Overview

The TIBCO Cloud™ Integration - BusinessWorks™ provides capabilities of TIBCO BusinessWorks Container Edition and Plug-ins on AWS. Using TIBCO Cloud™ Integration - BusinessWorks™, you can quickly and easily connect API's, microservices and backend systems. With easy-to-use drag-and-drop graphical development environment, graphical data mapper and a vast library of connectors, you can quickly and easily create cloud-native integration applications and deploy them on AWS leveraging native features of AWS Elastic Container Service or your choice of Docker-based PaaS build on AWS for container management.

The following are the product listing available for TIBCO Cloud™ Integration - BusinessWorks™ on AWS marketplace:

- **TIBCO Cloud™ Integration – BusinessWorks™ (PAYG)** - Consumption-based pricing model helps you to pay only for the number of containers running per hour. This gives you the flexibility to scale on demand and manage software cost as you go.
- **TIBCO Cloud™ Integration – BusinessWorks™ (BYOL)**- With BYOL model, you can use your existing TIBCO Cloud Integration licenses to run BusinessWorks Container Edition applications on AWS, leveraging the AMI (Amazon Machine Image) or CloudFormation templates provided on AWS Marketplace.

You must have knowledge of TIBCO BusinessWorks™ Container Edition to use TIBCO Cloud™ Integration - BusinessWorks™. For more information, See the [TIBCO Cloud™ Integration - BusinessWorks™](#) documentation.

This chapter contains the following sections:

- [Subscribing to TIBCO Cloud™ Integration - BusinessWorks™](#)
- [Metering Workflow for Flexible Consumption Pricing \(FCP\)](#)
- [Flexible Consumption Pricing Model](#)
- [Supported Plug-ins](#)
- [Cancellation and Termination](#)

Subscribing to TIBCO Cloud™ Integration - BusinessWorks™

To get started, you must first access AWS marketplace and subscribe to TIBCO Cloud™ Integration - BusinessWorks™ (PAYG) or TIBCO Cloud™ Integration - BusinessWorks™ (BYOL).

Prerequisites

You'll need a few things before you install and run TIBCO Cloud™ Integration - BusinessWorks™ for AWS Marketplace on Amazon Web Services. Ensure that you have an AWS account. To create an AWS account, go to [the Amazon Web Services sign up](#) page, click the Sign Up button, and follow the instructions.

Procedure

1. Log in to Amazon Web Services Marketplace account.
2. Use the search option to locate TIBCO Cloud™ Integration - BusinessWorks™ on the AWS Marketplace.
3. Click **Continue to Subscribe** to go to the Launch page.

4. To subscribe to TIBCO Cloud™ Integration - BusinessWorks™, verify the information on this page and click **Accept Software terms**.

After subscribing to the TIBCO Cloud™ Integration - BusinessWorks™, you can launch the Single AMI or AWS CloudFormation Stack using CloudFormation template. For more information, see [Launching TIBCO Cloud™ Integration - BusinessWorks™](#)

5. Click **Return to Launch Page** to start using TIBCO Cloud™ Integration - BusinessWorks™ software.

Thank you for subscribing to TIBCO BusinessWorks™ Container Edition and Plug-ins for AWS

Your subscription will be completed in a few moments.
Software and AWS hourly usage fees apply when the instance is running and will appear on your monthly bill.

Next Steps:

- You will receive an email once your subscription completes.
- Once you've received the email, please refer to the Usage Instructions and click one of the "Launch with EC2 Console" buttons on the [Launch Page](#) to start an instance of this software.
- You can also find and launch these AMIs by searching for the AMI IDs (shown below) in the "Community AMIs" tab of the [EC2 Console](#) Launch Wizard, or launch with the [EC2 APIs](#).
- The email will have a link to where you can launch the product from the CloudFormation console or EC2 console.
- If you want to only launch the AMI, you can also find and launch these AMIs by searching for the AMI IDs in the "Community AMIs" tab of the [EC2 Console](#) Launch Wizard, or launch with the [EC2 APIs](#). The AMI IDs are available in the custom launch tab of the products subscription page.

You can view this information at a later time by visiting the Your Software page. For help, see [step-by-step instructions](#) for launching Marketplace AMIs from the AWS Console.

Flexible Consumption Pricing (FCP) for TIBCO Cloud™ Integration - BusinessWorks™ (PAYG)

TIBCO Cloud™ Integration - BusinessWorks™ starts an aggregator service on every EC2 instance, launched through Single AMI or CloudFormation Template option. This service MUST be running on the EC2 instance. Any TIBCO BusinessWorks Container Edition application started in a Docker container on the EC2 instance, it automatically connects to the aggregator and sends its metering units every hour. The aggregator service aggregates metering units from all the containers running on the EC2 instance and invokes AWS Marketplace Metering Service to send metering record every hour.

Scenario 1

If aggregator service is down,

- TIBCO BusinessWorks Container Edition application tries to send metering units to aggregator hourly.
- If the hourly invocation fails due to TIBCO BusinessWorks Container Edition application not receiving any response from aggregator, the application tries to send the metering units to aggregator in the next hour.
- If 2 retry attempt fails, then TIBCO BusinessWorks Container Edition application will be stopped.

Scenario 2

If aggregator service fails to send metering records to AWS metering service,

- TIBCO BusinessWorks Container Edition application tries to send metering units to aggregator hourly.
- If the hourly invocation fails due to TIBCO BusinessWorks Container Edition application receiving any status code other than 200 from aggregator, the application tries to send the metering units to aggregator in the next hour.
- If 3 retry attempts fail, then TIBCO Cloud™ Integration - BusinessWorks™ is stopped.

Flexible Consumption Pricing Model

TIBCO Cloud™ Integration - BusinessWorks™ uses consumption-based pricing model to calculate the cost of running TIBCO BusinessWorks Container Edition application on AWS Marketplace Metering Service. You pay only for the number of containers running per hour. This gives you flexibility to scale on demand and manage software cost on the go. All charges are incurred hourly by the customer. Usage is calculated and billed monthly.

Software Cost for FCP

TIBCO Cloud™ Integration - BusinessWorks™ uses "Consumption Unit" as a Flexible Consumption Pricing (FCP) dimension when sending metering records to AWS Marketplace Metering Service. The metering service uses this dimension to meter the TIBCO Cloud™ Integration - BusinessWorks™ and Plug-ins consumption per hour and charges the customer based on the consumption.

One TIBCO BusinessWorks Container Edition application docker container uses 5 TIBCO BusinessWorks consumption units per hour and one ActiveMatrix BusinessWorks plug-in uses 2 TIBCO BusinessWorks consumption units per hour.

