

# eigrp log-neighbor-warnings through functions Commands

## eigrp log-neighbor-changes

To enable the logging of EIGRP neighbor adjacency changes, use the **eigrp log-neighbor-changes** command in router configuration mode. To turn off this function, use the **no** form of this command.

eigrp log-neighbor-changes

no eigrp log-neighbor-changes

Syntax Description	This command	has no arguments	or keywords.
--------------------	--------------	------------------	--------------

**Defaults** This command is enabled by default.

**Command Modes** The following table shows the modes in which you can enter the command:

	Firewall N	lode	Security (	Context	
				Multiple	
Command Mode	Routed	Transparent	Single	Context	System
Router configuration	•	_	•		—

Command History	Release	Modification
	8.0(2)	This command was introduced.

**Usage Guidelines** The **eigrp log-neighbor-changes** command is enabled by default; only the **no** form of the command appears in the running configuration.

**Examples** The following example disables the logging of EIGRP neighbor changes: hostname(config)# router eigrp 100 hostname(config-router)# no eigrp log-neighbor-changes

Related Commands Co	ommand	Description
ei	igrp	Enables logging of neighbor warning messages.
lo	og-neighbor-warnings	
re	outer eigrp	Enters router configuration mode for the EIGRP routing process.
	how running-config outer	Displays the commands in the global router configuration.

# eigrp log-neighbor-warnings

To enable the logging of EIGRP neighbor warning messages, use the **eigrp log-neighbor-warnings** command in router configuration mode. To turn off this function, use the **no** form of this command.

eigrp log-neighbor-warnings [seconds]

no eigrp log-neighbor-warnings

Syntax Description	seconds	<i>seconds</i> (Optional) The time interval (in seconds) between repeated neighbor warning messages. Valid values are from 1 to 65535. Repeated warnings are not logged if they occur during this interval.							
Defaults	This command is enabl	ed by default. All nei	ghbor warning m	nessages are	e logged.				
Command Modes	The following table sho	ows the modes in which	ch you can enter	the comma	ind:				
		<b>Firewall</b>	Node	Security (	Context				
					Multiple				
	Command Mode	Routed	Transparent	Single	Context	System			
	Router configuration	•	—	•		—			
Command History		Release Modification							
	8.0(2)   This command was introduced.								
Usage Guidelines	The <b>eigrp log-neighbo</b> appears in the running		l is enabled by d	efault; only	the <b>no</b> form o	f the command			
Examples	The following example	disables the logging	of EIGRP neight	oor warning	g messages:				
	hostname(config)# router eigrp 100 hostname(config-router)# no eigrp log-neighbor-warnings								
	The following example 5-minute (300 seconds)		r warning messa	ges and rep	eats the warning	ng messages in			
	hostname(config)# <b>ro</b> hostname(config-rout		hbor-warnings	300					

### **Related Commands**

Command	Description
eigrp log-neighbor-messages	Enables the logging of changes in EIGRP neighbor adjacencies.
router eigrp	Enters router configuration mode for the EIGRP routing process.
show running-config router	Displays the commands in the global router configuration.

## eigrp router-id

To specify router ID used by the EIGRP routing process, use the **eigrp router-id** command in router configuration mode. To restore the default value, use the **no** form of this command.

eigrp router-id *ip-addr* 

**no eigrp router-id** [*ip-addr*]

Syntax Description	<i>ip-addr</i> Router ID in IP address (dotted-decimal) format. You cannot use 0.0.0.0 or 255.255.255.255.255 as the router ID.							
Defaults	If not specified, the highe	est-level IP address	on the adaptive s	security app	liance is used	as the router ID.		
Command Modes	The following table show	rs the modes in whic	h you can enter	the comma	nd:			
		Firewall N	lode	Security Context				
					Multiple			
	Command Mode	Routed	Transparent	Single	Context	System		
	Router configuration	•	—	•				
Command History	Release Modification							
	8.0(2) This command was introduced.							
Usage Guidelines	If the <b>eigrp router-id</b> command is not configured, EIGRP automatically selects the highest IP address on the adaptive security appliance to use as the router ID when an EIGRP process is started. The router ID is not changed unless the EIGRP process is removed using the <b>no router eigrp</b> command or unless the router ID is manually configured with the <b>eigrp router-id</b> command.							
The router ID is used to identify the originating router for external routes. If an external with the local router ID, the route is discarded. To prevent this, use the <b>eigrp router-ic</b> specify a global address for the router ID.								
	A unique value should be	configured for each	EIGRP router.					
Examples	The following example co	onfigures 172.16.1.3	3 as a fixed route	er ID for the	e EIGRP routin	ng process:		
	hostname(config)# <b>rout</b> hostname(config-router		đ 172.16.1.3					

## **Related Commands**

Command	Description
router eigrp	Enters router configuration mode for the EIGRP routing process.
show running-config router	Displays the commands in the global router configuration.

## eigrp stub

To configure the EIGRP routing process as a stub routing process, use the **eigrp stub** command in router configuration mode. To remove EIGRP stub routing, use the **no** form of this command.

eigrp stub [receive-only] | {[connected] [redistributed] [static] [summary]}

no eigrp stub [receive-only] | {[connected] [redistributed] [static] [summary]}

	<b>connected</b> (Optional) Advertises connected routes.								
	receive-only	(Optional) Sets th	e adaptive securit	y appliance	e as a received-	only neighbor.			
	redistributed	(Optional) Adver	tises routes redist	ributed from	n other routing	g protocols.			
	static	(Optional) Adver	tises static routes.						
	summary	summary         (Optional) Advertises summary routes.							
Defaults	Stub routing is not ena	abled.							
Command Modes	The following table sh	nows the modes in wh	ich you can enter	the comma	ind:				
		Firewall	Mode	Security (	Context				
					Multiple				
	Command Mode	Routed	Transparent	Single	Context	System			
	Router configuration	•		•		—			
Commond Wintows	Delegas	Modification							
Command History	Release								
	8.0(2)	This command w	as introduced.						
Usage Guidelines	Use the <b>eigrp stub</b> co security appliance dire		he adaptive secur		ce as a stub wh	ere the adaptive			
Usage Guidelines	Use the <b>eigrp stub</b> co	ects all IP traffic to a o y keyword restricts th in the autonomous sys	he adaptive securi distribution router e adaptive securit stem; the adaptive	y appliance security ap	e from sharing opliance only r	any of its routes eccives updates			
Usage Guidelines	Use the <b>eigrp stub</b> co security appliance dire Using the <b>receive-onl</b> with any other router	ects all IP traffic to a d y keyword restricts th in the autonomous sys abor. You cannot use a r more of the <b>connecto</b>	he adaptive securi distribution router e adaptive securit stem; the adaptive any other keyword ed, static, summa	y appliance security ap l with the <b>r</b>	e from sharing opliance only r <b>eceive-only</b> ke l <b>istributed</b> key	any of its routes eccives updates yword. words. If any o			

The **static** keyword permits the EIGRP stub routing process to send static routes. Without the configuration of this option, EIGRP will not send any static routes. If the static routes are not covered by a **network** statement, it may be necessary to redistribute them with the **redistribute** command under the EIGRP process. The **summary** keyword permits the EIGRP stub routing process to send summary routes. You can create

summary routes manually with the summary-address eigrp command or automatically with the auto-summary command enabled (auto-summary is enabled by default).

The **redistributed** keyword permits the EIGRP stub routing process to send routes redistributed into the EIGRP routing process from other routing protocols. If you do you configure this option, EIGRP does not advertise redistributed routes.

```
Examples
```

The following example uses the **eigrp stub** command to configure the adaptive security appliance as an EIGRP stub that advertises connected and summary routes:

```
hostname(config)# router eigrp 100
hostname(config-router)# network 10.0.0.0
hostname(config-router)# eigrp stub connected summary
```

The following example uses the **eigrp stub** command to configure the adaptive security appliance as an EIGRP stub that advertises connected and static routes. Sending summary routes is not permitted.

```
hostname(config)# router eigrp 100
hostname(config-router)# network 10.0.0.0
hostname(config-router)# eigrp stub connected static
```

The following example uses the **eigrp stub** command to configure the adaptive security appliance as an EIGRP stub that only receives EIGRP updates. Connected, summary, and static route information is not sent.

```
hostname(config)# router eigrp 100
hostname(config-router)# network 10.0.0.0 eigrp
hostname(config-router)# eigrp stub receive-only
```

The following example uses the **eigrp stub** command to configure the adaptive security appliance as an EIGRP stub that advertises routes redistributed into EIGRP from other routing protocols:

```
hostname(config)# router eigrp 100
hostname(config-router)# network 10.0.0.0
hostname(config-router)# eigrp stub redistributed
```

The following example uses the **eigrp stub** command without any of the optional arguments. When used without arugments, the **eigrp stub** commands advertises connected and static routes by default.

```
hostname(config)# router eigrp 100
hostname(config-router)# network 10.0.0.0
hostname(config-router)# eigrp stub
```

<b>Related Commands</b>	Command	Description		
	router eigrp	Clears the EIGRP router configuration mode commands from the running configuration.		
	show running-config router eigrp	Displays the EIGRP router configuration mode commands in the running configuration.		

# eject

To support the removal of an ASA 5500 series external compact Flash device, use the **eject** command in user EXEC mode.

eject [/noconfirm] disk1:

Syntax Description	<i>disk1:</i> Specifies the device to eject.									
	/noconfirm									
Defaults	No default be	No default behaviors or values.								
ommand Modes	The following	g table shows the	modes in whic	h you can enter	the comma	and:				
			Firewall N	lode	Security (	Context

	<pre>Wer5520 up 5 hours 36 mins Hardware: ASA5520, 512 MB RAM, CPU Pentium 4 Celeron 2000 MHz Internal ATA Compact Flash, 256MB Slot 1: Compact Flash has been ejected! It may be removed and a new device installed. BIOS Flash M50FW016 @ 0xffe00000, 2048KB <more></more></pre>									

Related Commands	Command	Description
	show version	Displays information about the operating system software.

# email

To include the indicated email address in the Subject Alternative Name extension of the certificate during enrollment, use the **email** command in crypto ca-trustpoint configuration mode. To restore the default setting, use the **no** form of this command.

email address

no email

Syntax Description	address	Specifies the email address. The maximum length of <i>address</i> is 64 characters.							
Defaults	The default setting is n	ot set.							
Command Modes	The following table she	ows the modes in whic	h you can enter	the comma	ınd:				
		Firewall N	Firewall Mode		Security Context				
					Multiple				
	Command Mode	Routed	Transparent	Single	Context	System			
	Crypto ca-trustpoint configuration	•	•	•					
Command History	Release Modification								
	7.0This command was introduced.								
Examples	The following example includes the email add								
	hostname(config)# <b>cr</b> hostname(ca-trustpoi hostname(ca-trustpoi	nt)# <b>email user1@us</b>							
Related Commands	Command	Description							
	crypto ca-trustpoint	Enters trustpoint c	onfiguration mo	de.					

## enable

To enter privileged EXEC mode, use the **enable** command in user EXEC mode.

enable [level]

Syntax Description*level*(Optional) The privilege level between 0 and 15. Not used with enable<br/>authentication (the aaa authentication enable console command).

**Defaults** Enters privilege level 15 unless you are using enable authentication (using the **aaa authentication enable console** command), in which case the default level depends on the level configured for your username.

**Command Modes** The following table shows the modes in which you can enter the command:

	Firewall N	Firewall Mode		Security Context		
				Multiple		
Command Mode	Routed	Transparent	Single	Context	System	
User EXEC	•	•	•	•	•	

 Release
 Modification

 Preexisting
 This command was preexisting.

**Usage Guidelines** The default enable password is blank. See the **enable password** command to set the password.

Without enable authentication, when you enter the **enable** command, your username changes to enable\_*level*, where the default level is 15. With enable authentication (using the **aaa authentication enable console** command), the username and associated level are preserved. Preserving the username is important for command authorization (the **aaa authorization command** command, using either local or TACACS+).

Levels 2 and above enter privileged EXEC mode. Levels 0 and 1 enter user EXEC mode. To use levels in between, enable local command authorization (the **aaa authorization command LOCAL** command) and set the commands to different privilege levels using the **privilege** command. TACACS+ command authorization does not use the privilege levels configured on the adaptive security appliance.

See the **show curpriv** command to view your current privilege level.

Enter the **disable** command to exit privileged EXEC mode.

Examples

The following example enters privileged EXEC mode:

hostname> **enable** Password: **Pa\$\$w0rd** hostname# The following example enters privileged EXEC mode for level 10:

hostname> **enable 10** Password: **Pa\$\$w0rd10** hostname#

### **Related Commands**

Command	Description
enable password	Sets the enable password.
disable	Exits privileged EXEC mode.
aaa authorization command	Configures command authorization.
privilege	Sets the command privilege levels for local command authorization.
show curpriv	Shows the currently logged in username and the user privilege level.

## enable gprs

To enable GPRS with RADIUS accounting, use the **enable gprs** command in radius-accounting parameter configuration mode, which is accessed by using the **inspect radius-accounting** command. The security appliance checks for the 3GPP VSA 26-10415 in the Accounting-Request Stop messages to properly handle secondary PDP contexts. To disable this command, use the **no** form of this command.

enable gprs

no enable gprs

**Syntax Description** This command has no arguments or keywords.

**Defaults** No default behavior or values.

### **Command Modes** The following table shows the modes in which you can enter the command:

	Firewall <b>N</b>	lode	Security Context			
				Multiple	Multiple	
Command Mode	Routed	Transparent	Single	Context	System	
radius-accounting parameter configuration	•	•	•	•	—	

Command History	Release	Modification
7.2(1)		This command was introduced.

### **Usage Guidelines** This option is disabled by default. A GTP license is required to enable this feature.

**Examples** The following example shows how to enable GPRS with RADIUS accounting:

hostname(config)# policy-map type inspect radius-accounting ra hostname(config-pmap)# parameters hostname(config-pmap-p)# enable gprs

<b>Related Commands</b>	Commands	Description
	inspect radius-accounting	Sets inspection for RADIUS accounting.
	parameters	Sets parameters for an inspection policy map.

## enable password

To set the enable password for privileged EXEC mode, use the **enable password** command in global configuration mode. To remove the password for a level other than 15, use the **no** form of this command. You cannot remove the level 15 password.

enable password password [level level] [encrypted]

no enable password level level

	encrypted	saved in the configu password after you to another adaptive	ration in encryp enter it. If for so	ted form, so				
1		<ul> <li>(Optional) Specifies that the password is in encrypted form. The password is saved in the configuration in encrypted form, so you cannot view the original password after you enter it. If for some reason you need to copy the password to another adaptive security appliance but do not know the original password, you can enter the <b>enable password</b> command with the encrypted password and this keyword. Normally, you only see this keyword when you enter the <b>show running-config enable</b> command.</li> <li>(Optional) Sets a password for a privilege level between 0 and 15.</li> </ul>						
_	evel level			-				
ŀ	password	Sets the password as a case-sensitive string of 3 to 32 alphanumeric and special characters. You can use any character in the password except a question mark or a space.						
<b>Defaults</b> T	The default password is	s blank. The default le	vel is 15.					
Command Modes T	The following table sho		-	T				
		Firewall N	lode	Security Context				
					Multiple			
	Command Mode	Routed	Transparent	Single	Context	System		
	<b>Command Mode</b> Global configuration	Routed •	Transparent •	•	•	System •		
			-	•		-		

To use privilege levels other than the default of 15, configure local command authorization (see the **aaa authorization command** command and specify the **LOCAL** keyword), and set the commands to different privilege levels using the **privilege** command. If you do not configure local command authorization, the enable levels are ignored, and you have access to level 15 regardless of the level you set. See the **show curpriv** command to view your current privilege level.

Levels 2 and above enter privileged EXEC mode. Levels 0 and 1 enter user EXEC mode.

### Examples

The following example sets the enable password to Pa\$\$w0rd:

hostname(config)# enable password Pa\$\$w0rd

The following example sets the enable password to Pa\$\$w0rd10 for level 10:

hostname(config)# enable password Pa\$\$w0rd10 level 10

The following example sets the enable password to an encrypted password that you copied from another adaptive security appliance:

hostname(config)# enable password jMorNbK0514fadBh encrypted

Related Commands	Command	Description
	aaa authorization command	Configures command authorization.
	enable	Enters privileged EXEC mode.
	privilege	Sets the command privilege levels for local command authorization.
	show curpriv	Shows the currently logged in username and the user privilege level.
	show running-config enable	Shows the enable passwords in encrypted form.

# endpoint

To add an endpoint to an HSI group for H.323 protocol inspection, use the **endpoint** command in hsi group configuration mode. To disable this feature, use the **no** form of this command.

endpoint ip\_address if\_name

**no endpoint** *ip\_address if\_name* 

Syntax Description	if_name	The interface through which the endpoint is connected to the security appliance.						
	<i>ip_address</i> IP address of the endpoint to add. A maximum of ten endpoints per HSI group is allowed.							
Defaults	No default behavior o	or values.						
Command Modes	The following table s	shows the m	odes in whic	ch you can enter	the comma	and:		
			Firewall N	Node	Security (	Context		
					,	Multiple		
	Command Mode		Routed	Transparent	Single	Context	System

	policy-map	Creates a	a Layer 3/4 j	policy map.				
	show running-config Display all current policy map configurations. policy-map							

## endpoint-mapper

To configure endpoint mapper options for DCERPC inspection, use the **endpoint-mapper** command in parameters configuration mode. To disable this feature, use the **no** form of this command.

endpoint-mapper [epm-service-only] [lookup-operation [timeout value]]

no endpoint-mapper [epm-service-only] [lookup-operation [timeout value]]

Syntax Description	epm-service-only	Specifies to enforce endoint mapper service during binding.							
	lookup-operation	Specifies to enable lookup operation of the endpoint mapper service.							
	timeout valueSpecifies the timeout for pinholes from the lookup operation. Range is from 0:0:1 to 1193:0:0.								
Defaults	No default behavior or	values.							
Command Modes	The following table sho	ows the m	odes in whic	h you can enter	the comma	nd:			
			Firewall Mode		Security (	Context			
						Multiple			
	Command Mode		Routed	Transparent	Single	Context	System		
	Parameters configurati	•	•	•	•	•	—

	class	Identifie	s a class maj	name in the po	licy map.				
	class-map type Creates an inspection class map to match traffic specific to an application.								
	inspect		an inspection	class map to m		specific to un	application.		
	inspect policy-map	Creates a	a Layer 3/4 p	-		specific to un	application.		

