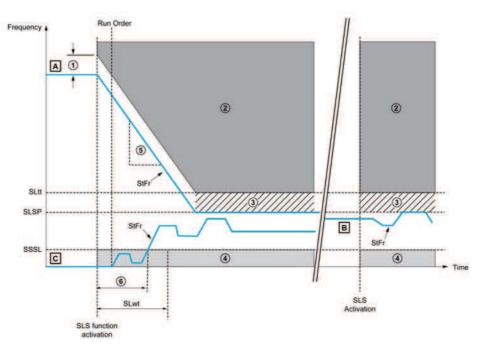

(1): Error and STO function triggered, (2): Reference upper limit, (3): STO function triggered

When the safety function is activated:

- If the [Stator Frequency] 5 *E F r* is above the [SLS tolerance threshold] 5 *L E L*, the safety function STO is triggered and an error is triggered with the error code [Safety function fault] 5 *R F F*.
- If the [Stator Frequency] 5 *E F r* is under the [SLS tolerance threshold] 5 *L E b*, the stator frequency is limited to the actual stator frequency. The reference frequency will only vary between this value and the standstill level SSSL.

- If the [Stator Frequency] 5 L F r decreases and reaches the [Standstill level] 5 5 5 L frequency, the safety function STO is triggered.
- If the [Stator Frequency] 5 *L F r* increases and reaches [SLS tolerance threshold] 5 *L L L*, the safety function STO is triggered and an error is triggered with the error code [Safety function fault] 5 *R F F*.

(1): SS1 trip threshold, (2): Error and STO function triggered, (3): Reference upper limit, (4): STO

function triggered, (5): SS1 deceleration ramp (dV/dT), (6): Time taken for the [Stator Frequency] 5 L F r to become greater than SSSL

[A]: [Stator Frequency] 5 L F r is above [Set Point] 5 L 5 P

B: [Stator Frequency] 5 L F r is between [Standstill level] 5 5 5 L and [Set Point] 5 L 5 P

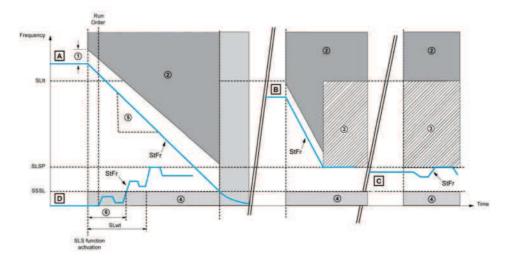

**C**: [Stator Frequency] 5 *E* F r is below [Standstill level] 5 5 5 *L* and [SLS wait time] (SLwt)  $\neq 0$ 

When the function is activated:

- If the [Stator Frequency] 5 *L F r* is above the [Set point] 5 *L* 5 *P*, the drive decelerates according to SS1 deceleration ramp until the [Set point] 5 *L* 5 *P* is reached.(see case A)
- If the [Stator Frequency] 5 L F r is below the SLSP the current reference is not changed but limited to the [Set point] 5 L 5 P.(see case B)
- If the [Stator Frequency] 5 *E F r* is still below the [Standstill level] 5 5 5 *L* frequency after [SLS wait time] (SLwt ) has elapsed, the safety function STO will be triggered.(see case C)

- The reference frequency can only vary between the [Set point] 5 L 5 P and the standstill level SSSL.
- If the [Stator Frequency] 5 *L F r* decreases and reaches the [Standstill level] 5 5 5 *L* frequency, safety function STO is triggered.
- If the [Stator Frequency] 5 L F r increases and reaches the [SLS tolerance threshold] 5 L L L, the safety function STO is triggered and an error is triggered with the error code [Safety function fault] 5 R F F.

SLS type 3 has the same behavior as SLS type 2 except that If the **[Stator Frequency]** 5 E F r is above the **[SLS tolerance threshold]** 5L E E, the safety function SS1 is triggered instead of decelerating to the **[Set point]** 5L 5P (see case A)

(1): SS1 trip threshold, (2): Error and STO function triggered, (3): Reference upper limit, (4): STO function triggered, (5): SS1 deceleration ramp (dV/dT), (6): Time taken for the **[Stator Frequency]** 5 L F r to become greater than SSSL

[A]: [Stator Frequency] 5 L F r is above [SLS tolerance threshold] 5 L L L

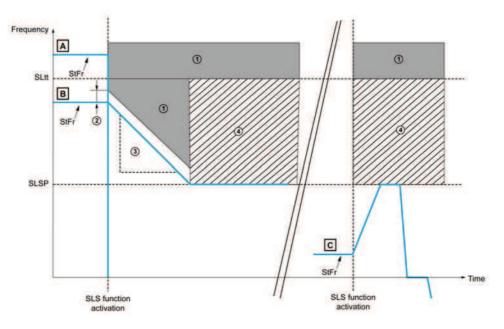

B: [Stator Frequency] 5 L F r is between [Set Point] 5 L 5 P and [SLS tolerance threshold] 5 L L L

C: [Stator Frequency] 5 L F r is between [Standstill level] 5 5 5 L and [Set Point] 5 L 5 P

**D**:[Stator Frequency] 5 E F r is below [Standstill level] 5 5 5 L and [SLS wait time] (SLwt)  $\neq 0$ When the function is activated:

- If the [Stator Frequency] 5 *L* F r is above the [SLS tolerance threshold] 5 *L L L*, the safety function SS1 is triggered. (see case A).
- If the [Stator Frequency] 5 *L* F r is between the [SLS tolerance threshold] 5 *L L L* and the [Set point] 5 *L* 5 *P*, the drive decelerates according to SS1 deceleration ramp until the [Set point] 5 *L* 5 *P* has been reached.(see case B).
- If the [Stator Frequency] 5 L F r is below the [Set point] 5 L 5 P the current reference is not changed but limited to the [Set point] 5 L 5 P.(see case C)
- If the [Stator Frequency] 5 *L F r* is still below the [Standstill level] 5 5 5 *L* frequency after [SLS wait time] SLwt has elapsed, the safety function STO will be triggered.(see case D)

- The reference frequency can only vary between the [Set point] 5 L 5 P and the [Standstill level] 5 5 5 L.
- If the [Stator Frequency] 5 *L* F r decreases and reaches the [Standstill level] 5 5 5 *L* frequency, the safety function STO is triggered.
- If the [Stator Frequency] 5 L F r increases and reaches the [SLS tolerance threshold] 5 L L L, the safety function STO is triggered and an error is triggered with the error code [Safety function fault] 5 R F F.

(1) Error and STO function triggered, (2) SS1 trip threshold, (3) SS1 deceleration ramp (dv/dt), (4) reference upper limit

[Stator Frequency] 5 L F r is above [SLS tolerance threshold] 5 L L L

**B**: [Stator Frequency] 5 *L* F r is between [Set Point] 5 *L* 5 *P* and [SLS tolerance threshold] 5 *L L L* 

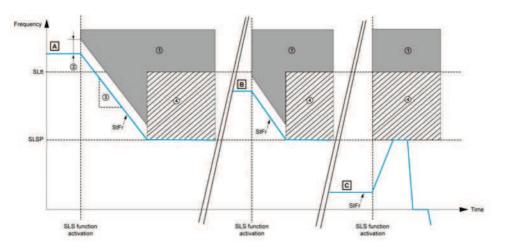

[C]: [Stator Frequency] 5 L F r is below [Set Point] 5 L 5 P

**NOTE:** If the SLTT  $\leq$  SLSP for SLS type 4, SAFF fault is triggered.

When the function is activated:

- If the [Stator Frequency] 5 *L F r* is above the [SLS tolerance threshold] 5 *L L L*, the safety function STO is triggered with the error code [Safety function fault] 5 *R F F*.(see case A)
- If the [Stator Frequency] 5 L F r is between the [SLS tolerance threshold] 5 L L L and the [Set point] 5 L 5 P, the drive decelerates according to SS1 deceleration ramp until the [Set point] 5 L 5 P has been reached.(see case B)
- If the [Stator Frequency] 5 *L* F r is below the [Set point] 5 *L* 5 *P*, the current reference is not changed but limited to the [Set point] 5 *L* 5 *P*.(see case C).

- The reference frequency can vary between the [Set point] 5 L 5 P in both forward and reverse directions.
- If the [Stator Frequency] 5 *L F r* increases and reaches [SLS tolerance threshold] 5 *L L L*, the safety function STO is triggered and an error is triggered with the error code [Safety function fault] 5 *R F F*.

(1): Error and STO function triggered, (2): SS1 trip threshold, (3): SS1 deceleration ramp (dv/dt), (4): Reference upper limit

[Stator Frequency] 5 L F r is above [SLS tolerance threshold] 5 L L L

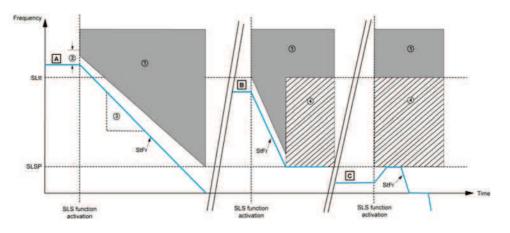

B: [Stator Frequency] 5 L F r is between [Set Point] 5 L 5 P and [SLS tolerance threshold] 5 L L L

```
[C]: [Stator Frequency] 5 L F r is below [Set Point] 5 L 5 P
```

When the function is activated:

- If the [Stator Frequency] 5 *L F r* is above the [SLS tolerance threshold] 5 *L L L*, the drive decelerates according to SS1 deceleration ramp until the [Set point] 5 *L* 5 *P* has been reached. (see case A)
- If the [Stator Frequency] 5 *L F r* is between the [SLS tolerance threshold] 5 *L L L* and the [Set point] 5 *L* 5 *P*, the drive decelerates according to SS1 deceleration ramp until the [Set point] 5 *L* 5 *P* has been reached.(see case B)
- If the [Stator Frequency] 5 *L* F r is below the [Set point] 5 *L* 5 *P*, the current reference is not changed but limited to the [Set point] 5 *L* 5 *P*.(see case C).

- The reference frequency can vary between the [Set point] 5 L 5 P in both forward and reverse directions.
- If the [Stator Frequency] 5 *L F r* increases and reaches [SLS tolerance threshold] 5 *L L L*, the safety function STO is triggered and an error is triggered with the error code [Safety function fault] 5 *R F F*.

(1): Error and STO function triggered, (2): SS1 trip threshold, (3): SS1 deceleration ramp (dV/dT) (4): Reference upper limit, (5): STO function triggered.

[A]: [Stator Frequency] 5 L F r is above [SLS tolerance threshold] 5 L L L

**B**: [Stator Frequency] 5 *L* F r is between [Set Point] 5 *L* 5 *P* and [SLS tolerance threshold] 5 *L L L* 

C: [Stator Frequency] 5 L F r is below [Set Point] 5 L 5 P

When the function is activated:

- If the [Stator Frequency] 5 *E F r* is above the [SLS tolerance threshold] 5 *L E L*, the drive decelerates according to SS1 deceleration ramp until 0 Hz has been reached (see case A).
- If the [Stator Frequency] 5 *L F r* is between the [SLS tolerance threshold] 5 *L L L* and the [Set point] 5 *L* 5 *P*, the drive decelerates according to SS1 deceleration ramp until the [Set point] 5 *L* 5 *P* has been reached.(see case B)
- If the [Stator Frequency] 5 *L F r* is below the [Set point] 5 *L* 5 *P*, the current reference is not changed but limited to the [Set point] 5 *L* 5 *P*.(see case C).