For Example,

Assume that 1 TIBCO BusinessWorks Container Edition application container is running for 10 hours and the TIBCO BusinessWorks Container Edition application uses 3 BusinessWorks Plug-ins supported with TIBCO Cloud™ Integration - BusinessWorks™ for AWS marketplace:

1 TIBCO Cloud™ Integration - BusinessWorks™ App Container = 5 TIBCO BusinessWorks Consumption Units per hour

1 BW Plug-in = 2 TIBCO BusinessWorks consumption units per hour

Total units consumed per hour = $1 \times 5 + 3 \times 2 = 11$ TIBCO BusinessWorks Consumption Units

Total units consumed in 10 hours = $10 \times 11 = 110$ TIBCO BusinessWorks ConsumptionUnit Hrs

Total Price for the app container = $110 \times \text{Price for 1 TIBCO BusinessWorks Consumption Unit}$

Price per consumption unit is listed on the AWS Marketplace page for TIBCO Cloud™ Integration - BusinessWorks™ and Plug-ins. On Billing dashboard for your AWS account, you can see the total ConsumptionUnitHrs for TIBCO Cloud™ Integration - BusinessWorks™ and Plug-ins and the software cost is calculated based on consumption.

For BYOL, software cost is not paid through AWS Marketplace. Users can use their existing TIBCO BusinessWorks Container Edition software licenses purchased from TIBCO.

AWS Infrastructure Cost

Users incur associated AWS infrastructure charges depending on the services and infrastructure used such as AWS EC2, S3, EBS and so on. These rates and fees are defined and controlled by AWS and can vary between regions.

If the target group is not configured correctly for an application, the health check fails and the application is stopped. In this scenario, the new container spins up and you are charged for the each new container spinned up automatically till the time you fix the target group or deletes the application service.

Annual Premium Subscription

Users can contact TIBCO Sales to purchase Premium Subscription for TIBCO Cloud™ Integration - BusinessWorks™. This subscription includes right to open up to 12 or unlimited Support Requests expiring one year from the date of purchase.

Supported Plug-ins

The following plug-ins are supported by TIBCO Cloud™ Integration - BusinessWorks™ on Amazon Web Services Marketplace.

Sr.No.	ID	Plug-In Name	Version
1	ADB	TIBCO ActiveMatrix BusinessWorks™ Plug-in for Database	8.4.0
2	AMQP	TIBCO ActiveMatrix BusinessWorks™ Plug-in for AMQP	6.2.0
3	Cassandra	TIBCO ActiveMatrix BusinessWorks™ Plug-in for Apache Cassandra	6.3.1
4	CAWSCS	TIBCO ActiveMatrix BusinessWorks™ Plug-in Component for AWS Common Services	6.0.2
5	bwpluginconfidentiality	TIBCO ActiveMatrix BusinessWorks™ Plug-in for Confidentiality	6.0.0
6	DC	TIBCO ActiveMatrix BusinessWorks™ Plug-in for Data Conversion	4.5.1
7	DCRM	TIBCO ActiveMatrix BusinessWorks™ Plug-in for Microsoft Dynamics CRM	6.9.1

Sr.No.	ID	Plug-In Name	Version
8	bwpluginejb	TIBCO ActiveMatrix BusinessWorks™ Plug-in for EJB	6.1.1
9	bwplugineftl	TIBCO ActiveMatrix BusinessWorks™ Plug-in for TIBCO eFTL™	6.0.0
10	Facebook	TIBCO ActiveMatrix BusinessWorks™ Plug-in for Facebook	6.3.0
11	Files	TIBCO ActiveMatrix BusinessWorks™ Plug-in for Files for Unix and Windows	8.1.0
12	FTL	TIBCO ActiveMatrix BusinessWorks™ Plug-in for TIBCO FTL	6.4.3
13	bwpluginbigquery	TIBCO ActiveMatrix BusinessWorks™ Plug-in for Google Big Query	6.0.0
14	bwplugingooglecps	TIBCO ActiveMatrix BusinessWorks™ Plug-in for Google Cloud Pub/Sub	6.0.1
15	JDE	TIBCO ActiveMatrix BusinessWorks™ Plug-in for JD Edwards EnterpriseOne	7.0.1
16	Kafka	TIBCO ActiveMatrix BusinessWorks™ Plug-in for Apache Kafka	6.5.0
17	LDAP	TIBCO ActiveMatrix BusinessWorks™ Plug-in for LDAP	7.2.0 HF-003
18	Marketo	TIBCO ActiveMatrix BusinessWorks™ Plug-in for Marketo	7.2.1
19	Excel	TIBCO ActiveMatrix BusinessWorks™ Plug-in for Microsoft Excel	6.1.1
20	MongoDB	TIBCO ActiveMatrix BusinessWorks™ Plug-in for MongoDB	6.4.1
21	MQ	TIBCO ActiveMatrix BusinessWorks™ Plug-in for WebSphere MQ	8.5.1
22	Netsuite	TIBCO ActiveMatrix BusinessWorks™ Plug-in for Netsuite	6.3.3
23	OData	TIBCO ActiveMatrix BusinessWorks™ Plug-in for OData	6.2.1
24	OracleEBS	TIBCO ActiveMatrix BusinessWorks™ Plug-in for Oracle E-Business Suite	6.1.2
25	Tuxedo	TIBCO ActiveMatrix BusinessWorks™ Plug-in for Oracle Tuxedo	8.0.1

45	bwlx	TIBCO ActiveMatrix BusinessWorks™ Plug-in for Large XML	6.1.3

Cancellation and Termination

Users have the right to cancel their subscription for TIBCO Cloud™ Integration - BusinessWorks™ at any time.

TIBCO may remove the listing from the AWS Marketplace at any time with prior notice in accordance with the AWS Marketplace Listing Guidelines. AWS may also remove the listing from the AWS Marketplace at any time for any reason. Upon any removal by TIBCO or AWS of the listing from the AWS Marketplace, existing users can continue to exercise their rights in Marketplace Listing for the remainder of the term the user has acquired rights to use Marketplace Content or, if longer, 90 days after removal. Upon termination of the Agreement, AWS may terminate all access to the Marketplace Content. We strongly advise existing users that they back up their data prior to expiration or cancellation, as TIBCO will not provide access to the customer's data after termination or cancellation.

Launching TIBCO Cloud™ Integration - BusinessWorks™

TIBCO Cloud™ Integration - BusinessWorks™ provide the following deployment options on AWS Marketplace.

- [Single AMI](#)
- [CloudFormation Template to setup AWS ECS Cluster.](#)
- [CloudFormation Template to create and extend TIBCO BusinessWorks Container Edition base docker image and push installers to S3](#)

Launching Single Amazon Machine Image (AMI)

You can create an EC2 instance from Amazon Machine Image (AMI). After you subscribe to TIBCO Cloud™ Integration - BusinessWorks™, you can launch the AMI from the marketplace page.