## enforcenextupdate

To specify how to handle the NextUpdate CRL field, use the enforcenextupdate command in ca-crl configuration mode. To permit a lapsed or missing NextUpdate field, use the no form of this command.

### enforcenextupdate

	no enforcenextupd	late								
Syntax Description	This command has no a	arguments or keyword	s.							
Defaults	The default setting is er	nforced (on).								
Command Modes	The following table sho	The following table shows the modes in which you can enter the command:								
		Firewall N	lode	Security C	Context					
					Multiple					
	Command Mode	Routed	Transparent	Single	Context	System				
	Ca-crl configuration	•	•	•	•	•				
Command History	Release     Modification       7.0     This command was introduced.									
Usage Guidelines	If set, this command rec adaptive security applia					If not used, th				
Examples	that has not expired for hostname(config)# cry hostname(ca-trustpoir	The following example enters ca-crl configuration mode, and requires CRLs to have a NextUpdate fiel that has not expired for trustpoint central: hostname(config)# crypto ca trustpoint central hostname(ca-trustpoint)# crl configure hostname(ca-crl)# enforcenextupdate								
Related Commands	Command	Description								
	cache-time	Specifies a cache refresh time in minutes.								
		-		iniutes.						
	crl configure crypto ca trustpoint	Enters ca-crl config Enters trustpoint co	guration mode.							

# enrollment-retrieval

To specify the time in hours that an enrolled user can retrieve a PKCS12 enrollment file, use the **enrollment-retrieval** command in local ca server configuration mode. To reset the time to the default number of hours (24), use the **no** form of this command.

enrollment-retrieval timeout

no enrollment-retrieval

Syntax Description	timeout	Specifies the number of hours users have to retrieve an issued certificate from the local CA enrollment web page. Valid timeout values range from c to 720 hours.							
Defaults	By default, the PKCS12	enrollme	nt file is sto	red and retrieval	ble for 24 h	nours.			
Command Modes	The following table show	ws the mo	odes in whic	h you can enter	the comma	nd:			
			Firewall M	lode	Security C	Context			
				_		Multiple			
	Command Mode		Routed	Transparent	Single	Context	System		
	Ca server configuration		•	—	•	—			
Command History	Release Modification								
·····	8.0(2)			introduced.					
Usage Guidelines	A PKCS12 enrollment file contains an issued certificate and key pair. The file is stored on the local server and is available for retrieval from the enrollment web page for the time period specified with enrollment-retrieval command. When a user is marked as allowed to enroll, that user has otp expiration amount of time to enroll v that password. Once the user enrolls successfully, a PKCS12 file is generated, stored, and a copy is returned by way of the enrollment web page. The user can return for another copy of the file for any reason (such as when a download fails while trying enrollment) for the enrollment-retrieval comm time period.								
Note	This time is independent	from the	OTP expira	ation period.					
Examples	The following example s CA server for 48 hours a hostname(config)# <b>crys</b>	fter the c	ertificate is		ile is availa	ble for retrieva	ll from the local		
	section (contrag) " orga								

hostname(config-ca-server)# enrollment-retrieval 48
hostname(config-ca-server)#

The following example resets the retrieval time back to the default of 24 hours:

```
hostname(config)# crypto ca server
hostname(config-ca-server)# no enrollment-retrieval
hostname(config-ca-server)#
```

Related	Commands
---------	----------

Command	Description
crypto ca server	Provides access to CA Server Configuration mode CLI command set, which allows you to configure and manage the local CA.
OTP expiration	Specifies the duration in hours that an issued one-time password for the CA enrollment page is valid.
smtp from-address	Specifies the e-mail address to use in the E-mail From: field for all e-mails generated by the CA server.
smtp subject	Specifies the text appearing in the subject field of all e-mails generated by the local CA server.
subject-name-default	Specifies a generic subject-name DN to be used along with the username in all user certificates issued by a CA server.

## enrollment retry count

To specify a retry count, use the **enrollment retry count** command in crypto ca-trustpoint configuration mode. After requesting a certificate, the adaptive security appliance waits to receive a certificate from the CA. If the adaptive security appliance does not receive a certificate within the configured retry period, it sends another certificate request. The adaptive security appliance repeats the request until either it receives a response or reaches the end of the configured retry period. To restore the default setting of the retry count, use the **no** form of the command.

#### enrollment retry count number

no enrollment retry count

Syntax Description number The maximum number of attempts to send an enrollment request. The valid range is 0, 1-100 retries. Defaults The default setting for number is 0 (unlimited). **Command Modes** The following table shows the modes in which you can enter the command: **Firewall Mode** Security Context Multiple **Command Mode** Routed Single Context Transparent System Crypto ca-trustpoint • • • • configuration **Command History** Modification Release 7.0 This command was introduced. **Usage Guidelines** This command is optional and applies only when automatic enrollment is configured. **Examples** The following example enters crypto ca trustpoint configuration mode for trustpoint central, and configures an enrollment retry count of 20 retries within trustpoint central: hostname(config)# crypto ca trustpoint central hostname(ca-trustpoint)# enrollment retry count 20 hostname(ca-trustpoint)# **Related Commands** Command Description crypto ca trustpoint Enters trustpoint configuration mode.

Command	Description
default enrollment	Returns enrollment parameters to their defaults.
enrollment retry period	Specifies the number of minutes to wait before resending an enrollment request.

## enrollment retry period

To specify a retry period, use the **enrollment retry period** command in crypto ca trustpoint configuration mode. After requesting a certificate, the adaptive security appliance waits to receive a certificate from the CA. If the adaptive security appliance does not receive a certificate within the specified retry period, it sends another certificate request. To restore the default setting of the retry period, use the **no** form of the command.

enrollment retry period minutes

#### no enrollment retry period

Syntax Description	Description         minutes         The number of minutes between attempts to send an enr           The valid range is 1- 60 minutes.         The valid range is 1- 60 minutes.						
Defaults	The default setting is 1 n	ninute.

	enrollment retry count Defines the number of retries to requesting an enrollment						

# enrollment terminal

To specify cut and paste enrollment with this trustpoint (also known as manual enrollment), use the **enrollment terminal** command in crypto ca-trustpoint configuration mode. To restore the default setting of the command, use the **no** form of the command.

### enrollment terminal

### no enrollment terminal

**Syntax Description** This command has no arguments or keywords.

**Defaults** The default setting is off.

**Command Modes** The following table shows the modes in which you can enter the command:

		Firewall N	Firewall Mode		Security Context		
					Multiple		
	Command Mode	Routed	Transparent	Single	Context	System	
	Crypto ca-trustpoint configuration	•	•	•	•		
Command History	Release	Modification					
	7.0	This command wa	s introduced.				

Examples

The following example enters crypto ca-trustpoint configuration mode for trustpoint central, and specifies the cut and paste method of CA enrollment for trustpoint central:

hostname(config)# crypto ca trustpoint central hostname(ca-trustpoint)# enrollment terminal hostname(ca-trustpoint)#

<b>Related Commands</b>	Command	Description
	crypto ca trustpoint	Enters trustpoint configuration mode.
	default enrollment	Returns enrollment parameters to their defaults.
	enrollment retry count	Specifies the number of retries to attempt to send an enrollment request.
	enrollment retry period	Specifies the number of minutes to wait before resending an enrollment request.
	enrollment url	Specifies automatic enrollment (SCEP) with this trustpoint and configures the URL.

## enrollment url

To specify automatic enrollment (SCEP) to enroll with this trustpoint and to configure the enrollment URL, use the **enrollment url** command in crypto ca-trustpoint configuration mode. To restore the default setting of the command, use the **no** form of the command.

enrollment url url

no enrollment url

Syntax Description	<i>url</i> Specifies the name of the URL for automatic enrollment. The maximum length is 1K characters (effectively unbounded).						
Defaults	The default setting is off.						
Command Modes	The following table show		•	the comma	and:		
		Firewall N	<b>Node</b>	Security (

	enrollment retry period	Specifies the numbrequest.	per of minutes to	wait befor	e resending an	enrollment	
	enrollment terminal	<b>enrollment terminal</b> Specifies cut and paste enrollment with this trustpoint.					

# enrollment-retrieval

To specify the time in hours that an enrolled user can retrieve a PKCS12 enrollment file, use the **enrollment-retrieval** command in local ca server configuration mode. To reset the time to the default number of hours (24), use the **no** form of this command.

enrollment-retrieval timeout

no enrollment-retrieval

Syntax Description	fi	pecifies the numb com the local CA e o 720 hours.				
Defaults	By default, the PKCS12 en	collment file is sto	ored and retrieva	ble for 24 l	iours.	
Command Modes	The following table shows	he modes in whic	h you can enter	the comma	ınd:	
		Firewall N	lode	Security (	Context	
					Multiple	
	Command Mode	Routed	Transparent	Single	Context	System
	Ca server configuration	•	—	•		
Command History	Release	Iodification				
Command mistory		This command was	sintroduced			
Usage Guidelines	A PKCS12 enrollment file of server and is available for re <b>enrollment-retrieval</b> comm When a user is marked as a that password. Once the user returned by way of the enror reason (such as when a dow time period.	etrieval from the e hand. llowed to enroll, t er enrolls successf llment web page. nload fails while	nrollment web p hat user has <b>otp</b> fully, a PKCS12 The user can ret trying enrollmen	expiration file is gene	time period sp amount of time rated, stored, a other copy of th	becified with the ne to enroll with and a copy is ne file for any
Note	This time is independent fro	om the OTP expir	ation period.			
Examples	The following example spectra CA server for 48 hours after			ile is availa	ble for retrieva	al from the local
	hostname(config)# crypto	ca server				

Cisco ASA 5580 Adaptive Security Appliance Command Reference

hostname(config-ca-server)# enrollment-retrieval 48
hostname(config-ca-server)#

The following example resets the retrieval time back to the default of 24 hours:

```
hostname(config)# crypto ca server
hostname(config-ca-server)# no enrollment-retrieval
hostname(config-ca-server)#
```

#### Related Commands

Command	Description
crypto ca server	Provides access to CA Server Configuration mode CLI command set, which allows you to configure and manage the local CA.
OTP expiration	Specifies the duration in hours that an issued one-time password for the CA enrollment page is valid.
smtp from-address	Specifies the e-mail address to use in the E-mail From: field for all e-mails generated by the CA server.
smtp subject	Specifies the text appearing in the subject field of all e-mails generated by the local CA server.
subject-name-default	Specifies a generic subject-name DN to be used along with the username in all user certificates issued by a CA server.

## eool

To define an action when the End of Options List (EOOL) option occurs in a packet with IP Options inspection, use the **eool** command in parameters configuration mode. To disable this feature, use the **no** form of this command.

eool action {allow | clear}

no eool action {allow | clear}

Syntax Description	allow Instructs the adaptive security appliance to allow a packet containing the End of Options List IP option to pass.							
	clear							
Defaults	By default, IP Options i	nspection, drops pac	kets containing t	he End of (	Options List IP	option.		
Command Modes	The following table sho	ws the modes in whi	ch you can enter	the comma	and:			
		Firewall <b>N</b>	Node	Security	Context			
					Multiple			
	Command Mode	Routed	Transparent	Single	Context	System		
	Parameters configuration	on •	•	•	•			
Command History	Release Mod	Release Modification						
	8.2(2)This command was introduced.							
Usage Guidelines	This command can be c	onfigured in an IP O	ptions inspection	policy ma	р.			
Usage duidennes	You can configure IP Options inspection to control which IP packets with specific IP options are allowed through the adaptive security appliance. Configuring this inspection instructs the adaptive security appliance to allow a packet to pass or to clear the specified IP options and then allow the packet to pass.							
	The End of Options List to mark the end of a list header length.	-	• •	•		-		
Examples	The following example	shows how to set up	an action for IP	Options ins	spection in a po	olicy map:		
	hostname(config)# <b>pol</b> hostname(config-pmap) hostname(config-pmap- hostname(config-pmap- hostname(config-pmap-	<pre># parameters p)# eool action al p)# nop action all</pre>	.low .ow	ip-options	:_map			

Command	Description		
class	Identifies a class map name in the policy map.		
class-map type inspect	Creates an inspection class map to match traffic specific to an application.		
policy-map	Creates a Layer 3/4 policy map.		
show running-config policy-map	Display all current policy map configurations.		

## eou allow

To enable clientless authentication in a NAC Framework configuration, use the **eou allow** command in global configuration mode. To remove the command from the configuration, use the **no** form of this command.

eou allow {audit | clientless | none}

no eou allow {audit | clientless | none}

audit An audit server performs clientless authentication.						
clientless	A Cisco ACS performs clientless authentication.					
none	Disables clientless authentication.					
The default configuration	on contains the <b>eou al</b>	low clientless co	onfiguratio	n.

hostname(config)# no eou allow clientless
hostname(config)#

## Relatedommands

Command	Description
debug eou	Enables logging of EAP over UDP events to debug NAC Framework messaging.
eou clientless	Changes the username and password to be sent to the ACS for clientless authentication in a NAC Framework configuration.
show vpn-session.db	Displays information about VPN sessions, including NAC results.

## eou clientless

To change the username and password to be sent to the Access Control Server for clientless authentication in a NAC Framework configuration, use the **eou clientless** command in global configuration mode. To use the default value, use the **no** form of this command.

eou clientless username username password password

**no eou clientless username** *username* **password** *password* 

Syntax Description	<b>password</b> Enter to change the password sent to the Access Control Server to obtain clientless authentication for a remote host that does not respond to EAPoUDP requests.						
	<i>password</i> Enter the password configured on the Access Control Server to support clientless hosts. Enter 4 – 32 ASCII characters.						
	usernameEnter to change the username sent to the Access Control Server to obtain clientless authentication for a remote host that does not respond to EAPoUDP requests.usernameEnter the username configured on the Access Control Server to support clientless hosts. Enter 1 to 64 ASCII characters, excluding leading and trailing spaces, pound signs (#), question marks (?), quotation marks ("), asterisks (*), and angle brackets (< and >).						
Defaults	The default	value for both the use	ername and J	bassword attribu	tes is client	less.	
Command Modes	The followi	ng table shows the mo		-	1

## eou initialize

To clear the resources assigned to one or more NAC Framework sessions and initiate a new, unconditional posture validation for each of the sessions, use the **eou initialize** command in privileged EXEC mode.

eou initialize {all | group tunnel-group | ip ip-address}

Syntax Description	all	Revalidates all NAC Framework sessions on this adaptive security appliance
	group	Revalidates all NAC Framework sessions assigned to a tunnel group.
	ip	Revalidates a single NAC Framework session.
	ip-address	IP address of the remote peer end of the tunnel.
	tunnel-group	Name of the tunnel group used to negotiate parameters to set up the tunnel.

### Defaults

No default behavior or values.

## eou port

To change the port number for EAP over UDP communication with the Cisco Trust Agent in a NAC Framework configuration, use the **eou port** command in global configuration mode. To use the default value, use the **no** form of this command.

eou port port\_number

no eou port

Syntax Description	port_numberPort number on the client endpoint to be designated for EAP over UDP communications. This number is the port number configured on the Cisco Trust Agent. Enter a value in the range 1024 to 65535.					
Defaults	The default value is 218	.62.				
Command Modes	The following table sho	ws the modes in whic	h you can enter	the comma	ınd:

## Relatedommands

Command	Description
eou initialize	Clears the resources assigned to one or more NAC Framework sessions and initiates a new, unconditional posture validation for each of the sessions.
eou timeout	Changes the number of seconds to wait after sending an EAP over UDP message to the remote host in a NAC Framework configuration.
reval-period	Specifies the interval between each successful posture validation in a NAC Framework session.
sq-period	Specifies the interval between each successful posture validation in a NAC Framework session and the next query for changes in the host posture.
debug eou	Enables logging of EAP over UDP events to debug NAC Framework messaging.