- The reference frequency can vary between the [Set point] 5 L 5 P in both forward and reverse directions.
- If the [Stator Frequency] 5 *L F r* increases and reaches [SLS tolerance threshold] 5 *L L L*, the safety function STO is triggered and an error is triggered with the error code [Safety function fault] 5 *R F F*.

#### Behavior on Deactivation of the Safety Function SLS for All SLS Types

lf	Then
The drive is still running when the function is deactivated	The reference frequency of the active channel is applied.
Safety function STO has been triggered and the drive is not in fault state.	A new run command must be applied.
The safety function SLS type 2, 3, 4 is deactivated while the drive decelerates to the <b>[Set point]</b> $5 L 5 P$ according to SS1 deceleration ramp. The safety function SLS type 3 is deactivated while the safety function SS1 has been triggered	The safety function SLS remains activated until the <b>[Set point]</b> 5 <i>L</i> 5 <i>P</i> has been reached. STO is triggered when <b>[Standstill level]</b> 5 5 5 <i>L</i> is reached and a new run command must be applied.
a stop command is applied	The safety function SLS remains active and the drive decelerates until standstill is reached. For SLS type 1, 2, or 3 STO function is triggered when the <b>[Stator Frequency]</b> $5 \pm F r$ decreases and reaches the <b>[Standstill level]</b> $5 \pm 5 \pm L$ frequency.
an error is detected	The safety function SLS remains active and the drive stops according to the configured error response. For SLS type 1, 2, or 3 STO function will be triggered after the <b>[Standstill level] 5 5 L</b> frequency has been reached. The drive can be reset after the cause is cleared.

#### **SLS Standards References**

The safety function SLS is defined in section 4.2.3.4 of standard IEC 61800-5-2 The SLS function helps to prevent the motor from exceeding the specified speed limit.

#### Safety Function (SF) Level for Safety Function SLS

Configuration	SIL Safety Integrity Level According to IEC 61-508	PL Performance level According to ISO-13849
LI3 and LI4	SIL 2	PL d
LI5 and LI6	SIL 2	PL d

# **Chapter 3** Calculation of Safety Related Parameters

### What Is in This Chapter?

This chapter contains the following topics:

Торіс	Page
SLS Type 1	30
SLS Type 2, Type 3, Type 4, Type 5, and Type 6	32
SS1	35

### SLS Type 1

#### **Collect Application Data**

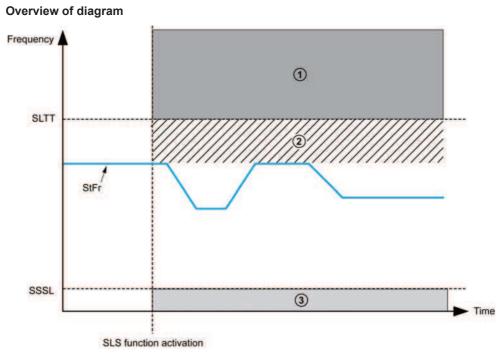

Before starting to configure the SLS function, you must collect the following data:

Code	Description	Unit	Comment
FrS	[Rated motor freq.]	Hz	See motor nameplate
n 5 P	[Rated motorspeed]	rpm	See motor nameplate
ppn	Motor pole pair number	-	See motor nameplate
Max Frequency	Maximum motor frequency for normal operation	Hz	This value is equal to <b>[High speed]</b> <i>H</i> <b>5</b> <i>P</i> or lower

Calculate the rated motor slip frequency Fslip (Hz) .:

$$Fslip = FrS - \frac{Nsp \times ppn}{60}$$

#### To Configure the Function

1: Error and STO function triggered, 2: Reference upper limit, 3: STO function triggered Standstill Level

The recommended standstill level is: SSSL = Fslip

If the application requires a different standstill level, it can be set accordingly with the SSSL parameter.

### Motor Frequency Limit Threshold

The recommended value of the parameter is SLtt = 1.2 x Max Frequency + Fslip

#### Testing and Adjusting the Configuration

When configuration is complete, test the SLS function to verify it behaves as expected.

If an error is triggered with the error code **[Safety function fault]** 5 *H F F* apply the following troubleshooting rules

Context	Drive Status	Adjustment
SLS activated and motor running at the fixed setpoint frequency	<ul> <li>SAFF error code</li> <li>SFFE.7 = 1</li> </ul>	Motor frequency has reached the motor frequency limit threshold. The cause of the detected error can be due to frequency instability. Investigate and correct the cause. The value of SLtt can be modifed to increase the tolerance threshold to the instability of the drive system.

#### Example

Code	Description	Unit
Fr 5	[Rated motor freq.]	50 Hz
n 5 P	[Rated motorspeed]	1350 rpm
ppn	Motor pole pair number	2
Max Frequency	Maximum motor frequency on normal operation. This value is generally equal to <b>[High speed]</b> <i>H</i> <b>5</b> <i>P</i> or lower	50 Hz

With these numerical values, the configuration of SLS type 1 is:

$$Fslip = 50 - \frac{1350 \times 2}{60} = 5$$
 Hz

SSSL = Fslip = 5 Hz

*SLtt* = 1.2 x *Max Frequency* + *Fslip* = 1.2 x 50 + 5 = 65 *Hz* 

### SLS Type 2, Type 3, Type 4, Type 5, and Type 6

#### **Collect Application Data**

Before starting to configure the SLS function, you must collect the following data:

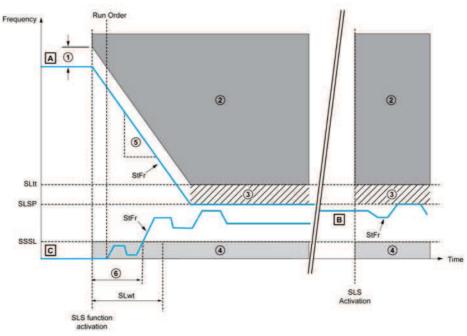

Code	Description	Unit	Comment
Fr 5	[Rated motor freq.]	Hz	See motor nameplate
n 5 P	[Rated motor speed]	rpm	See motor nameplate
ppn	Motor pole pair number	-	See motor nameplate
Max Frequency	Maximum motor frequency on normal operation	Hz	This value is equal to [High speed] H 5 P or lower.
SS1 deceleration ramp	Deceleration ramp to apply when SS1 ramp is triggered	Hz	-

Calculate the rated motor slip frequency Fslip (Hz).

 $Fslip = FrS - \frac{Nsp \times ppn}{60}$ 

#### To Configure the Function

①: SS1 trip threshold, ②: Error and STO function triggered, ③: Reference upper limit, ④: STO function triggered, ⑤: SS1 deceleration ramp (dV/dT), ⑥: Time taken for the **[Stator Frequency]**  $5 \pm F r$  to become greater than SSSL

[Stator Frequency] 5 L F r is above [Set Point] 5 L 5 P

**B**: [Stator Frequency] 5 L F r is between [Standstill level] 5 5 5 L and [Set Point] 5 L 5 P

**C**: [Stator Frequency]  $5 \pm F r$  is below [Standstill level] 5 5 5 L and [SLS wait time] (SLwt)  $\neq 0$ Standstill Level

The recommended standstill level is: SSSL = Fslip

If the application requires a different standstill level, it can be set accordingly with the SSSL parameter. **Ramp Value and Ramp Unit** 

Set SSrt (ramp value) and SSrU (ramp unit) parameters according to the deceleration ramp to apply when the safety function SS1 is triggered.

Ramp calculation: Ramp = SSrU\*SSrt

Example 1: If SSrU = 1 Hz/s and SSrt = 500.0 the deceleration ramp is 500.0 Hz/s and the accuracy is 0.1 Hz

Example 2: If SSrU = 10 Hz/s and SSrt = 50.0 the deceleration ramp is 500 Hz/s and the accuracy is 1 Hz

Use the table to set the correct accuracy according to the deceleration ramp to apply when the safety function SS1 is triggered:

Min	Мах	Accuracy	SSrt	SSrU
0.1 Hz/s	599 Hz/s	0.1 Hz/s	1 Hz/s	SS1 deceleration ramp
599 Hz/s	5990 Hz/s	1 Hz/s	10 Hz/s	SS1 deceleration ramp/10
5990 Hz/s	59900 Hz/s	10 Hz/s	100 Hz/s	SS1 deceleration ramp/100

#### **SLS Setpoint**

Set the SLS setpoint parameter (SLSP) to: SLSP= Fsetpoint (SLS)

#### Motor Frequency and ramp Limit Threshold

The recommended motor frequency limit threshold is *SLtt* = 1.2 x *SLSP* + *Fslip* and the recommended SS1 ramp limit threshold is: *SStt* = 0.2 x *Max Frequency* 

#### **SLS Wait time**

Set the **[SLS wait time]** (SLwt) greater than 0 ms to to allow the motor to run under the **[standstill level] 5 5** *L* for a given time after the safety function SLS has been activated.

**NOTE:** When SLS Type 4 is configured, **[SLS wait time]** (SLwt) must be set to 0 otherwise an error is triggered and the error code **[Safety function fault]** 5 *R F F* is displayed

#### Testing and Adjusting the Configuration

When configuration is complete, test the SLS function to verify that it behaves as expected.

If an error is triggered with the error code **[Safety function fault]** 5 *H F F*, apply the following troubleshooting rules

Context Drive Status Adjustment			
SLS activated and deceleration ramp in progress		Motor frequency has reached the motor frequency limit threshold. The cause of the detected error can be due to frequency instability. Investigate and correct the cause. The value of SLtt can be modified to increase the tolerance threshold to the instability of the drive system.	

Context	Drive Status	Adjustment		
SLS activated and end of ramp at SLSP	<ul> <li>SAFF error code</li> <li>SFFE.3 = 1</li> </ul>	Motor frequency stabilization at SLSP takes too long and has reach the safety function error detection condition.		
frequency	or • SFFE.7 = 1	F SStt		
		Tosc SLtt SLSP		
		(1): Safety function error detection, Tosc: T oscillation, F: Frequency The oscillations must be lower than SLtt before the time T(oscillation) elapses. If the condition is not followed, an error is triggered and the error code <b>[Safety function fault]</b> $5 \ \text{FF} F$ is displayed The relationship between SStt and T(oscillation) is:		
		$T (osc) = \frac{SSTT - (SLTT - SLSP - Fslip)}{SSRT \times SSRU}$		
		Motor frequency has reached the motor frequency limit threshold. The cause of the detected error can be due to frequency instability. Investigate and correct the cause. The value of SStt can be modified to increase the tolerance threshold to the oscillations of the drive system.		
SLS activated and motor running at SLSP frequency	<ul><li>SAFF error code</li><li>SFFE.7 = 1</li></ul>	Motor frequency has reached the motor frequency limit threshold. The cause of the detected error can be due to frequency instability. Investigate and correct the cause. The value of SLtt can be modified to increase the tolerance threshold to the instability of the drive system.		