The following are the artifacts that are provided in the Single AMI:

Directory `/home/ec2-user/bwce/` includes the following directories:

- `bwce-runtime`: Contains `bwce-runtime` zip.
- `bwce-docker`: Contains TIBCO BusinessWorks Container Edition docker open source script. For more information, refer to <https://github.com/TIBCOSoftware/bwce-docker>.
- `scripts`: Contains `create-push-image.sh` script which creates TIBCO BusinessWorks Container Edition base image and pushes it to ECR repo.
- `bwce-mon`: Contains application monitoring feature for TIBCO Cloud™ Integration - BusinessWorks™.

The following are the installer that are shipped with the Single AMI:

- `bwce`: Contains TIBCO Business Studio™ for BusinessWorks™ installers for all supported OS
- `plugins`: Contains installer for TIBCO Cloud™ Integration - BusinessWorks™ supported plugins & runtime zip files for all supported OS. For more information on supported plug-ins, see [Supported Plug-ins](#).

For more details about AMI, Refer [AWS Documentation](#).

Prerequisites

Ensure that you have subscribed to TIBCO Cloud™ Integration - BusinessWorks™ and Plug-ins. See [Subscribing TIBCO Cloud™ Integration - BusinessWorks™](#).

Run the following command,

to install docker in Single AMI.

```
sudo yum -y install docker-ce
```

to start docker

```
sudo systemctl start docker
```

For more details about Docker, Refer [Docker Documentation](#).

Procedure

1. Open the TIBCO Cloud™ Integration - BusinessWorks™ web page in AWS Marketplace.
2. In the **Pricing Information** section, select the region where you want to make the software available and specify the delivery method as **Single AMI**.

Product Overview

TIBCO Cloud™ Integration (TCI) is an iPaaS that provides pervasive integration capabilities in a hybrid, deploy-anywhere model, that enables businesses to rapidly connect their applications and build new ones.

TIBCO Cloud™ Integration - BusinessWorks™ (PAYG) provides capabilities of TIBCO BusinessWorks™ Container Edition and a range of plug-ins for flexible consumption on AWS. It allows you to quickly and easily connect APIs, Microservices and backend systems. With an easy-to-use drag-and-drop visual development environment, graphical data mapper and vast library of connectors, you can quickly and easily create cloud-native integration applications and deploy them on AWS using Amazon Elastic Container Service. With the consumption based pricing model, you will pay only for number of containers running per hour. This gives you flexibility to scale on demand and manage the software cost as you go.

Version	2.3.3 Show other versions
Sold by	TIBCO Software, Inc.
Video	See Product Video
Categories	Application Development
Operating System	Linux/Unix, CentOS CentOS 7
Fulfillment Methods	CloudFormation Template Amazon Machine Image

Highlights

- Speed time to market by graphically choreographing the interactions between microservices and APIs and leveraging an automated DevOps pipeline for continuous delivery
- Simplify the building and shipping of cloud-native apps, with native container support and transform existing apps to cloud-native with OOTB migration utility
- Build twelve-factor compliant cloud-native apps and simplify adopting microservices with out of the box support for microservices tooling such as; configuration management, service registry & discovery and circuit breaker patterns

[Cancel](#) [Previous](#) [Review and Launch](#) [Next: Add Storage](#)

- Click **Next: Add Storage** and review the storage details. You can add Elastic Block Store and instance store volumes by clicking the **Add New Volume** button.

1. Choose AMI 2. Choose Instance Type 3. Configure Instance 4. Add Storage 5. Add Tags 6. Configure Security Group 7. Review

Step 4: Add Storage

Your instance will be launched with the following storage device settings. You can attach additional EBS volumes and instance store volumes to your instance, or edit the settings of the root volume. You can also attach additional EBS volumes after launching an instance, but not instance store volumes. [Learn more](#) about storage options in Amazon EC2.

Volume Type ⓘ	Device ⓘ	Snapshot ⓘ	Size (GiB) ⓘ	Volume Type ⓘ	IOPS ⓘ	Throughput (MB/s) ⓘ	Delete on Termination ⓘ	Encrypted ⓘ
Root	/dev/sda1	snap-0e45171cc1d0156b9	30	General Purpose SSD (GP2) ▼	100 / 3000	N/A	<input type="checkbox"/>	Not Encrypted

[Add New Volume](#)

Free tier eligible customers can get up to 30 GB of EBS General Purpose (SSD) or Magnetic storage. [Learn more](#) about free usage tier eligibility and usage restrictions.

[Cancel](#) [Previous](#) [Review and Launch](#) [Next: Add Tags](#)

- Click **Next: Tag Instance** and add optional tags. To add more tags, click the **Create Tag** button.

1. Choose AMI 2. Choose Instance Type 3. Configure Instance 4. Add Storage 5. Add Tags 6. Configure Security Group 7. Review

Step 5: Add Tags

A tag consists of a case-sensitive key-value pair. For example, you could define a tag with key = Name and value = Webserver. [Learn more](#) about tagging your Amazon EC2 resources.

Key (127 characters maximum)	Value (255 characters maximum)
This resource currently has no tags	

Choose the Add tag button or [click to add a Name tag](#).
Make sure your [IAM policy](#) includes permissions to create tags.

Add Tag (Up to 50 tags maximum)

[Cancel](#) [Previous](#) [Review and Launch](#) [Next: Configure Security Group](#)

A tag is a key or value pair that flows to resources inside your stack. You can add up to 10 unique tags to each instance.

- Click **Next: Configure Security Group** and configure your firewall rules. Choose an existing security group or create a new security group.

1. Choose AMI 2. Choose Instance Type 3. Configure Instance 4. Add Storage 5. Add Tags 6. Configure Security Group 7. Review

Step 6: Configure Security Group

A security group is a set of firewall rules that control the traffic for your instance. On this page, you can add rules to allow specific traffic to reach your instance. For example, if you want to set up a web server and allow Internet traffic to reach your instance, add rules that allow unrestricted access to the HTTP and HTTPS ports. You can create a new security group or select from an existing one below. [Learn more](#) about Amazon EC2 security groups.

Assign a security group: ☒ Create a new security group ☐ Select an existing security group

Security group name: TIBCO BusinessWorks- Container Edition-2-3-0-AutogenByAWSMP-

Description: This security group was generated by AWS Marketplace and is based on recom

Type	Protocol	Port Range	Source	Description
SSH	TCP	22	Custom 0.0.0.0/0	e.g. SSH for Admin Desktop
HTTP	TCP	80	Custom 0.0.0.0/0	e.g. SSH for Admin Desktop

Add Rule

Warning
Rules with source of 0.0.0.0/0 allow all IP addresses to access your instance. We recommend setting security group rules to allow access from known IP addresses only.

- Click **Review and Launch**. Review your information and edit if necessary.

- Click **Launch**.

A message is displayed, informing you that the instance is now launching. Your instances might take a few minutes to launch, depending on the software you are running.

- Click **Close**.