## eou timeout

To change the number of seconds to wait after sending an EAP over UDP message to the remote host in a NAC Framework configuration, use the **eou timeout** command in global configuration mode. To use the default value, use the **no** form of this command.

eou timeout {hold-period | retransmit} seconds

no eou timeout {hold-period | retransmit}

Syntax Description	-	Maximum time to wait after sending EAPoUDP messages equal to the number of EAPoUDP retries. The <b>eou initialize</b> or <b>eou revalidate</b> command also clears this timer. If this timer expires, the adaptive security appliance initiates a new EAP over UDP association with the remote host.						
	retransmitMaximum time to wait after sending an EAPoUDP message. A response from the remote host clears this timer. The eou initialize or eou revalidate command also clears this timer. If the timer expires, the adaptive security appliance retransmits the EAPoUDP message to the remote host.							
		<i>Seconds</i> Number of seconds for the adaptive security appliance to wait. Enter a value in the range 60 to 86400 for the hold-period attribute, or the range 1 to 60 for the retransmit attribute.						
Defaults	The default value of the he	old-period attribute	is 180.					
	The default value of the re	etransmit attribute i	s 3.					
Command Modes	The following table shows		•	1

	Command Mode	Routed	Transparent	Single	Context	System		
	Global configuration	•		•				
Command History	Release	Modification						
	7.2(1)	This command was	s introduced.					
Usage Guidelines	This command applies onl	y to the Frameworl	k implementation	n of Cisco	NAC.			
Examples	The following example chaseconds:	anges the wait perio	d before initiatir	ng a new EA	AP over UDP as	ssociation to 120		
	hostname(config)# <b>eou t</b> hostname(config)#	imeout hold-perio	ođ 120					

The following example changes the wait period before initiating a new EAP over UDP association to its default value:

hostname(config)# no eou timeout hold-period
hostname(config)#

The following example changes the retransmission timer to 6 seconds:

hostname(config)# eou timeout retransmit 6
hostname(config)#

The following example changes the retransmission timer to its default value:

hostname(config)# no eou timeout retransmit
hostname(config)#

Relatedommands	Command	Description
	debug eou	Enables logging of EAP over UDP events to debug NAC Framework messaging.
	eou max-retry	Changes the number of times the adaptive security appliance resends an EAP over UDP message to the remote computer.

## erase

To erase and reformat the file system, use the **erase** command in privileged EXEC mode. This command overwrites all files and erases the file system, including hidden system files, and then reinstalls the file system.

erase [disk0: | disk1: | flash:]

Syntax Description	disk0:	(Optional	) Specifies	the internal Flas	h memory,	followed by a	colon.
	disk1:	(Optional colon.	) Specifies	the external, con	npact Flash	memory card,	followed by a
	flash:		) Specifies	the internal Flas	h memory,	followed by a	colon.
	$\wedge$						
		<b>Caution</b> Erasing the flash memory also removes the licensing information which is stored in flash memory. Save the licensing information before erasing the flash memory.					
		In the AS aliased to		es adaptive secu	rity applia	nce, the <b>flash</b> k	eyword is
Defaults	This command h	as no default sett	ings.				
Command Modes	The following ta	ble shows the mo	des in whic	h you can enter	the comma	nd:	
			Firewall N	lode	Security Context		
						Multiple	
	Command Mode		Routed	Transparent	Single	Context	System
	Privileged EXE	С	•	•	•		•
Command History	Release	Modific	ation				
	7.0(1)			s introduced.			
					1 0 55		
Usage Guidelines	The <b>erase</b> command erases all data on the flash memory using the OxFF pattern and then rewrites an empty file system allocation table to the device.						
	To delete all visi of the <b>erase</b> com	ble files (excludin mand.	ng hidden sy	ystem files), ente	er the <b>delet</b>	e /recursive co	mmand, instead
Note		ries adaptive adap 0xFF pattern. In	contrast, th	e format comm	and only re	sets the file sy	

## **Examples** The following example erases and reformats the file system: hostname# erase flash:

<b>Related Commands</b>	Command	Description
	delete	Removes all visible files, excluding hidden system files.
	format	Erases all files (including hidden system files) and formats the file system.

## esp

To specify parameters for esp and AH tunnels for IPSec Pass Thru inspection, use the **esp** command in parameters configuration mode. Parameters configuration mode is accessible from policy map configuration mode. To disable this feature, use the **no** form of this command.

{esp | ah} [per-client-max num] [timeout time]

**no** {**esp** | **ah**} [**per-client-max** *num*] [**timeout** *time*]

ntax Description	esp Specifies parameters for esp tunnel.						
	ah	Specifies parame	ters for AH tunnel	1.			
	per-client-max num	Specifies maximu	um tunnels from o	ne client.			
	timeout timeSpecifies idle timeout for the esp tunnel.						
Defaults	This command is disabl	ed by default.

	Global configuration	•	•	•	•	_
	7.0(1)	The keywords <b>to</b> a <b>permitto</b> and <b>perr</b>		moved from	n the CLI. Use	the keywor
Usage Guidelines The established command lets you permit return access for outbound connection security appliance. This command works with an original connection that is outb and protected by the adaptive security appliance and a return connection that is in				at is outbound		

**Command Modes** The following table shows the modes in which you can enter the command:

dest\_port Specifies the destination port to use for the established connection lookup. permitfrom (Optional) Allows the return protocol connection(s) originating from the specified port. permitto (Optional) Allows the return protocol connections destined to the specified port. (Optional) Specifies the (UDP or TCP) destination port(s) of the return connection. port [-port] (Optional) IP protocol (UDP or TCP) used by the return connection. protocol (Optional) Specifies the source port to use for the established connection lookup. source port

# established

Syntax Description

Defaults

L

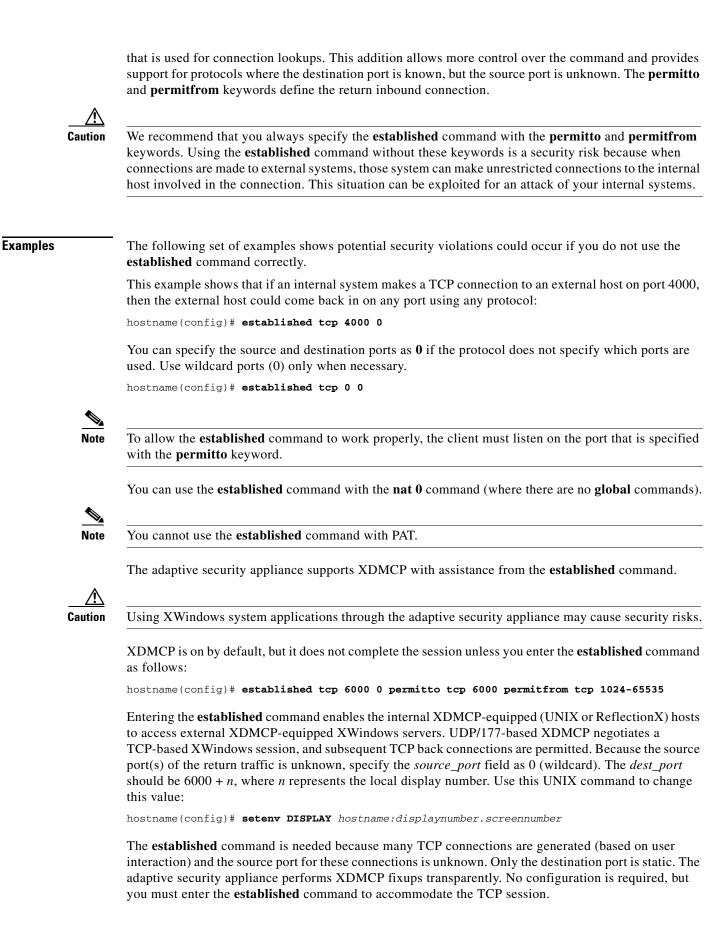

To permit return connections on ports that are based on an established connection, use the established command in global configuration mode. To disable the established feature, use the no form of this command.

- established est\_protocol dest\_port [source\_port] [permitto protocol port [-port]] [permitfrom protocol port[-port]]
- **no established** *est\_protocol dest\_port* [*source\_port*] [**permitto** *protocol port* [*-port*]] [**permitfrom** protocol port[-port]]

Specifies the IP protocol (UDP or TCP) to use for the established connection lookup.

est\_protocol

The defaults are as follows: • *dest port*—0 (wildcard) • *source\_port*—0 (wildcard)

The following example shows a connection between two hosts using protocol A destined for port B from source port C. To permit return connections through the adaptive security appliance and protocol D (protocol D can be different from protocol A), the source port(s) must correspond to port F and the destination port(s) must correspond to port E.

hostname(config)# established A B C permitto D E permitfrom D F

The following example shows how a connection is started by an internal host to an external host using TCP destination port 6060 and any source port. The adaptive security appliance permits return traffic between the hosts through TCP destination port 6061 and any TCP source port.

hostname(config)# established tcp 6060 0 permitto tcp 6061 permitfrom tcp 0

The following example shows how a connection is started by an internal host to an external host using UDP destination port 6060 and any source port. The adaptive security appliance permits return traffic between the hosts through TCP destination port 6061 and TCP source port 1024-65535.

hostname(config)# established udp 6060 0 permitto tcp 6061 permitfrom tcp 1024-65535

The following example shows how a local host starts a TCP connection on port 9999 to a foreign host. The example allows packets from the foreign host on port 4242 back to local host on port 5454.

hostname(config)# established tcp 9999 permitto tcp 5454 permitfrom tcp 4242

<b>Related Commands</b>	Command	Description
	clear configure established	Removes all established commands.
	show running-config established	Displays the allowed inbound connections that are based on established connections.

## exceed-mss

To allow or drop packets whose data length exceeds the TCP maximum segment size set by the peer during a three-way handshake, use the **exceed-mss** command in tcp-map configuration mode. To remove this specification, use the **no** form of this command.

exceed-mss {allow | drop}

no exceed-mss {allow | drop}

Syntax Description	allow Allows packets that exceed the MSS. This setting is the default.								
	drop Drops packets that exceed the MSS.								
Defaults	Packets are allowed by	y default.							
Command Modes	The following table sh	lows the modes in v	which you can enter	r the comma	and:

Usage Guidelines	The <b>tcp-map</b> comman class of traffic using th commands. Apply the <b>service-policy</b> comma	he <b>class-map</b> comr new TCP map usin	nand and customize	the TCP in	spection with	tcp-map			
	Use the <b>tcp-map</b> command to enter tcp-map configuration mode. Use the <b>exceed-mss</b> command in tcp-map configuration mode to drop TCP packets whose data length exceed the TCP maximum segment size set by the peer during a three-way handshake.								
Examples	hostname(config)# to hostname(config-tcp- hostname(config)# c hostname(config-cmap	cp-map tmap -map)# exceed-mss lass-map cmap p)# match port to olicy-map pmap	drop	excess of M	<pre>size set by the peer during a three-way handshake. The following example drops flows on port 21 if they are in excess of MSS: hostname(config)# tcp-map tmap hostname(config-tcp-map)# exceed-mss drop hostname(config)# class-map cmap hostname(config-cmap)# match port tcp eq ftp hostname(config)# policy-map pmap</pre>				

hostname(config-pmap)# set connection advanced-options tmap hostname(config)# service-policy pmap global

<b>Related Commands</b>	Command	Description
	class	Specifies a class map to use for traffic classification.
	policy-map	Configures a policy; that is, an association of a traffic class and one or more actions.
	set connection advanced-options	Configures advanced connection features, including TCP normalization.
	tcp-map	Creates a TCP map and allows access to tcp-map configuration mode.

# exempt-list

To add an entry to the list of remote computer types that are exempt from posture validation, use the **exempt-list** command in nac-policy-nac-framework configuration mode. To remove an entry from the exemption list, use the **no** form of this command and name the operating system, and ACL, in the entry to be removed.

exempt-list os "os-name" [ disable | filter acl-name [ disable ] ]

no exempt-list os "os-name" [ disable | filter acl-name [ disable ] ]

SyntaDescription	acl-name	Name of the ACL present in the adaptive security appliance configuration. When specified, it must follow the <b>filter</b> keyword.					configuration.
	disable	Perfor	rms one of tw	vo functions, as f	follows:		
		• If you enter it after the "os-name," the adaptive security appliance ignores the exemption, and applies NAC posture validation to the remote hosts that are running that operating system.					
		th		after the <i>acl-nam</i> system, but does			
	filter			filter the traffic <i>ne</i> . The <b>filter</b> /ac			ng system
	05	Exem	pts an operat	ing system from	posture va	lidation.	
	os name			name. Quotation or example, "win			f the name
Defaults	No default behavior o	or values.					
Defaults Command Modes	No default behavior of The following table st			-	1		
			nodes in whic	-	the comma	Context	
				-	1		System
	The following table s	hows the n	Firewall N	Node	Security C	Context Multiple	System
Command Modes	The following table st <b>Command Mode</b> nac-policy-nac-frame configuration	hows the n	Firewall N Routed •	Node	Security C Single	Context Multiple	System 
	The following table st <b>Command Mode</b> nac-policy-nac-frame	hows the n ework Modif Comn moved	Firewall N Routed •	Node Transparent — nanged from vpn -policy configura	Security C Single • -nac-exem	Context Multiple Context — upt to exempt-	list. Command

Usage Guidelines	When the command specifies an operating system, it does not overwrite the previously added entry to the exception list; enter the command once for each operating system and ACL you want to exempt.
	The <b>no exempt-list</b> command removes all exemptions from the NAC Framework policy. Specifying an entry when issuing the <b>no</b> form of the command removes the entry from the exemption list.
	To remove all entries from the exemption list associated with this NAC policy, use the <b>no</b> form of this command without specifying additional keywords.
Examples	The following example adds all hosts running Windows XP to the list of computers that are exempt from posture validation:
	hostname(config-group-policy)# <b>exempt-list os "Windows XP"</b> hostname(config-group-policy)
	The following example exempts all hosts running Windows XP and applies the ACL acl-1 to traffic from those hosts:
	hostname(config-nac-policy-nac-framework)# <b>exempt-list os "Windows XP" filter acl-1</b> hostname(config-nac-policy-nac-framework)
	The following example removes the same entry from the exemption list:
	hostname(config-nac-policy-nac-framework)# <b>no exempt-list os "Windows XP" filter acl-1</b> hostname(config-nac-policy-nac-framework)
	The following example removes all entries from the exemption list:
	hostname(config-nac-policy-nac-framework)# <b>no exempt-list</b> hostname(config-nac-policy-nac-framework)

Relatedommands	Command	Description		
	nac-policy	Creates and accesses a Cisco NAC policy, and specifies its type.		
	nac-settings	Assigns a NAC policy to a group policy.		
	show vpn-session_summary.db	Displays the number IPSec, Cisco AnyConnect, and NAC sessior y.db		
	show vpn-session.db	Displays information about VPN sessions, including NAC results.		
	debug nac	Enables logging of NAC Framework events.		

## exit

To exit the current configuration mode, or to log out of the privileged EXEC or user EXEC mode, use the **exit** command.

exit

- **Syntax Description** This command has no arguments or keywords.
- **Defaults** No default behavior or values.

**Command Modes** The following table shows the modes in which you can enter the command:

	Firewall N	lode	Security Context			
				Multiple	Multiple	
Command Mode	Routed	Transparent	Single	Context	System	
User EXEC	•	•	•	•	•	

Command History	Release	Modification
	Preexisting	This command was preexisting.

**Usage Guidelines** You can also use the key sequence **Ctrl Z** to exit the global configuration and higher modes. This key sequence does not work with the privileged EXEC or user EXEC mode.

When you enter the **exit** command in privileged EXEC or user EXEC mode, you log out of the adaptive security appliance. Use the **disable** command to return to user EXEC mode from privileged EXEC mode.

**Examples** The following example shows how to use the **exit** command to exit the global configuration mode, and then log out of the session:

hostname(config)# exit
hostname# exit

Logoff

The following example shows how to use the **exit** command to exit global configuration mode, and then use the **disable** command to exit privileged EXEC mode:

hostname(config)# exit
hostname# disable
hostname>

#### **Related Commands**

Command	Description
quit	Exits a configuration mode or logs out from the privileged or user EXEC mode.

# expiry-time

To configure an expiration time for caching objects without revalidating them, use the **expiry-time** command in cache configuration mode. To remove the expiration time from the configuration and reset it to the default value, use the **no** form of this command.

expiry-time time

no expiry-time

Syntax Description	<i>time</i> The amount of time in minutes that the adaptive security appliance caches objects without revalidating them.							
Defaults	One minute.							
Command Modes	The following table shows	the modes in whic	h you enter the	command:				
		Firewall N	lode	Security C	Context			
					Multiple			
	Command Mode	Routed	Transparent	Single	Context	System		
	Cache configuration	•		•	—			
Command History		Modification This command was	s introduced.					
Usage Guidelines	The expiration time is the an without revalidating it. Rev				arity appliance	caches an objec		
Examples	The following example shows how to set an expiration time with a value of 13 minutes: hostname(config) # webvpn hostname(config-webvpn) # cache hostname(config-webvpn-cache) #expiry-time 13 hostname(config-webvpn-cache) #							
Related Commands	Command	Description						
	cache	Enters WebV	PN Cache mode	•				
	cache-compressed	Configures W	ebVPN cache c	ompression	1.			
	disable	Disables cach	ning.					

Command	Description
Imfactor	Sets a revalidation policy for caching objects that have only the last-modified timestamp.
max-object-size	Defines the maximum size of an object to cache.
min-object-size	Defines the minimum sizze of an object to cache.

## export

To specify the certificate to be exported to the client, use the **export** command in CTL provider configuration mode. To remove the configuration, use the **no** form of this command.

export certificate trustpoint\_name

**no export certificate** [trustpoint\_name]

### Syntax Description certificate *trustpoint\_name* Specifies the certificate to be exported to the client.

**Defaults** No default behavior or values.

**Command Modes** The following table shows the modes in which you can enter the command:

	Firewall N	Firewall Mode		Security Context	
				Multiple	
Command Mode	Routed	Transparent	Single	Context	System
CTL provider configuration	•	•	•	•	

Command History	Release	Modification
	8.0(2)	This command was introduced.

**Usage Guidelines** Use the **export** command in CTL provider configuration mode to specify the certificate to be exported to the client. The trustpoint name is defined by the **crypto ca trustpoint** command. The certificate will be added to the Certificate Trust List file composed by the CTL client.

 Examples
 The following example shows how to create a CTL provider instance:

 hostname(config)# ctl-provider my\_ctl
 hostname(config-ctl-provider)# client interface inside 172.23.45.1

 hostname(config-ctl-provider)# client username CCMAdministrator password XXXXXX encrypted

 hostname(config-ctl-provider)# export certificate ccm\_proxy

 hostname(config-ctl-provider)# ctl install

Related Commands	Commands	Description
	ctl	Parses the CTL file from the CTL client and install trustpoints.
	ctl-provider	Configures a CTL provider instance in CTL provider mode.
	client	Specifies clients allowed to connect to the CTL provider and also username and password for client authentication.