#### Example

Code	Description	Unit
Fr 5	Rated motor frequency	50 Hz
n 5 P	Rated motor speed	1350 rpm
ppn	Motor pole pair number	2
Max Frequency	Maximum motor frequency on normal operation. This value is equal to <b>[High speed]</b> <i>H</i> <b>5</b> <i>P</i> or lower	50 Hz
Fsetpoint(SLS)	Motor frequency setpoint	15 Hz
SS1 deceleration ramp	Deceleration ramp to apply when SS1 is triggered	20 Hz/s

With these numerical values, the configuration of SLS type 2, 3, and 4 is:

$$Fslip = 50 - \frac{1350 \times 2}{60} = 5 \text{ Hz}$$

$$SSSL = Fslip = 5 \text{ Hz}$$

$$SSrU = 1 \text{ Hz/s and } SSrt = 20.0 \text{ for } SS1 \text{ deceleration ramp} = 20 \text{ Hz/s (accuracy is } 0.1 \text{ Hz})$$

$$SLSP = Fsetpoint(SLS) = 15 \text{ Hz}$$

$$SLtt = 1.2 \times SLSP + Fslip = 1.2 \times 15 + 5 = 23 \text{ Hz}$$

$$SStt = 0.2 \times \text{Max Frequency} = 0.2 * 50 = 10 \text{ Hz}$$

 $T (oscillation) = \frac{SSSt - (SLtt - SLSP - Fslip)}{SSrt \times SSrU} = \frac{10 - (23 - 15 - 5)}{20 \times 1} = 350 ms$ 

In this example, the frequency oscillations are allowed to be higher than SLtt for 350 ms.

### SS1

#### **Collect Application Data**

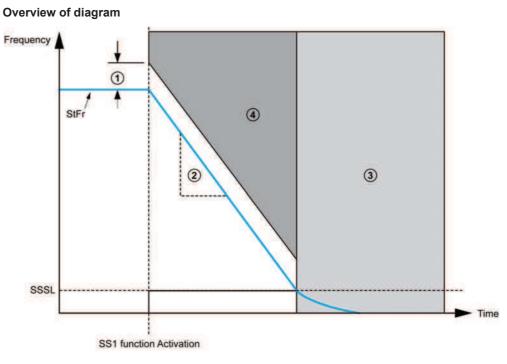

Before configuring the SS1 function, you must collect the following data:

Code	Description	Unit	Comment
Fr 5	Rated motor frequency	Hz	From motor
n 5 P	Rated motor speed	rpm	From motor
ppn	Motor pole pair number	-	From motor
Max Frequency	Maximum motor frequency on normal operation	Hz	This value is equal to [High speed] H 5 P or lower

Calculate the rated motor slip frequency Fslip (Hz).

$$Fslip = FrS - \frac{Nsp \times ppn}{60}$$

#### **To Configure the Function**

①: SS1 trip threshold, ②: SS1 deceleration ramp (dV/dT), ③: STO function triggered, ④: Error and STO function triggered

#### Standstill Level

The recommended standstill level is: SSSL = Fslip

If the application requires a different standstill level, it can be set accordingly with the SSSL parameter.

#### **Ramp Value and Ramp Unit**

Set SSrt (ramp value) and SSrU (ramp unit) parameters according to the deceleration ramp to apply when the safety function SS1 is triggered.

Ramp Calculation: Ramp = SSrU\*SSrt

Example 1: If SSrU = 1 Hz/s and SSrt = 500.0 the deceleration ramp is 500.0 Hz/s and the accuracy is 0.1 Hz

Example 2: If SSrU = 10 Hz/s and SSrt = 50.0 the deceleration ramp is 500 Hz/s and the accuracy is 1 Hz

Use the table to set the correct accuracy according to the deceleration ramp to apply when the safety function SS1 is triggered:

Min	Мах	Accuracy	SSrU	SSrt
0.1 Hz/s	599 Hz/s	0.1 Hz/s	1 Hz/s	SS1 deceleration ramp
599 Hz/s	5990 Hz/s	1 Hz/s	10 Hz/s	SS1 deceleration ramp/10
5990 Hz/s	59900 Hz/s	10 Hz/s	100 Hz/s	SS1 deceleration ramp/100

#### **Ramp Limit Threshold**

The SS1 ramp trip threshold is calculated by: *SStt* = 0.2 *x Max Frequency* This value is equal to **[High speed]** *H* **5** *P* or lower

#### **Testing and Adjusting the Configuration**

When configuration is complete, test the safety function SS1 to verify that it behaves as expected. If an error is triggered with the error code **[Safety function fault]** 5 *R F F*, apply the following troubleshooting rules

Context	Drive Status	Adjustment
SS1 activated and the [Standstill level] 5 5 5 <i>L</i> has not yet been reached	<ul> <li>SAFF error code</li> <li>SFFE.3 = 1</li> </ul>	Motor frequency has reached the motor frequency limit threshold. The cause of the detected error can be due to frequency instability. Investigate and correct the cause. The value of SStt can be modified to increase the tolerance threshold to the instability of the drive system.

#### Example

Code	Description	Unit
Fr 5	Rated motor frequency	50 Hz
n 5 P	Rated motor speed	1350 rpm
ppn	Motor pole pair number	2
Max Frequency	Maximum motor frequency on normal operation	50 Hz
SS1 deceleration ramp	Deceleration ramp to apply when SS1 is triggered	20 Hz/s

With these numerical values, the configuration of SS1 is:

$$Fslip = 50 - \frac{1350 \times 2}{60} = 5$$
 Hz

SSSL = Fslip = 5 Hz

SSrU = 1 Hz/s and SSrt = 20.0 for SS1 deceleration ramp = 20 Hz/s (accuracy is 0.1 Hz)  $SStt = 0.2 \times Max$  Frequency = 0.2 x 50 = 10 Hz

## **Chapter 4** Behavior of Safety Functions

### What Is in This Chapter?

This chapter contains the following topics:

Торіс	Page
Limitations	38
Detected Fault Inhibition	39
Priority Between Safety Functions	40
Factory Settings	41
Configuration Download	42
Priority Between Safety Functions and No Safety-Related Functions	43

## Limitations

#### **Type Of Motor**

The safety functions SLS and SS1 on ATV32 are **only applicable for asynchronous motors** with open-loop control profile.

The safety function STO can be used with synchronous and asynchronous motors.

#### **Prerequisites for Using Safety Functions**

- Following conditions have to be fulfilled for correct operation:
- The motor size is adequate for the application and is not at the limit of its capacity.
- The drive size has been correctly chosen for the line supply, sequence, motor, and application and is not at the limit of their capacities as stated in the catalog.
- If required, the appropriate options are used.
- Example: dynamic braking resistor or motor choke.
- The drive is correctly set up with the correct speed loop and torque characteristics for the application; the reference frequency profile applied to the drive control loop is followed.

#### **Requirements on Logical Inputs**

- Sink mode must not been used with the safety function. If you use the safety function, you need to wire the logic inputs in source mode.
- PTC on LI6 is incompatible with the safety function set on this input. If you are using the safety function on LI6, do not set the PTC switch to PTC
- If you are using the pulse input, you cannot set the safety function on LI5 at the same time.

## **Detected Fault Inhibition**

When a safety function has been configured, the error [Safety Function Fault] 5 H F F cannot be inhibited by the function [Fault Inhibit assign.] I P H

## **Priority Between Safety Functions**

- **1.** The safety function STO has the highest priority. If the safety function STO is triggered, a Safe Torque Off is performed regardless of which other functions are active.
- 2. The safety function SS1 has medium priority in relation to the other safety functions.
- 3. The safety function SLS has the lowest priority.

## **Factory Settings**

If the safety functions are configured and you restore the factory settings, only the parameters which are not safety-related will be reset to the factory setting. The settings of safety-related parameters can only be reset using the commissioning software, for more information see Commissioning (*see page 75*).

## **Configuration Download**

You can transfer a configuration in all situations. If a safety function has been configured, the functions using these same logic inputs will not be configured.

For example: If the downloaded configuration has functions (Preset speed,...) on LI3-4-5-6 and if the drive has a safety function configured on these logic inputs, safety function will not be erased. It is the functions that have the same logic input as safety functions that are not transferred. Multiconfiguration/multimotor and macro configuration obey the same rules.

## Priority Between Safety Functions and No Safety-Related Functions

#### **Priority Table**

- o: Compatible functions
- x: Incompatible functions
- $\hat{\mathbb{T}}$   $\Leftarrow$ : The function indicated by the arrow has priority over the other.

Drive Function	SLS	SS1	STO
[HIGH SPEED HOISTING] H 5 H -	Ŷ	Û	Ŷ

## **Chapter 5** Safety Functions Visualization by HMI

### What Is in This Chapter?

This chapter contains the following topics:

Торіс	Page
Status of Safety Functions	48
Dedicated HMI	49
Error Code Description	50

## **Status of Safety Functions**

#### Description

The status of the safety functions can be displayed using the HMI of the drive or using the commissioning software. HMI of the drive can be the local HMI on the product or the graphic display terminal or the remote display terminal. There is one register for each safety function. See introduction (*see page 12*) for more information about the safety functions.

- [STO status] 5 L o 5: Status of the safety function STO (Safe Torque Off)
- [SLS status] 5 L 5 5: Status of the safety function SLS (Safely-Limited Speed)
- [SS1 status] 5 5 / 5: Status of the safety function SS1 (Safe Stop 1)

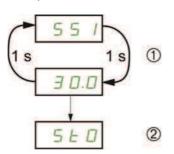

The status registers are not approved for any type of safety-related use.

For more information about these registers, see ATV32 Visualization and Status of Safety Functions *(see page 81)* on www.schneider-electric.com.

## **Dedicated HMI**

#### Description

When a safety function has been triggered, some information is displayed. Example with the local HMI of the product when the safety function SS1 has been triggered:

(1): Display alternately the name of the safety function SS1 and the current display parameter as long as the motor decelerates according to the specified monitoring ramp until standstill is reached, (2) After the **[Standstill level] 5 5 5** *L* has been reached, the safety function STO is triggered and displayed

## **Error Code Description**

#### Description

When an error is detected by the safety function, the drive displays **[Safety function fault]** (**5** *H F F*). This detected error can only be reset after powering the drive OFF/ON.

for more information, you can access to the registers to find out the possible reasons for triggering.

These registers can be displayed using the graphic display terminal or the commissioning software:

[DRIVE MENU] --> [MONITORING] --> [DIAGNOSTICS] --> [MORE FAULT INFO]

#### 5 F F E [Safety Function Error Register]

Bit	Description
Bit0=1	Logic inputs debounce time-out (verify value of debounce time LIDT according to the application)
Bit1	Reserved
Bit2=1	Motor speed sign has changed during SS1 ramp
Bit3=1	Motor speed has reached the frequency limit threshold during SS1 ramp.
Bit4	Reserved
Bit5	Reserved
Bit6=1	Motor speed sign has changed during SLS limitation
Bit7=1	Motor speed has reached the frequency limit threshold during SS1 ramp.
Bit8	Reserved
Bit9	Reserved
Bit10	Reserved
Bit11	Reserved
Bit12	Reserved
Bit13=1	Not possible to measure the motor speed (verify the motor wiring connection)
Bit14=1	Motor ground short-circuit detected (verify the motor wiring connection)
Bit15=1	Motor phase to phase short-circuit detected (verify the motor wiring connection)

This register is reset after powering OFF/ON.