Running TIBCO BusinessWorks Container Edition Application on Standalone EC2

You can run a TIBCO BusinessWorks Container Edition application on standalone EC2 instance using Single AMI.

Prerequisites

- Run the following command to install required packages for Docker.

```
sudo yum install -y yum-utils device-mapper-persistent-data lvm2
```

2. Run the following command to set up stable repository.

```
sudo yum-config-manager --add-repo https://download.docker.com/linux/centos/docker-ce.repo
```

Procedure

1. Log in to EC2 instance of TIBCO Cloud™ Integration - BusinessWorks™ created by launching Single AMI.

2. Run the following command to install Docker.

```
sudo yum -y install docker-ce
```

3. Run the following command to start Docker container.

```
sudo systemctl start docker
```

The scripts for creating Docker image for TIBCO Cloud™ Integration - BusinessWorks™ are available at `/home/ec2-user/bwce/bwce-docker/`

4. Run the following command to manage Docker as non-root user.

```
sudo usermod -aG docker $USER
```

5. Copy the required artifacts at `/home/ec2-user/bwce/bwce-docker/resources/addons/` (certs, jars, lib, monitoring-agents, plugins, thirdparty-installs) location if you want to extend TIBCO BusinessWorks Container Edition base image.

6. Run the following command to create TIBCO Cloud™ Integration - BusinessWorks™ Docker image at `/home/ec2-user/bwce/bwce-docker/` run location.

```
./createDockerImage.sh /home/ec2-user/bwce/bwce-runtime/bwceruntime-aws-  
<version>.zip tibco/bwce:<version>
```

7. Create the application image using the following command:

```
docker build -t http-app .
```

You can build the TIBCO Cloud™ Integration - BusinessWorks™ Application image on top of `tibco/bwce:<version>` image.

8. Run the application image using the following command.

```
docker run -i -d -p 8080:8080 http-app
```

For more information about running application on Docker, see of *TIBCO BusinessWorks Container Edition Sample* guide.

Launching CloudFormation Template to Set up AWS ECS Cluster

CloudFormation template creates a CloudFormation Stack which builds a base TIBCO Cloud™ Integration - BusinessWorks™ and Plug-ins docker image, creates an ECR repository with name 'tibco-bwce' and pushes base docker image into the ECR repository. It then deploys a VPC, with a pair of public and private subnets spread across two availability zones. It deploys an Internet Gateway, with a default route on the public subnets. It deploys a pair of NAT Gateways (one in each AZ) and default routes for them in the private subnets. It then deploys a highly available ECS cluster of EC2 instances (ECS Hosts) launched from the TIBCO BWCE AMI in an AutoScaling Group, with the EC2 instances distributed across multiple Availability Zones. This template also provides you an option to create an Amazon S3 bucket and folder structure inside the bucket required for base docker image customization.

Prerequisites

Ensure that you have subscribed to TIBCO Cloud™ Integration - BusinessWorks™ and Plug-ins on AWS Marketplace. For more information, see [Subscribing TIBCO Cloud™ Integration - BusinessWorks™](#).

Procedure

1. Open the TIBCO Cloud™ Integration - BusinessWorks™ web page.
2. In the **Pricing Information** section, select the region where you want to make the software available and specify the delivery method as **Setup ECS Cluster**.

Product Overview

TIBCO Cloud™ Integration (TCI) is an iPaaS that provides pervasive integration capabilities in a hybrid, deploy-anywhere model, that enables businesses to rapidly connect their applications and build new ones.

TIBCO Cloud™ Integration - BusinessWorks™ (PAYG) provides capabilities of TIBCO BusinessWorks™ Container Edition and a range of plug-ins for flexible consumption on AWS. It allows you to quickly and easily connect APIs, Microservices and backend systems. With an easy-to-use drag-and-drop visual development environment, graphical data mapper and vast library of connectors, you can quickly and easily create cloud-native integration applications and deploy them on AWS using Amazon Elastic Container Service. With the consumption based pricing model, you will pay only for number of containers running per hour. This gives you flexibility to scale on demand and manage the software cost as you go.

Version	2.3.3 Show other versions
Sold by	TIBCO Software, Inc.
Video	See Product Video
Categories	Application Development
Operating System	Linux/Unix, CentOS CentOS 7
Fulfillment Methods	CloudFormation Template Amazon Machine Image

Highlights

- Speed time to market by graphically choreographing the interactions between microservices and APIs and leveraging an automated DevOps pipeline for continuous delivery
- Simplify the building and shipping of cloud-native apps, with native container support and transform existing apps to cloud-native with OOTB migration utility
- Build twelve-factor compliant cloud-native apps and simplify adopting microservices with out of the box support for microservices tooling such as; configuration management, service registry & discovery and circuit breaker patterns

Specify Details

Specify a stack name and parameter values. You can use or change the default parameter values, which are defined in the AWS CloudFormation template. [Learn more.](#)Stack name

Parameters

ECS Cluster Configuration

ECS Cluster Size:

Number of EC2 instances to be created initially in the ECS Cluster (1-1000). This value will be used to set the Min, Max & Desired count of instances in the Auto Scaling Group.

EC2 Instance Type:

Select an instance type for EC2 instances to be created in the ECS cluster.

Volume Size:

Volume Size (GB) for EC2 instances.

Key Pair:

Select an existing key pair. You must provide existing key pair to be able to SSH into EC2 instances.

Base Image Customization Configuration

Create S3 Bucket for Base Image Customization?

Do you want to create a new S3 bucket & required folder structure for extending base image? You can upload third-party drivers, OSGI bundles, certificates, plugins etc. in this bucket to extend the base image later.

S3 Bucket Name:

Provide name for S3 bucket to be created, if you selected the previous option as 'Yes'.

Network Configuration

VpcCIDR:

The CIDR range for the VPC. This should be a valid private (RFC 1918) CIDR range.

PublicSubnet1CIDR:

CidrBlock for PublicSubnet1 within the VPC

PublicSubnet2CIDR:

CidrBlock for PublicSubnet2 within the VPC

PrivateSubnet1CIDR:

CidrBlock for PrivateSubnet1 within the VPC

PrivateSubnet2CIDR:

CidrBlock for PrivateSubnet1 within the VPC

[Cancel](#)[Previous](#)[Next](#)

8. In the **Stack Name** field, give a unique name to your CloudFormation stack .

Stack name must not exceed 24 characters.