Commands	Description
service	Specifies the port to which the CTL provider listens.
tls-proxy	Defines a TLS proxy instance and sets the maximum sessions.

## export webvpn Anyconnect-customization

To export a customization object that customizes Anyconnect screens visible to Clientless SSL VPN users, use the **export webvpn Anyconnect-customization** command from privileged EXEC mode.

export webvpn AnyConnect-customization name url stdout

<i>binary</i> Specifies a file you import as your own client executable that uses the AnyConnect client API.							
name	<i>name</i> The name that identifies the customization object. Maximum 64 characters.

Examples

## export webvpn mst-translation

To export an MST translation table used to translate terms displayed to remote users establishing SSL VPN connection, use the **export webvpn mst-translation** command from privileged EXEC mode.

export webvpn mst-translation translation\_domain {language language | template} url stdout

Syntax Description	language	Specifies the name of a previously-imported translation table. Enter the value in the manner expressed by your browser language options.						
	stdout	Allows you to print information to the console.						
	translation_domain	The functional area and associated messages. Table 12-1 lists available translation domains.						
	url			f the object.				
		Specifics (		i the object.				
Defaults	There is no default be	havior for this	command	1.				
Command Modes	The following table sh	lows the mode	es in whicl	n you can enter	the comma	nd:		
		F	irewall M	ode	Security C	Context		
						Multiple		
	Command Mode	F	louted	Transparent	Single	Context	System	
	privileged EXEC		•		•			
Command History	Release Modification							
	8.0(2)	8.0(2) This command was introduced.						
Usage Guidelines	The adaptive security users that initiate brow to AnyConnect VPN C	ser-based, clie Client users.	entless SS	L VPN connecti	ons, as well	l as the user int	erface displayed	
	Each functional area and its messages that is visible to remote users has its own translation domain and is specified by the <i>translation_domain</i> argument. Table 12-1 shows the translation domains and the functional areas translated.							
	Table 12-1Translation Domains and Functional Areas Affected							
	Translation Domain	Functional A	Areas Tran	slated				
	AnyConnect	AnyConnect         Messages displayed on the user interface of the Cisco AnyConnect VPN Client.						
	CSD	Messages fo	or the Cisc	o Secure Deskt	op (CSD).			
	customization       Messages on the logon and logout pages, portal page, and all the messages customizable by the user.							

Translation Domain	Functional Areas Translated		
banners	Banners displayed to remote users and messages when VPN access is denied.		
PortForwarder	Messages displayed to Port Forwarding users.		
url-list	Text that user specifies for URL bookmarks on the portal page.		
webvpn	All the layer 7, AAA and portal messages that are not customizable.		
plugin-ica	Messages for the Citrix plug-in.		
plugin-rdp	Messages for the Remote Desktop Protocol plug-in.		
plugin-telnet,ssh	Messages for the Telnet and SSH plug-in.		
plugin-vnc	Messages for the VNC plug-in.		
AnyConnect	Messages displayed on the user interface of the Cisco AnyConnect VPN Client.		

A translation template is an XML file in the same format as the translation table, but has all the translations empty. The software image package for the adaptive security appliance includes a template for each domain that is part of the standard functionality. Templates for plug-ins are included with the plug-ins and define their own translation domains. Because you can customize the logon and logout pages, portal page, and URL bookmarks for clientless users, the adaptive security appliance generates the **customization** and **url-list** translation domain templates dynamically and the template automatically reflects your changes to these functional areas.

Exporting a previously-imported translation table creates an XML file of the table at the URL location. You can view a list of available templates and previously-imported tables using the **show import webvpn mst-translation** command.

Download a template or translation table using the **export webvpn mst-translation** command, make changes to the messages, and import the translation table using the **import webvpn mst-translation** command.

#### Examples

The following example exports a template for the translation domain *customization*, which is used to translate the logon and logout pages, portal page, and all the messages customizable and visible to remote users establishing clientless SSL VPN connections. The adaptive security appliance creates the XML file with the name *Sales*:

The next example exports a previously-imported translation table for the Chinese language named zh, an abbreviation compatible with the abbreviation specified for Chinese in the Internet Options of the Microsoft Internet Explorer browser. The adaptive security appliance creates the XML file with the name *Chinese*:

Related Commands	Command Description

Table 12-2 Translation Domains and Functional Areas Affected
--------------------------------------------------------------

A translation template is an XML file in the same format as the translation table, but has all the translations empty. The software image package for the adaptive security appliance includes a template for each domain that is part of the standard functionality. Templates for plug-ins are included with the plug-ins and define their own translation domains. Because you can customize the logon and logout pages, portal page, and URL bookmarks for clientless users, the adaptive security appliance generates the **customization** and **url-list** translation domain templates dynamically and the template automatically reflects your changes to these functional areas.

Exporting a previously-imported translation table creates an XML file of the table at the URL location. You can view a list of available templates and previously-imported tables using the **show import webvpn translation-table** command.

Download a template or translation table using the **export webvpn translation-table** command, make changes to the messages, and import the translation table using the **import webvpn translation-table** command.

**Examples** 

The following example exports a template for the translation domain *customization*, which is used to translate the logon and logout pages, portal page, and all the messages customizable and visible to remote users establishing clientless SSL VPN connections. The adaptive security appliance creates the XML file with the name *Sales*:

The next example exports a previously-imported translation table for the Chinese language named zh, an abbreviation compatible with the abbreviation specified for Chinese in the Internet Options of the Microsoft Internet Explorer browser. The adaptive security appliance creates the XML file with the name *Chinese*:

#### **Related Commands**

Command	Description
import webvpn translation-table	Imports a translation table.
revert	Removes translation tables from cache memory.
show import webvpn translation-table	Displays information about imported translation tables.

# export webvpn url-list

To export a URL list to a remote location, use the **export webvpn url-list** command from privileged EXEC mode.

export webvpn url-list name url stdout

Syntax Description	<i>name</i> The name that identifies the URL list. Maximum 64 characters.								
	stdout	Allows you to p	print information	to the con	sole.				
	URL Remote path to the source of the URL list. Maximum 255 characters.								
Defaults	There is no default beha	vior for this comman	d.						
Command Modes	The following table sho			1					
		Firewall N	lode	Security C					
		Deuted	<b>T</b>	Cinala	Multiple				
	Command Mode	Routed	Transparent	Single •	Context	System			
	privileged EXEC	•		•					
Command History	Release Modification								
oonnana motory	8.0(2)     This command was introduced.								
Usage Guidelines	No URL lists are present in WebVPN by default. An object, Template, is available for downloading with the <b>export webvpn url-list</b> command. Template cannot be changed or deleted. The contents of Template can be edited and saved as a custom URL list, and imported with the <b>import webvpn url-list</b> command to add a custom URL list.								
	Exporting a previously-imported URL list creates an XML file of the list at the URL location. You can view a list of available templates and previously-imported tables using the <b>show import webvpn url-list</b> command.

Command	Description
import webvpn url-list	Imports a URL list.
revert webvpn url-list	Removes URL lists from cache memory.
show import webvpn url-list	Displays information about imported URL lists.

### export webvpn webcontent

To export previously-imported content in flash memory that is visible to remote Clientless SSL VPN users, use the **export webvpn webcontent** command from privileged EXEC mode.

export webvpn webcontent <source url> <destination url> stdout

Syntax Description	<i><destination url=""></destination></i> The URL to export to. Maximum 255 characters.								
	<i><source url=""/></i> The URL in the adaptive security appliance flash memory where the content resides. See Maximum 64 characters.								
	<i>stdout</i> Allows you to print information to the console.								
Defaults	There is no default l	behavior for this com	mand						
Command Modes	The following table	shows the modes in v	vhich you can enter	the comma	and:				
		Firewa	II Mode	Security (	Context				
	<b>Command Mode</b> privileged EXEC				Multiple				
		Routed	l Transparent	Single	Context	System			
		•	—	•					
Command History Usage Guidelines	ReleaseModification8.0(2)This command was introduced.								
	Content exported with the <b>webcontent</b> option is content visible to remote Clientless users. This includes previously-imported help content visible on the Clientless portal and logos used by customization								
	objects. You can see a list of content available for export by entering a question mark (?) after the <b>export webvpn webcontent</b> command. For example:								
	hostname# export webvpn webcontent ?								
	<pre>Select webcontent to export: /+CSCOE+/help/en/app-access-hlp.inc /+CSCOU+/cisco_logo.gif</pre>								
Examples	The following exam logo_copy.gif:	ple exports the file <i>lo</i>	<i>go.gif</i> , using tftp, to	) 209.165.2	00.225, as the	filename			
Lxamples	<pre>logo_copy.gif: hostname# export webvpn webcontent /+CSCOU+/logo.gif tftp://209.165.200.225/logo_copy.gif !!!!* Web resource `/+CSCOU+/logo.gif' was successfully initialized</pre>								

<b>Related Commands</b>	Command	Description			
	import webvpn webcontent	Imports content visible to Clientless SSL VPN users.			
	revert webvpn webcontent	Removes content from flash memory.			
	show import webvpn webcontent	Displays information about imported content.			

# failover

To enable failover, use the **failover** command in global configuration mode. To disable failover, use the **no** form of this command.

failover

no failover

- **Syntax Description** This command has no arguments or keywords.
- **Defaults** Failover is disabled.

**Command Modes** The following table shows the modes in which you can enter the command:

	Firewall Mode Security Context				
				Multiple	
Command Mode	Routed	Transparent	Single	Context	System
Global configuration	•	•	•	_	•

<b>Command History</b>	Release	Modification
	7.0(1)	This command was limited to enable or disable failover in the configuration
		(see the <b>failover active</b> command).

**Usage Guidelines** 

Use the **no** form of this command to disable failover.

<u>/!\</u> Caution

All information sent over the failover and Stateful Failover links is sent in clear text unless you secure the communication with a failover key. If the adaptive security appliance is used to terminate VPN tunnels, this information includes any usernames, passwords and preshared keys used for establishing the tunnels. Transmitting this sensitive data in clear text could pose a significant security risk. We recommend securing the failover communication with a failover key if you are using the adaptive security appliance to terminate VPN tunnels.

The ASA 5505 device allows only Stateless Failover, and only while not acting as an Easy VPN hardware client.

Examples

The following example disables failover:

hostname(config) # no failover
hostname(config) #

Related Commands	Command	Description
	clear configure failover	Clears <b>failover</b> commands from the running configuration and restores failover default values.
	failover active	Switches the standby unit to active.
	show failover	Displays information about the failover status of the unit.
	show running-config failover	Displays the <b>failover</b> commands in the running configuration.

### failover active

To switch a standby adaptive security appliance or failover group to the active state, use the **failover active** command in privileged EXEC mode. To switch an active adaptive security appliance or failover group to standby, use the **no** form of this command.

failover active [group group\_id]

**no failover active** [group group\_id]

efaults	No default behavior or	values.

### failover exec

To execute a command on a specific unit in a failover pair, use the **failover exec** command in privileged EXEC or global configuration mode.

failover exec {active | standby | mate} cmd\_string

Syntax Description	active	activeSpecifies that the command is executed on the active unit or failover group in the failover pair. Configuration commands entered on the active unit or failover group are replicated to the standby unit or failover group.						
	cmd_string	The comm supported.	and to be exe	ecuted. Show, co	onfiguration	, and exec con	nmands are	
	mate Specifies that the command is executed on the failover peer.							
	standby	failover pa	ir. Configura	and is executed tion commands to the active un	executed of	n the standby u	over group in the init or failover	
Defaults	No default behavio	ors or values.						
Command Modes	The following tabl	e shows the m			the comma			
			Firewall Mode		Security C			
					o. 1	Multiple	0	
	Command Mode		Routed	Transparent	Single	Context	System	
	Privileged EXEC		•	•	•	•	•	
Command History	Release Modification							
	8.0(2)   This command was introduced.							
Usage Guidelines	You can use the <b>fa</b>	<b>ilover exec</b> co	mmand to se	end commands to	o a specific	unit in a failo	ver pair.	
·	Because configuration commands are replicated from the active unit or context to the standby unit or context, you can use the <b>failover exec</b> command to enter configuration commands on the correct unit, no matter which unit you are logged-in to. For example, if you are logged-in to the standby unit, you can use the <b>failover exec active</b> command to send configuration changes to the active unit. Those changes are then replicated to the standby unit. Do not use the <b>failover exec</b> command to send configuration changes are not replicated to the active unit or context; those configuration changes are not replicated to the active unit and the two configurations will no longer be synchronized.							
	Output from configure volution of the second	ilover exec con						

You must have sufficient privileges to execute a command on the local unit to execute the command on the peer unit.

#### **Command Modes**

The **failover exec** command maintains a command mode state that is separate from the command mode of your terminal session. By default, the **failover exec** command mode is global configuration mode for the specified device. You can change that command mode by sending the appropriate command (such as the **interface** command) using the **failover exec** command.

Changing **failover exec** command modes for the specified device does not change the command mode for the session you are using to access the device. For example, if you are logged-in to the active unit of a failover pair, and you issue the following command from global configuration mode, you will remain in global configuration mode but any commands sent using the **failover exec** command will be executed in interface configuration mode:

```
hostname(config)# failover exec interface GigabitEthernet0/1
hostname(config)#
```

Changing commands modes for your current session to the device does not affect the command mode used by the **failover exec** command. For example, if you are in interface configuration mode on the active unit, and you have not changed the **failover exec** command mode, the following command would be executed in global configuration mode:

```
hostname(config-if)# failover exec active router ospf 100
hostname(config-if)#
```

Use the **show failover exec** command to display the command mode on the specified device in which commands sent with the **failover exec** command are executed.

#### **Security Considerations**

The **failover exec** command uses the failover link to send commands to and receive the output of the command execution from the peer unit. You should use the **failover key** command to encrypt the failover link to prevent eavesdropping or man-in-the-middle attacks.

#### Limitations

- If you upgrade one unit using the zero-downtime upgrade procedure and not the other, both units must be running software that supports the **failover exec** command for the command to work.
- Command completion and context help is not available for the commands in the *cmd\_string* argument.
- In multiple context mode, you can only send commands to the peer context on the peer unit. To send commands to a different context, you must first change to that context on the unit you are logged-in to.
- You cannot use the following commands with the failover exec command:
  - changeto
  - debug (undebug)
- If the standby unit is in the failed state, it can still receive commands from the **failover exe**c command if the failure is due to a service card failure; otherwise, the remote command execution will fail.
- You cannot use the **failover exec** command to switch from privileged EXEC mode to global configuration mode on the failover peer. For example, if the current unit is in privileged EXEC mode, and you enter **failover exec mate configure terminal**, the **show failover exec mate** output

will show that the failover exec session is in global configuration mode. However, entering configuration commands for the peer unit using **failover exec** will fail until you enter global configuration mode on the current unit.

- You cannot enter recursive failover exec commands, such as **failover exec mate failover exec mate** *command*.
- Commands that require user input or confirmation must use the /nonconfirm option.

**Examples** The following example shows how to use the **failover exec** command to display failover information on the active unit. The unit on which the command is executed is the active unit, so the command is executed locally.

hostname(config)# failover exec active show failover

                      0
                             1
                                     344
```

The following example uses the **failover exec** command to display the failover configuration of the failover peer. The command is executed on the primary unit, which is the active unit, so the information displayed is from the secondary, standby unit.

```
hostname(config)# failover exec mate show running-config failover
```

```
failover
failover lan interface failover GigabitEthernet0/3
failover polltime unit 1 holdtime 3
failover polltime interface 3 holdtime 15
failover link failover GigabitEthernet0/3
failover interface ip failover 10.0.5.1 255.255.0 standby 10.0.5.2
ciscoasa(config)#
```

The following example uses the **failover exec** command to create a context on the active unit from the standby unit. The command is replicated from the active unit back to the standby unit. Note the two "Creating context..." messages. One is from the **failover exec** command output from the peer unit when the context is created, and the other is from the local unit when the replicated command creates the context locally.

hostname(config) # show context Context Name Class Interfaces URL \*admin default GigabitEthernet0/0, disk0:/admin.cfg GigabitEthernet0/1 Total active Security Contexts: 1 ! The following is executed in the system execution space on the standby unit. hostname(config) # failover exec active context text Creating context 'text'... Done. (2) Creating context 'text'... Done. (3) hostname(config) # show context Context Name URL Class Interfaces \*admin default GigabitEthernet0/0, disk0:/admin.cfg GigabitEthernet0/1 default (not entered) text Total active Security Contexts: 2

The following example shows the warning that is returned when you use the **failover exec** command to send configuration commands to a failover peer in the standby state:

```
hostname# failover exec mate static (inside,outside) 192.168.5.241 192.168.0.241
```

```
**** WARNING ****
Configuration Replication is NOT performed from Standby unit to Active unit.
Configurations are no longer synchronized.
hostname(config)#
```

The following example uses the **failover exec** command to send the **show interface** command to the standby unit:

#### hostname(config)# failover exec standby show interface

```

The following example shows the error message returned when issuing an illegal command to the peer unit:

hostname# failover exec mate bad command

```
bad command
   ^
ERROR: % Invalid input detected at '^' marker.
```

The following example shows the error message that is returned when you use the **failover exec** command when failover is disabled:

hostname(config)# failover exec mate show failover

ERROR: Cannot execute command on mate because failover is disabled

<b>Related Commands</b>
-------------------------

Command	Description
debug fover	Displays failover-related debug messages.
debug xml	Displays debug messages for the XML parser used by the <b>failover exec</b> command.
show failover exec	Displays the <b>failover exec</b> command mode.