This register can also be accessed from [DRIVE MENU] --> [MONITORING] --> [MONIT. SAFETY]

#### 5 R F / [Safety Fault Register 1]

This is an application control error register.

Bit	Description
Bit0=1	PWRM consistency detected error
Bit1=1	Safety functions parameters detected error
Bit2=1	Application auto test has detected an error
Bit3=1	Diagnostic verification of safety function has detected an error
Bit4=1	Logical input diagnostic has detected an error
Bit5=1	Application hardware watchdog active
Bit6=1	Application watchdog management active
Bit7=1	Motor control detected error
Bit8=1	Internal serial link core detected error
Bit9=1	Logical input activation detected error
Bit10=1	Safe Torque Off function has triggered an error
Bit11=1	Application interface has detected an error of the safety functions
Bit12=1	Safe Stop 1 function has detected an error of the safety functions
Bit13=1	Safely Limited Speed function has triggered an error
Bit14=1	Motor data is corrupted
Bit15=1	Internal serial link data flow detected error

This register is reset after powering OFF/ON.

#### 5 R F 2 [Safety Fault Register 2]

This is a motor control error register.

Bit	Description
Bit0=1	Consistency stator frequency verification has detected an error
Bit1=1	Stator frequency estimation detected error
Bit2=1	Motor control watchdog management is active
Bit3=1	Motor control hardware watchdog is active
Bit4=1	Motor control auto test has detected an error
Bit5=1	Chain testing detected error
Bit6=1	Internal serial link core detected error
Bit7=1	Direct short-circuit detected error
Bit8=1	PWM driver detected error
Bit9	Reserved
Bit10	Reserved
Bit11=1	Application interface has detected an error of the safety functions
Bit12	Reserved
Bit13	Reserved
Bit14=1	Motor data is corrupted
Bit15=1	Internal serial link data flow detected error

This register is reset after powering OFF/ON.

### 5 F D D [Safety Fault Subregister 00]

This is an application auto test error register.

Bit	Description
Bit0	Reserved
Bit1=1	Ram stack overflow
Bit2=1	Ram address integrity detected error
Bit3=1	Ram data access detected error
Bit4=1	Flash checksum detected error
Bit5	Reserved
Bit6	Reserved
Bit7	Reserved
Bit8	Reserved
Bit9=1	Fast task overflow
Bit10=1	Slow task overflow
Bit11=1	Application task overflow
Bit12	Reserved
Bit13	Reserved
Bit14=1	PWRM line is not activated during initialization phase
Bit15=1	Application hardware watchdog is not running after initialization

### 5 F D / [Safety Fault Subregister 01]

This is a logical input diagnostics error register

Bit	Description
Bit0=1	Management - state machine detected error
Bit1=1	Data required for test management are corrupted
Bit2=1	Channel selection detected error
Bit3=1	Testing - state machine detected error
Bit4=1	Test request is corrupted
Bit5=1	Pointer to test method is corrupted
Bit6=1	Incorrect test action provided
Bit7=1	Detected error in results collecting
Bit8=1	LI3 detected error.Cannot activate safety function
Bit9=1	LI4 detected error. Cannot activate safety function
Bit10=1	LI5 detected error. Cannot activate safety function
Bit11=1	LI6 is detected error. Cannot activate safety function
Bit12=1	Test sequence updated while a diagnostic is in progress
Bit13=1	Detected error in test pattern management
Bit14	Reserved
Bit15	Reserved

This register is reset after powering OFF/ON.

### 5 F D 2 [Safety Fault Subregister 02]

This is an application watchdog management detected error register.

Bit	Description
Bit0=1	Fast task detected error
Bit1=1	Slow task detected error
Bit2=1	Application task detected error
Bit3=1	Background task detected error
Bit4=1	Safety function fast task/input detected error
Bit5=1	Safety function slow task/input detected error
Bit6=1	Safety function application task/inputs detected error
Bit7=1	Safety function application task/treatment detected error
Bit8=1	Safety function background task detected error
Bit9	Reserved
Bit10	Reserved
Bit11	Reserved
Bit12	Reserved
Bit13	Reserved
Bit14	Reserved
Bit15	Reserved

### 5 F D 3 [Safety Fault Subregister 03]

Bit	Description
Bit0=1	Debounce time out
Bit1=1	Input not consistent
Bit2=1	Consistency verification - state machine detected error
Bit3=1	Consistency verification - debounce timeout corrupted
Bit4=1	Response time data detected error
Bit5=1	Response time corrupted
Bit6=1	Undefined consumer queried
Bit7=1	Configuration detected error
Bit8=1	Inputs are not in nominal mode
Bit9	Reserved
Bit10	Reserved
Bit11	Reserved
Bit12	Reserved
Bit13	Reserved
Bit14	Reserved
Bit15	Reserved

This register is reset after powering OFF/ON.

### 5 F D 4 [Safety Fault Subregister 04]

This is a [Safe Torque Off] 5 L a detected error register

Bit	Description
Bit0=1	No signal configured
Bit1=1	State machine detected error
Bit2=1	Internal data detected error
Bit3	Reserved
Bit4	Reserved
Bit5	Reserved
Bit6	Reserved
Bit7	Reserved
Bit8	Reserved
Bit9	Reserved
Bit10	Reserved
Bit11	Reserved
Bit12	Reserved
Bit13	Reserved
Bit14	Reserved
Bit15	Reserved

### 5 F D 5 [Safety Fault Subregister 05]

Bit	Description
Bit0=1	State machine detected error
Bit1=1	Motor speed sign has changed during stop
Bit2=1	Motor speed has reached the frequency limit threshold.
Bit3=1	Theoretical motor speed corrupted
Bit4=1	Unauthorized configuration
Bit5=1	Theoretical motor speed computation detected error
Bit6	Reserved
Bit7=1	Speed sign verification: consistency detected error
Bit8=1	Internal SS1 request corrupted
Bit9	Reserved
Bit10	Reserved
Bit11	Reserved
Bit12	Reserved
Bit13	Reserved
Bit14	Reserved
Bit15	Reserved

This is a [Safe Stop 1] 5 5 / detected error register

This register is reset after powering OFF/ON.

### 5 F D 6 [Safety Fault Subregister 06]

### This is a [Safely Limited Speed] 5 L 5 detected error register

Bit	Description		
Bit0=1	State machine detected error		
Bit1=1	lotor speed sign changed during limitation		
Bit2=1	Motor speed has reached the frequency limit threshold		
Bit3=1	Data corruption		
Bit4	Reserved		
Bit5	Reserved		
Bit6	Reserved		
Bit7	Reserved		
Bit8	Reserved		
Bit9	Reserved		
Bit10	Reserved		
Bit11	Reserved		
Bit12	Reserved		
Bit13	Reserved		
Bit14	Reserved		
Bit15	Reserved		

#### 5 F D 7 [Safety Fault Subregister 07]

This is an application watchdog management detected error register.

Bit	Description
Bit0	Reserved
Bit1	Reserved
Bit2	Reserved
Bit3	Reserved
Bit4	Reserved
Bit5	Reserved
Bit6	Reserved
Bit7	Reserved
Bit8	Reserved
Bit9	Reserved
Bit10	Reserved
Bit11	Reserved
Bit12	Reserved
Bit13	Reserved
Bit14	Reserved
Bit15	Reserved

This register is reset after powering OFF/ON.

### 5 F D B [Safety Fault Subregister 08]

This is an application watchdog management detected error register

Bit	Description
Bit0=1	PWM task detected error
Bit1=1	Fixed task detected error
Bit2=1	ATMC watchdog detected error
Bit3=1	DYNFCT watchdog detected error
Bit4	Reserved
Bit5	Reserved
Bit6	Reserved
Bit7	Reserved
Bit8	Reserved
Bit9	Reserved
Bit10	Reserved
Bit11	Reserved
Bit12	Reserved
Bit13	Reserved
Bit14	Reserved
Bit15	Reserved

#### 5 F D 9 Safety Fault Subregister 09

This is a motor control auto test detected error register.

Bit	Description	
Bit0	Reserved	
Bit1=1	Ram stack overflow	
Bit2=1	Ram address integrity detected error	
Bit3=1	Ram data access detected error	
Bit4=1	Flash checksum error	
Bit5	Reserved	
Bit6	Reserved	
Bit7	Reserved	
Bit8	Reserved	
Bit9=1	1 ms task overflow	
Bit10=1	PWM task overflow	
Bit11=1	Fixed task overflow	
Bit12	Reserved	
Bit13	Reserved	
Bit14=1	Unwanted interruption	
Bit15=1	Hardware WD is not running after initialization	

This register is reset after powering OFF/ON.

### 5 F I D [Safety Fault Subregister 10]

This is a motor control direct short-circuit detected error register

Bit	Description
Bit0=1	Ground short circuit - configuration detected error
Bit1=1	Phase to phase short circuit - configuration detected error
Bit2=1	Ground short circuit
Bit3=1	Phase to phase short circuit
Bit4	Reserved
Bit5	Reserved
Bit6	Reserved
Bit7	Reserved
Bit8	Reserved
Bit9	Reserved
Bit10	Reserved
Bit11	Reserved
Bit12	Reserved
Bit13	Reserved
Bit14	Reserved
Bit15	Reserved

#### 5 F / / [Safety Fault Subregister 11]

This is a motor control dynamic verification of activity detected error register

Bit	Description
Bit0=1	Application requested a diagnostic of direct short-circuit
Bit1=1	Application requested consistency verification of stator frequency estimation (voltage and current)
Bit2=1	Application requested diagnostic of SpdStat provided by motor control
Bit3	Reserved
Bit4	Reserved
Bit5	Reserved
Bit6	Reserved
Bit7	Reserved
Bit8=1	Motor control diagnostic of direct short circuit is enabled
Bit9=1	Motor control consistency verification of stator frequency estimation is enabled
Bit10=1	Motor control diagnostic of SpdStat provided by motor control is enabled
Bit11	Reserved
Bit12	Reserved
Bit13	Reserved
Bit14	Reserved
Bit15	Reserved

## **Chapter 6** Technical Data

### What Is in This Chapter?

This chapter contains the following topics:

Торіс	Page
Electrical Data	58
Getting and Operating the Safety Function	
Safety Function Capability	60
Debounce Time and Response Time	62

## **Electrical Data**

#### Logic Type

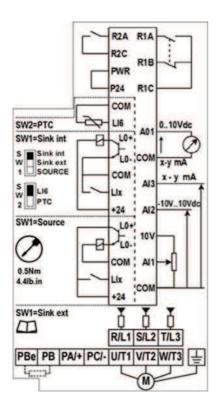

The drive logic inputs and logic outputs can be wired for logic type 1 or logic type 2.

Logic Type	Active State
1	The output draws current (Sink) Current flows to the input
2	The output supply flows from the input current Current (Source)

Safety functions must only be used in source mode.

Signal inputs are protected against reverse polarity, outputs are protected against short-circuits. The inputs and outputs are galvanically isolated.