9. In the **ECS Cluster Size** field, enter the number of ECS hosts you want to deploy.

10. Select an appropriate **EC2 InstanceType** for the ECS Cluster from the drop-down.

Performance might vary based on system attributes such as network bandwidth, memory requirements for a given use case and query requirements. For more information about EC2 instance types, see the AWS documentation: <http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/instance-types.html>

11. In the **Key Pair** field (optional), enter an existing key pair name for SSH access to the ECS instance.

12. Select **Yes** to **Create S3 Bucket for Base Image Customization** and specify **S3 Bucket Name**.

- After the Stack is in CREATE_COMPLETE state, an S3 Bucket is created with the user provided name.
- The S3 Bucket consist of following folders:

- /certs
- /jars
- /lib
- /monitor-agents
- /plugins
- /thirdparty-installs

- c) Before running the Extend TIBCO Cloud™ Integration - BusinessWorks™ Docker Image CloudFormation template, user must copy required artifacts (optional) in respective folders in the S3 bucket.

- Copy certificates to /certs folder.
- Copy additional OSGi bundle jars (jars required by plugins, DB drivers, MQ jars etc.) to /jars folder.
- Copy additional libraries to /lib folder.
- Copy TIBCO Cloud™ Integration - BusinessWorks™ monitoring agent jar to /monitor-agents folder.
- Copy TIBCO Cloud™ Integration - BusinessWorks™ supported plug-in runtime zip files to /plugins folder.
- Copy thirdparty installation zip to /thirdparty-installs folder.

- d) Configure the network by providing the CIDR IP range for VPC, public and private subnets. By default, the values are provided.

13. Click **Next**. The Options page is displayed.

14. Specify tags (key-value pairs) for resources in your stack and select the **IAM Role** to create, modify, or delete resources from the stack. You can also set the amount of monitoring time, during which CloudFormation monitor all rollback triggers after the stack creation or update operation deployed on all necessary resources.

Result

You see your Stack Name listed in a table. While it is being created, the Status column is displays the status as CREATE_IN_PROGRESS. After a few minutes the status should change to CREATE_COMPLETE. After the Stack is in CREAT_COMPLETE state, the **Outputs tab** contains the URL for various AWS resources created as part of the Stack.

Launching CloudFormation Template to create and extend TIBCO BusinessWorks Container Edition Base Docker Image

The CloudFormation template creates new ECR repository and pushes TIBCO BusinessWorks Container Edition base docker image into the repository. You can use it to extend the base docker image. If you provide S3 Bucket Name, the template adds all resources uploaded in the S3 bucket to the base image. If you provide List of Plug-ins, the template adds specified BusinessWorks Plug-ins runtime artifacts to the base image. In case, you select **Do you want to push Business Studio and BusinessWorks Plug-ins installer to S3** as **Yes** and provide **S3 Bucket Name**, the TIBCO Business Studio™ for BusinessWorks™ and Business works Plug-ins installer is copied to S3 bucket.

Prerequisites

Ensure that you have subscribed to TIBCO Cloud™ Integration - BusinessWorks™ on AWS Marketplace. Refer [Subscribing to TIBCO Cloud™ Integration - BusinessWorks™](#).

Procedure

1. Open the TIBCO Cloud™ Integration - BusinessWorks™ webpage.
2. Select the region where you want to make the software available and select the delivery method as **Extend BWCE Docker Image** from the drop-down list.

Template URL	https://s3-external-1.amazonaws.com/cf-templates-1otf60gv5loyrr-us-east-1/2018018EGc-bwce-ecs.yaml
Description	TIBCO BWCE 2.3.2. This template builds a base TIBCO BWCE docker image, creates an ECR repo with name 'tibco-bwce' and pushes base docker image into the ECR repo. It then deploys a VPC, with a pair of public and private subnets spread across two Availability Zones. It deploys an Internet Gateway, with a default route on the public subnets. It deploys a pair of NAT Gateways (one in each AZ), and default routes for them in the private subnets. It then deploys a highly available ECS cluster of EC2 instances (ECS Hosts) launched from the TIBCO BWCE AMI in an AutoScaling Group, with the EC2 instances distributed across multiple Availability Zones. This template also provides you an option to create an S3 bucket and folder structure inside the bucket required for base docker image customization. This template also provides you an option to install BWCE Monitoring Application.
Estimate cost	Link is not available

Details

Stack name: AWSMPSSetupECScluster

ECS Cluster Configuration

ClusterSize	2
InstanceType	t2.medium
VolSize	30
KeyName	

Base Image Customization Configuration

ExtBucket	Yes
ExtBucketName	test S3B

Monitoring Configuration

InstMonitoring	Yes
MonInstanceType	t2.medium

Rollback on failure	Yes

Capabilities

The following resource(s) require capabilities: [AWS::IAM::InstanceProfile, AWS::IAM::Role]

This template contains Identity and Access Management (IAM) resources. Check that you want to create each of these resources and that they have the minimum required permissions. In addition, they have custom names. Check that the custom names are unique within your AWS account. [Learn more.](#)

☒ I acknowledge that AWS CloudFormation might create IAM resources with custom names.

Cloud Formation Template Behavior

This section describe the creation and deletion behavior of the cloud formation templates.

- **Set up ECS cluster:**

The following AWS resources are created when ECS Cloud Formation template is used to create a stack.

```
AWS::EC2::VPC
AWS::EC2::Subnet (4)
AWS::EC2::SubnetRouteTableAssociation (4)
AWS::EC2::Route (3)
AWS::EC2::RouteTable (2)
AWS::EC2::EIP (2)
AWS::EC2::NatGateway (2)
AWS::EC2::SecurityGroup (2)
AWS::EC2::VPCGatewayAttachment
AWS::EC2::InternetGateway
AWS::ECS::Cluster
AWS::ElasticLoadBalancingV2::LoadBalancer
AWS::ElasticLoadBalancingV2::TargetGroup
AWS::ElasticLoadBalancingV2::Listener
AWS::AutoScaling::LaunchConfiguration
AWS::AutoScaling::AutoScalingGroup
AWS::IAM::InstanceProfile
AWS::IAM::Role
AWS::ECR::Repository
AWS::S3::Bucket
```

When you delete the stack, the AWS resources are deleted except for the following resources.

```
AWS::ECR::Repository
AWS::S3::Bucket
```

- **"Extend BusinessWorks Container Edition base Docker image" template:**

The following AWS resources are created when EXT Cloud Formation template is used to create a stack.

```
AWS::EC2::Instance
AWS::IAM::InstanceProfile
AWS::IAM::Role
AWS::ECR::Repository
AWS::S3::Bucket
```

When you delete the stack, the AWS resources are deleted except for the following resources.

```
AWS::IAM::Role
AWS::ECR::Repository
AWS::S3::Bucket
```

Application Development for Docker

The following section provides information about system module properties and environment variables as they apply to TIBCO BusinessWorks™ Container Edition.

Switching the Container Platform

Procedure

1. In TIBCO Business Studio™ for BusinessWorks™, click **Window > Preferences**.
2. In the Preferences dialog click **BusinessWorks Container Edition > Container Platform**.
3. Choose **Docker**.
4. Click **Apply** and then **OK**.

What to do next

TIBCO Business Studio for BusinessWorks has to be restarted for the changes to take effect.