# failover group

To configure an Active/Active failover group, use the **failover group** command in global configuration mode. To remove a failover group, use the **no** form of this command.

failover group num

no failover group num

Syntax Description	num	<i>num</i> Failover group number. Valid values are 1 or 2.						
Defaults	No default behavior or v	values.						
Command Modes	The following table show	ws the modes in whi	ch you can enter	the comma	und:			
		Firewall I	Mode	Security (	Context

	When removing failover the admin context. Any							

remove a failover group that has contexts explicitly assigned to it.

# <u>Note</u>

If you have more than one Active/Active failover pair on the same network, it is possible to have the same default virtual MAC addresses assigned to the interfaces on one pair as are assigned to the interfaces of the other pairs because of the way the default virtual MAC addresses are determined. To avoid having duplicate MAC addresses on your network, make sure you assign each physical interface a virtual active and standby MAC address using the **mac address** command.

#### Examples

The following partial example shows a possible configuration for two failover groups:

```
hostname(config)# failover group 1
hostname(config-fover-group)# primary
hostname(config-fover-group)# preempt 100
hostname(config)# failover group 2
hostname(config-fover-group)# secondary
hostname(config-fover-group)# preempt 100
hostname(config-fover-group)# exit
hostname(config-fover-group)# exit
hostname(config-fover-group)# exit
hostname(config)#
```

Related Commands	Command	Description					
	asr-group	Specifies an asymmetrical routing interface group ID.					
	interface-policy	Specifies the failover policy when monitoring detects interface failures.					
	join-failover-group	Assigns a context to a failover group.					
	mac address	Defines virtual mac addresses for the contexts within a failover group.					
	polltime interface	Specifies the amount of time between hello messages sent to monitored interfaces.					
	preempt	Specifies that a unit with a higher priority becomes the active unit after a reboot.					
	primary	Gives the primary unit higher priority for a failover group.					
	replication http	Specifies HTTP session replication for the selected failover group.					
	secondary	Gives the secondary unit higher priority for a failover group.					

# failover interface ip

To specify the IP address and mask for the failover interface and the Stateful Failover interface, use the **failover interface ip** command in global configuration mode. To remove the IP address, use the **no** form of this command.

failover interface ip if\_name ip\_address mask standby ip\_address

**no failover interface ip** *if\_name ip\_address mask* **standby** *ip\_address*

failover reset	Restores a failed unit to an unfailed state.
monitor-interface	Specifies the interfaces being monitored for failover.
show failover	Displays information about the failover state of the unit.

# failover key

To specify the key for encrypted and authenticated communication between units in a failover pair, use the **failover key** command in global configuration mode. To remove the key, use the **no** form of this command.

failover key {secret | hex key}

no failover key

Syntax Description	hex key	Specifies a hexadecimal value for the encryption key. The key must be 32 hexadecimal characters (0-9, a-f).						
	secret	secretSpecifies an alphanumeric shared secret. The secret can be from 1 to 63 characters. Valid character are any combination of numbers, letters, or punctuation. The shared secret is used to generate the encryption key.						
Defaults	No default behavior or v	values.						
Command Modes	The following table show	ws the modes in whic	h you can enter	the comma	ind:

the tunnels. Transmitting this sensitive data in clear text could pose a significant security risk. We recommend securing the failover communication with a failover key if you are using the adaptive security appliance to terminate VPN tunnels.

**Examples** The following example shows how to specify a shared secret for securing failover communication between units in a failover pair:

hostname(config)# failover key abcdefg

The following example shows how to specify a hexadecimal key for securing failover communication between two units in a failover pair:

hostname(config)# failover key hex 6aled228381cf5c68557cb0c32e614dc

 
 Commands
 Command
 Description

 show running-config failover
 Displays the failover commands in the running configuration.

### failover lan enable

To enable lan-based failover on the PIX adaptive security appliance, use the **failover lan enable** command in global configuration mode. To disable LAN-based failover, use the **no** form of this command.

failover lan enable

no failover lan enable

**Syntax Description** This command has no arguments or keywords.

**Defaults** Not enabled.

**Command Modes** The following table shows the modes in which you can enter the command:

	Firewall N	lode	Security Context		
				Multiple	
Command Mode	Routed	Transparent	Single	Context	System
Global configuration	•	•	•	_	•

Command History	Release	Modification
	Preexisting	This command was preexisting.

**Usage Guidelines** 

When LAN-based failover is disabled using the **no** form of this command, cable-based failover is used if the failover cable is installed. This command is available on the PIX adaptive security appliance only.

Caution All information sent over the failover and Stateful Failover links is sent in clear text unless you secure the communication with a failover key. If the adaptive security appliance is used to terminate VPN tunnels, this information includes any usernames, passwords and preshared keys used for establishing the tunnels. Transmitting this sensitive data in clear text could pose a significant security risk. We recommend securing the failover communication with a failover key if you are using the adaptive security appliance to terminate VPN tunnels.

**Examples** 

The following example enables LAN-based failover: hostname(config)# failover lan enable

#### **Related Commands**

Cisco ASA 5580 Adaptive Security Appliance Command Reference

Command	Description
failover lan interface	Specifies the interface used for failover communication.
failover lan unit	Specifies the LAN-based failover primary or secondary unit.
show failover	Displays information about the failover status of the unit.
show running-config failover	Displays the <b>failover</b> commands in the running configuration.

# failover lan interface

To specify the interface used for failover communication, use the **failover lan interface** command in global configuration mode. To remove the failover interface, use the **no** form of this command.

failover lan interface if\_name {phy\_if[.sub\_if] | vlan\_if]}

**no failover lan interface** [*if\_name* {*phy\_if*[.*sub\_if*] | *vlan\_if*]}]

Syntax Description	if_name	<i>if_name</i> Specifies the name of the adaptive security appliance interface dedicated failover.							
	phy_if								
	respective     respective       sub_if     (Optional) Specifies a subinterface number.								
	vlan_if								
				the failover link					
Defaults	Not configured.								
Command Modes	The following table	shows the mo	odes in which	n you can enter	the comma	nd:			
			Firewall M	ode	Security C	ontext			
						Multiple			
	<b>Command Mode</b>		Routed	Transparent	Single	Context	System		
	Global configuration	on	•	•	•		•

units directly.

•	
N	lote

When using VLANs, use a dedicated VLAN for the failover link. Sharing the failover link VLAN with any other VLANs can cause intermittent traffic problems and ping and ARP failures. If you use a switch to connect the failover link, use dedicated interfaces on the switch and adaptive security appliance for the failover link; do not share the interface with subinterfaces carrying regular network traffic.

On systems running in multiple context mode, the failover link resides in the system context. This interface and the state link, if used, are the only interfaces that you can configure in the system context. All other interfaces are allocated to and configured from within security contexts.

Note

The IP address and MAC address for the failover link do not change at failover.

The **no** form of this command also clears the failover interface IP address configuration.

This command must be part of the configuration when bootstrapping a adaptive security appliance for LAN failover.

Caution

All information sent over the failover and Stateful Failover links is sent in clear text unless you secure the communication with a failover key. If the adaptive security appliance is used to terminate VPN tunnels, this information includes any user names, passwords and preshared keys used for establishing the tunnels. Transmitting this sensitive data in clear text could pose a significant security risk. We recommend securing the failover communication with a failover key if you are using the adaptive security appliance to terminate VPN tunnels.

#### **Examples**

The following example configures the failover LAN interface on a PIX 500 series adaptive security appliance:

hostname(config)# failover lan interface folink Ethernet4

The following example configures the failover LAN interface using a subinterface on an ASA 5500 series adaptive adaptive security appliance (except for the ASA 5505 adaptive adaptive security appliance):

hostname(config)# failover lan interface folink GigabitEthernet0/3.1

The following example configures the failover LAN interface on the ASA 5505 adaptive adaptive security appliance:

hostname(config)# failover lan interface folink Vlan6

<b>Related Commands</b>	Command	Description
	failover lan enable	Enables LAN-based failover on the PIX adaptive security appliance.
	failover lan unit	Specifies the LAN-based failover primary or secondary unit.
	failover link	Specifies the Stateful Failover interface.

### failover lan unit

To configure the adaptive security appliance as either the primary or secondary unit in a LAN failover configuration, use the **failover lan unit** command in global configuration mode. To restore the default setting, use the **no** form of this command.

failover lan unit {primary | secondary}

no failover lan unit {primary | secondary}

Syntax Description	<b>primary</b> Specifies the adaptive security appliance as a primary unit.						
	<b>secondary</b> Specifies the security appliance as a secondary unit.						
efaults	- Secondary.						
Command Modes	The following table sho	ws the modes in whic	eh you can enter	the comma	nd:

#### **Examples** The following example sets the adaptive security appliance as the primary unit in LAN-based failover: hostname(config)# failover lan unit primary

<b>Related Commands</b>	Command	Description
	failover lan enable	Enables LAN-based failover on the PIX adaptive security appliance.
	failover lan interface	Specifies the interface used for failover communication.

# failover link

To specify the Stateful Failover interface, use the **failover link** command in global configuration mode. To remove the Stateful Failover interface, use the **no** form of this command.

failover link if\_name [phy\_if]

no failover link

Syntax Description	<i>if_name</i> Specifies the name of the adaptive security appliance interface dedicated to Stateful Failover.							
	phy_if(Optional) Specifies the physical or logical interface port. If the Stateful Failover interface is sharing the interface assigned for failover communication or sharing a standard firewall interface, then this argument is not required.							
Defaults	No default behavior or values.							
Command Modes	The following table sho	ws the modes in whic	h you can enter	the comma	ind:			
		Firewall N	lode	Security (	Context			
					Multiple			
	Command Mode	Routed	Transparent	Single	Context	System		
	Global configuration	•	•	•		•		
ommand History	Release	Release Modification						
	7.0(1)This command was modified to include the <i>phy_if</i> argument.							
	7.0(4)This command was modified to accept standard firewall interfaces.							
Usage Guidelines	This command is not ava not support Stateful Fai The physical or logical	lover.	-	-				
	a standard firewall interface.							
	The <b>failover link</b> command enables Stateful Failover. Enter the <b>no failover link</b> command to disable Stateful Failover. If you are using a dedicated Stateful Failover interface, the <b>no failover link</b> comman also clears the Stateful Failover interface IP address configuration.							
	To use Stateful Failover have three options for co			ver link to p	pass all state in	nformation. Y		
	• You can use a dedic	ated Ethernet interfa	ce for the Statef	ul Failover	link.			
	• If you are using LAN-based failover, you can share the failover link							

• If you are using LAN-based failover, you can share the failover link.

• You can share a regular data interface, such as the inside interface. However, this option is not recommended.

If you are using a dedicated Ethernet interface for the Stateful Failover link, you can use either a switch or a crossover cable to directly connect the units. If you use a switch, no other hosts or routers should be on this link.

Note

Enable the PortFast option on Cisco switch ports that connect directly to the adaptive security appliance.

If you are using the failover link as the Stateful Failover link, you should use the fastest Ethernet interface available. If you experience performance problems on that interface, consider dedicating a separate interface for the Stateful Failover interface.

If you use a data interface as the Stateful Failover link, you will receive the following warning when you specify that interface as the Stateful Failover link:

Sharing a data interface with the Stateful Failover interface can leave you vulnerable to replay attacks. Additionally, large amounts of Stateful Failover traffic may be sent on the interface, causing performance problems on that network segment.

Note

Using a data interface as the Stateful Failover interface is only supported in single context, routed mode.

In multiple context mode, the Stateful Failover link resides in the system context. This interface and the failover interface are the only interfaces in the system context. All other interfaces are allocated to and configured from within security contexts.

Note

The IP address and MAC address for the Stateful Failover link does not change at failover unless the Stateful Failover link is configured on a regular data interface.

All information sent over the failover and Stateful Failover links is sent in clear text unless you secure the communication with a failover key. If the adaptive security appliance is used to terminate VPN tunnels, this information includes any user names, passwords and preshared keys used for establishing the tunnels. Transmitting this sensitive data in clear text could pose a significant security risk. We recommend securing the failover communication with a failover key if you are using the adaptive security appliance to terminate VPN tunnels.

#### **Examples**

The following example shows how to specify a dedicated interface as the Stateful Failover interface. The interface in the example does not have an existing configuration.

hostname(config)# failover link stateful\_if e4 INFO: Non-failover interface config is cleared on Ethernet4 and its sub-interfaces

#### **Related Commands**

Command	Description
failover interface ip	Configures the IP address of the <b>failover</b> command and stateful failover interface.
failover lan interface	Specifies the interface used for failover communication.

# failover mac address

To specify the failover virtual MAC address for a physical interface, use the **failover mac address** command in global configuration mode. To remove the virtual MAC address, use the **no** form of this command.

failover mac address phy\_if active\_mac standby\_mac

**no failover mac address** *phy\_if active\_mac standby\_mac* 

Syntax Description	phy_if	The physical name	e of the interface	to set the N	AAC address.	
	active_mac	The MAC address assigned to the specified interface the active adaptive security appliance. The MAC address must be entered in h.h.h format, where h is a 16-bit hexadecimal number.				
	standby_mac       The MAC address assigned to the specified interface of the standby adaptive security appliance. The MAC address must be entered in h.h.h format, where h is a 16-bit hexadecimal number.					
efaults	Not configured.					
command Modes	The following table sl	hows the modes in whi				
		Firewall <b>N</b>	Aode	Security Context		
					Multiple	
	Command Mode	Routed	Transparent	Single	Context	System
	<b>Command Mode</b> Global configuration	Routed •	Transparent •	Single •	Context —	System •
command History			-	-	Context —	-
Command History	Global configuration	•	•	-	Context —	-

The **failover mac address** command is unnecessary (and therefore cannot be used) on an interface configured for LAN-based failover because the **failover lan interface** command does not change the IP and MAC addresses when failover occurs. This command has no effect when the adaptive security appliance is configured for Active/Active failover.

When adding the **failover mac address** command to your configuration, it is best to configure the virtual MAC address, save the configuration to Flash memory, and then reload the failover pair. If the virtual MAC address is added when there are active connections, then those connections stop. Also, you must write the complete configuration, including the **failover mac address** command, to the Flash memory of the secondary adaptive security appliance for the virtual MAC addressing to take effect.

If the **failover mac address** is specified in the configuration of the primary unit, it should also be specified in the bootstrap configuration of the secondary unit.

 Note	This command applies to Active/Standby failover only. In Active/Active failover, you configure the virtual MAC address for each interface in a failover group with the <b>mac address</b> command in failover group configuration mode.	
Examples		The following example configures the active and standby MAC addresses for the interface named intf2:
		<pre>hostname(config)# failover mac address Ethernet0/2 00a0.c969.87c8 00a0.c918.95d8</pre>

<b>Related Commands</b>	Command	Description
	show interface	Displays interface status, configuration, and statistics.

# failover polltime

To specify the failover unit poll and hold times, use the **failover polltime** command in global configuration mode. To restore the default poll and hold times, use the **no** form of this command.

failover polltime [unit] [msec] poll\_time [holdtime [msec] time]

**no failover polltime [unit] [msec]** *poll\_time* [**holdtime [msec]** *time*]

Syntax Description	holdtime time	(Optional) Sets the time during which a unit must receive a hello message on the failover link, after which the peer unit is declared failed.
		Valid values are from 3 to 45 seconds or from 800 to 999 milliseconds if the optional <b>msec</b> keyword is used.
	msec	(Optional) Specifies that the given time is in milliseconds.
	poll_time	Amount of time between hello messages.
		Valid values are from 1 to 15 seconds or from 200 to 999 milliseconds if the optional <b>msec</b> keyword is used.
	unit	(Optional) Indicates that the command is used for unit poll and hold times.
		Adding this keyword to the command does not have any affect on the command, but it can make it easier to differentiate this command from the <b>failover polltime interface</b> commands in the configuration.

#### Defaults

The default values on the PIX adaptive security appliance are as follows:

- The *poll\_time* is 15 seconds.
- The **holdtime** *time* is 45 seconds.

The default values on the ASA adaptive security appliance are as follows:

- The *poll\_time* is 1 second.
- The **holdtime** *time* is 15 seconds.

#### **Command Modes** The following table shows the modes in which you can enter the command:

	Firewall Mode		Security Context			
			Single	Multiple	Multiple	
Command Mode	Routed	Transparent		Context	System	
Global configuration	•	•	•	_	•	

Command History	Release	Modification			
	7.0(1)	This command was changed from the <b>failover poll</b> command to the <b>failover polltime</b> command and now includes <b>unit</b> and <b>holdtime</b> keywords.			
	7.2(1)	The <b>msec</b> keyword was added to the <b>holdtime</b> keyword. The <b>polltime</b> minimum value was reduced to 200 milliseconds from 500 milliseconds. The <b>holdtime</b> minimum value was reduced to 800 milliseconds from 3 seconds.			
Usage Guidelines	You cannot enter a <b>holdtime</b> value that is less than 3 times the unit poll time. With a faster poll time, the adaptive security appliance can detect failure and trigger failover faster. However, faster detection can cause unnecessary switch overs when the network is temporarily congested. If a unit does not hear hello packet on the failover communication interface or cable for one polling period, additional testing occurs through the remaining interfaces. If there is still no response from the peer unit during the hold time, the unit is considered failed and, if the failed unit is the active unit, the standby unit takes over as the active unit.				
Note	When CTIQBE traffic is passed through a adaptive security appliance in a failover configuration, you should decrease the failover hold time on the adaptive security appliance to below 30 seconds. The CTIQBE keepalive timeout is 30 seconds and may time out before failover occurs in a failover situation. If CTIQBE times out, Cisco IP SoftPhone connections to Cisco CallManager are dropped, and the IP SoftPhone clients need to reregister with the CallManager.				
Examples					
	The following example configures the adaptive security appliance to send a hello packet every 200 milliseconds and to fail over in 800 milliseconds if no hello packets are received on the failover interface within that time. The optional <b>unit</b> keyword is included in the command.				
	hostname(config)# <b>f</b> a	ailover polltime unit msec 200 holdtime msec 800			
Related Commands	Command	Description			
	failover polltime interface	Specifies the interface poll and hold times for Active/Standby failover configurations.			
	polltime interface	Specifies the interface poll and hold times for Active/Active failover configurations.			