#### **Cabling Label**

## **Getting and Operating the Safety Function**

#### **Logic Input**

General-purpose logic inputs can be used to trigger a safety function. Logic inputs have to be combined in pairs to obtain a redundant request. There are only 4 general-purpose logic inputs that can be linked to safety functions (LI3, LI4, LI5, LI6). The pairs of logic inputs are fixed and are:

- LI3 and LI4
- LI5 and LI6
- Another combination is only possible for the STO function: LI3 and STO

Pairs of logic inputs can only be assigned once when they are linked to a safety function. When you set a safety function on an logic input you cannot set another function (safety or other) on this logic input. If you set a non-safety function on an logic input you cannot set a safety function on this logic input.

#### The SISTEMA Software

The SISTEMA software allows machine developers and testers of safety-related machine controls to evaluate the safety standard or level of their machine in the context of ISO 13849-1. The tool allows you to model the structure of safety-related control components based on the designated architectures, allowing automated calculation of the reliability standards with various levels of detail, including that of the Performance Level (PL).

The Altivar 32 Libraries are available from www.schneider-electric.com.

#### **Preventa Safety Relays**

Used for the creation of complex safety functions in machines, allowing management of the I/O, and also for protecting both the operator and the machine.

The Preventa range of products feature microprocessor-based technology using the redundancy principle, and are essential to ensure safe operation of dangerous machinery.

## **Safety Function Capability**

#### PDS (SR) safety functions are part of an overall system

If the qualitative and quantitative safety objectives determined by the final application require some adjustments to ensure safe use of the safety functions, the integrator of the BDM (Basic Drive Module) is responsible for these additional changes (for example, managing the mechanical brake on the motor).

Also, the output data generated by the use of safety functions (fault relay activation, error codes or information on the display, etc.) is not considered to be safety-related data.

#### **Machine Application Function Configuration**

		STO		SS1 type C (5)		SLS/STO/SS 1 type B (6)	
		STO	STO and LI3	STO with Preventa XPS ATE or XPS AV or equivalent	STO and LI3 with Preventa XPS AV or equivalent	LI3 LI4	LI5 LI6
	IEC 61800-5-2 / IEC 61508 /	SIL2	SIL3	SIL2	SIL3	SIL2	
rd	IEC 62061 (1)	SIL2	SIL3 CL	SIL2 CL	SIL3 CL	SIL2 CL	
Standard	EN 954-1 (2)	Category 3	Category 4	Category 3	Category 4	Category 3	
Sta	ISO 13849-1 (3)	Category 3 PL d	Category 4 PL e	Category 3 PL d	Category 4 PL e	Category 3 PL d	
	IEC 60204-1 (4)	Category stop 0	Category stop 0	Category stop 1	Category stop 1		

(1) Because the IEC 62061 standard concerns integration, this standard distinguishes the overall safety function (which is classified SIL2 or SIL3 for ATV32 according to the diagrams Process system SF - Case 1 and Process system SF - Case 2 from components which constitute the safety function (which is classified SIL2 CL or SIL3 CL for ATV32).

(2) According to table 6 of IEC 62061 (2005).

(3) According to table 4 of EN 13849-1 (2008).

(4) If protection against supply interruption or voltage reduction and subsequent restoration is needed according to IEC 60204-1, a safety module type Preventa XPS AF or equivalent must be used.

(5) SS1 type C: the power drive initiates the motor deceleration and initiates the STO function after an application specific time delay.

(6) SS1 type B: the power drive initiates and monitors the motor deceleration rate within set limits to stop the motor and initiates the STO function when the motor speed is below a specified limit.

#### **Process Application Function Configuration**

		STO		SS1 type C (2)		SLS / STO / SS1 type B (3)	
		STO	STO and LI3	STO with Preventa XPS ATE or XPS AV or equivalent	STO and LI3 with Preventa XPS AV or equivalent	LI3 LI4	LI5 LI6
Standard	IEC 61800-5-2 IEC 61508	SIL2	SIL3	SIL2	SIL3	SIL2	
Star	IEC 62061 (1)	SIL2 CL	SIL3 CL	SIL2 CL	SIL3 CL	SIL2 CL	

(1) Because the IEC 62061 standard concerns integration, this standard distinguishes the overall safety function (which is classified SIL2 or SIL3 for ATV32 according to diagrams CASE 1 and CASE 2 from components which constitute the safety function (which is classified SIL2 CL or SIL3 CL for ATV32).

(2) SS1 type C: the power drive initiates the motor deceleration and initiates the STO function after an application specific time delay.

(3) SS1 type B: the power drive initiates and monitors the motor deceleration rate within set limits to stop the motor and initiates the STO function when the motor speed is below a specified limit.

#### **Input Signal Safety Functions**

Input signals safety functions	Units	Value for LI3 to LI6	Value for STO
Logic 0 (Ulow)	V	< 5	< 2
Logic 1 (Uhigh)	V	> 11	> 17
Impedance (24V)	kΩ	3.5	1.5
Debounce time	ms	< 1	< 1
Response time of safety function	ms	< 10	< 10

#### Summary of the Reliability Study

Function	Standard	Input	STO input	STO input & LI3	LI3 & LI4 or LI5 & LI6
STO IEC 61508 Ed.2	IEC 61508 Ed.2	SFF	96.7%	96%	94.8%
		PFD10y	7.26.10-4	4.00.10-4	2.44.10-3
		PFD1y	7.18.10-5	3.92.10-5	2.33.10-4
		PFHequ_1y	8.20 FIT (1)	4.47 FIT (1)	26.6 FIT (1)
		Туре	В	В	В
		HFT	1	1	0
		DC	93.1%	91.5%	90%
		SIL capability	2	3	2
	IEC 62061 (1)	SIL CL capability	2	3	2
	EN 954-1 (2)	Category	3	4	3
	ISO 13849-1 (3)	PL	d	е	d
		Category	3	4	3
		MTTFd in years	13900	L1 3850L2 29300	4290
	IEC 61508 Ed.2	SFF			93.3%
BSLS	SLS	PFD10y			2.72.10-3
		PFHequ_10y			31.1 FIT (1)
		Туре			В
		HFT			0
		DC			78.7%
		SIL capability			2
	IEC 62061 (2)	SIL CL capability			2
	EN 954-1 (3)	Category	1		3
	ISO 13849-1 (4)	PL			d
		Category	1		3
		MTTFd in years	1		3670

(1) FIT: Failure In Time = Failure/10-9 hours.

(2) Because the IEC 62061 standard concerns integration, this standard distinguishes the overall safety function (which is classified SIL2 or SIL3 for ATV32 according to diagrams Process system SF - Case 1 and Process system SF - Case 2, from components which constitute the safety function (which is classified SIL2 CL or SIL3 CL for ATV32).

(3) According to table 6 of IEC 62061 (2005).

(4) According to table 4 of EN 13849-1 (2008).

Preventive annual activation of the safety function is recommended.

However, the safety levels can be obtained (with lower margins) without annual activation.

For the machine environment, a safety module is required for the STO function.

To avoid the use of a safety module, the Restart function parameters must be part of the safety function.

Please refer to the description of advantages of the safety module.

**NOTE:** The table above is not sufficient to evaluate the PL of a PDS. The PL evaluation has to be done at the system level. The fitter or the integrator of the BDM (Basic Drive Module) has to do the system PL evaluation by including sensors data with numbers from the table above.

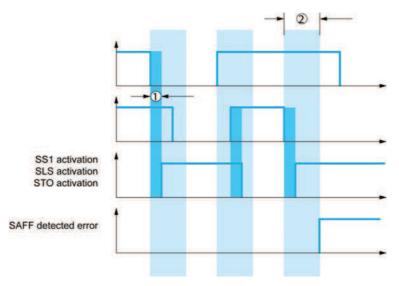

## **Debounce Time and Response Time**

#### Description

On the ATV32 there are 2 parameters to configure logic inputs for safety function (LI3, LI4, LI5, LI6). The consistency of each pair of logical input is verified continuously.

**[LI debounce time]** *L* , *d E* : A logical state difference between LI3/LI4 or LI5/LI6 is allowed during debounce time, otherwise a detected error is activated.

[LI response time] L I r L: The logic input response time manages the safety function activation shift.

(): Logic input Response Time

2 : Logic input Debounce Time

## **Chapter 7** Certified Architectures

### What Is in This Chapter?

This chapter contains the following topics:

Торіс	Page
Introduction	64
Multi-drive with the Safety Module Type Preventa XPS AF - Case 1	65
Multi-drive with the Safety Module Type Preventa XPS AF - Case 2	66
Multi-drive Without the Safety Module	67
Single Drive with the Safety Module Type Preventa XPS AV - Case 1	68
Single Drive with the Safety Module Type Preventa XPS AV - Case 2	69
Single Drive with the Safety Module Type Preventa XPS AF - Case 1	70
Single Drive with the Safety Module Type Preventa XPS AF - Case 2	71
Single Drive According to IEC 61508 and IEC 60204-1 - Case 1	72
Single Drive According to IEC 61508 and IEC 60204-1 - Case 2	73

## Introduction

#### **Certified Architectures**

**NOTE:** For certification relating to functional aspects, only the PDS(SR) (Power Drive System suitable for use in safety-related applications) will be considered, not the complete system into which it is integrated to help to ensure the functional safety of a machine or a system/process.

These are the certified architectures:

- Multi-drive with the Safety module type Preventa XPS AF Case 1
- Multi-drive with the Safety module type Preventa XPS AF Case 2
- Multi-drive without the Safety module
- Single drive with the Safety module type Preventa XPS AV Case 1
- Single drive with the Safety module type Preventa XPS AV Case 2
- Single drive with the Safety module type Preventa XPS AF Case 1
- Single drive with the Safety module type Preventa XPS AF Case 2
- Single drive according to IEC 61508 and IEC 60204-1 Case 1
- Single drive according to IEC 61508 and IEC 60204-1 Case 2

The safety functions of a PDS(SR) (Power Drive System suitable for use in safety-related applications) are part of an overall system.

If the qualitative and quantitative safety-related objectives determined by the final application require some adjustments to ensure safe use of the safety functions, the integrator of the BDM (Basic Drive Module) is responsible for these additional changes (for example, managing the mechanical brake on the motor).

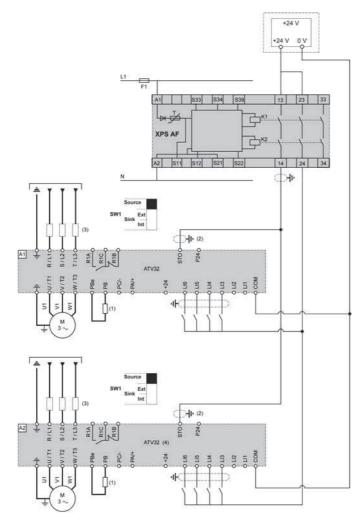

Also, the output data generated by the use of safety functions (fault relay activation, error codes or information on the display, etc.) is not considered to be a safety-related data.