TIBCO recommends that you clean your workspace after TIBCO Business Studio for BusinessWorks is restarted.

This option can be accessed from the TIBCO Business Studio for BusinessWorks menu **Project > Clean**.

Starting TIBCO Business Studio™ for BusinessWorks™ in the Docker Mode

To start TIBCO Business Studio for BusinessWorks in the Docker mode add the property `ContainerTarget` and set the value to `Docker` in the following file:

- `TIBCO_HOME\studio\<version>\eclipse\configuration\config.ini`

Here is a snippet of a sample `config.ini` file:

```
eclipse.application=org.eclipse.ui.ide.workbench
eclipse.p2.data.area=@config.dir/..p2
osgi.bundles.defaultStartLevel=4
ContainerTarget=Docker
```

The preference is now set to `Docker` for every new workspace.

Environment Variables

This section lists the environment variables that can be used for TIBCO BusinessWorks™ Container Edition application deployment on Docker and Docker based platforms.

Environment Variable	Default Values	Description
BW_LOGLEVEL	ERROR	Used to set a log level for the TIBCO BusinessWorks™ Container Edition application. The default value is ERROR. Supported values are: <ul style="list-style-type: none"> • INFO • DEBUG • WARN • ERROR
BW_ENGINE_THREADCOUNT	8	Used to set engine thread count for the TIBCO BusinessWorks™ Container Edition application.
BW_ENGINE_STEPCOUNT	-1	Used to set engine step count for the TIBCO BusinessWorks™ Container Edition application.
BW_APPLICATION_JOB_FLOWLIMIT	n/a	Used to set flow limit for TIBCO BusinessWorks™ Container Edition application.
APP_CONFIG_PROFILE	n/a	Name of the application profile that is to be used from a configuration management system such as ZUUL, Spring Cloud Config etc.
BW_PROFILE	n/a	Used to set the name of the BusinessWorks profile from the application.
BW_JAVA_OPTS	n/a	Used to set Java properties that are used at runtime. The properties are specified using name-value pairs and are separated by spaces. For example, BW_JAVA_OPTS="-Dname=value -Dname=value"
MASHERY_SERVICE_CONFIG	n/a	Applications can pass TIBCO Mashery configuration information using the MASHERY_SERVICE_CONFIG environment variable. The value of the environment variable is a JSON string with the required TIBCO Mashery configuration. See Integrating with TIBCO Mashery for more information.

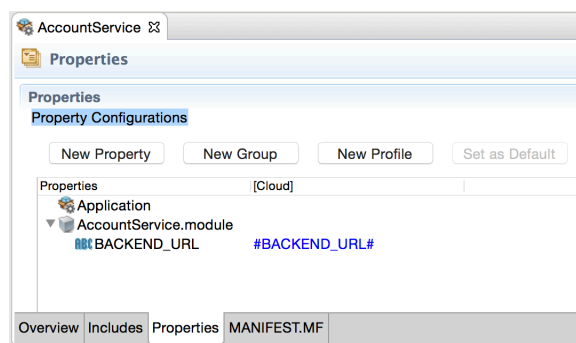

Environment Variable	Default Values	Description
CONSUL_SERVER_URL	n/a	Used to set Consul server configuration. For example, CONSUL_SERVER_URL=http://127.0.0.1:8085 This must be set if you intend to use Consul for application configuration or for service registration and discovery.
EUREKA_SERVER_URL		Used to set Eureka server configuration. For example, EUREKA_SERVER_URL=http://127.1.0.1:8080/eureka This must be set if you intend to use Eureka for service registration and discovery.
MEMORY_LIMIT	1024M	To optimize memory usage at runtime, set this environment variable to the configured memory. For example, MEMORY_LIMIT=512M when the Docker container is launched with 512M.
BW_JMX_CONFIG	n/a	Used to set JMX configuration (RMI host and JMX port) for monitoring TIBCO BusinessWorks™ Container Edition application. The value should be provided in RMI_HOST:JMX_PORT format. For example, BW_JMX_CONFIG=192.168.99.100:8050
BW_JAVA_GC_OPTS	-XX:+UseG1GC	Used to set JAVA GC configuration. The value should be one of the standard Java GC VM Options. For example: BW_JAVA_GC_OPTS=-XX:+UseParallelGC

Environment Variable	Default Values	Description
-e DISABLE_BWCE_EAR_VA LIDATION=true	None	Used to deploy the ActiveMatrix BusinessWorks 6.x application EAR file on TIBCO Cloud™ Integration - BusinessWorks™ without converting project to Container Edition and rebuilding EAR file from TIBCO Business Studio for BusinessWorks  Ensure that the ActiveMatrix BusinessWorks 6.x EAR file is exported. ActiveMatrix BusinessWorks 6.x EAR file should only have TIBCO Cloud™ Integration - BusinessWorks™ supported activities and features.

Using Configurations from Configuration Management Services

You can use configurations from the configuration management services such as Consul by defining a token such as `#<property name>#` in the application properties, where `<property name>` is the name of the configuration parameter.

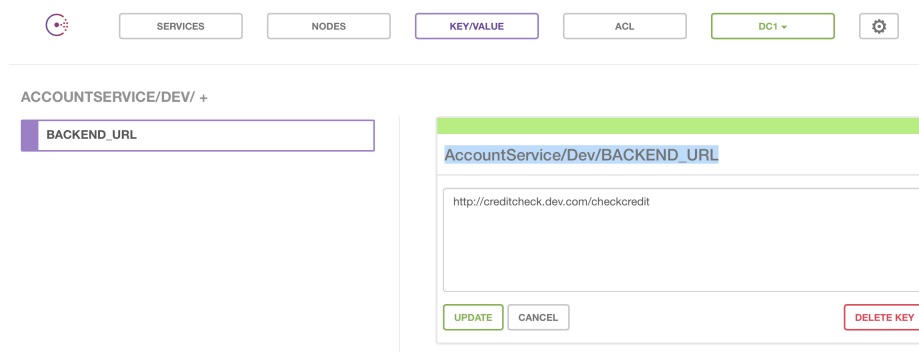

For example, `#BACKEND_URL#`.

Follow these steps to use configurations from Consul:

1. Set the environment variable `CONSUL_SERVER_URL`. See [Environment Variables](#)
2. In your Consul service define the keys using the format `<BWCE_APP_NAME>/<PROFILE NAME>/<KEY Name>`.