Displays failover configuration information.

show failover

12-109

### failover polltime interface

To specify the data interface poll and hold times in an Active/Standby failover configuration, use the **failover polltime interface** command in global configuration mode. To restore the default poll and hold times, use the **no** form of this command.

failover polltime interface [msec] time [holdtime time]

**no failover polltime interface** [msec] *time* [holdtime *time*]

Syntax Description	holdtime time	(Optional) Sets the time during which a data interface must receive a hello message on the data interface, after which the peer is declared failed. Valid values are from 5 to 75 seconds.					
	interface timeSpecifies the poll time for interface monitoring. Valid values range from 1 to 15 seconds. If the optional msec keyword is used, the valid values are from 500 to 999 milliseconds.						
	msec	(Optional)	Specifies th	at the given time	is in milli	seconds.	
Defaults	The default values a	are as follows	:				
	• The poll <i>time</i> is	5 seconds.					
	• The holdtime t	<i>ime</i> is 5 times	s the poll <i>tin</i>	ne.			
Command Modes	The following table	shows the m	odes in whic	ch you can enter	the comma	ind:

OL-12173-03

polltime interface command.

You cannot enter a **holdtime** value that is less than 5 times the unit poll time. With a faster poll time, the adaptive security appliance can detect failure and trigger failover faster. However, faster detection can cause unnecessary switchovers when the network is temporarily congested. Interface testing begins when a hello packet is not heard on the interface for over half the hold time.

You can include both **failover polltime unit** and **failover polltime interface** commands in the configuration.

Note	

When CTIQBE traffic is passed through a adaptive security appliance in a failover configuration, you should decrease the failover hold time on the adaptive security appliance to below 30 seconds. The CTIQBE keepalive timeout is 30 seconds and may time out before failover occurs in a failover situation. If CTIQBE times out, Cisco IP SoftPhone connections to Cisco CallManager are dropped, and the IP SoftPhone clients need to reregister with the CallManager.

#### Examples

The following example sets the interface poll time frequency to 15 seconds:

hostname(config)# failover polltime interface 15

The following example sets the interface poll time frequency to 500 milliseconds and the hold time to 5 seconds:

hostname(config)# failover polltime interface msec 500 holdtime 5

Related Commands	Command Description	
	failover polltime	Specifies the unit failover poll and hold times.
	polltime interface	Specifies the interface polltime for Active/Active failover configurations.
	show failover	Displays failover configuration information.

# failover reload-standby

To force the standby unit to reboot, use the **failover reload-standby** command in privileged EXEC mode.

failover reload-standby

**Syntax Description** This command has no arguments or keywords.

**Defaults** No default behavior or values.

**Command Modes** The following table shows the modes in which you can enter the command:

	Firewall Mode		Security Context		
				Multiple	
Command Mode	Routed	Transparent	Single	Context	System
Privileged EXEC	•	•	•		•

Command History	Release	Modification
	7.0(1)	This command was introduced.

**Usage Guidelines** Use this command when your failover units do not synchronize. The standby unit restarts and resynchronizes to the active unit after it finishes booting.

**Examples** The following example shows how to use the **failover reload-standby** command on the active unit to force the standby unit to reboot:

hostname# failover reload-standby

<b>Related Commands</b>	Command	Description
	write standby	Writes the running configuration to the memory on the standby unit.

### failover replication http

To enable HTTP (port 80) connection replication, use the **failover replication http** command in global configuration mode. To disable HTTP connection replication, use the **no** form of this command.

failover replication http

no failover replication http

Syntax Description	This command has no arguments or keywords.
--------------------	--------------------------------------------

Defaults Disabled.

**Command Modes** The following table shows the modes in which you can enter the command:

	Firewall N	Firewall Mode		Security Context		
				Multiple		
Command Mode	Routed	Transparent	Single	Context	System	
Global configuration	•	•	•		•	

Command History	Release	Modification
	Preexisting	This command was changed from failover replicate http to failover
		replication http.

**Usage Guidelines** By default, the adaptive security appliance does not replicate HTTP session information when Stateful Failover is enabled. Because HTTP sessions are typically short-lived, and because HTTP clients typically retry failed connection attempts, not replicating HTTP sessions increases system performance without causing serious data or connection loss. The **failover replication http** command enables the stateful replication of HTTP sessions in a Stateful Failover environment, but could have a negative effect on system performance.

In Active/Active failover configurations, you control HTTP session replication per failover group using the **replication http** command in failover group configuration mode.

**Examples** The following example shows how to enable HTTP connection replication: hostname(config)# failover replication http

#### **Related Commands**

Command	Description
replication http	Enables HTTP session replication for a specific failover group.
show running-config failover	Displays the <b>failover</b> commands in the running configuration.

# failover reset

To restore a failed adaptive security appliance to an unfailed state, use the **failover reset** command in privileged EXEC mode.

failover reset [group group\_id]

#### **Related Commands**

Cisco ASA 5580 Adaptive Security Appliance Command Reference

Command	Description
failover interface-policy	Specifies the policy for failover when monitoring detects interface failures.
show failover	Displays information about the failover status of the unit.

### failover timeout

To specify the failover reconnect timeout value for asymmetrically routed sessions, use the **failover timeout** command in global configuration mode. To restore the default timeout value, use the **no** form of this command.

failover timeout hh[:mm:[:ss]

**no failover timeout** [*hh*[:*mm*:[:ss]]

Syntax Description	hh	Specifies the number of hours in the timeout value. Valid values range from -1 to 1193. By default, this value is set to 0.						
				o -1 disables the amount of time		llowing conne	ctions to	
		sets the from re	e command	o 0, without spe back to the defau . Entering <b>no fai</b> t (0).	ult value, w	hich prevents	connections	
		Note	When set to running con	o the default valu	ie, this com	mand does no	t appear in the	
	mm	(Optional) Specifies the number of minutes in the timeout value. Va values range from 0 to 59. By default, this value is set to 0.						
	SS	· •	· •	(Optional) Specifies the number of seconds in the timeout value. Valid values range from 0 to 59. By default, this value is set to 0.

Note

Adding the **nailed** option to the **static** command causes TCP state tracking and sequence checking to be skipped for the connection.

Enter the **no** form of this command restores the default value. Entering **failover timeout 0** also restores the default value. When set to the default value, this command does not appear in the running configuration.

Examples	The following example switches the standby group 1 to active:					
	hostname(config)# <b>failover timeout 12:30</b> hostname(config)# <b>show running-config failover</b> no failover failover timeout 12:30:00					
	hostname(config)# <b>show running-config failover</b> no failover					

<b>Related Commands</b>	Command	Description
	static	Configures a persistent one-to-one address translation rule by mapping a local IP address to a global IP address.

#### file-bookmarks

To customize the File Bookmarks title or the File Bookmarks links on the WebVPN Home page that is displayed to authenticated WebVPN users, use the **file-bookmarks** command from webvpn customization configuration mode. To remove the command from the configuration and cause the value to be inherited, use the **no** form of this command.

file-bookmarks {link {style value} | title {style value | text value}}

no file-bookmarks {link {style value} | title {style value | text value}}

Syntax Description	link	Specifie	es you are cha	anging the links.				
	title Specifies you are changing the title.

Here are some tips for making the most common changes to the WebVPN pages—the page colors:

• You can use a comma-separated RGB value, an HTML color value, or the name of the color if recognized in HTML.

- RGB format is 0,0,0, a range of decimal numbers from 0 to 255 for each color (red, green, blue); the comma separated entry indicates the level of intensity of each color to combine with the others.
- HTML format is #000000, six digits in hexadecimal format; the first and second represent red, the third and fourth green, and the fifth and sixth represent blue.

Note

To easily customize the WebVPN pages, we recommend that you use ASDM, which has convenient features for configuring style elements, including color swatches and preview capabilities.

#### Examples

The following example customizes the File Bookmarks title to "Corporate File Bookmarks":

```
F1-asa1(config)# webvpn
F1-asa1(config-webvpn)# customization cisco
F1-asa1(config-webvpn-custom)# file-bookmarks title text Corporate File Bookmarks
```

Related Commands	Command	Description
	application-access	Customizes the Application Access box of the WebVPN Home page.
	browse-networks	Customizes the Browse Networks box of the WebVPN Home page.
	web-applications	Customizes the Web Application box of the WebVPN Home page.
	web-bookmarks	Customizes the Web Bookmarks title or links on the WebVPN Home page.

### file-browsing

To enable or disable CIFS/FTP file browsing for file servers or shares, use the **file-browsing** command in dap webvpn configuration mode.

	file-browsing ena	able   disab	le						
	enable   disable	Enables	or disables t	he ability to brow	wse for file	servers or sha	res.		
Defaults Command Modes	No default value or be The following table sh		odes in whic	ch you can enter	the comma	ind:

command, the attribute is not present in the DAP record, so the adaptive security appliance moves down to the AAA attribute in the username, and if necessary, the group policy to find a value to apply.

#### Examples

The following example shows how to enable file browsing for the DAP record called Finance:

hostname (config)# config-dynamic-access-policy-record Finance hostname(config-dynamic-access-policy-record)# webvpn hostname(config-dap-webvpn)# file-browsing enable hostname(config-dap-webvpn)#

#### Related Commands

Command	Description
dynamic-access-policy-record	Creates a DAP record.
file-entry	Enables or disables the ability to enter file server names to
	access.

### file-encoding

To specify the character encoding for pages from Common Internet File System servers, use the **file-encoding** command in webvpn configuration mode. To remove the values of the file-encoding attribute use the **no** form of this command.

file-encoding {server-name | server-ip-addr} charset

no file-encoding {server-name | server-ip-addr}

inherit th	to -addr II to me N T ig n all CIFS servers character encodi		e adaptive securi ed decimal notation er encoding. server for which rity appliance ret hen matching the	ty applianc on, of the CI you want t ains the cas name to a ding entries	e configuration FS server for v o specify char e you specify, server. in the WebVP	n. which you want acter encoding. although it

Command History Release	N	Iodification				
7.1(1)	Т	his command wa	s introduced.			

value if WebVPN configuration does not specify a file-encoding entry for the CIFS server and the character-encoding attribute is not set. The remote browser uses its own default encoding if the WebVPN portal page does not specify the character encoding or if it specifies a character encoding value that the browser does not support.

The mapping of CIFS servers to their appropriate character encoding, globally with the webvpn character-encoding attribute, and individually with file-encoding overrides, provides for the accurate handling and display of CIFS pages when the proper rendering of file names or directory paths, as well as pages, are an issue.

Note	

The character-encoding and file-encoding values do not exclude the font family to be used by the browser. You need to complement the setting of one these values with the **page style** command in webvpn customization command mode to replace the font family if you are using Japanese Shift\_JIS character encoding, as shown in the following example, or enter the **no page style** command in webvpn customization command mode to remove the font family.

#### **Examples**

The following example sets the file-encoding attribute of the CIFS server named "CISCO-server-jp" to support Japanese Shift\_JIS characters, removes the font family, and retains the default background color:

```
hostname(config)# webvpn
hostname(config-webvpn)# file-encoding CISCO-server-jp shift_jis
F1-asa1(config-webvpn)# customization DfltCustomization
F1-asa1(config-webvpn-custom)# page style background-color:white
F1-asa1(config-webvpn-custom)#
```

The following example sets the file-encoding attribute of the CIFS server 10.86.5.174 to support IBM860 (alias "CP860") characters:

```
hostname(config)# webvpn
hostname(config-webvpn)# file-encoding 10.86.5.174 cp860
hostname(config-webvpn)
```

<b>Related Commands</b>	Command	Description
	character-encoding	Specifies the global character encoding used in all WebVPN portal pages except for pages from servers specified in file-encoding entries in the WebVPN configuration.
	show running-config [all] webvpn	Displays the running configuration for WebVPN. Use the <b>all</b> keyword to include the default configuration.
	debug webvpn cifs	Displays debug messages about the Common Internet File System.

# file-entry

To enable or disable the ability of a user to enter file server names to access, use the **file-entry** command in dap webvpn configuration mode.

	file-entry enable   disable

Command History	Release	Modification						
	7.0(1)     This command was introduced.							
Usage Guidelines	The <b>no</b> option allows in use the <b>filter value no</b>		e from another grou	p policy. To	prevent inheri	ting filter values		
	You configure ACLs to permit or deny various types of traffic for this user or group policy. You then use the <b>filter</b> command to apply those ACLs for WebVPN traffic.							
	WebVPN does not use ACLs defined in the <b>vpn-filter</b> command.							
Examples	The following example policy named FirstGro		a filter that invokes	an access l	list named <i>acl_</i>	<i>in</i> for the grou		
	<pre>hostname(config)# group-policy FirstGroup attributes hostname(config-group-policy)# webvpn hostname(config-group-webvpn)# filter acl_in</pre>							

Related Commands	Command	Description
	access-list	Creates an access list, or uses a downloadable access list.
	webvpn	Use in group-policy configuration mode or in username configuration mode. Lets you enter webvpn mode to configure parameters that apply to group policies or usernames.
	webvpn	Use in global configuration mode. Lets you configure global settings for WebVPN.

### filter activex

To remove ActiveX objects in HTTP traffic passing through the adaptive security appliance, use the **filter activex** command in global configuration mode. To remove the configuration, use the **no** form of this command.

**filter activex** | java <port> [-<port>] | **except** <local\_ip> <mask> <foreign\_ip> <foreign\_mask>

**no filter activex** | java <port> [-<port>] | **except** <local\_ip> <mask> <foreign\_ip> <foreign\_mask>

Syntax Description	port	The TCP port to v other values are a The range of value ports and their life	ccepted. The <b>http</b> es permitted is 0 t	or <b>url</b> lite	eral can be used	for port 21.		
	-port	(Optional) Specif						
	except	Creates an except	ion to a previous	filter cond	ition.			
	local_ip	The IP address of the highest security level interface from which access is sought. You can set this address to <b>0.0.0.0</b> (or in shortened form, <b>0</b> ) to specify all hosts.						
	maskNetwork mask of local_ip. You can use 0.0.0.0 (or in shortened specify all hosts.foreign_ipThe IP address of the lowest security level interface to which a sought. You can use 0.0.0.0 (or in shortened form, 0) to specifi							
	foreign_mask	Network mask of <i>foreign_ip</i> . Always specify a specific mask value. You can use <b>0.0.0</b> (or in shortened form, <b>0</b> ) to specify all hosts.

	Preexisting	This command wa	as preexisting.					
Usage Guidelines	ActiveX objects may p servers on a protected	•	•					

ActiveX controls, formerly known as OLE or OCX controls, are components you can insert in a web page or other application. These controls include custom forms, calendars, or any of the extensive third-party forms for gathering or displaying information. As a technology, ActiveX creates many potential problems for network clients including causing workstations to fail, introducing network security problems, or being used to attack servers.

The **filter activex** command command blocks the HTML <object> commands by commenting them out within the HTML web page. ActiveX filtering of HTML files is performed by selectively replacing the <APPLET> and </APPLET> and </OBJECT CLASSID> and </OBJECT> tags with comments. Filtering of nested tags is supported by converting top-level tags to comments.

∕!∖ Caution

**Examples** 

The <object> tag is also used for Java applets, image files, and multimedia objects, which will also be blocked by this command.

If the <object> or </object> HTML tags split across network packets or if the code in the tags is longer than the number of bytes in the MTU, the adaptive security appliance cannot block the tag.

ActiveX blocking does not occur when users access an IP address referenced by the **alias** command or for WebVPN traffic.

#### The following example specifies that Activex objects are blocked on all outbound connections:

hostname(config)# filter activex 80 0 0 0 0

This command specifies that the ActiveX object blocking applies to web traffic on port 80 from any local host and for connections to any foreign host.

Related Commands\	Commands	Description
	filter url	Directs traffic to a URL filtering server.
	filter java	Removes Java applets from HTTP traffic passing through the adaptive security appliance.

Usage Guidelines	The <b>filter ftp</b> command lets you identify the FTP traffic to be filtered by a Websense or N2H2 server.
	After enabling this feature, when a user issues an FTP GET request to a server, the adaptive security appliance sends the request to the FTP server and to the Websense or N2H2 server at the same time. If the Websense or N2H2 server permits the connection, the adaptive security appliance allows the successful FTP return code to reach the user unchanged. For example, a successful return code is "250: CWD command successful."
	If the Websense or N2H2 server denies the connection, the adaptive security appliance alters the FTP return code to show that the connection was denied. For example, the adaptive security appliance would change code 250 to "550 Requested file is prohibited by URL filtering policy." Websense only filters FTP GET commands and not PUT commands).
	Use the <b>interactive-block</b> option to prevent interactive FTP sessions that do not provide the entire directory path. An interactive FTP client allows the user to change directories without typing the entire path. For example, the user might enter <b>cd</b> ./ <b>files</b> instead of <b>cd</b> / <b>public</b> / <b>files</b> . You must identify and enable the URL filtering server before using these commands.
Examples	The following example shows how to enable FTP filtering:
	hostname(config)# <b>url-server (perimeter) host 10.0.1.1</b> hostname(config)# <b>filter ftp 21 0 0 0 0</b>

<b>Related Commands</b>	Commands	Description
	filter https	Identifies the HTTPS traffic to be filtered by a Websense sor N2H2 erver.
	filter java	Removes Java applets from HTTP traffic passing through the adaptive security appliance.
	filter url	Directs traffic to a URL filtering server.
	show running-config filter	Displays filtering configuration.
	url-block	Manages the URL buffers used for web server responses while waiting for a filtering decision from the filtering server.
	url-server	Identifies an N2H2 or Websense server for use with the <b>filter</b> command.

hostname(config)# filter ftp except 10.0.2.54 255.255.255.255 0 0

### filter https

To identify the HTTPS traffic to be filtered by a N2H2 or Websense server, use the **filter https** command in global configuration mode. To remove the configuration, use the **no** form of this command.