## Multi-drive with the Safety Module Type Preventa XPS AF - Case 1

# Multi-drive with the Safety Module Type Preventa XPS AF According to EN 954-1, ISO 13849-1 and IEC 60204-1 (Machine)

The following configurations apply to the diagram:

- STO category 4, PL e/SIL3 Machine with Safety module type Preventa XPS AF or equivalent and LI3 set to STO
- SLS category 3, PL d/SIL2 or SS1 type B category 3 on LI5/LI6
- Or
- STO category 4, PL e/SIL3 Machine with Safety module type Preventa XPS AF or equivalent and LI3 set to STO
- LI4 and LI5/LI6 not set to a safety function

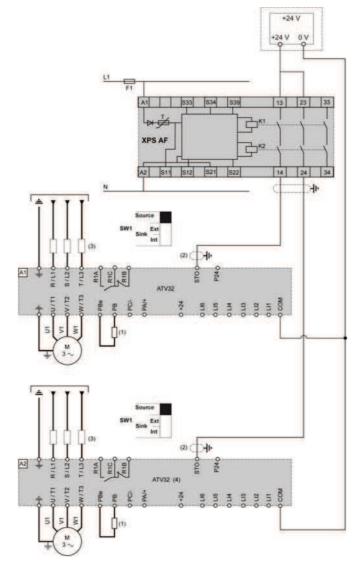

(1) Braking resistor, if used, (2) Standardized coaxial cable, type RG174/U according to MIL-C17 or KX3B according to NF C 93-550, external diameter 2.54 mm /0.09 in., maximum length 15 m / 49.21 ft. The cable shielding must be earthed, (3) Line choke, if used, (4) Multi-drives is possible with another drive (Example: ATV71 with PWR connection or Lexium servo drives)

## Multi-drive with the Safety Module Type Preventa XPS AF - Case 2

# Multi-drive with the Safety Module Type Preventa XPS AF According to EN 954-1, ISO 13849-1 and IEC 60204-1 (Machine)

The following configurations apply to the diagram below:

- STO category 3, PL d/SIL2 Machine with Safety module type Preventa XPS AF or equivalent
- SLS category 3, PL d/SIL2 or SS1 type B category 3 on LI3/LI4 or LI5/LI6

(1) Braking resistor, if used, (2) Standardized coaxial cable, type RG174/U according to MIL-C17 or KX3B according to NF C 93-550, external diameter 2.54 mm /0.09 in., maximum length 15 m / 49.21 ft. The cable shielding must be earthed, (3) Line choke, if used, (4) Multi-drives is possible with another drive (Example: ATV71 with PWR connection or Lexium servo drives).

## Multi-drive Without the Safety Module

#### Multi-drive Without the Safety Module Type Preventa XPS AF According to IEC 61508

The following configurations apply to the diagram below:

- STO SIL2 on STO
- SLS SIL2 or SS1 type B SIL2 on LI3/LI4 or LI5/LI6

Or

- STO SIL2 on STO
- SLS or SS1 type B on LI3/LI4
- LI5/LI6 not set to a safety function

Or

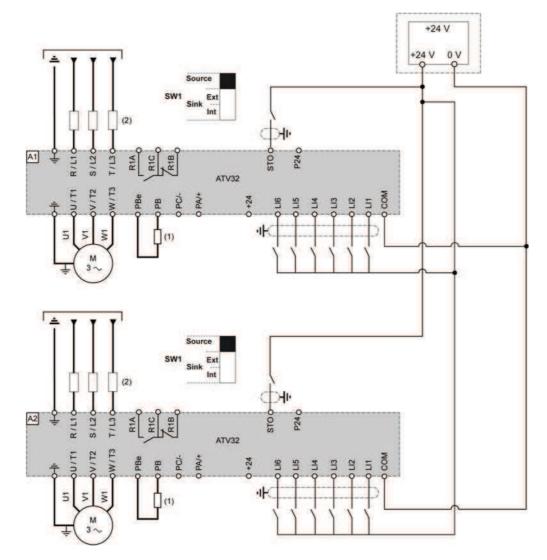

- STO SIL2 on STO
- LI3/LI4 and LI5/LI6 not set to a safety function

Or

- STO SIL3 on STO and LI3
- SLS SIL2 or SS1 type B SIL2 on LI5/LI6
- LI4 not set to a safety function

Or

- STO SIL3 on STO and LI3
- LI4 and LI5/LI6 not set to a safety function

(1) Braking resistor, if used, (2) Line chokes, if used.

## Single Drive with the Safety Module Type Preventa XPS AV - Case 1

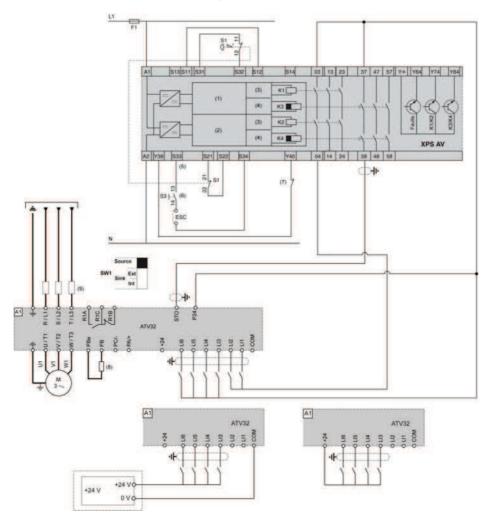

# Single Drive with the Safety Module Type Preventa XPS AV According to EN 954-1, ISO 13849-1 and IEC 60204-1 (Machine)

The following configurations apply to the diagram below:

- SS1 type C category 3, PL d/SIL2 on STO with Safety module type Preventa XPS AV or equivalent Or
- SS1 type C category 3, PL d/SIL2 on STO with Safety module type Preventa XPS AV or equivalent
- SLS category 3, PL d/SIL2 or SS1 type B category 3 on LI3/LI4
- LI5/LI6 not set to a safety function

Or

- SS1 type C category 3, PL d/SIL2 on STO and LI3 with Safety module type Preventa XPS AV or equivalent
- LI3/LI4 and LI5/LI6 not set to a safety function

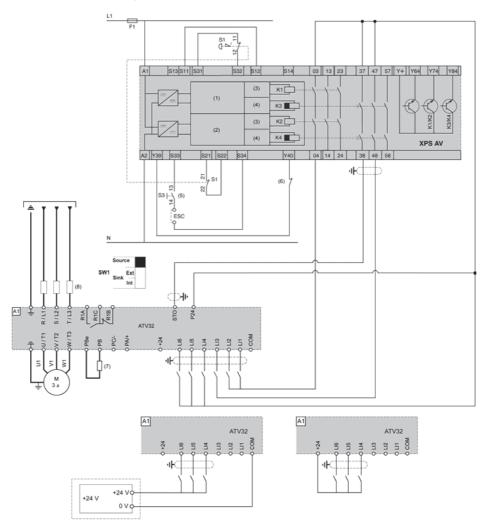

(1) Channel 1 logic, (2) Channel 2 logic, (3) Output 1, (4) Output 2, (5) Emergency stop, (6) Start, (7) Time delay stop, (8) Braking resistor, if used, (9) Line chokes, if used

## Single Drive with the Safety Module Type Preventa XPS AV - Case 2

# Single Drive with the Safety Module Type Preventa XPS AV According to EN 954-1, ISO 13849-1 and IEC 60204-1 (Machine)

The following configurations apply to the diagram below:

- SS1 type C category 4, PL e/SIL3 on STO and LI3 with Safety module type Preventa XPS AV or equivalent
- SLS category 3, PL d/SIL2 or SS1 type B category 3 PL d/SIL2 on LI5/LI6
- LI4 not set to a safety function

(1) Channel 1 logic, (2) Channel 2 logic, (3) Output 1, (4) Output 2, (5) Emergency stop, (6) Time delay stop, (7) Braking resistor, if used, (8) Line chokes, if used.

## Single Drive with the Safety Module Type Preventa XPS AF - Case 1

# Single Drive with the Safety Module Type Preventa XPS AF According to EN 954-1, ISO 13849-1, IEC 62061 and 60204-1 (Machine)

The following configurations apply to the diagram below:

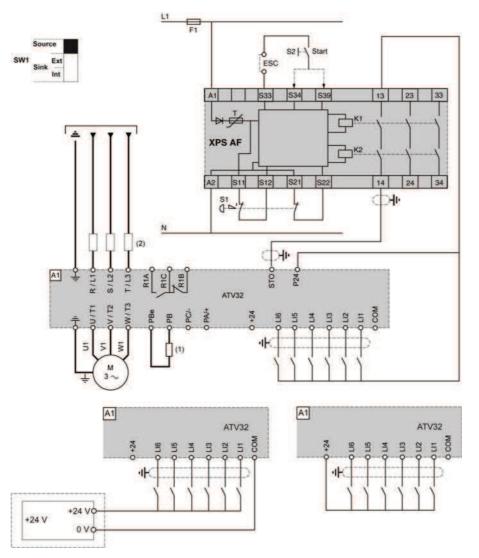

- STO category 3, PL d/SIL2 on STO with Safety module type Preventa XPS AF or equivalent
- SLS category 3, PL d/SIL2 or SS1 type B category 3 on LI3/LI4 or LI5/LI6

Or

- STO category 3, PL d/SIL2 on STO with Safety module type Preventa XPS AF or equivalent
- SLS category 3, PL d/SIL2 or SS1 type B category 3 on LI3/LI4
- LI5/LI6 not set to a safety function

Or

- STO category 3, PL d/SIL2 on STO with Safety module type Preventa XPS AF or equivalent
- LI3/LI4 and LI5/LI6 not set to a safety function

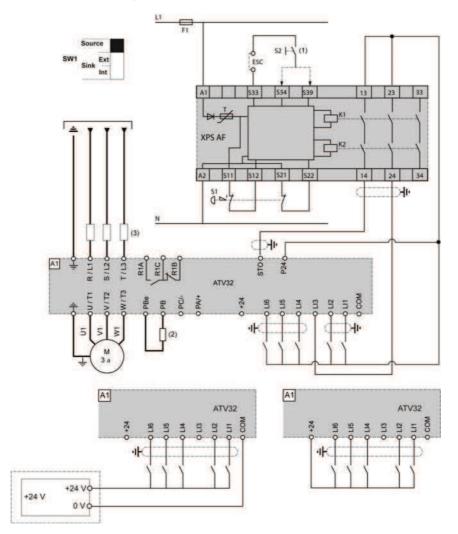

(1) Braking resistor, if used, (2) Line chokes, if used.

## Single Drive with the Safety Module Type Preventa XPS AF - Case 2

# Single Drive with the Safety Module Type Preventa XPS AF According to EN 954-1, ISO 13849-1, IEC 62061 and 60204-1 (Machine)

The following configurations apply to the diagram below:

- STO category 4, PL e/SIL3 on STO with Safety module type Preventa XPS AF or equivalent and LI3 set to STO
- SLS category 3, PL d/SIL2 or SS1 type B category 3 on LI5/LI6
- LI4 not set to a safety function

(1) Start, (2) Braking resistor, if used, (3) Line chokes if used.