For example, `AccountService/Dev/BACKEND_URL`

`AccountService/Prod/BACKEND_URL`

The screenshot shows the 'KEY/VALUE' tab in the TIBCO BusinessWorks configuration console. At the top, there is a navigation bar with buttons for SERVICES, NODES, KEY/VALUE (selected), ACL, DC1 (with a dropdown arrow), and a settings gear icon. Below the navigation bar, the breadcrumb 'ACCOUNTSERVICE/PROD/ +' is displayed. On the left, a search bar contains the text 'BACKEND_URL'. The main area on the right shows a configuration entry with the key 'AccountService/Prod/BACKEND_URL' in a blue header bar. Below this, a text area contains the value 'http://creditcheck.prod.com/checkcredit'. At the bottom of the configuration panel, there are three buttons: 'UPDATE' (green), 'CANCEL' (grey), and 'DELETE KEY' (red).

For more information, see [Launching CloudFormation Template to create and extend TIBCO BusinessWorks™ Container Edition Base Docker Image](#).

Deploying an application on ECS

You can deploy an application on ECS and monitor the application logs by configuring the container with CloudWatch.

Prerequisites

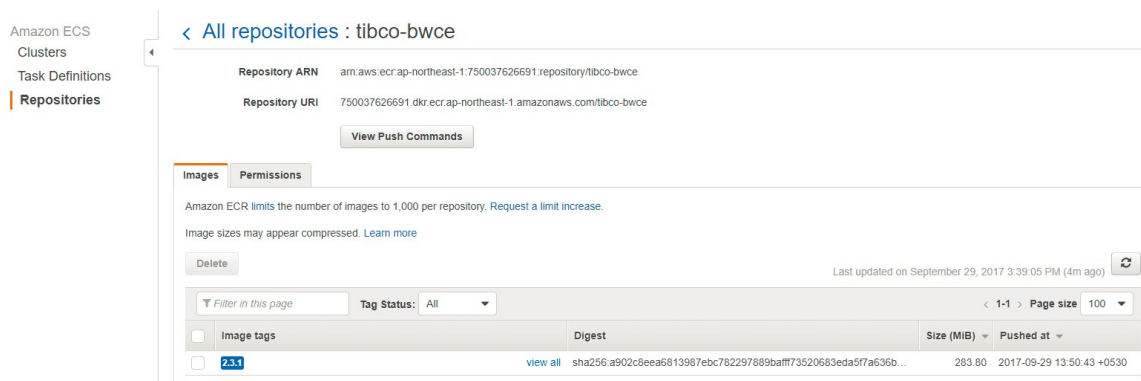

- Ensure that you have TIBCO BusinessWorks Container Edition application EAR and Docker files in the same directory.
- In the Docker file, ensure that the EAR file name and path is correct.
- In the Docker file, ensure that the base image points to the TIBCO BusinessWorks™ Container Edition runtime base image, which is created by the CloudFormation template.

Procedure

1. To view the runtime base image, go to **AWS Console > Services > EC2 Container Service > Repositories > tibco-bwce**.

The Repository URI is shown as

```
<AWS_account_id>.dkr.ecr.<region_name>.amazonaws.com/tibco-bwce
```

To install the AWS CLI and Docker and for more information, see [Amazon ECR Documentation](#).

2. Retrieve the docker login command that is used to authenticate your Docker client with your registry.

```
aws ecr get-login --no-include-email --region <region_name>
```

If you receive an Unknown options: --no-include-email error, install the latest version of the AWS CLI. For more details, see [Installing the AWS Command Line Interface](#).

3. Run the docker login command that was returned in the previous step.

If you are using Windows PowerShell, run the following command.

```
Invoke-Expression -Command (aws ecr get-login --no-include-email --region <region_name>)
```

4. To generate the application image, navigate to the folder where the EAR and Docker files are stored and run the following command. For information about building a Docker file, see [Docker Basics](#).

```
docker build -t <application_name> .
```

You can skip this step if your image is already built.

5. After the build is ready, tag the image to push it to the repository.

```
docker tag application_name:latest <AWS_account_id>.dkr.ecr.<region_name>.amazonaws.com/application_name:latest
```

6. To push the image to your newly created AWS repository, run the following command:

```
docker push <AWS_account_id>.dkr.ecr.<region_name>.amazonaws.com/application_name:latest
```

Ensure that you replace the `<region_name>` with your region such as `ap-northeast-1` and Repository URI with the URI.

7. Create the services and task definition in ECS. A task definition is required to run Docker containers on Amazon ECS. Create task definition for TIBCO Cloud™ Integration - BusinessWorks™ application. For more details, see [Amazon ECS Task Definitions](#).

The following is a sample taskdef.json file for reference.

```
{
  "family": "launch-test-app",
  "containerDefinitions": [
    {
      "image": "<AWS-account_id>.dkr.ecr.<region_name>.amazonaws.com/
<repo_name>:latest",
      "name": "bwce-test-app",
      "cpu": 10,
      "memory": 512,
      "essential": true,
      "portMappings": [
        {
          "containerPort": 8080,
          "hostPort": 8080
        }
      ],
      "environment": [
        {
          "name": "BW_LOGLEVEL",
          "value": "DEBUG"
        }
      ],
      "logConfiguration": {
        "logDriver": "awslogs",
        "options": {
          "awslogs-group": "bwce-app-log",
          "awslogs-region": "<region_name>",
          "awslogs-stream-prefix": "bwce"
        }
      }
    }
  ]
}
```

8. Register the task definition in the repository by running the following command.

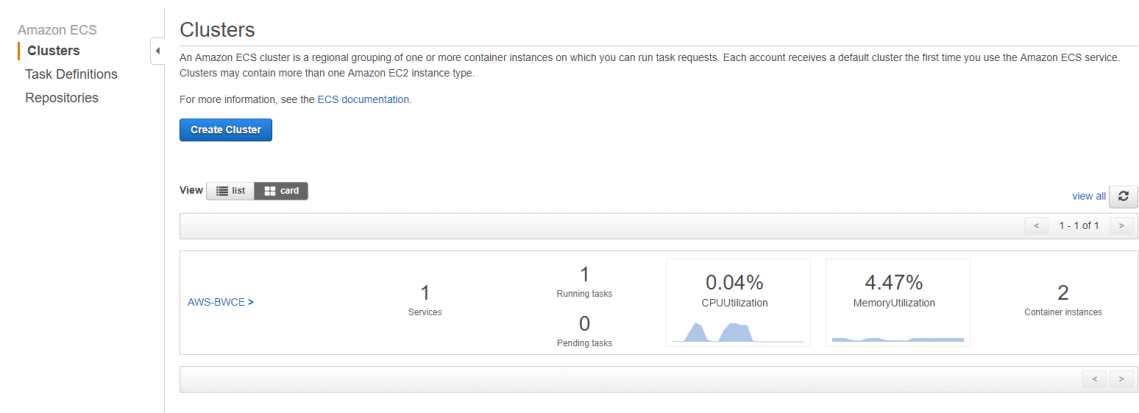

```
aws ecs register-task-definition --family <family_name_for_your_app> --cli-input-
json file://<taskdef_path>.json/> --region <aws_region>
```

9. To create a new service for your application, run the following command using the task definition. You can optionally configure your service to use load balancer to distribute traffic evenly across tasks in your service. For more details, see [Services](#) in Amazon ECS Documentation.