**filter https** <*port*> [-<*port*>] | **except** <*local\_ip*> <*mask*> <*foreign\_ip*> <*foreign\_mask*> [**allow**]

**no filter https** <*port*> [-<*port*>] | **except** <*local\_ip*> <*mask*> <*foreign\_ip*> <*foreign\_mask*> [**allow**]

	local_ip	The IP address of the highest security level interface from which access is sought. You can set this address to $0.0.0.0$ (or in shortened form, $0$ ) to specify all hosts.								
	except	(Optional) Creates	-	-						
	-port	(Optional) Specifi	es a port range.							
		The TCP port to which filtering is applied. Typically, this is port 443, but other values are accepted. The <b>https</b> literal can be used for port 443.								

Usage Guidelines	The adaptive security appliance supports filtering of HTTPS and FTP sites using an external Websense or N2H2 filtering server.
	HTTPS filtering works by preventing the completion of SSL connection negotiation if the site is not allowed. The browser displays an error message such as "The Page or the content cannot be displayed."
	Because HTTPS content is encrypted, the adaptive security appliance sends the URL lookup without directory and filename information.
Examples	The following example filters all outbound HTTPS connections except those from the 10.0.2.54 host:

hostname(config)# url-server (perimeter) host 10.0.1.1
hostname(config)# filter https 443 0 0 0 0
hostname(config)# filter https except 10.0.2.54 255.255.255.255 0 0

<b>Related Commands</b>	Commands	Description

The **filter java** command filters out Java applets that return to the adaptive security appliance from an outbound connection. The user still receives the HTML page, but the web page source for the applet is commented out so that the applet cannot execute. The **filter java** command does not filter WebVPN traffic.

If the applet or /applet HTML tags split across network packets or if the code in the tags is longer than the number of bytes in the MTU, the adaptive security appliance cannot block the tag. If Java applets are known to be in <object> tags, use the **filter activex** command to remove them.

**Examples** The following example specifies that Java applets are blocked on all outbound connections:

hostname(config)# filter java 80 0 0 0 0

This command specifies that the Java applet blocking applies to web traffic on port 80 from any local host and for connections to any foreign host.

The following example blocks downloading of Java applets to a host on a protected network:

hostname(config)# filter java http 192.168.3.3 255.255.255.255 0 0

This command prevents host 192.168.3.3 from downloading Java applets.

<b>Related Commands</b>	Commands	Description
	filter activex	Removes ActiveX objects from HTTP traffic passing through the adaptive security appliance.
	filter url	Directs traffic to a URL filtering server.
	show running-config filter	Displays filtering configuration.
	url-server	Identifies an N2H2 or Websense server for use with the <b>filter</b> command.

# filter url

To direct traffic to a URL filtering server, use the **filter url** command in global configuration mode. To remove the configuration, use the **no** form of this command.

filter url <port> [-<port>] | except <local\_ip> <mask> <foreign\_ip> <foreign\_mask> [allow]
 [cgi-truncate] [longurl-truncate | longurl-deny] [proxy-block]

**no filter url** <port> [-<port>] | except <local\_ip> <mask> <foreign\_ip> <foreign\_mask> [allow] [cgi-truncate] [longurl-truncate | longurl-deny] [proxy-block]

Syntax Description	allow	When the server is unavailable, let outbound connections pass through the adaptive security appliance without filtering. If you omit this option, and if the N2H2 or Websense server goes off line, the adaptive security appliance stops outbound port 80 (Web) traffic until the N2H2 or Websense server is back on line.
	cgi_truncate	When a URL has a parameter list starting with a question mark (?), such as a CGI script, truncate the URL sent to the filtering server by removing all characters after and including the question mark.
	except	Creates an exception to a previous filter condition.
	foreign_ip	The IP address of the lowest security level interface to which access is sought. You can use <b>0.0.0.0</b> (or in shortened form, <b>0</b> ) to specify all hosts.
	foreign_mask	Network mask of <i>foreign_ip</i> . Always specify a specific mask value. You can use <b>0.0.0.0</b> (or in shortened form, <b>0</b> ) to specify all hosts.
	http	Specifies port 80. You can enter <b>http</b> or <b>www</b> instead of 80 to specify port 80.)
	local_ip	The IP address of the highest security level interface from which access is sought. You can set this address to <b>0.0.0.0</b> (or in shortened form, <b>0</b> ) to specify all hosts.
	local_mask	Network mask of <i>local_ip</i> . You can use <b>0.0.0.0</b> (or in shortened form, <b>0</b> ) to specify all hosts.
	longurl-deny	Denies the URL request if the URL is over the URL buffer size limit or the URL buffer is not available.
	longurl-truncate	Sends only the originating hostname or IP address to the N2H2 or Websense server if the URL is over the URL buffer limit.
	mask	Any mask.
	-port	<ul> <li>(Optional) The TCP port to which filtering is applied. Typically, this is port 80, but other values are accepted. The http or url literal can be used for port 80. Adding a second port after a hyphen optionally identifies a range of ports.</li> </ul>
	proxy-block	Prevents users from connecting to an HTTP proxy server.
	url	Filter URLs from data moving through the adaptive security appliance.

Defaults

This command is disabled by default.

#### **Command Modes** The following table shows the modes in which you can enter the command: **Firewall Mode Security Context** Multiple **Command Mode** Routed Single Context Transparent System Global configuration • • • • • **Command History** Release Modification Preexisting This command was preexisting. **Usage Guidelines** The **filter url** command lets you prevent outbound users from accessing World Wide Web URLs that you designate using the N2H2 or Websense filtering application. Note The **url-server** command must be configured before issuing the **filter url** command. The **allow** option to the **filter url** command determines how the adaptive security appliance behaves if the N2H2 or Websense server goes off line. If you use the **allow** option with the **filter url** command and the N2H2 or Websense server goes offline, port 80 traffic passes through the adaptive security appliance without filtering. Used without the allow option and with the server off line, the adaptive security appliance stops outbound port 80 (Web) traffic until the server is back on line, or if another URL server is available, passes control to the next URL server. Note With the **allow** option set, the adaptive security appliance now passes control to an alternate server if the N2H2 or Websense server goes off line. The N2H2 or Websense server works with the adaptive security appliance to deny users from access to websites based on the company security policy. **Using the Filtering Server** Websense protocol Version 4 enables group and username authentication between a host and a adaptive security appliance. The adaptive security appliance performs a username lookup, and then Websense server handles URL filtering and username logging. The N2H2 server must be a Windows workstation (2000, NT, or XP), running an IFP Server, with a recommended minimum of 512 MB of RAM. Also, the long URL support for the N2H2 service is capped at 3 KB, less than the cap for Websense. Websense protocol Version 4 contains the following enhancements: • URL filtering allows the adaptive security appliance to check outgoing URL requests against the policy defined on the Websense server. Username logging tracks username, group, and domain name on the Websense server.

• Username lookup enables the adaptive security appliance to use the user authentication table to map the host's IP address to the username.

Information on Websense is available at the following website:

#### http://www.websense.com/

#### **Configuration Procedure**

Follow these steps to filter URLs:

- **Step 1** Designate an N2H2 or Websense server with the appropriate vendor-specific form of the **url-server** command.
- **Step 2** Enable filtering with the **filter** command.
- Step 3 If needed, improve throughput with the url-cache command. However, this command does not update Websense logs, which may affect Websense accounting reports. Accumulate Websense run logs before using the url-cache command.
- **Step 4** Use the **show url-cache statistics** and the **show perfmon** commands to view run information.

#### Working with Long URLs

Filtering URLs up to 4 KB is supported for the Websense filtering server, and up to 3 KB for the N2H2 filtering server.

Use the **longurl-truncate** and **cgi-truncate** options to allow handling of URL requests longer than the maximum permitted size.

If a URL is longer than the maximum, and you do not enable the **longurl-truncate** or **longurl-deny** options, the adaptive security appliance drops the packet.

The **longurl-truncate** option causes the adaptive security appliance to send only the hostname or IP address portion of the URL for evaluation to the filtering server when the URL is longer than the maximum length permitted. Use the **longurl-deny** option to deny outbound URL traffic if the URL is longer than the maximum permitted.

Use the **cgi-truncate** option to truncate CGI URLs to include only the CGI script location and the script name without any parameters. Many long HTTP requests are CGI requests. If the parameters list is very long, waiting and sending the complete CGI request including the parameter list can use up memory resources and affect adaptive security appliance performance.

#### **Buffering HTTP Responses**

By default, when a user issues a request to connect to a specific website, the adaptive security appliance sends the request to the web server and to the filtering server at the same time. If the filtering server does not respond before the web content server, the response from the web server is dropped. This delays the web server response from the point of view of the web client.

By enabling the HTTP response buffer, replies from web content servers are buffered and the responses will be forwarded to the requesting user if the filtering server allows the connection. This prevents the delay that may otherwise occur.

To enable the HTTP response buffer, enter the following command:

url-block block block-buffer-limit

Replace *block-buffer* with the maximum number of blocks that will be buffered. The permitted values are from 1 to 128, which specifies the number of 1550-byte blocks that can be buffered at one time.

Examples	The following example filters all outbound HTTP connections except those from the 10.0.2.54 host:			
	hostname(config)# <b>url-server (perimeter) host 10.0.1.1</b> hostname(config)# <b>filter url 80 0 0 0 0</b> hostname(config)# <b>filter url except 10.0.2.54 255.255.255.255 0 0</b>			
	The following example blocks all outbound HTTP connections destined to a proxy server that listens on port 8080:			

hostname(config)# filter url 8080 0 0 0 proxy-block

Related Commands	Commands	Description

Command History	Release	Modification
	7.0(1)	This command was introduced.

**Usage Guidelines** For multiple context mode, you can use only one firewall mode for all contexts. You must set the mode in the system configuration. This command also appears in each context configuration for informational purposes only; you cannot enter this command in a context.

When you change modes, the adaptive security appliance clears the configuration because many commands are not supported for both modes. If you already have a populated configuration, be sure to back up your configuration before changing the mode; you can use this backup for reference when creating your new configuration.

If you download a text configuration to the adaptive security appliance that changes the mode with the **firewall transparent** command, be sure to put the command at the top of the configuration; the adaptive security appliance changes the mode as soon as it reads the command and then continues reading the configuration you downloaded. If the command is later in the configuration, the adaptive security appliance clears all the preceding lines in the configuration.

#### Examples

The following example changes the firewall mode to transparent:

hostname(config)# firewall transparent

Related Commands	Command	Description
	arp-inspection	Enables ARP inspection, which compares ARP packets to static ARP entries.
	mac-address-table static	Adds static MAC address entries to the MAC address table.
	mac-learn	Disables MAC address learning.
	show firewall	Shows the firewall mode.
	show mac-address-table	Shows the MAC address table, including dynamic and static entries.

# flowcontrol

To enable pause (XOFF) frames for flow control, use the **flowcontrol** command in interface configuration mode. To disable pause frames, use the **no** form of this command.

flowcontrol send on [low\_water high\_water pause\_time] [noconfirm]

**no flowcontrol send on** [low\_water high\_water pause\_time] [**noconfirm**]

Syntax Description		
	high_water	Sets the high-water mark, between 0 and 511 KB for 10 GigabitEthernet, and between 0 and 47 KB for 1 GigabitEthernet. When the buffer usage exceeds the high-water mark, the NIC sends a pause frame.
	low_water	Sets the low-water mark, between 0 and 511 KB for 10 GigabitEthernet, and between 0 and 47 KB for 1 GigabitEthernet. After the network interface controller (NIC) sends a pause frame, when the buffer usage is reduced below the low-water mark, the NIC sends an XON frame. The link partner can resume traffic after receiving an XON frame.
	noconfirm	Applies the command without confirmation. Because this command resets the interface, without this option, you are asked to confirm the configuration change.
	pause_time	Sets the pause refresh threshold value, between 0 and 65535 slots. Each slot is the amount of time to transmit 64 bytes, so the time per unit depends on your link speed. The link partner can resume traffic after receiving an XON, or after the XOFF expires, as controlled by this timer value in the pause frame. If the buffer usage is consistently above the high-water mark, pause frames are sent repeatedly, controlled by the pause refresh threshold value. The default is 26624.

#### **Command Default**

Pause frames are disabled by default.

For 10 GigabitEthernet, see the following default settings:

- The default high watermark is 128 KB.
- The default low watermark is 64 KB.
- The default pause refresh threshold value is 26624 slots.

For 1 GigabitEthernet, see the following default settings:

- The default high watermark is 24 KB.
- The default low watermark is 16 KB.
- The default pause refresh threshold value is 26624 slots.

Command History	Release Modification								
-	8.2(2)     This command was introduced for 10-GigabitEthernet interfaces on the ASA 5580.								
	8.2(3)								
	8.2(5)	Addeo	l support for	1-GigabitEthern	et interface	es on all mode	ls.		
Usage Guidelines	This command is does not support r		-	ernet and 10-Gig	abit Ethern	et interfaces.	This command		
	Enter this command for a physical interface.								
	If you have a traffic burst, dropped packets can occur if the burst exceeds the buffering capacity of the FIFO buffer on the NIC and the receive ring buffers. Enabling pause frames for flow control can alleviate this issue.								
	The output flow control status is based on negotiation with the link partner for 1-GigabitEthernet interfaces. Although the <b>show interface</b> command has been enabled in the running configuration, this command is expected to display "output flow-control is off" if the peer device is not enabled for flow control; otherwise, negotiation fails. The following example shows the difference in the outputs for the <b>show running-config interface</b> command and the <b>show interface</b> command:								
	hostname(config-if)# show run interface g0/1								
	! interface Gigabi flowcontrol ser nameif inside security-level ip address 10.1 delay 60 hostname(config-	nd on 100 40.21 255.2	55.255.0						
	<pre>hostname(config-if)# show interface g0/1 Interface GigabitEthernet0/1 "inside", is up, line protocol is up Hardware is i82546GB rev03, EW 1000 Mbps, DLY 600 usec Auto-Duplex(Full-duplex), Auto-Speed(1000 Mbps) Input flow control is unsupported, output flow control is off MAC address 0017.5a88.78d3, MTU 1500 IP address 10.1.40.21, subnet mask 255.255.255.0 24969 packets input, 1937745 bytes, 0 no buffer Received 2 broadcasts, 0 runts, 0 giants 0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort 0 pause input, 0 resume input 0 L2 decode drops 6781 packets output, 524150 bytes, 0 underruns 0 pause output, 0 resume output 0 output errors, 0 collisions, 3 interface resets 0 late collisions, 0 deferred</pre>								

0 input reset drops, 0 output reset drops, 0 tx hangs input queue (blocks free curr/low): hardware (255/254)
output queue (blocks free curr/low): hardware (255/254)
Traffic Statistics for "inside":
24966 packets input, 1378625 bytes
6781 packets output, 398978 bytes
13646 packets dropped
1 minute input rate 0 pkts/sec, 54 bytes/sec
1 minute output rate 0 pkts/sec, 14 bytes/sec
1 minute drop rate, 0 pkts/sec
5 minute input rate 0 pkts/sec, 53 bytes/sec
5 minute output rate 0 pkts/sec, 14 bytes/sec
5 minute drop rate, 0 pkts/sec

When you enable this command, pause (XOFF) and XON frames are generated automatically by the NIC hardware based on the FIFO buffer usage:

- 1. The NIC sends a pause frame when the buffer usage exceeds the high-water mark.
- 2. After a pause is sent, the NIC sends an XON frame when the buffer usage is reduced below the low-water mark.
- **3.** The link partner can resume traffic after receiving an XON, or after the XOFF expires, as controlled by the timer value in the pause frame.
- **4.** If the buffer usage is consistently above the high-water mark, the NIC sends pause frames repeatedly, controlled by the pause refresh threshold value.

When you use this command, the following warning message appears:

```
Changing flow-control parameters will reset the interface. Packets may be lost during the reset.
```

Proceed with flow-control changes?

To change the parameters without being prompted, use the **noconfirm** keyword.

Only flow control frames defined in 802.3x are supported. Priority-based flow control is not supported.

Examples	The following example enables pause frames using the default settings:						
	<pre>hostname(config)# interface tengigabitethernet 1/0 hostname(config-if)# flowcontrol send on</pre>						
	Changing flow-control parameters will reset the interface. Packets may be lost during the reset. Proceed with flow-control changes?						
	hostname(config-if)# <b>y</b>

### **Examples** The following example shows how to configure a collector for NetFlow data:

hostname(config)# flow-export destination inside 209.165.200.224 2055

<b>Related Commands</b>	Commands	Description
	clear flow-export counters	Resets all runtime counters in NetFlow to zero.
	flow-export delay flow-create seconds	Delays the export of the flow-create event by a specified amount of time.
	flow-export template timeout-rate minutes	Controls the interval at which the template information is sent to the NetFlow collector.
	logging flow-export-syslogs enable	Enables syslog messages after you have entered the <b>logging</b> <b>flow-export-syslogs disable</b> command, and the syslog messages that are associated with NetFlow data.
	show flow-export counters	Displays a set of runtime counters for NetFlow.