**NOTE:** For more information about the control terminal characteristics, please refer to the installation manual.

## Single Drive According to IEC 61508 and IEC 60204-1 - Case 1

## Single Drive According to IEC 61508 and IEC 60204-1 Without Protection Against Supply Interruption or Voltage Reduction and Subsequent Rotation

The following configurations apply to the diagram below:

- STO SIL2 on STO
- STO or SLS SIL2 or SS1 type B SIL2 on LI3/LI4 or LI5/LI6

Or

- STO SIL2 on STO
- STO or SLS or SS1 type B on LI3/LI4
- LI5/LI6 not set to a safety function

Or

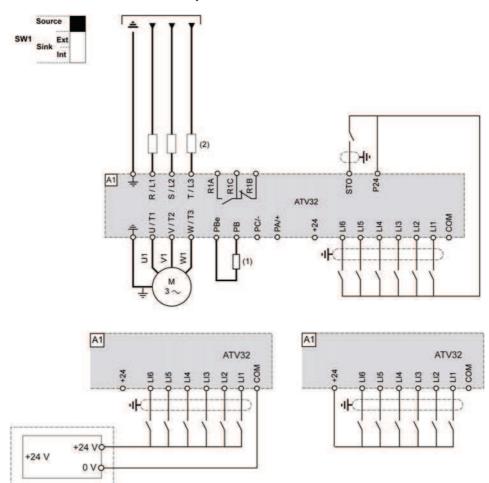

- STO SIL2 on STO
- LI3/LI4 and LI5/LI6 not set to a safety function

Or

- STO SIL3 on STO and LI3
- SLS SIL2 or SS1 type B SIL2 on LI5/LI6
- LI4 not set to a safety function

Or

- STO SIL3 on STO and LI3
- LI4 and LI5/LI6 not set to a safety function

(1) Braking resistor, if used, (2) Line chokes if used.

**NOTE:** For more information about the control terminal characteristics, please refer to the installation manual.

## Single Drive According to IEC 61508 and IEC 60204-1 - Case 2

# Single Drive According to IEC 61508 and IEC 60204-1 Without Protection Against Supply Interruption or Voltage Reduction and Subsequent Rotation

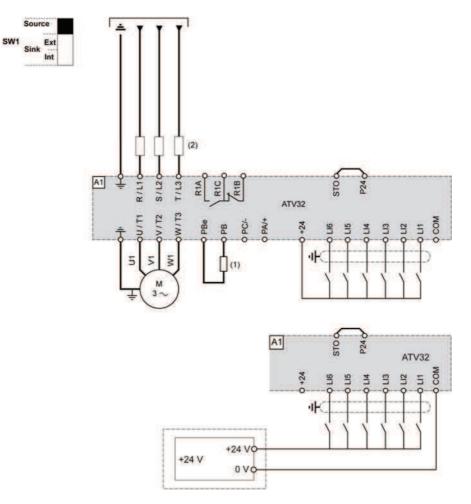

The following configurations apply to the diagram below:

- STO SIL2 on LI3 and LI4
- SLS SIL2 or SS1 type B SIL2 on LI5/LI6

Or

- STO SIL2 on LI3 and LI4
- LI5/LI6 not set to a safety function

#### Wiring Diagram

(1) Braking resistor, if used, (2) Line chokes, if used.

**NOTE:** For more information about the control terminal characteristics, please refer to the installation manual.

## Chapter 8 Commissioning

### What Is in This Chapter?

This chapter contains the following topics:

Торіс	Page
Safety Functions Tab	76
Configure Safety Functions Panel	77
Visualization and Status of Safety Functions	81
Copying Safety Related Configuration from Device to PC and from PC to Device	82
Machine Signature	85

## **Safety Functions Tab**

#### Introduction

To access the safety function configuration, click the **Safety Functions** tab. This screen is read-only, allowing you to see all current safety function configurations.

The Safety Functions tab provides access to:

- an outline of the safety function features available on the ATV32 (accessible online/offline)
- the status of all I/O in connected mode
- general information about the machine (online/offline).

It also provides access to the following dialog boxes:

- Configuration
  - **Configure** (only available in connected mode)
  - Reset Configuration
  - Copy from DEVICE to PC
  - Copy from PC to DEVICE
- Password Configuration
   Modify Password
  - Reset Password

#### Steps to Configure the Safety Functions

lf	Then
you are not in online mode	In the menu bar, click Communication $\rightarrow$ Connect to Device or click the Connect to Device icon
you are online mode	Click the <b>Configure</b> button in the <b>Safety Functions</b> tab.

Once connected:

Step	Action	Comment
1	Click the <b>Configure</b> button in the <b>Safety Functions</b> tab.	<ul> <li>A Define Configuration Password dialog box appears:</li> <li>Type the new configuration password in Enter New Password box</li> <li>Retype the new configuration password in Confirm New Password box.</li> <li>Click Ok</li> </ul>
		NOTE:
		<ul> <li>Your password:</li> <li>Should have only numeric value, choose the value between 19999.</li> <li>Should not exceed more than 4 digits.</li> <li>Should not have the value 0.</li> </ul>
		Result: Opens the Configuration of Safety Functions window.

lf	Then
you have already defined the password	type your safety function configuration password in Enter Configuration Password box, click Ok.
	Result: Opens the Configuration of Safety Functions window.

## **Configure Safety Functions Panel**

#### **Overview**

The Configuration of Safety Functions panel includes the Information, STO, SLS, SS1 and Input/Output tabs.

#### **Information Tab**

The information tab allows you to define and display product system information

formation	- 200	8.0 50		
		Date: Device Type: Device Reference: Device Serial No: Machine Name: Company Name:		
		End User Name: Comments:		
			OK. Cancel	

Information filled in automatically by SoMove:

- Date (format depends on the PC local and linguistic options)
- Device Type

Drive Reference

Information filled in manually:

- Device Serial No (number)
- Machine Name
- Company Name
- End-User Name
- Comments

## Safe Torque Off (STO) Tab

For more information about STO function, see STO description (see page 18).

For this function, only the associated set of inputs should be selected in the box. The parameter to be managed is: STOA.

Code	Name/Description	Factory Setting
5 <i>L</i> o	[Safe Torque Off]	·
5 E o A	[STO function activation]	[No]
n 0	[No: Not assigned]	
L 3 4	[LI3 and LI4]: logic input 3/4 low state	
L 5 6	[LI5 and LI6]: logic input 5/6 low state	
LJPW	[LI3 and STO]: logic input 3/STO low state	
	This parameter is used to configure the channel used to trigger the STO function. If you see STO function is always active but just on STO input	et STOA=No,

## Safely Limited Speed (SLS) Tab

For more information about **SLS** function, see SLS description (see page 22).

Code	Name/Description	Adj. Range	Factory Setting
5 L 5	[Safely-Limited Speed]		
5 L 5 A	[SLS function activation]		[No]
п в L 3 4 L 5 6	[No]: Not assigned [LI3 and LI4]: logic input 3/4 low state [LI5 and LI6]: logic input 5/6 low state This parameter is used to configure the channel used to trigger the SLS *	function.	
5 L E	[Safely Limited speed Type Element]		[Type1]
E	[Type3] : SLS type 3	ent type.	
SLSP	[SLS set point] parameter	0599 Hz	0
	This parameter is only visible if SLT = Type2 or SLT = Type3 or SLT = T SLSP is used to set the maximum speed	ype 4	
SLEE	[SLS tolerance threshold] parameter	0599 Hz	0
	The behavior of this parameter depends on the value of SLT, see above	L	
SLwt	[SLS Wait Time] parameter	05000 ms	0
	This parameter is used to set the maximum time for 5 <i>L F r</i> to be greate When SLwt is reached, STO function is triggered. Unit of this parameter is 1 ms. For example If the value is set to 2000 units, then the SLS wait time in second is: 2000*1  ms = 2  s This parameter can be modified only if SLT = Type 2 or SLT = Type 3 For SLS type 1 and SLS type 4, SLwt is always set to 0		
SSrL	[SS1 ramp value] parameter	1 to 5990	1
	The unit depends on the SSRU parameter. Use this parameter to set the ramp. SS1 ramp = SSRT*SSRU example: If SSRT = 250 and SSRU = 1 Hz/s the Hz/s. This parameter is similar to the SS1 safety function, for more information	en the decelerati	on ramp = 25
55 <i>r</i> u	[SS1 ramp unit] parameter		[1 Hz/s]
IH IOH IOOH	<ul> <li>[1 Hz/s]</li> <li>[10 Hz/s]</li> <li>[100 Hz/s]</li> <li>This parameter is used to set the SSrt unit.</li> <li>This parameter is similar to the SS1 safety function configured, for more (see page 35).</li> </ul>	information see	SS1
5 5 <i>E E</i>	[SS1 trip threshold]	0599 Hz	0
	This parameter sets the tolerance zone around the deceleration ramp in w This parameter is similar to the SS1 safety function configured in another		ncy may vary.
5 5 5 L	[SLS/SS1 standstill level] parameter	0599 Hz	0
	This parameter adjusts the frequency at which the drive should go into ST ramp. This parameter is similar to the SS1 safety function configured in another		nd of the SS1

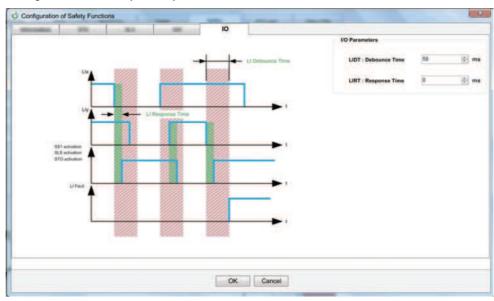

### Safe Stop 1 (SS1) Tab

For more information about **SS1** function, see SS1 description (see page 20).

Code	Name/Description	Adj. Range	Factory Setting
551	[Safe Stop 1]		
55 IA no	[Safe Stop 1] [No]: Not assigned		[No]
L 5 6	[LI5 and LI6]: logic input 5/6 low state This parameter is used to configure the channel used to trigger the SS1	function.	
55rE	[SS1 ramp value]	1 to 800	1
	The unit depends on the SSRU parameter. Use this parameter to set the ramp. SS1 ramp = SSRT*SSRU example: If SSRT = 250 and SSRU = 1 Hz/s t 25 Hz/s. This parameter is similar to the SLS safety function configured in another	hen the deceler	
55 <i>r</i> u	[SS1 ramp unit]		[1 Hz/s]
н 10н 100н	[1 Hz/s] [10 Hz/s] [100 Hz/s] This parameter is used to set the SSRT unit. This parameter is similar to the SLS safety function configured in anothe	r tab.	
5 5 <i>E E</i>	[SS1 trip threshold] parameter	0599 Hz	0
	This parameter sets the tolerance zone around the deceleration ramp in w This parameter is similar to the SLS safety function configured,	which the freque	ncy may vary.
5 5 5 L	[SLS/SS1 standstill level] parameter	0599 Hz	0
	This parameter adjusts the frequency at which the drive should go into ST ramp. This parameter is similar to the SLS safety function configured in anothe		nd of the SS1

## Input/Output Configuration

#### The figure shows the Input/Output tab:

Code	Name/Description	Adj. Range	Factory Setting
	[Input/Output]		
Lıdt	[LI debounce time]	02000 ms	50
	In most cases, the 2 logic inputs in a pair used for a safety function (LI3-LI4 or LI5-LI6 or STO-LI3) will not be 100% synchronized. They will not change state at the same time. There is a small delta between the 2 logic input transitions. $L \cdot d E$ is the parameter used to set this delta. If the 2 logic inputs change state with a delta lasting less than $L \cdot d E$ it is considered to be simultaneous transition of the logic inputs. If the delta lasts longer than $L \cdot d E$ , the drive considers the logic Inputs are no longer synchronized and detected error is triggered.		
Lırt	[LI response time]	050 ms	0
	This parameter is used to filter short impulses on the logic input (only for LI3-LI4 or LI5-LI6, STO no concerned). Some applications send short impulses on the line to test it. This parameter is used to fil these short impulses. Commands are only taken into account if the duration is longer than $L$ or $r$ LI5 If the duration is shorter the drive considers that there is no command: the command is filtered.		sed to filter

#### **Password Configuration - Modify Password**

This function allows you to modify the configuration password in the drive.