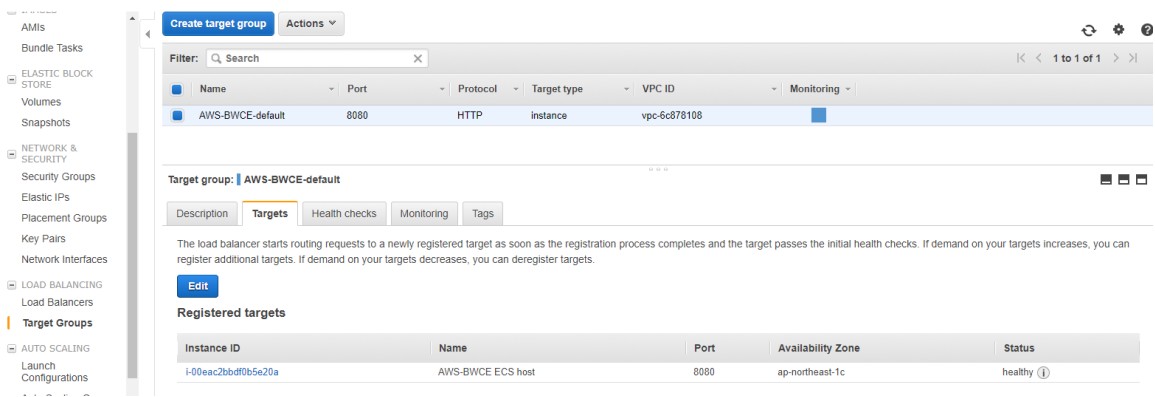

```
aws ecs create-service --service-name <Your_service_name> --desired-count 1 --task-
definition <your_family_name> --load-balancers
targetGroupArn=<your_target_group_arn>,containerName=<container_name>,containerPort=<
container_Port> --role <your_IAM_role_Arn> --cluster <your_cluster_name>
```

After the container is automatically configured with CloudWatch logs in taskdef, you can check your application logs in the service created in the ECS cluster.

You can also manually configure the CloudWatch. For more details, see [Amazon Cloud watch Logs](#).

After the service is successfully running and the target group status is healthy, you can hit the load balancer URL according to the listener and target group configured in load balancers.

Amazon Terminology

- **Amazon Machine Image (AMI)**
A supported and maintained Linux provided by Amazon Web Services for use on Amazon Elastic Compute Cloud (Amazon EC2). It is designed to provide a stable, secure, and high-performance execution environment for applications running on Amazon EC2. It also includes several packages that enable easy integration with AWS, including launch configuration tools and many popular AWS libraries and tools. Amazon Web Services also provides ongoing security and maintenance updates to all instances running the Amazon AMI.
- **Amazon Web Services (AWS)**
Cloud platform, used to provide and host a family of services, such as RDS, S3, EC2, DynamoDB.
- **AWS Console**
The user interface Amazon has built around the available services offered. Within the AWS Console, there are sub-consoles for individual services (EC2, S3, RDS, CloudFront, DynamoDB, etc.)
- **AWS Marketplace**
Storefront for commercial AMIs provided and managed by Amazon, which bills customer for usage and keeps a percentage of sales proceeds.
- **AWS Identity and Access Management (IAM)**
AWS Identity and Access Management (IAM) enables you to create multiple users and manage the permissions for each of these users within your AWS Account. A user is an identity within your AWS account with unique security credentials that can be used to access AWS Services. IAM eliminates the need to share passwords or access keys, and makes it easy to enable or disable a user's access as appropriate.
- **CloudFormation (CF)** AWS CloudFormation gives developers and systems administrators an easy way to create and manage a collection of related AWS resources, provisioning and updating them in an orderly and predictable fashion.
- **Marketplace AMI**
An AMI that is distributed through the AWS Marketplace.
- **Public AMI**
AMI configured as public by any Amazon user, and listed in everyone's AWS EC2 console AMI area.
- **RDS**
Amazon Relational Database Service, which makes it easy to run MySQL, Oracle, or SQL Server database servers in the cloud. Amazon manages, upgrades, and backs up the server.
- **Stack**
A collection of AWS resources you create and delete as a single unit.
- **CloudWatch**
Amazon CloudWatch is a monitoring service for AWS cloud resources and the applications you run on AWS. You can use Amazon CloudWatch to collect and track metrics, collect and monitor log files, set alarms, and automatically react to changes in your AWS resources. Amazon CloudWatch can monitor AWS resources such as Amazon EC2 instances, Amazon DynamoDB tables, and Amazon RDS DB

instances, as well as custom metrics generated by your applications and services, and any log files your applications generate. You can use Amazon CloudWatch to gain system-wide visibility into resource utilization, application performance, and operational health. You can use these insights to react and keep your application running smoothly.

- ECS

Amazon EC2 Container Service (Amazon ECS) is a highly scalable, fast, container management service that makes it easy to run, stop, and manage Docker containers on a cluster of Amazon Elastic Compute Cloud (Amazon EC2) instances. Amazon ECS lets you launch and stop container-based applications with simple API calls, allows you to get the state of your cluster from a centralized service, and gives you access to many familiar Amazon EC2 features.

TIBCO Documentation and Support Services

How to Access TIBCO Documentation

Documentation for TIBCO products is available on the TIBCO Product Documentation website, mainly in HTML and PDF formats.

The TIBCO Product Documentation website is updated frequently and is more current than any other documentation included with the product. To access the latest documentation, visit <https://docs.tibco.com>.

Product-Specific Documentation

The following documents for this product can be found on the TIBCO Documentation site:

- *TIBCO Cloud™ Integration - BusinessWorks™ Release Notes*
- *TIBCO Cloud™ Integration - BusinessWorks™ User's Guide*

How to Contact TIBCO Support

You can contact TIBCO Support in the following ways:

- For an overview of TIBCO Support, visit <http://www.tibco.com/services/support>.
- For accessing the Support Knowledge Base and getting personalized content about products you are interested in, visit the TIBCO Support portal at <https://support.tibco.com>.
- For creating a Support case, you must have a valid maintenance or support contract with TIBCO. You also need a user name and password to log in to <https://support.tibco.com>. If you do not have a user name, you can request one by clicking Register on the website.

How to Join TIBCO Community

TIBCO Community is the official channel for TIBCO customers, partners, and employee subject matter experts to share and access their collective experience. TIBCO Community offers access to Q&A forums, product wikis, and best practices. It also offers access to extensions, adapters, solution accelerators, and tools that extend and enable customers to gain full value from TIBCO products. In addition, users can submit and vote on feature requests from within the [TIBCO Ideas Portal](#). For a free registration, go to <https://community.tibco.com>.