### flow-export enable

Version 8.1(1):

To enable export of NetFlow packets, use the **flow-export enable** command in global configuration mode. To disable export of NetFlow packets, use the **no** form of this command.

flow-export enable

no flow-export enable

Version 8.1(2):

The **flow-export enable** command is a macro to enable NetFlow configuration in the global policy with the Modular Policy Framework based NetFlow configuration commands. This command has been deprecated. Use the **flow-export event-type** command, described under the **policy-map** command, for NetFlow configuration.

**Syntax Description** Version 8.1(1) :

This command has no arguments or keywords.

Version 8.1(2):

This command has no arguments or keywords. Because the command is a macro, the use of the **no** keyword is invalid.

**Defaults** This command is not available in the default configuration.

**Command Modes** The following table shows the modes in which you can enter the command:

	Firewall Mode Security C			Context		
				Multiple		
Command Mode	Routed	Transparent	Single	Context	System	
Global configuration	•	•	•	•	_	

# Command HistoryReleaseModification8.1(1)This command was introduced.8.1(2)This command has been deprecated.

Usage Guidelines

Version 8.1(1):

When you enter the **flow-export enable** command, the template records are sent to all configured NetFlow collectors. When you enter the **no flow-export enable** command, any pending, cached NetFlow records are deleted from all collectors.

### <u>Note</u>

You cannot export NetFlow records from a standby device. Consequently, configuring this command on a standby device has no effect.

Version 8.1(2):

The **flow-export enable** command has been deprecated. Use the **flow-export event-type all destination** command instead. When you enter this command, the following informational message appears:

INFO: 'flow-export enable' command is deprecated. Converting to flow-export actions under MPF.

Note

To enable the commands to be modified, you must have configured the **flow-export destination** command and have defined a Netflow collector. If no NetFlow collector has been defined, no configuration actions occur.

The **flow-export enable** command adds the following configuration to the Modular Policy Framework, in which 192.168.1.1 is the IP address that has been configured with the **flow-export destination** command.

hostname(config)# policy-map global\_policy
hostname(config-pmap)# class class-default
hostname(config-pmap-c)# flow-export event-type all destination 192.168.1.1

When you enter the **no flow-export enable** command, the following error message appears:

ERROR: This command is no longer supported. Flow-export actions under MPF need to be removed to stop exporting NetFlow events.

Because the **flow-export enable** command is only a macro to convert to the Modular Policy Framework based NetFlow configuration commands, the **no** keyword has no effect.

#### Examples

#### Version 8.1(1):

The following example shows how to start exporting NetFlow events:

hostname(config)# flow-export enable

Version 8.1(2):

The flow-export enable command has been deprecated.

hostname(config)# flow-export enable INFO: 'flow-export enable' command is deprecated. Converting to flow-export actions under MPF.

#### Related Commands

Commands	Description
clear flow-export counters	Resets all runtime counters in NetFlow to zero.
<b>flow-export destination</b> interface-name ipv4-address   hostname udp-port	Specifies the IP address or hostname of the NetFlow collector, and the UDP port on which the NetFlow collector is listening.

### flow-export event-type destination

To configure the address of NetFlow collectors and filters to determine which NetFlow records should be sent to each collector, use the **flow-export event-type destination** command in policy-map class configuration mode. To remove the address of NetFlow collectors and filters, use the **no** form of this command.

flow-export event-type {all | flow-create | flow-denied | flow-update | flow-teardown} destination

no flow-export event-type {all | flow-create | flow-denied | flow-update | flow-teardown} destination

Syntax Description	all Specifies all four event types.								
	flow-create	Specifies	flow-create	events.					
	flow-denied	Specifies flow-denied events.							
	flow-teardown	low-teardown Specifies flow-teardown events.							
	flow-update	Specifies	flow-update	events.					
Defaults	No default behavior	r or values.							
Command Modes	The following table	shows the me	odes in whic	h you can enter	the comma	nd.			
	-			-					
			Firewall N	lode	Security C	Security Context			
						Multiple			
	Command Mode		Routed	Transparent	Single	Context	System		
	Policy-map class c	onfiguration	•	•	•	•			
Command History	Release	Modifi	cation						
	8.1(2)	This co	ommand was	introduced.					
Usage Guidelines	NetFlow events are configured for NetF configured. After a configuration requi	Flow, no events match is dete	s are logged. cted, no othe	Traffic is match	ed based or	n the order in w	which classes are		
	• A flow-export	destination (th	nat is, a NetF	Flow collector) i	s uniquely i	identified by it	s IP address.		
	• Supported ever include the fou			ow-teardown, flo ypes.	ow-denied,	flow-update, a	and all, which		
	• Flow-export actions are not supported in interface policies.								

- Flow-export actions are only supported in the **class-default** command and in classes with the **match any** or **match access-list** command.
- If no NetFlow collector has been defined, no configuration actions occur.
- NetFlow Secure Event Logging filtering is order-independent.

To create a valid NetFlow configuration, you must have both the flow-export destination configuration and the flow-export event-type configuration. The flow-export destination configuration alone does nothing. You must also configure a class map for the flow-export event-type configuration. This can either be the default class map or one that you create.

Examples

The following example exports all NetFlow events between hosts 10.1.1.1 and 20.1.1.1 to the destination 15.1.1.1.

```
hostname(config)# access-list flow_export_acl permit ip host 10.1.1.1 host 20.1.1.1
hostname(config)# class-map flow_export_class
hostname(config-cmap)# match access-list flow_export_acl
hostname(config)# policy-map global_policy
hostname(config-pmap)# class flow_export_class
hostname(config-pmap-c)# flow-export event-type all destination 15.1.1.1
```

enrollment retry count	Specifies the number of retries to attempt to send an enrollment request.
enrollment retry period	Specifies the number of minutes to wait before trying to send an enrollment request.
enrollment terminal	Specifies cut and paste enrollment with this trustpoint.

# fragment

To provide additional management of packet fragmentation and improve compatibility with NFS, use the **fragment** command in global configuration mode. To return to the default values, use the **no** form of this command.

fragment reassembly {full | virtual } {size | chain | timeout limit } [interface]

**no fragment reassembly** {**full | virtual**}{**size | chain | timeout** *limit*} *interface* 

Syntax Description	chain limit	Specifies the maximum number of fragments into which a full IP packet can be fragmented.					
	interface	(Optional) Specifies the adaptive security appliance interface. If an interface is not specified, the command applies to all interfaces.					
	reassembly full   virtual	Specifies the full or virtual reassembly for IP fragments that are routed through the adaptive security appliance. IP fragments that terminate at the adaptive security appliance are always fully reassembled. Sets the maximum number of fragments that can be in the IP reassembly database waiting for reassembly.					
	size limit						
		<b>Note</b> The adaptive security appliance does not accept any fragments that are not part of an existing fabric chain after the queue size reaches 2/3 full. The remaining 1/3 of the queue is used to accept fragments where the source/destination IP addresses and IP identification number are the same as an incomplete fragment chain that is already partially queued. This limit is a DoS protection mechanism to help legitimate fragment chains be reassembled when there is a fragment flooding attack.					
	timeout limit	Specifies the maximum number of seconds to wait for an entire fragmented packet to arrive. The timer starts after the first fragment of a packet arrives. If all fragments of the packet do not arrive by the number of seconds specified, all fragments of the packet that were already received will be discarded.					

#### Defaults

The defaults are as follows:

- chain is 24 packets
- *interface* is all interfaces
- **size** is 200
- timeout is 5 seconds
- virtual reassembly is enabled

Command Modes	The following table sho	sws the modes in white	n you can chief

	If a large percentage of the network traffic through the adaptive security appliance is NFS, additional tuning might be necessary to avoid database overflow.							
	In an environment where the MTU size is small between the NFS server and client, such as a WAN interface, the <b>chain</b> keyword might require additional tuning. In this case, we recommend using NFS over TCP to improve efficiency.							
	Setting the <b>size</b> <i>limit</i> to a large value can make the adaptive security appliance more vulnerable to a DoS attack by fragment flooding. Do not set the <b>size</b> <i>limit</i> equal to or greater than the total number of blocks in the 1550 or 16384 pool.							
	The default values will limit DoS attacks caused by fragment flooding.							
	The following processes are performed regardless of the <b>reassembly</b> option setting:							
	• IP fragments are collected until a fragment set is formed or until a timeout interval has elapsed (see the <b>timeout</b> option).							
	• If a fragment set is formed, integrity checks are performed on the set. These checks include no overlapping, no tail overflow, and no chain overflow (see the <b>chain</b> option).							
	If the <b>fragment reassembly virtual</b> command is configured, the fragment set is forwarded to the transport layer for further processing.							
	If the <b>fragment reasse</b> IP packet. The single I							
Examples	The following example	shows how to preven	t fragmented pac	kets on the	outside and in	nside interfaces		
	hostname(config)# <b>fr</b> hostname(config)# fr							

Command

Continue entering the **fragment chain 1** *interface* command for each additional interface on which you want to prevent fragmented packets.

The following example shows how to configure the fragment database on the outside interface to a maximum size of 2000, a maximum chain length of 45, and a wait time of 10 seconds:

hostname(config)# fragment size 2000 outside hostname(config)# fragment chain 45 outside hostname(config)# fragment timeout 10 outside

The following example displays output from the **show fragment** command that includes the **reassembly virtual** option:

```
hostname(config)# show fragment
Interface: outside
Size: 200, Chain: 24, Timeout: 5, Reassembly: virtual
Queue: 0, Assembled: 0, Fail: 0, Overflow: 0
Interface: inside
Size: 200, Chain: 24, Timeout: 5, Reassembly: virtual
Queue: 0, Assembled: 0, Fail: 0, Overflow: 0
```

#### Related Commands

Description
-------------

show running-config fragment	Displays the IP fragment reassembly configuration.			

### frequency

To set the rate at which the selected SLA operation repeats, use the **frequency** command in SLA monitor protocol configuration mode. To restore the default value, use the **no** form of this command.

frequency seconds

no frequency

Syntax Description		secondsThe number of seconds between SLA probes. Valid values are from 1 to 604800 seconds. This value cannot be less than the <b>timeout</b> value.							
Defaults	The default frequency is 60 s	econds.							
Command Modes	The following table shows th	e modes in whic	h you can enter	the comma	nd:				
		Firewall N	lode	Security C	ontext				
					Multiple				
	Command Mode	Routed	Transparent	Single	Context	System			
	SLA monitor protocol configuration	•	_	•	_	_			
Command History	Release Modification								
	7.2(1) Th	is command was	s introduced.						
Usage Guidelines	An SLA operation repeats at a given frequency for the lifetime of the operation. For example, an <b>ipIcmpEcho</b> operation with a frequency of 60 seconds repeats by sending the echo request packets once every 60 seconds for the lifetime of the operation. For example, the default number of packets in an echo operation is 1. This packet is sent when the operation is started and is then sent again 60 seconds later.								
	If an individual SLA operation takes longer to execute than the specified frequency value, a statistics counter called "busy" is increased rather than immediately repeating the operation.								
	The value specified for the <b>fr</b> command.	requency comma	and cannot be les	ss than the v	value specified	for the <b>timeout</b>			
Examples	The following example configures an SLA operation with an ID of 123 and creates a tracking entry with the ID of 1 to track the reachability of the SLA. The frequency of the SLA operation is set to 3 seconds, and the timeout value us set to 1000 milliseconds.								
	hostname(config)# <b>sla mon</b> hostname(config-sla-monite hostname(config-sla-monite hostname(config-sla-monite	or)# <b>type echo</b> or-echo)# <b>time</b> d	out 1000	mpEcho 10.	1.1.1 interfa	ace outside			

hostname(config)# sla monitor schedule 123 life forever start-time now hostname(config)# track 1 rtr 123 reachability

<b>Related Commands</b>	Command	Description	
	sla monitor Defines an SLA monitoring operation.		
	timeout	Defines the amount of time the SLA operation waits for a response.	

# fsck

To perform a file system check and to repair corruptions, use the **fsck** command in privileged EXEC mode.

fsck [/noconfirm] {disk0: | disk1: | flash:}

Syntax Description	<b>/noconfirm</b> (Optional) Does not prompt for confirmation to repair.							
	<b>disk0</b> : Specifies the internal Flash memory, followed by a colon.							
	disk1:	disk1: Specifies the external Flash memory card, followed by a colon.						
	flash:	flash:Specifies the internal Flash memory, followed by a colon. The flash keyword is aliased to disk0.						
Defaults	No default behavio	ors or values.						
Command Modes	The following tabl	e shows the ma	odes in whic	h you can enter	the comma	nd:

### ftp mode passive

To set the FTP mode to passive, use the **ftp mode passive** command in global configuration mode. To reset the FTP client to active mode, use the **no** form of this command.

ftp mode passive

no ftp mode passive

#### **Command Modes** The following table shows the modes in which you can enter the command:

	Firewall N	lode	Security Context			
				Multiple		
Command Mode	Routed	Transparent	Single	Context	System	
Global configuration	•	•	•		•	

Command History	Release	Modification
	7.0(1)	This command was introduced.

# **Usage Guidelines** The **ftp mode passive** command sets the FTP mode to passive. The adaptive security appliance can use FTP to upload or download image files or configuration files to or from an FTP server. The **ftp mode passive** command controls how the FTP client on the adaptive security appliance interacts with the FTP server.

In passive FTP, the client initiates both the control connection and the data connection. Passive mode refers to the server state, in that the server is passively accepting both the control connection and the data connection, which are initiated by the client.

In passive mode, both destination and source ports are ephemeral ports (greater than 1023). The mode is set by the client, as the client issues the **passive** command to initiate the setup of the passive data connection. The server, which is the recipient of the data connection in passive mode, responds with the port number to which it is listening for the specific connection.

#### **Examples** The following example sets the FTP mode to passive: hostname(config)# **ftp mode passive**

Related Commands copy

Uploads or downloads image files or configuration files to or from an FTP server.

debug ftp client	Displays detailed information about FTP client activity.
show running-config ftp mode	Displays the FTP client configuration.

### functions (removed)

You cannot use **functions** command for Release 8.0(2). It is deprecated, and remains in this Command Reference only for reasons of backward compatibility. Use the import and export commands to create URL lists for websites, file access, and plug-ins, customization, and language translations.

To configure automatic downloading of the port forwarding java applet, Citrix support, file access, file browsing, file server entry, application of a webtype ACL, HTTP Proxy, port forwarding, or URL entry over WebVPN for this user or group policy, use the **functions** command in webvpn configuration mode. To remove a configured function, use the **no** form of this command.

# functions {auto-download | citrix | file-access | file-browsing | file-entry | filter | http-proxy | url-entry | port-forward | none}

no functions [auto-download | citrix | file-access | file-browsing | file-entry | filter | url-entry | port-forward]

auto-download	Enables or disables automatic download of the port forwarding java applet upon WebVPN login. You must first enable port forwarding, Outlook/Exchange proxy, or HTTP proxy.
citrix	Enables or disables support for terminal services from a MetaFrame Application Server to the remote user. This keyword lets the security appliance act as a secure gateway within a secure Citrix configuration. These services provide users with access to MetaFrame applications through a standard Web browser.
file-access	Enables or disables file access. When enabled, the WebVPN home page lists file servers in the server list. You must enable file access to enable file browsing and/or file entry.
file-browsing	Enables or disables browsing for file servers and shares. You must enable file browsing to allow user entry of a file server.
file-entry	Enables or disables user ability to enter names of file servers.
filter	Applies a webtype ACL. When enabled, the adaptive security appliance applies the webtype ACL defined with the webvpn <b>filter</b> command.
http-proxy	Enables or disables the forwarding of an HTTP applet proxy to the remote user. The proxy is useful for technologies that interfere with proper mangling, such as Java, ActiveX, and Flash. It bypasses mangling while ensuring the continued use of the security appliance. The forwarded proxy modifies the browser's old proxy configuration automatically and redirects all HTTP and HTTPS requests to the new proxy configuration. It supports virtually all client side technologies, including HTML, CSS, JavaScript, VBScript, ActiveX, and Java. The only browser it supports is Microsoft Internet Explorer.
none	Sets a null value for all WebVPN <b>functions</b> . Prevents inheriting functions from a default or specified group policy.
	citrix file-access file-browsing file-entry filter http-proxy

	<b>port-forward</b> Enables port forwarding. When enabled, the adaptive security appliance uses the port forwarding list defined with the webvpn <b>port-forward</b> command.									
	url-entryEnables or disables user entry of URLs. When enabled, the adaptive security appliance still restricts URLs with any configured URL or network ACLs. When URL entry is disabled, the adaptive security appliance restricts WebVPN users to the URLs on the home page.									
Defaults	Functions are disabled	l by defaul	t.							
Command Modes	The following table sh	nows the m	odes in whic	h you can enter	the comma	nd:				
			Firewall M	ode	Security C	ontext				
						Multiple				
	Command Mode		Routed	Transparent	Single	Context	System			
	Webvpn configuration		•		•					
					1					
Command History	Release Modification									
	8.0(2)This command was deprecated.									
	7.1(1)The auto-download and citrix keywords were added.									
	7.0(1)This command was introduced.									
Usage Guidelines	To remove all configured functions, including a null value created by issuing the <b>functions none</b> command, use the <b>no</b> form of this command without arguments. The <b>no</b> option allows inheritance value from another group policy. To prevent inheriting function values, use the <b>functions none</b> command.									
Examples	The following example shows how to configure file access and file browsing for the group policy named FirstGroup:									
	hostname(config)# group-policy FirstGroup attributes hostname(config-group-policy)# webvpn hostname(config-group-webvpn)# functions file-access file-browsing