To modify the configuration password

Step	Action
1	In Safety Functions tab, click the Modify Password button Result: opens the Modify Configuration Password dialog box.
2	In the <b>Modify Configuration Password</b> dialog box: • Type the existing configuration password in <b>Enter Current Password</b> box • Type the new configuration password in <b>Enter New Password</b> box • Retype the new configuration password in <b>Confirm New Password</b> box • Click <b>Ok</b>
	NOTE: The password typed in Enter New Password box and Confirm New Password box should be same.
	NOTE:
	<ul> <li>Your password:</li> <li>Should contain only numeric value, choose the value between 19999.</li> <li>Should not exceed more than 4 digits.</li> <li>Should not have the value 0.</li> </ul>
	Result: modifies the configuration password.

#### **Password Configuration - Reset Password**

If you cannot remember the configuration password defined in the drive, you need to know the universal password to reset the drive. To obtain this password, contact your Schneider Electric contact.

After this operation, the device reverts to no defined configuration password and the session is automatically closed.

However, the function configuration remains unchanged.

#### **Reset Configuration**

This function is used to reset the configuration of the safety function to the factory settings.

To access the function, click the **Reset Configuration** button in the **Safety Functions** tab.

First enter the password, then confirm your choice.

After this action, all safety-related parameters are set to factory settings.

## Visualization and Status of Safety Functions

Code	Name/Description
5 A F -	[MONIT. SAFETY] menu - Visible on SoMove and keypad
StFr	[Stator Frequency] Displays the estimated stator frequency in Hz
5605	[STO status] Status of the Safe Torque Off safety function
, d L E 5 E o F L E	[IdLE]: STO not in progress [Safe torque off]: STO in progress [Fault]: STO in detected error
5155	[SLS status] Status of the Safely limited speed safety function
FLE	[IdLE]: SLS not in progress [Safe stop 1]: SLS ramp in progress [Safe torque off]: SLS safe torque off request in progress [Fault]: SLS in detected error [wAIT]: SLS waiting for activation
55/5	[SS1 status] Status of the Safe Stop 1 safety function
	[Not config]: SS1 not configured [IdLE]: SS1 not in progress [Safe stop 1]: SS1 ramp in progress [Safe torque off]: SS1 safe torque off request in progress [Fault]: SS1 in detected error

## Copying Safety Related Configuration from Device to PC and from PC to Device

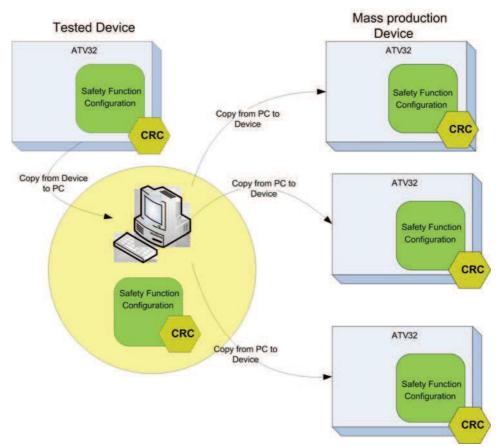

#### Overview

This feature is used to copy/paste the tested safety-related configuration in several ATV32 drives.

- This feature allows you to:
- identify unique safety-related configuration on the drive
- copy the safety-related configuration file from ATV32 drive to PC.
- copy the safety-related configuration file from PC to ATV32 drives

#### Architecture

The figure shows the architecture for copying the safety-related configuration from device to PC and PC to device:

#### Identify Unique Safety Related Configuration

The identification of the safety-related configuration is done by using CRC, calculated using all safety-related parameters

You can get the CRC value from My Device tab. Note down the CRC value after the drive is fully tested.

haracteristics :	Bio feesanti panti 123 Benati feesati 020 Registrational 020 Registrational 020	
ristilare i	Inf Name of States and	
anfiguration(s) (	Indexes office 1983 Samp from 198 CR1 Hald	

#### Copy from Device to PC

To copy a configuration file from device to PC:

Step	Action
1	In the Safety Functions tab, click the Copy from DEVICE to PC button
	(1)(1)(1)(1)(1)(1)(1)(1)(1)(1)(1)(1)(1)(
	A T T DE CONTRACTOR DE CONTRAC
	Standor Edit Foctors
	Sector allocation and
	And and a second s

	term term
	Terretor and Terretoria
	Constant Constant of Constant
	U famouty
	Passed Configuration
	THE DESCRIPTION OF THE DESCRIPTO
	2) ginesis gine
	Result: opens the Copy from Device to PC dialog box.
2	Type the configuration password in Enter configuration Password box, click Ok.
	Result: Displays the CRC1 value
3	Note the CRC1 value, click Save.
Ũ	Result: opens the Save File window.
4	In the Save File., Window
4	Select/create the folder
	<ul> <li>Type the name of the file in <b>File name</b> box.</li> </ul>
	<ul> <li>Type the name of the file in File hame box.</li> <li>Click Save.</li> </ul>
	Result: Safety-related Parameters Successfully saved message appears on the screen,
	which confirms that the file has been saved successfully in the desired path.

## NOTE:

You cannot copy the configuration from device to PC if:

- the motor is powered.
- a function block is in **Run** state.
- the function Forced Local is active.
- a safety function is triggered.

#### Copy from PC to Device

## **WARNING**

### UNEXPECTED EQUIPMENT OPERATION

- Connect the PC using point-to-point connection.
- Copy from PC to Device operation should be performed only by qualified IEC61800-5-2 personnel
- Test the safety function configuration after copying the configuration from PC to device.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

To copy a file from PC to device:

Step	Action
2 2	Action In the Safety Functions tab, click the Copy from PC to DEVICE button The safety Functions tab, click the Copy from PC to DEVICE button The safety Function stab, click the Copy from PC to DEVICE button The safety Function stab, click the Copy from PC to device operation.
	UNEXPECTED EQIPMENT OPERATION Failure to follow these instructions can result in death, serious injury, or equipment damage. OK Click Ok
	Result: Opens the Open File window.
3	In the <b>Open File</b> Window <ul> <li>Select .sfty file.</li> <li>Click <b>Open</b></li> </ul> Result: Displays the CRC1 value
4	Verify whether the CRC1 value is same as the CRC1 value noted while copying the configuration from device to PC if both CRC1 values are same then click <b>Continue</b> . <b>Result</b> : Opens the <b>Copy from PC to Device</b> dialog box.
5	Type the password (49157) in the <b>Enter copy password</b> box, click <b>Ok</b> . <b>Result</b> : Configuration is successfully copied from PC to device. A commisoning test must be done on the safety function.

#### NOTE:

You cannot copy the cofiguration from PC to device if:

- the motor is powered.
- a function block is in **Run** state.
- the function Forced Local is active.
- the configuration of the safety function is already present in the device

## **Machine Signature**

#### Overview

The purpose of the test is to verify proper configuration of the defined safety functions and test mechanisms and to examine the response of dedicated monitoring functions to explicit input of values outside the tolerance limits.

The test must cover all drive-specific Safety configured monitoring functions and global Safety integrated functionality in ATV32.

#### **Condition Prior to Acceptance Test**

- The machine is wired up correctly.
- All safety-related devices such as protective door monitoring devices, light barriers, and emergency stop switches are connected and ready for operation.
- All motor parameters and command parameters must be correctly set on the drive.

#### **Acceptance Test Process**

The acceptance test is configured with SoMove software.

Step	Action	Comment
1	Select the <b>Device</b> $\rightarrow$ <b>Safety Function</b> $\rightarrow$ <b>Machine Signature</b> menu and follow the five steps below	
2	General Information To add this step to the final report select Add to the machine signature Click Next.	The information displayed here corresponds to the <b>Identification</b> section in the <b>Safety Functions</b> tab.
3	Function Summary To add a function to the final report select Add to the machine signature Click Next	This step is composed of sub-steps. Each sub-step relates to one of the following safety functions: • STO • SLS • SS1
		In a function, sub-step the function diagram and parameters values are displayed. A text box allows you to enter additional text in this step.
4	I/O Summary To add a function to the final report select Add to the machine signature Click Next	<ul> <li>The information displayed here corresponds to the Logic Input summary folder of the Safety Functions tab:</li> <li>The logic input that is assigned to a safety function are displayed in red and show the related safety function</li> <li>The logic input that is not assigned to a safety function do not show any assignment and are displayed in green</li> </ul>
5	Test To add a function to the final report select Add to the machine signature Click Next	In this step, you tick the box when you have tested the safety functions to confirm that you have verified the correct behavior of the functions for all devices.
6	Key Click Finish to create the report	The checksum of the safety-related configuration is displayed as it is calculated for transmission to the connected device when you click <b>Apply</b> . This allows you to compare the checksum value with the one displayed in the identification menu on the graphic display terminal

#### **Acceptance Report**

SoMove creates the acceptance report.

This function provides a final report when one or several safety functions have been configured and verified. This report is deemed to be a machine signature and certifies that all the safety functions are operational. The acceptance report has been added as an optional document to be printed to a printer or to a PDF file.

If the drive configuration is modified (not only applicable on the safety related parameters), you must repeat the acceptance test.

## **Chapter 9** Services and Maintenance

### What Is in This Chapter?

This chapter contains the following topics:

Торіс	Page
Maintenance	
Power and MCU Replacement	
Changing Machine Equipment	92

### Maintenance

#### Overview

By way of preventive maintenance, the Safety functions must be activated at least once a year. The drive power supply must be turned off and then on again before carrying out this preventive maintenance. The drive logic output signals cannot be considered to be safety-related signals. Install interference suppressors on all inductive circuits near the drive or coupled to the same circuit (relays, contactors, solenoid, valves, etc.).

**NOTE:** For more product information, see the installation manual and programming manual on www.schneider-electric.com.

## **Power and MCU Replacement**

#### **Overview**

You can replace the MCU (Motor Control Unit) part (APP + HMI card) and the power part.

Depending on the drive configuration (safety function active or not), the drive response will differ.

If you replace the power and you keep your MCU, you won't lose the configuration of the safety functions but you need to repeat the Acceptance Test to avoid incorrect wiring or incorrect behavior of the safety function.

If you replace the MCU you will lose your safety-related configuration. You need to reinstall your Configuration on the new MCU and then repeat the Acceptance Test.

**NOTE:** For more product information, see the installation manual and programming manual www.schneider-electric.com.

## **Changing Machine Equipment**

#### **Overview**

If you need to change any part of the drive system (Motor, Emergency stop, etc.) you must repeat the Acceptance Test.

**NOTE:** For more product information, see the installation manual and programming manual www.schneider-electric.com.
